British Pharmacopoeia 2022

Volume V

The British Pharmacopoeia Commission has caused this British Pharmacopoeia 2022 to be prepared under regulation 317(1) of the Human Medicines Regulations 2012 and, in accordance with regulation 317(4), the Ministers have arranged for it to be published.

The monographs of the Tenth Edition of the European Pharmacopoeia (2019), as amended by Supplements 10.1 to 10.5, published by the Council of Europe are reproduced either in this edition of the British Pharmacopoeia or in the associated edition of the British Pharmacopoeia (Veterinary).

Notices

Monographs of the European Pharmacopoeia are distinguished by a chaplet of stars against the title. The term European Pharmacopoeia, used without qualification, means the Tenth Edition of the European Pharmacopoeia comprising, unless otherwise stated, the main volume, published in 2019, as amended by any subsequent supplements and revisions.

Patents In this Pharmacopoeia certain drugs and preparations have been included notwithstanding the existence of actual or potential patent rights. In so far as such substances are protected by Letters Patent their inclusion in this Pharmacopoeia neither conveys, nor implies, licence to manufacture.

Effective dates New and revised monographs of national origin enter into force on 1 January 2022. The monographs are brought into effect under regulation 320(2) of the Human Medicines Regulations 2012.

Monographs of the European Pharmacopoeia have previously been published by the European Directorate for the Quality of Medicines & HealthCare, in accordance with the Convention on the Elaboration of a European Pharmacopoeia, and have been brought into effect under the Human Medicines Regulations 2012, as amended, and the Veterinary Medicines Regulations 2013, as amended.

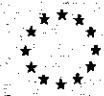
Notes

Part I

The British Pharmacopoeia comprises the entire text within this publication. The word 'official' is used in the Pharmacopoeia to signify 'of the Pharmacopoeia'. It applies to any title, substance, preparation, method or statement included in the general notices, monographs and appendices of the Pharmacopoeia. The abbreviation for British Pharmacopoeia is BP.

European Pharmacopoeia

Monographs of the European Pharmacopoeia are reproduced in this edition of the British Pharmacopoeia by incorporation of the text published under the direction of the Council of Europe (Partial Agreement) in accordance with the Convention on the Elaboration of a European Pharmacopoeia (Treaty Series No. 32 (1974) CMND 5763) as amended by the Protocol to the Convention (Treaty Series No. MISC16 (1990) CMND 1133). They are included for the convenience of users of the British Pharmacopoeia. In cases of doubt or dispute reference should be made to the Council of Europe text.



Monographs of the European Pharmacopoeia are distinguished by a chaplet of stars against the title and by reference to the European Pharmacopoeia monograph number included immediately below the title in italics. The beginning and end of text from the European Pharmacopoeia are denoted by means of horizontal lines with the symbol '*Ph Eur*' ranged left and right, respectively.

The general provisions of the European Pharmacopoeia relating to different types of dosage form are included in the appropriate general monograph in that section of the British Pharmacopoeia entitled Monographs: Formulated Preparations. These general provisions apply to all dosage forms of the type defined, whether or not an individual monograph is included in the British Pharmacopoeia. In addition, the provisions of the European Pharmacopoeia General Monograph for Pharmaceutical Preparations apply to all dosage forms, whether or not an individual monograph is included in the British Pharmacopoeia.

Texts of the European Pharmacopoeia are governed by the General Notices of the European Pharmacopoeia. These are reproduced as Part III of these notices.

Part II

The following general notices apply to the statements made in the monographs of the British Pharmacopoeia other than those reproduced from the European Pharmacopoeia and to the statements made in the Appendices of the British Pharmacopoeia other than when a method, test or other matter described in an appendix is invoked in a monograph reproduced from the European Pharmacopoeia.

Official Standards The requirements stated in the monographs of the Pharmacopoeia apply to articles that are intended for medicinal use but not necessarily to articles that may be sold under the same name for other purposes. An article intended for medicinal use that is described by means of an official title must comply with the requirements of the relevant monograph. A formulated preparation must comply throughout its assigned shelf-life (period of validity). The subject of any other monograph must comply throughout its period of use.

A monograph is to be construed in accordance with any general monograph or notice or any appendix, note or other explanatory material that is contained in this edition and that is applicable to that monograph. All statements contained in the monographs, except where a specific general notice indicates otherwise and with the exceptions given below, constitute standards for the official articles. An article is not of pharmacopoeial quality unless it complies with all of the requirements stated. This does not imply that a manufacturer is obliged to perform all the tests in a monograph in order to assess compliance with the Pharmacopoeia before release of a product. The manufacturer may assure himself that a product is of pharmacopoeial quality by other means, for example, from data derived from validation studies of the manufacturing process, from in-process controls or from a combination of the two. Parametric release in appropriate circumstances is thus not precluded by the need to comply with the Pharmacopoeia. The general notice on Assays and Tests indicates that analytical methods other than those described in the Pharmacopoeia may be employed for routine purposes.

Requirements in monographs have been framed to provide appropriate limitation of potential impurities rather than to provide against all possible impurities. Material found to contain an impurity not detectable by means of the prescribed tests is not of pharmacopoeial quality if the nature or amount of the impurity found is incompatible with good pharmaceutical practice.

The status of any statement given under the headings Definition, Production, Characteristics, Storage, Labelling or Action and use is defined within the general notice relating to the relevant heading. In addition to any exceptions indicated by one of the general notices referred to above, the following parts of a monograph do not constitute standards: (a) a graphic or molecular formula given at the beginning of a monograph; (b) a molecular weight; (c) a Chemical Abstracts Service Registry Number; (d) any information given at the end of a monograph concerning impurities known to be limited by that monograph; (e) information in any annex to a

monograph. Any statement containing the word 'should' constitutes non-mandatory advice or recommendation.

The expression 'unless otherwise justified and authorised' means that the requirement in question has to be met, unless a competent authority authorises a modification or exemption where justified in a particular case. The term 'competent authority' means the national, supranational or international body or organisation vested with the authority for making decisions concerning the issue in question. It may, for example, be a licensing authority or an official control laboratory. For a formulated preparation that is the subject of monograph in the British Pharmacopoeia any justified and authorised modification to, or exemption from, the requirements of the relevant general monograph of the European Pharmacopoeia is stated in the individual monograph. For example, the general monograph for Tablets requires that Uncoated Tablets, except for chewable tablets, disintegrate within 15 minutes; for Calcium Lactate Tablets a time of 30 minutes is permitted.

Many of the general monographs for formulated preparations include statements and requirements additional to those of the European Pharmacopoeia that are applicable to the individual monographs of the British Pharmacopoeia. Such statements and requirements apply to all monographs for that dosage form included in the Pharmacopoeia unless otherwise indicated in the individual monograph.

Where a monograph on a biological substance or preparation refers to a strain, a test, a method, a substance, etc., using the qualifications 'suitable' or 'appropriate' without further definition in the text, the choice of such strain, test, method, substance, etc., is made in accordance with any international agreements or national regulations affecting the subject concerned.

Definition of Terms

Where the term 'about' is included in a monograph or test it should be taken to mean approximately (fairly correct or accurate; near to the actual value).

Where the term 'corresponds' is included in a monograph or test it should be taken to mean similar or equivalent in character or quantity.

Where the term 'similar' is included in a monograph or test it should be taken to mean alike though not necessarily identical.

Further qualifiers (such as numerical acceptance criteria) for the above terms are not included in the BP. The acceptance criteria for any individual case is set based on the range of results obtained from known reference samples, the level of precision of the equipment or apparatus used and the level of accuracy required for the particular application. The user should determine the variability seen in his/her own laboratory and set in-house acceptance criteria that he/she judges to be appropriate based on the local operating conditions.

Expression of Standards

Where the standard for the content of a substance described in a monograph is expressed in terms of the chemical formula for that substance an upper limit exceeding 100% may be stated. Such an upper limit applies to the result of the assay calculated in terms of the equivalent content of the specified chemical formula. For example, the statement 'contains not less than 99.0% and not more than 101.0% of $C_{20}H_{24}N_2O_2$,HCl' implies that the result of the assay is not less than 99.0% and not more than 101.0%, calculated in terms of the equivalent content of $C_{20}H_{24}N_2O_2$,HCl.

Where the result of an assay or test is required to be calculated with reference to the dried, anhydrous or ignited substance, the substance free from a specified solvent or to the peptide content, the determination of loss on drying, water content, loss on ignition, content of the specified solvent or peptide content is carried out by the method prescribed in the relevant test in the monograph.

Temperature The Celsius thermometric scale is used in expressing temperatures.

Weights and Measures The metric system of weights and measures is employed; SI Units have generally been adopted. Metric measures are required to have been graduated at 20° and all measurements involved in the analytical operations of the Pharmacopoeia are intended, unless otherwise stated, to be made at that temperature. Graduated glass apparatus used in analytical operations should comply with Class A requirements of the appropriate International Standard issued by the International Organization for Standardization. The abbreviation for litre is 'L' throughout the Pharmacopoeia.

Atomic Weights The atomic weights adopted are the values given in the Table of Relative Atomic Weights 2001 published by the International Union of Pure and Applied Chemistry (Appendix XXV).

Constant Weight The term 'constant weight', used in relation to the process of drying or the process of ignition, means that two consecutive weighings do not differ by more than 0.5 mg, the second weighing being made after an additional period of drying or ignition under the specified conditions appropriate to the nature and quantity of the residue (1 hour is usually suitable).

Expression of Concentrations The term 'per cent' or more usually the symbol '%' is used with one of four different meanings in the expression of concentrations according to circumstances. In order that the meaning to be attached to the expression in each instance is clear, the following notation is used:

Per cent w/w (% w/w) (percentage weight in weight) expresses the number of grams of solute in 100 g of product.

Per cent w/v (% w/v) (percentage weight in volume) expresses the number of grams of solute in 100 mL of product.

Per cent v/v (% v/v) (percentage volume in volume) expresses the number of millilitres of solute in 100 mL of product.

Per cent v/w (% v/w) (percentage volume in weight) expresses the number of millilitres of solute in 100 g of product.

Usually the strength of solutions of solids in liquids is expressed as percentage weight in volume, of liquids in liquids as percentage volume in volume and of gases in liquids as percentage weight in weight.

When the concentration of a solution is expressed as parts per million (ppm), it means weight in weight, unless otherwise specified.

When the concentration of a solution is expressed as parts of dissolved substance in parts of the solution, it means parts by weight (g) of a solid in parts by volume (mL) of the final solution; or parts by volume (mL) of a liquid in parts by volume (mL) of the final solution; or parts by weight (g) of a gas in parts by weight (g) of the final solution.

When the concentration of a solution is expressed in molarity designated by the symbol M preceded by a number, it denotes the number of moles of

the stated solute contained in sufficient Purified Water (unless otherwise stated) to produce 1 litre of solution.

Water Bath The term 'water bath' means a bath of boiling water, unless water at some other temperature is indicated in the text. An alternative form of heating may be employed providing that the required temperature is approximately maintained but not exceeded.

Reagents The reagents required for the assays and tests of the Pharmacopoeia are defined in appendices. The descriptions set out in the appendices do not imply that the materials are suitable for use in medicine.

Indicators Indicators, the colours of which change over approximately the same range of pH, may be substituted for one another but in the event of doubt or dispute as to the equivalence of indicators for a particular purpose, the indicator specified in the text is alone authoritative.

The quantity of an indicator solution appropriate for use in acid-base titrations described in assays or tests is 0.1 mL unless otherwise stated in the text.

Any solvent required in an assay or test in which an indicator is specified is previously neutralised to the indicator, unless a blank test is prescribed.

Caution Statements A number of materials described in the monographs and some of the reagents specified for use in the assays and tests of the Pharmacopoeia may be injurious to health unless adequate precautions are taken. The principles of good laboratory practice and the provisions of any appropriate regulations such as those issued in the United Kingdom in accordance with the Health and Safety at Work *etc.* Act 1974 should be observed at all times in carrying out the assays and tests of the Pharmacopoeia.

Attention is drawn to particular hazards in certain monographs by means of an italicised statement; the absence of such a statement should not however be taken to mean that no hazard exists.

Titles Subsidiary titles, where included, have the same significance as the main titles. An abbreviated title constructed in accordance with the directions given in Appendix XXI A has the same significance as the main title.

Titles that are derived by the suitable inversion of words of a main or subsidiary title, with the addition of a preposition if appropriate, are also official titles. Thus, the following are all official titles: Aspirin Tablets, Tablets of Aspirin; Atropine Injection, Injection of Atropine.

A title of a formulated preparation that includes the full nonproprietary name of the active ingredient or ingredients, where this is not included in the title of the monograph, is also an official title. For example, the title Promethazine Hydrochloride Oral Solution has the same significance as Promethazine Oral Solution and the title Brompheniramine Maleate Tablets has the same significance as Brompheniramine Tablets.

Where the English title at the head of a monograph in the European Pharmacopoeia is different from that at the head of the text incorporated into the British Pharmacopoeia, an Approved Synonym has been created on the recommendation of the British Pharmacopoeia Commission. Approved Synonyms have the same significance as the main title and are thus official titles. A cumulative list of such Approved Synonyms is provided in Appendix XXI B.

Where the names of pharmacopoeial substances, preparations and other materials occur in the text they are printed with capital initial letters and this indicates that materials of Pharmacopoeial quality must be used. Words in the text that name a reagent or other material, a physical characteristic or a process that is described or defined in an appendix are printed in italic type, for example, *methanol*, *absorbance*, *gas chromatography*, and these imply compliance with the requirements specified in the appropriate appendix.

Chemical Formulae When the chemical composition of an official substance is known or generally accepted, the graphic and molecular formulae, the molecular weight and the Chemical Abstracts Service Registry Number are normally given at the beginning of the monograph for information. This information refers to the chemically pure substance and is not to be regarded as an indication of the purity of the official material. Elsewhere, in statements of standards of purity and strength and in descriptions of processes of assay, it is evident from the context that the formulae denote the chemically pure substances.

Where the absolute stereochemical configuration is specified, the International Union of Pure and Applied Chemistry (IUPAC) *R/S* and *E/Z* systems of designation have been used. If the substance is an enantiomer of unknown absolute stereochemistry the sign of the optical rotation, as determined in the solvent and under the conditions specified in the monograph, has been attached to the systematic name. An indication of sign of rotation has also been given where this is incorporated in a trivial name that appears on an IUPAC preferred list.

All amino acids, except glycine, have the L-configuration unless otherwise indicated. The three-letter and one-letter symbols used for amino acids in peptide and protein sequences are those recommended by the Joint Commission on Biochemical Nomenclature of the International Union of Pure and Applied Chemistry and the International Union of Biochemistry and Molecular Biology.

In the graphic formulae the following abbreviations are used:

Me	$-CH_3$	Bu^s	$-CH(CH_3)CH_2CH_3$
Et	$-CH_2CH_3$	Bu^n	$-CH_2CH_2CH_2CH_3$
Pr^i	$-CH(CH_3)_2$	Bu^t	$-C(CH_3)_3$
Pr^n	$-CH_2CH_2CH_3$	Ph	$-C_6H_5$
Bu^i	$-CH_2CH(CH_3)_2$	Ac	$-COCH_3$

Definition Statements given under the heading Definition constitute an official definition of the substance, preparation or other article that is the subject of the monograph. They constitute instructions or requirements and are mandatory in nature.

Certain medicinal or pharmaceutical substances and other articles are defined by reference to a particular method of manufacture. A statement that a substance or article *is* prepared or obtained by a certain method constitutes part of the official definition and implies that other methods are not permitted. A statement that a substance *may be* prepared or obtained by a certain method, however, indicates that this is one possible method and does not imply that other methods are proscribed.

Additional statements concerning the definition of formulated preparations are given in the general notice on Manufacture of Formulated Preparations.

Production Statements given under the heading Production draw attention to particular aspects of the manufacturing process but are not necessarily comprehensive. They constitute mandatory instructions to manufacturers. They may relate, for example, to source materials, to the manufacturing process itself and its validation and control, to in-process testing or to testing that is to be carried out by the manufacturer on the final product (bulk material or dosage form) either on selected batches or on each batch prior to release. These statements cannot necessarily be verified on a sample of the final product by an independent analyst. The competent authority may establish that the instructions have been followed, for example, by examination of data received from the manufacturer, by inspection or by testing appropriate samples.

The absence of a section on Production does not imply that attention to features such as those referred to above is not required. A substance, preparation or article described in a monograph of the Pharmacopoeia is to be manufactured in accordance with the principles of good manufacturing practice and in accordance with relevant international agreements and supranational and national regulations governing medicinal products.

Where in the section under the heading Production a monograph on a vaccine defines the characteristics of the vaccine strain to be used, any test methods given for confirming these characteristics are provided as examples of suitable methods. The use of these methods is not mandatory.

Additional statements concerning the production of formulated preparations are given in the general notice on Manufacture of Formulated Preparations.

Manufacture of Formulated Preparations Attention is drawn to the need to observe adequate hygienic precautions in the preparation and dispensing of pharmaceutical formulations. The principles of good pharmaceutical manufacturing practice should be observed.

The Definition in certain monographs for pharmaceutical preparations is given in terms of the principal ingredients only. Any ingredient, other than those included in the Definition, must comply with the general notice on Excipients and the product must conform with the Pharmacopoeial requirements.

The Definition in other monographs for pharmaceutical preparations is presented as a full formula. No deviation from the stated formula is permitted except those allowed by the general notices on Colouring Agents and Antimicrobial Preservatives. Where additionally directions are given under the heading Extemporaneous Preparation these are intended for the extemporaneous preparation of relatively small quantities for short-term supply and use. When so prepared, no deviation from the stated directions is permitted. If, however, such a pharmaceutical preparation is manufactured on a larger scale with the intention that it may be stored, deviations from the stated directions are permitted provided that the final product meets the following criteria:

(1) compliance with all of the requirements stated in the monograph;

(2) retention of the essential characteristics of the preparation made strictly in accordance with the directions of the Pharmacopoeia.

Monographs for yet other pharmaceutical preparations include both a Definition in terms of the principal ingredients and, under the side-heading Extemporaneous Preparation, a full formula together with, in some cases, directions for their preparation. Such full formulae and directions are intended for the extemporaneous preparation of relatively small quantities for short-term supply and use. When so prepared, no deviation from the stated formula and directions is permitted. If, however, such a pharmaceutical preparation is manufactured on a larger scale with the intention that it may be stored, deviations from the formula and directions stated under the heading Extemporaneous Preparation are permitted provided that any ingredient, other than those included in the Definition, complies with the general notice on Excipients and that the final product meets the following criteria:

(1) accordance with the Definition stated in the monograph;

(2) compliance with all of the requirements stated in the monograph;

(3) retention of the essential characteristics of the preparation made strictly in accordance with the formula and directions of the Pharmacopoeia.

In the manufacture of any official preparation on a large scale with the intention that it should be stored, in addition to following any instruction under the heading Production, it is necessary to ascertain that the product is satisfactory with respect to its physical and chemical stability and its state of preservation over the claimed shelf-life. This applies irrespective of whether the formula of the Pharmacopoeia and any instructions given under the heading Extemporaneous Preparation are followed precisely or modified. Provided that the preparation has been shown to be stable in other respects, deterioration due to microbial contamination may be inhibited by the incorporation of a suitable antimicrobial preservative. In such circumstances the label states appropriate storage conditions, the date after which the product should not be used and the identity and concentration of the antimicrobial preservative.

Freshly and Recently Prepared The direction, given under the heading Extemporaneous Preparation, that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15° to 25°.

Methods of Sterilisation The methods of sterilisation used in preparing the sterile materials described in the Pharmacopoeia are given in Appendix XVIII. For aqueous preparations, steam sterilisation (heating in an autoclave) is the method of choice wherever it is known to be suitable. Any method of sterilisation must be validated with respect to both the assurance of sterility and the integrity of the product and to ensure that the final product complies with the requirements of the monograph.

Water The term water used without qualification in formulae for formulated preparations means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled Purified Water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation.

Excipients Where an excipient for which there is a pharmacopoeial monograph is used in preparing an official preparation it shall comply with that monograph. Any substance added in preparing an official preparation shall be innocuous, shall have no adverse influence on the therapeutic efficacy of the active ingredients and shall not interfere with the assays and tests of the Pharmacopoeia. Particular care should be taken to ensure that such substances are free from harmful organisms.

Colouring Agents If in a monograph for a formulated preparation defined by means of a full formula a specific colouring agent or agents is prescribed, suitable alternatives approved in the country concerned may be substituted.

Antimicrobial Preservatives When the term 'suitable antimicrobial preservative' is used it is implied that the preparation concerned will be effectively preserved according to the appropriate criteria applied and interpreted as described in the test for *efficacy of antimicrobial preservation* (Appendix XVI C). In certain monographs for formulated preparations defined by means of a full formula, a specific antimicrobial agent or agents may be prescribed; suitable alternatives may be substituted provided that their identity and concentration are stated on the label.

Characteristics Statements given under the heading Characteristics are not to be interpreted in a strict sense and are not to be regarded as official requirements. Statements on taste are provided only in cases where this property is a guide to the acceptability of the material (for example, a material used primarily for flavouring). The status of statements on solubility is given in the general notice on Solubility.

Solubility Statements on solubility given under the heading Characteristics are intended as information on the approximate solubility at a temperature between 15° and 25°, unless otherwise stated, and are not to be considered as official requirements.

Statements given under headings such as Solubility in ethanol express exact requirements and constitute part of the standards for the substances under which they occur.

The following table indicates the meanings of the terms used in statements of approximate solubilities.

Descriptive term	Approximate volume of solvent in millilitres per gram of solute
very soluble	less than 1
freely soluble	from 1 to 10
soluble	from 10 to 30
sparingly soluble	from 30 to 100
slightly soluble	from 100 to 1000
very slightly soluble	from 1000 to 10 000
practically insoluble	more than 10 000

The term 'partly soluble' is used to describe a mixture of which only some of the components dissolve.

Identification The tests described or referred to under the heading Identification are not necessarily sufficient to establish absolute proof of identity. They provide a means of verifying that the identity of the material being examined is in accordance with the label on the container.

Unless otherwise prescribed, identification tests are carried out at a temperature between 15° and 25°.

Reference spectra Where a monograph refers to an infrared reference spectrum, this spectrum is provided in a separate section of the Pharmacopoeia. A sample spectrum is considered to be concordant with a reference spectrum if the transmission minima (absorption maxima) of the principal bands in the sample correspond in position, relative intensities and shape to those of the reference. Instrumentation software may be used to calculate concordance with a previously recorded reference spectrum.

When tests for infrared absorption are applied to material extracted from formulated preparations, strict concordance with the specified reference spectrum may not always be possible, but nevertheless a close resemblance between the spectrum of the extracted material and the specified reference spectrum should be achieved.

Assays and Tests The assays and tests described are the official methods upon which the standards of the Pharmacopoeia depend. The analyst is not precluded from employing alternative methods, including methods of micro-analysis, in any assay or test if it is known that the method used will give a result of equivalent accuracy. Local reference materials may be used for routine analysis, provided that these are calibrated against the official reference materials. In the event of doubt or dispute, the methods of analysis, the reference materials and the reference spectra of the Pharmacopoeia are alone authoritative.

Where the solvent used for a solution is not named, the solvent is Purified Water.

Unless otherwise prescribed, the assays and tests are carried out at a temperature between 15° and 25°.

A temperature in a test for Loss on drying, where no temperature range is given, implies a range of ±2° about the stated value.

Visual comparative tests, unless otherwise prescribed, are carried out using identical tubes of colourless, transparent, neutral glass with a flat base. The volumes of liquid prescribed are for use with tubes 16 mm in internal diameter; tubes with a larger internal diameter may be used but the volume of liquid examined must be increased so that the depth of liquid in the tubes is not less than that obtained when the prescribed volume of liquid and tubes 16 mm in internal diameter are used. Equal volumes of the liquids to be compared are examined down the vertical axis of the tubes against a white background or, if necessary, against a black background. The examination is carried out in diffuse light.

Where a direction is given that an analytical operation is to be carried out 'in subdued light', precautions should be taken to avoid exposure to direct sunlight or other strong light. Where a direction is given that an analytical operation is to be carried out 'protected from light', precautions should be taken to exclude actinic light by the use of low-actinic glassware, working in a dark room or similar procedures.

For preparations other than those of fixed strength, the quantity to be taken for an assay or test is usually expressed in terms of the active ingredient. This means that the quantity of the active ingredient expected to

be present and the quantity of the preparation to be taken are calculated from the strength stated on the label.

In assays the approximate quantity to be taken for examination is indicated but the quantity actually used must not deviate by more than 10% from that stated. The quantity taken is accurately weighed or measured and the result of the assay is calculated from this exact quantity. Reagents are measured and the procedures are carried out with an accuracy commensurate with the degree of precision implied by the standard stated for the assay.

In tests the stated quantity to be taken for examination must be used unless any divergence can be taken into account in conducting the test and calculating the result. The quantity taken is accurately weighed or measured with the degree of precision implied by the standard or, where the standard is not stated numerically (for example, in tests for Clarity and colour of solution), with the degree of precision implied by the number of significant figures stated. Reagents are measured and the procedures are carried out with an accuracy commensurate with this degree of precision.

The limits stated in monographs are based on data obtained in normal analytical practice; they take account of normal analytical errors, of acceptable variations in manufacture and of deterioration to an extent considered acceptable. No further tolerances are to be applied to the limits prescribed to determine whether the article being examined complies with the requirements of the monograph.

In determining compliance with a numerical limit, the calculated result of a test or assay is first rounded to the number of significant figures stated, unless otherwise prescribed. The last figure is increased by 1 when the part rejected is equal to or exceeds one half-unit, whereas it is not modified when the part rejected is less than a half-unit.

In certain tests, the concentration of impurity is given in parentheses either as a percentage or in parts per million by weight (ppm). In chromatographic tests such concentrations are stated as a percentage irrespective of the limit. In other tests they are usually stated in ppm unless the limit exceeds 500 ppm. In those chromatographic tests in which a secondary spot or peak in a chromatogram obtained with a solution of the substance being examined is described as corresponding to a named impurity and is compared with a spot or peak in a chromatogram obtained with a reference solution of the same impurity, the percentage given in parentheses indicates the limit for that impurity. In those chromatographic tests in which a spot or peak in a chromatogram obtained with a solution of the substance being examined is described in terms other than as corresponding to a named impurity (commonly, for example, as any (other) *secondary spot* or *peak*) but is compared with a spot or peak in a chromatogram obtained with a reference solution of a named impurity, the percentage given in parentheses indicates an impurity limit expressed in terms of a nominal concentration of the named impurity. In chromatographic tests in which a comparison is made between spots or peaks in chromatograms obtained with solutions of different concentrations of the substance being examined, the percentage given in parentheses indicates an impurity limit expressed in terms of a nominal concentration of the medicinal substance itself. In some monographs, in particular those for certain formulated preparations, the impurity limit is expressed in terms of a nominal concentration of the active moiety rather than of the medicinal

substance itself. Where necessary for clarification the terms in which the limit is expressed are stated within the monograph.

In all cases where an impurity limit is given in parentheses, the figures given are approximations for information only; conformity with the requirements is determined on the basis of compliance or otherwise with the stated test.

The use of a proprietary designation to identify a material used in an assay or test does not imply that another equally suitable material may not be used.

Biological Assays and Tests

Methods of assay described as Suggested methods are not obligatory, but when another method is used its precision must be not less than that required for the Suggested method.

For those antibiotics for which the monograph specifies a microbiological assay the potency requirement is expressed in the monograph in International Units (IU) per milligram. The material is not of pharmacopoeial quality if the upper fiducial limit of error is less than the stated potency. For such antibiotics the required precision of the assay is stated in the monograph in terms of the fiducial limits of error about the estimated potency.

For other substances and preparations for which the monograph specifies a biological assay, unless otherwise stated, the precision of the assay is such that the fiducial limits of error, expressed as a percentage of the estimated potency, are within a range not wider than that obtained by multiplying by a factor of 10 the square roots of the limits given in the monograph for the fiducial limits of error about the stated potency.

In all cases fiducial limits of error are based on a probability of 95% ($P = 0.95$).

Where the biological assay is being used to ascertain the purity of the material, the stated potency means the potency stated on the label in terms of International Units (IU) or other Units per gram, per milligram or per millilitre. When no such statement appears on the label, the stated potency means the fixed or minimum potency required in the monograph. This interpretation of stated potency applies in all cases except where the monograph specifically directs otherwise.

Where the biological assay is being used to determine the total activity in the container, the stated potency means the total number of International Units (IU) or other Units stated on the label or, if no such statement appears, the total activity calculated in accordance with the instructions in the monograph.

Wherever possible the primary standard used in an assay or test is the respective International Standard or Reference Preparation established by the World Health Organization for international use and the biological activity is expressed in International Units (IU).

In other cases, where Units are referred to in an assay or test, the Unit for a particular substance or preparation is, for the United Kingdom, the specific biological activity contained in such an amount of the respective primary standard as the appropriate international or national organisation indicates. The necessary information is provided with the primary standard.

Unless otherwise directed, animals used in an assay or a test are healthy animals, drawn from a uniform stock, that have not previously been treated with any material that will interfere with the assay or test. Unless otherwise stated, guinea-pigs weigh not less than 250 g or, when used in systemic

toxicity tests, not less than 350 g. When used in skin tests they are white or light coloured. Unless otherwise stated, mice weigh not less than 17 g and not more than 22 g.

Certain of the biological assays and tests of the Pharmacopoeia are such that in the United Kingdom they may be carried out only in accordance with the Animals (Scientific Procedures) Act 1986. Instructions included in such assays and tests in the Pharmacopoeia, with respect to the handling of animals, are therefore confined to those concerned with the accuracy and reproducibility of the assay or test.

Reference Substances and Reference Preparations

Certain monographs require the use of a reference substance, a reference preparation or a reference spectrum. These are chosen with regard to their intended use as prescribed in the monographs of the Pharmacopoeia and are not necessarily suitable in other circumstances.

Any information necessary for proper use of the reference substance or reference preparation is given on the label or in the accompanying leaflet or brochure. Where no drying conditions are stated in the leaflet or on the label, the substance is to be used as received. No certificate of analysis or other data not relevant to the prescribed use of the product are provided. The products are guaranteed to be suitable for use for a period of three months from dispatch when stored under the appropriate conditions. The stability of the contents of opened containers cannot be guaranteed. The current lot is listed in the BP Laboratory website catalogue. Additional information is provided in Supplementary Chapter III E.

Chemical Reference Substances The abbreviation BPCRS indicates a Chemical Reference Substance established by the British Pharmacopoeia Commission. The abbreviation CRS or EPCRS indicates a Chemical Reference Substance established by the European Pharmacopoeia Commission. Some Chemical Reference Substances are used for the microbiological assay of antibiotics and their activity is stated, in International Units, on the label or on the accompanying leaflet and defined in the same manner as for Biological Reference Preparations.

Biological Reference Preparations The majority of the primary biological reference preparations referred to are the appropriate International Standards and Reference Preparations established by the World Health Organisation. Because these reference materials are usually available only in limited quantities, the European Pharmacopoeia has established Biological Reference Preparations (indicated by the abbreviation BRP or EPBRP) where appropriate. Where applicable, the potency of the Biological Reference Preparations is expressed in International Units. For some Biological Reference Preparations, where an international standard or reference preparation does not exist, the potency is expressed in European Pharmacopoeia Units.

Storage

Statements under the side-heading Storage constitute non-mandatory advice. The substances and preparations described in the Pharmacopoeia are to be stored under conditions that prevent contamination and, as far as possible, deterioration. Unless otherwise stated in the monograph, the substances and preparations described in the Pharmacopoeia are kept in well-closed containers and stored at a temperature not exceeding 25°. Precautions that should be taken in relation to the effects of the atmosphere, moisture, heat and light are indicated, where appropriate, in

the monographs. Further precautions may be necessary when some materials are stored in tropical climates or under other severe conditions.

The expression 'protected from moisture' means that the product is to be stored in an airtight container. Care is to be taken when the container is opened in a damp atmosphere. A low moisture content may be maintained, if necessary, by the use of a desiccant in the container provided that direct contact with the product is avoided.

The expression 'protected from light' means that the product is to be stored either in a container made of a material that absorbs actinic light sufficiently to protect the contents from change induced by such light or in a container enclosed in an outer cover that provides such protection or stored in a place from which all such light is excluded.

The expression 'tamper-evident container' means a closed container fitted with a device that reveals irreversibly whether the container has been opened.

Labelling The labelling requirements of the Pharmacopoeia are not comprehensive, and the provisions of regulations issued in accordance with the requirements of the territory in which the medicinal product is to be used should be met.

Licensed medicines intended for use within the United Kingdom must comply with the requirements of the Human Medicines Regulations 2012, as amended, in respect of their labelling and packaging leaflets, together with those regulations for the labelling of hazardous materials.

Best practice guidance on the labelling and packaging of medicines for use in the United Kingdom advises that certain items of information are deemed critical for the safe use of the medicine (see "Best Practice Guidance on the Labelling and Packaging of Medicines" issued by the MHRA, 2012). Further information and guidance on the labelling of medicinal products can be found in Supplementary Chapter I G.

Such matters as the exact form of wording to be used and whether a particular item of information should appear on the primary label and additionally, or alternatively, on the package or exceptionally in a leaflet are, in general, outside the scope of the Pharmacopoeia. When the term 'label' is used in Labelling statements of the Pharmacopoeia, decisions as to where the particular statement should appear should therefore be made in accordance with relevant legislation.

The label of every official formulated preparation other than those of fixed strength also states the content of the active ingredient or ingredients expressed in the terms required by the monograph. Where the content of active ingredient is required to be expressed in terms other than the weight of the official medicinal substance used in making the formulation, this is specifically stated under the heading Labelling. Unless otherwise stated in the monograph, the content of the active ingredient is expressed in terms of the official medicinal substance used in making the formulation.

These requirements do not necessarily apply to unlicensed preparations supplied in accordance with a prescription. For requirements for unlicensed medicines see the general monograph on Unlicensed Medicines.

Action and Use The statements given under this heading in monographs are intended only as information on the principal pharmacological actions or the uses of the materials in medicine or pharmacy. It should not be assumed that the

substance has no other action or use. The statements are not intended to be binding on prescribers or to limit their discretion.

Crude Drugs; Traditional Herbal and Complementary Medicines

Herbal and complementary medicines are classed as medicines under the Human Medicines Regulations 2012, as amended. It is emphasised that, although requirements for the quality of the material are provided in the monograph to assist the registration scheme by the UK Licensing Authority, the British Pharmacopoeia Commission has not assessed the safety or efficacy of the material in traditional use.

Monograph Title For traditional herbal medicines, the monograph title is a combination of the binomial name together with a description of use. Monographs for the material that has not been processed (the herbal drug) and the processed material (the herbal drug preparation) are published where possible. To distinguish between the two, the word 'Processed' is included in the relevant monograph title.

Definition Under the heading Definition, the botanical name together with any synonym is given. Where appropriate, for material that has not been processed, information on the collection/harvesting and/or treatment/drying of the whole herbal drug may be given. For processed materials, the method of processing, where appropriate, will normally be given in a separate section.

Characteristics References to odour are included only where this is highly characteristic. References to taste are not included.

Control methods Where applicable, the control methods to be used in monographs are:

(a) macroscopical and microscopical descriptions and chemical/chromatographic tests for identification
(b) tests for absence of any related species
(c) microbial test to assure microbial quality
(d) tests for inorganic impurities and non-specific purity tests, including extractive tests, Sulfated ash and Heavy metals, where appropriate
(e) test for Loss on drying or Water
(f) wherever possible, a method for assaying the active constituent(s) or suitable marker constituent(s).

The macroscopical characteristics include those features that can be seen by the unaided eye or by the use of a hand lens. When two species/subspecies of the same plant are included in the Definition, individual differences between the two are indicated where possible.

The description of the microscopical characteristics of the powdered drug includes information on the dominant or the most specific characters. Where it is considered to be an aid to identification, illustrations of the powdered drug may be provided.

The following aspects are controlled by the general monograph for Herbal Drugs: they are required to be free from moulds, insects, decay, animal matter and animal excreta. Unless otherwise prescribed the amount of foreign matter is not more than 2% w/w. Microbial contamination should be minimal.

In determining the content of the active constituents or the suitable marker substances measurements are made with reference to the dried or anhydrous herbal drug. In the tests for Acid-insoluble ash, Ash, Extractive soluble in ethanol, Loss on drying, Sulfated ash, Water, Water-soluble ash and Water-soluble extractive of herbal drugs, the calculations are made with

reference to the herbal drug that has not been specifically dried unless otherwise prescribed in the monograph.

Homoeopathic Medicines

Homoeopathic medicines are classed as medicines under the Human Medicines Regulations 2012, as amended. It is emphasised that, although requirements for the quality of the material are provided in the relevant monograph in order to assist the simplified registration scheme by the UK Licensing Authority, the British Pharmacopoeia Commission has not assessed the safety or efficacy of the material in use.

All materials used for the production of homoeopathic medicines, including excipients, must comply with European Pharmacopoeia or British Pharmacopoeia monographs for those materials. Where such European Pharmacopoeia or British Pharmacopoeia monographs do not exist, each material used for the production of homoeopathic medicines must comply with an official national pharmacopoeia of a Member State.

British Pharmacopoeia monographs for homoeopathic medicines apply to homoeopathic stocks and mother tinctures only, but may be prefaced by a section which details the quality requirements applicable to the principle component where there is no European Pharmacopoeia or British Pharmacopoeia monograph for the material. These monographs also include either general statements on the methods of preparation or refer to specific methods of preparation given in the European Pharmacopoeia. Homoeopathic stocks and mother tinctures undergo the further process referred to as potentisation. Potentisation is a term specific to homoeopathic medicine and is a process of dilution of stocks and mother tinctures to produce the final product.

Identification tests are established for the components in homoeopathic stocks and usually relate to those applied to the materials used in the production of the homoeopathic stocks. An assay is included for the principal component(s) where possible. For mother tinctures, an identification test, usually chromatographic, is established and, where applicable, an assay for the principle component(s); where appropriate, other tests, related to the solvent, dry matter or known adulterants, are included.

Specifications have not been set for final homoeopathic products due to the high dilution used in their preparation and the subsequent difficulty in applying analytical methodology.

Statements under Crude Drugs; Traditional Herbal and Complementary Medicines also apply to homoeopathic stocks and mother tinctures, when appropriate.

Unlicensed Medicines

The General Monograph for Unlicensed Medicines applies to those formulations used in human medicine that are prepared under a Manufacturer's 'Specials' Licence or prepared extemporaneously under the supervision of a pharmacist, whether or not there is a published monograph for the specific dosage form.

An article intended for medicinal use that is described by means of an official title must comply with the requirements of the relevant monograph. A formulated preparation must comply throughout its assigned shelf-life (period of validity). The subject of any other monograph must comply throughout its period of use.

Unlicensed medicines that are prepared under a Manufacturer's 'Specials' Licence comply with the requirements of the General Monograph

for Pharmaceutical Preparations, the requirements of the General Monograph for Unlicensed Medicines and, where applicable, the requirements of the individual monograph for the specific dosage form.

Unlicensed medicines prepared extemporaneously under the supervision of a pharmacist comply with the requirements of the General Monograph for Pharmaceutical Preparations, the requirements of the General Monograph for Unlicensed Medicines and, where applicable, the requirements of the individual monograph for the specific dosage form. While it is expected that extemporaneous preparations will demonstrate pharmacopoeial compliance when tested, it is recognised that it might not be practicable to carry out the pharmacopoeial tests routinely on such formulations. In the event of doubt or dispute, the methods of analysis, the reference materials and the reference spectra of the Pharmacopoeia are alone authoritative.

Part III

Monographs and other texts of the European Pharmacopoeia that are incorporated in this edition of the British Pharmacopoeia are governed by the general notices of the European Pharmacopoeia; these are reproduced below.

GENERAL NOTICES OF THE EUROPEAN PHARMACOPOEIA

1.1. GENERAL STATEMENTS

The General Notices apply to all monographs and other texts of the European Pharmacopoeia.

The official texts of the European Pharmacopoeia are published in English and French. Translations in other languages may be prepared by the signatory States of the European Pharmacopoeia Convention. In case of doubt or dispute, the English and French versions are alone authoritative.

In the texts of the European Pharmacopoeia, the word 'Pharmacopoeia' without qualification means the European Pharmacopoeia. The official abbreviation Ph. Eur. may be used to indicate the European Pharmacopoeia.

The use of the title or the subtitle of a monograph implies that the article complies with the requirements of the relevant monograph. Such references to monographs in the texts of the Pharmacopoeia are shown using the monograph title and reference number in *italics*.

A preparation must comply throughout its period of validity; a distinct period of validity and/or specifications for opened or broached containers may be decided by the competent authority. The subject of any other monograph must comply throughout its period of use. The period of validity that is assigned to any given article and the time from which that period is to be calculated are decided by the competent authority in light of experimental results of stability studies.

Unless otherwise indicated in the General Notices or in the monographs, statements in monographs constitute mandatory requirements. General chapters become mandatory when referred to in a monograph, unless such reference is made in a way that indicates that it is not the intention to make the text referred to mandatory but rather to cite it for information.

The active substances, excipients, pharmaceutical preparations and other articles described in the monographs are intended for human and veterinary use (unless explicitly restricted to one of these uses).

Quality systems The quality standards represented by monographs are valid only where the articles in question are produced within the framework of a suitable quality system. The quality system must assure that the articles consistently meet the requirements of the Pharmacopoeia.

Alternative methods The tests and assays described are the official methods upon which the standards of the Pharmacopoeia are based. With the agreement of the competent authority, alternative methods of analysis may be used for control purposes, provided that the methods used enable an unequivocal decision to be made as to whether compliance with the standards of the

monographs would be achieved if the official methods were used. In the event of doubt or dispute, the methods of analysis of the Pharmacopoeia are alone authoritative.

Demonstration of compliance with the Pharmacopoeia

(1) An article is not of Pharmacopoeia quality unless it complies with all the requirements stated in the monograph. This does not imply that performance of all the tests in a monograph is necessarily a prerequisite for a manufacturer in assessing compliance with the Pharmacopoeia before release of a product. The manufacturer may obtain assurance that a product is of Pharmacopoeia quality on the basis of its design, together with its control strategy and data derived, for example, from validation studies of the manufacturing process.

(2) An enhanced approach to quality control could utilise process analytical technology (PAT) and/or real-time release testing (including parametric release) strategies as alternatives to end-product testing alone. Real-time release testing in circumstances deemed appropriate by the competent authority is thus not precluded by the need to comply with the Pharmacopoeia.

(3) Reduction of animal testing: the European Pharmacopoeia is dedicated to phasing out the use of animals for test purposes, in accordance with the 3Rs (Replacement, Reduction, Refinement) set out in the European Convention for the Protection of Vertebrate Animals used for Experimental and Other Scientific Purposes. In demonstrating compliance with the Pharmacopoeia as indicated above (1), manufacturers may consider establishing additional systems to monitor consistency of production. With the agreement of the competent authority, the choice of tests performed to assess compliance with the Pharmacopoeia when animal tests are prescribed is established in such a way that animal usage is minimised as much as possible.

Grade of materials

Certain materials that are the subject of a pharmacopoeial monograph may exist in different grades suitable for different purposes. Unless otherwise indicated in the monograph, the requirements apply to all grades of the material. In some monographs, particularly those on excipients, a list of functionality-related characteristics that are relevant to the use of the substance may be appended to the monograph for information. Test methods for determination of one or more of these characteristics may be given, also for information.

General monographs

Substances and preparations that are the subject of an individual monograph are also required to comply with relevant, applicable general monographs. Cross-references to applicable general monographs are not normally given in individual monographs.

General monographs apply to all substances and preparations within the scope of the Definition section of the general monograph, except where a preamble limits the application, for example to substances and preparations that are the subject of a monograph of the Pharmacopoeia.

General monographs on dosage forms apply to all preparations of the type defined. The requirements are not necessarily comprehensive for a given specific preparation and requirements additional to those prescribed in the general monograph may be imposed by the competent authority.

General monographs and individual monographs are complementary. If the provisions of a general monograph do not apply to a particular product, this is expressly stated in the individual monograph.

Validation of pharmacopoeial methods The test methods given in monographs and general chapters have been validated in accordance with accepted scientific practice and current recommendations on analytical validation. Unless otherwise stated in the monograph or general chapter, validation of the test methods by the analyst is not required.

Implementation of pharmacopoeial methods When implementing a pharmacopoeial method, the user must assess whether and to what extent the suitability of the method under the actual conditions of use needs to be demonstrated according to relevant monographs, general chapters and quality systems.

Conventional terms The term 'competent authority' means the national, supranational or international body or organisation vested with the authority for making decisions concerning the issue in question. It may, for example, be a national pharmacopoeia authority, a licensing authority or an official control laboratory.

The expression 'unless otherwise justified and authorised' means that the requirements have to be met, unless the competent authority authorises a modification or an exemption where justified in a particular case.

Statements containing the word 'should' are informative or advisory.

In certain monographs or other texts, the terms 'suitable' and 'appropriate' are used to describe a reagent, micro-organism, test method etc.; if criteria for suitability are not described in the monograph, suitability is demonstrated to the satisfaction of the competent authority.

Medicinal product (a) Any substance or combination of substances presented as having properties for treating or preventing disease in human beings and/or animals; or (b) any substance or combination of substances that may be used in or administered to human beings and/or animals with a view either to restoring, correcting or modifying physiological functions by exerting a pharmacological, immunological or metabolic action, or to making a medical diagnosis.

Herbal medicinal product Any medicinal product, exclusively containing as active ingredients one or more herbal drugs or one or more herbal drug preparations, or one or more such herbal drugs in combination with one or more such herbal drug preparations.

Active substance Any substance intended to be used in the manufacture of a medicinal product and that, when so used, becomes an active ingredient of the medicinal product. Such substances are intended to furnish a pharmacological activity or other direct effect in the diagnosis, cure, mitigation, treatment or prevention of disease, or to affect the structure and function of the body.

Excipient (auxiliary substance). Any constituent of a medicinal product that is not an active substance. Adjuvants, stabilisers, antimicrobial preservatives, diluents, antioxidants, for example, are excipients.

Interchangeable methods Certain general chapters contain a statement that the text in question is harmonised with the corresponding text of the Japanese Pharmacopoeia and/or the United States Pharmacopeia and that these texts are interchangeable. This implies that if a substance or preparation is found to

comply with a requirement using an interchangeable method from one of these pharmacopoeias it complies with the requirements of the European Pharmacopoeia. In the event of doubt or dispute, the text of the European Pharmacopoeia is alone authoritative.

References to regulatory documents Monographs and general chapters may contain references to documents issued by regulatory authorities for medicines, for example directives and notes for guidance of the European Union. These references are provided for information for users for the Pharmacopoeia. Inclusion of such a reference does not modify the status of the documents referred to, which may be mandatory or for guidance.

1.2. OTHER PROVISIONS APPLYING TO GENERAL CHAPTERS AND MONOGRAPHS

Quantities In tests with numerical limits and assays, the quantity stated to be taken for examination is approximate. The amount actually used, which may deviate by not more than 10 per cent from that stated, is accurately weighed or measured and the result is calculated from this exact quantity. In tests where the limit is not numerical, but usually depends upon comparison with the behaviour of a reference substance in the same conditions, the stated quantity is taken for examination. Reagents are used in the prescribed amounts.

Quantities are weighed or measured with an accuracy commensurate with the indicated degree of precision. For weighings, the precision corresponds to plus or minus 5 units after the last figure stated (for example, 0.25 g is to be interpreted as 0.245 g to 0.255 g). For the measurement of volumes, if the figure after the decimal point is a zero or ends in a zero (for example, 10.0 mL or 0.50 mL), the volume is measured using a pipette, a volumetric flask or a burette, as appropriate; otherwise, a graduated measuring cylinder or a graduated pipette may be used. Volumes stated in microlitres are measured using a micropipette or microsyringe.

It is recognised, however, that in certain cases the precision with which quantities are stated does not correspond to the number of significant figures stated in a specified numerical limit. The weighings and measurements are then carried out with a sufficiently improved accuracy.

Apparatus and procedures Volumetric glassware complies with Class A requirements of the appropriate International Standard issued by the International Organisation for Standardisation.

Unless otherwise prescribed, analytical procedures are carried out at a temperature between 15 °C and 25 °C.

Unless otherwise prescribed, comparative tests are carried out using identical tubes of colourless, transparent, neutral glass with a flat base; the volumes of liquid prescribed are for use with tubes having an internal diameter of 16 mm, but tubes with a larger internal diameter may be used provided the volume of liquid used is adjusted (*2.1.5*). Equal volumes of the liquids to be compared are examined down the vertical axis of the tubes against a white background, or if necessary against a black background. The examination is carried out in diffuse light.

Any solvent required in a test or assay in which an indicator is to be used is previously neutralised to the indicator, unless a blank test is prescribed.

Water-bath The term 'water-bath' means a bath of boiling water unless water at another temperature is indicated. Other methods of heating may be substituted provided the temperature is near to but not higher than 100 °C or the indicated temperature.

Drying and ignition to constant mass The terms 'dried to constant mass' and 'ignited to constant mass' mean that 2 consecutive weighings do not differ by more than 0.5 mg, the 2nd weighing following an additional period of drying or of ignition respectively appropriate to the nature and quantity of the residue.

Where drying is prescribed using one of the expressions 'in a desiccator' or '*in vacuo*', it is carried out using the conditions described in chapter *2.2.32. Loss on drying*.

Reagents The proper conduct of the analytical procedures described in the Pharmacopoeia and the reliability of the results depend, in part, upon the quality of the reagents used. The reagents are described in general chapter 4. It is assumed that reagents of analytical grade are used; for some reagents, tests to determine suitability are included in the specifications.

Solvents Where the name of the solvent is not stated, the term 'solution' implies a solution in water.

Where the use of water is specified or implied in the analytical procedures described in the Pharmacopoeia or for the preparation of reagents, water complying with the requirements of the monograph *Purified water (0008)* is used, except that for many purposes the requirements for bacterial endotoxins (*Purified water in bulk*) and microbial contamination (*Purified water in containers*) are not relevant. The term 'distilled water' indicates purified water prepared by distillation.

The term 'ethanol' without qualification means anhydrous ethanol. The term 'alcohol' without qualification means ethanol (96 per cent). Other dilutions of ethanol are indicated by the term 'ethanol' or 'alcohol' followed by a statement of the percentage by volume of ethanol (C_2H_6O) required.

Expression of content In defining content, the expression 'per cent' is used according to circumstances with one of 2 meanings:

— per cent *m/m* (percentage, mass in mass) expresses the number of grams of substance in 100 g of final product;

— per cent *V/V* (percentage, volume in volume) expresses the number of millilitres of substance in 100 mL of final product.

The expression 'parts per million' (or ppm) refers to mass in mass, unless otherwise specified.

Temperature Where an analytical procedure describes temperature without a figure, the general terms used have the following meaning:

— in a deep-freeze: below −15 °C;

— in a refrigerator: 2 °C to 8 °C;

— cold or cool: 8 °C to 15 °C;

— room temperature: 15 °C to 25 °C.

1.3. GENERAL CHAPTERS

Containers Materials used for containers are described in general chapter *3.1*. General names used for materials, particularly plastic materials, each cover a range

of products varying not only in the properties of the principal constituent but also in the additives used. The test methods and limits for materials depend on the formulation and are therefore applicable only for materials whose formulation is covered by the preamble to the specification. The use of materials with different formulations, and the test methods and limits applied to them, are subject to agreement by the competent authority.

The specifications for containers in general chapter *3.2* have been developed for general application to containers of the stated category, but in view of the wide variety of containers available and possible new developments, the publication of a specification does not exclude the use, in justified circumstances, of containers that comply with other specifications, subject to agreement by the competent authority.

Reference may be made within the monographs of the Pharmacopoeia to the definitions and specifications for containers provided in chapter *3.2. Containers*. The general monographs for pharmaceutical dosage forms may, under the heading Definition/Production, require the use of certain types of container; certain other monographs may, under the heading Storage, indicate the type of container that is recommended for use.

1.4. MONOGRAPHS

Titles Monograph titles are in English and French in the respective versions and there is a Latin subtitle.

Relative Atomic And Molecular Masses The relative atomic mass (A_r) or the relative molecular mass (M_r) is shown, as and where appropriate, at the beginning of each monograph. The relative atomic and molecular masses and the molecular and graphic formulae do not constitute analytical standards for the substances described.

Chemical Abstracts Service (CAS) Registry Number CAS registry numbers are included for information in monographs, where applicable, to provide convenient access to useful information for users. CAS Registry Number® is a registered trademark of the American Chemical Society.

Definition Statements under the heading Definition constitute an official definition of the substance, preparation or other article that is the subject of the monograph.

Limits of content Where limits of content are prescribed, they are those determined by the method described under Assay.

Herbal drugs In monographs on herbal drugs, the definition indicates whether the subject of the monograph is, for example, the whole drug or the drug in powdered form. Where a monograph applies to the drug in several states, for example both to the whole drug and the drug in powdered form, the definition states this.

Production Statements under the heading Production draw attention to particular aspects of the manufacturing process but are not necessarily comprehensive. They constitute mandatory requirements for manufacturers, unless otherwise stated. They may relate, for example, to source materials; to the manufacturing process itself and its validation and control; to in-process testing; or to testing that is to be carried out by the manufacturer on the final article, either on selected batches or on each batch prior to release. These statements cannot necessarily be verified on a sample of the final article by an independent analyst. The competent authority may establish

that the instructions have been followed, for example, by examination of data received from the manufacturer, by inspection of manufacture or by testing appropriate samples.

The absence of a Production section does not imply that attention to features such as those referred to above is not required.

Choice of vaccine strain, Choice of vaccine composition The Production section of a monograph may define the characteristics of a vaccine strain or vaccine composition. Unless otherwise stated, test methods given for verification of these characteristics are provided for information as examples of suitable methods. Subject to approval by the competent authority, other test methods may be used without validation against the method shown in the monograph.

Potential Adulteration

Due to the increasing number of fraudulent activities and cases of adulteration, information may be made available to Ph. Eur. users to help detect adulterated materials (i.e. active substances, excipients, intermediate products, bulk products and finished products).

To this purpose, a method for the detection of potential adulterants and relevant limits, together with a reminder that all stages of production and sourcing are subjected to a suitable quality system, may be included in this section of monographs on substances for which an incident has occurred or that present a risk of deliberate contamination. The frequency of testing by manufacturers or by users (e.g. manufacturers of intermediate products, bulk products and finished products, where relevant) depends on a risk assessment, taking into account the level of knowledge of the whole supply chain and national requirements.

This section constitutes requirements for the whole supply chain, from manufacturers to users (e.g. manufacturers of intermediate products, bulk products and finished products, where relevant). The absence of this section does not imply that attention to features such as those referred to above is not required.

Characters

The statements under the heading Characters are not to be interpreted in a strict sense and are not requirements.

Solubility In statements of solubility in the Characters section, the terms used have the following significance, referred to a temperature between 15 °C and 25 °C.

Descriptive term	Approximate volume of solvent in millilitres per gram of solute			
Very soluble	less than	1		
Freely soluble	from	1	to	10
Soluble	from	10	to	30
Sparingly soluble	from	30	to	100
Slightly soluble	from	100	to	1000
Very slightly soluble	from	1000	to	10 000
Practically insoluble	more than			10 000

The term 'partly soluble' is used to describe a mixture where only some of the components dissolve. The term 'miscible' is used to describe a liquid that is miscible in all proportions with the stated solvent.

Identification

Scope The tests given in the Identification section are not designed to give a full confirmation of the chemical structure or composition of the product; they are intended to give confirmation, with an acceptable degree of assurance, that the article conforms to the description on the label.

First and second identifications Certain monographs have subdivisions entitled 'First identification' and 'Second identification'. The test or tests that constitute the 'First identification' may be used in all circumstances. The test or tests that constitute the 'Second identification' may be used in pharmacies provided it can be demonstrated that the substance or preparation is fully traceable to a batch certified to comply with all the other requirements of the monograph.

Certain monographs give two or more sets of tests for the purpose of the first identification, which are equivalent and may be used independently. One or more of these sets usually contain a cross-reference to a test prescribed in the Tests section of the monograph. It may be used to simplify the work of the analyst carrying out the identification and the prescribed tests. For example, one identification set cross-refers to a test for enantiomeric purity while the other set gives a test for specific optical rotation: the intended purpose of the two is the same, that is, verification that the correct enantiomer is present.

Powdered herbal drugs Monographs on herbal drugs may contain schematic drawings of the powdered drug. These drawings complement the description given in the relevant identification test.

Tests And Assays

Scope The requirements are not framed to take account of all possible impurities. It is not to be presumed, for example, that an impurity that is not detectable by means of the prescribed tests is tolerated if common sense and good pharmaceutical practice require that it be absent. See also below under Impurities.

Calculation Where the result of a test or assay is required to be calculated with reference to the dried or anhydrous substance or on some other specified basis, the determination of loss on drying, water content or other property is carried out by the method prescribed in the relevant test in the monograph. The words 'dried substance' or 'anhydrous substance' etc. appear in parentheses after the result.Where a quantitative determination of a residual solvent is carried out and a test for loss on drying is not carried out, the content of residual solvent is taken into account for the calculation of the assay content of the substance, the specific optical rotation and the specific absorbance. No further indication is given in the specific monograph.

Limits The limits prescribed are based on data obtained in normal analytical practice; they take account of normal analytical errors, of acceptable variations in manufacture and compounding and of deterioration to an extent considered acceptable. No further tolerances are to be applied to the limits prescribed to determine whether the article being examined complies with the requirements of the monograph.

In determining compliance with a numerical limit, the calculated result of a test or assay is first rounded to the number of significant figures stated, unless otherwise prescribed. The limits, regardless of whether the values are expressed as percentages or as absolute values, are considered significant to the last digit shown (for example 140 indicates 3 significant figures). The last figure of the result is increased by one when the part rejected is equal to

or exceeds one half-unit, whereas it is not modified when the part rejected is less than a half-unit.

Indication of permitted limit of impurities The acceptance criteria for related substances are expressed in monographs either in terms of comparison of peak areas (comparative tests) or as numerical values. For comparative tests, the approximate content of impurity tolerated, or the sum of impurities, may be indicated in brackets for information only. Acceptance or rejection is determined on the basis of compliance or non-compliance with the stated test. If the use of a reference substance for the named impurity is not prescribed, this content may be expressed as a nominal concentration of the substance used to prepare the reference solution specified in the monograph, unless otherwise described.

Herbal Drugs For herbal drugs, the sulfated ash, total ash, water-soluble matter, alcohol-soluble matter, water content, content of essential oil and content of active principle are calculated with reference to the drug that has not been specially dried, unless otherwise prescribed in the monograph.

Equivalents Where an equivalent is given, for the purposes of the Pharmacopoeia only the figures shown are to be used in applying the requirements of the monograph.

Culture media The culture media described in monographs and general chapters have been found to be satisfactory for the intended purpose. However, the components of media, particularly those of biological origin, are of variable quality, and it may be necessary for optimal performance to modulate the concentration of some ingredients, notably:

— peptones and meat or yeast extracts, with respect to their nutritive properties;
— buffering substances;
— bile salts, bile extract, deoxycholate, and colouring matter, depending on their selective properties;
— antibiotics, with respect to their activity.

Storage The information and recommendations given under the heading Storage do not constitute a pharmacopoeial requirement but the competent authority may specify particular storage conditions that must be met.

The articles described in the Pharmacopoeia are stored in such a way as to prevent contamination and, as far as possible, deterioration. Where special conditions of storage are recommended, including the type of container (see section 1.3. General chapters) and limits of temperature, they are stated in the monograph.

The following expressions are used in monographs under Storage with the meaning shown.

In an airtight container Means that the product is stored in an airtight container (*3.2*). Care is to be taken when the container is opened in a damp atmosphere. A low moisture content may be maintained, if necessary, by the use of a desiccant in the container provided that direct contact with the product is avoided.

Protected from light Means that the product is stored either in a container made of a material that absorbs actinic light sufficiently to protect the contents from change induced by such light, or in a container enclosed in an outer cover that provides such protection, or is stored in a place from which all such light is excluded.

Labelling In general, labelling of medicines is subject to supranational and national regulation and to international agreements. The statements under the heading Labelling are not therefore comprehensive and, moreover, for the purposes of the Pharmacopoeia only those statements that are necessary to demonstrate compliance or non-compliance with the monograph are mandatory. Any other labelling statements are included as recommendations. When the term 'label' is used in the Pharmacopoeia, the labelling statements may appear on the container, the package, a leaflet accompanying the package, or a certificate of analysis accompanying the article, as decided by the competent authority.

Warnings Materials described in monographs and reagents specified for use in the Pharmacopoeia may be injurious to health unless adequate precautions are taken. The principles of good quality control laboratory practice and the provisions of any appropriate regulations are to be observed at all times. Attention is drawn to particular hazards in certain monographs by means of a warning statement; absence of such a statement is not to be taken to mean that no hazard exists.

Impurities A list of all known and potential impurities that have been shown to be detected by the tests in a monograph may be given. See also chapter *5.10. Control of impurities in substances for pharmaceutical use*. The impurities are designated by a letter or letters of the alphabet. Where a letter appears to be missing, the impurity designated by this letter has been deleted from the list during monograph development prior to publication or during monograph revision.

Functionality-related Characteristics of Excipients Monographs on excipients may have a section on functionality-related characteristics. The characteristics, any test methods for determination and any tolerances are not mandatory requirements; they may nevertheless be relevant for use of the excipient and are given for information (see also section 1.1. General statements).

Reference Standards Certain monographs require the use of reference standards (chemical reference substances, herbal reference standards, biological reference preparations, reference spectra). See also chapter *5.12. Reference standards*. The European Pharmacopoeia Commission establishes the official reference standards, which are alone authoritative in case of arbitration. These reference standards are available from the European Directorate for the Quality of Medicines & HealthCare (EDQM). Information on the available reference standards and a batch validity statement can be obtained via the EDQM website.

1.5. ABBREVIATIONS AND SYMBOLS

A	Absorbance	mp	Melting point
$A_{1\ cm}^{1\ per\ cent}$	Specific absorbance	n_D^{20}	Refractive index
A_r	Relative atomic mass	Ph. Eur. U.	European Pharmacopoeia Unit
$[\alpha]_D^{20}$	Specific optical rotation	ppb	Parts per billion (micrograms per kilogram)
bp	Boiling point	ppm	Parts per million (milligrams per kilogram)
BRP	Biological reference preparation	R	Substance or solution defined under 4. *Reagents*
CRS	Chemical reference substance	R_F	Retardation factor (see chapter *2.2.46*)
d_{20}^{20}	Relative density	R_{st}	Used in chromatography to indicate the ratio of the distance travelled by a substance to the distance travelled by a reference substance
λ	Wavelength		
HRS	Herbal reference standard	RV	Substance used as a primary standard in volumetric analysis (chapter *4.2.1*)
IU	International Unit		
M	Molarity		
M_r	Relative molecular mass		

Abbreviations used in the monographs on immunoglobulins, immunosera and vaccines

CFU	Colony-forming units	Lo/10 dose	The largest quantity of a toxin that, in the conditions of the test, when mixed with 0.1 IU of antitoxin and administered by the specified route, does not cause symptoms of toxicity in the test animals within a given period
LD_{50}	The statistically determined quantity of a substance that, when administered by the specified route, may be expected to cause the death of 50 per cent of the test animals within a given period	Lf dose	The quantity of toxin or toxoid that flocculates in the shortest time with 1 IU of antitoxin
MLD	Minimum lethal dose	$CCID_{50}$	The statistically determined quantity of virus that may be expected to infect 50 per cent of the cell cultures to which it is added
L+/10 dose	The smallest quantity of a toxin that, in the conditions of the test, when mixed with 0.1 IU of antitoxin and administered by the specified route, causes the death of the test animals within a given period	EID_{50}	The statistically determined quantity of virus that may be expected to infect 50 per cent of the fertilised eggs into which it is inoculated
L+ dose	The smallest quantity of a toxin that, in the conditions of the test, when mixed with 1 IU of antitoxin and administered by the specified route, causes the death of the test animals within a given period	ID_{50}	The statistically determined quantity of a virus that may be expected to infect 50 per cent of the animals into which it is inoculated
In/100 dose	The smallest quantity of a toxin that, in the conditions of the test, when mixed with 0.01 IU of antitoxin and injected intracutaneously causes a characteristic reaction at the site of injection within a given period	PD_{50}	The statistically determined dose of a vaccine that, in the conditions of the test, may be expected to protect 50 per cent of the animals against a challenge dose of the micro-organisms or toxins against which it is active
Lp/10 dose	The smallest quantity of toxin that, in the conditions of the test, when mixed with 0.1 IU of antitoxin and administered by the specified route, causes paralysis in the test animals within a given period	ED_{50}	The statistically determined dose of a vaccine that, in the conditions of the test, may be expected to induce specific antibodies in 50 per cent of the animals for the relevant vaccine antigens
		PFU	Pock-forming units or plaque-forming units
		SPF	Specified-pathogen-free

1.6. UNITS OF THE INTERNATIONAL SYSTEM (SI) USED IN THE PHARMACOPOEIA AND EQUIVALENCE WITH OTHER UNITS

International System Of Units (SI)

The International System of Units comprises 2 main classes of units, namely base units and derived units[1]. The base units are the metre, the kilogram, the second, the ampere, the kelvin, the mole and the candela.

The derived units are formed as products of powers of the base units according to the algebraic relationships linking the corresponding quantities. Some of these derived units have special names and symbols. The derived units used in the Pharmacopoeia are shown in Table 1.6.-1.

Some important and widely used units outside the International System are shown in Table 1.6.-2.

The prefixes shown in Table 1.6.-3 are used to form the names and symbols of the decimal multiples and submultiples of SI units.

Table 1.6.-1. – *Derived units used in the European Pharmacopoeia and equivalence with other units*

Quantity		Unit				Conversion of other units into SI units
Name	Symbol	Name	Symbol	Expression in SI base units	Expression in other SI units	
Wave number	ν	one per metre	1/m	m^{-1}		
Wavelength	λ	micrometre nanometre	µm nm	10^{-6} m 10^{-9} m		
Area	A, S	square metre	m^2	m^2		
Volume	V	cubic metre	m^3	m^3		1 mL = 1 cm^3 = 10^{-6} m^3
Frequency	ν	hertz	Hz	s^{-1}		
Density	ρ	kilogram per cubic metre	kg/m^3	$kg \cdot m^{-3}$		1 g/mL = 1 g/cm^3 = 10^3 $kg \cdot m^{-3}$
Velocity, speed	v	metre per second	m/s	$m \cdot s^{-1}$		
Force	F	newton	N	$m \cdot kg \cdot s^{-2}$		1 dyne = 1 $g \cdot cm \cdot s^{-2}$ = 10^{-5} N 1 kp = 9.806 65 N
Pressure, stress	p	pascal	Pa	$m^{-1} \cdot kg \cdot s^{-2}$	$N \cdot m^{-2}$	1 dyne/cm^2 = 10^{-1} Pa = 10^{-1} $N \cdot m^{-2}$ 1 atm = 101 325 Pa = 101.325 kPa 1 bar = 10^5 Pa = 0.1 MPa 1 mm Hg = 133.322 387 Pa 1 Torr = 133.322 368 Pa 1 psi = 6.894 757 kPa
Dynamic viscosity	η	pascal second	Pa·s	$m^{-1} \cdot kg \cdot s^{-1}$	$N \cdot s \cdot m^{-2}$	1 P = 10^{-1} Pa·s = 10^{-1} $N \cdot s \cdot m^{-2}$ 1 cP = 1 mPa·s
Kinematic viscosity	ν	square metre per second	m^2/s	$m^2 \cdot s^{-1}$	$Pa \cdot s \cdot m^3 \cdot kg^{-1}$ $N \cdot m \cdot s \cdot kg^{-1}$	1 St = 1 $cm^2 \cdot s^{-1}$ = 10^{-4} $m^2 \cdot s^{-1}$

[1] *The definitions of the units used in the International System are given in the booklet 'Le Système International d'Unités (SI)', published by the Bureau International des Poids et Mesures, Pavillon de Breteuil, F-92310 Sèvres.*

Quantity		Unit				Conversion of other units into SI units
Name	Symbol	Name	Symbol	Expression in SI base units	Expression in other SI units	
Energy	W	joule	J	$m^2 \cdot kg \cdot s^{-2}$	N·m	1 erg = 1 $cm^2 \cdot g \cdot s^{-2}$ = 1 dyne·cm = 10^{-7} J 1 cal = 4.1868 J
Power, radiant flux	P	watt	W	$m^2 \cdot kg \cdot s^{-3}$	$N \cdot m \cdot s^{-1}$ $J \cdot s^{-1}$	1 erg/s = 1 dyne·$cm \cdot s^{-1}$ = 10^{-7} W = 10^{-7} $N \cdot m \cdot s^{-1}$ = 10^{-7} $J \cdot s^{-1}$
Absorbed dose (of radiant energy)	D	gray	Gy	$m^2 \cdot s^{-2}$	$J \cdot kg^{-1}$	1 rad = 10^{-2} Gy
Electric potential difference, voltage	U	volt	V	$m^2 \cdot kg \cdot s^{-3} \cdot A^{-1}$	$W \cdot A^{-1}$	
Electric resistance	R	ohm	Ω	$m^2 \cdot kg \cdot s^{-3} \cdot A^{-2}$	$V \cdot A^{-1}$	
Electric charge	Q	coulomb	C	A·s		
Activity referred to a radionuclide	A	becquerel	Bq	s^{-1}		1 Ci = $37 \cdot 10^9$ Bq = $37 \cdot 10^9$ s^{-1}
Concentration (of amount of substance), molar concentration	c	mole per cubic metre	mol/m^3	$mol \cdot m^{-3}$		1 mol/L = 1 M = 1 mol/dm^3 = 10^3 $mol \cdot m^{-3}$
Mass concentration	ρ	kilogram per cubic metre	kg/m^3	$kg \cdot m^{-3}$		1 g/L = 1 g/dm^3 = 1 $kg \cdot m^{-3}$
Catalytic activity	Z	katal	kat	$mol \cdot s^{-1}$		

Table 1.6.-2. – *Non-SI units accepted for use with the SI units*

Quantity	Unit		Value in SI units
	Name	Symbol	
Time	minute	min	1 min = 60 s
	hour	h	1 h = 60 min = 3600 s
	day	d	1 d = 24 h = 86 400 s
Plane angle	degree	°	$1° = (\pi/180)$ rad
Volume	litre	L	1 L = 1 dm^3 = 10^{-3} m^3
Mass	tonne	t	1 t = 10^3 kg
	dalton	Da	1 Da = 1.660539040(20) × 10^{-27} kg
Rotational frequency	revolution per minute	r/min	1 r/min = (1/60) s^{-1}
Energy	electronvolt	eV	1eV=1.602176634 × 10^{-19}J

Table 1.6.-3. – *Decimal multiples and sub-multiples of SI units*

10^{1}	deca	da	10^{-18}	atto	a

Notes

1. In the Pharmacopoeia, the Celsius temperature is used (symbol t). This is defined by the following equation:

$$t = T - T_0$$

where T_0 = 273.15 K by definition. The Celsius or centigrade temperature is expressed in degrees Celsius (symbol °C). The unit 'degree Celsius' is equal to the unit 'kelvin'.

2. The practical expressions of concentrations used in the Pharmacopoeia are defined in the General Notices.

3. The radian is the plane angle between two radii of a circle that cut off on the circumference an arc equal in length to the radius.

4. In the Pharmacopoeia, conditions of centrifugation are defined by reference to the acceleration due to gravity (g):

$$g = 9.806\ 65\ m \cdot s^{-2}$$

5. Certain quantities without dimensions are used in the Pharmacopoeia: relative density (*2.2.5*), absorbance (*2.2.25*), specific absorbance (*2.2.25*) and refractive index (*2.2.6*).

6. The microkatal is defined as the enzymic activity that, under defined conditions, produces the transformation (e.g. hydrolysis) of 1 micromole of the substrate per second.

Infrared Reference Spectra

Preparation of Infrared Reference Spectra

All spectra presented in this section were recorded using either a Perkin-Elmer model 682 dispersive infrared spectrophotometer, a Perkin Elmer model 16PC Fourier transform infrared spectrophotometer, a Perkin Elmer model Spectrum 100 Fourier transform infrared spectrophotometer, or a Perkin Elmer model Spectrum One Fourier transform infrared spectrophotometer.

Pressed discs, 13 mm in diameter, were prepared using potassium bromide or potassium chloride. Liquid paraffin mulls and thin films were prepared between potassium bromide plates, and gas and solution spectra were prepared using cells with potassium bromide windows. Solution spectra were prepared against a solvent reference and all other spectra were recorded against air. Attenuated Total Reflectance (ATR) spectra were recorded by pressing the sample against a horizontal diamond ATR crystal.

For solution spectra the regions of the spectrum within which the solvent shows strong absorption should be disregarded. Solvent 'cut-offs' in the reference spectra may be recorded as horizontal straight lines or may appear as blank regions on the spectrum.

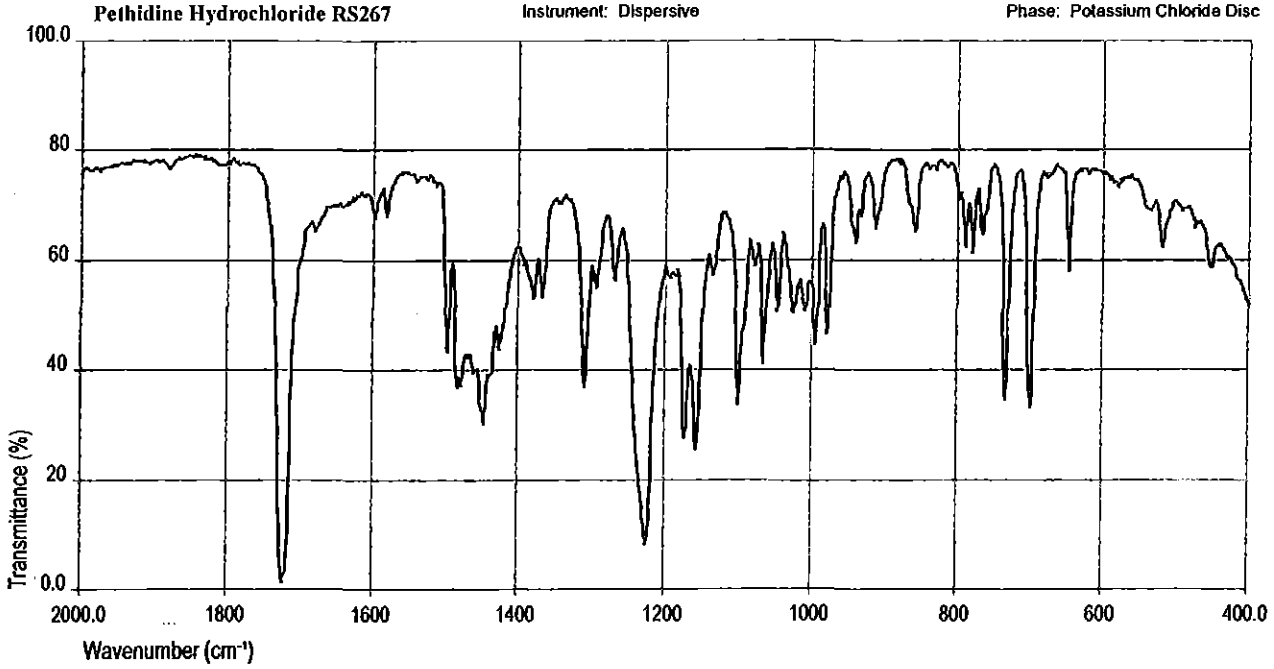
Pethidine Hydrochloride RS267

Instrument: Dispersive

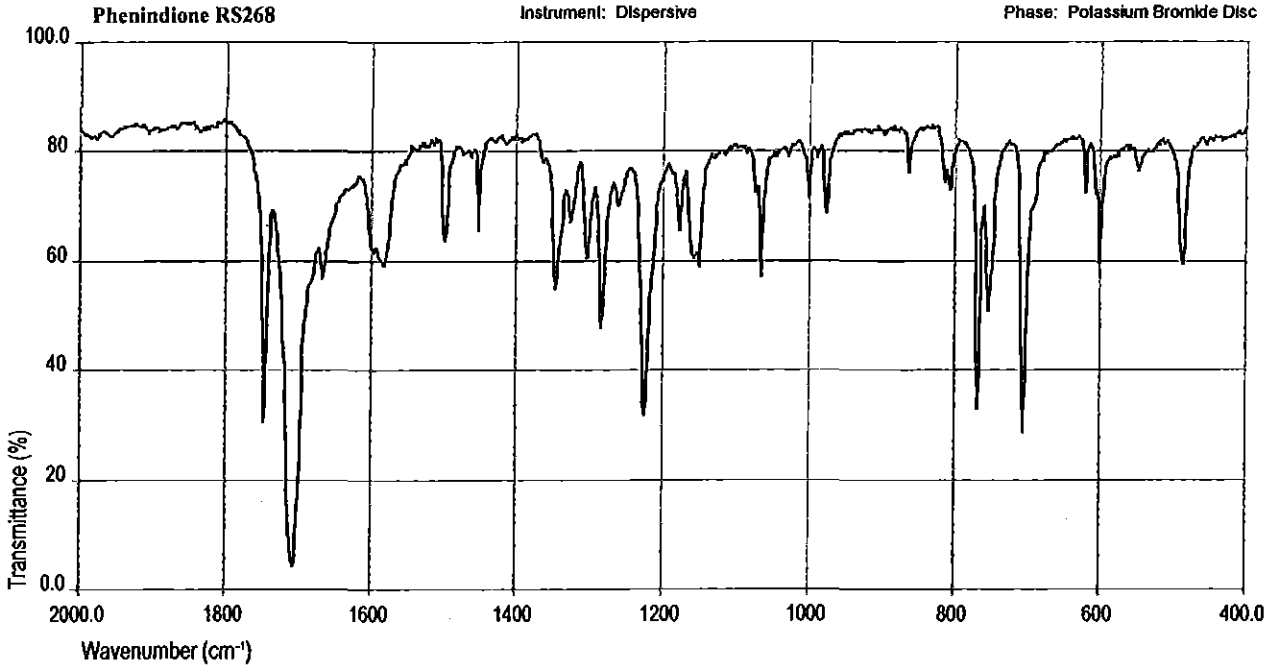
Phase: Potassium Chloride Disc



Phenindione RS268

Instrument: Dispersive

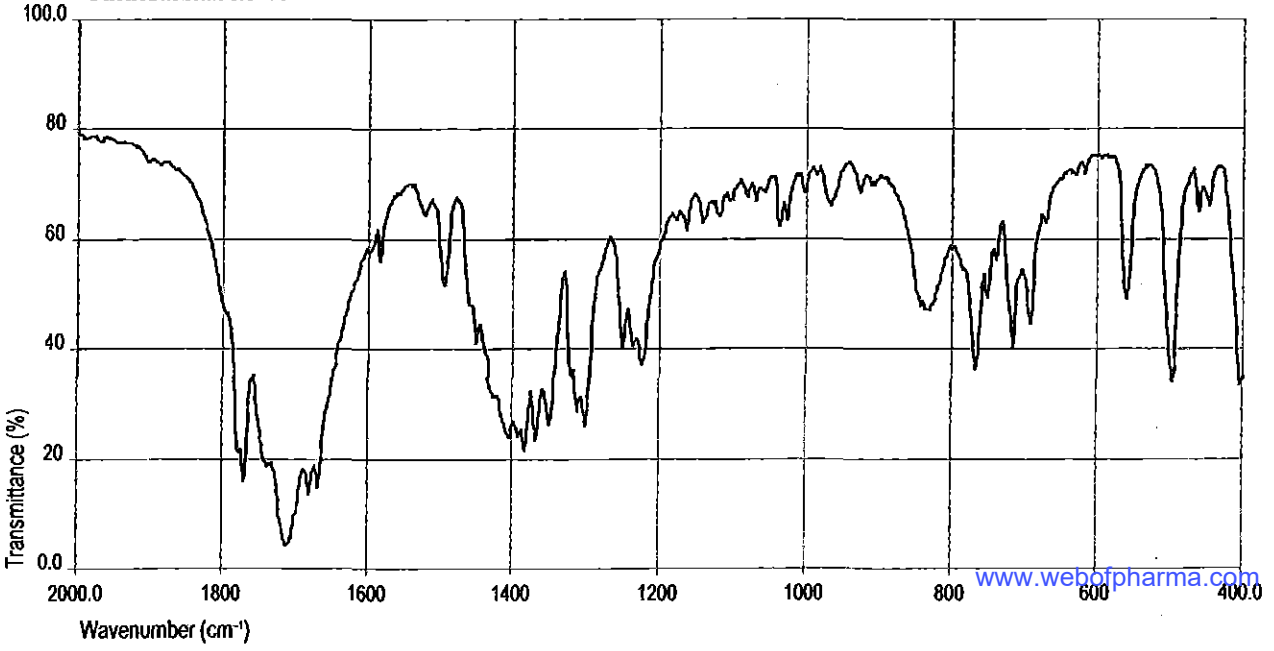
Phase: Potassium Bromide Disc



Phenobarbital RS270

Instrument: Dispersive

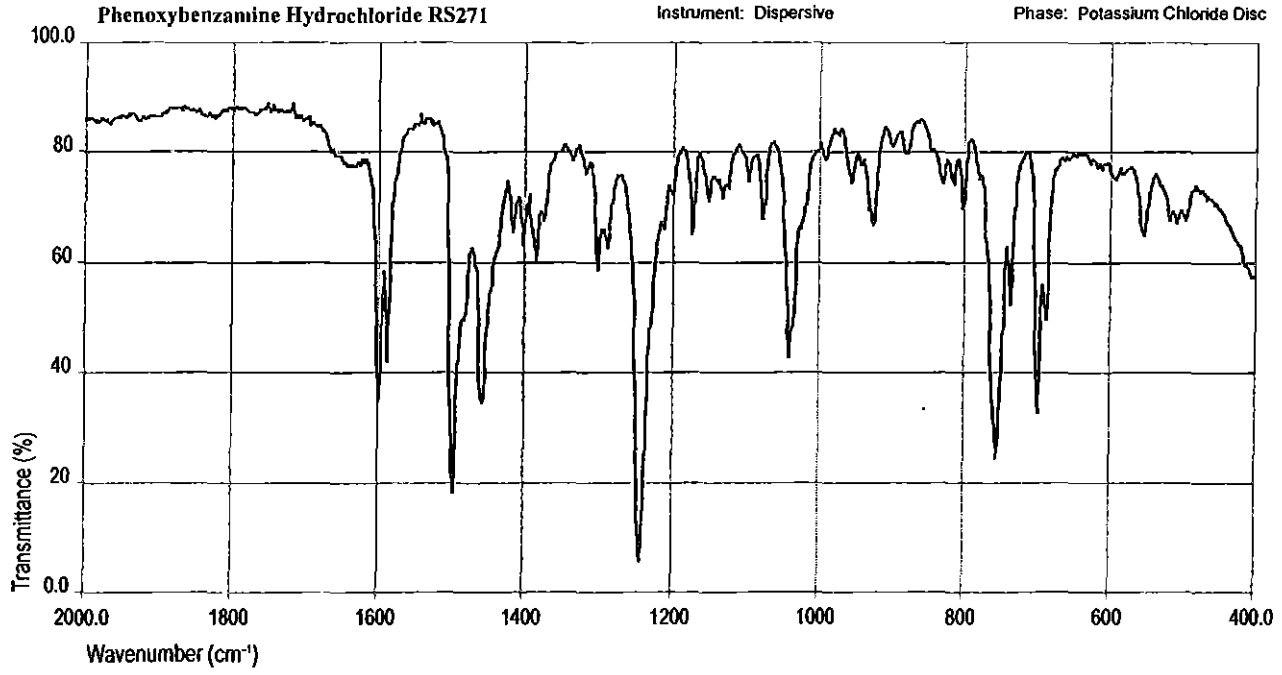
Phase: Potassium Bromide Disc



Phenoxybenzamine Hydrochloride RS271

Instrument: Dispersive

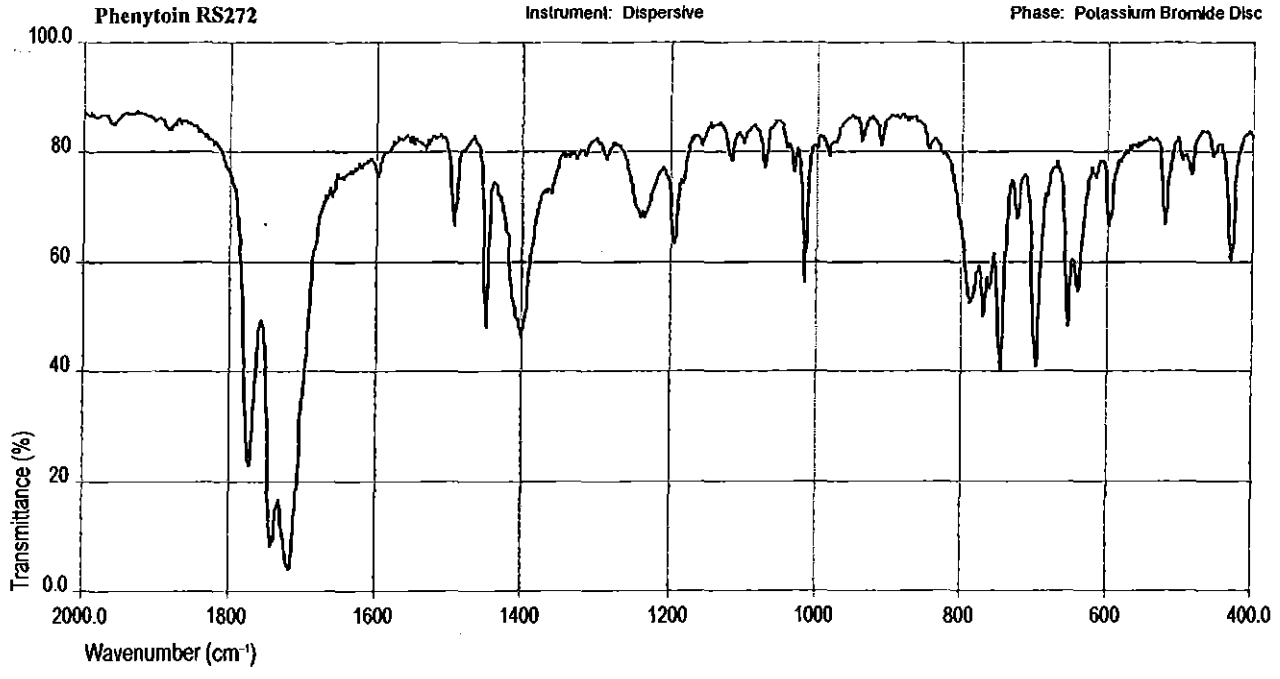
Phase: Potassium Chloride Disc



Phenytoin RS272

Instrument: Dispersive

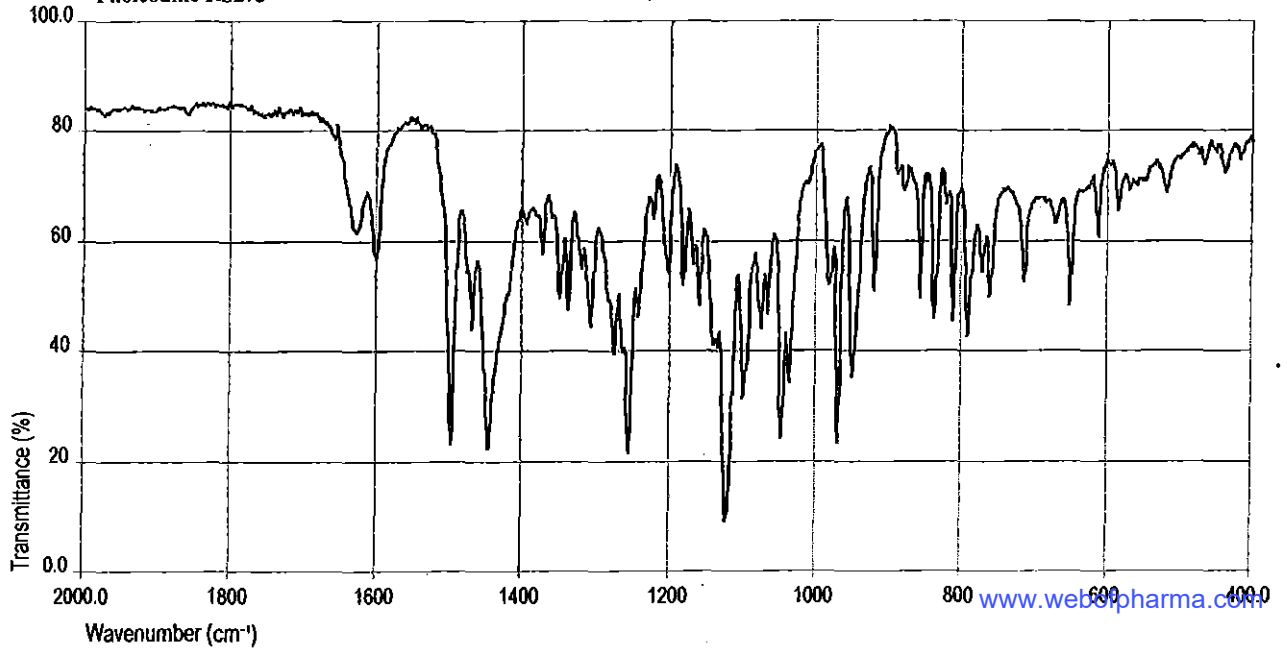
Phase: Potassium Bromide Disc

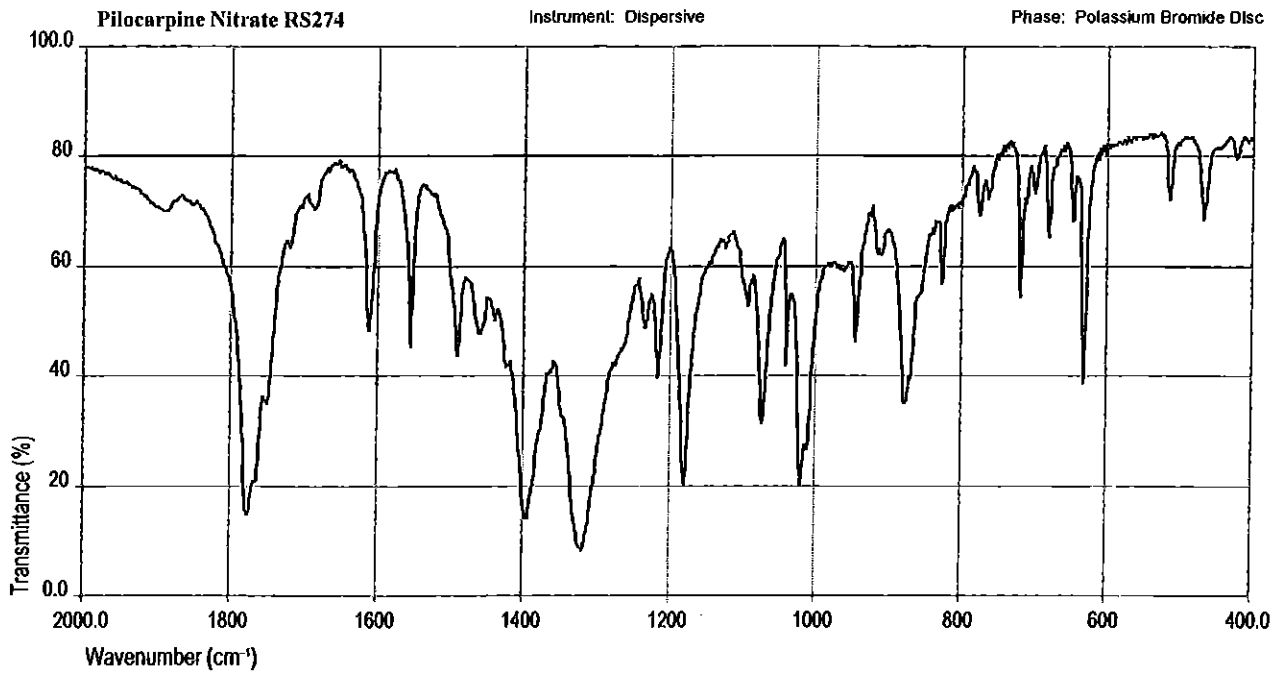


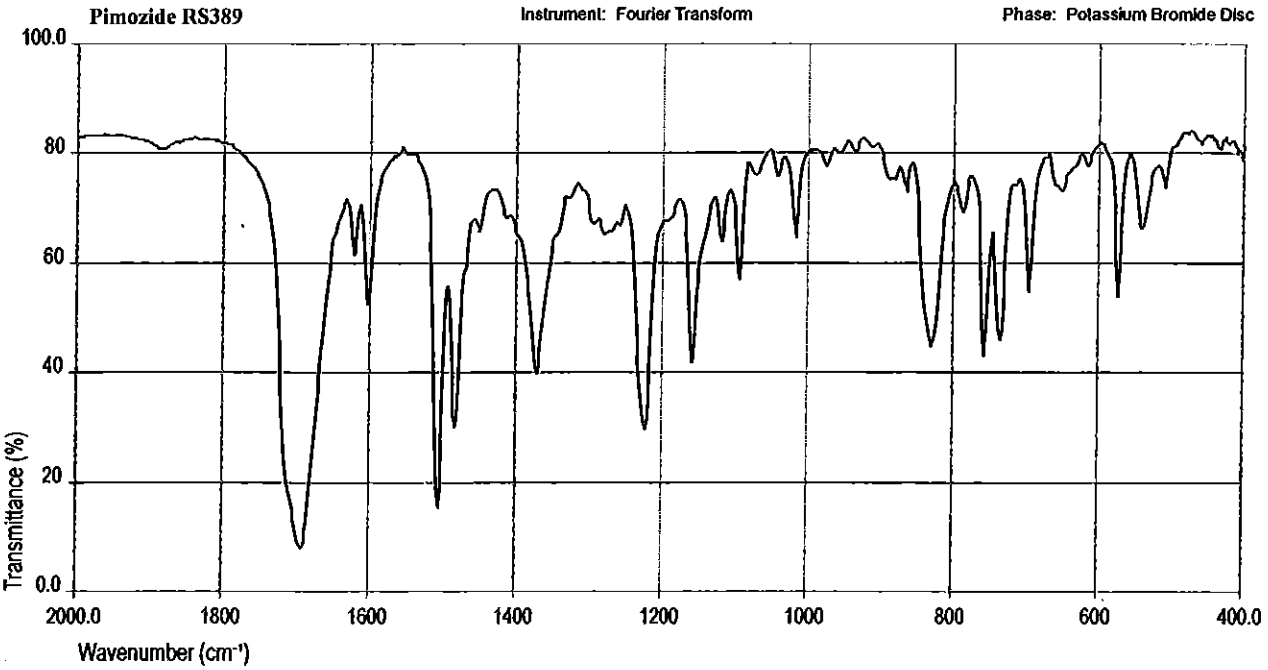
Pholcodine RS273

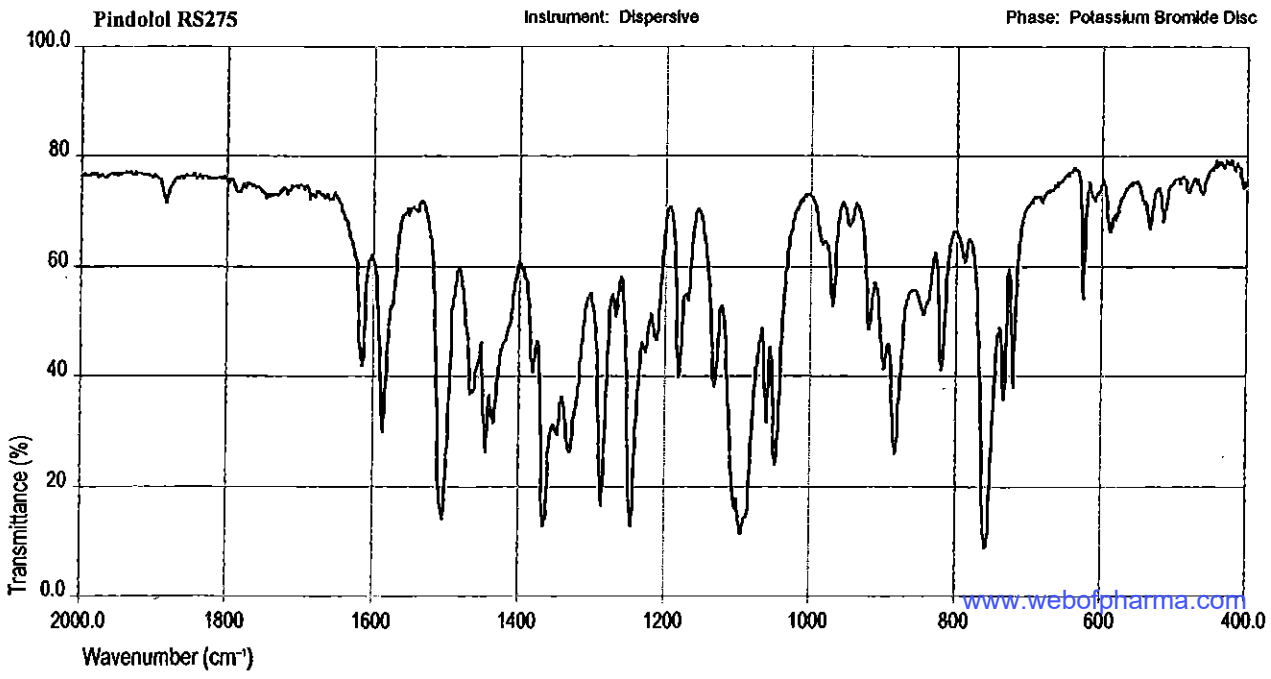
Instrument: Dispersive

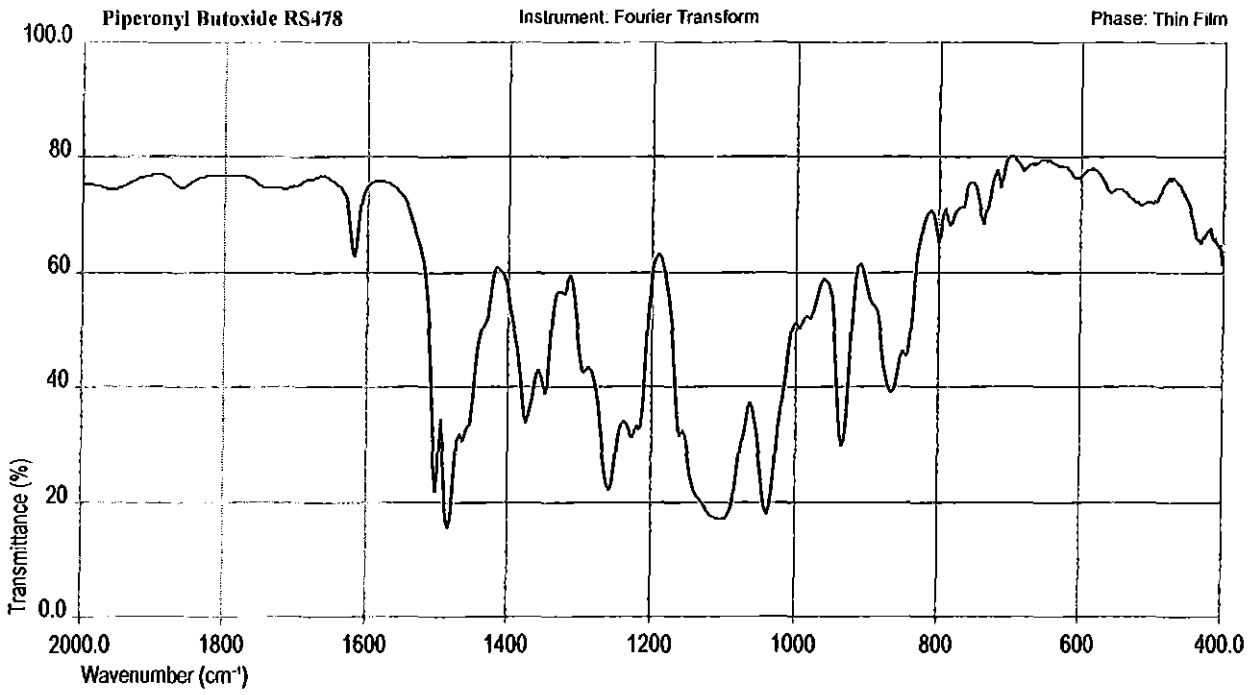
Phase: Potassium Bromide Disc

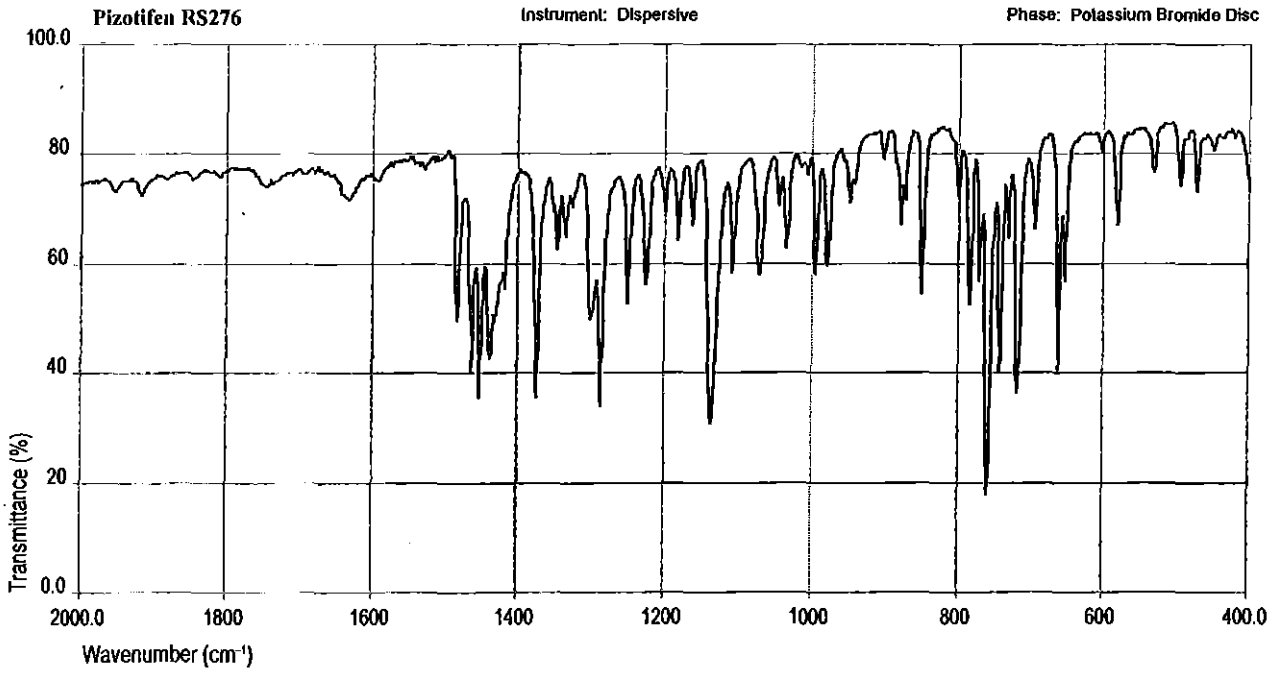


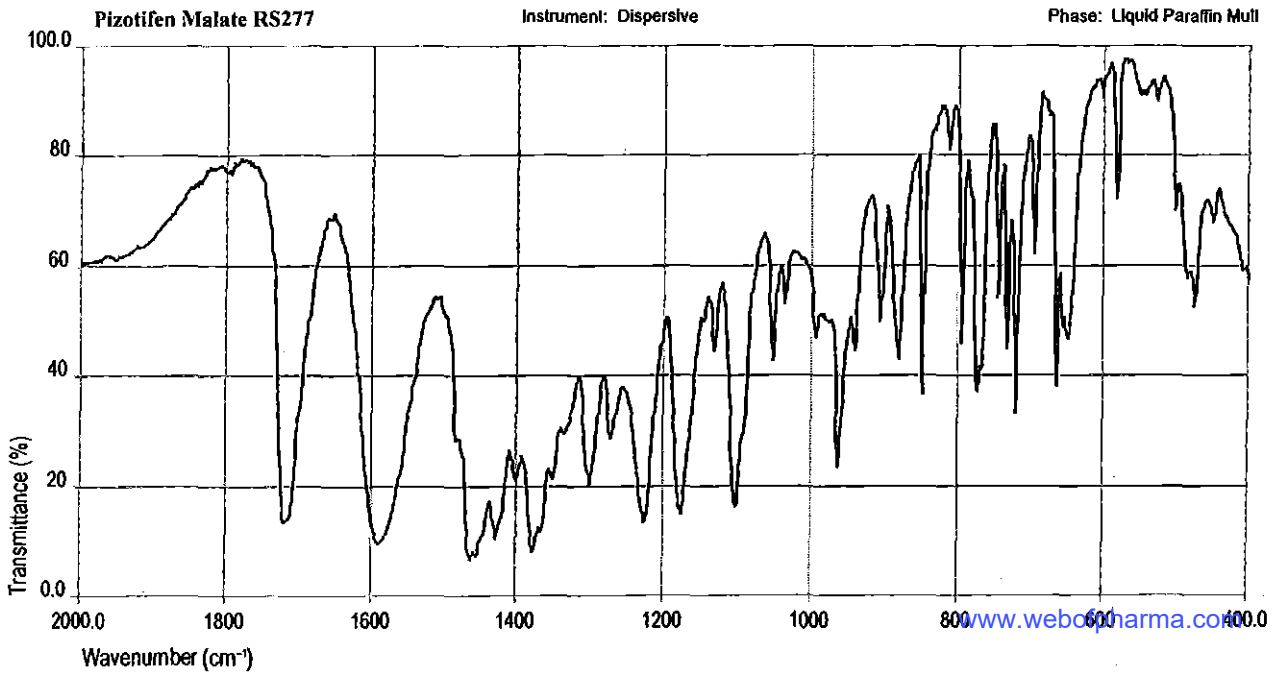








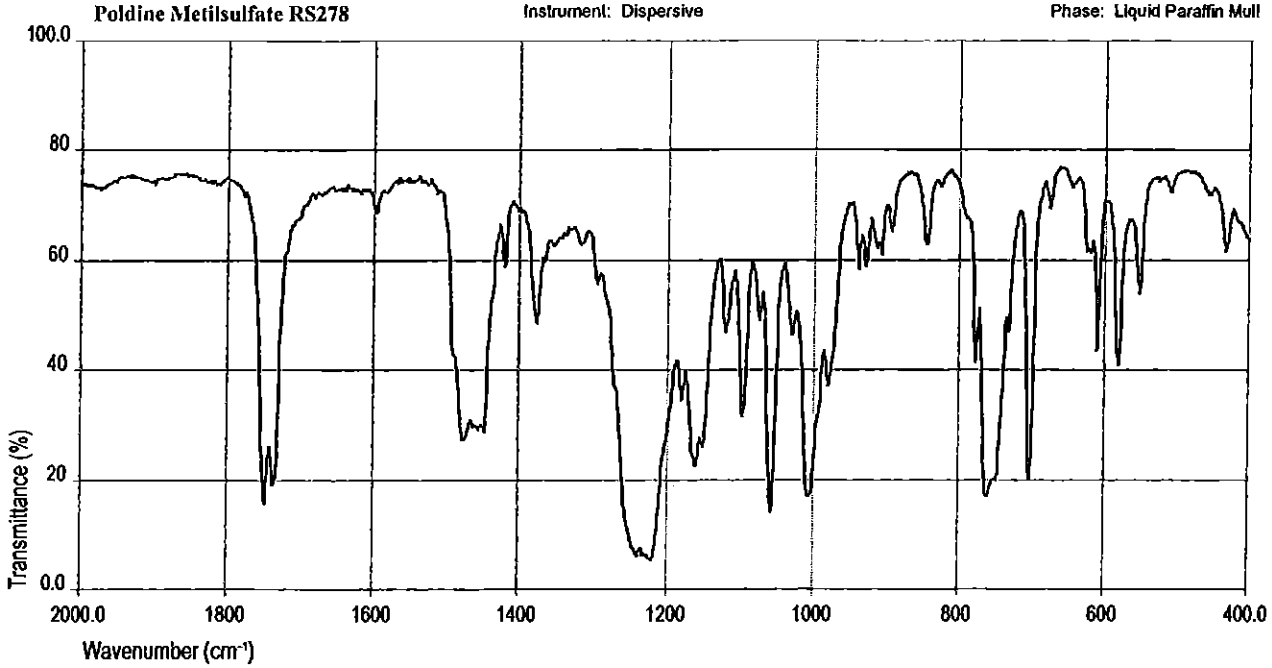




Poldine Metilsulfate RS278

Instrument: Dispersive

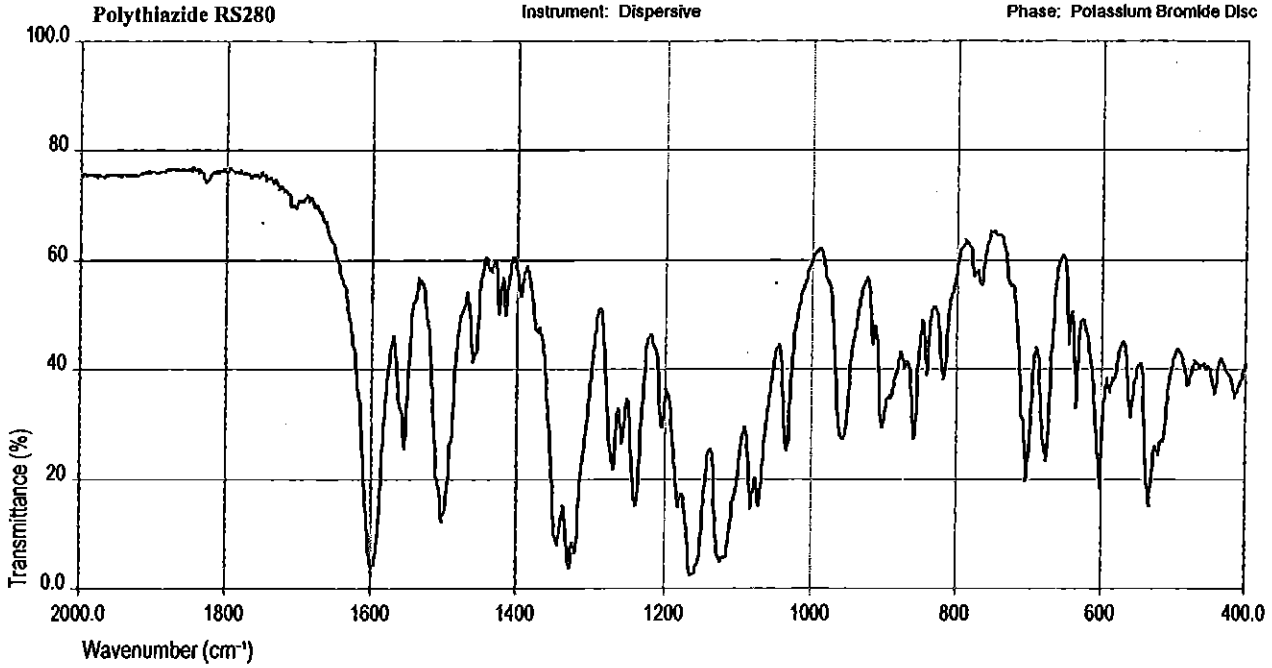
Phase: Liquid Paraffin Mull



Polythiazide RS280

Instrument: Dispersive

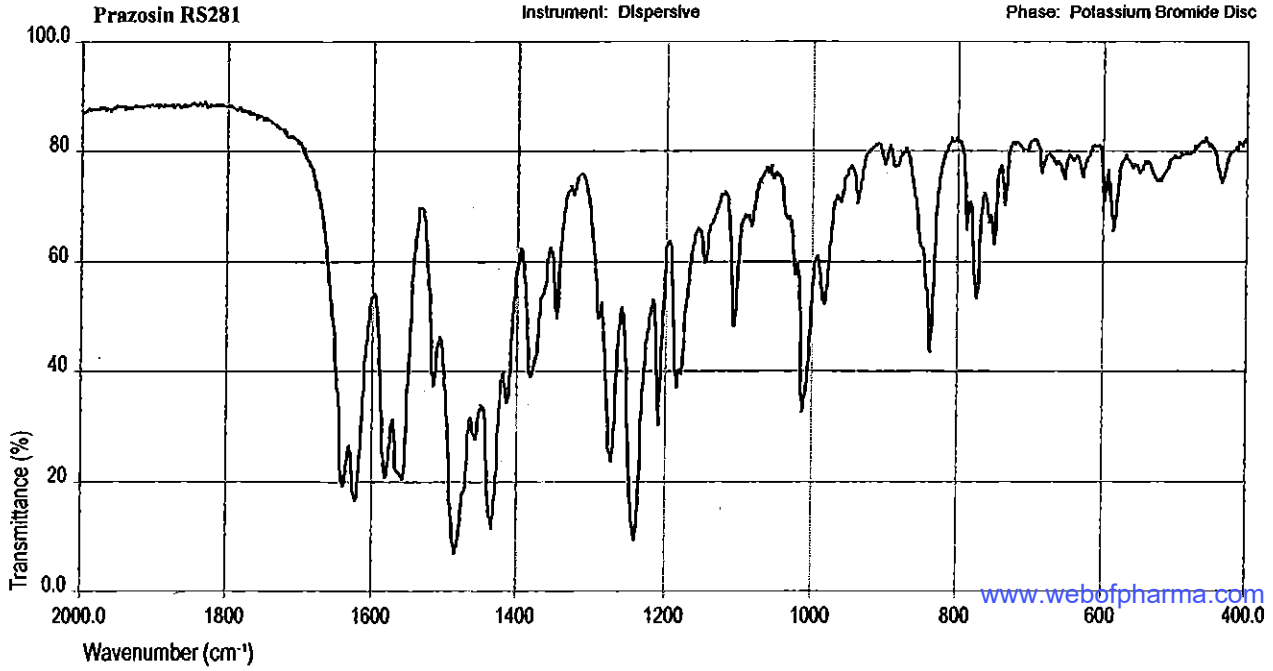
Phase: Potassium Bromide Disc

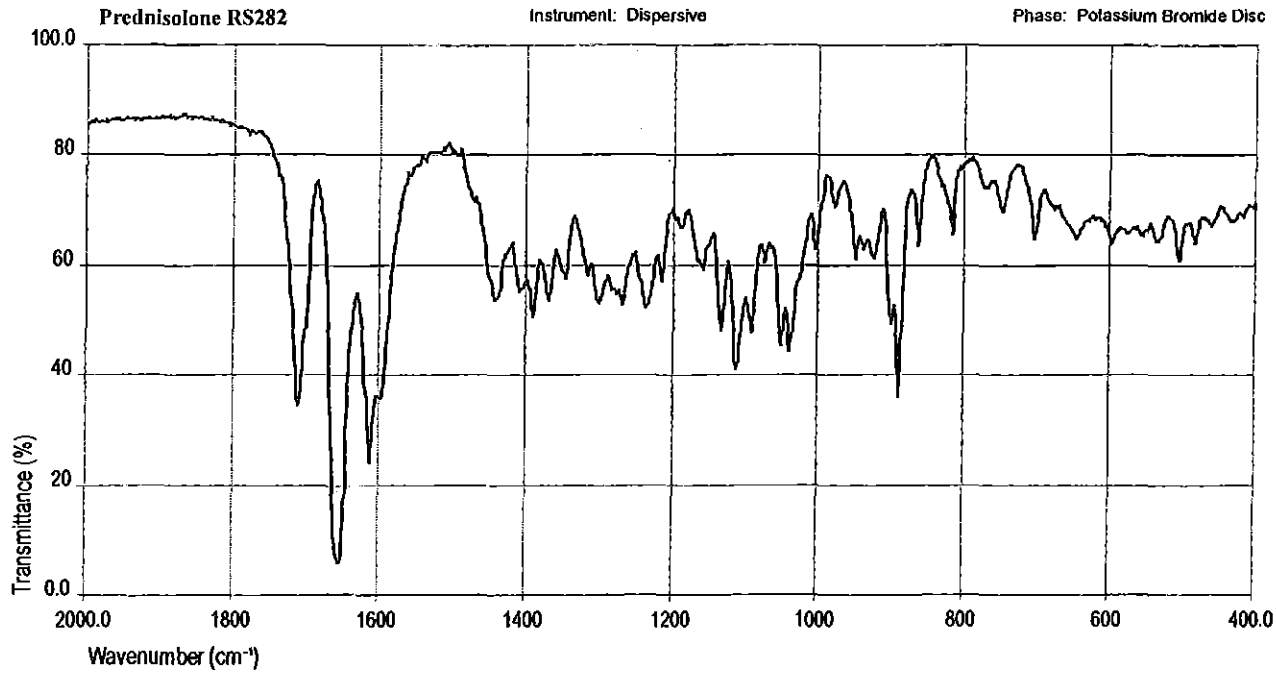


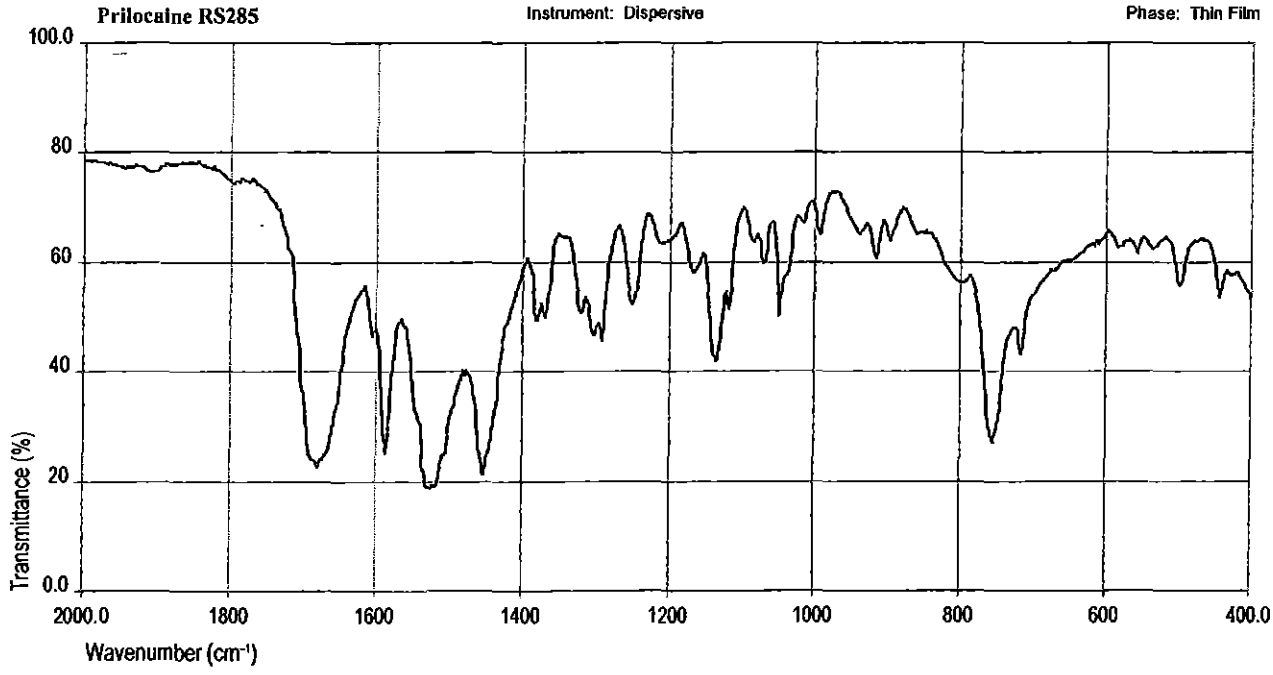
Prazosin RS281

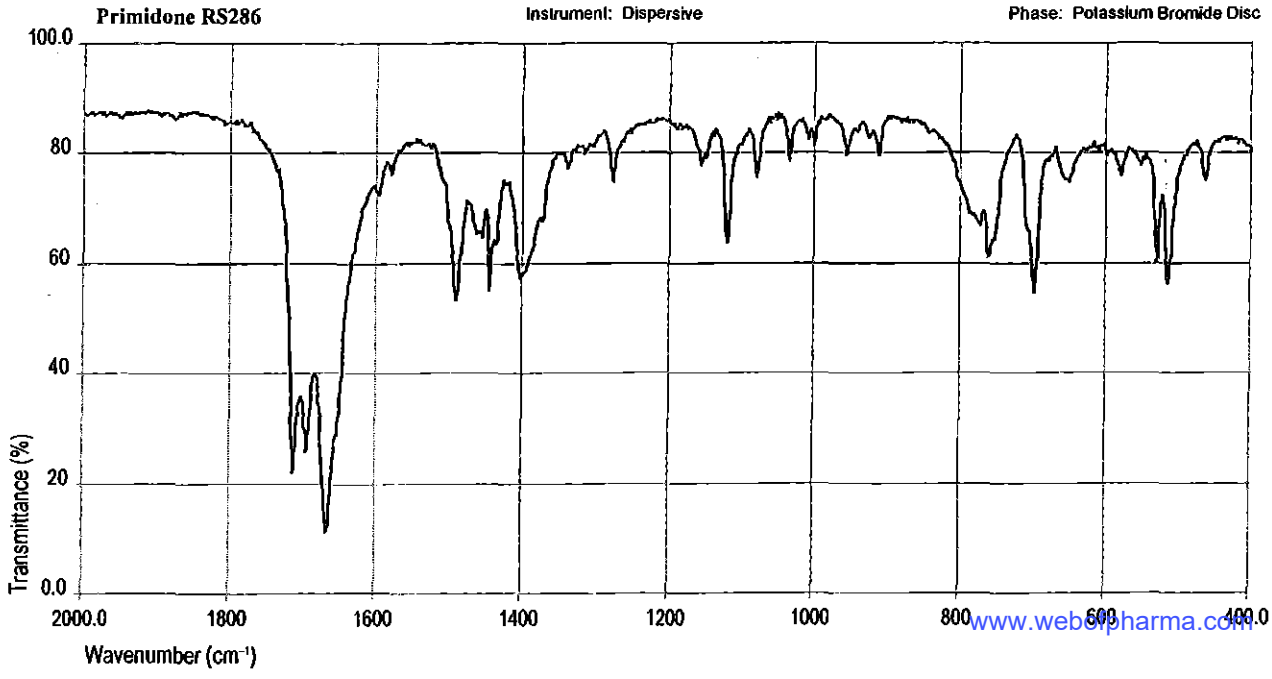
Instrument: Dispersive

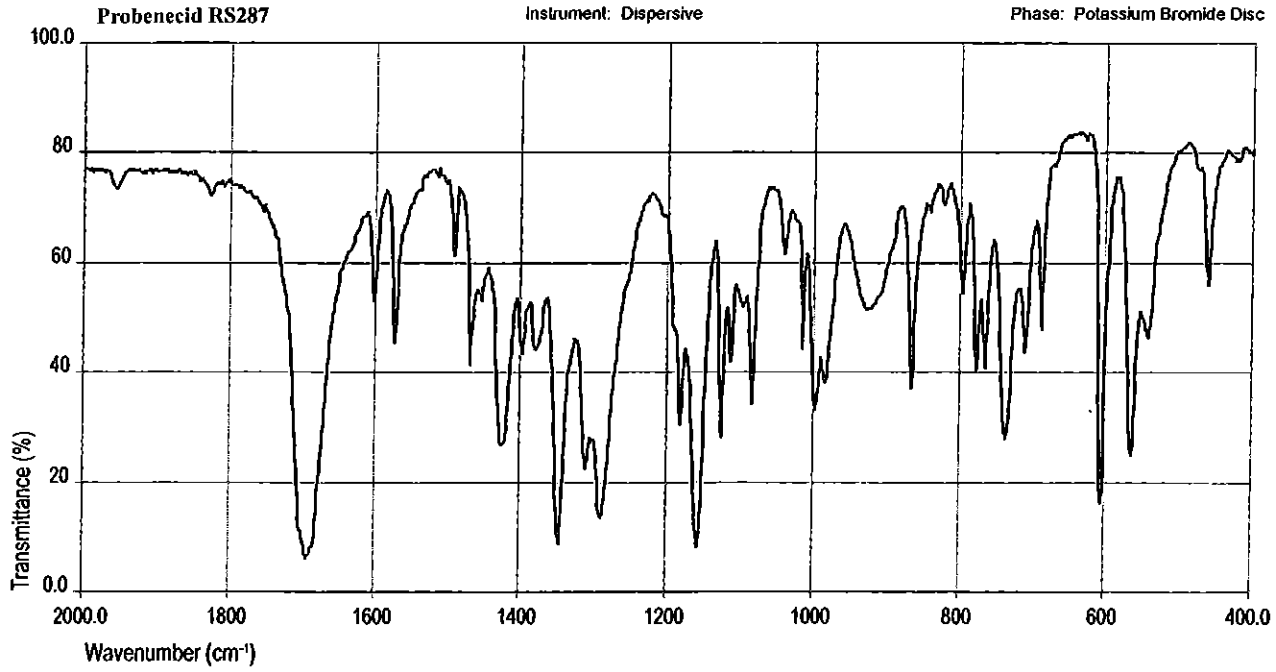
Phase: Potassium Bromide Disc

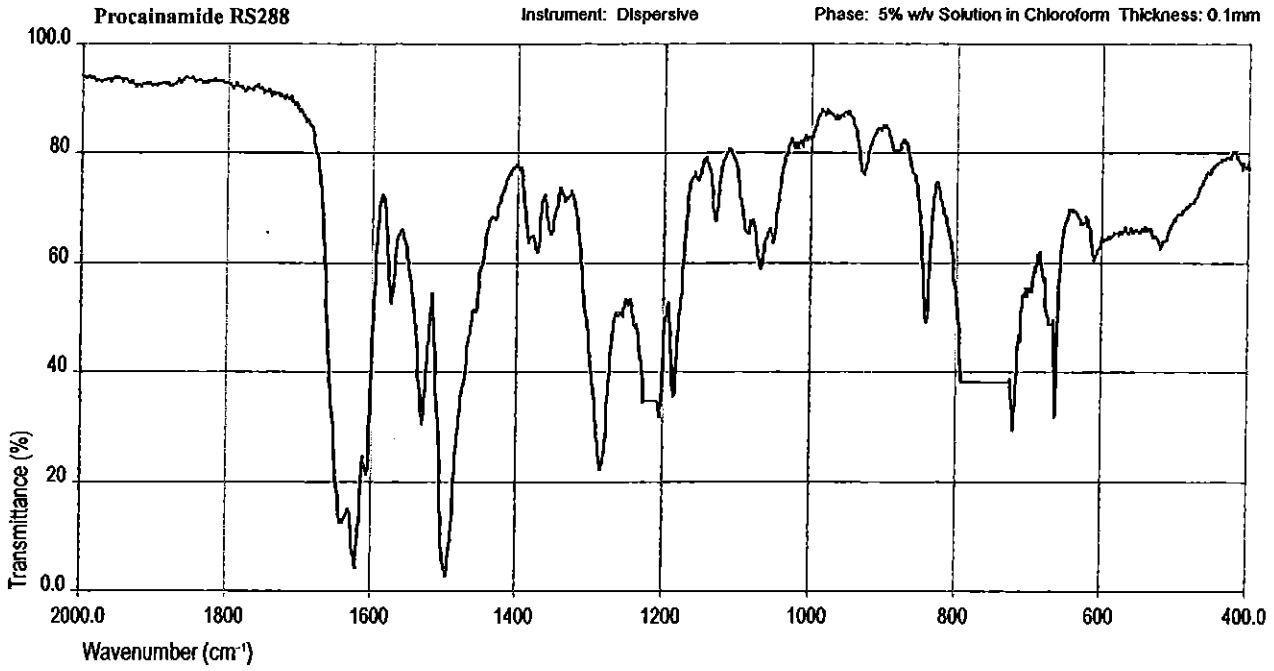


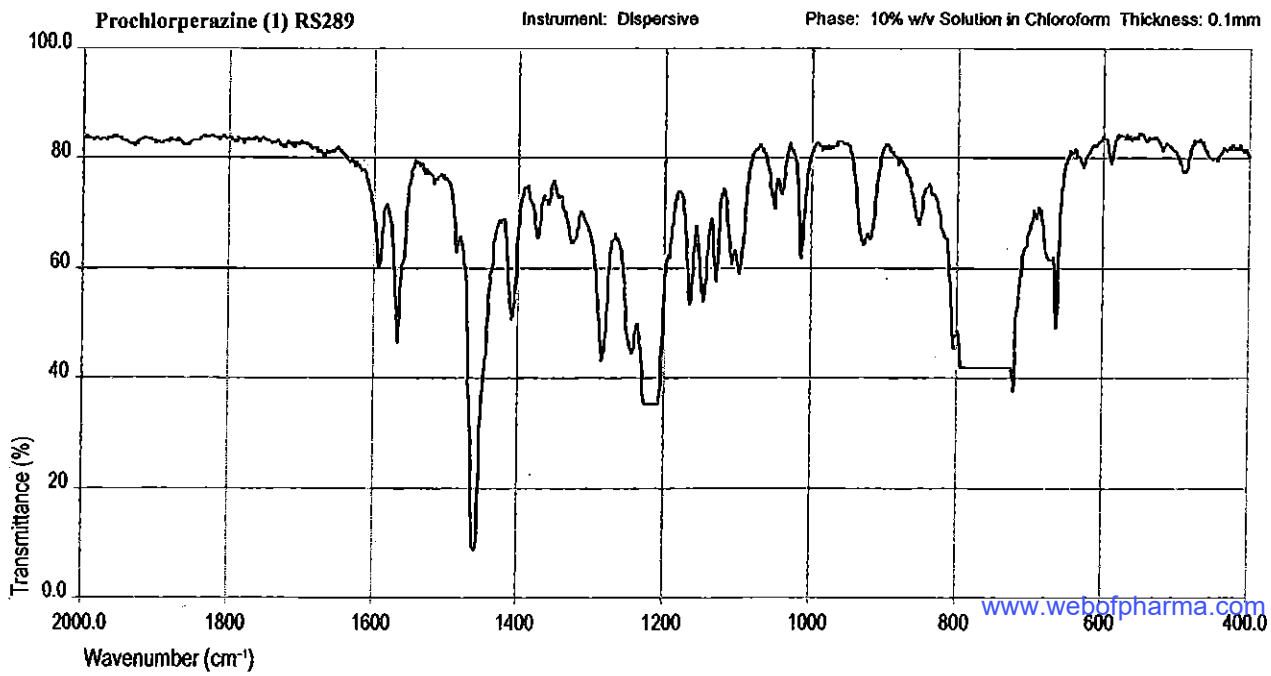




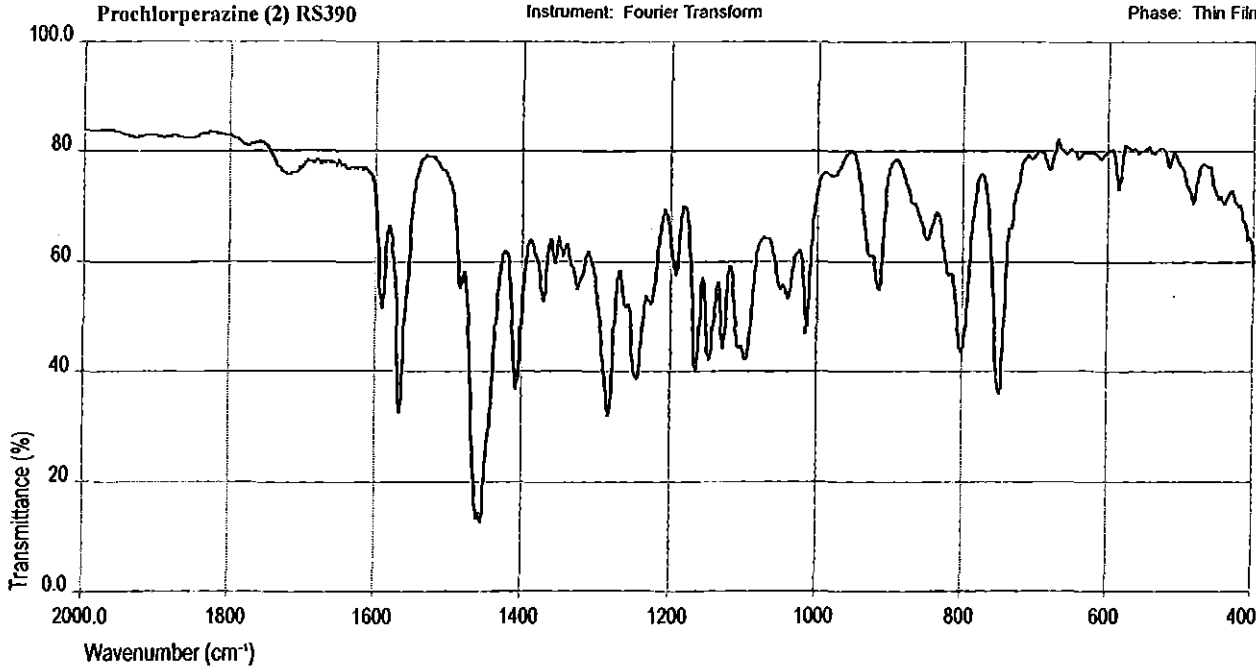




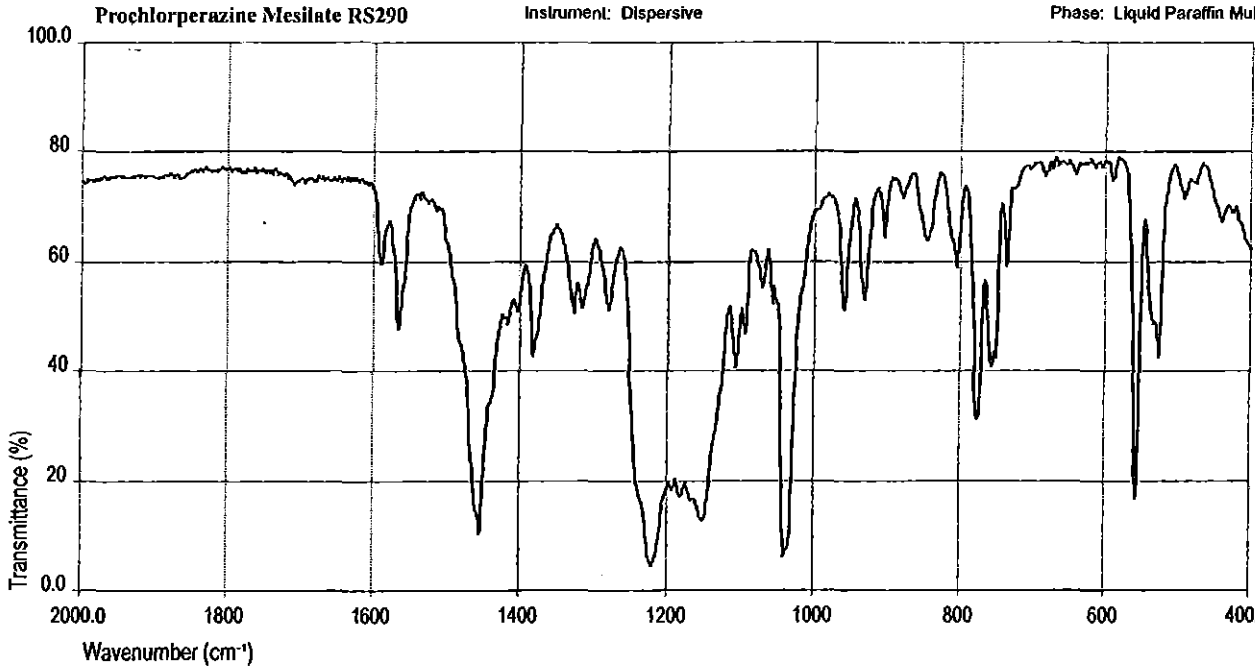




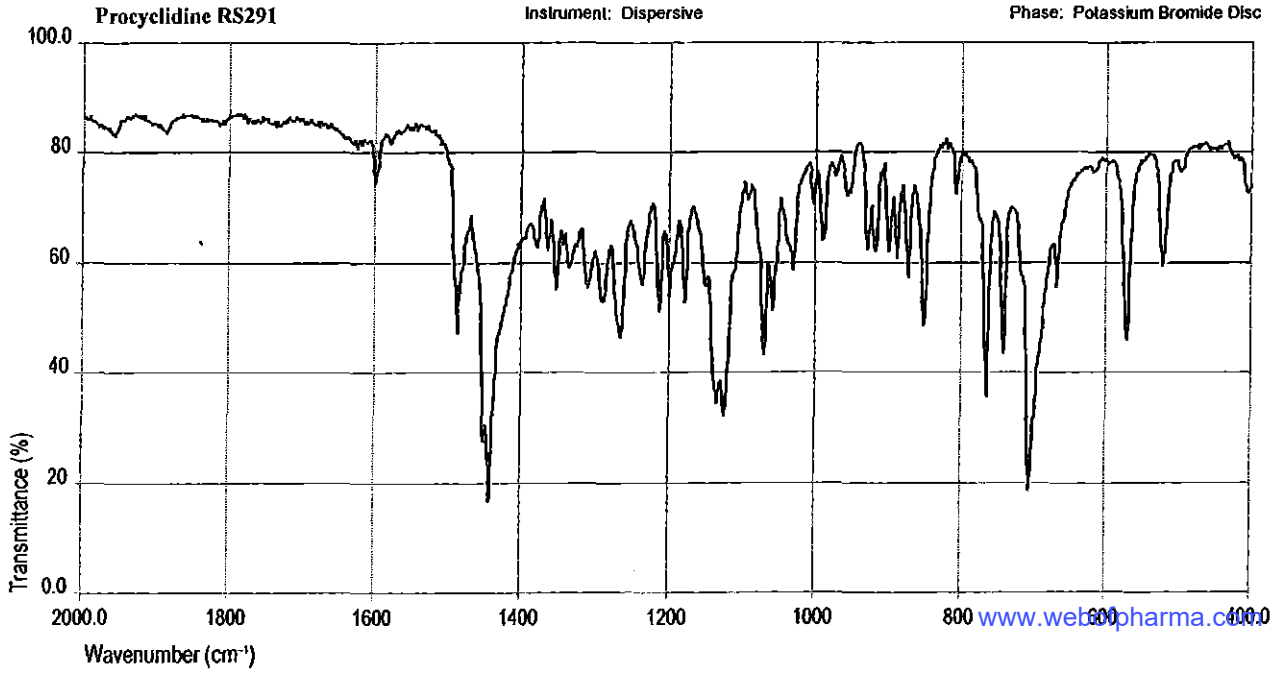
Prochlorperazine (2) RS390 Instrument: Fourier Transform Phase: Thin Film



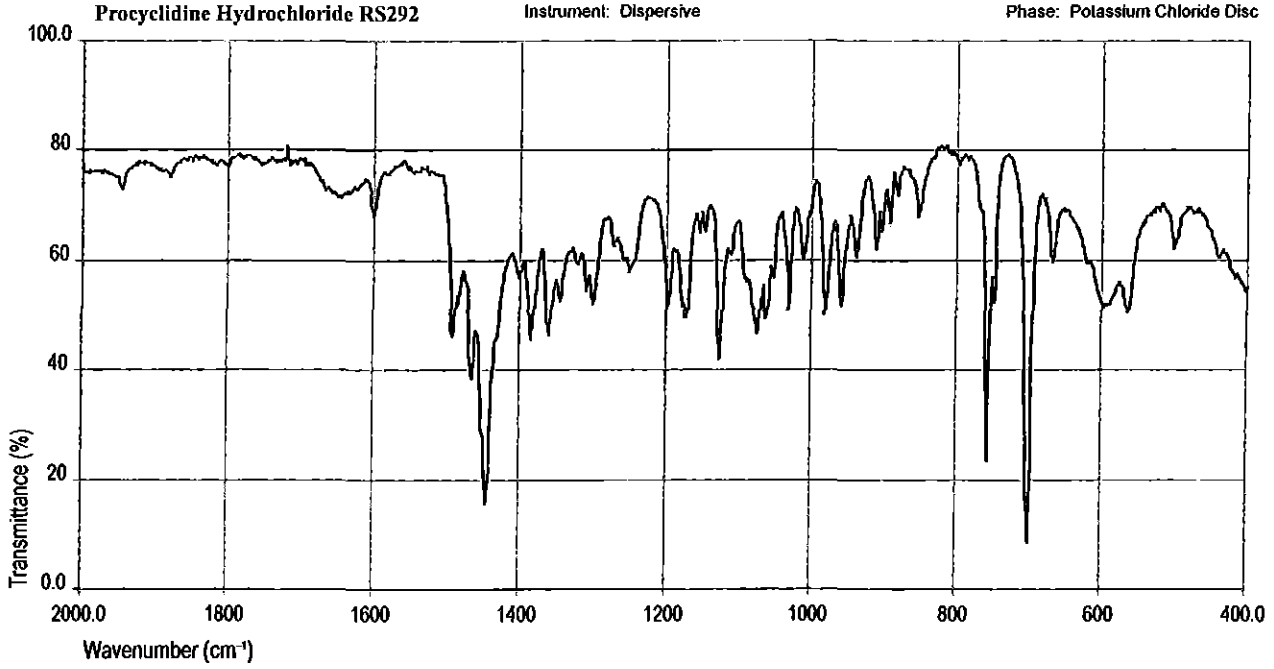
Prochlorperazine Mesilate RS290 Instrument: Dispersive Phase: Liquid Paraffin Mull



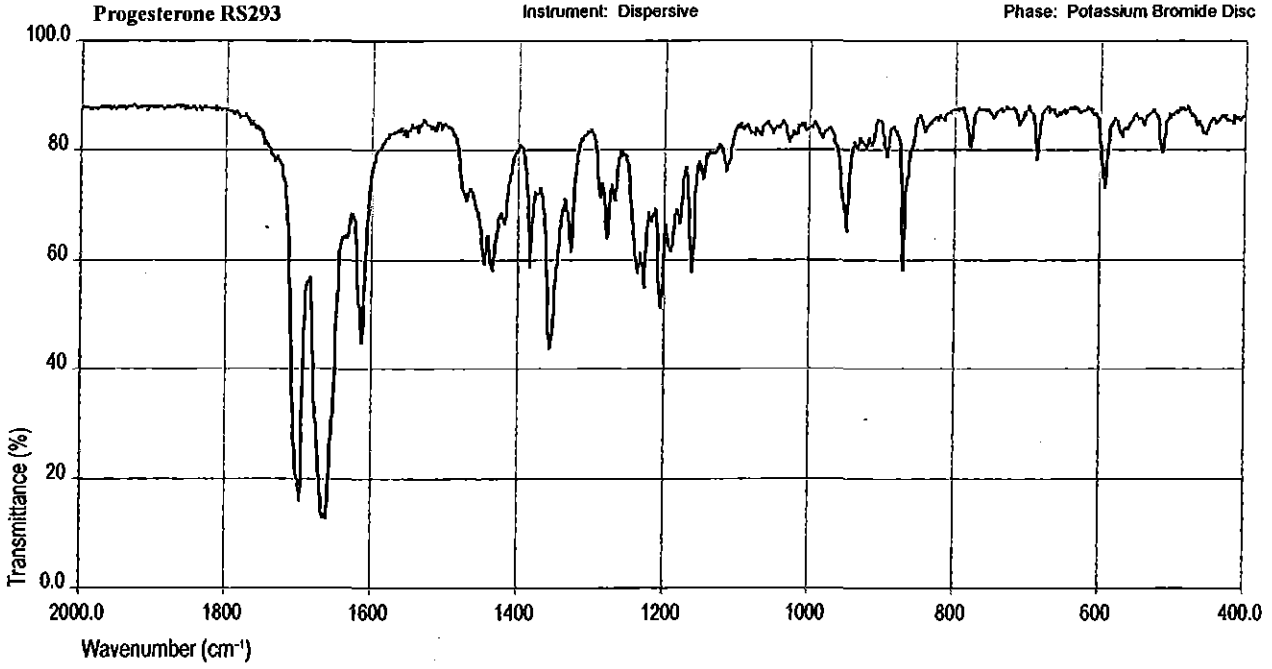
Procyclidine RS291 Instrument: Dispersive Phase: Potassium Bromide Disc



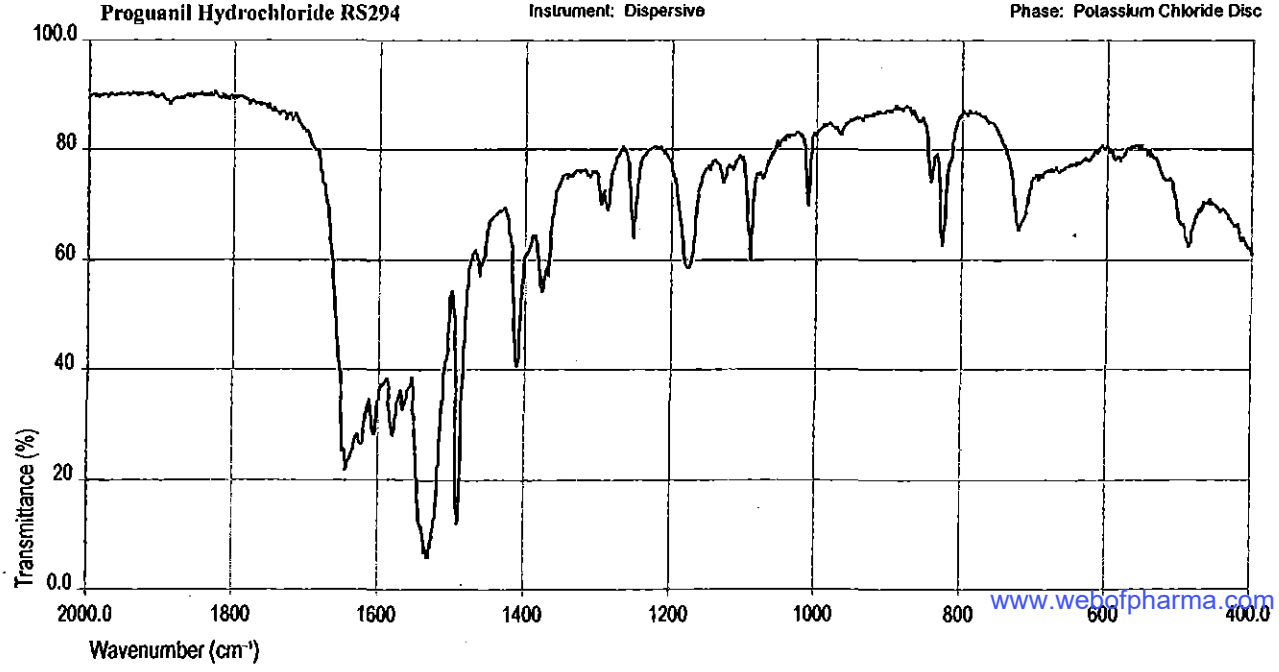
Procyclidine Hydrochloride RS292 Instrument: Dispersive Phase: Potassium Chloride Disc

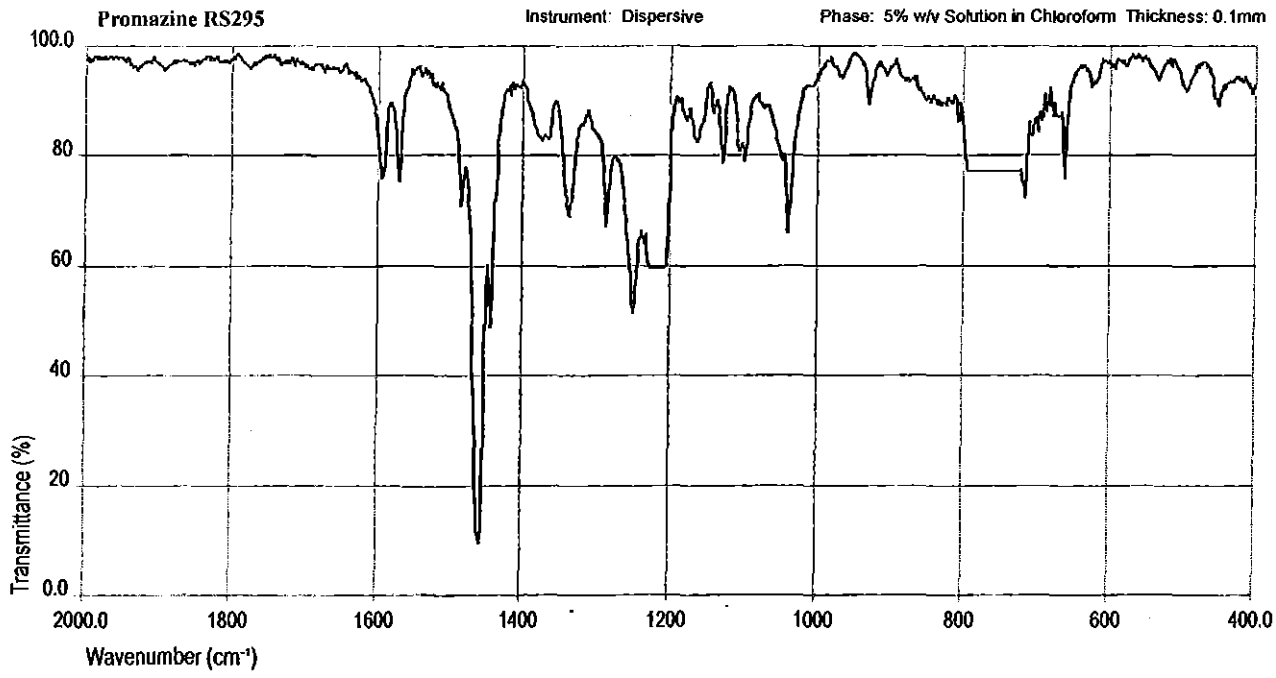


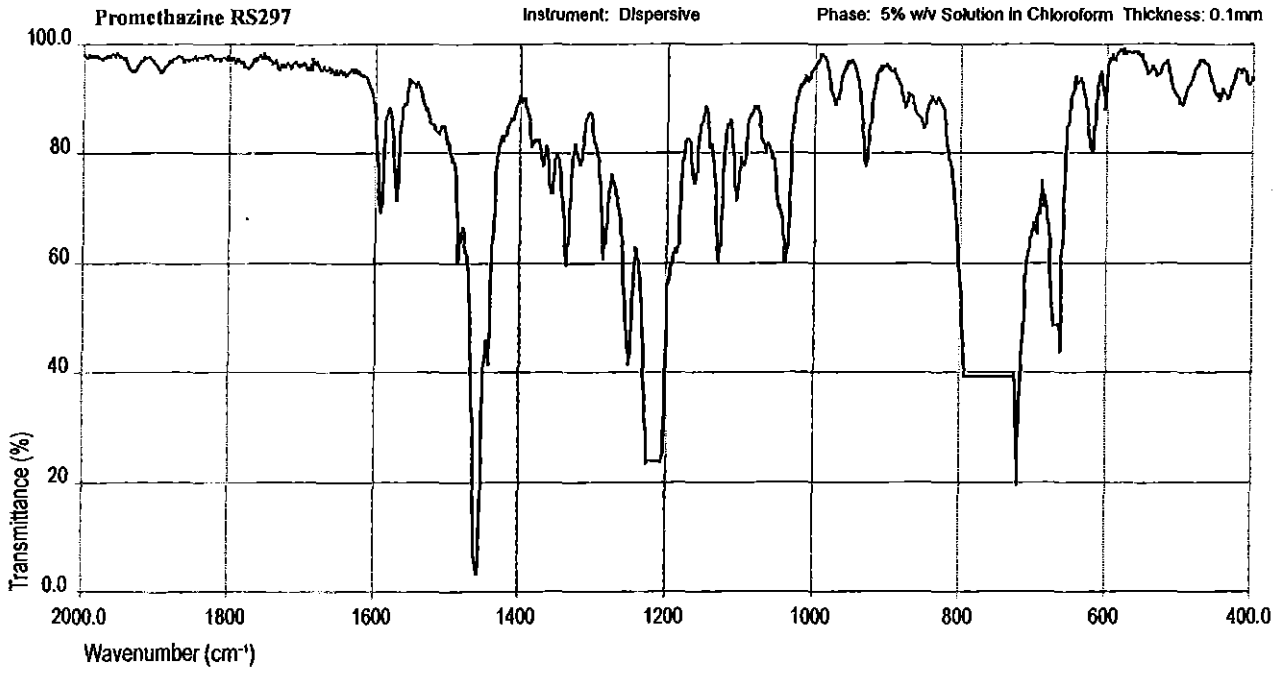
Progesterone RS293 Instrument: Dispersive Phase: Potassium Bromide Disc

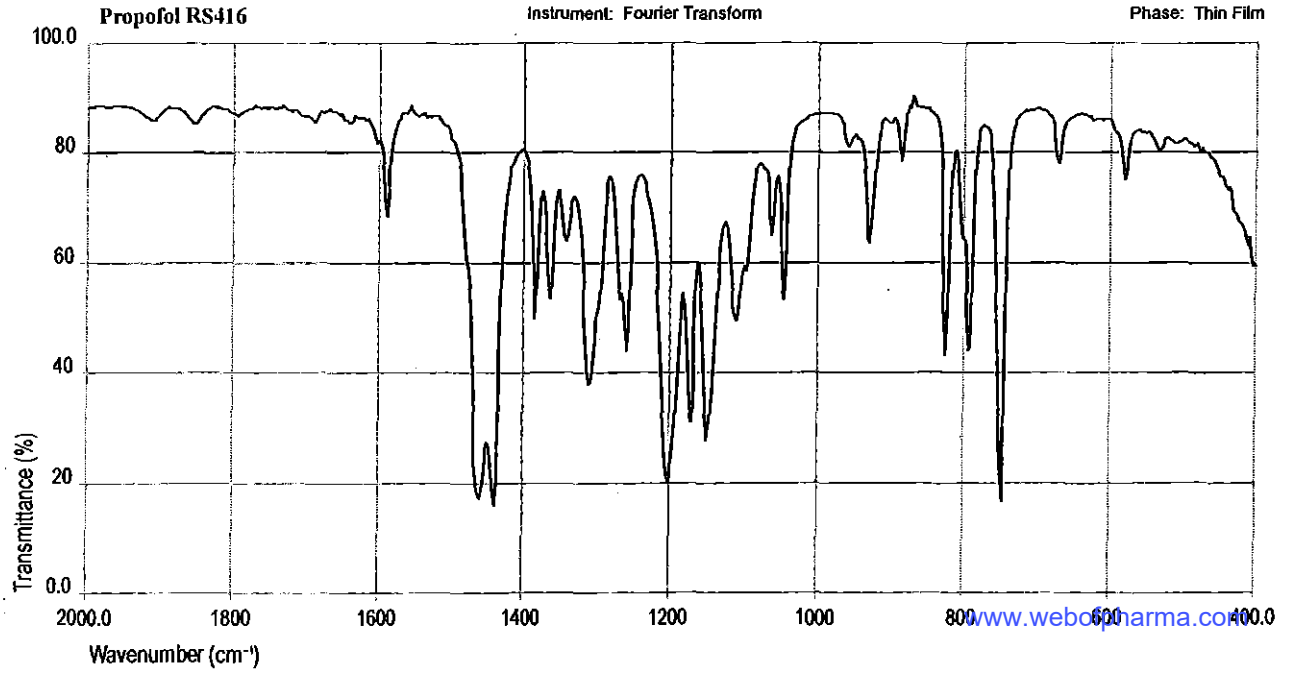


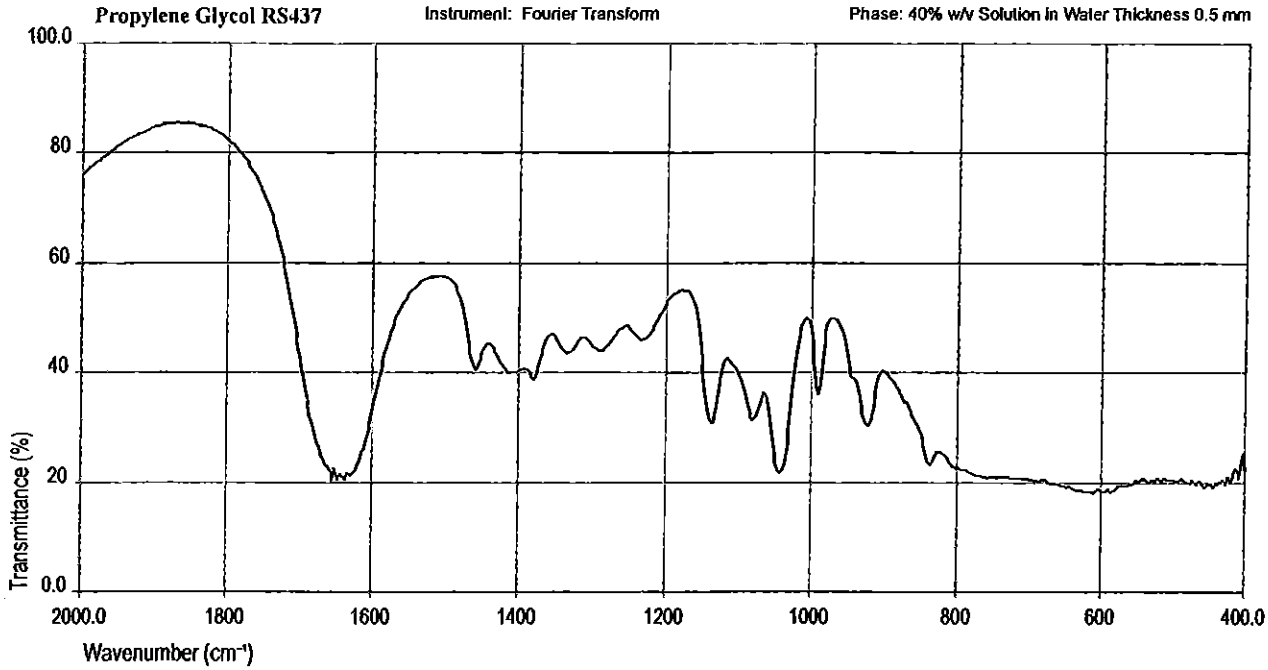
Proguanil Hydrochloride RS294 Instrument: Dispersive Phase: Potassium Chloride Disc

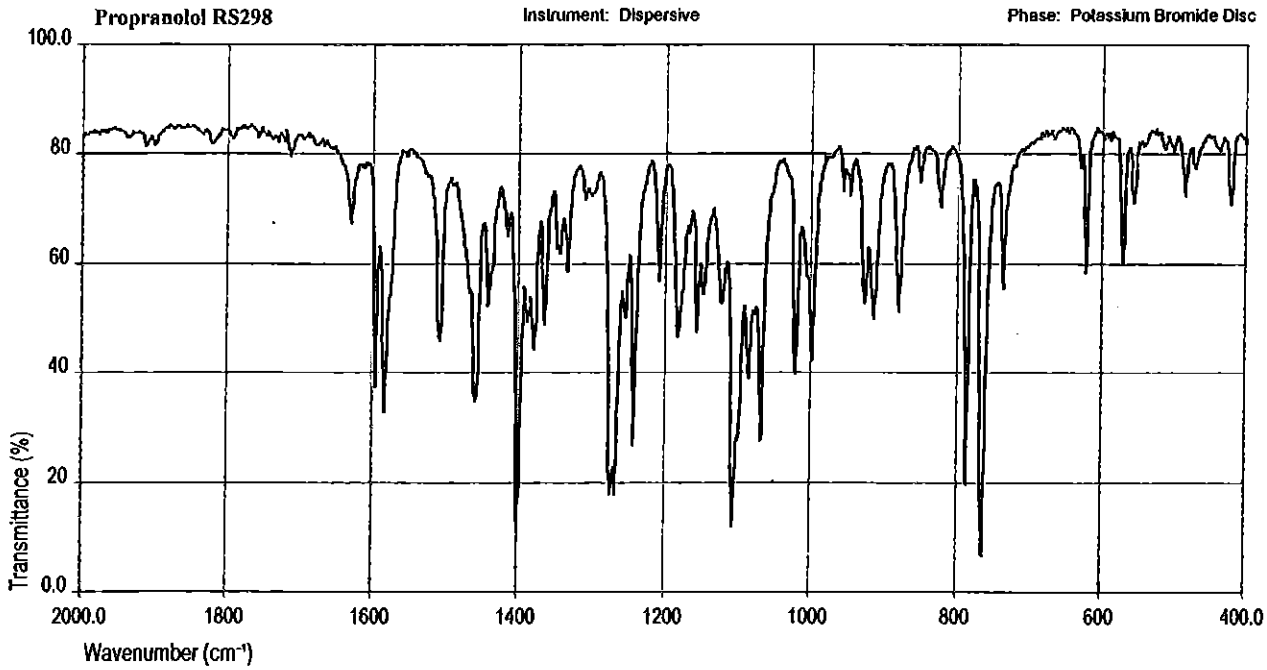


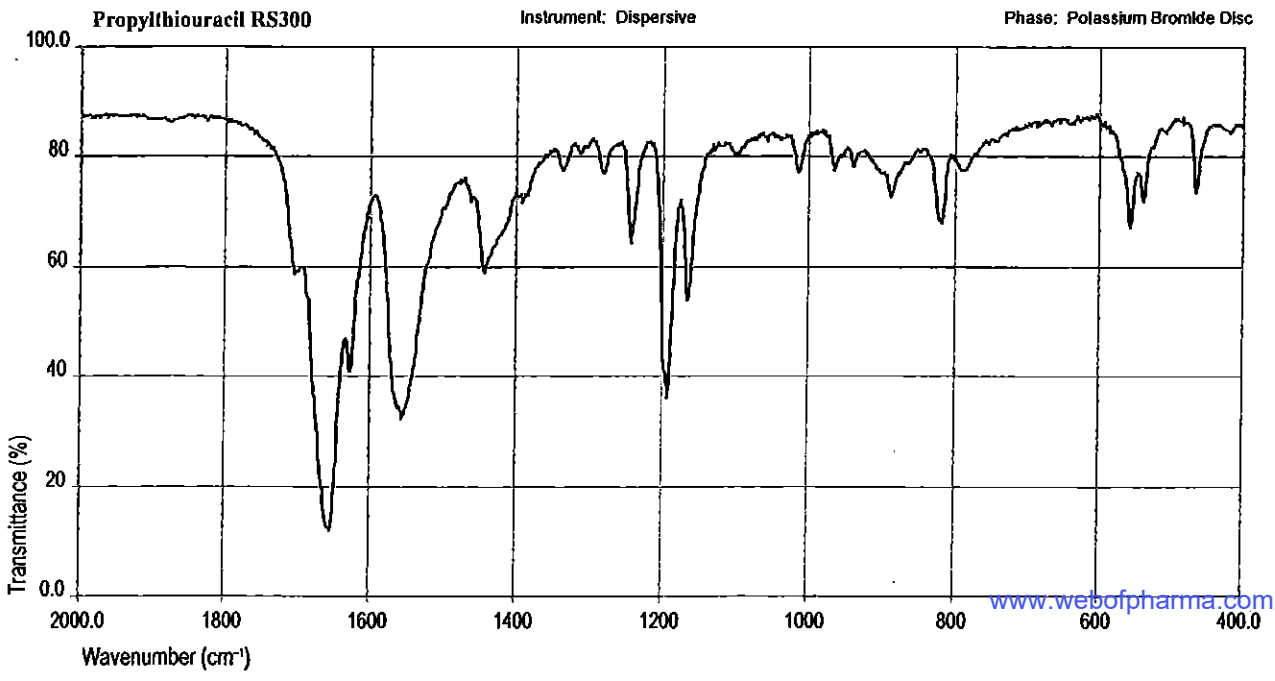


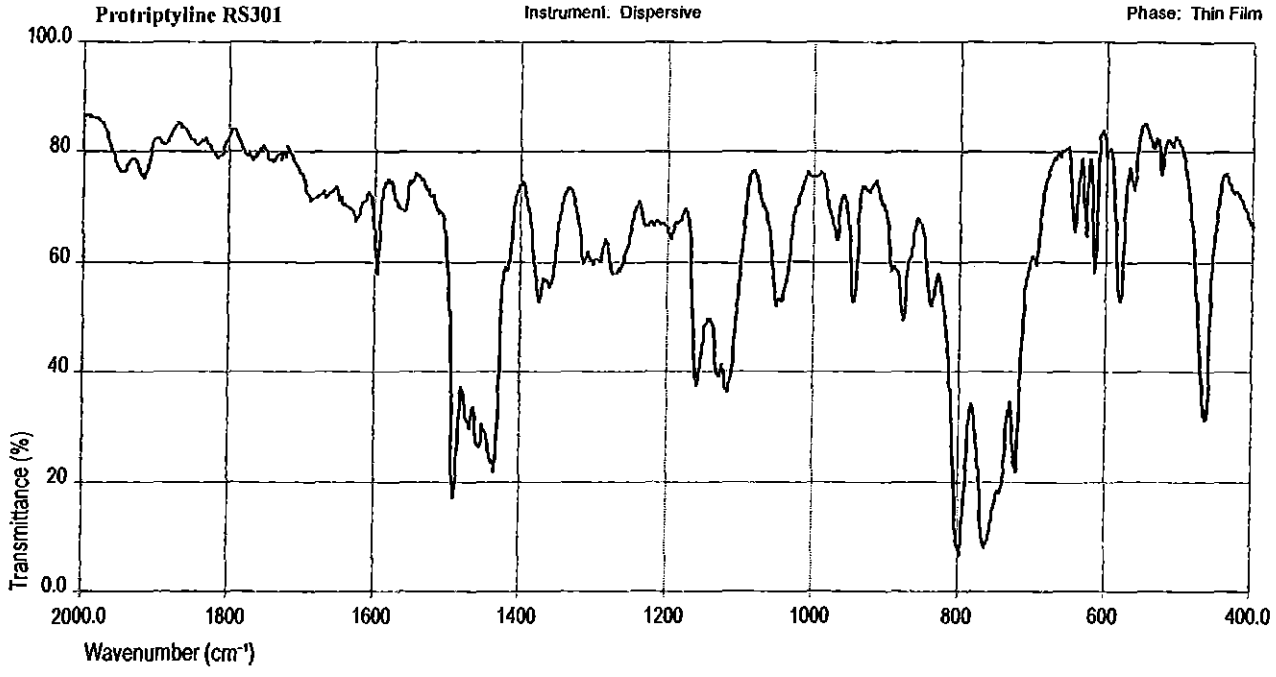


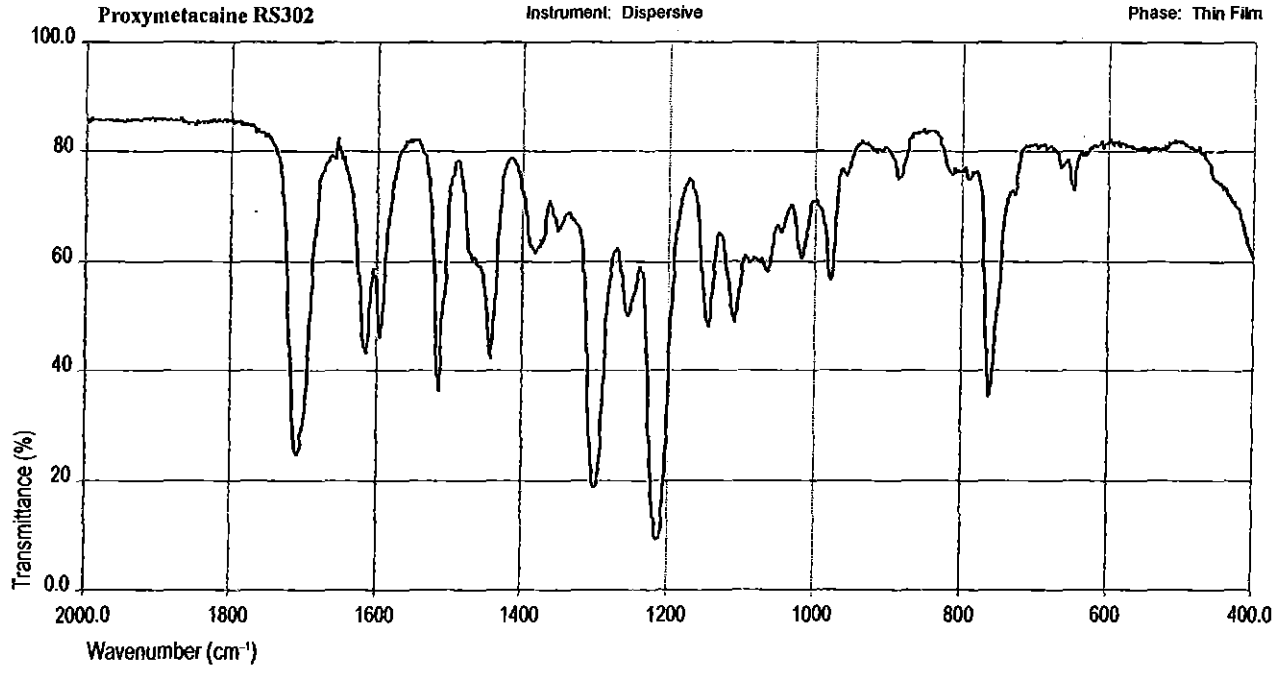


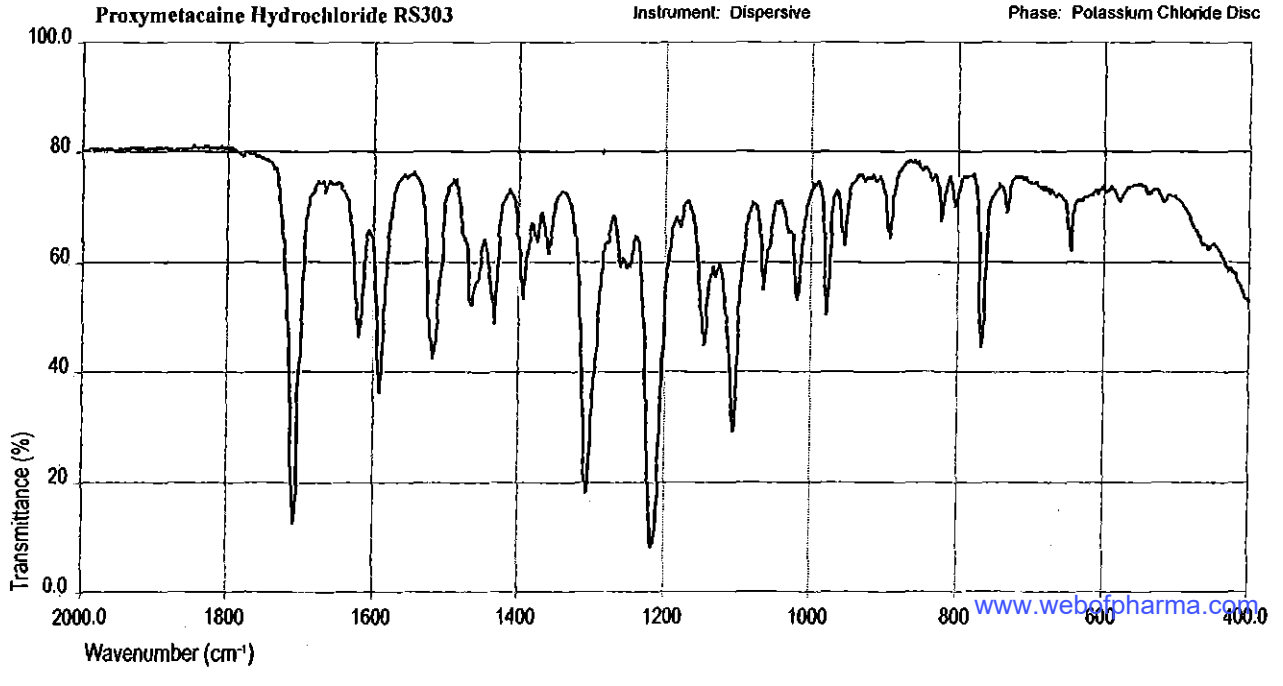


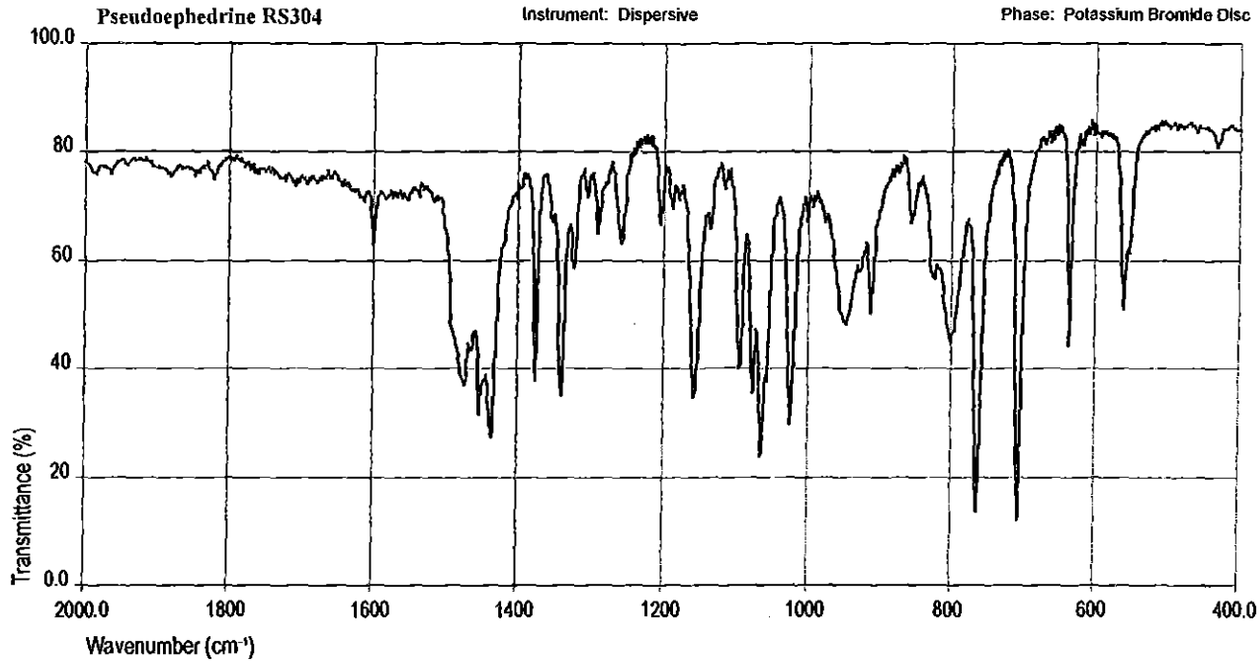


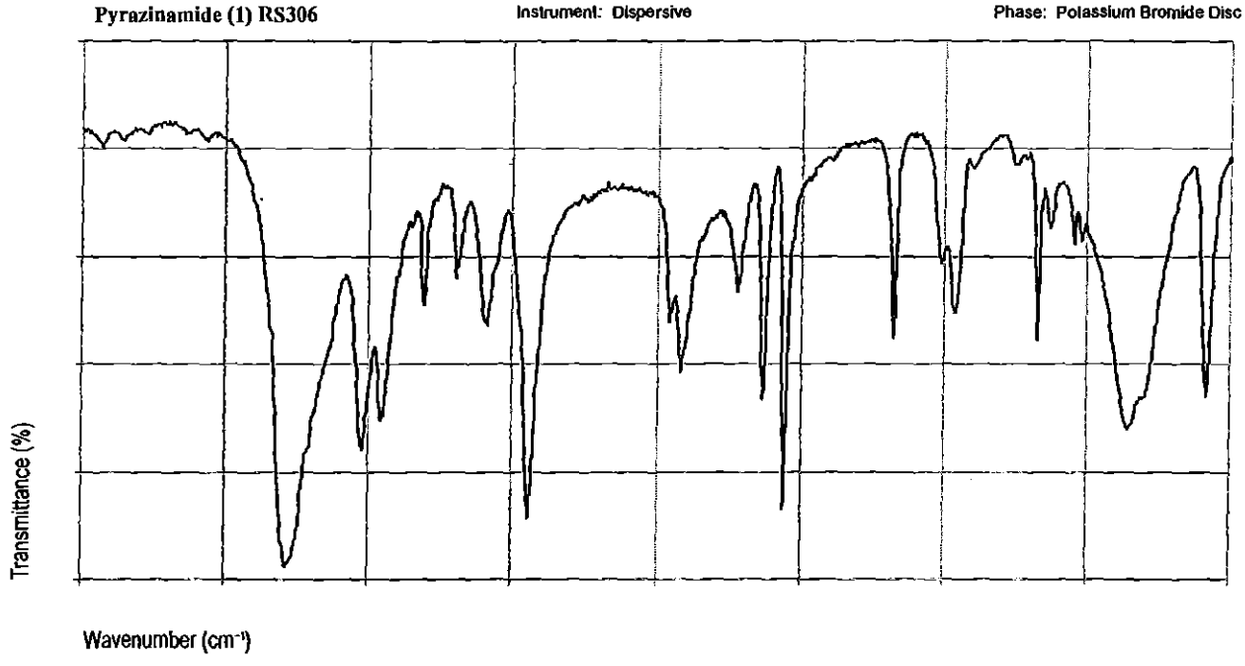


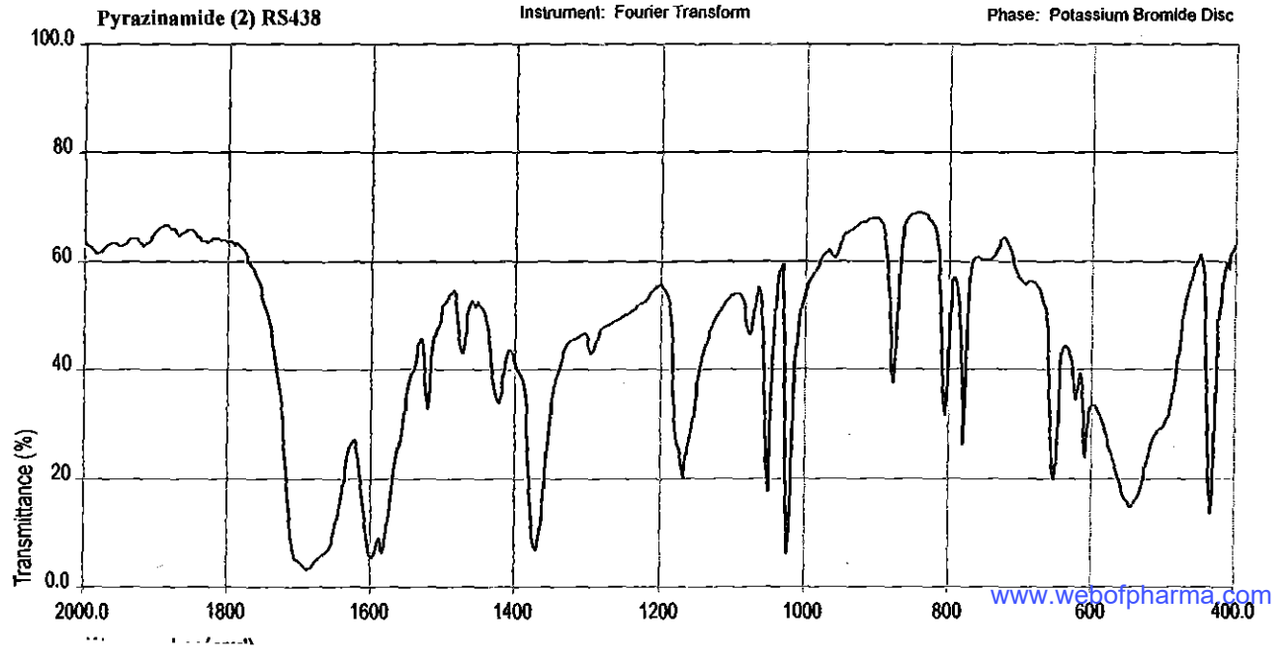


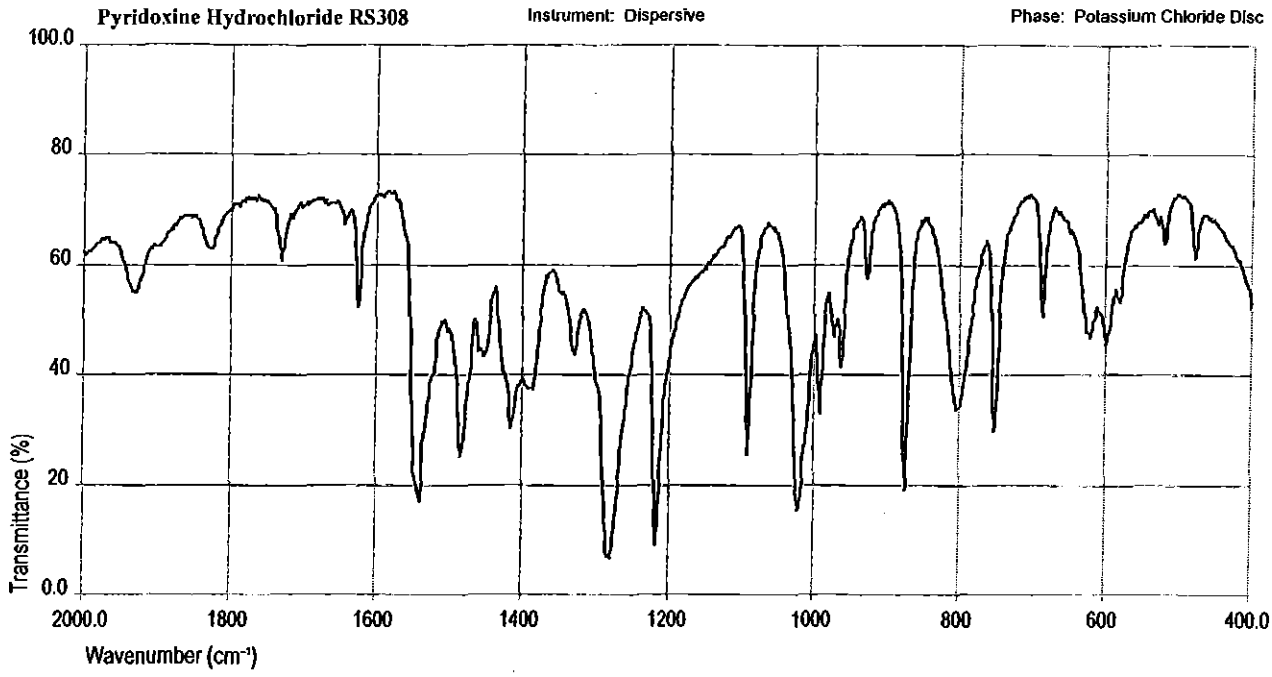


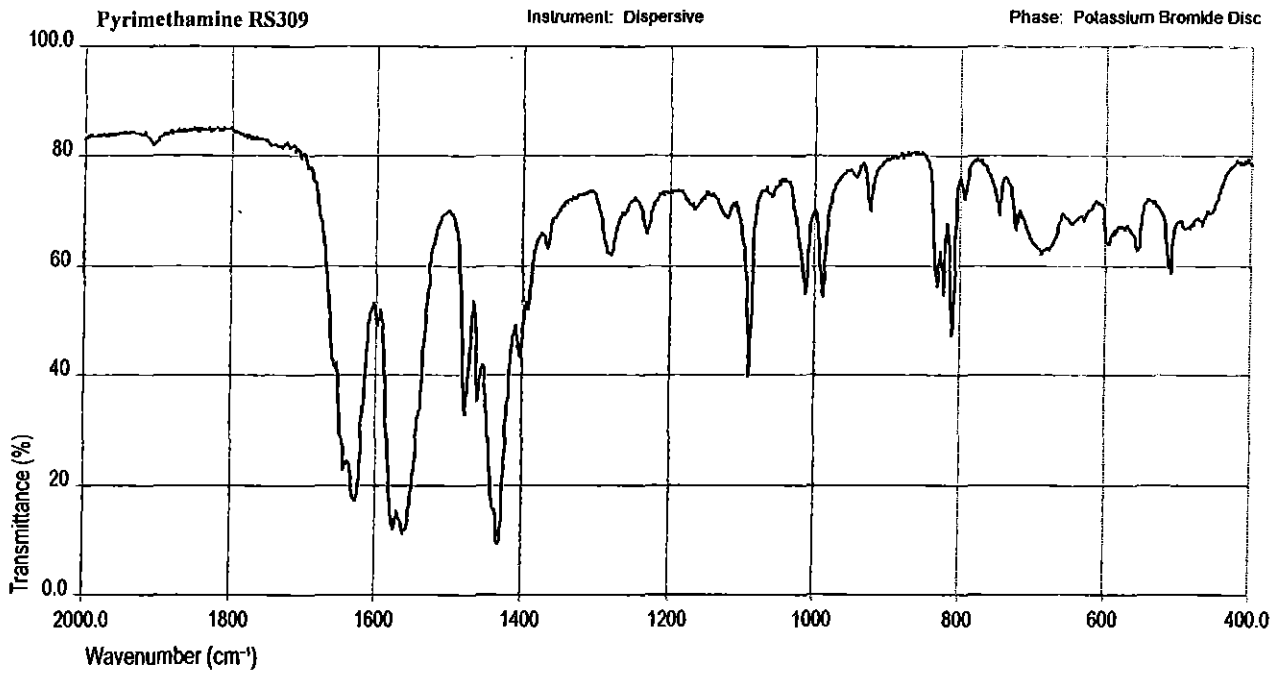


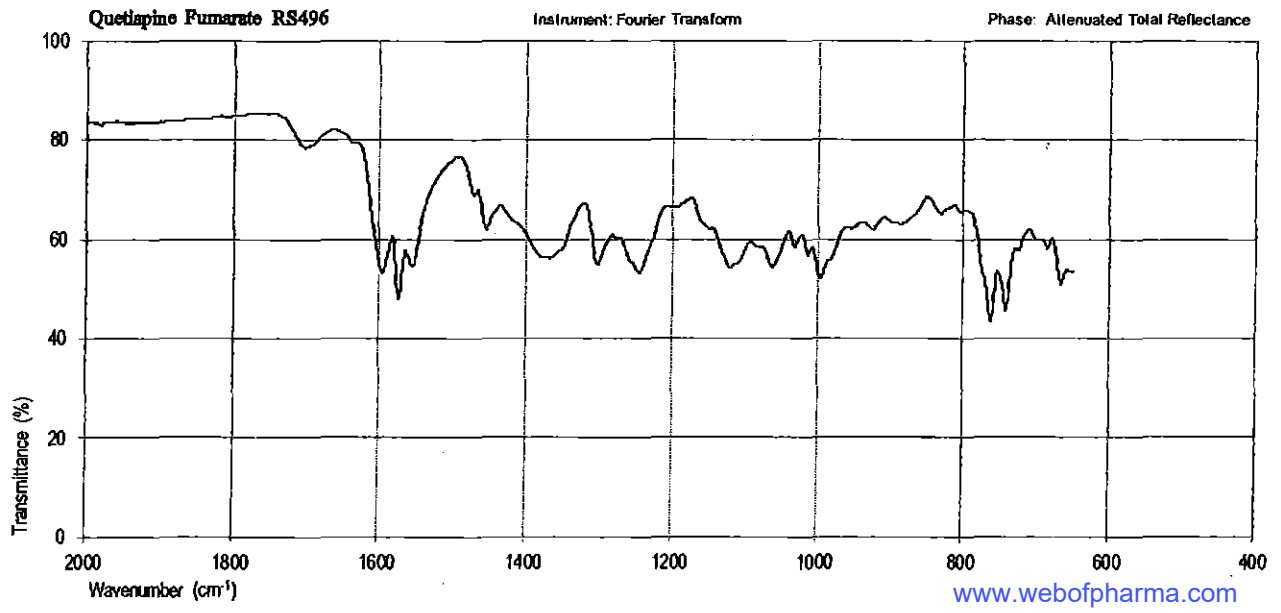


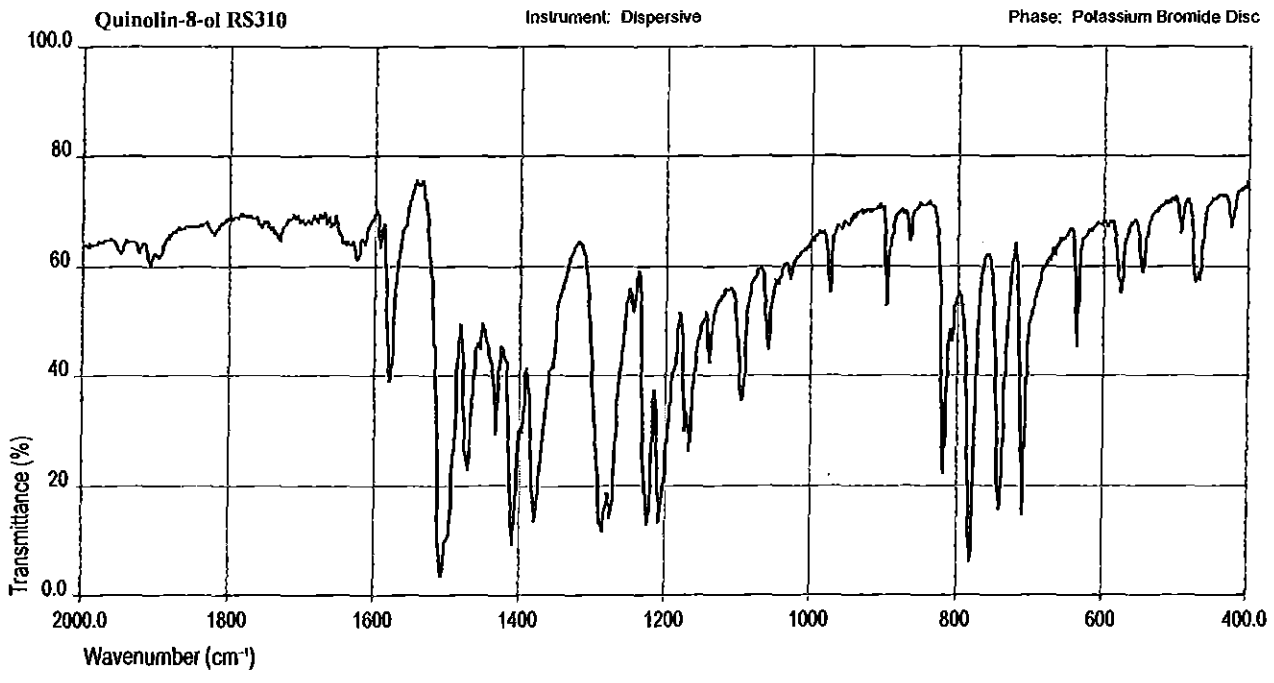


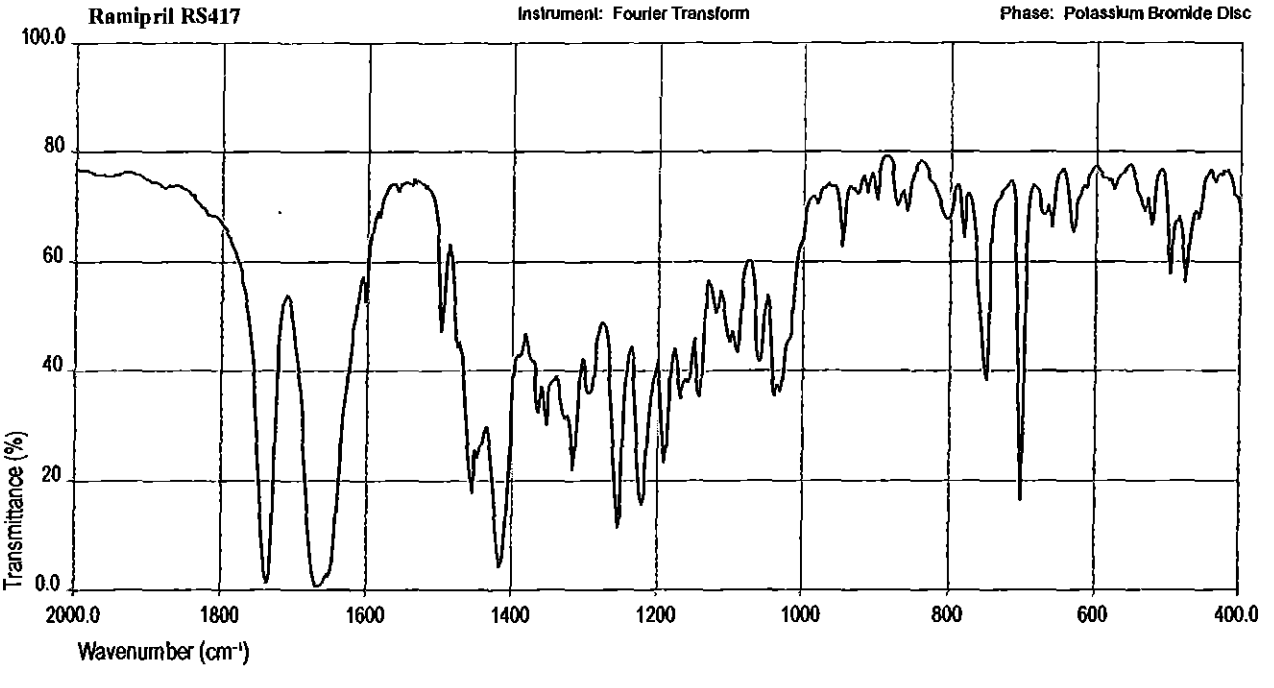


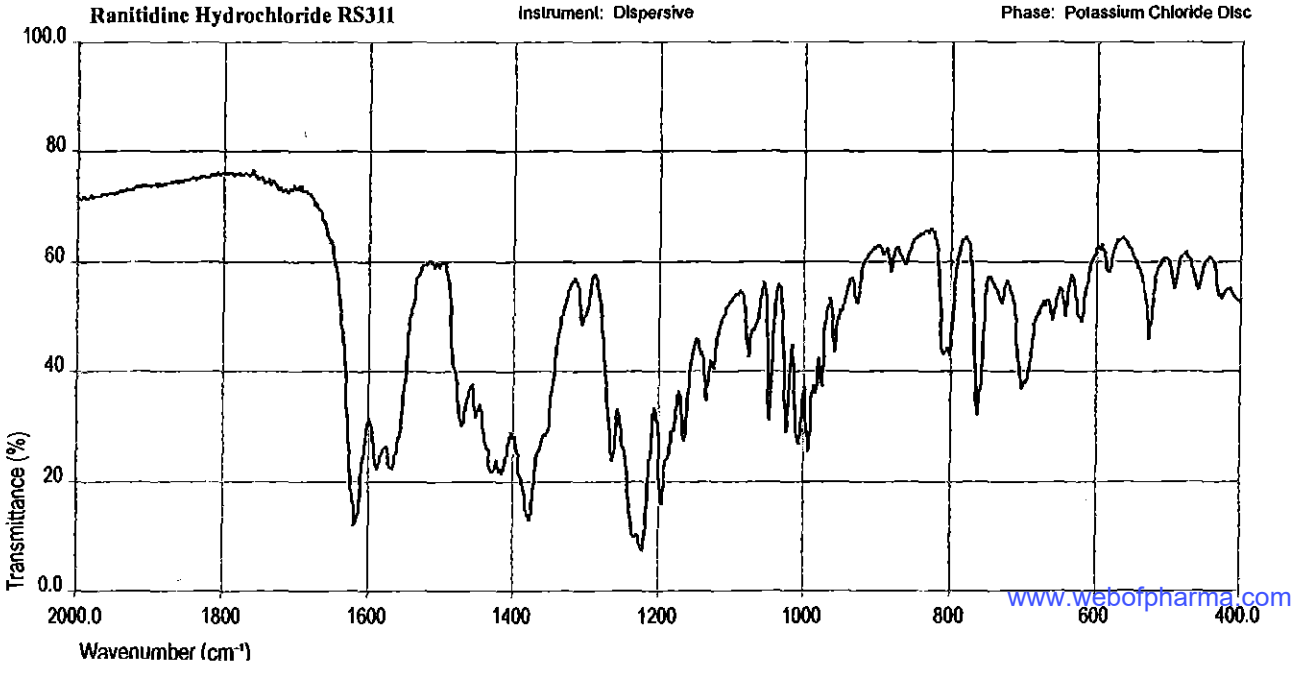








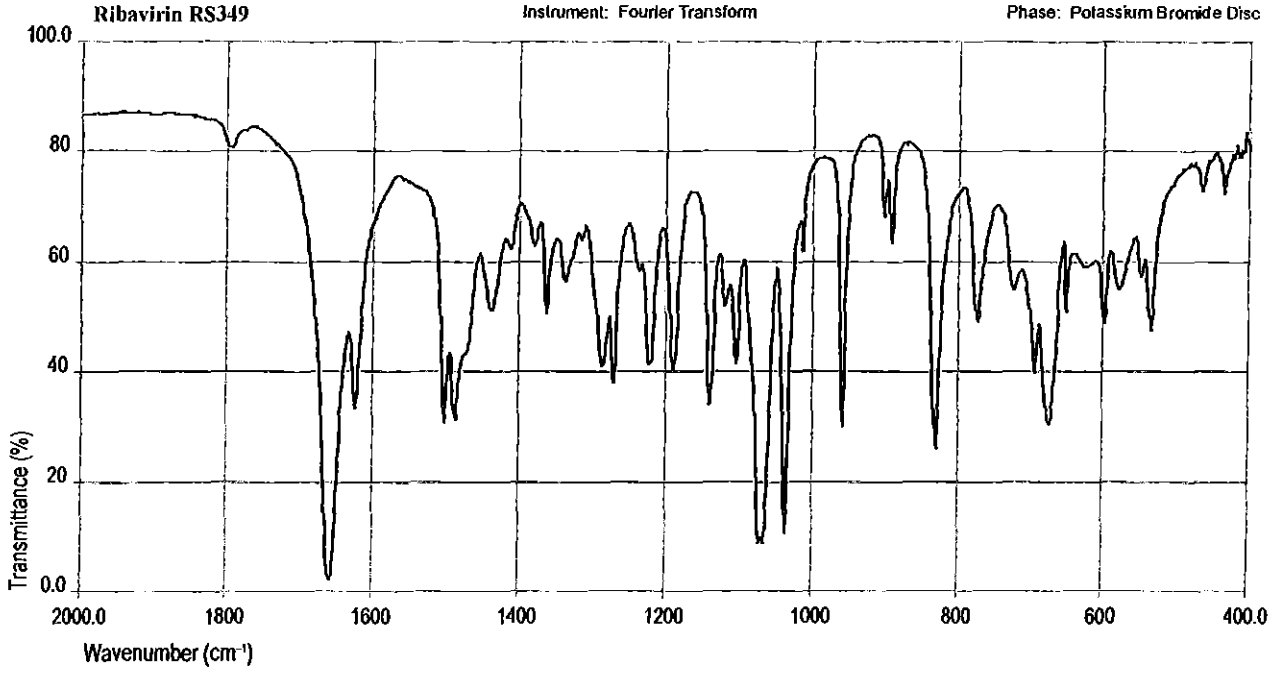




Ribavirin RS349

Instrument: Fourier Transform

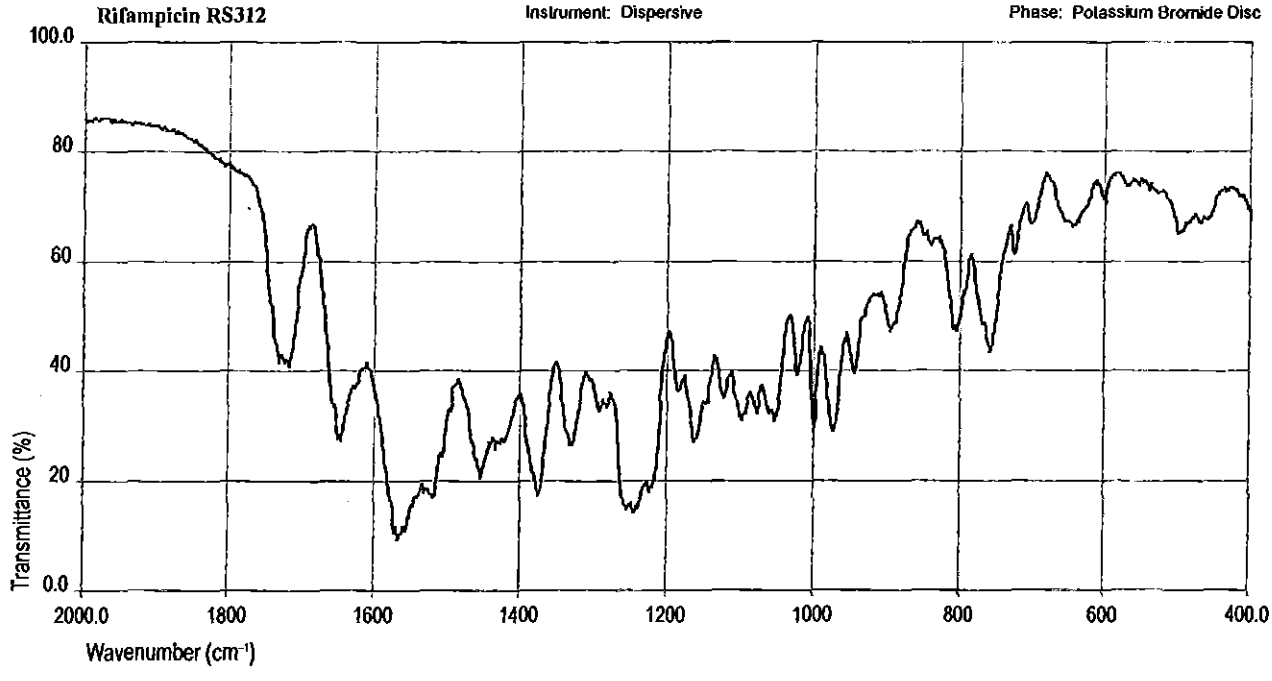
Phase: Potassium Bromide Disc



Rifampicin RS312

Instrument: Dispersive

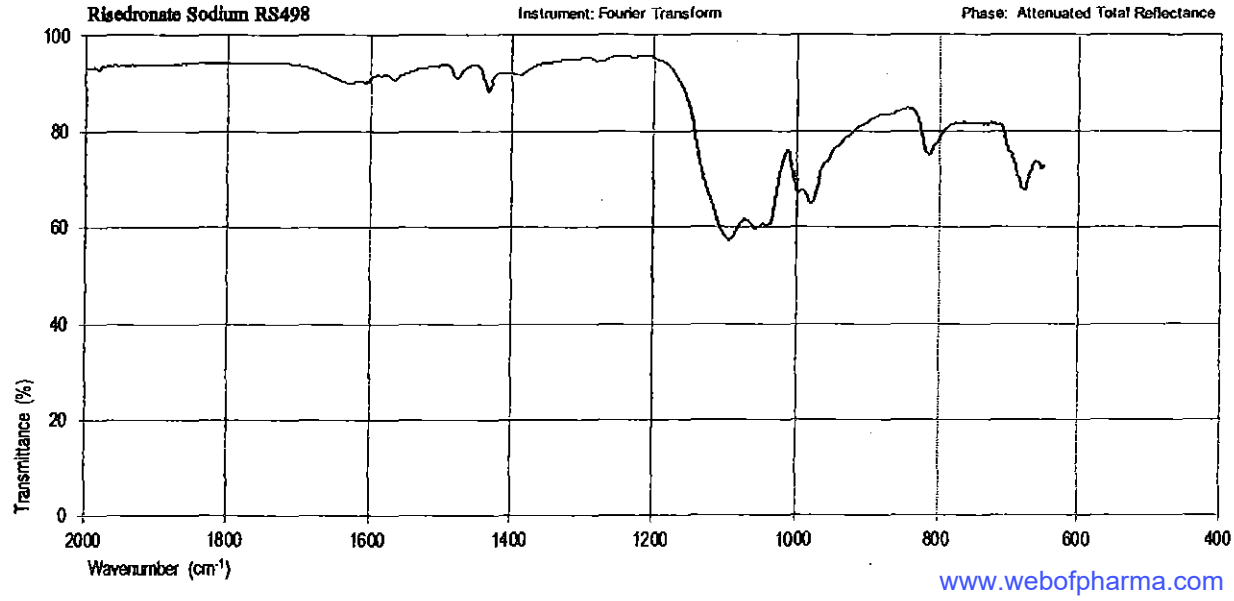
Phase: Potassium Bromide Disc

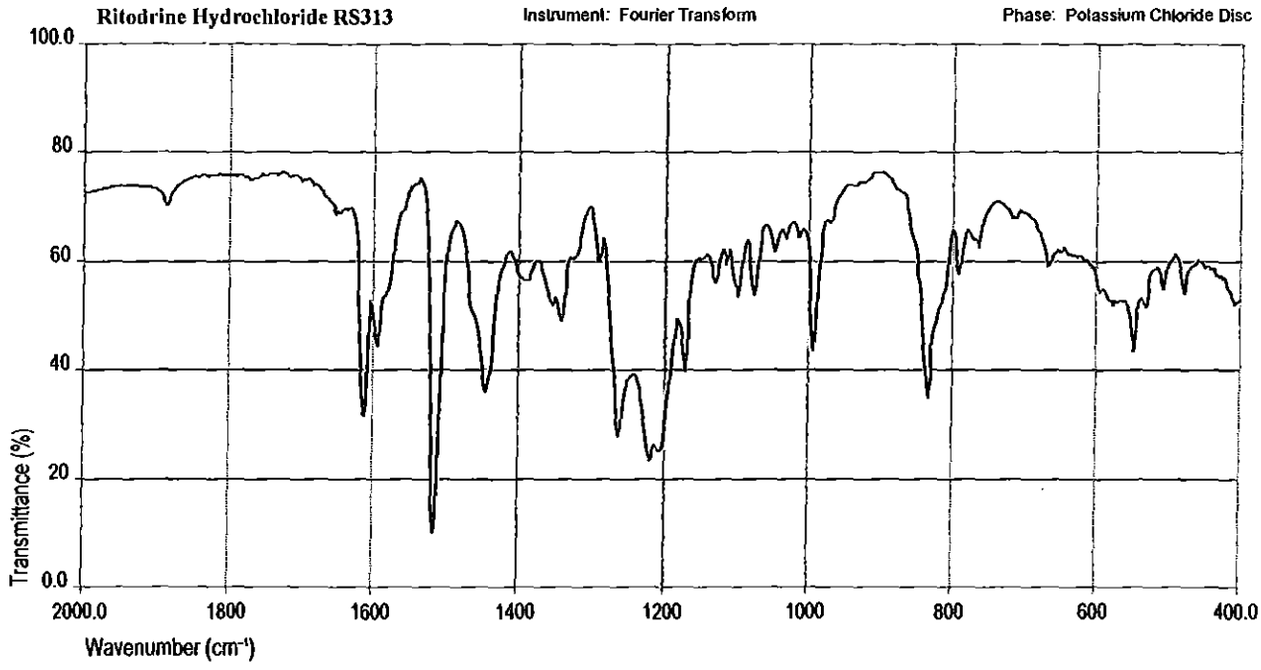


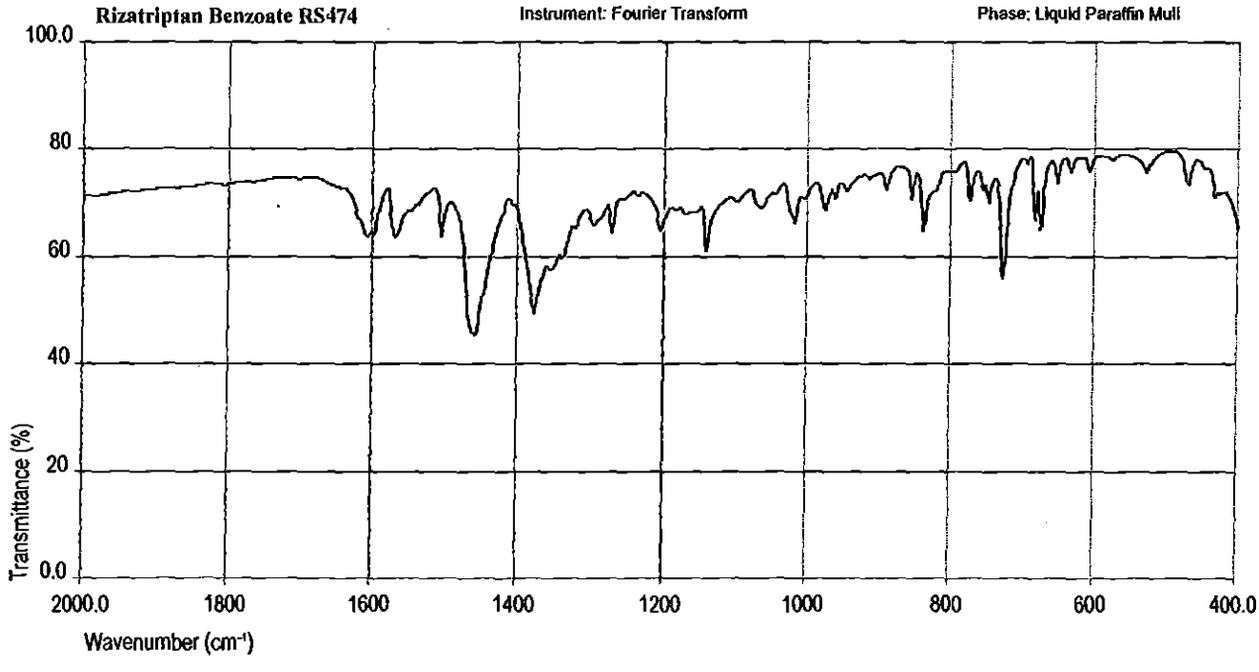
Risedronate Sodium RS498

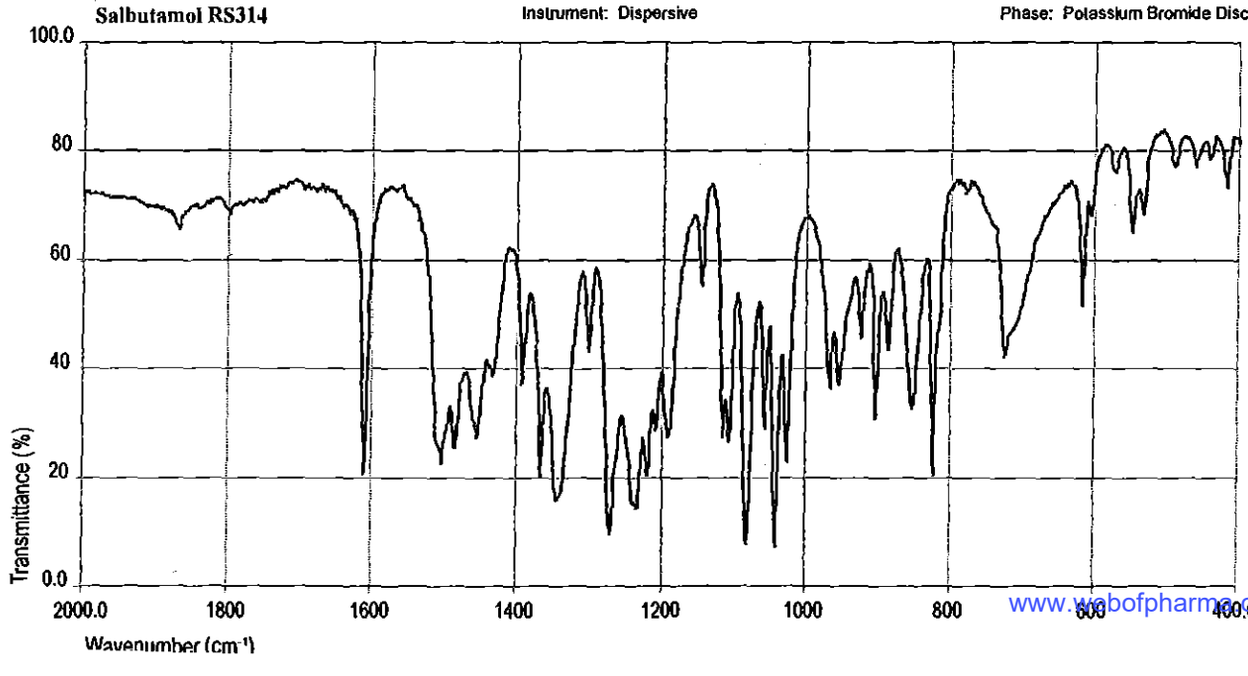
Instrument: Fourier Transform

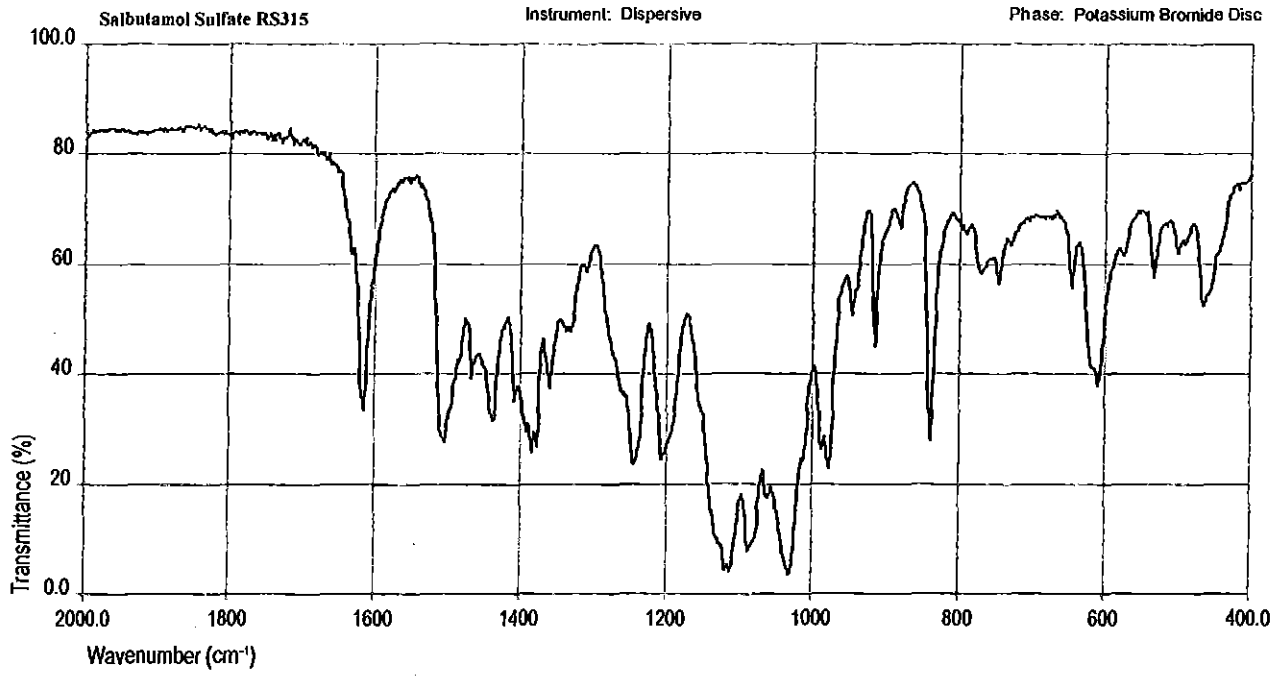
Phase: Attenuated Total Reflectance

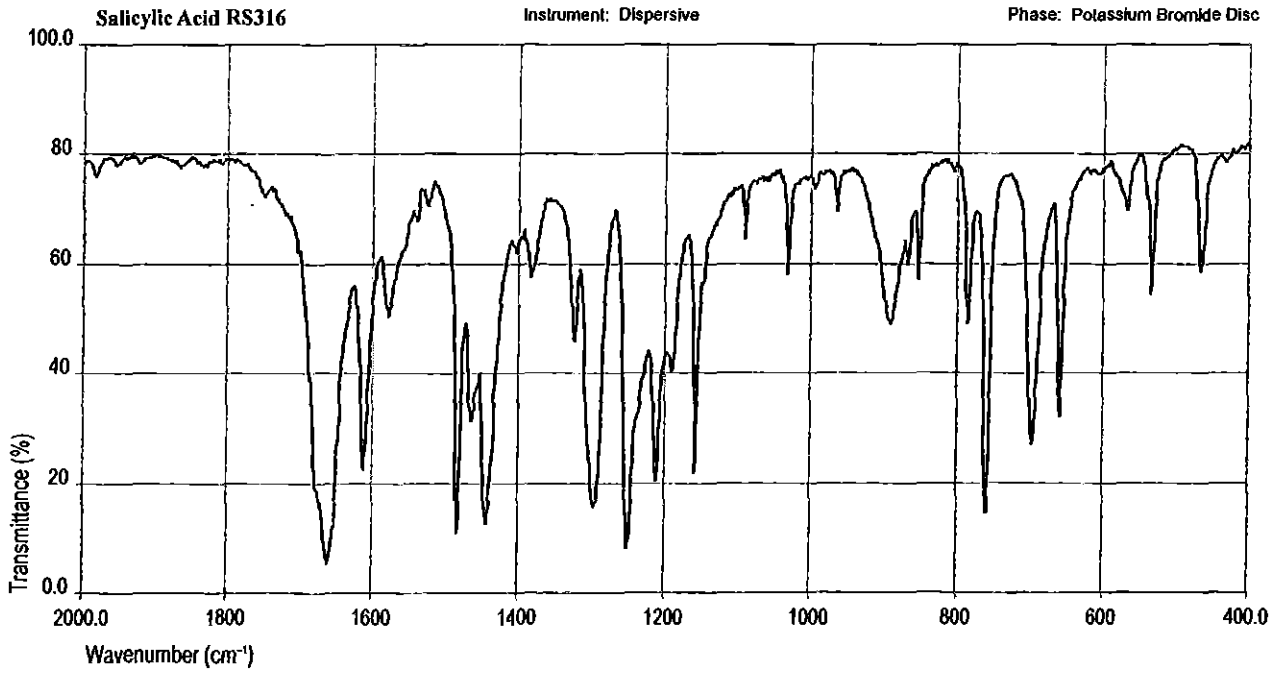


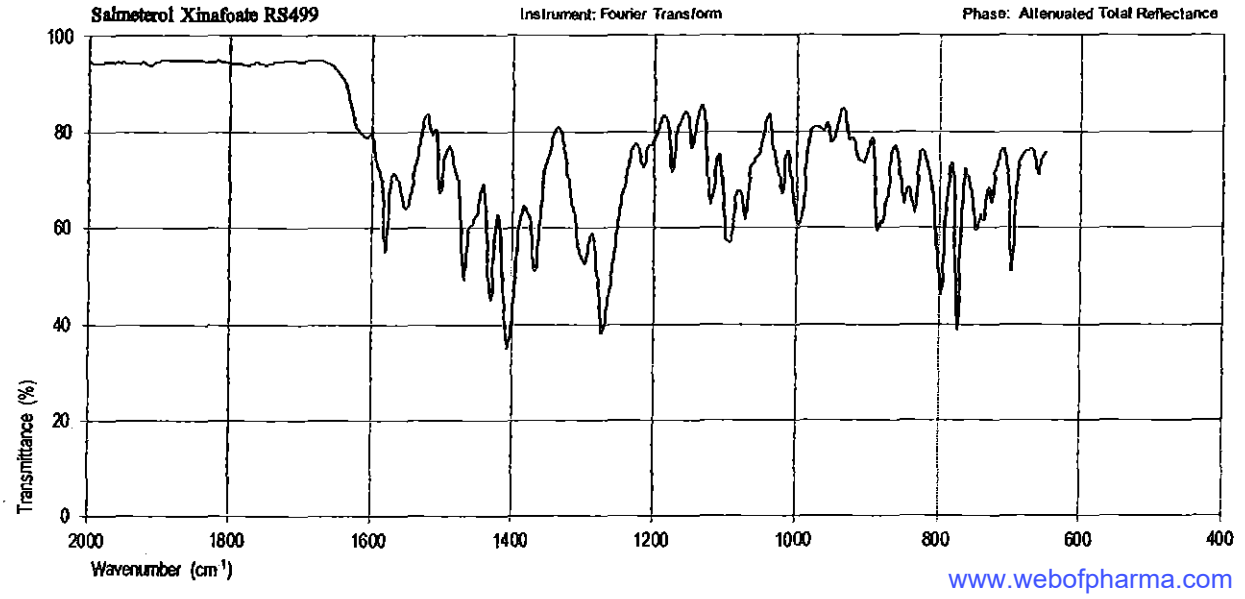


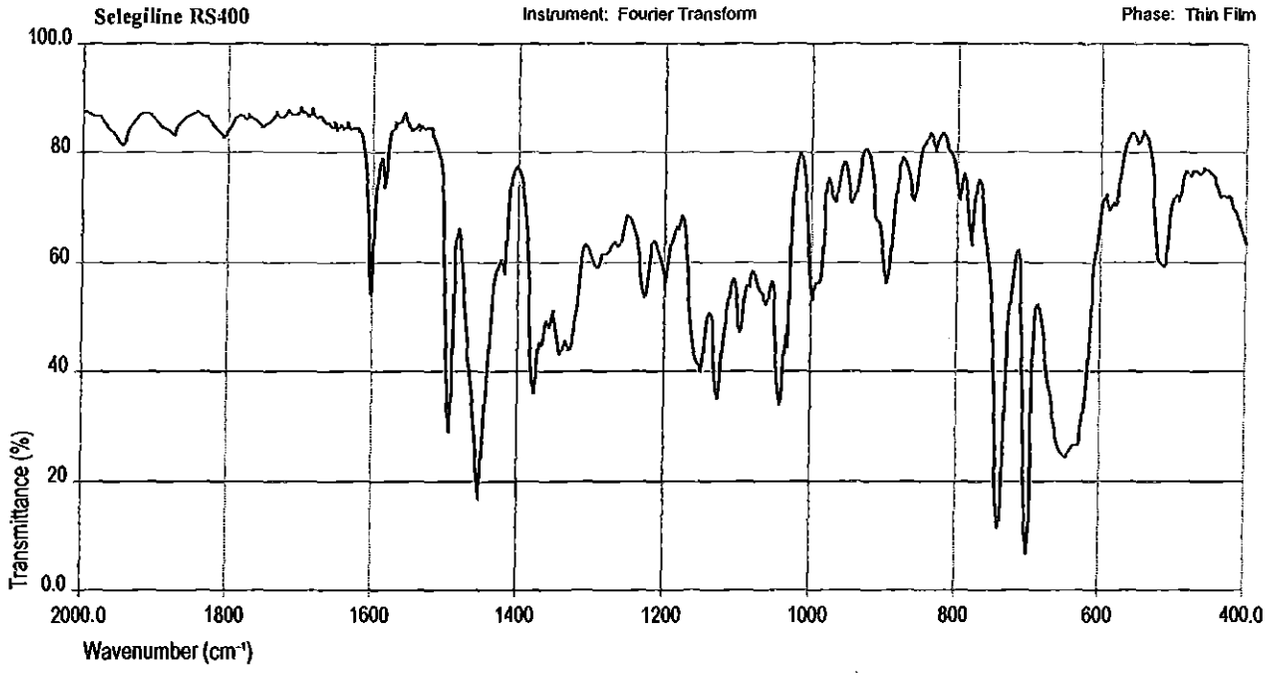


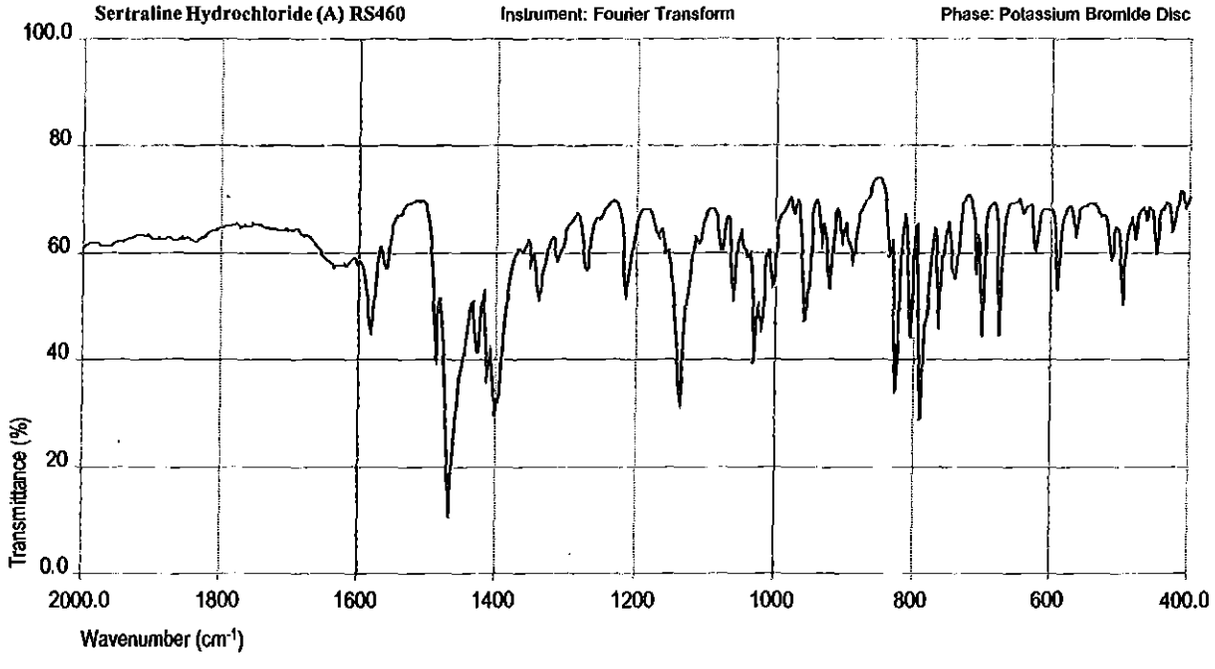


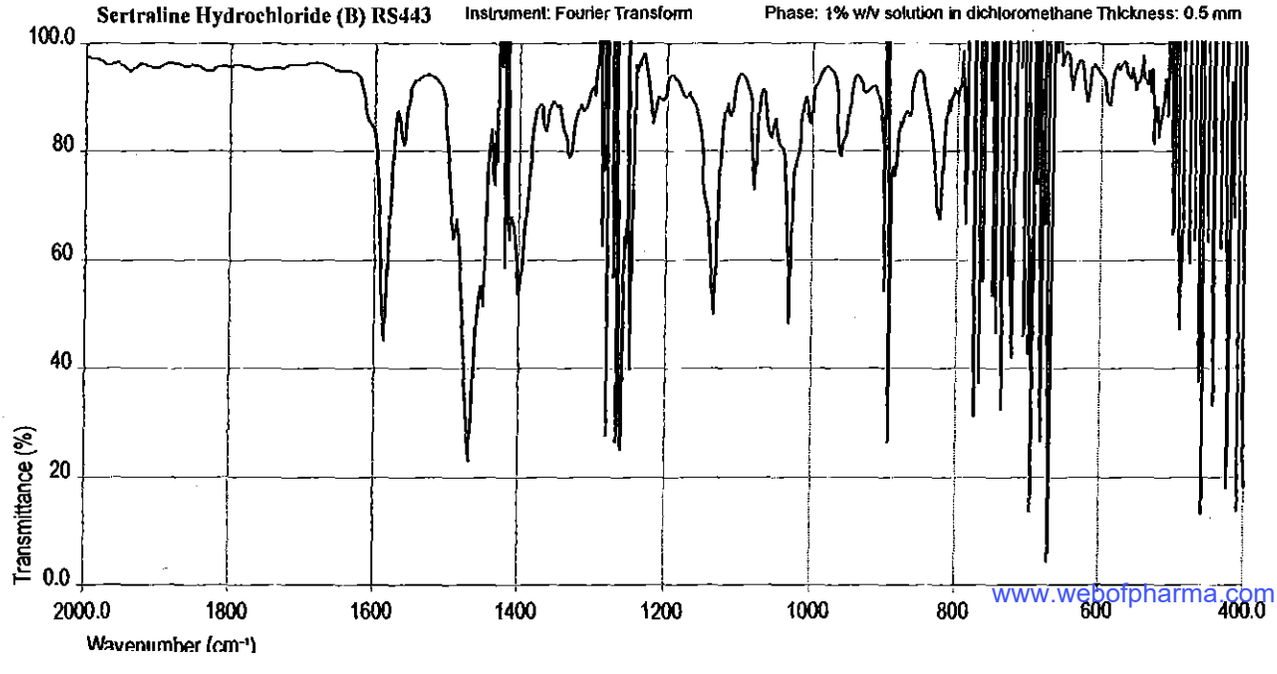


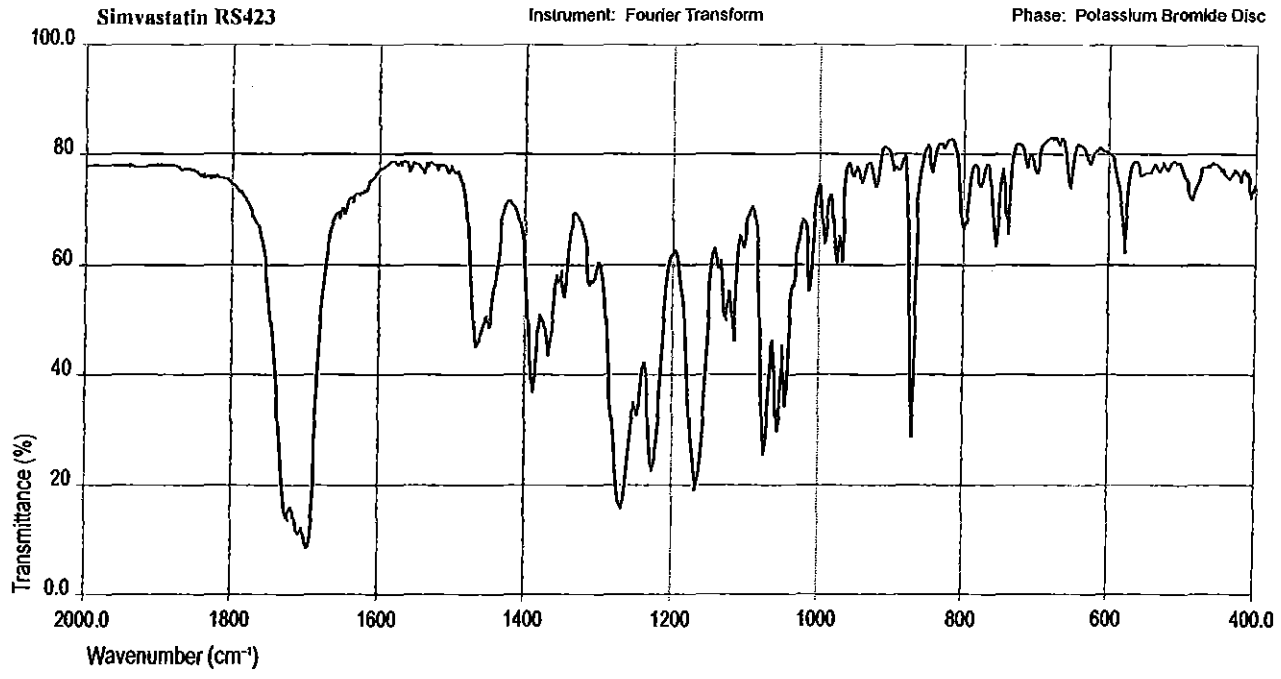


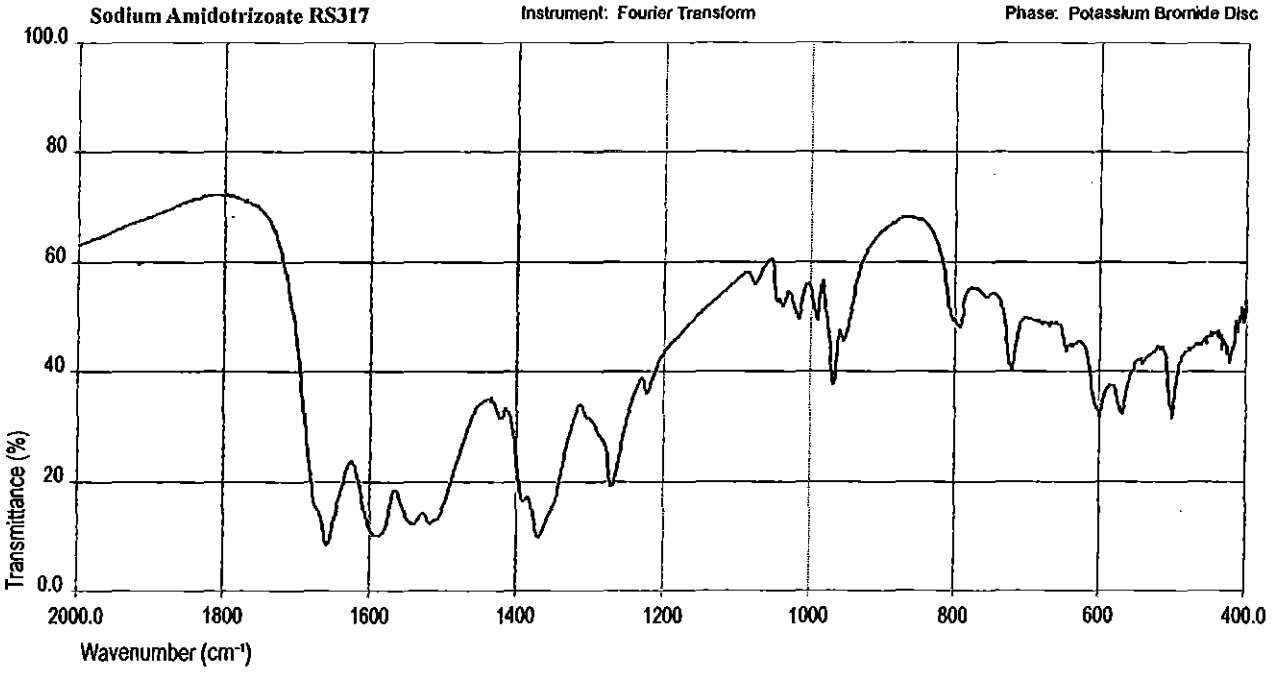


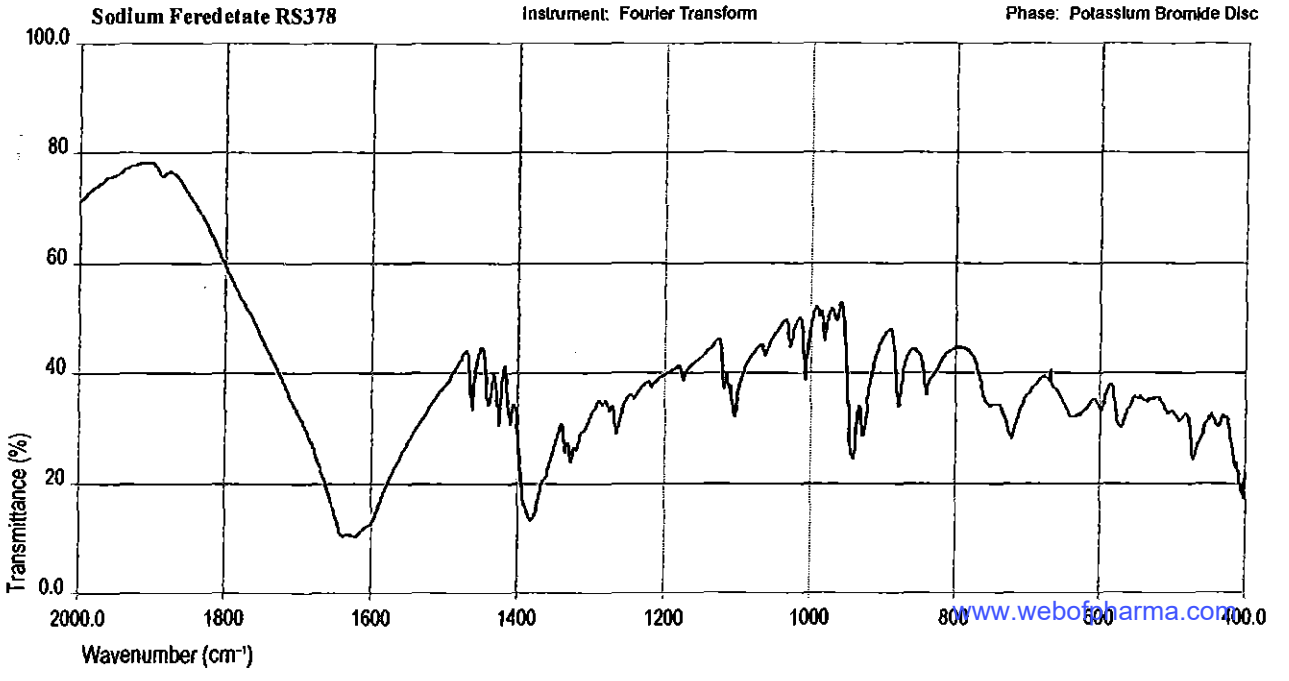




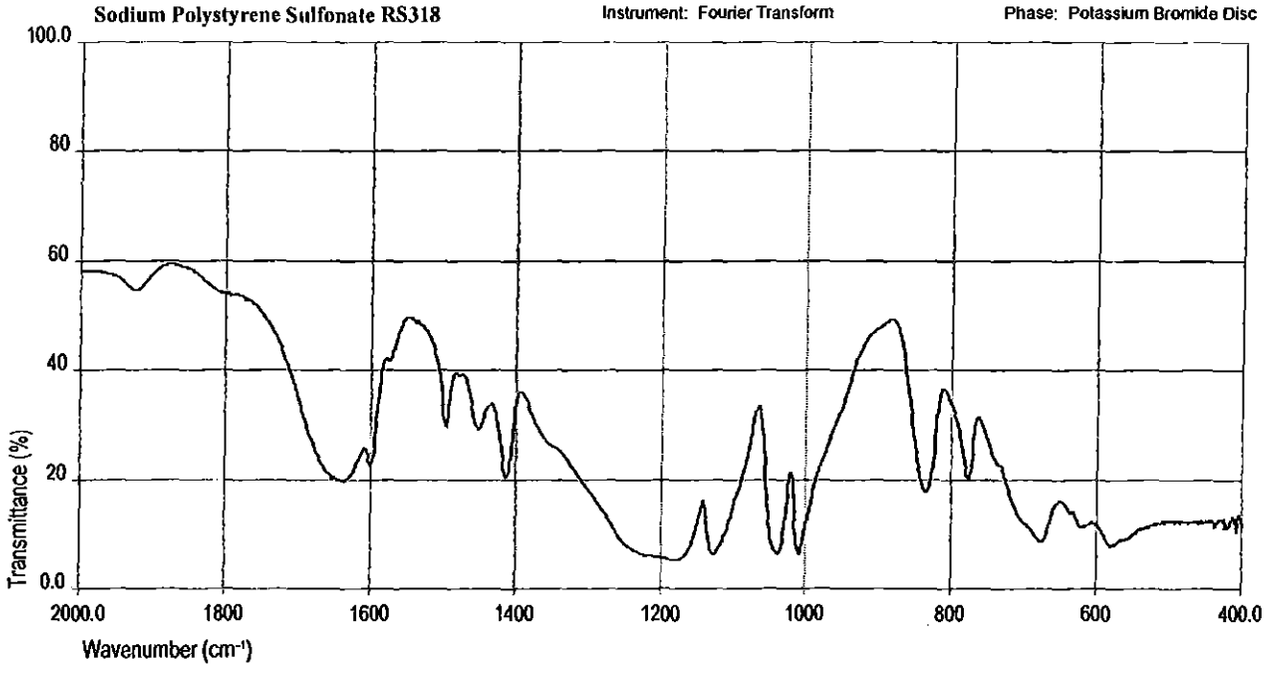




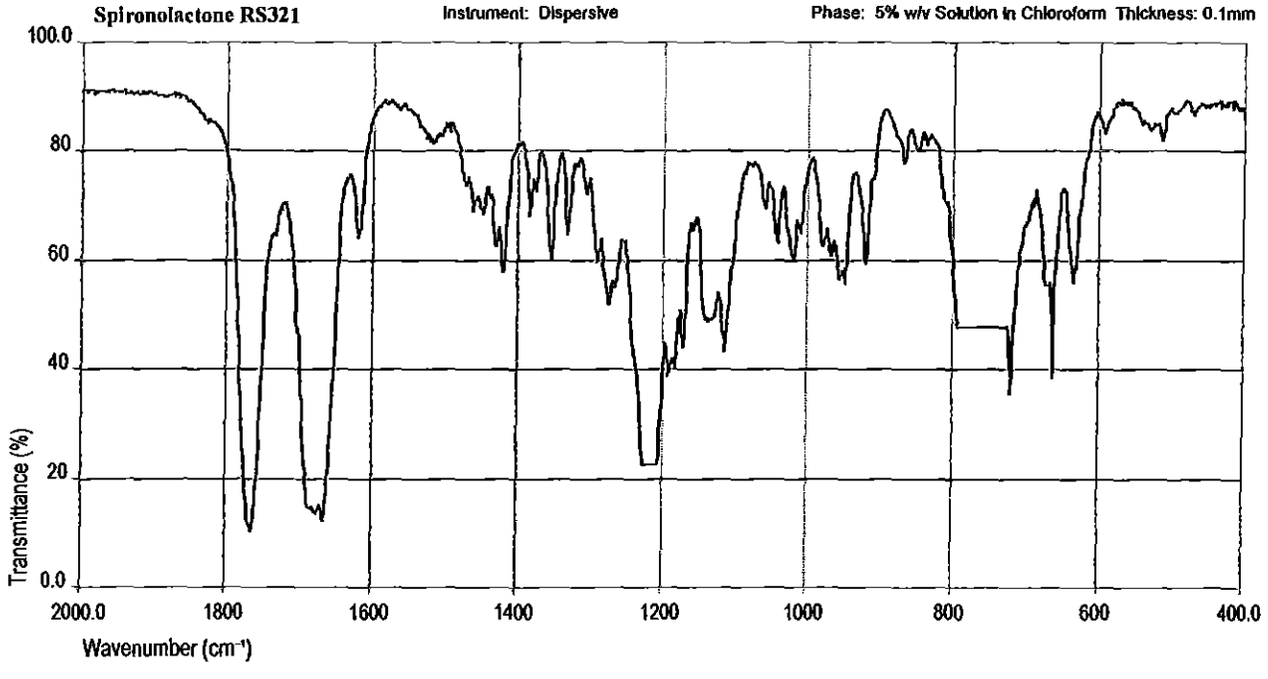




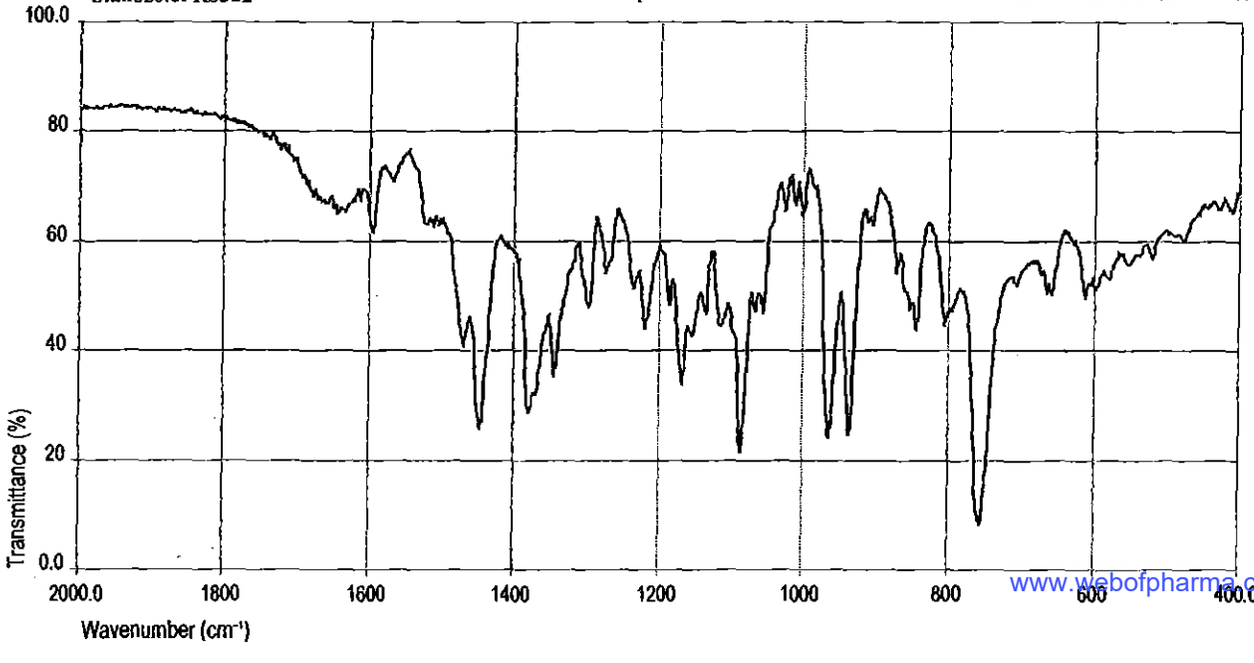
Sodium Polystyrene Sulfonate RS318 Instrument: Fourier Transform Phase: Potassium Bromide Disc

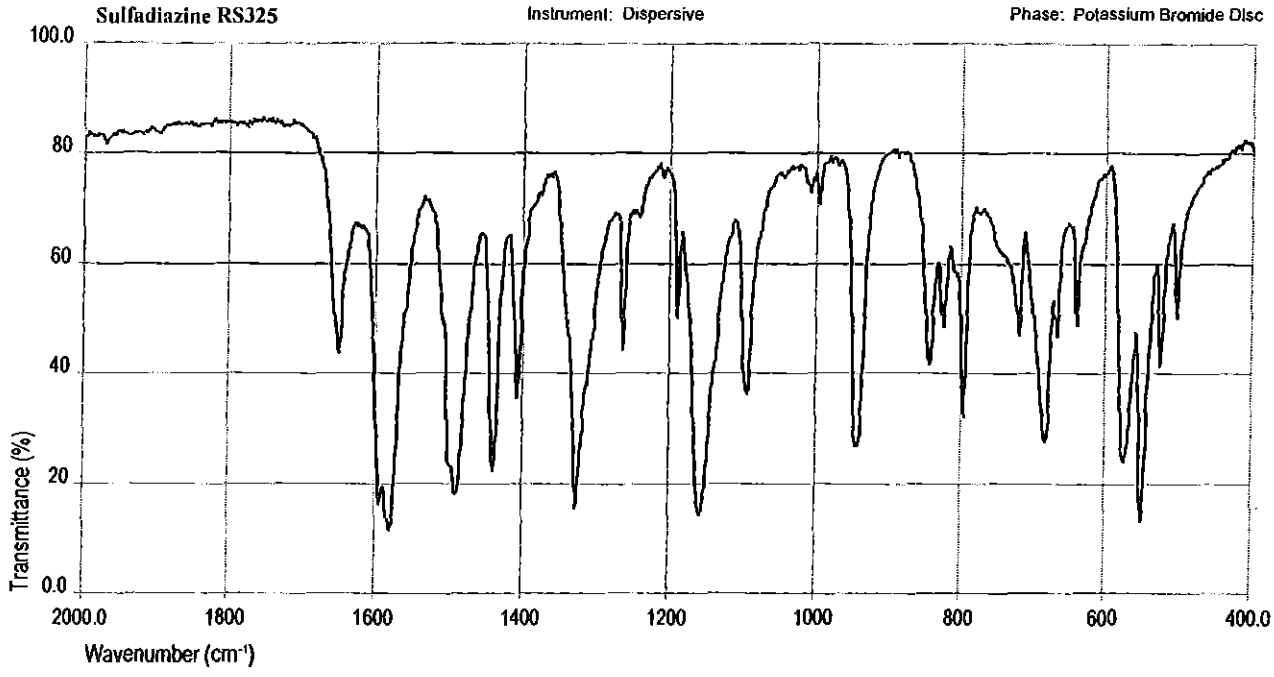


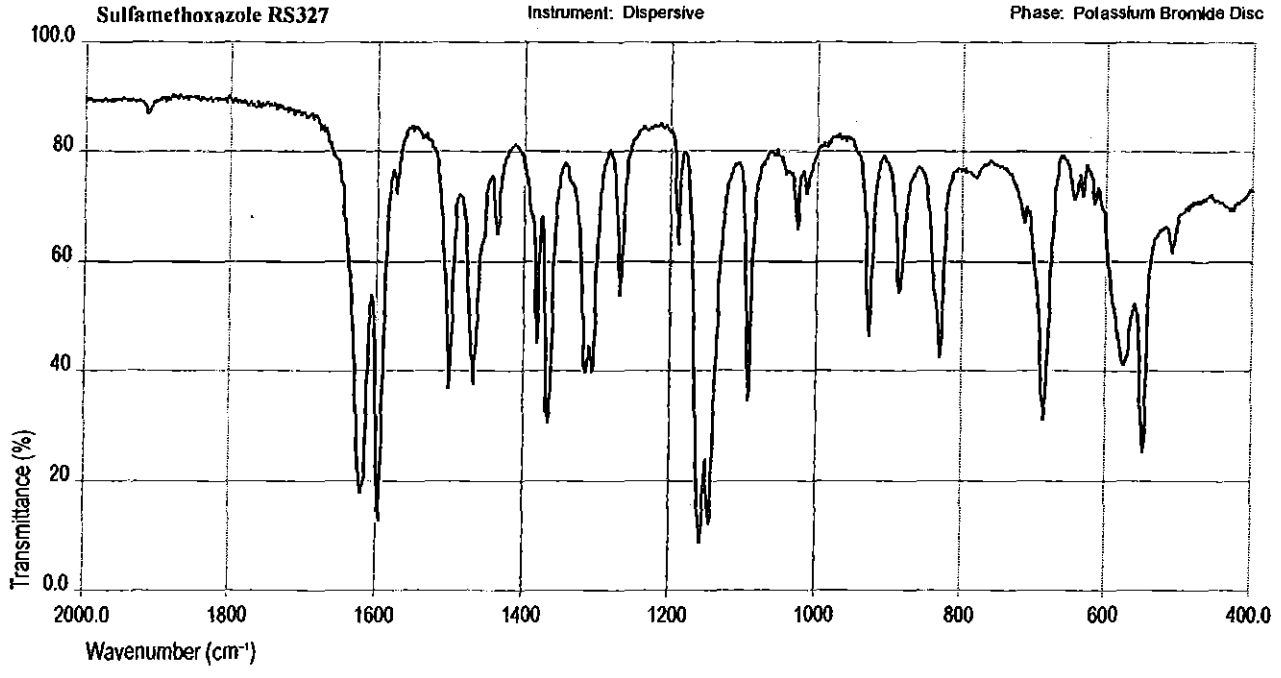
Spironolactone RS321 Instrument: Dispersive Phase: 5% w/v Solution in Chloroform Thickness: 0.1mm

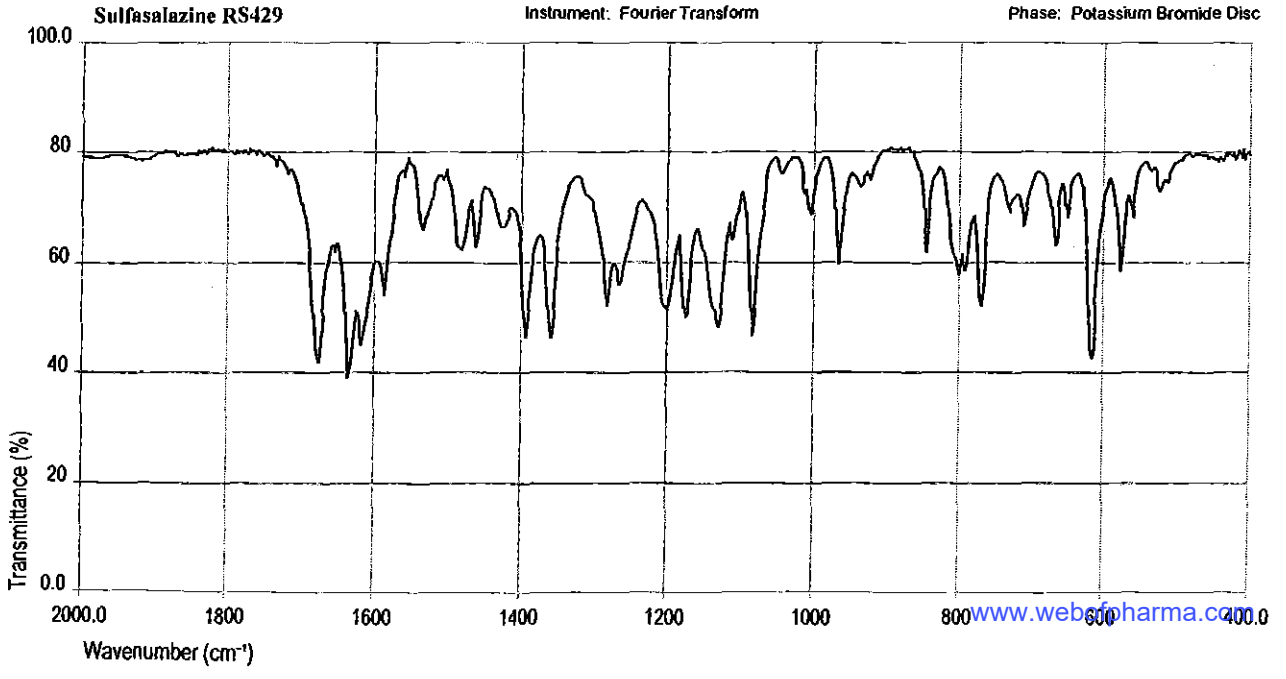


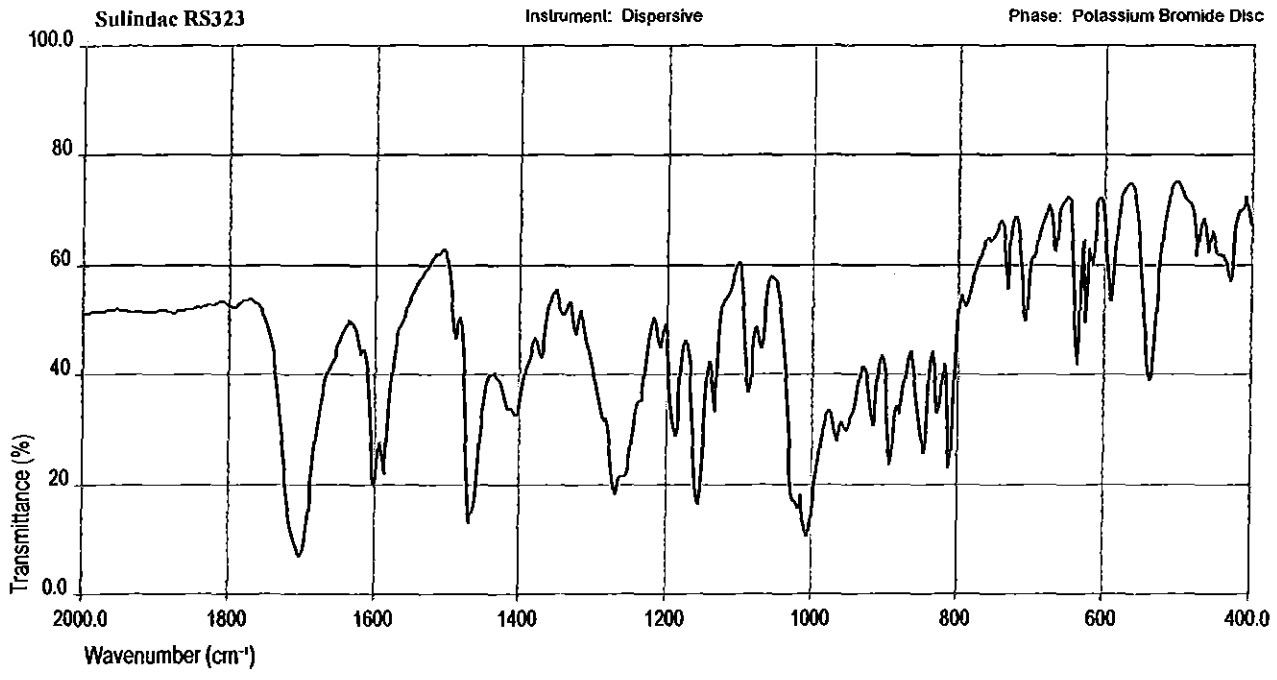
Stanozolol RS322 Instrument: Dispersive Phase: Potassium Bromide Disc

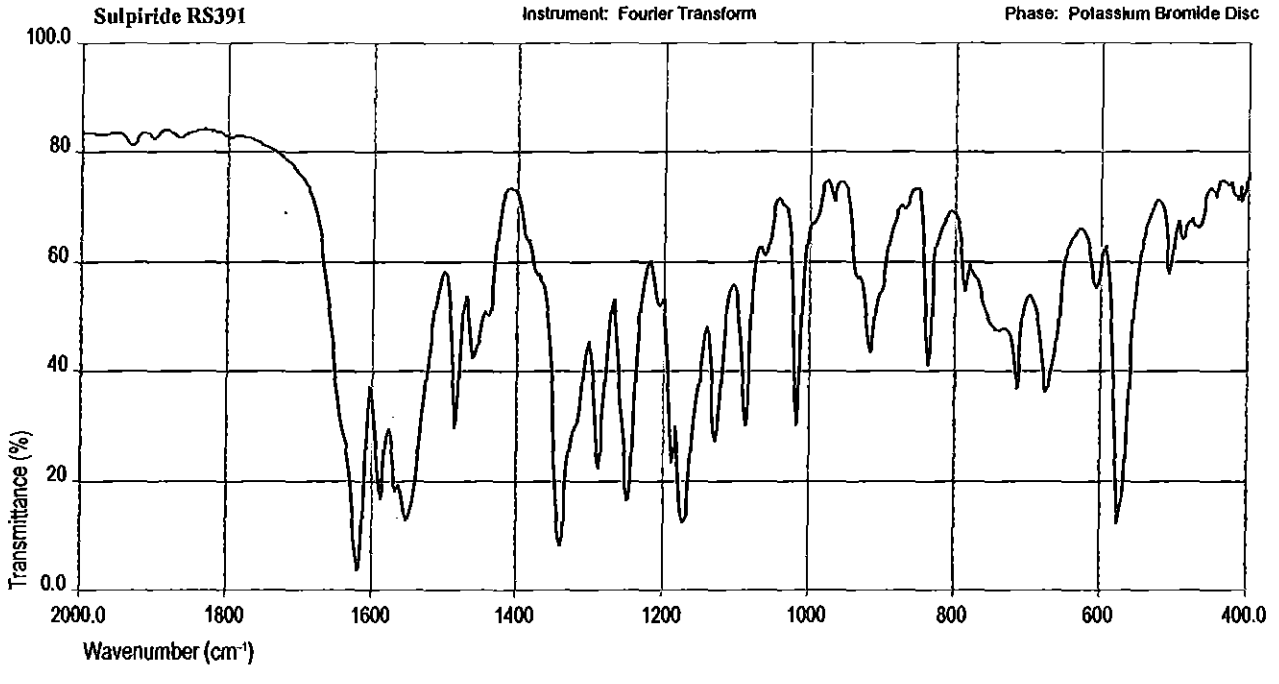


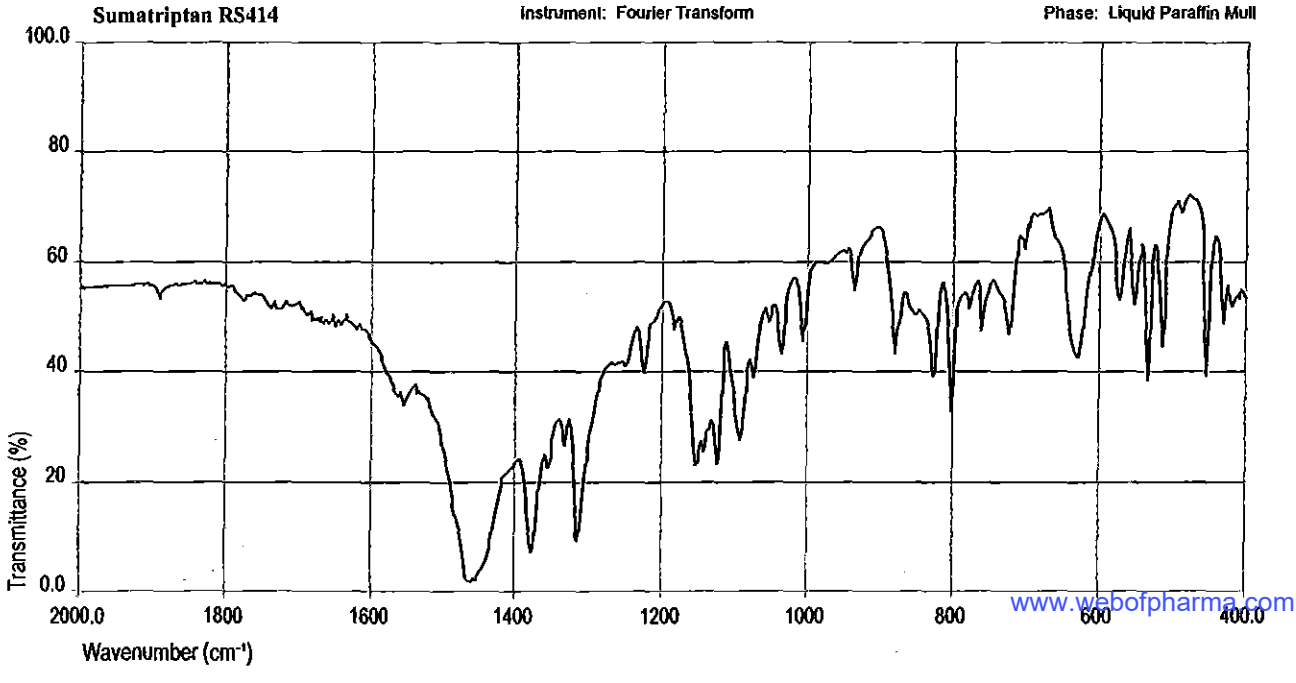


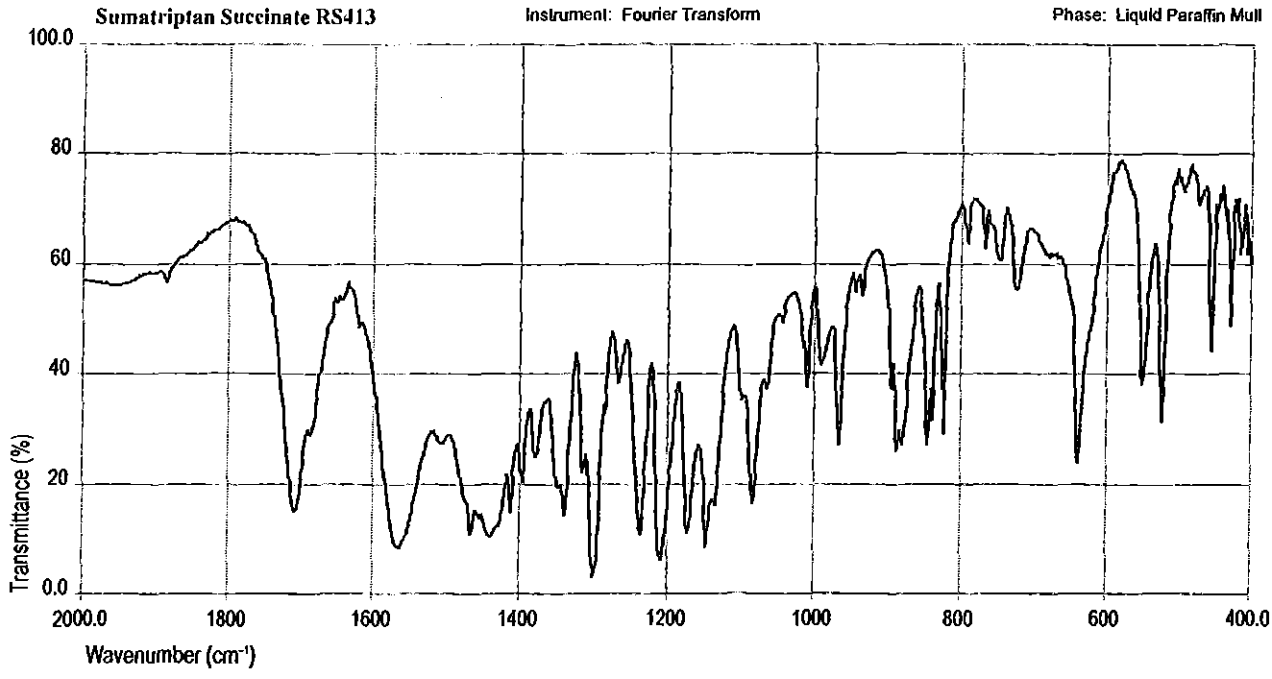


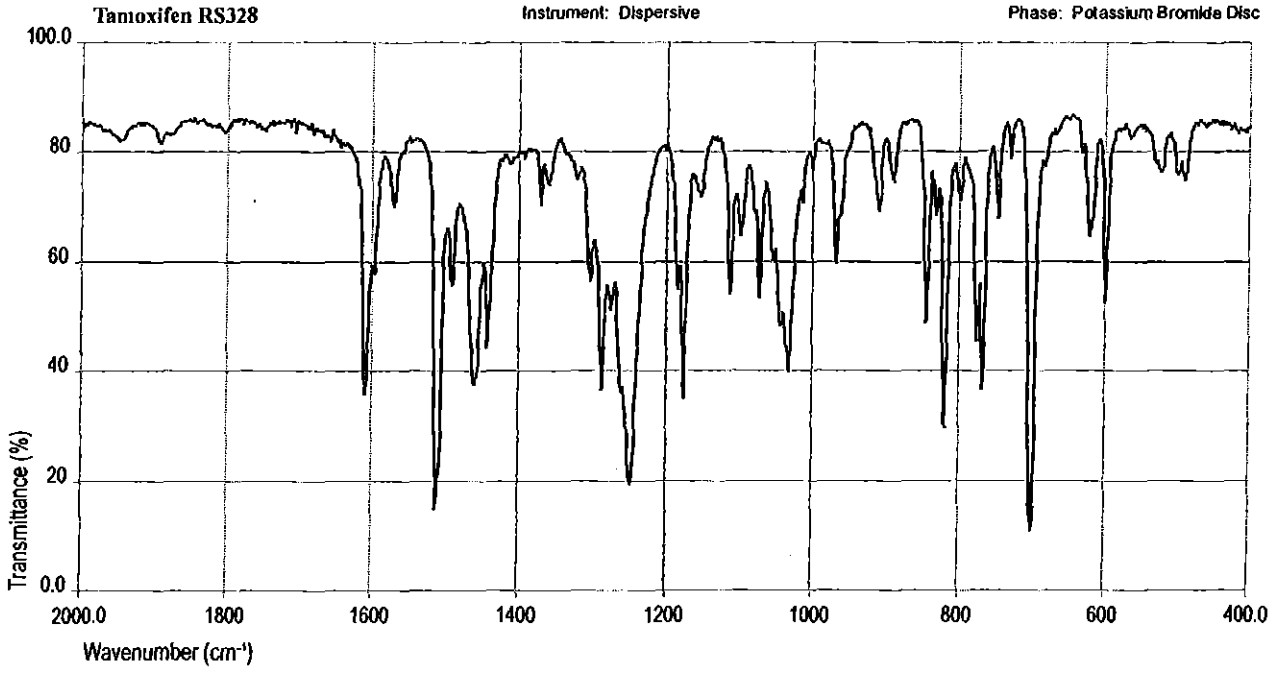


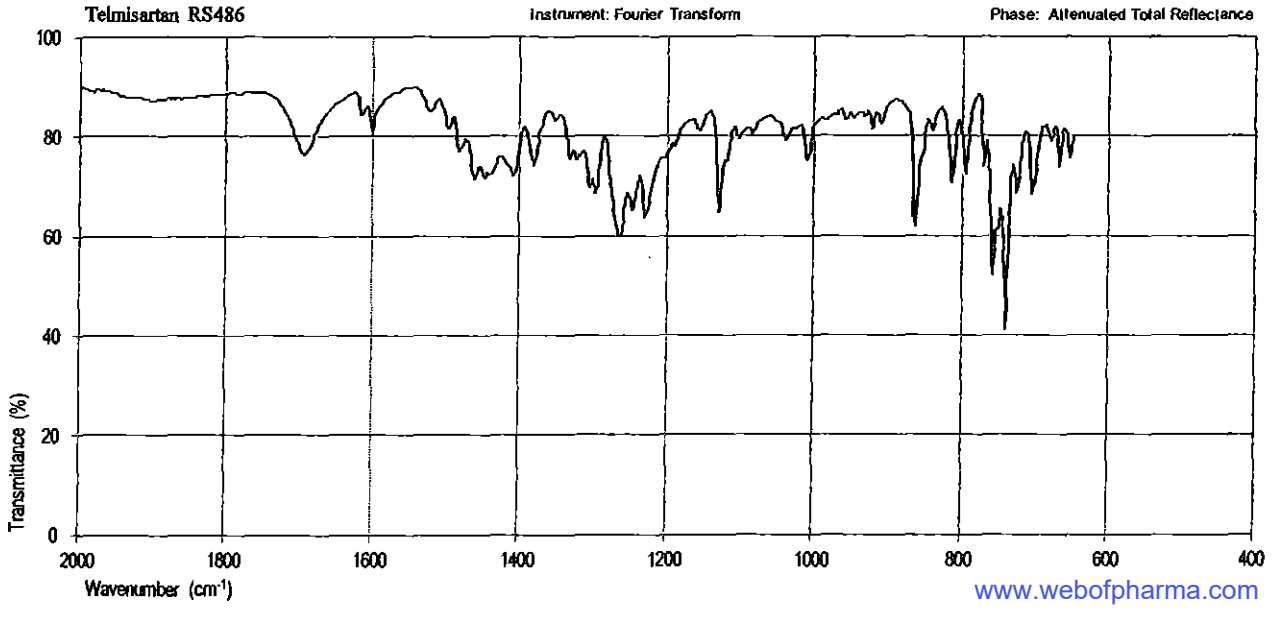


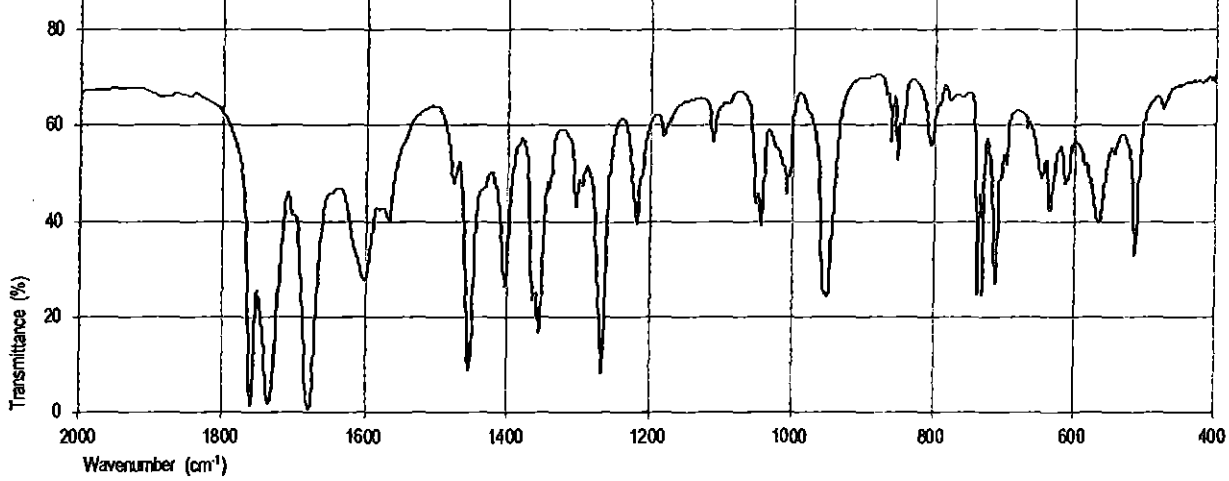


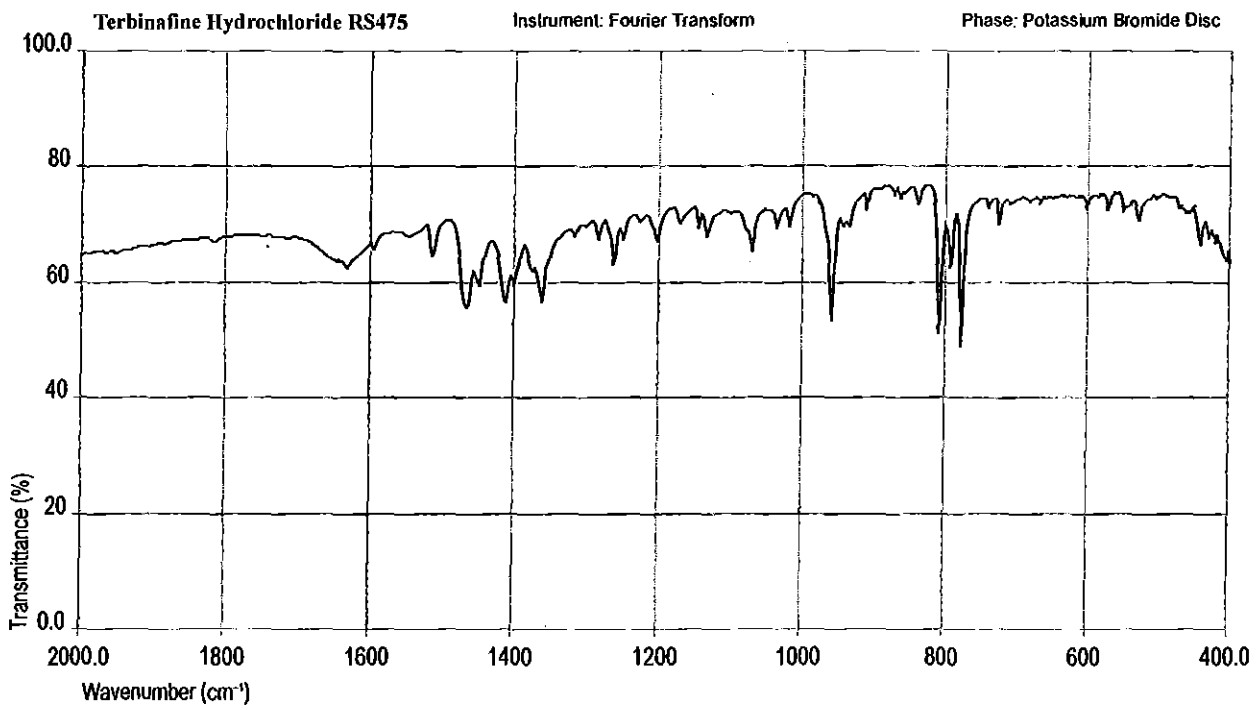


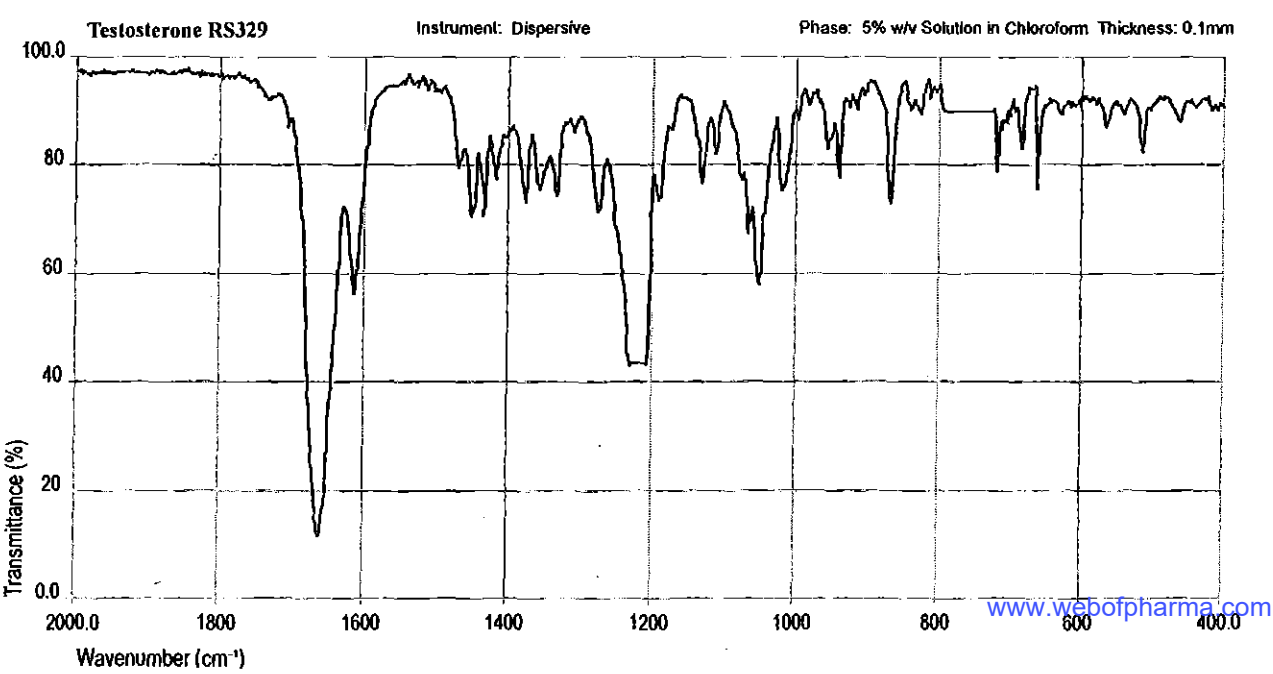


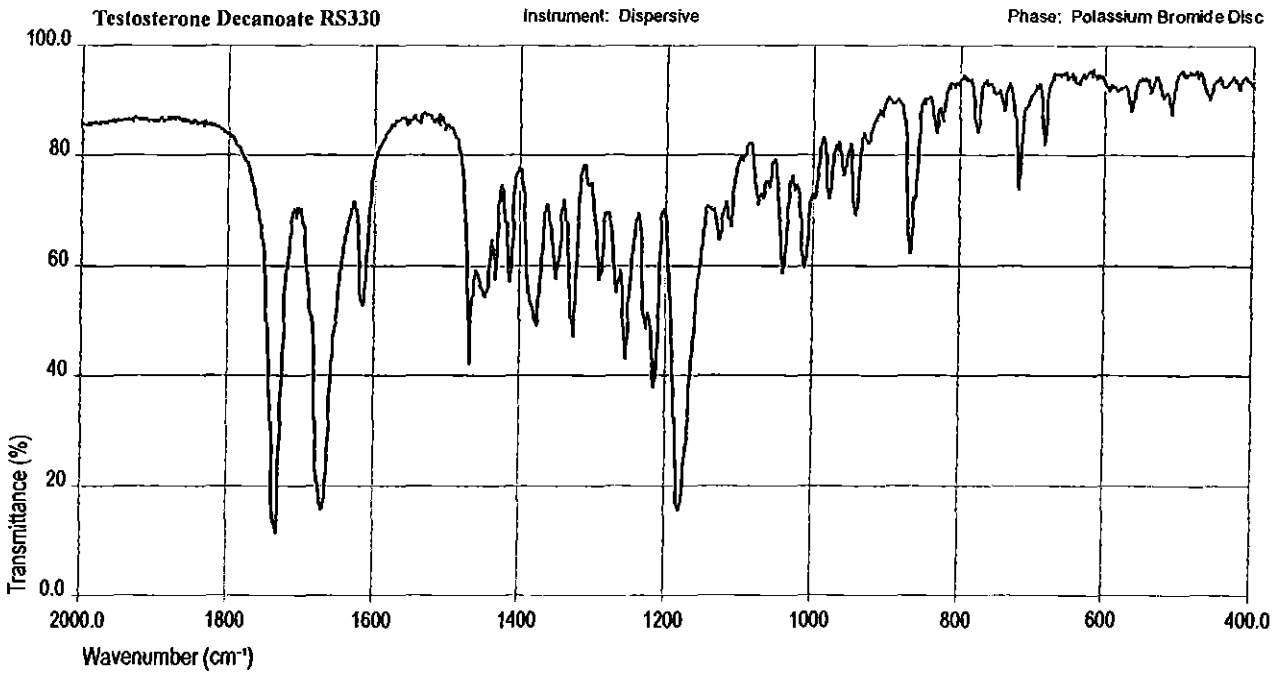


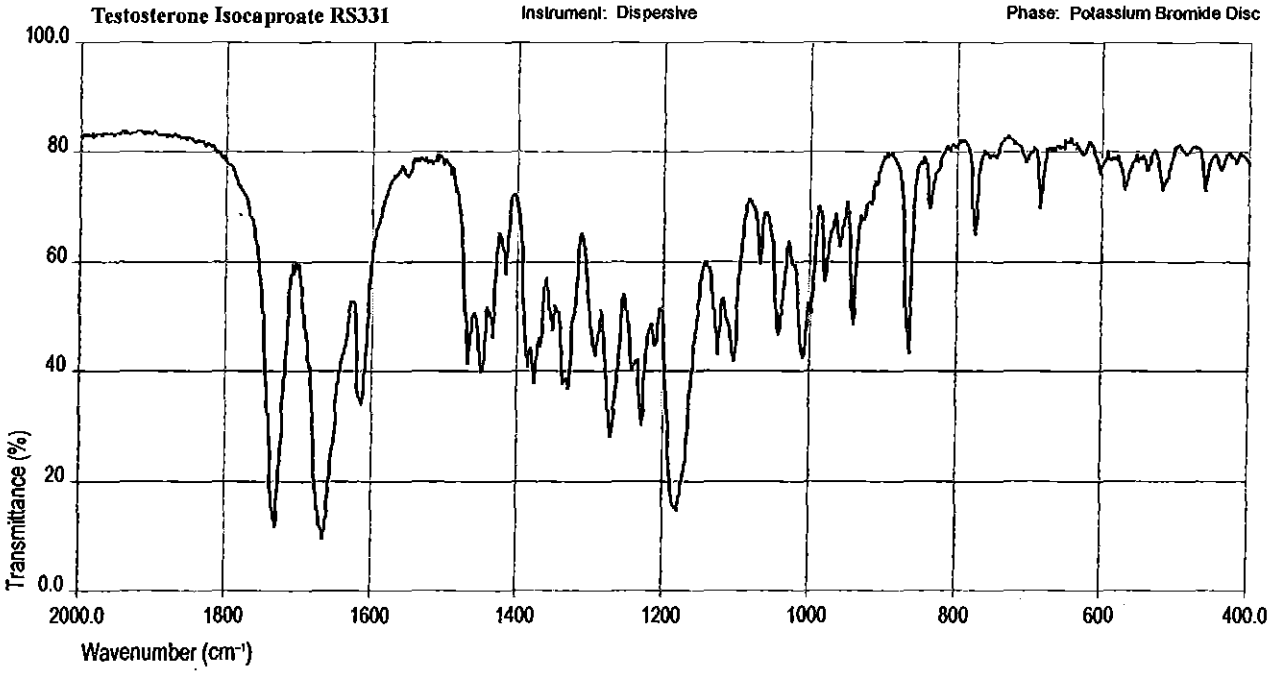


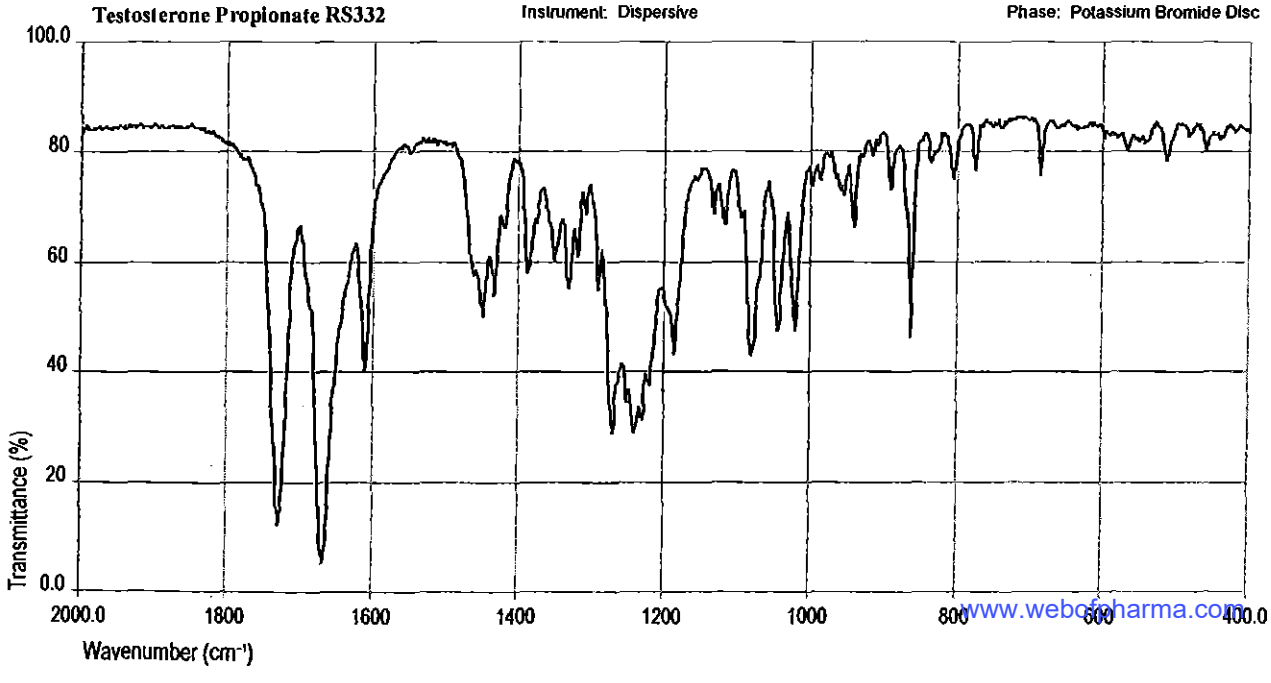


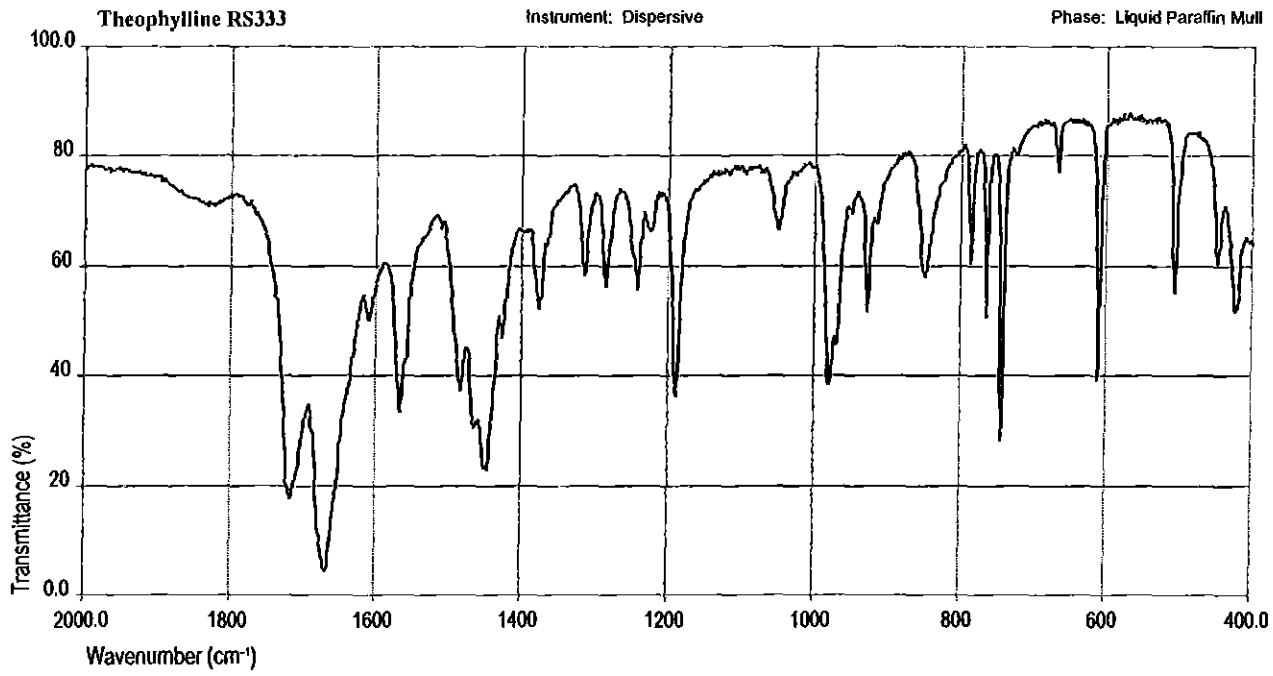


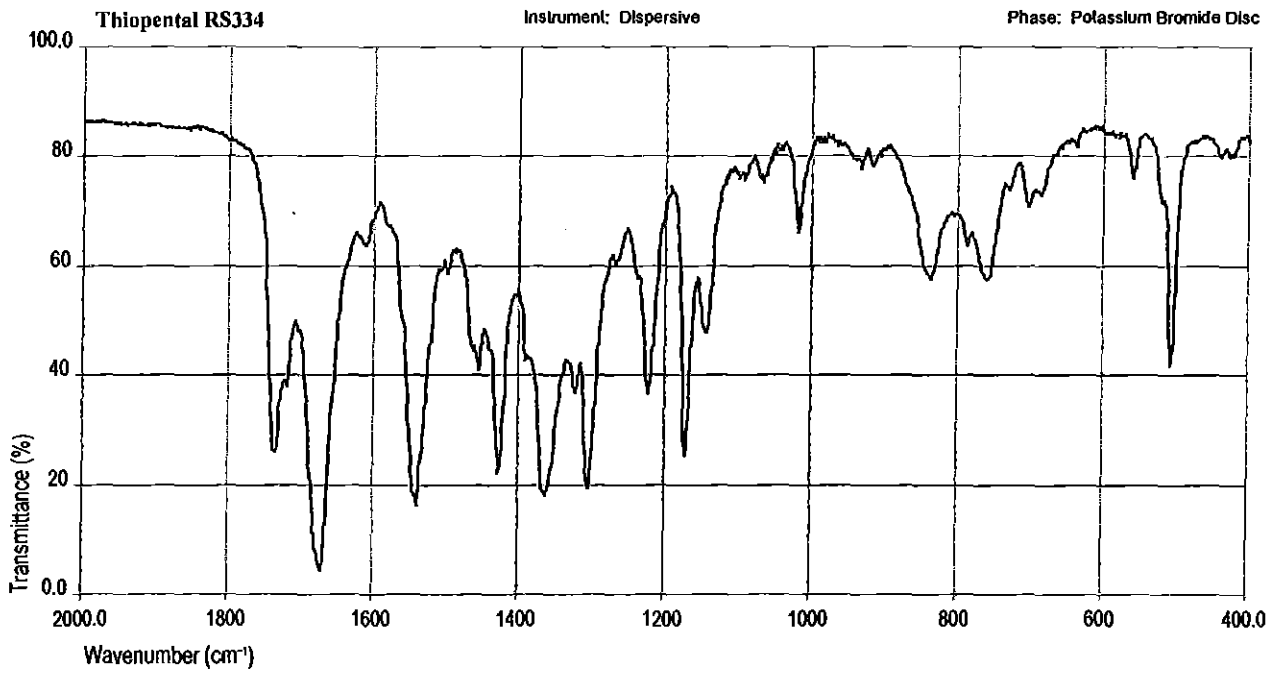


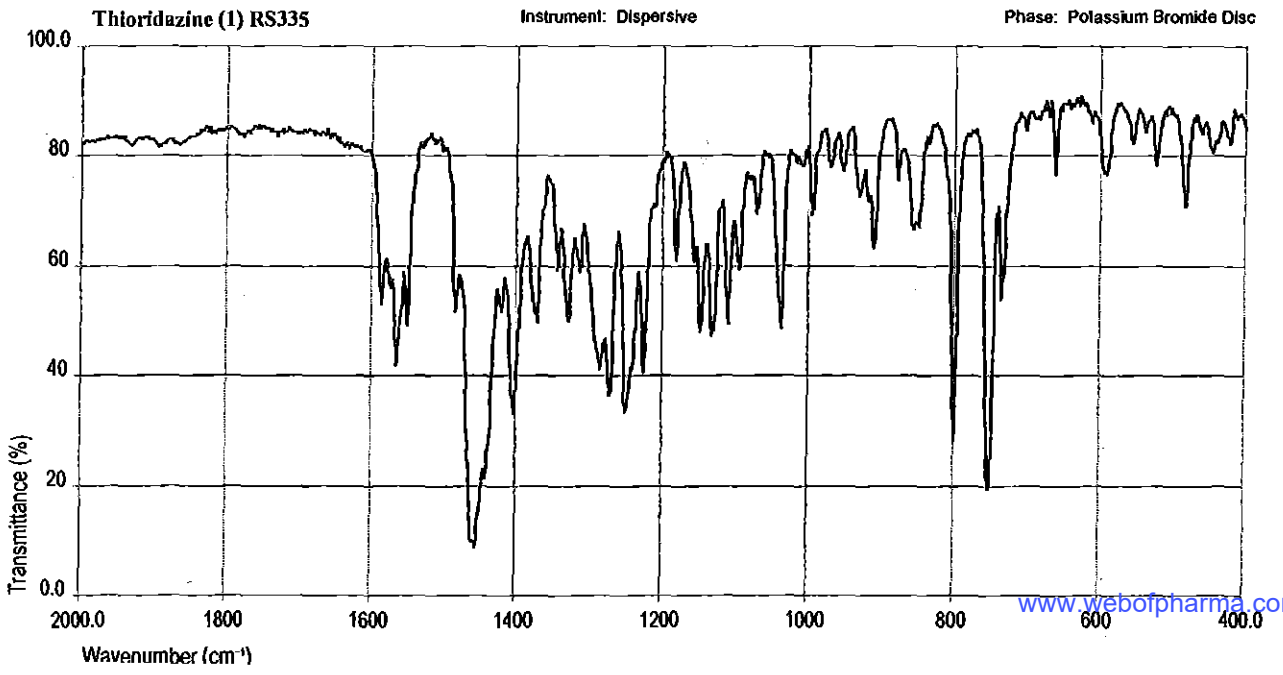


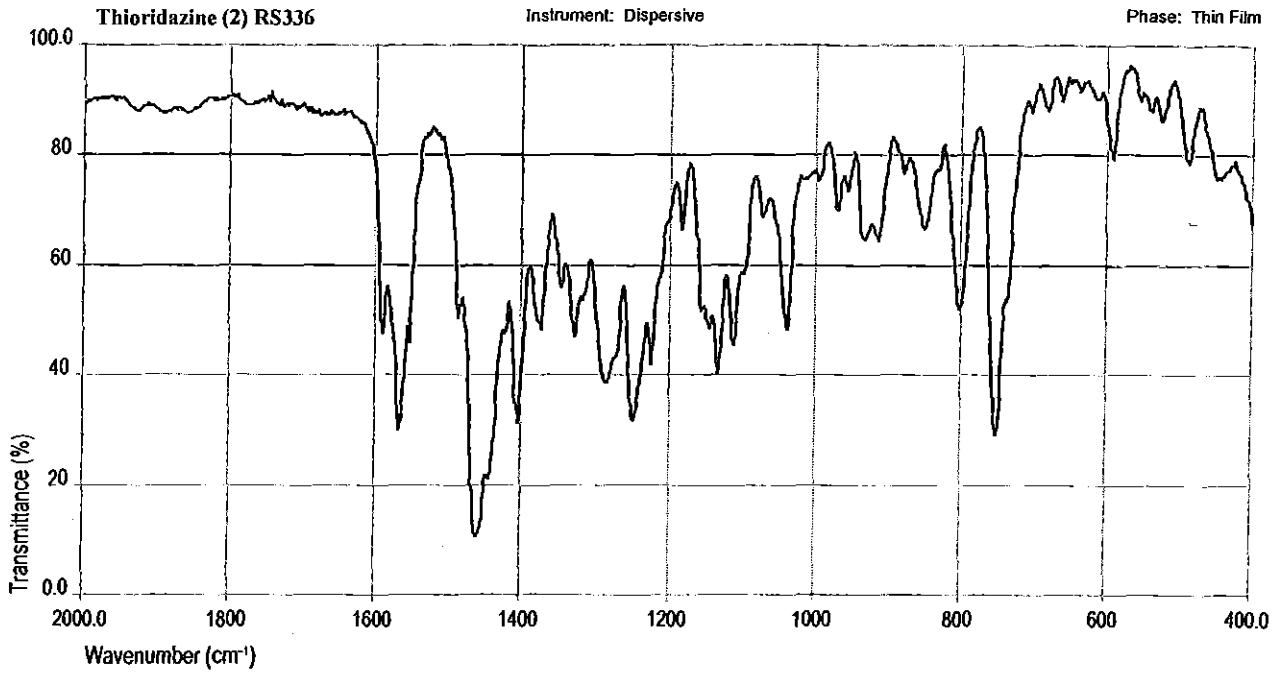


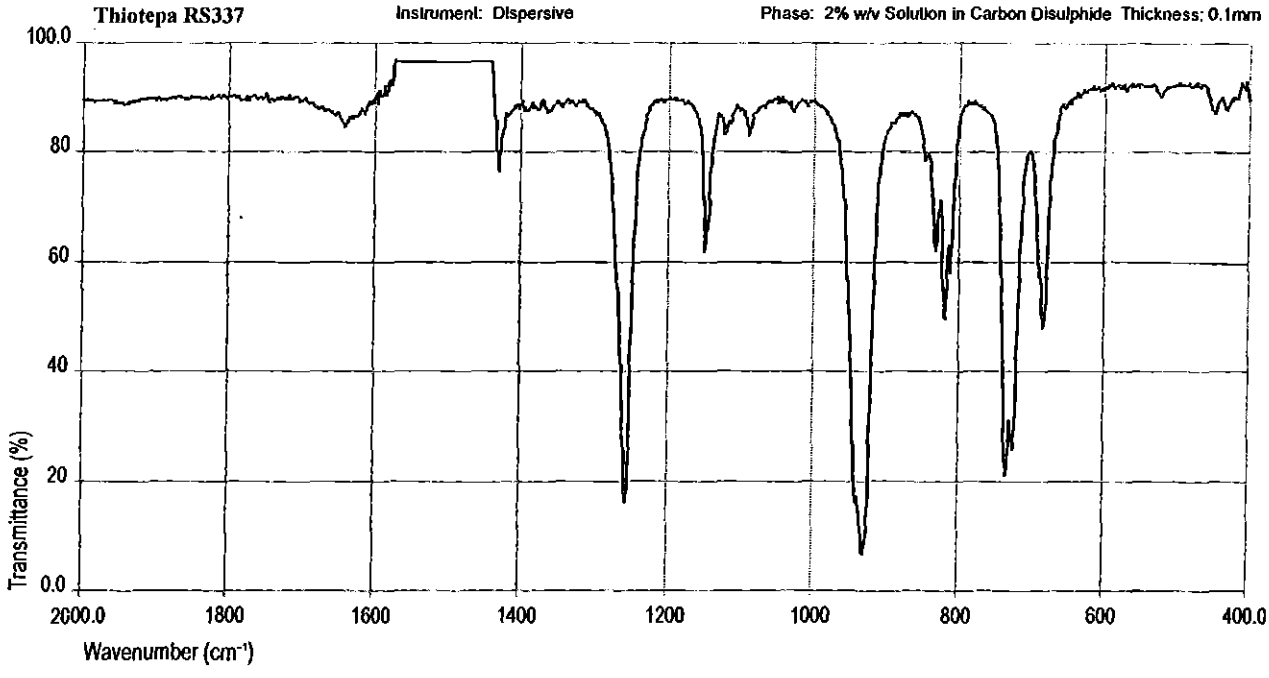


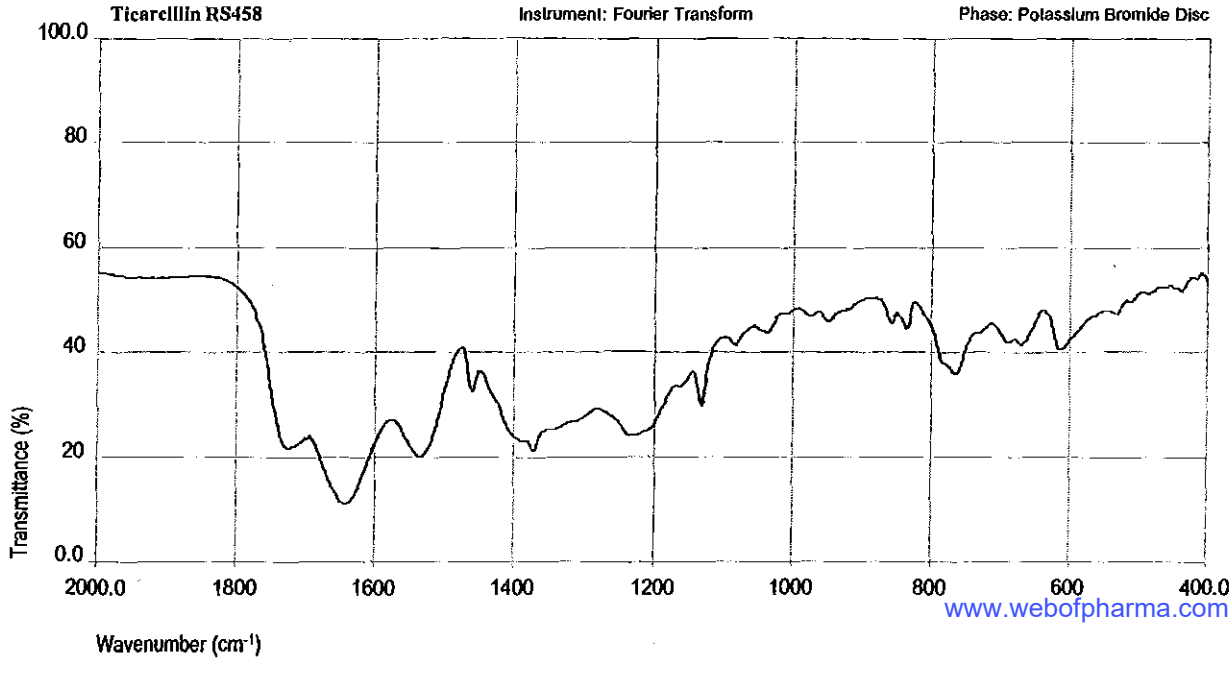


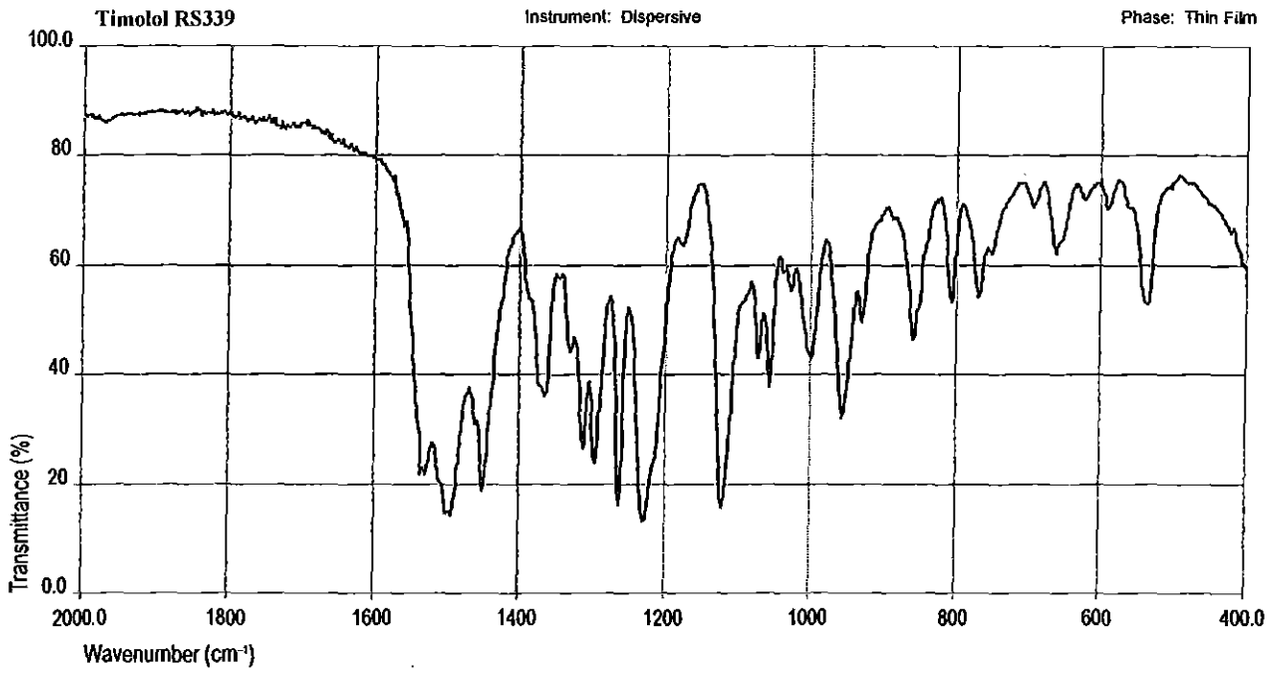


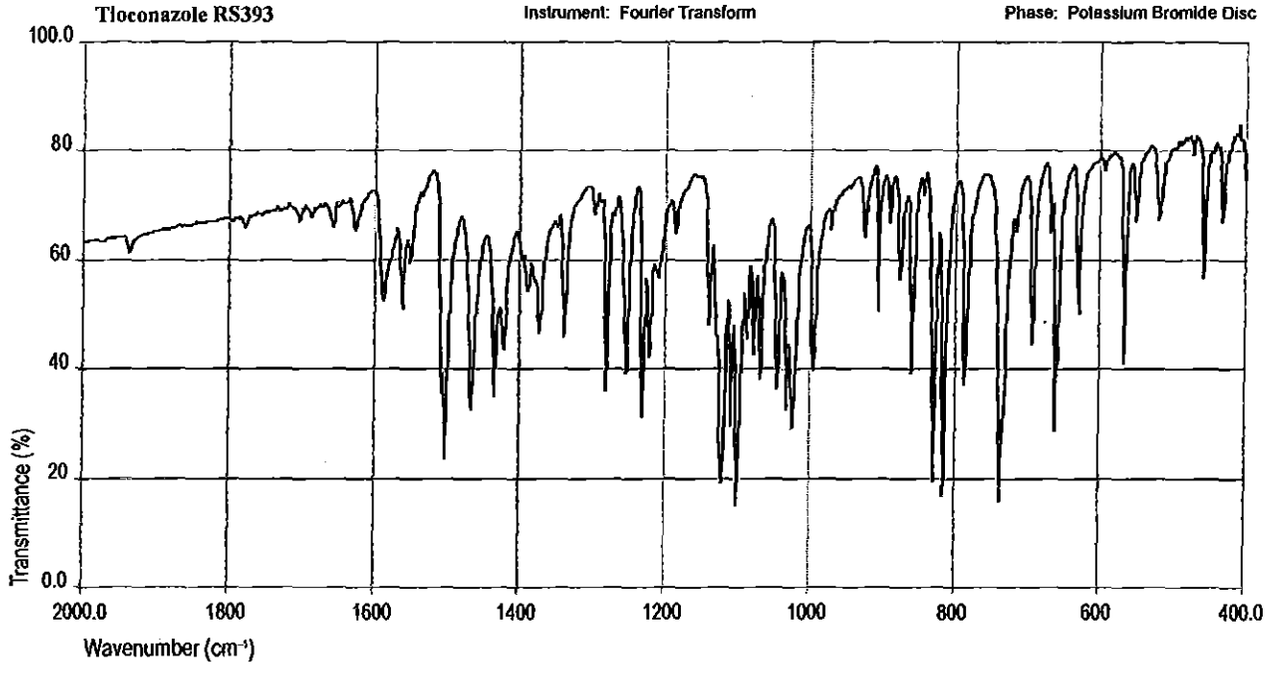


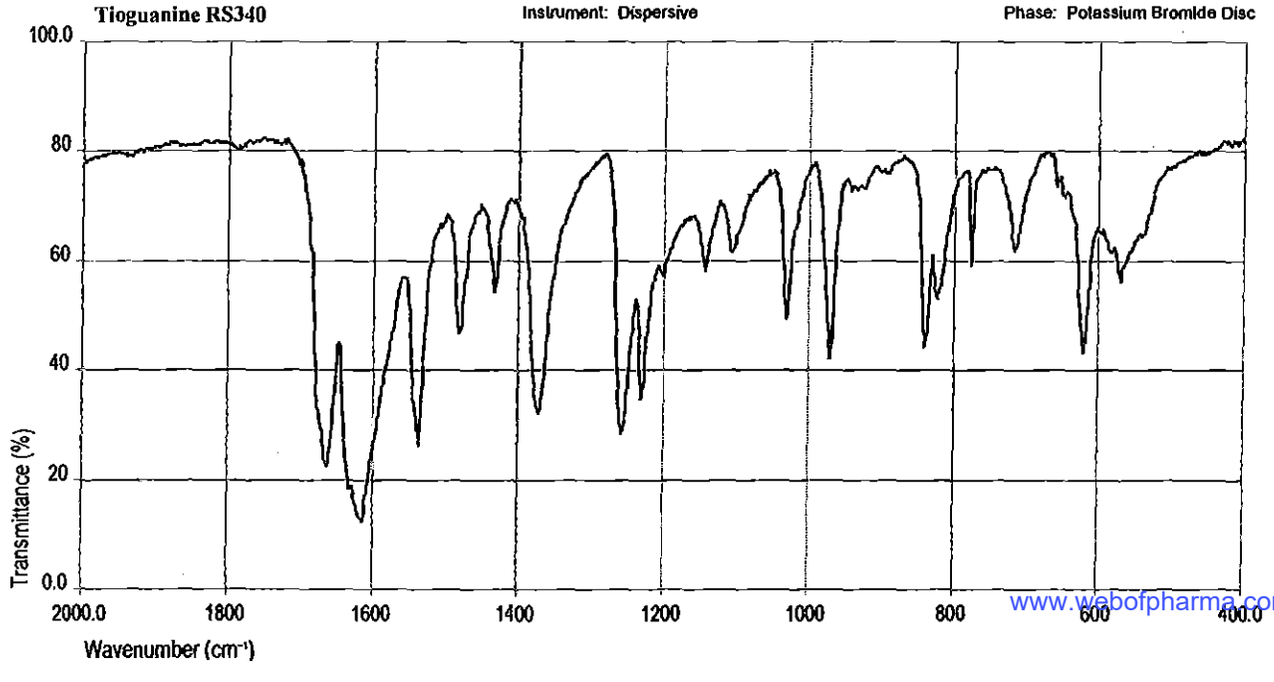


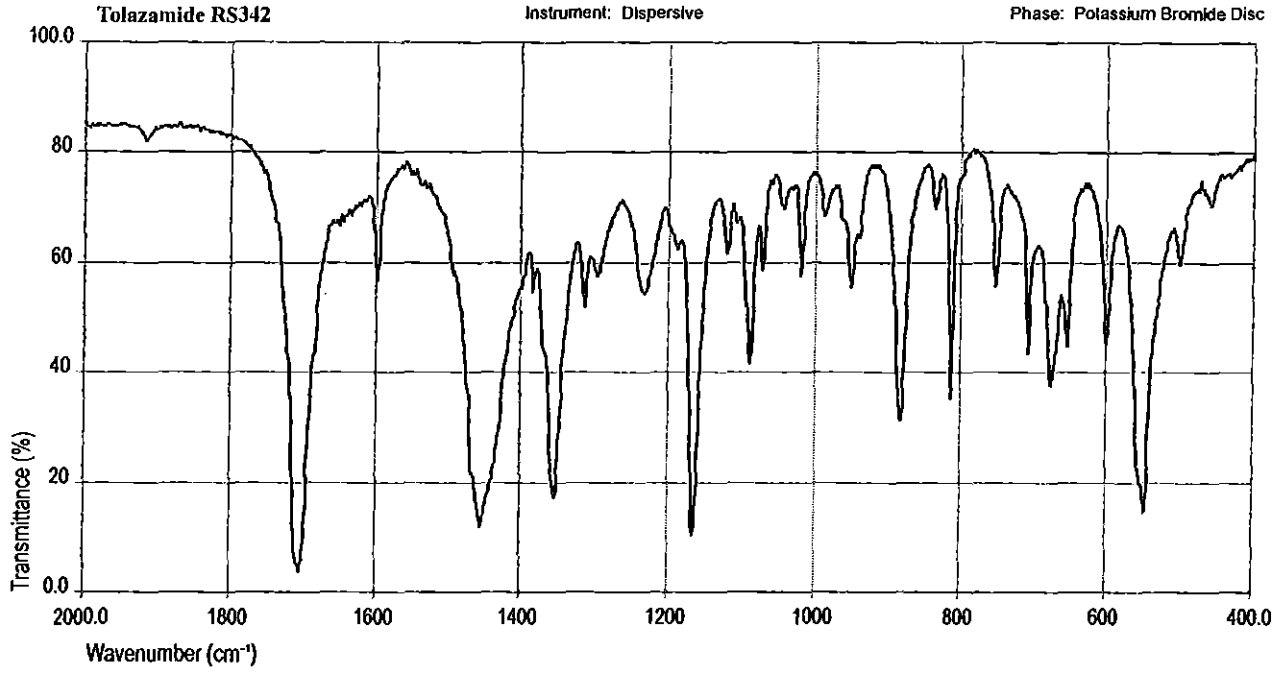


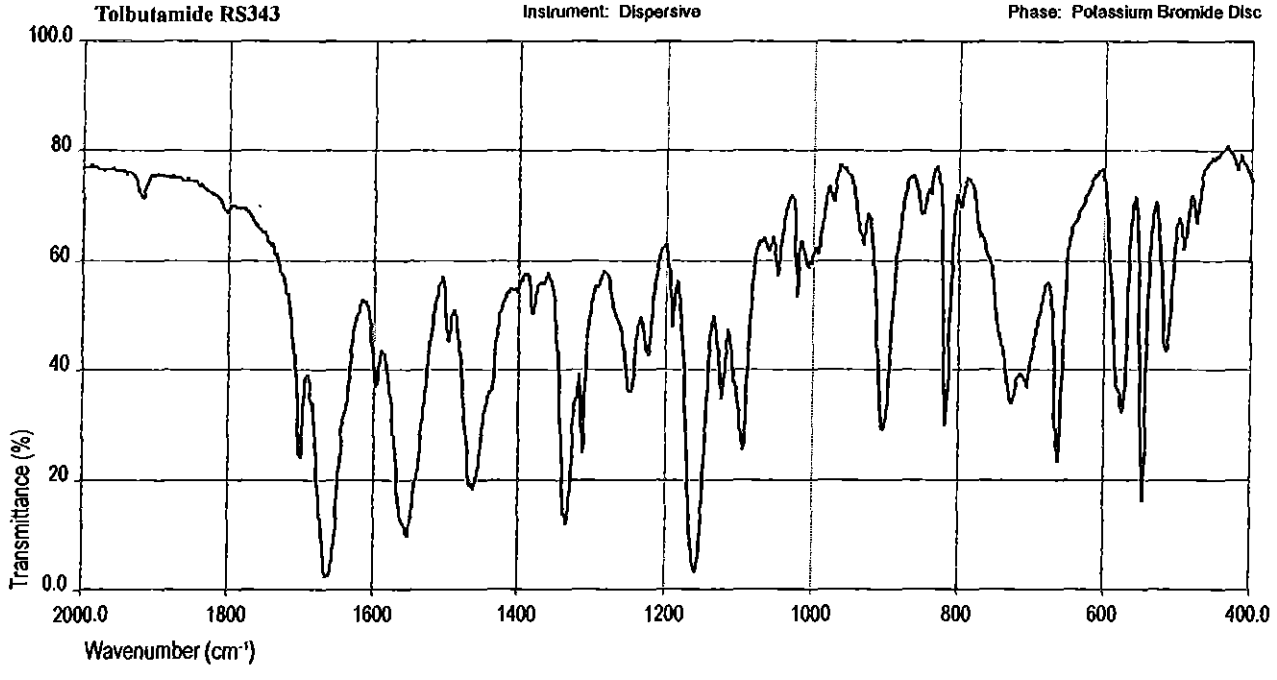


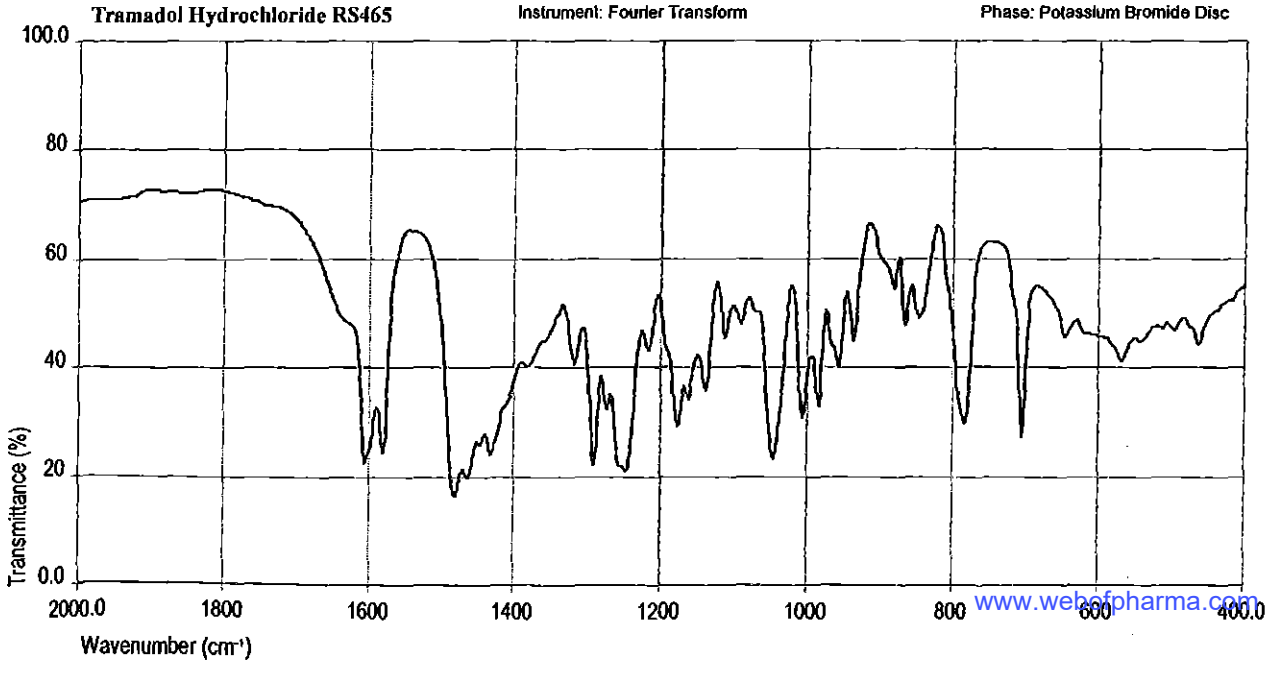


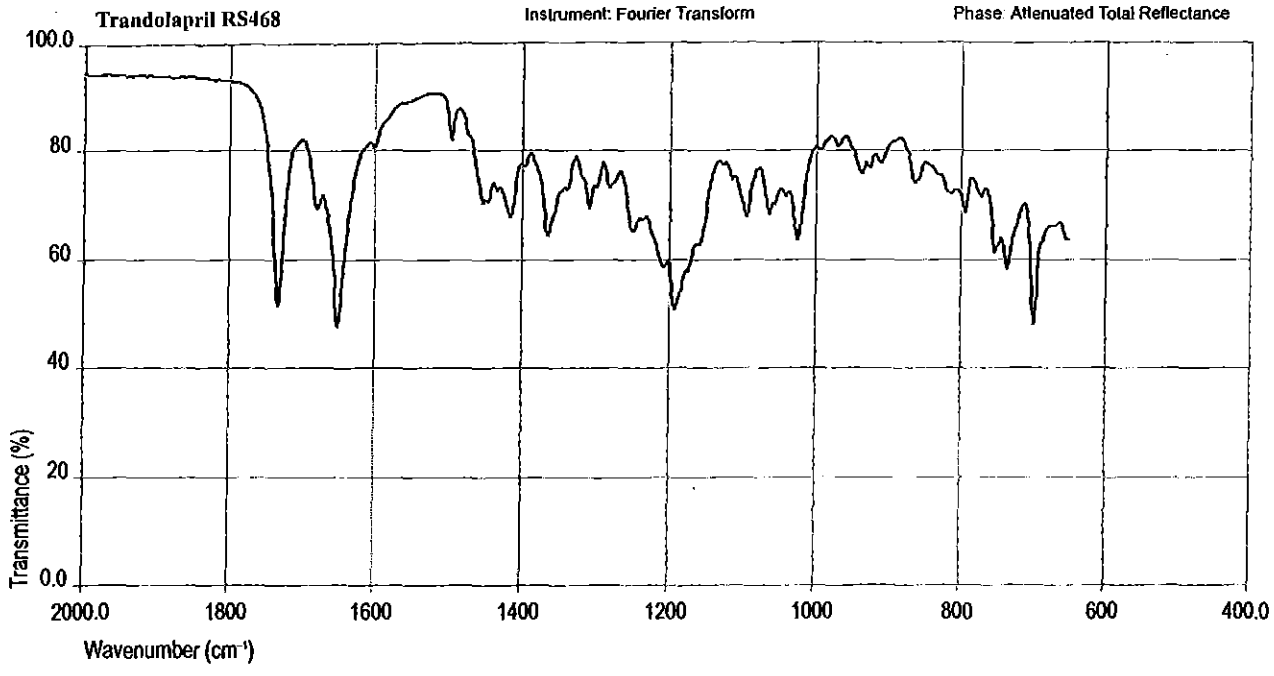


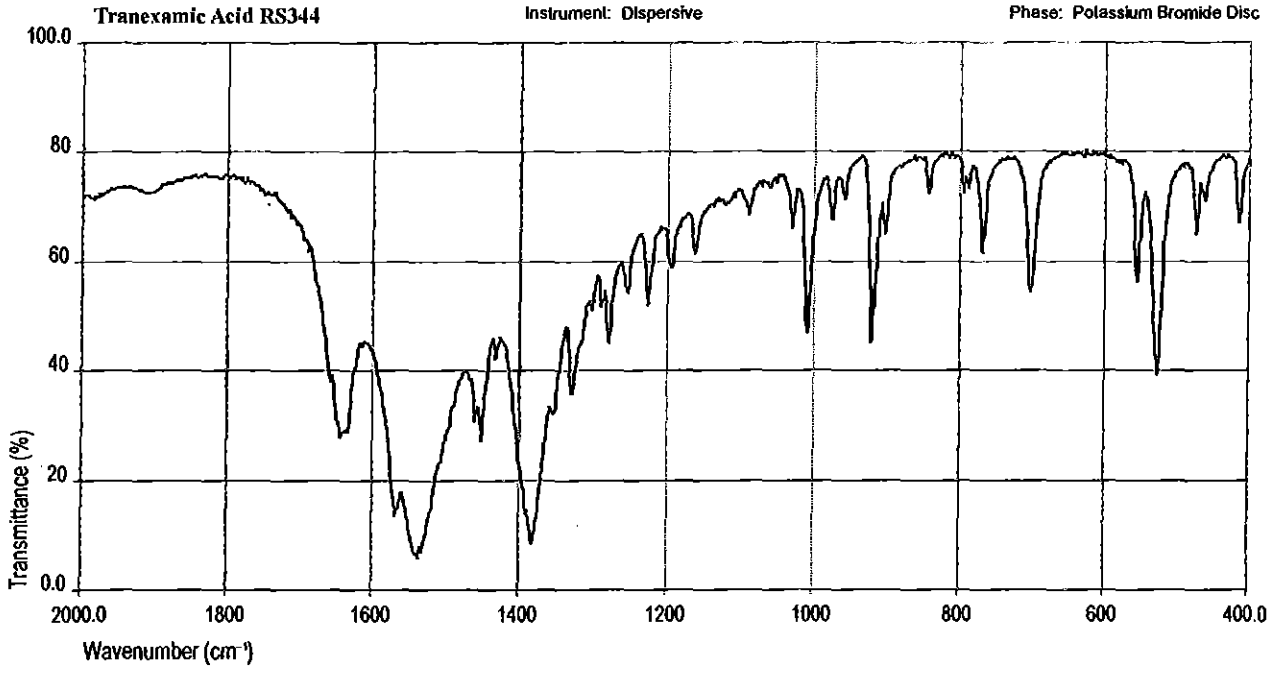


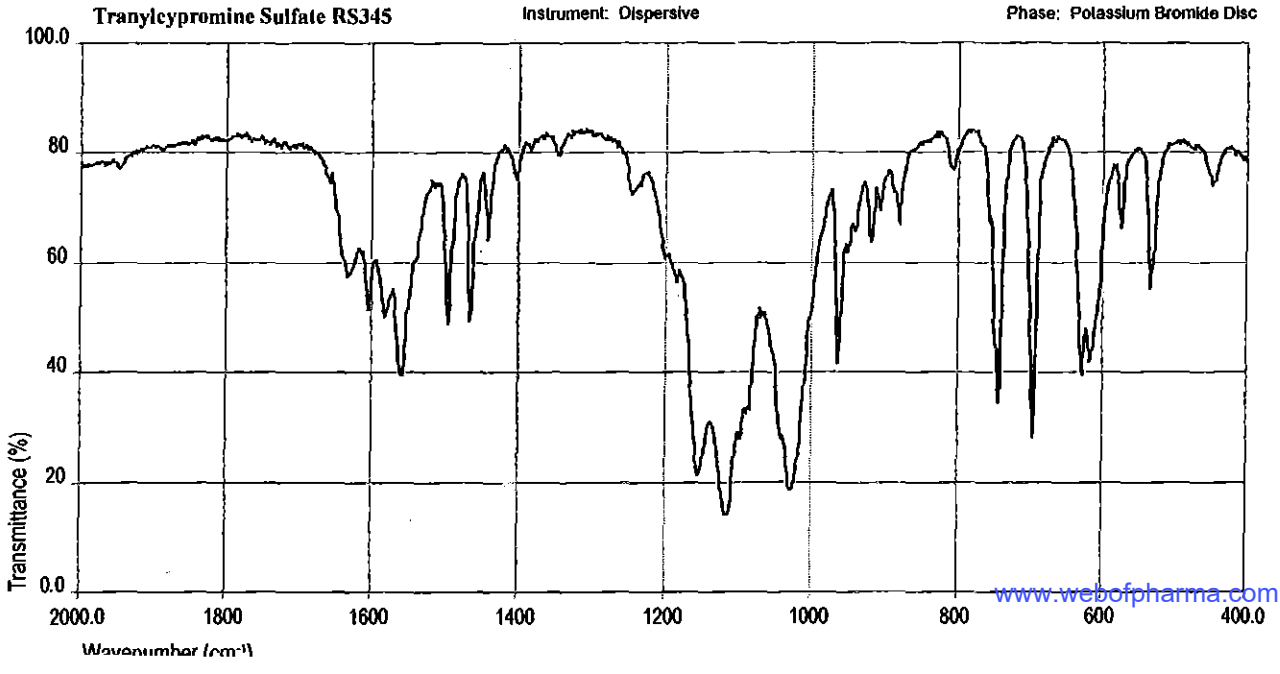


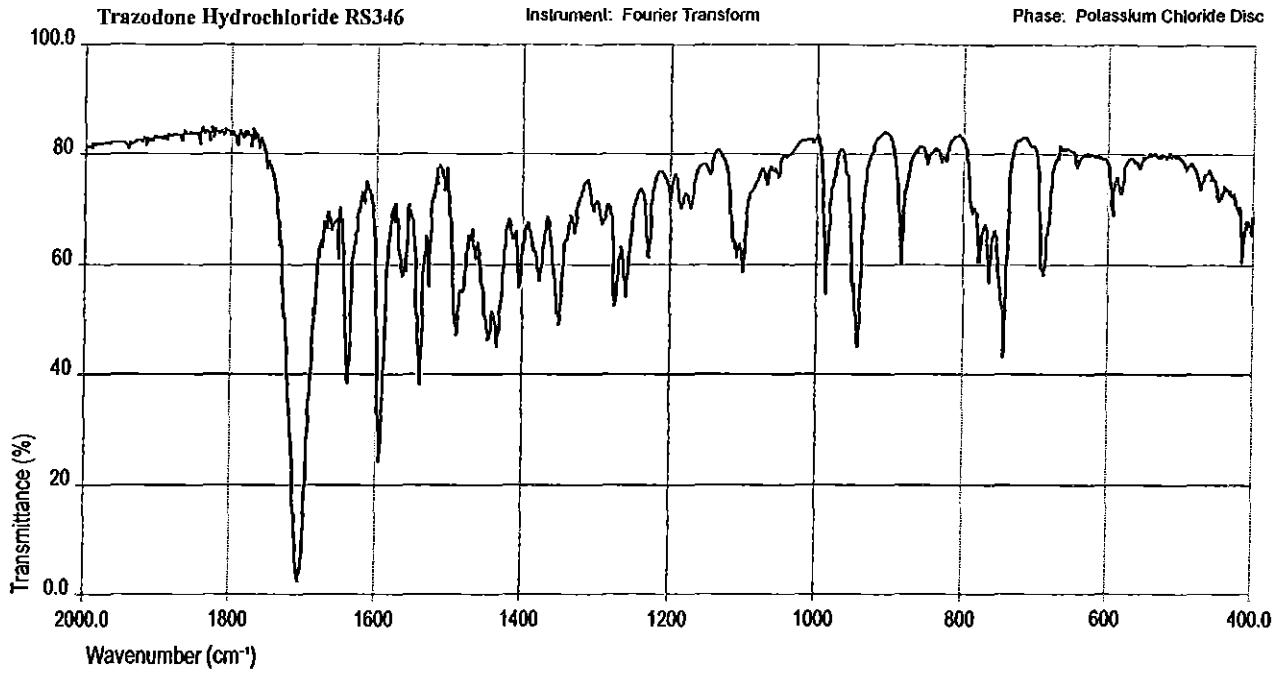


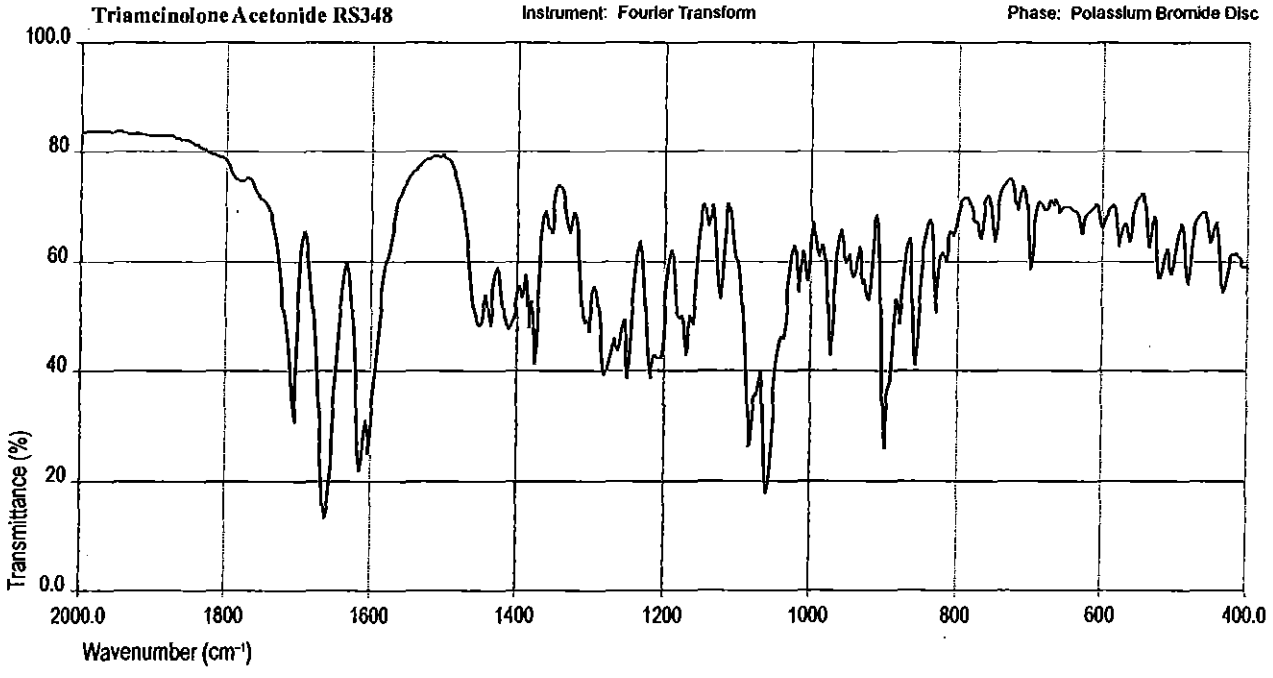


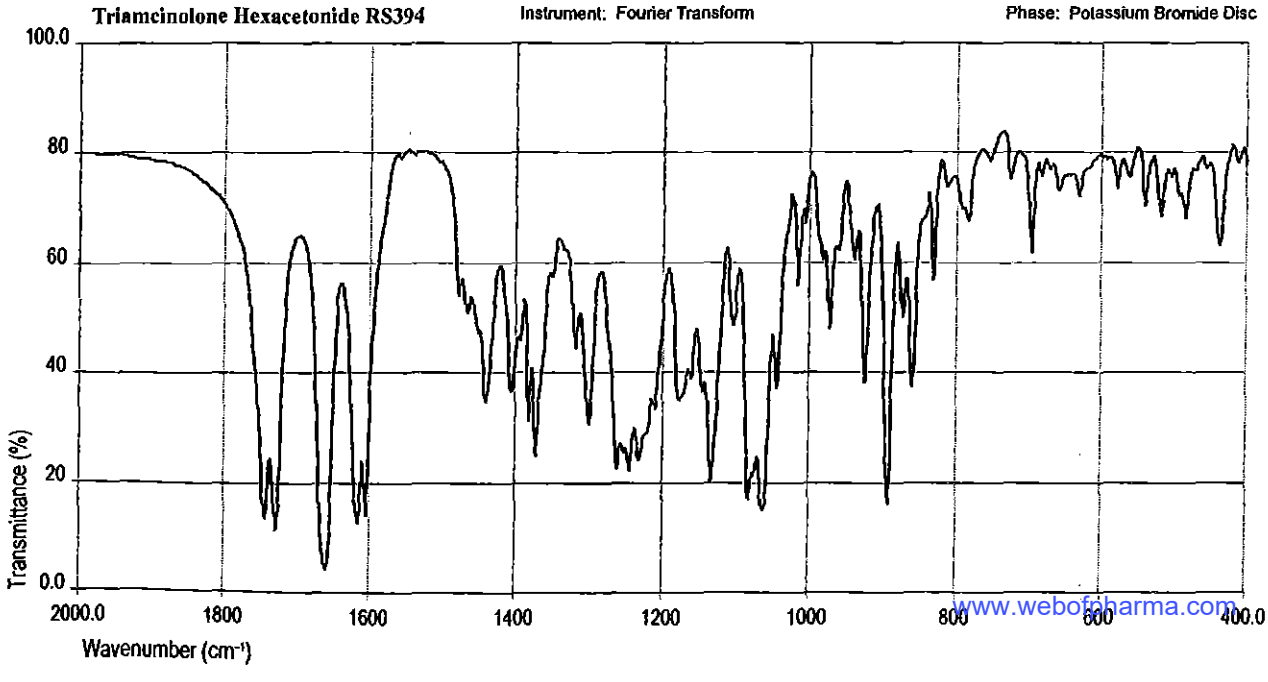


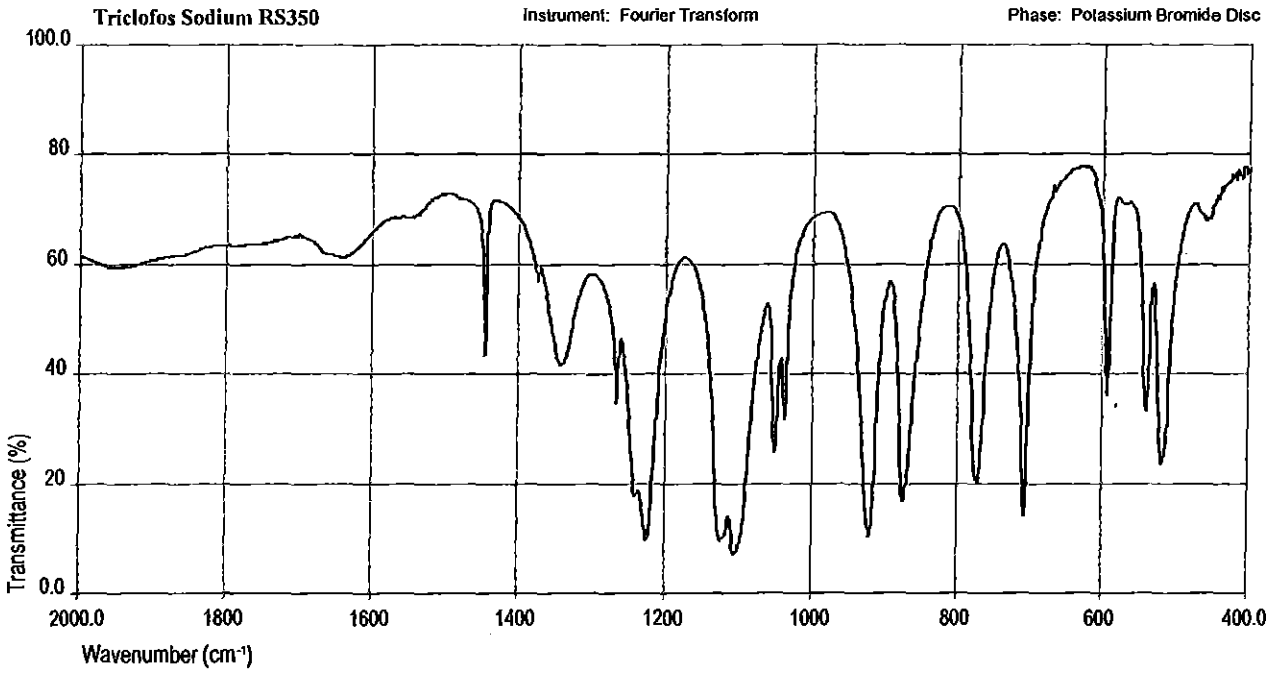


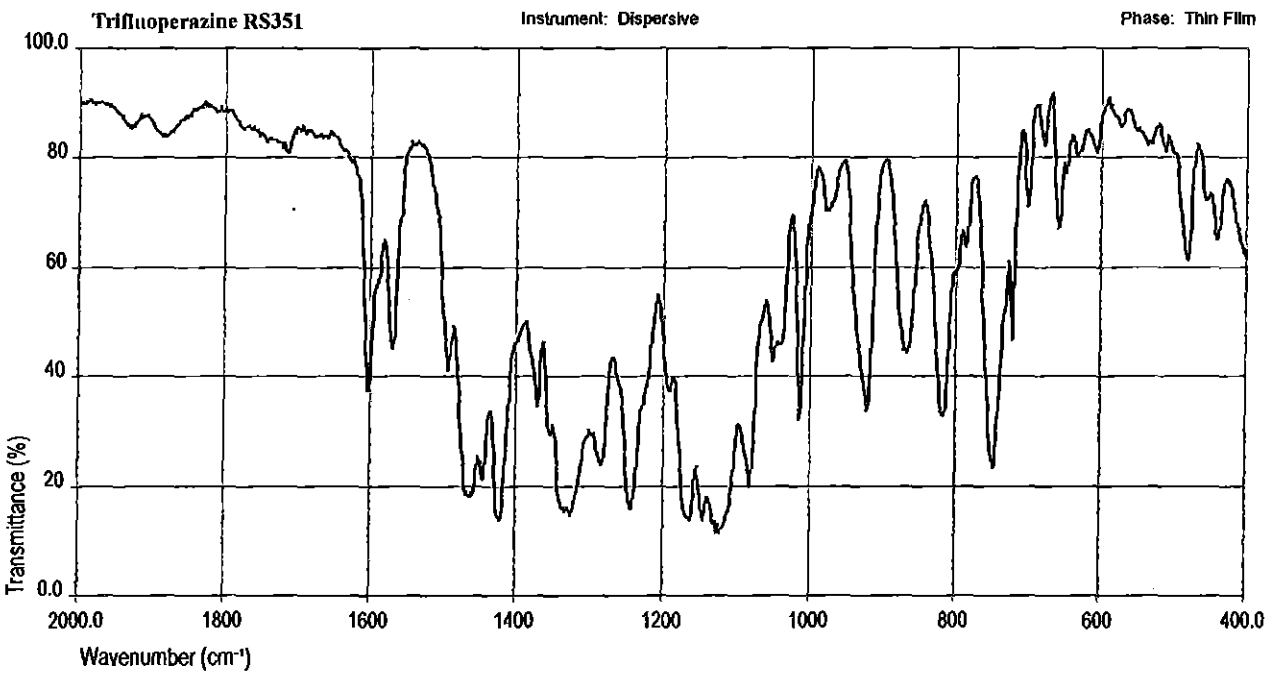


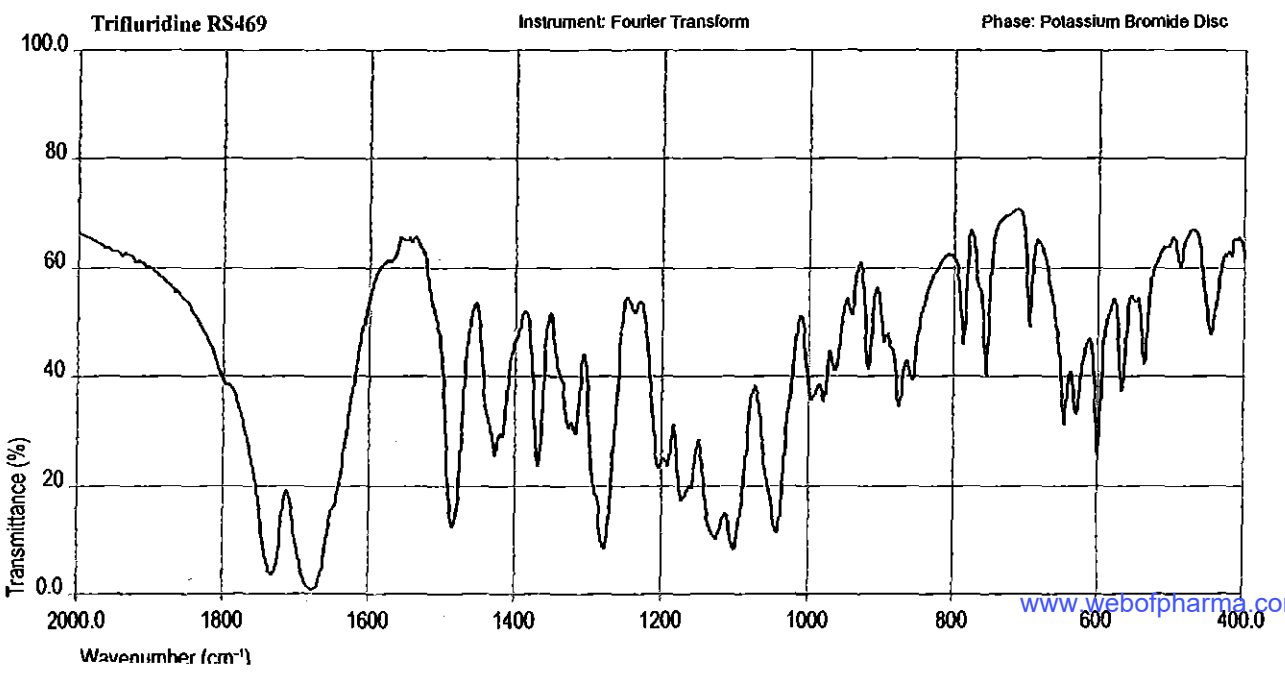


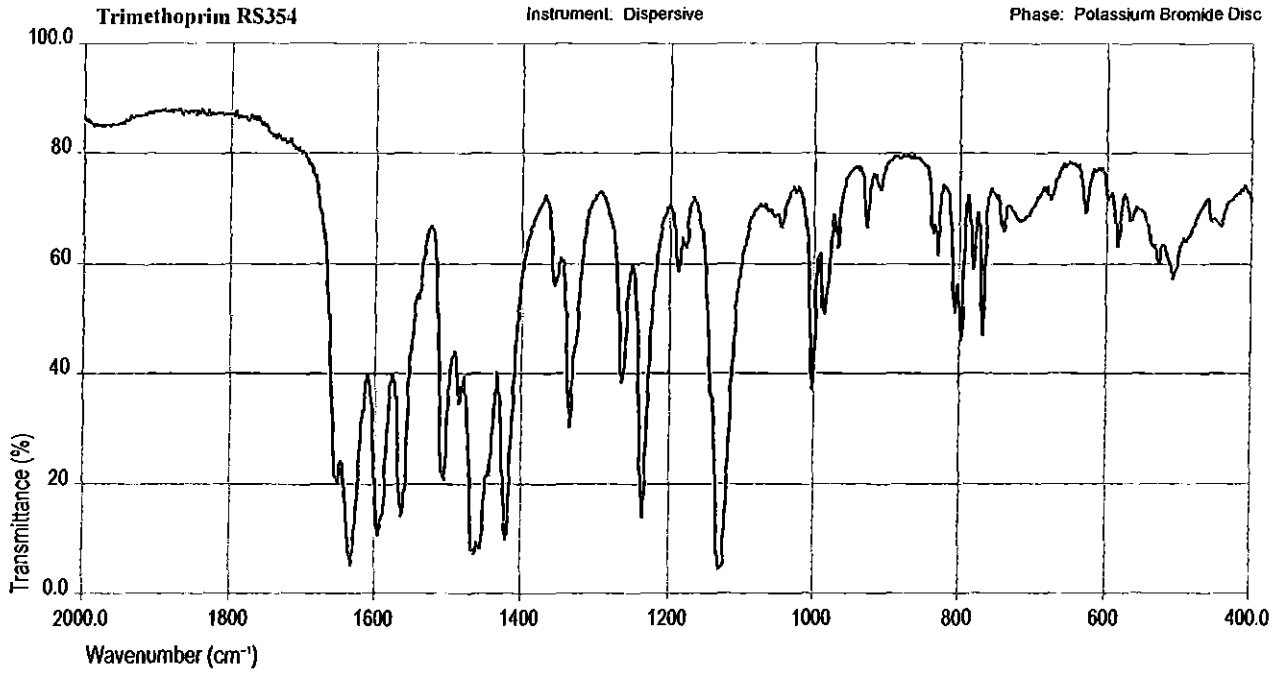


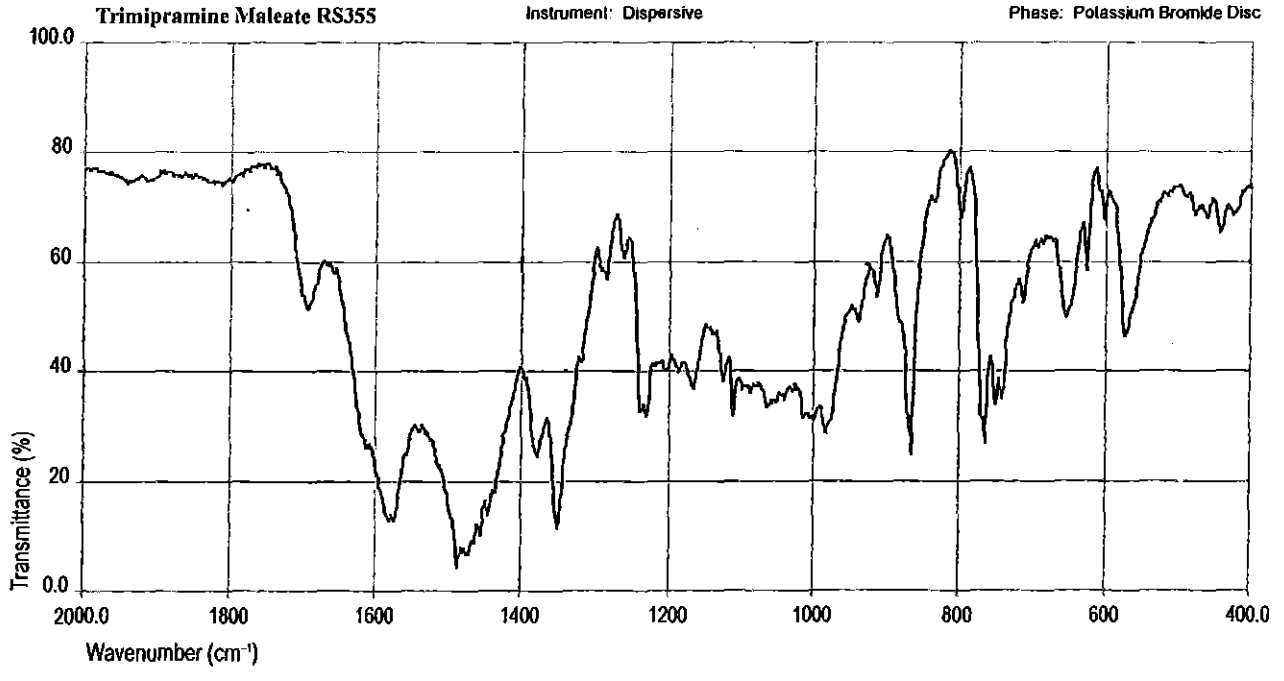


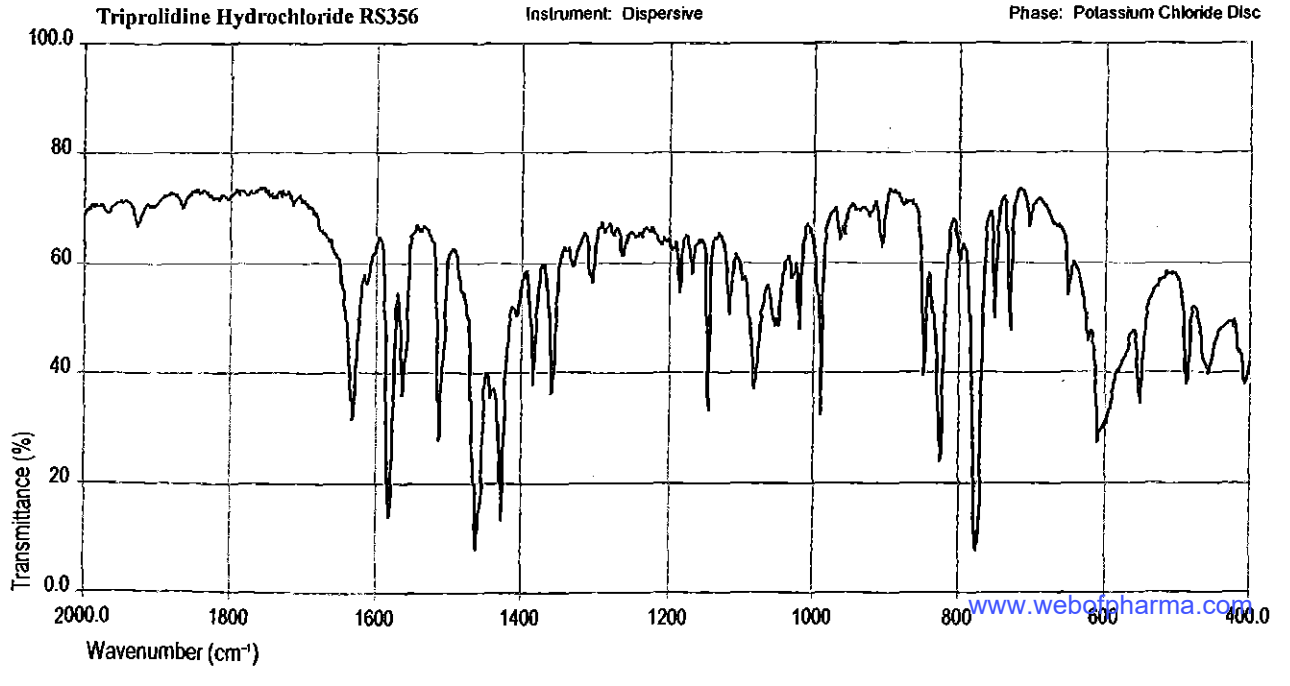


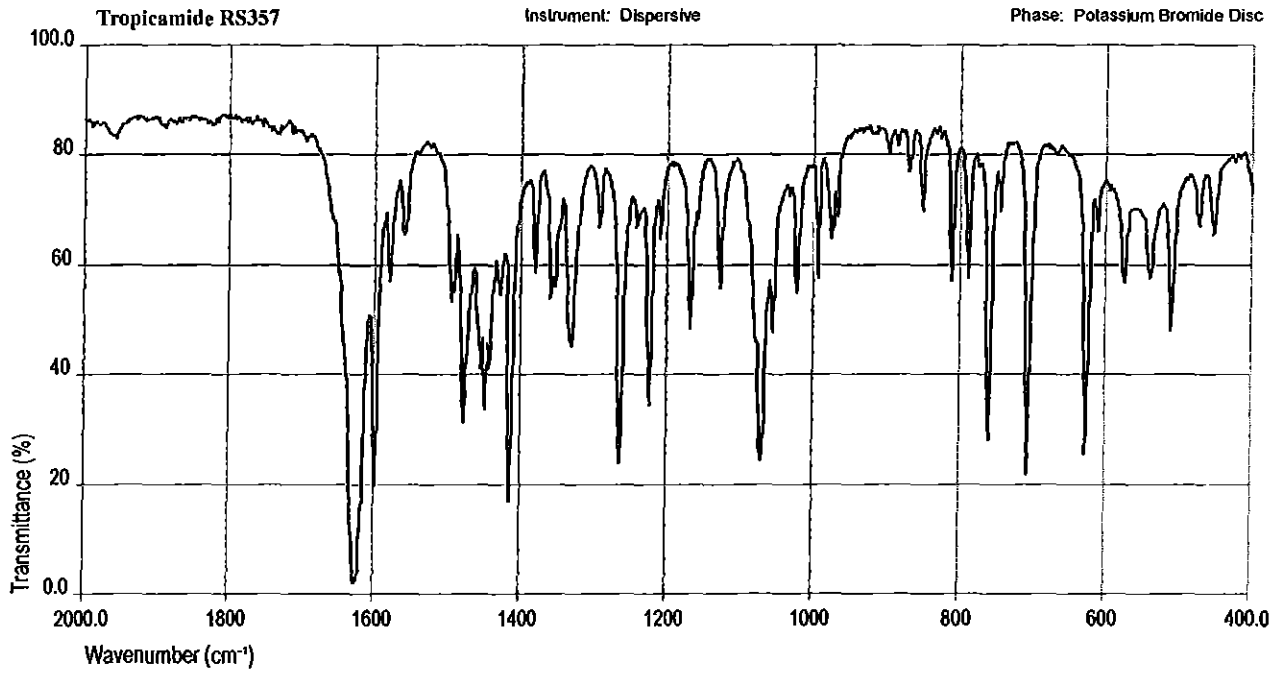


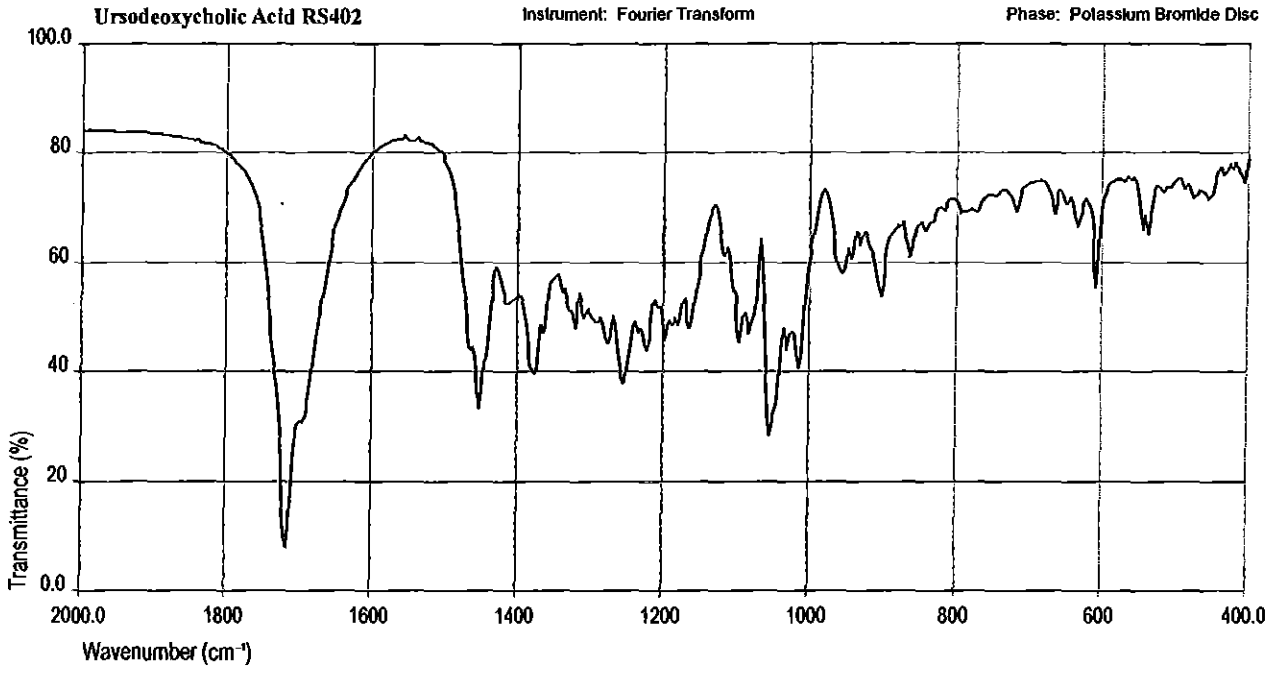


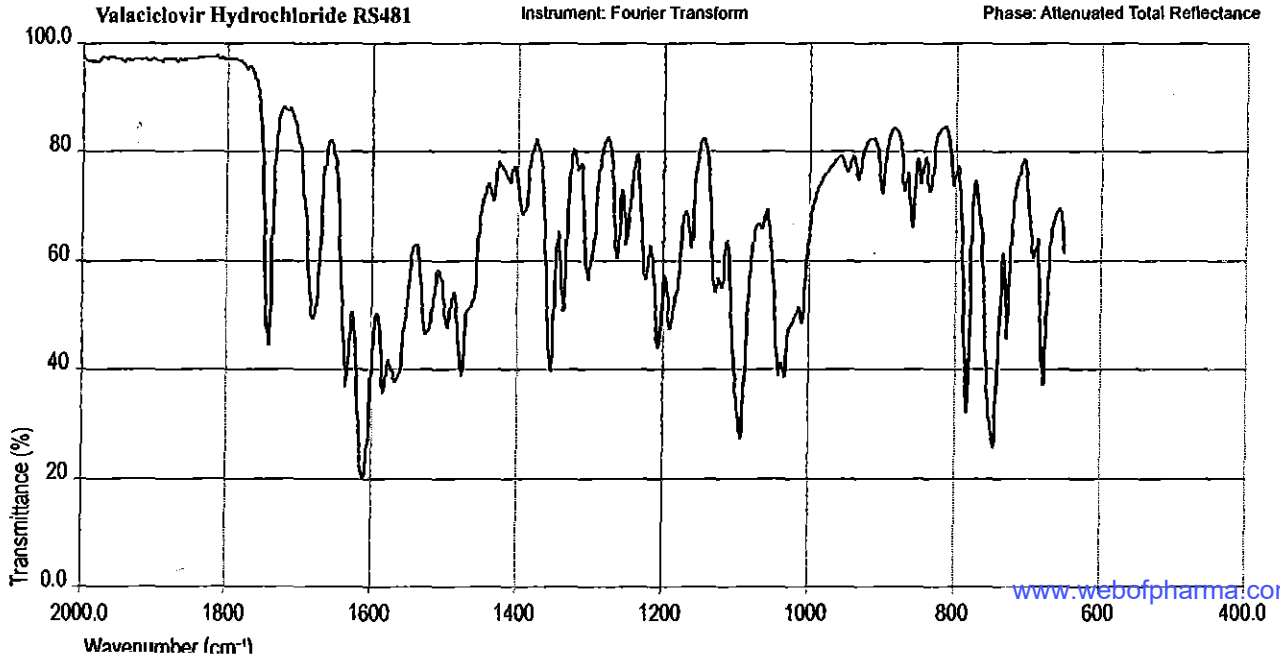


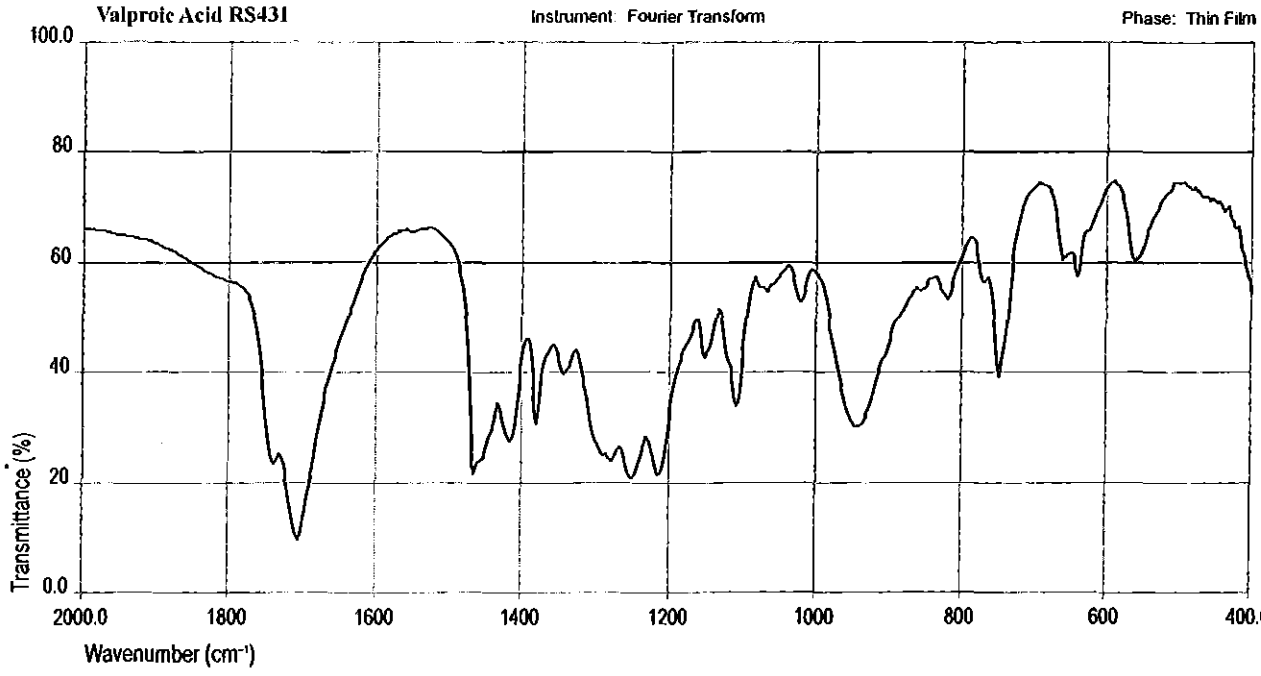


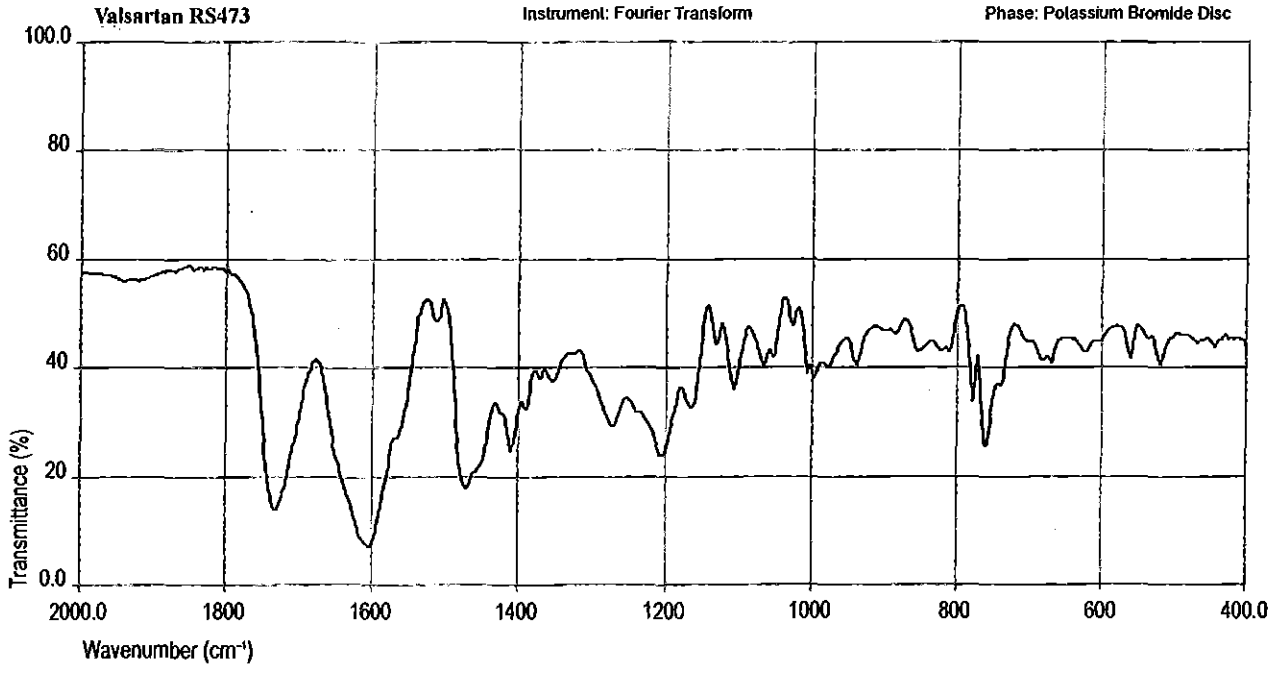


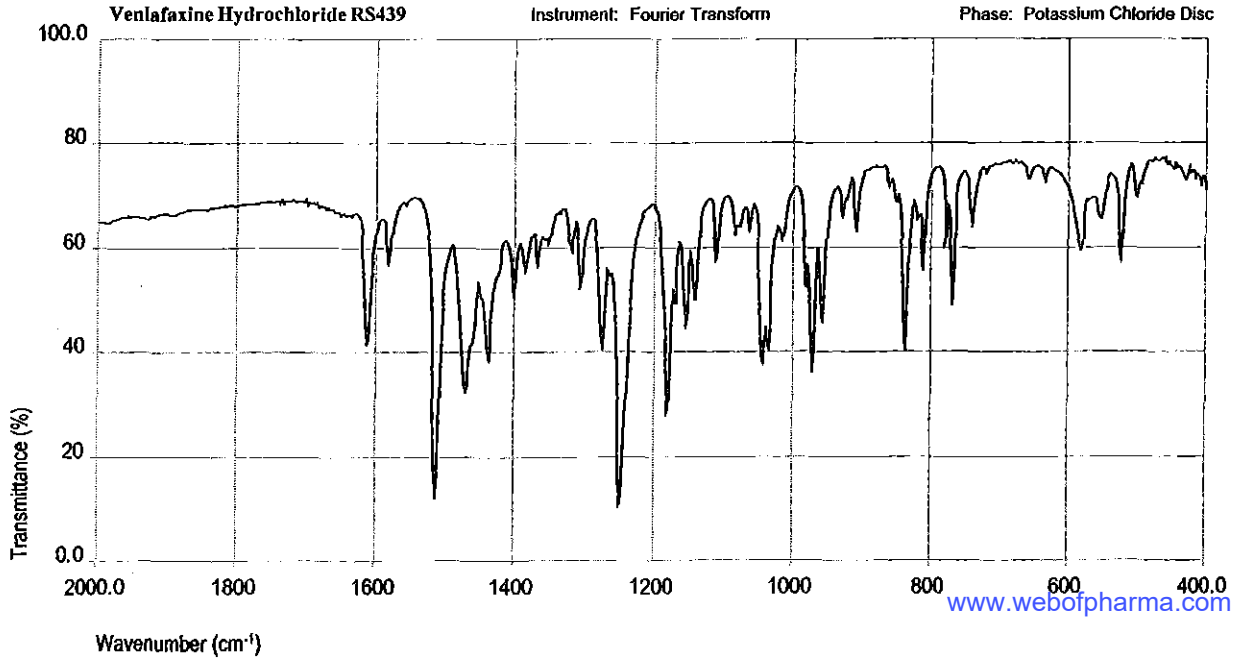


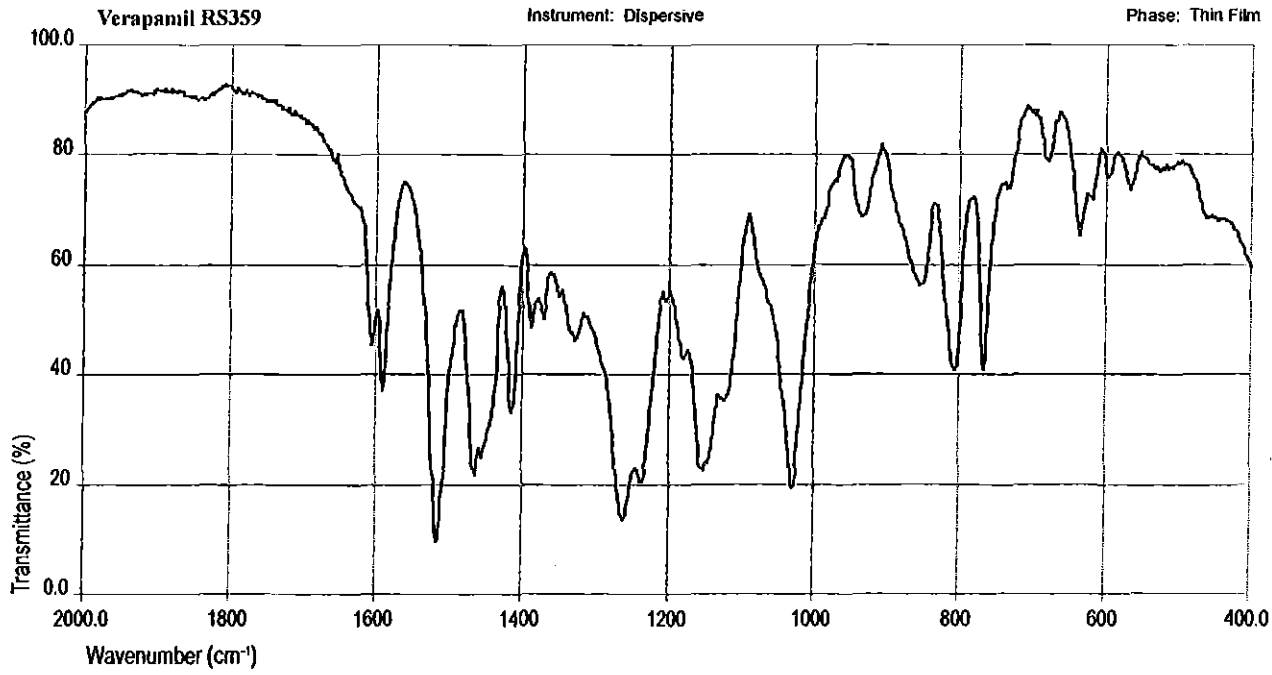


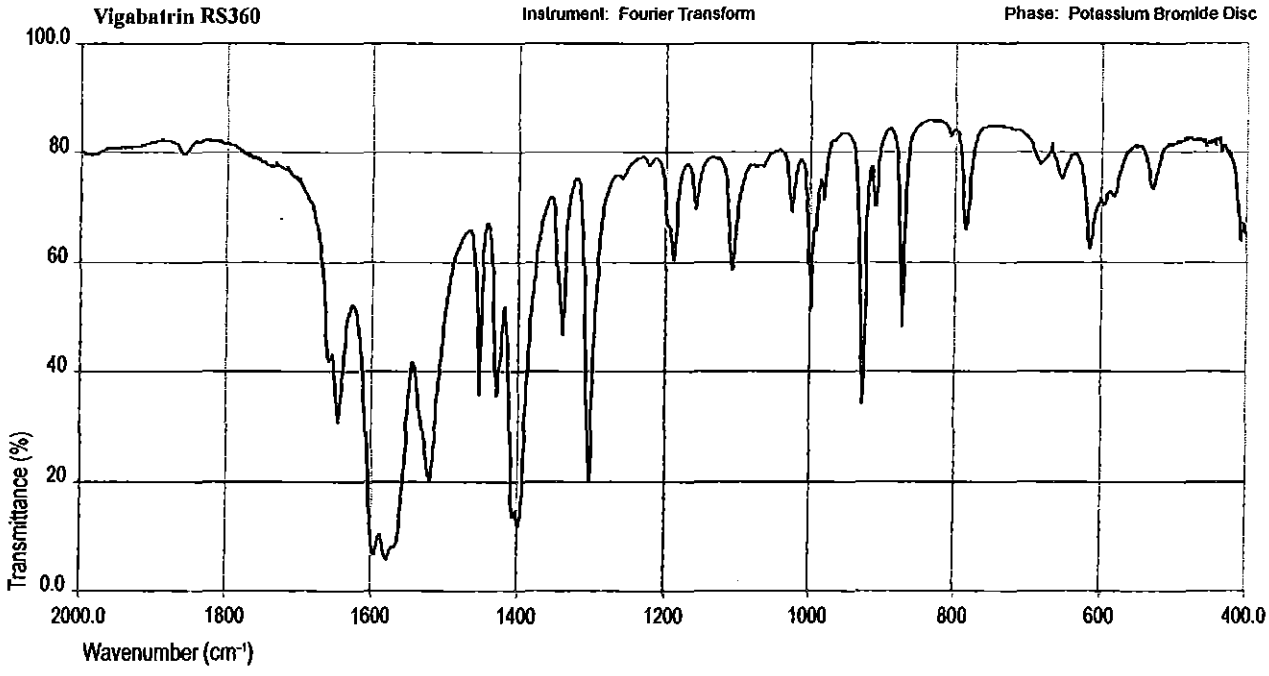


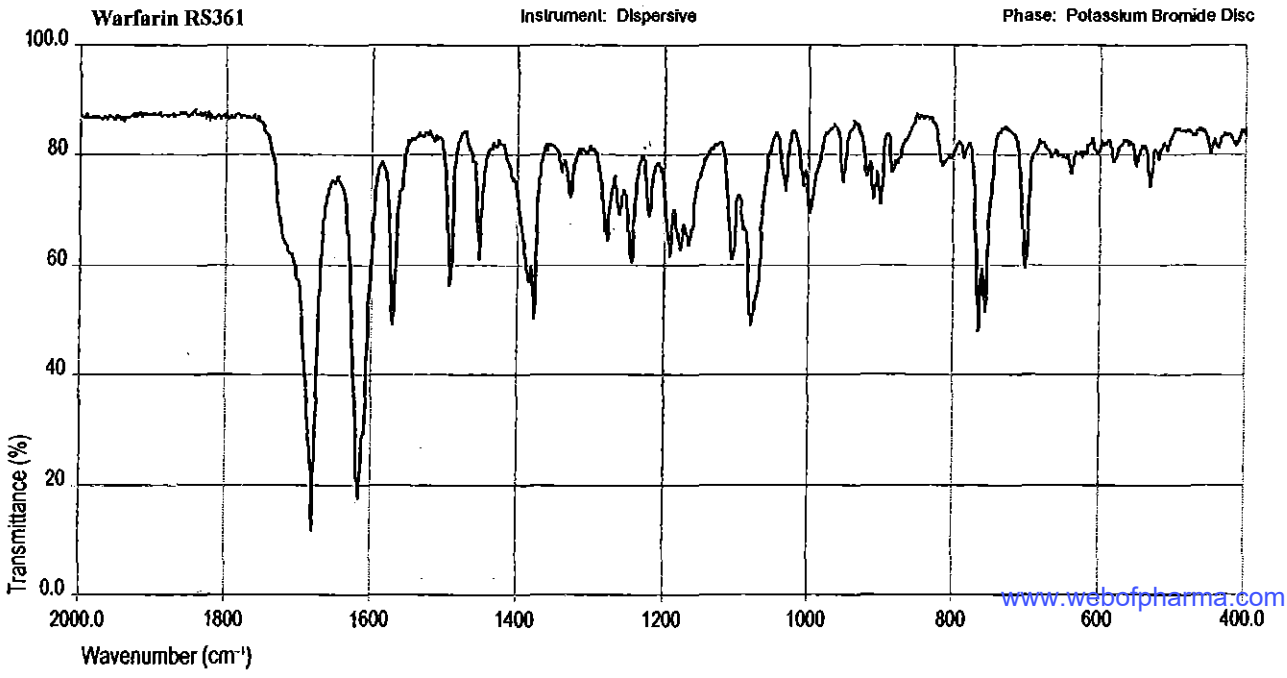


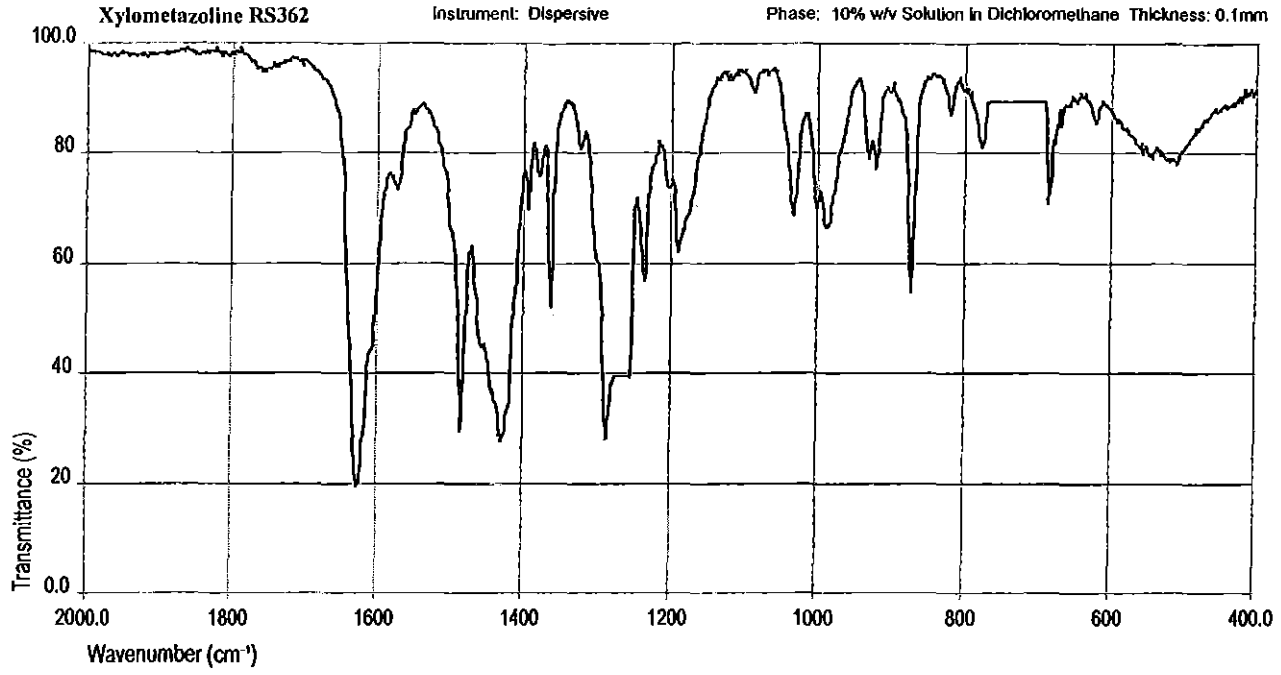


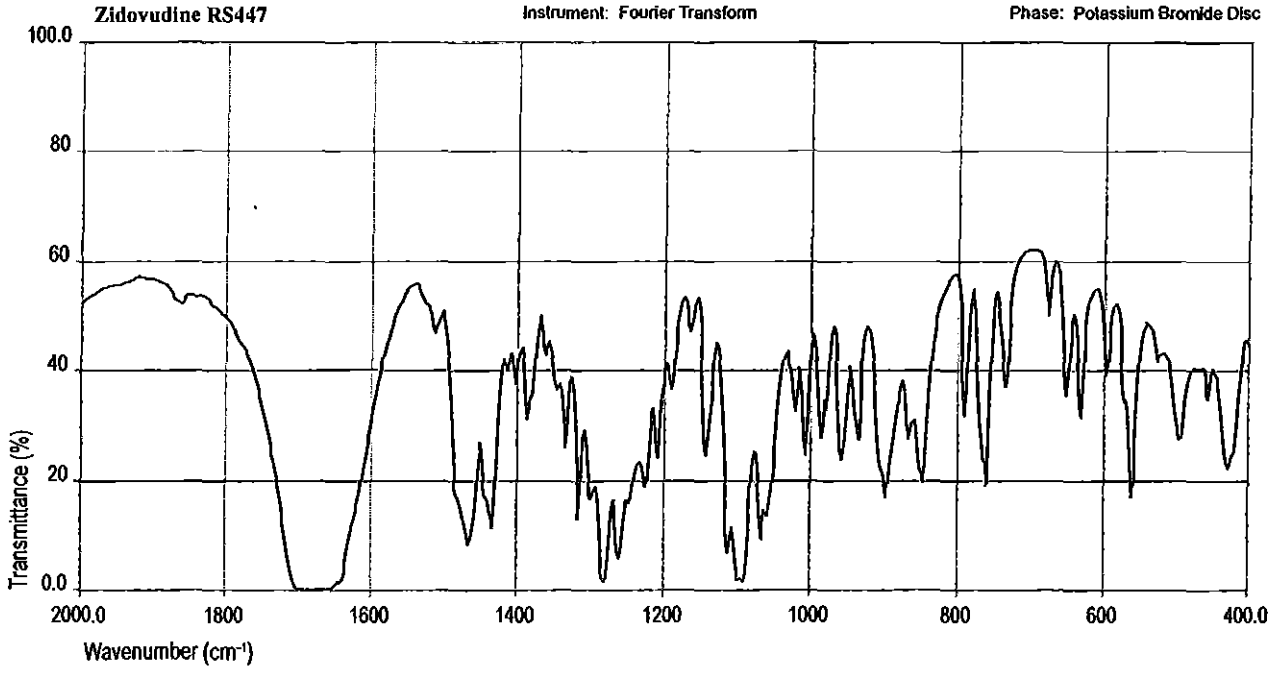


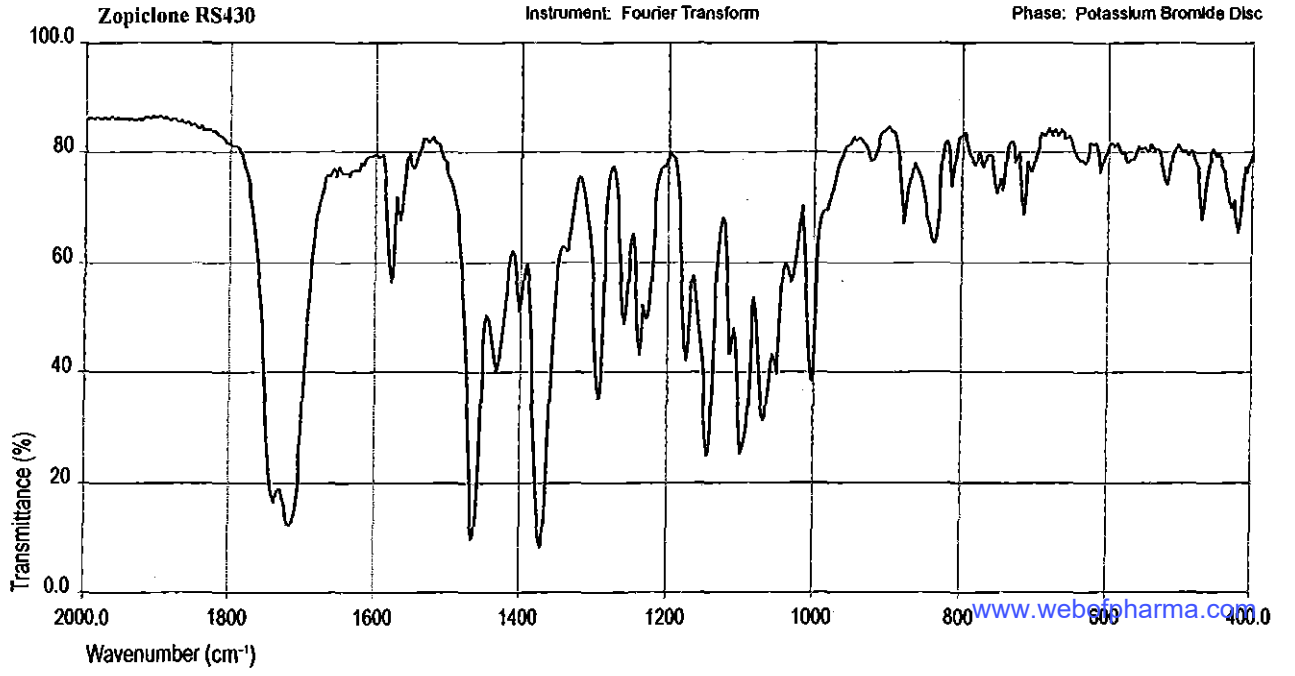


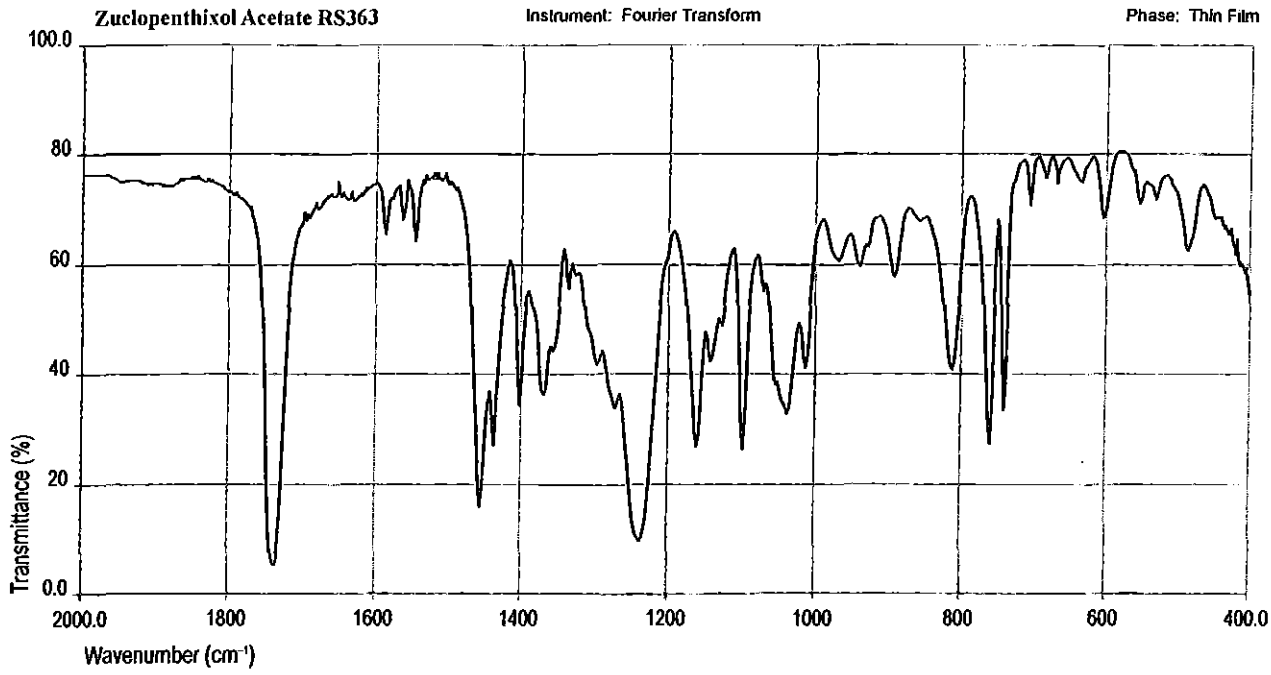


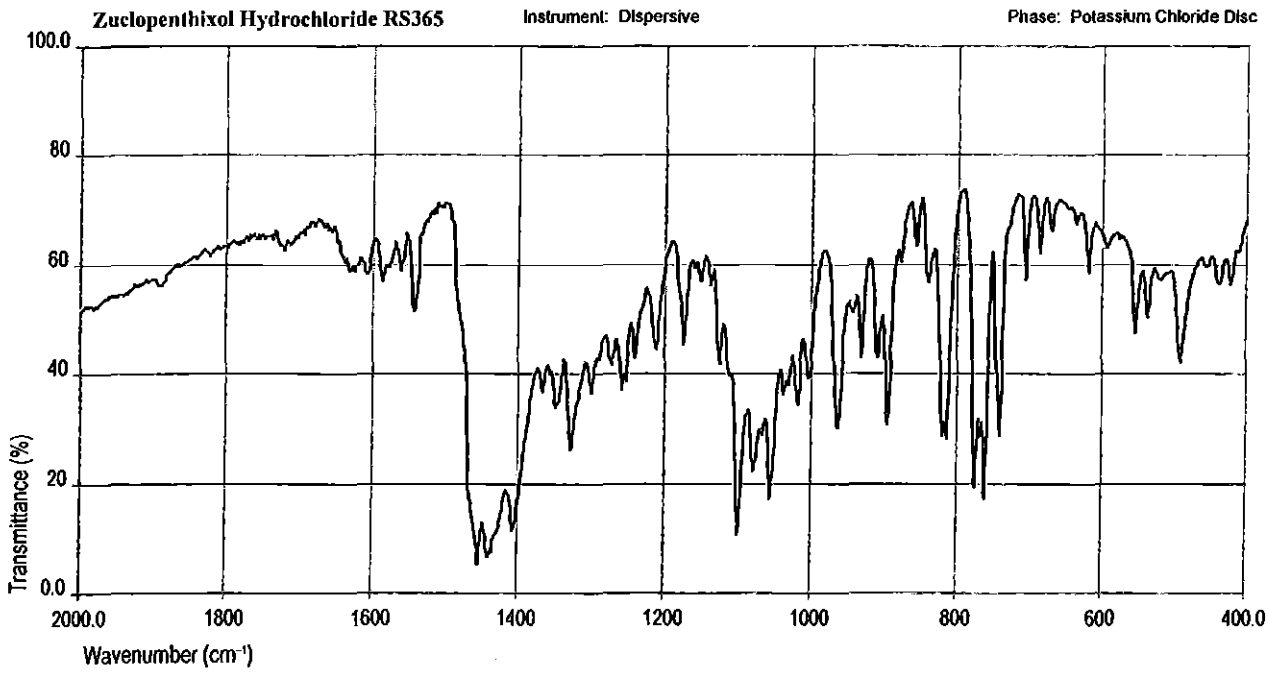












Appendices

Introduction

When a method, test or other matter described in an appendix is invoked in a monograph reproduced from the European Pharmacopoeia, Part III of the General Notices applies. When a method, test or other matter described in an appendix is invoked in any other monograph, Part II of General Notices applies.

Contents of the Appendices

EUROPEAN PHARMACOPOEIA EQUIVALENT TEXTS A15

APPENDIX I A23
A. General Reagents A23
B. Volumetric Reagents and Solutions A161
C. Standard Solutions A168
D. Buffer Solutions A173
E. Reference Materials A181
F. Polymorphism A181

APPENDIX II A183
A. Infrared Spectrophotometry A183
B. Ultraviolet and Visible Absorption Spectrophotometry A191
C. Nuclear Magnetic Resonance Spectrometry A195
D. Atomic Spectrophotometry: Emission and Absorption A198
E. Fluorescence Spectrophotometry [Fluorimetry] A204
F. X-Ray Fluorescence Spectrometry A204
G. Mass Spectometry A206
1. Inductively Coupled Plasma-Mass Spectrometry A208
H. Raman Spectrometry A210
J. Flow Cytometry A212
K. Peptide Identification by Nuclear Magnetic Resonance Spectrometry A214
L. Chemical Imaging A214
M. Direct Amperometric and Pulsed Electrochemical Detection A220
N. Process Analytical Technology A221

APPENDIX III A224
Chromatographic Separation Techniques A224
A. Thin-layer Chromatography A231
B. Gas Chromatography A234
C. Size-exclusion Chromatography A235
D. Liquid Chromatography A238
E. Paper Chromatography A240
F. Electrophoresis A241
G. Capillary Electrophoresis A247
H. Supercritical Fluid Chromatography A252
J. Isoelectric Focusing A252
K. Peptide Mapping A254
L. Amino Acid Analysis A258
M. Glycan Analysis of Glycoproteins A265

APPENDIX IV A271
A. Clarity of Solution A271
B. Colour of Solution A272

APPENDIX V A276
Determination of: A276

A. Melting Point A276
B. Freezing Point A279
C. Distillation Range A279
D. Boiling Point A280
E. Refractive Index A280
F. Optical Rotation and Specific Optical Rotation A281
G. Weight per Millilitre, Density, Relative Density and Apparent Density A281
H. Viscosity A283
J. Circular Dichroism A287
K. Approximate pH of Solutions A289
L. Determination of pH Values A289
M. Thermal Analysis A290
N. Osmolality A293
O. Conductivity A294
P. Total Organic Carbon in Water for Pharmaceutical Use A296
Q. Density of Solids A296
R. Detection and Measurement of Radioactivity A297

APPENDIX VI A305
Qualitative Reactions and Tests A305

APPENDIX VII A309
Nessler Cylinders A309
Tubes for Comparative Tests A309
Limit Test for: A309
Aluminium A309
Ammonium A309
Arsenic A309
Calcium A310
Chlorides A310
Fluorides A310
Heavy Metals A311
Iron A314
Lead in Sugars A314
Magnesium A314
Magnesium and Alkaline-earth Metals A314
Heavy Metals in Herbal Drugs and Herbal Drug Preparations A314
Nickel in Polyols A316
Phosphates A317
Potassium A317
Sulfates A317

APPENDIX VIII A317
A. Non-aqueous Titration A317
B. Amperometric, Potentiometric and Voltametric Titrations A317
C. Oxygen-flask Combustion A318
D. Complexometric Titrations A319

E. Potentiometric Determination of Ionic Concentration using Ion-selective Electrodes A319
F. Determination of Ethanol A320
G. Determination of Methanol and Propan-2-ol A323
H. Determination of Nitrogen A325
J. Tetrazolium Assay of Steroids A325
K. Ethylene Glycol and Diethylene Glycol in Ethoxylated Substances A325
L. Residual Solvents A326
M. Residual Ethylene Oxide and Dioxan A331
N. *N,N*-Dimethylaniline A332
O. 2-Ethylhexanoic Acid A332
P. Total Protein A333
Q. Acetic Acid in Synthetic Peptides A336
R. Nickel in Hydrogenated Vegetable Oils A336
S. Methyl, Ethyl and Isopropyl Methanesulfonate in Methanesulfonic Acid A337
T. Methyl, Ethyl and Isopropyl Methanesulfonate in Active Substances A338
V. Methanesulfonyl Chloride in Methanesulfonic Acid A339
W. Determination of Elemental Impurities A340
X. Methyl, Ethyl and Isopropyl Toluenesulfonate in Active Substances A343
Y. Methyl, Ethyl and Isopropyl Benzenesulfonate in Active Substances A344
Z. Tetrabutylammonium in Radiopharmaceutical Preparations A345

APPENDIX IX A346
Determination of: A346
A. Sulfated Ash A346
B. Sulfur Dioxide A346
C. Water A347
D. Loss on Drying A349
E. Limit Test for Carbon Monoxide in Medicinal Gases A350
F. Carbon Dioxide in Medicinal Gases A351
G. Nitrogen Monoxide and Nitrogen Dioxide in Medicinal Gases A351
H. Oxygen in Medicinal Gases A352
J. Water in Medicinal Gases A352
K. Gas Detector Tubes A352
L. Nitrous Oxide in Gases A353
M. Water-Solid Interactions: Determination of Sorption-Desorption Isotherms and of Water Activity A353

APPENDIX X A357
A. Acetyl Value A357
B. Acid Value A357
C. Ester Value A357
D. Hydroxyl Value A358
E. Iodine Value A358
F. Peroxide Value A359
G. Saponification Value A360
H. Unsaponifiable Matter A360

J. Determination of Cineole A361
K. Determination of Aldehydes A361
L. Oxidising Substances A361
M. Essential Oils A361
N. Fixed Oils A362
O. Anisidine Value A366
P. Oils Rich in Omega-3-acids A366
1. Composition of Fatty Acids A366
2. Total Cholesterol in Oils Rich in Omega-3-Acids A368
Q Sterols in Fatty Oils A369

APPENDIX XI A372
A. Total Solids A372
B1. Ethanol-soluble Extractive A372
B2. Water-soluble Extractive A372
C. Swelling Index A372
D. Foreign Matter A372
E. Essential Oils in Herbal Drugs A373
F. Continuous Extraction of Drugs A374
G. Complete Extraction of Alkaloids A374
H. Stomata A375
J. Ash A375
K. Acid-insoluble Ash A375
L. Pesticide Residues A375
M. Tannins in Herbal Drugs A377
N. Bitterness Value A377
O. Foam Index A378
P. Dry Residue of Extracts A379
Q. Loss on Drying of Extracts A379
R. Test for Aristolochic Acids in Herbal Drugs A379
1. Test for Aristolochic Acids in Herbal Drugs A379
2. Test for Aristolochic Acids I and II in Herbal Drugs A381
S. Determination of Mycotoxins in Herbal Drugs A381
1. Determination of Aflatoxin B_1 in Herbal Drugs A381
2. Determination of Ochratoxin A in Herbal Drugs A383
T. Herbal Drugs: Sampling and Sample Preparation A384
U. Microscopic Examination of Herbal Drugs A385
V. Deoxyribonucleic acid (DNA) Based Identification Techniques for Herbal Drugs A386
W. High-performance Thin-Layer Chromatography of Herbal Drugs and Herbal Drug Preparations A391

APPENDIX XII A392
A. Disintegration A392
1. Disintegration Test for Tablets and Capsules A392
2. Disintegration Test for Suppositories and Pessaries A395

B. Dissolution A398
1. Dissolution Test for Tablets and Capsules (Dissolution Test for Solid Dosage Forms) A398
2. Dissolution Test for Transdermal Patches A405
3. Dissolution Test for Lipophilic Solid Dosage Forms A408
4. Drug Release from Medicated Chewing Gum A409
5. Intrinsic Dissolution A412
6. Apparent Dissolution A416
C. Consistency of Formulated Preparations A417
1. Uniformity of Weight (Mass) A417
2. Uniformity of Weight (Mass) of Delivered Doses from Multidose Containers A417
3. Uniformity of Content A417
4. Uniformity of Dosage Units A418
5. Extractable Volume of Parenteral Preparations A421
6. Vacant
7. Aerodynamic Assessment of Fine Particles – Fine Particle Dose and Particle Size Distribution A421
8. Preparations for Nebulisation: Characterisation A433
9. Demonstration of Uniformity of Dosage Units Using Larger Sample Sizes A436
10. Content of active ingredient on actuation of the valve test A437

APPENDIX XIII A440
Particulate Contamination A440
A. Sub-visible Particles A440
B. Visible Particles A443

APPENDIX XIV A443
Biological Assays and Tests A443
A. Microbiological Assay of Antibiotics A443
B. Immunochemical Methods A451
C. Test for Bacterial Endotoxins A452
D. Test for Pyrogens A458
E. Vacant
F. Test for Depressor Substances A459
G. Test for Histamine A460
H. Monocyte-Activation Test A460
I. Assay of Pancreatin A466
J. Blood and Related Products A468
Coagulants A468
A1. Assay of Human Coagulation Factor II A468
A2. Assay of Factor VII Fraction A469
A3. Assay of Factor VIII Fraction A470
A4. Assay of Factor IX Fraction A471
A5. Assay of Human Coagulation Factor X A471
A6. Assay of Human Coagulation Factor XI A472

A7. Activated Coagulation Factors A472
A8. Assay of Human von Willebrand factor A472
A9. Test for Prekallikrein Activator A473
A10. Assay of Human Plasmin Inhibitor A474
Anticoagulants A475
B1. Assay of Heparin in Coagulation Factors A475
B2. Assay of Heparin A475
B3. Assay of Human Antithrombin III A476
B4. Assay of Human Protein C A476
B5. Assay of Human Protein S A463
Immunoglobulins A478
C1. Test for Fc Function of Immunoglobulins A478
C2. Test for Anticomplementary Activity of Immunoglobulin A478
C3. Assay of Human anti-D Immunoglobulin A479
C4. Test for anti-D Antibodies in Human Immunoglobulin A481
C5. Anti-A and anti-B Haemagglutinins A484
Other blood-related components A484
D1. Assay of Human α-1-Proteinase Inhibitor A486
D2. Assay of Human C1-Esterase Inhibitor A486
K. Immunological Products A486
1. Assay of Diphtheria Vaccine (Adsorbed) A486
2. Assay of Pertussis Vaccine (Whole Cell) A486
3. Assay of Tetanus Vaccine (Adsorbed) A491
4. Assay of Hepatitis A Vaccine A496
5. Assay of Hepatitis B Vaccine (rDNA) A496
6. Assay of Pertussis Vaccine (Acellular) A497
7. *In vivo* Assay of Poliomyelitis Vaccine (Inactivated) A499
8. Flocculation Value (Lf) of Diphtheria and Tetanus Toxins and Toxoids (Ramon Assay) A500
9. Residual Pertussis Toxin and Irreversibility of Pertussis A501
L. Nucleic Acid Amplification Techniques A503
M. Assay of Interferons A508
N1. Numeration of CD34/CD45+ Cells in Haematopoietic Products A510
N2. Colony-forming Cell Assay for Human Haematopoietic Progenitor Cells A512
N3. Nucleated Cell Count and Viability A513
O1. Host-cell Protein Assays A514
O2. Quantification and Characterisation of Residual Host-cell DNA
P. Determination of Bactericidal, Fungicidal or Yeasticidal Activity of Antiseptic Medicinal Products A521

APPENDIX XV A523
Production and Testing of Vaccines A523
A. Terminology used in Monographs on Biological Products A523
B. Aluminium in Adsorbed Vaccines A523
C. Calcium in Adsorbed Vaccines A524
D. Free Formaldehyde A524

E. Phenol in Immunosera (Antisera) and Vaccines A524
F. Neurovirulence A524
G. Composition of Polysaccharide Vaccines A525
H. Chicken Flocks Free From Specified Pathogens for the Production and Quality Control of Vaccines A527
J. Cell Substrates for the Production of Vaccines for Human Use A530
K. Carrier Proteins for the Production of Conjugated Polysaccharide Vaccines for Human Use A534
L. Immunonephelometry for Vaccine Component Assay A535
M. Substitution of in Vivo Method(s) by in Vitro Method(s) for the Quality Control of Vaccines A536

APPENDIX XVI A539
A. Test for Sterility A539
B. Microbiological Examination of Non-sterile Products A543
1. Test for Specified Micro-organisms A543
2. Microbial Enumeration Tests A547
3. Test for Absence of Mycoplasmas A551
4. Mycobacteria A556
5. Extraneous Agents in Viral Vaccines A556
C. Efficacy of Antimicrobial Preservation A559
D. Microbiological Quality of Non-sterile Pharmaceutical Preparations and Substances for Pharmaceutical Use A560
E. Microbiological Examination of Cell-Based Preparations A561
F. Microbiological Examination of Herbal Medicinal Products for Oral Use and Extracts used in their Preparation A564
G. Microbiological Quality of Herbal Medicinal Products for Oral Use and Extracts used in their Preparation A566
H. Microbiological Examination of Live Biotherapeutic Products A567

APPENDIX XVII A576
A. Particle Size of Powders A576
1. Particle Size Classification of Powders A576
2. Powder Fineness A577
B. Sieves and Filters A577
1. Sieves A577
2. Filters A578
3. Particle-size Distribution Estimation by Analytical Sieving A578
C. Specific Surface Area by Air Permeability A581
D. Vacant
E. Flowability A583
F. Measurement of Consistency and Texture Analysis A584
1. Measurement of Consistency by Penetrometry A584
2. Texture Analysis of Semi-solids or Gels A586
G. Friability A586
1. Friability of Uncoated Tablets A586
2. Friability of Granules and Spheroids A587
H. Resistance to Crushing of Tablets A589

J. Softening Time Determination of Lipophilic Suppositories A589
K. Pycnometric Density of Solids A590
L. Vacant
M. Specific Surface Area by Gas Adsorption A591
N1. Powder Flow A594
N2. Powder Flow Properties by Shear Cell Methods A597
O1. Optical Microscopy A600
O2. Scanning Electron Microscopy A602
P. Particle Size Analysis by Laser Light Diffraction A606
Q. Characterisation of Crystalline and Partially Crystalline Solids by X-ray Powder Diffraction (XRPD) A610
R. Porosity and Pore-size Distribution of Solids by Mercury Porosimetry A616
S. Bulk Density and Tapped Density of Powders A618
T. Wettability of Porous Solids Including Powders A621
U. Crystallinity A624
V. Characterisation of Crystalline Solids by Microcalorimetry and Solution Calorimetry A625

APPENDIX XVIII A628
Methods of Sterilisation A628

APPENDIX XIX A636
Containers A636
A. Introduction A636
B. Glass Containers for Pharmaceutical Use A636
C. Plastic Containers and Closures A643
1. Plastic Containers for Aqueous Solutions for Parenteral Infusions A643
D. Containers for Blood and Blood Components A644
1. Sterile Plastic Containers for Blood and Blood Components A644
2. Empty Sterile Containers of Plasticised Poly(Vinyl Chloride) for Human Blood and Blood Components A646
3. Sterile Containers of Plasticised Poly(Vinyl Chloride) for Human Blood Containing Anticoagulant Solution A647
E. Rubber Closures for Containers for Aqueous Parenteral Preparations A648
F. Sets for the Transfusion of Blood and Blood Components A650
G. Sterile Single-use Plastic Syringes A652

APPENDIX XX A654
Materials Used for the Manufacture of Containers A654
A. Materials for Containers for Human Blood and Blood Components A654
1. Materials Based on Plasticised Poly(Vinyl Chloride) for Containers for Human Blood and Blood Components A654
2. Materials Based on Plasticised Poly(Vinyl Chloride) for Tubing Used in Sets for the Transfusion of Blood and Blood Components A658
3. Materials Based on Non-plasticised Poly(Vinyl Chloride) for Containers for Non-injectable, Aqueous Solutions A661
4. Materials Based on Non-plasticised Poly(Vinyl Chloride) for Containers for Solid Dosage forms for Oral Administration A663

5. Materials Based on Plasticised Poly(Vinyl Chloride) for Containers for Aqueous Solutions for Intravenous Infusion A665
B. Polyolefins A669
C. Polyethylene A673
1. Polyethylene Without Additives for Containers for Parenteral Preparations and for Ophthalmic Preparations A673
2. Polyethylene With Additives for Containers for Parenteral and for Ophthalmic Preparations A674
D. Polypropylene for Containers and Closures for Parenteral Preparations and Ophthalmic Preparations A677
E. Poly(ethylene - vinyl acetate) for Containers and Tubing for Total Parenteral Nutrition Preparations A681
F. Silicone A683
1. Silicone Oil Used as a Lubricant A683
2. Silicone Elastomer for Closures and Tubing A684
G. Plastic Additives A685
H. Polyethylene Terephthalate for Containers for Preparations not for Parenteral Use A691

APPENDIX XXI A693
A. Abbreviated Titles A693
B. Approved Synonyms A693
C. Eye Drops A706

APPENDIX XXII A707
A. Viral Safety A707
B. Minimising the Risk of Transmitting Animal Spongiform Encephalopathy Agents via Human and Veterinary Medicinal Products A707

APPENDIX XXIII A721
Weights and Measures A721
B. Conversion Tables for Commonly Used Units A721

APPENDIX XXIV A722
Abbreviations A722

APPENDIX XXV A723
Names, Symbols and Atomic Weights of Elements A723

European Pharmacopoeia Equivalent Texts

In monographs reproduced from the European Pharmacopoeia the analytical methods, tests and other supporting texts are invoked by means of the reference number of the text in the General Chapters of the European Pharmacopoeia.

The table below lists the contents of the General Chapters of the European Pharmacopoeia and gives the British Pharmacopoeia or British Pharmacopoeia (Veterinary) equivalents. It is provided for information but it is emphasised that, for texts of the European Pharmacopoeia, in cases of doubt or dispute the text published by the Council of Europe is authoritative. Appendices of the British Pharmacopoeia (Veterinary) are identified by inclusion of '(Vet)' after the Appendix letter, for example, Appendix XV J (Vet)[1].

Ph. Eur.	Subject of text	British Pharmacopoeia reference
1	General Notices	[1]
2.1.1	Droppers	Appendix I A
2.1.2	Sintered-glass Filters	Appendix XVII B2
2.1.3	UV lamps	Appendix III A
2.1.4	Sieves	Appendix XVII B1
2.1.5	Tubes for Comparative Tests	Appendix VII
2.1.6	Gas detector tubes	Appendix IX K
2.2.1	Clarity and Degree of Opalescence of Liquids	Appendix IV A
2.2.2	Degree of Coloration of Liquids	Appendix IV B
2.2.3	Potentiometric Determination of pH	Appendix V L
2.2.4	Approximate pH of Solutions	Appendix V K
2.2.5	Relative Density	Appendix V G
2.2.6	Refractive Index	Appendix V E
2.2.7	Optical Rotation	Appendix V F
2.2.8	Viscosity	Appendix V H
2.2.9	Capillary Viscometer Method	Appendix V H, Method II
2.2.10	Rotating Viscometer Method	Appendix V H, Method III
2.2.11	Distillation Range	Appendix V C
2.2.12	Boiling Point	Appendix V D
2.2.13	Water by Distillation Range	Appendix IX C, Method II
2.2.14	Melting point: Capillary Method	Appendix V A, Method I
2.2.15	Melting point: Open Capillary Method	Appendix V A, Method IV
2.2.16	Melting point: Instantaneous Method	Appendix V A, Method V
2.2.17	Drop Point	Appendix V A, Method III
2.2.18	Freezing Point	Appendix V B
2.2.19	Amperometric Titration	Appendix VIII B
2.2.20	Potentiometric Titration	Appendix VIII B
2.2.21	Fluorimetry	Appendix II E
2.2.22	Atomic Emission Spectrometry	Appendix II D
2.2.23	Atomic Absorption Spectrometry	Appendix II D
2.2.24	Infrared Spectrophotometry	Appendix II A
2.2.25	Visible and Ultraviolet Spectrophotometry	Appendix II B
2.2.26	Paper Chromatography	Appendix III E
2.2.27	Thin-layer Chromatography	Appendix III A
2.2.28	Gas Chromatography	Appendix III B
2.2.29	Liquid Chromatography	Appendix III D
2.2.30	Size-exclusion Chromatography	Appendix III C
2.2.31	Electrophoresis	Appendix III F
2.2.32	Loss on Drying	Appendix IX D
2.2.33	Nuclear Magnetic Resonance Spectrometry	Appendix II C
2.2.34	Thermogravimetry	Appendix V M
2.2.35	Osmolality	Appendix V N
2.2.36	Ion-selective Potentiometry	Appendix VIII E
2.2.37	X-ray Fluorescent Spectrophotometry	Appendix II F
2.2.38	Conductivity	Appendix V O
2.2.39	Molecular Mass Distribution in Dextrans	Appendix III C
2.2.40	Near-Infrared Spectroscopy	Appendix II A

[1] *Reproduced in full as Part III of the General Notices of the British Pharmacopoeia and British Pharmacopoeia (Veterinary).*

2.2.41	Circular Dichroism	Appendix V J
2.2.42	Density of Solids	Appendix V Q
2.2.43	Mass Spectrometry	Appendix II G
2.2.44	Total Organic Carbon in Water	Appendix V P
2.2.45	Supercritical Fluid Chromatography	Appendix III H
2.2.46	Chromatographic Separation Techniques	Appendix III
2.2.47	Capillary Electrophoresis	Appendix III G
2.2.48	Raman Spectroscopy	Appendix II H
2.2.49	Falling Ball and Automatic Rolling Ball Viscometer Methods	Appendix V H, Method IV
2.2.54	Isoelectric Focussing	Appendix III J
2.2.55	Peptide Mapping	Appendix III K
2.2.56	Amino Acid Analysis	Appendix III L
2.2.57	Inductively Coupled Plasma-Atomic Emission Spectrometry	Appendix II D
2.2.58	Inductively Coupled Plasma-Mass Spectrometry	Appendix II G1
2.2.59	Glycan Analysis of Glycoproteins	Appendix III M
2.2.60	*Vacant*	
2.2.61	Characterisation of Crystalline Solids by Microcalorimetry and Solution Calorimetry	Appendix XVII V
2.2.63	Direct Amperometric and Pulsed Electrochemical Detection	Appendix II M
2.2.64	Peptide Identification by Nuclear Magnetic Resonance Spectrometry	Appendix II K
2.2.65	Voltametric Titration	Appendix VIII B
2.2.66	Detection and Measurement of Radioactivity	Appendix V R
2.3.1	Identification Reactions	Appendix VI
2.3.2	Identification of Fatty Oils by TLC	Appendix X N
2.3.3	Identification of Phenothiazines by TLC	Appendix III A
2.3.4	Odour	Appendix VI
	Limit test for:	
2.4.1	– Ammonium	Appendix VII
2.4.2	– Arsenic	Appendix VII
2.4.3	– Calcium	Appendix VII
2.4.4	– Chlorides	Appendix VII
2.4.5	– Fluorides	Appendix VII
2.4.6	– Magnesium	Appendix VII
2.4.7	– Magnesium and Alkaline-earth Metals	Appendix VII
2.4.8	– Heavy Metals	Appendix VII
2.4.9	– Iron	Appendix VII
2.4.10	– Lead in Sugars	Appendix VII
2.4.11	– Phosphates	Appendix VII
2.4.12	– Potassium	Appendix VII
2.4.13	– Sulfate	Appendix VII
2.4.14	Sulfated Ash	Appendix IX A, Method II
2.4.15	Limit test for Nickel in Polyols	Appendix VII
2.4.16	Total Ash	Appendix XI J, Method II
2.4.17	Limit test for Aluminium	Appendix VII
2.4.18	Free Formaldehyde	Appendix XV D
2.4.19	Alkaline Impurities in Fatty Oils	Appendix X N
2.4.20	Determination of Elemental Impurities	Appendix VIII W
2.4.21	Foreign Oils in Fatty Oils by TLC	Appendix X N
2.4.22	Composition of Fatty Acids by Gas Chromatography	Appendix X N
2.4.23	Sterols in Fatty Oils	Appendix X Q
2.4.24	Residual Solvents	Appendix VIII L
2.4.25	Residual Ethylene Oxide and Dioxan	Appendix VIII M
2.4.26	*N,N*-Dimethylaniline	Appendix VIII N
2.4.27	Heavy Metals in Herbal Drugs and Fatty Oils	Appendix VII
2.4.28	2-Ethylhexanoic acid	Appendix VIII O
2.4.29	Composition of Fatty Acids in Oils Rich in Omega-3-acids	Appendix X P1
2.4.30	Ethylene Glycol and Diethylene Glycol in Ethoxylated Substances	Appendix VIII K
2.4.31	Nickel in Hydrogenated Vegetable Oils	Appendix VIII R
2.4.32	Total Cholesterol in Oils Rich in Omega-3 Acids	Appendix X P2
2.4.33	Tetrabutylammonium in Radiopharmaceutical Preparations	Appendix VIII Z
2.5.1	Acid Value	Appendix X B
2.5.2	Ester Value	Appendix X C
2.5.3	Hydroxyl Value	Appendix X D
2.5.4	Iodine Value	Appendix X E

2.5.5	Peroxide Value	Appendix X F
2.5.6	Saponification Value	Appendix X G, Method II
2.5.7	Unsaponifiable Matter	Appendix X H, Method II
2.5.8	Assay of Primary Aromatic Amino Nitrogen	Appendix VIII B
2.5.9	Semi-micro Determination of Nitrogen by Sulfuric Acid Digestion	Appendix VIII H
2.5.10	Oxygen-flask Method	Appendix VIII C
2.5.11	Complexometric Titrations	Appendix VIII D
2.5.12	Semi-micro Determination of Water	Appendix IX C, Method I
2.5.13	Aluminium in Adsorbed Vaccines	Appendix XV B
2.5.14	Calcium in Adsorbed Vaccines	Appendix XV C
2.5.15	Phenol in Immunosera and Vaccines	Appendix XV E
	Polysaccharide Vaccines:	
2.5.16	– Protein	Appendix XV G
2.5.17	– Nucleic Acids	Appendix XV G
2.5.18	– Phosphorus	Appendix XV G
2.5.19	– *O*-acetyl	Appendix XV G
2.5.20	– Hexosamines	Appendix XV G
2.5.21	– Methylpentoses	Appendix XV G
2.5.22	– Uronic Acids	Appendix XV G

Appendix I

Additional Information for Reagents

(Ph. Eur. text 4.0)

Additional information for reagents that can only be fully identified by a trademark or whose availability is limited may be found in the Knowledge database on the EDQM website. This information is given only to make it easier to obtain such reagents and this does not suggest in any way that the mentioned suppliers are especially recommended or certified by the European Pharmacopoeia Commission or the Council of Europe. It is therefore acceptable to use reagents from another source provided that they comply with the standards of the Pharmacopoeia.

A. General Reagents

(Ph. Eur. text 4.1)

Where the name of a substance or a solution is followed by the letter R (the whole in italics), this indicates a reagent included in the following list. The specifications given for reagents do not necessarily guarantee their quality for use in medicines.

Within the description of each reagent there is a 7-digit reference code in italics (for example, *1002501*). This number, which will remain unchanged for a given reagent during subsequent revisions of the list, is used for identification purposes by the Secretariat, and users of the Pharmacopoeia may also find it useful, for example in the management of reagent stocks. The description may also include a CAS number (Chemical Abstract Service Registry Number) recognisable by its typical format, for example 9002-93-1.

Some of the reagents included in the list are toxic and are to be handled in conformity with good quality control laboratory practice.

Reagents in aqueous solution are prepared using *water R*. For liquid chromatography, *water for chromatography R* is used for the preparation of mobile phases when water, or an aqueous solution, is one of the components. Where a reagent solution is described using an expression such as 'hydrochloric acid (10 g/L HCl)', the solution is prepared by an appropriate dilution with *water R* of a more concentrated reagent solution specified in this chapter. Reagent solutions used in the limit tests for barium, calcium and sulfates are prepared using *distilled water R*. Where the name of the solvent is not stated, an aqueous solution is intended.

The reagents and reagent solutions are to be stored in well-closed containers. The labelling should comply with the relevant national legislation and international agreements.

Droppers

(Ph. Eur. text 2.1.1)

The term 'drops' means standard drops delivered from a standard dropper as described below.

Standard droppers (Figure 2.1.1.-1) are constructed of practically colourless glass. The lower extremity has a circular orifice in a flat surface at right angles to the axis.

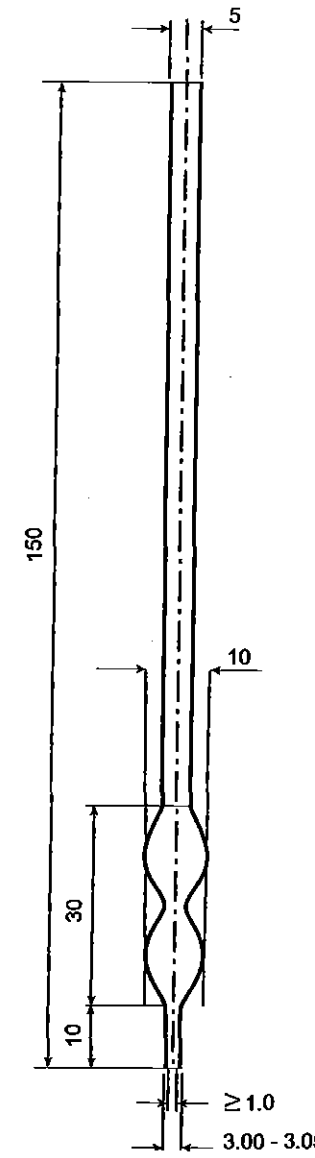

Figure 2.1.1.-1. – *Standard dropper*
Dimensions in millimetres

Other droppers may be used provided they comply with the following test.

20 drops of *water R* at 20 ± 1 °C flowing freely from the dropper held in the vertical position at a constant rate of 1 drop per second weighs 1000 ± 50 mg.

The dropper must be carefully cleaned before use. Carry out 3 determinations on any given dropper. No result may deviate by more than 5 per cent from the mean of the 3 determinations.

Acacia See *Acacia (0307)*.

Acacia Solution

Dissolve 100 g of *acacia R* in 1000 mL of *water R*. Stir with a mechanical stirrer for 2 h. Centrifuge at about 2000 *g* for 30 min to obtain a clear solution.

Storage: in polyethylene containers of about 250 mL capacity at a temperature of 0 °C to −20 °C.

Acebutolol Hydrochloride *(34381-68-5)*

See *Acebutolol hydrochloride (0871)*.

Acetal Acetaldehyde diethyl acetal; 1,1-Diethoxyethane; $C_6H_{14}O_2$ = 118.2 *(105-57-7)*

Clear, colourless, volatile liquid, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: about 0.824.

n_D^{20}: about 1.382.

bp: about 103 °C.

Acetaldehyde Ethanal; C_2H_4O = 44.1 (*75-07-0*)

Clear, colourless flammable liquid, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: about 0.788.

n_D^{20}: about 1.332.

bp: about 21 °C.

Acetaldehyde Ammonia Trimer Trihydrate 2,4,6-Trimethylhexahydro-1,3,5-triazine trihydrate; $C_6H_{15}N_3,3H_2O$ = 183.3 (*58052-80-5*)

mp: 95 °C to 97 °C.

Content: minimum 95.0 per cent.

Colourless or white or pale yellow crystals or powder

Assay. Dissolve 0.900 g in *water R* and dilute to 50.0 mL with the same solvent. Titrate with *1 M hydrochloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *1 M hydrochloric acid* is equivalent to 61.08 mg of $C_6H_{15}N_3,3H_2O$.

Acetamide C_2H_5NO = 59.07 (*60-35-5*)

mp: about 78°.

General reagent grade of commerce.

Acetic Acid

Content: 290 g/L to 310 g/L of $C_2H_4O_2$ (M_r 60.1).

Dilute 30 g of *glacial acetic acid R* to 100 mL with *water R*.

Acetic Acid (6 per cent) Acetic acid, dilute R1

Content: 57.5 g/L to 62.5 g/L (M_r 60.1).

Dilute 6 g of *glacial acetic acid R* to 100 mL with *water R*.

Acetic Acid, Anhydrous Anhydrous glacial acetic acid; $C_2H_4O_2$ = 60.1 (*64-19-7*)

Content: minimum 99.6 per cent *m/m* of $C_2H_4O_2$.

Colourless liquid or white or almost white, shining, fern-like crystals, miscible with or very soluble in water, in ethanol (96 per cent), in glycerol (85 per cent), and in most fatty and essential oils.

d_{20}^{20}: 1.052 to 1.053.

bp: 117 °C to 119 °C.

A 100 g/L solution is strongly acid (*2.2.4*).

A 5 g/L solution neutralised with *dilute ammonia R2* gives reaction (b) of acetates (*2.3.1*).

Freezing point (*2.2.18*): minimum 15.8 °C.

Water (*2.5.12*): maximum 0.4 per cent. If the water content is more than 0.4 per cent it may be adjusted by adding the calculated amount of *acetic anhydride R*.

Storage: protected from light.

Acetic Acid, Dilute

Content: 115 g/L to 125 g/L of $C_2H_4O_2$ (M_r 60.1).

Dilute 12 g of *glacial acetic acid R* to 100 mL with *water R*.

Acetic Acid, Glacial $C_2H_4O_2$ = 60.1 (*64-19-7*)

See *Acetic acid, glacial (0590)*.

Solutions of molarity *x*M should be prepared by diluting 57*x* mL (60*x* g) of glacial acetic acid to 1000 mL with *water*.

Acetic Anhydride $C_4H_6O_3$ = 102.1 (*108-24-7*)

Content: minimum 97.0 per cent *m/m* of $C_4H_6O_3$.

Clear, colourless liquid.

bp: 136 °C to 142 °C.

Assay. Dissolve 2.00 g in 50.0 mL of *1 M sodium hydroxide* in a ground-glass-stoppered flask and boil under a reflux condenser for 1 h. Titrate with *1 M hydrochloric acid*, using 0.5 mL of *phenolphthalein solution R* as indicator. Calculate the number of millilitres of *1 M sodium hydroxide* required for 1 g (n_1). Dissolve 2.00 g in 20 mL of *cyclohexane R* in a ground-glass-stoppered flask, cool in ice and add a cold mixture of 10 mL of *aniline R* and 20 mL of *cyclohexane R*. Boil the mixture under a reflux condenser for 1 h, add 50.0 mL of *1 M sodium hydroxide* and shake vigorously. Titrate with *1 M hydrochloric acid*, using 0.5 mL of *phenolphthalein solution R* as indicator. Calculate the number of millilitres of *1 M sodium hydroxide* required for 1 g (n_2). Calculate the percentage of $C_4H_6O_3$ from the following expression:

$$10.2(n_1 - n_2)$$

Acetic Anhydride Solution R1

Dissolve 25.0 mL of *acetic anhydride R* in *anhydrous pyridine R* and dilute to 100.0 mL with the same solvent.

Storage: protected from light and air.

Acetic Anhydride–Dioxan Solution

Add 1 mL of *acetic anhydride* to 50 mL of *1,4-dioxan*.

Acetic Anhydride–Sulfuric Acid Solution

Carefully mix 5 mL of *acetic anhydride R* with 5 mL of *sulfuric acid R*. Add dropwise and with cooling to 50 mL of *anhydrous ethanol R*.

Prepare immediately before use.

Acetone Propan-2-one; (*67-64-1*)

See *Acetone (0872)*.

Acetonitrile Methyl cyanide; Ethanenitrile; C_2H_3N = 41.05 (*75-05-8*)

Clear, colourless liquid, miscible with water, with acetone and with methanol.

d_{20}^{20}: about 0.78.

n_D^{20}: about 1.344.

A 100 g/L solution is neutral to litmus paper.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 80 °C and 82 °C.

Acetonitrile used in spectrophotometry complies with the following additional test.

Absorbance (*2.2.25*): maximum 0.01 from 255 nm to 420 nm, determined using *water R* as compensation liquid.

Acetonitrile for Chromatography

See *Acetonitrile R*.

Acetonitrile used in chromatography complies with the following additional tests.

Absorbance (*2.2.25*): maximum 0.01 at 240 nm and higher wavelengths, determined using *water R* as compensation liquid.

Content (*2.2.28*): minimum 99.8 per cent.

Acetonitrile R1

Complies with the requirements prescribed for *acetonitrile R* and with the following additional requirements.

Content: minimum 99.9 per cent.

Absorbance (*2.2.25*): maximum 0.10, determined at 200 nm using *water R* as the compensation liquid.

Acetoxyvalerenic Acid (2*E*)-3-[(1*RS*,4*S*,7*R*,7a*R*)-1-(Acetyloxy)-3,7-dimethyl-2,4,5,6,7,7a-hexahydro-1*H*-inden-4-yl]-2-methylprop-2-enoic acid; $C_{17}H_{24}O_4$ = 292.4 (*81397-67-3*)

Colourless or pale yellow viscous oil.

Absorbance (*2.2.25*). A solution in *methanol R* shows an absorption maximum at about 216 nm.

Acetyl Chloride C_2H_3ClO = 78.5 (*75-36-5*)

Clear, colourless liquid, flammable, decomposes in contact with water and with ethanol (96 per cent), miscible with ethylene chloride.

d_{20}^{20}: about 1.10.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 49 °C and 53 °C.

Acetylacetamide 3-Oxobutanamide; $C_4H_7NO_2$ = 101.1 (*5977-14-0*)

mp: 53 °C to 56 °C.

Acetylacetone 2,4-Pentanedione; $C_5H_8O_2$ = 100.1 (*123-54-6*)

Colourless or slightly yellow, easily flammable liquid, freely soluble in water, miscible with acetone, with ethanol (96 per cent) and with glacial acetic acid.

n_D^{20}: 1.452 to 1.453.

bp: 138 °C to 140 °C.

Acetylacetone Reagent R1

To 100 mL of *ammonium acetate solution R* add 0.2 mL of *acetylacetone R*.

Acetylacetone Reagent R2

Dissolve 0.2 mL of *acetylacetone R*, 3 mL of *glacial acetic acid R* and 25 g of *ammonium acetate R* in *water R* and dilute to 100 mL with the same solvent.

4-Acetylbiphenyl 4-Phenylacetophenone; $C_{14}H_{12}O$ = 196.2 (*51-42-3*)

mp: about 117°.

General reagent grade of commerce.

***N*-Acetyl-ε-caprolactam** *N*-Acetylhexane-6-lactam; $C_8H_{13}NO_2$ = 155.2 (*1888-91-1*)

Colourless liquid, miscible with anhydrous ethanol.

d_{20}^{20}: about 1.100.

n_D^{20}: about 1.489.

bp: about 135 °C.

Acetylcholine Chloride $C_7H_{16}ClNO_2$ = 181.7 (*60-31-1*)

Crystalline powder, very soluble in cold water and in ethanol (96 per cent). It decomposes in hot water and in alkalis.

Storage: at −20 °C.

***N*-Acetyl-L-cysteine** $C_5H_9NO_3S$ = 163.2 (*616-91-1*)

$[\alpha]_D^{20}$: about +4.6.

mp: about 110°.

General reagent grade of commerce.

Acetylene Ethyne; C_2H_2 = 26.04 (*74-86-2*)

Content: minimum 99.0 per cent *V/V*.

Acetyleugenol 2-Methoxy-4-(2-propenyl)phenylacetate; $C_{12}H_{14}O_3$ = 206.2 (*93-28-7*)

Yellow coloured, oily liquid, practically insoluble in water, freely soluble in ethanol (96 per cent).

n_D^{20}: about 1.521.

bp: 281 °C to 282 °C.

Acetyleugenol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Clove oil (1091)*.

Test solution. The substance to be examined.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

***N*-Acetylglucosamine** 2-(Acetylamino)-2-deoxy-D-glucopyranose; $C_8H_{15}NO_6$ = 221.2 (*7512-17-6*)

mp: about 202 °C.

Acetyl-11-keto-β-boswellic Acid 3α-(Acetyloxy)-11-oxours-12-en-24-oic acid; (4β)-3α-(Acetyloxy)-11-oxours-12-en-23-oic acid; $C_{32}H_{48}O_5$ = 512.7 (*67416-61-9*)

White or almost white powder, insoluble in water, soluble in acetone, in anhydrous ethanol and in methanol.

mp: 271 °C to 274 °C.*Acetyl-11-keto-β-boswellic acid used in liquid chromatography complies with the following additional test.*

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph on *Indian frankincense (2310)*.

Content: minimum 90 per cent, calculated by the normalisation procedure.

N-(α)-Acetyl-L-lysine (2*S*)-2-Acetamido-6-aminohexanoic acid; $C_8H_{16}N_2O_3$ = 188.2 (*1946-82-3*)

N-(ε)-Acetyl-L-lysine (2*S*)-6-Acetamido-2-aminohexanoic acid; $C_8H_{16}N_2O_3$ = 188.2 (*692-04-6*)

***N*-Acetylneuraminic Acid** Sialic acid; $C_{11}H_{19}NO_9$ = 309.3 (*131-48-6*)

White or almost white acicular crystals, soluble in water and in methanol, slightly soluble in anhydrous ethanol, practically insoluble in acetone.

$[\alpha]_D^{20}$: about −36, determined on a 10 g/L solution.

mp: about 186 °C, with decomposition.

Acetylsalicylic Acid 2-(Acetyloxy)benzoic acid; $C_9H_8O_4$ = 180.2 (*50-78-2*)

White or almost white, crystalline powder or colourless crystals, slightly soluble in water, freely soluble in ethanol (96 per cent).

***N*-Acetyltryptophan** 2-Acetylamino-3-(indol-3-yl) propanoic acid; $C_{13}H_{14}N_2O_3$ = 246.3 (*1218-34-4*)

White or almost white powder or colourless crystals, slightly soluble in water. It dissolves in dilute solutions of alkali hydroxides.

mp: about 205 °C.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Tryptophan (1272)*.

Test solution. Dissolve 10.0 mg in a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R* and dilute to 100.0 mL with the same mixture of solvents.

Content: minimum 99.0 per cent, calculated by the normalisation procedure.

Acetyltyrosine Ethyl Ester Ethyl *N*-acetyl-L-tyrosinate; $C_{13}H_{17}NO_4,H_2O$ = 269.3 (*36546-50-6*)

White or almost white, crystalline powder suitable for the assay of chymotrypsin.

$[\alpha]_D^{20}$: + 21 to + 25, determined on a 10 g/L solution in *ethanol (96 per cent) R*.

$A_{1\,cm}^{1\%}$: 60 to 68, determined at 278 nm in *ethanol (96 per cent) R*.

Acetyltyrosine Ethyl Ester, 0.2M 0.2M Ethyl acetyltyrosinate

Dissolve 0.54 g of *acetyltyrosine ethyl ester R* in *ethanol (96 per cent) R* and dilute to 10.0 mL with the same solvent.

α1-Acid-glycoprotein Silica Gel for Chiral Separation
A very finely divided silica gel for chromatography consisting of spherical particles coated with α1-acid glycoprotein.

Acid Blue 83 Brilliant blue; Coomassie brilliant blue R 250; $C_{45}H_{44}N_3NaO_7S_2$ = 826 (*6104-59-2*)
Colour Index No. 42660
Brown powder insoluble in cold water, slightly soluble in boiling water and in anhydrous ethanol, soluble in sulfuric acid, glacial acetic acid and in dilute solutions of alkali hydroxides.

Acid Blue 90 Coomassie brilliant blue G; $C_{47}H_{48}N_3NaO_7S_2$ = 854 (*6104-58-1*)
Colour Index No. 42655
A dark brown powder, with a violet sheen and some particles having a metallic lustre, soluble in water and in anhydrous ethanol.
$A_{1\,cm}^{1\%}$: greater than 500, determined at 577 nm in a 0.01 g/L solution in buffer solution pH 7.0 and calculated with reference to the dried substance.
Loss on drying (*2.2.32*): maximum 5.0 per cent, determined on 0.500 g by drying in an oven at 105 °C.

Acid Blue 92 Coomassie blue; Anazolene sodium; Trisodium 8-hydroxy-4′-(phenylamino)azonaphthalene-3,5′,6-trisulfonate; $C_{26}H_{16}N_3Na_3O_{10}S_3$ = 696 (*3861-73-2*)
Colour Index No. 13390
Dark blue crystals, soluble in water, in acetone and in ethylene glycol monoethylether, slightly soluble in ethanol (96 per cent).

Acid Blue 92 Solution Coomassie blue solution
Dissolve 0.5 g of *acid blue 92 R* in a mixture of 10 mL of *glacial acetic acid R*, 45 mL of *ethanol (96 per cent) R* and 45 mL of *water R*.

Acid Blue 93 Methyl blue; Poirrier blue; $C_{37}H_{27}N_3Na_2O_9S_3$ = 800 (*28983-56-4*)
Colour Index No. 42780
Mixture of triphenylrosaniline di- and trisulfonate and of triphenylpararosaniline.
Dark blue powder.
Colour change: pH 9.4 to pH 14.0.

Acid Blue 93 Solution
Dissolve 0.2 g of *acid blue 93 R* in *water R* and dilute to 100 mL with the same solvent.

Acrylamide Propenamide; C_3H_5NO = 71.1 (*79-06-1*)
Colourless or white flakes or a white or almost white, crystalline powder, very soluble in water and in methanol, freely soluble in anhydrous ethanol.
mp: about 84 °C.

Acrylamide/bisacrylamide (29:1) Solution, 30 per cent
Prepare a solution containing 290 g of *acrylamide R* and 10 g of *methylenebisacrylamide R* per litre of *water R*. Filter.

Acrylamide/bisacrylamide (36.5:1) Solution, 30 per cent
Prepare a solution containing 292 g of *acrylamide R* and 8 g of *methylenebisacrylamide R* per litre of *water R*. Filter.

Acrylic Acid Prop-2-enoic acid; Vinylformic acid; $C_3H_4O_2$ = 72.1 (*79-10-7*)
Content: minimum 99 per cent.
It is stabilised with 0.02 per cent of hydroquinone monomethyl ether.
Corrosive liquid, miscible with water and ethanol (96 per cent). It polymerises readily in the presence of oxygen.
d_{20}^{20}: about 1.05.
n_D^{20}: about 1.421.
bp: about 141 °C.
mp: 12 °C to 15 °C.

Actein (23*R*,24*R*,25*S*,26*S*)-3β-(β-D-Xylopyranosyloxy)-16β,23:23,26:24,25-triepoxy-26-hydroxy-9,19-cyclolanostan-12β-yl acetate; $C_{37}H_{56}O_{11}$ = 677 (*18642-44-9*)

Acteoside 2-(3,4-Dihydroxyphenyl)ethyl 3-*O*-(6-deoxy-α-L-mannopyranosyl)-4-*O*-[(2*E*)-3-(3,4-dihydroxyphenyl)prop-2-enoyl]-β-D-glucopyranoside; Verbascoside; $C_{29}H_{36}O_{15}$ = 624.6 (*61276-17-3*)
Light yellowish powder, freely soluble in water and in methanol.
mp: about 140 °C, with decomposition.

Adamantane Tricyclo[3.3.1.1^{3,7}]decane; $C_{10}H_{16}$ = 136.2 (*281-23-2*)
mp: about 270 °C.

Adenine (*73-24-5*)
See *Adenine (0800)*.

Adenosine 6-Amino-9-β-D-ribofuranosyl-9*H*-purine; $C_{10}H_{13}N_5O_4$ = 267.2 (*58-61-7*)
White or almost white, crystalline powder, slightly soluble in water, practically insoluble in acetone and in ethanol (96 per cent). It dissolves in dilute solutions of acids.
mp: about 234 °C.

Adipic Acid $C_6H_{10}O_4$ = 146.1 (*124-04-9*)
Prisms, freely soluble in methanol, soluble in acetone, practically insoluble in light petroleum.
mp: about 152 °C.

Adrenaline (1*R*)-1-(3,4-Dihydroxyphenyl)-2-(methylamino)ethanol; 4-[(1*R*)-1-hydroxy-2-(methylamino) ethyl]benzene-1,2-diol; $C_9H_{13}NO_3$ = 183.2 (*51-43-4*)
White or almost white powder, gradually becoming brown on exposure to light and air, very slightly soluble in water and in ethanol (96 per cent), insoluble in acetone. It dissolves in dilute solutions of mineral acids and alkali hydroxides.
mp: about 215 °C.

Adrenaline Acid Tartrate L-Epinephrine D-hydrogen tartrate; $C_{13}H_{19}NO_9$ = 333 (*51-42-3*)
General reagent grade of commerce.

(±) Adrenaline Hydrochloride DL-adrenaline hydrochloride; DL-epinephrine hydrochloride; $C_9H_{13}NO_3$, HCl = 220 (*329-63-5*)
General reagent grade of commerce.

Adrenalone Hydrochloride 1-(3,4-Dihydroxyphenyl)-2-(methylamino)ethanone hydrochloride; 3′,4′-Dihydroxy-2-(methylamino)acetophenone hydrochloride; $C_9H_{12}ClNO_3$ = 217.7 (*62-13-5*)
Pale yellow crystals, freely soluble in water, soluble in ethanol (96 per cent).
mp: about 244 °C.

Aescin Escin; (*6805-41-0*)
A mixture of related saponins obtained from the seeds of *Aesculus hippocastanum* L.
Fine, almost white or slightly reddish or yellowish, amorphous powder.
Chromatography. Thin-layer chromatography (*2.2.27*).

Test solution. Dissolve 10 mg of *aescin R* in *ethanol (70 per cent V/V) R* and dilute to 10 mL with the same solvent.

Plate: TLC silica gel plate R.

Mobile phase: the upper layer of a mixture of 10 volumes of *glacial acetic acid R*, 40 volumes of *water R* and 50 volumes of *butanol R*.

Application: 20 µL of the test solution as bands of 20 mm by 3 mm.

Development: over a path of 12 cm.

Drying: at 100-105 °C.

Detection: spray with about 10 mL of *anisaldehyde solution R* for a plate 200 mm square and heat again at 100-105 °C.

Results: the chromatogram shows a principal band with an R_F of about 0.4.

$C_{54}H_{84}O_{23},2H_2O$ = 1138

Aflatoxin B_1 (6a*R*,9a*S*)-4-Methoxy-2,3,6a,9a-tetrahydrocyclopenta[*c*]furo[3′,2′:4,5]furo[2,3-*h*][1]benzopyran-1,11-dione; $C_{17}H_{12}O_6$ = 312.3 (*1162-65-8*)

White or faint yellow crystals.

Agar (*9002-18-0*)

The dried extract from *Gelidium* sp. and other algae belonging to the class Rhodophyceae.

Microbiological reagent grade of commerce.

Agarose for Chromatography (*9012-36-6*)

Swollen beads 60-140 µm in diameter presented as a 4 per cent suspension in *water R*.

Used in size-exclusion chromatography for the separation of proteins with relative molecular masses of 6×10^4 to 20×10^6 and of polysaccharides with relative molecular masses of 3×10^3 to 5×10^6.

Agarose for Chromatography, Cross-linked (*61970-08-9*)

Prepared from agarose by reaction with 2,3-dibromopropanol in strongly alkaline conditions.

It occurs as swollen beads and is presented as a suspension.

Used in size-exclusion chromatography for the separation of proteins and of polysaccharides.

Agarose for Chromatography R1, Cross-linked (*65099-79-8*)

Prepared for agarose by reaction with 2,3-dibromopropanol in strongly alkaline conditions.

It occurs as swollen beads 60-140 µm in diameter and is presented as a 4 per cent suspension in *water R*.

Used in size-exclusion chromatography for the separation of proteins with relative molecular masses of 7×10^4 to 40×10^6 and of polysaccharides with relative molecular masses of 1×10^5 to 2×10^7.

Agarose for Electrophoresis (*9012-36-6*)

A neutral, linear polysaccharide, the main component of which is derived from agar.

White or almost white powder, practically insoluble in cold water, very slightly soluble in hot water.

Agarose-DEAE for Ion Exchange Chromatography (*57407-08-6*)

Cross-linked agarose substituted with diethylaminoethyl groups, presented as beads.

Agarose/Cross-linked Polyacrylamide

Agarose trapped within a cross-linked polyacrylamide network; it is used for the separation of globular proteins with relative molecular masses of 2×10^4 to 35×10^4.

Agnuside (1*RS*,4a*SR*,5*RS*,7a*RS*)-5-Hydroxy-7-[[(4-hydroxybenzoyl)oxy]methyl]-1,4a,5,7a-tetrahydrocyclopenta[*c*]pyran-1-yl β-D-glucopyranoside; $C_{22}H_{26}O_{11}$ = 466.4 (*11027-63-7*)

White or almost white crystals.

Air, Hydrocarbon-free

Complies with the requirements prescribed for the monograph *Medicinal air (1238)* with the following additional requirement.

Hydrocarbons: maximum 5 ppm *V/V*, calculated as CH_4.

Alanine L-Alanine; (*56-41-7*)

See *Alanine (0752)*.

β-Alanine (*107-95-9*)

See *3-aminopropionic acid R*.

Albumin, Bovine (*9048-46-8*)

Bovine serum albumin containing about 96 per cent of protein.

White to light brownish-yellow powder.

Water (*2.5.12*): maximum 3.0 per cent, determined on 0.800 g.

Albumin, Bovine R1 (*9048-46-8*)

Bovine serum albumin containing about 96 per cent of protein.

White or light brownish-yellow powder.

Albumin, Human

Human serum albumin containing not less than 96 per cent of albumin.

Albumin Solution, Human Albumin; (*9048-46-8*)

See *Human albumin solution (0255)*.

Albumin Solution R1, Human

Dilute *human albumin solution R* with a 9 g/L solution of *sodium chloride R* to a concentration of 1 g/L of protein. Adjust the pH to 3.5-4.5 with *glacial acetic acid R*.

Alcohol (*64-17-5*)

See *Ethanol (96 per cent) R*.

Alcohol, Aldehyde-free Ethanol (96%), aldehyde-free

Mix 1200 mL of *ethanol (96 per cent) R* with 5 mL of a 400 g/L solution of *silver nitrate R* and 10 mL of a cooled 500 g/L solution of *potassium hydroxide R*. Shake, allow to stand for a few days and filter. Distil the filtrate immediately before use.

Alcohol (*x*% v/v)

See *Ethanol (x per cent V/V) R*.

Aldehyde Dehydrogenase

Enzyme obtained from baker's yeast which oxidises acetaldehyde to acetic acid in the presence of nicotinamide-adenine dinucleotide, potassium salts and thiols, at pH 8.0.

Aldehyde Dehydrogenase Solution

Dissolve in *water R* a quantity of *aldehyde dehydrogenase R*, equivalent to 70 units and dilute to 10 mL with the same solvent. This solution is stable for 8 h at 4 °C.

Aldrin $C_{12}H_8Cl_6$ = 364.9 (*309-00-2*)

bp: about 145 °C.

mp: about 104 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Aleuritic Acid (9*RS*,10*SR*)-9,10,16-Trihydroxyhexadecanoic acid; $C_{16}H_{32}O_5$ = 304.4 (*533-87-9*)

White or almost white powder, greasy to the touch, soluble in methanol.

mp: about 101 °C.

Alizarin S Alizarin red S; $C_{14}H_7NaO_7S,H_2O$ = 360.3 (*130-22-3*)

Schultz No. 1145

Colour Index No. 58005

Orange-yellow powder, freely soluble in water and in ethanol (96 per cent).

Alizarin S Solution

A 1 g/L solution of *alizarin S R*.

Test for sensitivity. If alizarin S solution is used for the standardisation of *0.05 M barium perchlorate*, it shows a colour change from yellow to orange-red when it is tested according to the standardisation of *0.05 M barium perchlorate*.

Colour change: pH 3.7 (yellow) to pH 5.2 (violet).

Aloe Emodin $C_{15}H_{10}O_5$ = 270.2 (*481-72-1*)

1,8-Dihydroxy-3-(hydroxymethyl)anthracene-9,10-dione.

1,8-Dihydroxy-3-(hydroxymethyl)anthraquinone.

Alovudine 1-[(2*R*,4*S*,5*R*)-4-Fluoro-5-(hydroxymethyl) tetrahydrofuran-2-yl]-5-methylpyrimidine-2,4(1*H*,3*H*)-dione; Fluorodeoxythymidine; 3′-Deoxy-3′-fluorothymidine; $C_{10}H_{13}FN_2O_4$ = 244.2 (*25526-93-6*)

Content: minimum 95 per cent.

Colourless crystals.

Aluminium Al = 26.98 (*7429-90-5*)

White or almost white, malleable, flexible, bluish metal, available as bars, sheets, powder, strips or wire. In moist air an oxide film forms which protects the metal from corrosion.

Analytical grade.

Aluminium Chloride Aluminium chloride hexahydrate; $AlCl_3,6H_2O$ = 241.4 (*7784-13-6*)

Content: minimum 98.0 per cent of $AlCl_3,6H_2O$.

White or slightly yellowish, crystalline powder, hygroscopic, freely soluble in water and in ethanol (96 per cent).

Storage: in an airtight container.

Aluminium Chloride Reagent

Dissolve 2.0 g of *aluminium chloride R* in 100 mL of a 5 per cent *V/V* solution of *glacial acetic acid R* in *methanol R*.

Aluminium Chloride Solution

Dissolve 65.0 g of *aluminium chloride R* in *water R* and dilute to 100 mL with the same solvent. Add 0.5 g of *activated charcoal R*, stir for 10 min, filter and add to the filtrate, with continuous stirring, sufficient of a 10 g/L solution of *sodium hydroxide R* (about 60 mL) to adjust the pH to about 1.5.

Aluminium Hydroxide Gel $Al(OH)_3$+ aq (*21645-51-2*)

A hydrated grade of aluminium hydroxide of commerce.

Aluminium Nitrate Aluminium nitrate nonahydrate; $Al(NO_3)_3,9H_2O$ = 375.1 (*7784-27-2*)

Crystals, deliquescent, very soluble in water and ethanol (96 per cent), very slightly soluble in acetone.

Storage: in an airtight container.

Aluminium Oxide, Activated Acid Al_2O_3 = 102.1

An almost white, fine, granular powder, very hygroscopic, activated by heating at 200° to 250° for 3 hours.

Mean particle size, 50 to 200 µm.

Aluminium Oxide, Anhydrous (*1344-28-1*)

Aluminium oxide, consisting of γ-Al_2O_3, dehydrated and activated by heat treatment.

Particle size: 75 µm to 150 µm.

Al_2O_3 = 102.0

Aluminium Oxide, Basic

A basic grade of *anhydrous aluminium oxide R* suitable for column chromatography.

pH (*2.2.3*). Shake 1 g with 10 mL of *carbon dioxide-free water R* for 5 min. The pH of the suspension is 9 to 10.

When used in monographs other than those of the European Pharmacopoeia, the following test applies.

Activity Pack into a chromatographic tube (25 cm × 10 mm) sufficient of the basic aluminium oxide to form a column 50 mm deep. Apply to the column a mixture of 5 mL of sudan yellow solution and 5 mL of sudan red solution and elute with 20 mL of a mixture of 1 volume of benzene and 4 volumes of petroleum spirit (boiling range, 60° to 80°). Sudan red forms a zone about 10 mm in depth on the upper part of the column separated by a colourless zone from a yellow zone of sudan yellow below.

Aluminium Oxide for Chromatography, Deactivated

Aluminium oxide suitably deactivated for the separation and detection of traces of polar hydrocarbons, with porous layer open tubular (PLOT) design.

Aluminium Oxide, Deactivated

To a suitable basic alumina add 1.5 to 2% of *water*, mix well and allow to stand overnight in a stoppered bottle.
The product complies with the following test.

Prepare a column (20 cm × 10 mm) using the alumina and *hexane*. Add a solution of 0.25 g of *calciferol* in 10 mL of *hexane*. When the level of the solution falls just to the top of the column, begin eluting with a 17.5% v/v solution of *ether* in *hexane* adjusting the rate of flow, if necessary, to between 1 and 2 mL per minute. Collect 200 mL of eluate; no calciferol is present. Collect a further 100 mL of eluate; it contains not less than 95% of the calciferol used in the test, when determined by the Assay described under Calciferol Oral Solution.

Aluminium Oxide G

A fine, white, homogeneous powder of an average particle size between 10 and 40 µm containing about 10% w/w of calcium sulfate hemihydrate.

Content of calcium sulfate Carry out the test described under *silica gel G*.

Acidity or alkalinity pH of a suspension prepared by shaking 1 g with 10 mL of *carbon dioxide-free water*, about 7.5, Appendix V L.

Aluminium Oxide, Neutral See *Aluminium oxide, hydrated (0311)*.

Aluminium Potassium Sulfate Alum; Aluminium potassium sulphate; Aluminium potassium sulfate dodecahydrate; Aluminium potassium sulphate dodecahydrate; (*7784-24-9*)

See *Alum (0006)*.

Aluminium Sulfate Aluminium sulfate; $Al_2(SO_4)_3,16H_2O$ = 630.4 (*10043-01-3*)

Analytical reagent grade of commerce.

Aluminium Test Strip

Commercially available test strip for the determination of aluminium in aqueous solvents at a level below 5 ppm.

Allantoin $C_4H_6N_4O_3$ = 158.1 (*97-59-6*)

Allantoin of the British Pharmacopoeia

Amaranth S CI 16185; acid red 27; $C_{20}H_{11}N_2Na_3O_{10}S_3$ = 604 (*915-67-3*)

General reagent grade of commerce.

A deep brown or deep reddish brown, fine powder.

When used for the titration of iodine and iodides with potassium iodate, the colour changes from orange-red to yellow.

Amaranth Solution

A 0.2% w/v solution of *amaranth S*.

Americium-243 Spiking Solution

Contains 50 Bq/L ^{243}Am and a 134 mg/L solution of *lanthanum chloride heptahydrate R* in a 103 g/L solution of *hydrochloric acid R*.

Amido Black 10B Disodium 5-amino-4-hydroxy-6-[(4-nitrophenyl)azo]-3-(phenylazo)naphthalene-2,7-disulfonate; $C_{22}H_{14}N_6Na_2O_9S_2$ = 617 (*1064-48-8*)

Schultz No. 299

Colour Index No. 20470

Dark-brown to black powder, sparingly soluble in water, soluble in ethanol (96 per cent).

Amido Black 10B Solution

A 5 g/L solution of *amido black 10B R* in a mixture of 10 volumes of *acetic acid R* and 90 volumes of *methanol R*.

4-Aminoantipyrine 4-Amino-1,5-dimethyl-2-phenyl-1,2-dihydro-3*H*-pyrazol-3-one; $C_{11}H_{13}N_3O$ = 203.2 (*83-07-8*)

Light yellow needles or powder, sparingly soluble in water, freely soluble in ethanol (96 per cent).

mp: about 108 °C.

4-Aminoantipyrine Solution

A 1 g/L solution of *4-aminoantipyrine R* in *buffer solution pH 9.0 R*.

Aminoazobenzene α-Aminoazobenzene; 4-Aminoazobenzene; $C_{12}H_{11}N_3$ = 197.2 (*60-09-3*)

Colour Index No. 11000

Brownish-yellow needles with a bluish tinge, slightly soluble in water, freely soluble in ethanol (96 per cent).

mp: about 128 °C.

3-Aminobenzoic Acid $C_7H_7NO_2$ = 137.1 (*99-05-8*)

White or almost white crystals. An aqueous solution turns brown on standing in air.

mp: about 174 °C.

Storage: in an airtight container, protected from light.

4-Aminobenzoic Acid $C_7H_7NO_2$ = 137.1 (*150-13-0*)

White or almost white, crystalline powder, slightly soluble in water, freely soluble in ethanol (96 per cent), practically insoluble in light petroleum.

mp: about 187 °C.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Procaine hydrochloride (0050)*; the chromatogram shows only one principal spot.

Storage: protected from light.

4-Aminobenzoic Acid Solution

Dissolve 1 g of *4-aminobenzoic acid R* in a mixture of 18 mL of *anhydrous acetic acid R*, 20 mL of *water R* and 1 mL of *phosphoric acid R*. Immediately before use, mix 2 volumes of the solution with 3 volumes of *acetone R*.

(4-Aminobenzoyl)-L-glutamic Acid *N*-(4-Aminobenzoyl)-L-glutamic acid; $C_{12}H_{14}N_2O_5$ = 266.3 (*4271-30-1*)

White or almost white, crystalline powder.

mp: about 175 °C, with decomposition.

2-Aminobutan-1-ol Aminobutanol; $C_4H_{11}NO$ = 89.1 (*5856-63-3*)

Oily liquid, miscible with water, soluble in ethanol (96 per cent).

d_{20}^{20}: about 0.94.

n_D^{20}: about 1.453.

bp: about 180 °C.

4-Amino-*N*-butyric Acid 4-Aminobutanoic acid; $C_4H_9NO_2$ = 103.1 (*56-12-2*)

Leaflets from methanol and ether, needles from water and ethanol (96 per cent). Freely soluble in water, practically insoluble or slightly soluble in other solvents.

mp: about 202 °C (decreases on rapid heating).

2-Amino-5-chlorobenzophenone Aminochlorobenzophenone; $C_{13}H_{10}ClNO$ = 231.7 (*719-59-5*)

Yellow, crystalline powder, practically insoluble in water, freely soluble in acetone, soluble in ethanol (96 per cent).

mp: about 97 °C.

Content: minimum 95.0 per cent.

Storage: protected from light.

6-Aminohexanoic Acid 6-Aminocaproic acid; $C_6H_{13}NO_2$ = 131.2 (*60-32-2*)

Colourless crystals, freely soluble in water, sparingly soluble in methanol, practically insoluble in anhydrous ethanol.

mp: about 205 °C.

***p*-Aminohippuric Acid** Aminohippuric acid; $C_9H_{10}N_2O_3$ = 194.2 (*61-78-9*)

White or almost white powder, sparingly soluble in water, soluble in ethanol (96 per cent).

mp: about 200 °C.

Aminohippuric Acid Reagent

Dissolve 3 g of *phthalic acid R* and 0.3 g of *aminohippuric acid R* in *ethanol (96 per cent) R* and dilute to 100 mL with the same solvent.

4-Amino-3-hydroxynaphthalene-1-sulfonic Acid Aminohydroxynaphthalenesulfonic acid; $C_{10}H_9NO_4S$ = 239.3 (*116-63-2*)

White or grey needles, turning pink on exposure to light, especially when moist, practically insoluble in water and in ethanol (96 per cent), soluble in solutions of alkali hydroxides and in hot solutions of sodium metabisulfite.

Storage: protected from light.

Aminohydroxynaphthalenesulfonic Acid Solution Aminohydroxynaphthalenesulphonic acid solution

Mix 5.0 g of *anhydrous sodium sulfite R* with 94.3 g of *sodium hydrogensulfite R* and 0.7 g of *aminohydroxynaphthalenesulfonic acid R*. Dissolve 1.5 g of the mixture in *water R* and dilute to 10.0 mL with the same solvent. Prepare the solution daily.

Aminohydroxynaphthalenesulfonic Acid Solution, Strong

Aminohydroxynaphthalenesulphonic acid solution, strong.

Dissolve 0.25 g of *4-amino-3-hydroxynaphthalene-1-sulfonic acid* in 75 mL of a 15% w/v solution of *sodium metabisulfite*, warming to assist solution if necessary. Add 2.5 mL of a 20% w/v solution of *sodium sulfite*, mix and add sufficient of the sodium metabisulfite solution to produce 100 mL.

5-Aminoimidazole-4-carboxamide Hydrochloride $C_4H_6N_4O,HCl$ = 162.6 (*72-40-2*)

mp: about 251°, with decomposition.

General reagent grade of commerce.

***cis*-Aminoindanol** (1*S*,2*R*)-1-Amino-2,3-dihydro-1*H*-inden-2-ol; (−)-*cis*-1-Aminoindan-2-ol; $C_9H_{11}NO$ = 149.2 (*126456-43-7*)

Content: minimum 98.0 per cent (sum of enantiomers, determined by gas chromatography).

$[\alpha]_D^{20}$: −69 to −59, determined on a 2 g/L solution in *chloroform R*.

mp: 118 °C to 122 °C.

3-Aminomethylalizarin-N,N-diacetic Acid Aminomethylalizarindiacetic acid; $C_{19}H_{15}NO_8,2H_2O$ = 421.4 (*3952-78-1*)

Fine, pale brownish-yellow or orange-brown powder, practically insoluble in water, soluble in solutions of alkali hydroxides.

mp: about 185 °C.

Loss on drying (*2.2.32*): maximum 10.0 per cent, determined on 1.000 g.

Aminomethylalizarindiacetic Acid Reagent

Solution A. Dissolve 0.36 g of *cerous nitrate R* in *water R* and dilute to 50 mL with the same solvent.

Solution B. Suspend 0.7 g of *aminomethylalizarindiacetic acid R* in 50 mL of *water R*. Dissolve with the aid of about 0.25 mL of *concentrated ammonia R*, add 0.25 mL of *glacial acetic acid R* and dilute to 100 mL with *water R*.

Solution C. Dissolve 6 g of *sodium acetate R* in 50 mL of *water R*, add 11.5 mL of *glacial acetic acid R* and dilute to 100 mL with *water R*.

To 33 mL of *acetone R* add 6.8 mL of solution C, 1.0 mL of solution B and 1.0 mL of solution A and dilute to 50 mL with *water R*.

Test for sensitivity. To 1.0 mL of *fluoride standard solution (10 ppm F) R* add 19.0 mL of *water R* and 5.0 mL of the aminomethylalizarindiacetic acid reagent. After 20 min, the solution assumes a blue colour.

Storage: use within 5 days.

Aminomethylalizarindiacetic Acid Solution

Dissolve 0.192 g of *aminomethylalizarindiacetic acid R* in 6 mL of freshly prepared *1 M sodium hydroxide*. Add 750 mL of *water R*, 25 mL of *succinate buffer solution pH 4.6 R* and, dropwise, *0.5 M hydrochloric acid* until the colour changes from violet-red to yellow (pH 4.5 to 5). Add 100 mL of *acetone R* and dilute to 1000 mL with *water R*.

4-Aminomethylbenzoic Acid $C_8H_9NO_2$ = 151.2 (*56-91-7*)

3-(Aminomethyl)pyridine (3-Pyridylmethyl)amine; 3-picolylamine; $C_6H_8N_2$ = 108.1 (*3731-52-0*)

General reagent grade of commerce.

8-Aminonaphthalene-2-sulfonic Acid 8-Amino-2-naphthalenesulfonic acid; 1-naphthylamine-7-sulfonic acid; 8-aminonaphthalene-2-sulfonic acid; $C_{10}H_9NO_3S$ = 223.2 (*119-28-8*)

General reagent grade of commerce.

Aminonaphthalenesulfonic Acid Solution

Aminonaphthalenesulphonic acid solution.

Mix 0.5 g of *8-aminonaphthalene-2-sulfonic acid*, 30 mL of *glacial acetic acid* and 120 mL of *water* and heat with stirring until dissolved. Allow to cool and filter.

Use the solution within 3 weeks.

2-Amino-5-nitrobenzophenone Aminonitrobenzophenone; $C_{13}H_{10}N_2O_3$ = 242.2 (*1775-95-7*)

Yellow, crystalline powder, practically insoluble in water, soluble in tetrahydrofuran, slightly soluble in methanol.

mp: about 160 °C.

$A_{1\,cm}^{1\%}$: 690 to 720, determined at 233 nm using a 0.01 g/L solution in *methanol R*.

6-Aminopenicillanic Acid (2*S*,5*R*,6*R*)-6-Amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid; $C_8H_{12}N_2O_3S$ = 216.3 (*551-16-6*)

Appearance: white or almost white powder.

mp: about 205 °C, with decomposition.

Aminophenazone 4-(Dimethylamino)-1,5-dimethyl-2-phenyl-1,2-dihydro-3*H*-pyrazol-3-one; $C_{13}H_{17}N_3O$ = 231.3 (*58-15-1*)

White or almost white, crystalline powder or colourless crystals, soluble in water, freely soluble in ethanol (96 per cent).

mp: about 108 °C.

2-Aminophenol C_6H_7NO = 109.1 (*95-55-6*)

Pale yellowish-brown crystals which rapidly become brown, sparingly soluble in water, soluble in ethanol (96 per cent).

mp: about 172 °C.

Storage: in an airtight container, protected from light.

3-Aminophenol C_6H_7NO = 109.1 (*591-27-5*)

Pale yellowish-brown crystals, sparingly soluble in water.

mp: about 122 °C.

4-Aminophenol C_6H_7NO = 109.1 (*123-30-8*)

Content: minimum 95 per cent.

White or slightly coloured, crystalline powder, becoming coloured on exposure to air and light, sparingly soluble in water, soluble in anhydrous ethanol.

mp: about 186 °C, with decomposition.

Storage: protected from light.

Aminopolyether 4,7,13,16,21,24-hexaoxa-1,10-diazabicyclo[8,8,8]hexacosane; $C_{18}H_{36}N_2O_6$ = 376.5 (*23978-09-8*)

mp: 70 °C to 73 °C.

4-(4-Aminophenoxy)-N-methylpicolinamide 4-(4-Aminophenoxy)-*N*-methylpyridine-2-carboxamide; $C_{13}H_{13}N_3O_2$ = 243.3 (*284462-37-9*)

Content: minimum 99.0 per cent.

Light brown powder.

mp: 110 °C to 112 °C.

3-Aminopropionic Acid 3-Amino-1-propanol; $C_3H_7NO_2$ = 89.1 (*107-95-9*)

Content: minimum 99 per cent.

White or almost white, crystalline powder, freely soluble in water, slightly soluble in ethanol (96 per cent), practically insoluble in acetone.

mp: about 200 °C, with decomposition.

Aminopterine 4-Aminofolic acid; $C_{19}H_{20}N_8O_5$ = 440.4 (*54-62-6*)

Yellowish powder.

mp: about 230 °C.

Aminopyrazolone 4-Aminophenazone; (*83-07-8*)

See *4-aminoantipyrine R*.

Aminopyrazolone Solution See *4-aminoantipyrine solution R*.

3-Aminosalicylic Acid 3-Amino-2-hydroxybenzoic acid; $C_7H_7NO_3$ = 153.1 (*570-23-0*)

mp: about 240 °C.

Slightly soluble in water.

4-Aminosalicylic Acid 4-Amino-2-hydroxybenzoic acid; $C_7H_7NO_3$ = 153.1 (*65-49-6*)

White or almost white, bulky powder, slightly soluble in water, soluble in ethanol (96 per cent), in dilute nitric acid and in sodium hydroxide. It darkens on exposure to air and light.

mp: 135 °C to 145 °C.

Storage: at a temperature not exceeding 30 °C, in an airtight container, protected from light.

Ammonia

Content: 170 g/L to 180 g/L of NH_3 (M_r 17.03).

Dilute 67 g of *concentrated ammonia R* to 100 mL with *water R*.

d_{20}^{20}: 0.931 to 0.934.

When used in the test for iron, *ammonia R* complies with the following additional requirement. Evaporate 5 mL of ammonia to dryness on a water-bath, add 10 mL of *water R*, 2 mL of a 200 g/L solution of *citric acid monohydrate R* and 0.1 mL of *thioglycollic acid R*. Make alkaline by adding *ammonia R* and dilute to 20 mL with *water R*. No pink colour develops.

Storage: protected from atmospheric carbon dioxide, at a temperature below 20 °C.

For 18M and 13.5M ammonia use analytical reagent grade solutions of commerce containing 35% and 25% w/w of NH_3 and weighing 0.88 g and 0.91 g per mL, respectively.

Solutions of molarity *x*M should be prepared by diluting 75*x* mL of 13.5M ammonia or 56*x* mL of 18M ammonia to 1000 mL with *water*.

Ammonia, Chloride-free

13.5M *ammonia* that complies with the following test.

Chloride Evaporate 54 mL on a water bath almost to dryness and dilute to 15 mL with *water*. The solution complies with the *limit test for chlorides*, Appendix VII (1 ppm).

Ammonia, Concentrated See *Concentrated ammonia solution (0877)*.

Ammonia, Lead-free

Complies with the requirements prescribed for *dilute ammonia R1* with the following additional test: to 20 mL of lead-free ammonia, add 1 mL of *lead-free potassium cyanide solution R*, dilute to 50 mL with *water R* and add 0.10 mL of *sodium sulfide solution R*. The solution is not more intensely coloured than a reference solution prepared without sodium sulfide.

Ammonia, Methanolic

Solutions of the requisite molarity may be obtained by diluting 13.5M *ammonia* or 18M *ammonia* with *methanol* as directed under *ammonia*.

Ammonia R1, Concentrated

Content: minimum 30.0 per cent *m/m* of NH_3 (M_r 17.03).

A clear, colourless liquid.

d_{20}^{20}: less than 0.892.

Assay. Weigh accurately a ground-glass-stoppered flask containing 50.0 mL of *1 M hydrochloric acid*. Introduce 2 mL of *concentrated ammonia R1* and weigh again. Titrate the solution with *1 M sodium hydroxide*, using 0.5 mL of *methyl red mixed solution R* as indicator.

1 mL of *1 M hydrochloric acid* is equivalent to 17.03 mg of NH_3.

Storage: protected from atmospheric carbon dioxide, at a temperature below 20 °C.

Ammonia R1, Dilute

Content: 100 g/L to 104 g/L of NH_3 (M_r 17.03).

Dilute 41 g of *concentrated ammonia R* to 100 mL with *water R*.

Ammonia R2, Dilute

Content: 33 g/L to 35 g/L of NH_3 (M_r 17.03).

Dilute 14 g of *concentrated ammonia R* to 100 mL with *water R*.

Ammonia R3, Dilute

Content: 1.6 g/L to 1.8 g/L of NH_3 (M_r 17.03).

Dilute 0.7 g of *concentrated ammonia R* to 100 mL with *water R*.

Ammonia R4, Dilute

Content: 8.4 g/L to 8.6 g/L of NH_3 (M_r 17.03).

Dilute 3.5 g of *concentrated ammonia R* to 100 mL with *water R*.

Ammonium Acetate $C_2H_7NO_2$ = 77.1 (*631-61-8*)

Colourless crystals, very deliquescent, very soluble in water and in ethanol (96 per cent).

Storage: in an airtight container.

Ammonium Acetate Solution

Dissolve 150 g of *ammonium acetate R* in *water R*. Add 3 mL of *glacial acetic acid R* and dilute to 1000 mL with *water R*.

Storage: use within 1 week.

(1*R*)-(–)-Ammonium 10-Camphorsulfonate 10-Camphorsulfonic acid; 10-camphorsulphonic acid; Ammonium salt; (1R)-(–)-Ammonium 10-Camphorsulfonate; $C_{10}H_{19}NO_4S$ = 249.3

Content: minimum 97.0 per cent of (1*R*)-(–)-ammonium 10-camphorsulfonate.

$[\alpha]_D^{20}$: −18 ± 2, determined on a 50 g/L solution.

Ammonium Carbamate Carbamic acid ammonium salt; $CH_6N_2O_2$ = 78.1 (*1111-78-0*)

Ammonium Carbonate A mixture of varying proportions of ammonium hydrogen carbonate (NH_4HCO_3, M_r 79.1) and ammonium carbamate (NH_2COONH_4, M_r 78.1); (*506-87-6*)

White or almost white translucent mass, slowly soluble in about 4 parts of water. It is decomposed by boiling water. Ammonium carbonate liberates not less than 30 per cent *m/m* of NH_3 (M_r 17.03).

Assay. Dissolve 2.00 g in 25 mL of *water R*. Slowly add 50.0 mL of *1 M hydrochloric acid*, titrate with *1 M sodium hydroxide*, using 0.1 mL of *methyl orange solution R* as indicator.

1 mL of *1 M hydrochloric acid* is equivalent to 17.03 mg of NH_3.

Storage: at a temperature below 20 °C.

Ammonium Carbonate Solution

A 158 g/L solution of *ammonium carbonate R*.

Ammonium Carbonate Solution R1

Dissolve 20 g of *ammonium carbonate R* in 20 mL of *dilute ammonia R1* and dilute to 100 mL with *water R*.

Ammonium Carbonate Solution, Dilute

Dissolve 5 g of *ammonium carbonate* in a mixture of 7.5 mL of 5M *ammonia* and 50 mL of *water*, dilute to 100 mL with *water* and filter, if necessary.

Ammonium Cerium(IV) Nitrate Ammonium and cerium nitrate; $(NH_4)_2Ce(NO_3)_6$ = 548.2 (*16774-21-3*)

Orange-yellow, crystalline powder, or orange transparent crystals, soluble in water.

Ammonium Cerium(IV) Sulfate Ammonium and cerium sulfate; $(NH_4)_4Ce(SO_4)_4,2H_2O$ = 633 (*10378-47-9*)

Orange-yellow, crystalline powder or crystals, slowly soluble in water.

Ammonium Chloride (*12125-02-9*)

See *Ammonium chloride (0007)*.

Ammonium Chloride Solution

A 107 g/L solution of *ammonium chloride R*.

Ammonium Citrate Diammonium hydrogen citrate; $C_6H_{14}N_2O_7$ = 226.2 (*3012-65-5*)

White or almost white, crystalline powder or colourless crystals, freely soluble in water, slightly soluble in ethanol (96 per cent).

pH (*2.2.3*): about 4.3 for a 22.6 g/L solution.

Ammonium Citrate Solution

Dissolve, with cooling, 500 g of *citric acid* in a mixture of 200 mL of *water* and 200 mL of 13.5M *ammonia*. Filter and dilute to 1000 mL with *water*.

Ammonium Cobaltothiocyanate Solution

Dissolve 37.5 g of *cobalt(II) nitrate* and 150 g of *ammonium thiocyanate* in sufficient *water* to produce 1000 mL.

Use within 1 day of preparation.

Ammonium Dihydrogen Orthophosphate Ammonium dihydrogen phosphate; $(NH_4)H_2PO_4$ = 115.0 (*7722-76-1*)

White or almost white, crystalline powder or colourless crystals, freely soluble in water.

pH (*2.2.3*): about 4.2 for a 23 g/L solution.

Ammonium Formate CH_5NO_2 = 63.1 (*540-69-2*)

Deliquescent crystals or granules, very soluble in water, soluble in ethanol (96 per cent).

mp: 119 °C to 121 °C.

Storage: in an airtight container.

Ammonium Hexafluorogermanate(IV) $(NH_4)_2GeF_6$ = 222.7 (*16962-47-3*)

White or almost white crystals, freely soluble in water.

Ammonium Hydrogen Carbonate Ammonium bicarbonate; NH_4HCO_3 = 79.1 (*1066-33-7*)

Content: minimum 99 per cent.

Ammonium Iron(III) Citrate Ferric ammonium citrate; (*1185-57-5*)

General reagent grade (brown) of commerce.

Ammonium Iron(II) Sulfate Ferrous ammonium sulfate; $Fe(NH_4)_2(SO_4)_2,6H_2O$ = 392.2 (*7783-85-9*)

Pale bluish-green crystals or granules, freely soluble in water, practically insoluble in ethanol (96 per cent).

Storage: protected from light.

Ammonium Iron(III) Sulfate Ferric ammonium sulfate; $FeNH_4(SO_4)_2,12H_2O$ = 482.2 (*7783-83-7*)

Pale-violet crystals, efflorescent, very soluble in water, practically insoluble in ethanol (96 per cent).

Ammonium Iron(III) Sulfate Solution R1

Ammonium iron(III) sulphate solution R1

Dissolve 0.2 g of *ammonium iron(III) sulfate* in 50 mL of *water*, add 5 mL of *nitric acid* and dilute to 100 mL with *water*.

Ammonium Iron(III) Sulfate Solution R2 Ferric ammonium sulfate solution R2

A 100 g/L solution of *ferric ammonium sulfate R*. If necessary filter before use.

Ammonium Iron(III) Sulfate Solution R5 Ferric ammonium sulfate solution R5

Shake 30.0 g of *ferric ammonium sulfate R* with 40 mL of *nitric acid R* and dilute to 100 mL with *water R*. If the solution is turbid, centrifuge or filter it.

Storage: protected from light.

Ammonium Iron(III) Sulfate Solution R6 Ferric ammonium sulfate solution R6

Dissolve 20 g of *ferric ammonium sulfate R* in 75 mL of *water R*, add 10 mL of a 2.8 per cent *V/V* solution of *sulfuric acid R* and dilute to 100 mL with *water R*.

Ammonium Mercaptoacetate Solution

Add 300 mL of *water* to 50 mL of *mercaptoacetic acid*, neutralise with about 40 mL of 13.5M *ammonia* and dilute to 500 mL with *water*.

Ammonium Mercurithiocyanate Reagent

Dissolve 30 g of *ammonium thiocyanate* and 27 g of *mercury(II) chloride* in sufficient *water* to produce 1000 mL.

Ammonium Metavanadate Ammonium vanadate; NH_4VO_3 = 117.0 (*7803-55-6*)

White or slightly yellowish, crystalline powder, slightly soluble in water, soluble in *dilute ammonia R1*.

Ammonium Metavanadate Solution

Ammonium vanadate solution

Dissolve 1.2 g of *ammonium vanadate R* in 95 mL of *water R* and dilute to 100 mL with *sulfuric acid R*.

Ammonium Molybdate $(NH_4)_6Mo_7O_{24},4H_2O$ = 1236 (*12054-85-2*)

Colourless or slightly yellow or greenish crystals, soluble in water, practically insoluble in ethanol (96 per cent).

Ammonium Molybdate Reagent

Mix, in the given order, 1 volume of a 25 g/L solution of *ammonium molybdate R*, 1 volume of a 100 g/L solution of *ascorbic acid R* and 1 volume of *sulfuric acid R* (294.5 g/L H_2SO_4). Add 2 volumes of *water R*.

Storage: use within 1 day.

Ammonium Molybdate Reagent R1

Mix 10 mL of a 60 g/L solution of *disodium arsenate R*, 50 mL of *ammonium molybdate solution R*, 90 mL of *dilute sulfuric acid R* and dilute to 200 mL in *water R*.

Storage: in amber flasks at 37 °C for 24 h.

Ammonium Molybdate Reagent R2

Dissolve 50 g of *ammonium molybdate R* in 600 mL of *water R*. To 250 mL of cold *water R* add 150 mL of *sulfuric acid R* and cool. Mix the 2 solutions together. *Storage*: use within 1 day.

Ammonium Molybdate Solution

A 100 g/L solution of *ammonium molybdate R*.

Ammonium Molybdate Solution R2

Dissolve 5.0 g of *ammonium molybdate R* with heating in 30 mL of *water R*. Cool, adjust the pH to 7.0 with *dilute ammonia R2* and dilute to 50 mL with *water R*.

Ammonium Molybdate Solution R3

Solution A. Dissolve 5 g of *ammonium molybdate R* in 20 mL of *water R* with heating.

Solution B. Mix 150 mL of *ethanol (96 per cent) R* with 150 mL of *water R*. Add with cooling 100 mL of *sulfuric acid R*.

Immediately before use add 80 volumes of solution B to 20 volumes of solution A.

Ammonium Molybdate Solution R4

Dissolve 1.0 g of *ammonium molybdate R* in *water R* and dilute to 40 mL with the same solvent. Add 3 mL of *hydrochloric acid R* and 5 mL of *perchloric acid R* and dilute to 100 mL with *acetone R*.

Storage: protected from light; use within 1 month.

Ammonium Molybdate Solution R5

Dissolve 1.0 g of *ammonium molybdate R* in 40.0 mL of a 15 per cent *V/V* solution of *sulfuric acid R*. Prepare the solution daily.

Ammonium Molybdate Solution R6

Slowly add 10 mL of *sulfuric acid R* to about 40 mL of *water R*. Mix and allow to cool. Dilute to 100 mL with *water R* and mix. Add 2.5 g of *ammonium molybdate R* and 1 g of *cerium sulfate R*, and shake for 15 min to dissolve.

Ammonium Molybdate-Sulfuric Acid Solution

Dissolve 10 g of *ammonium molybdate* in sufficient *water* to produce 100 mL and add the solution slowly to 250 mL of cold 10M *sulfuric acid*.

Store in a plastic bottle protected from light.

Ammonium Nitrate NH_4NO_3 = 80.0 (*6484-52-2*)

White or almost white, crystalline powder or colourless crystals, hygroscopic, very soluble in water, freely soluble in methanol, soluble in ethanol (96 per cent).

Storage: in an airtight container.

Ammonium Nitrate R1

Complies with the requirements prescribed for *ammonium nitrate R* with the following additional requirements.

Acidity. The solution of the substance is slightly acid (*2.2.4*).

Chlorides (*2.4.4*): maximum 100 ppm, determined on 0.50 g.

Sulfates (*2.4.13*): maximum 150 ppm, determined on 1.0 g.

Sulfated ash (*2.4.14*): maximum 0.05 per cent, determined on 1.0 g.

Ammonium Oxalate $C_2H_8N_2O_4,H_2O$ = 142.1 (*6009-70-7*)

Colourless crystals, soluble in water.

Ammonium Oxalate Solution

A 40 g/L solution of *ammonium oxalate R*.

Ammonium Persulfate Ammonium Peroxodisulfate; Ammonium Peroxodisulphate; Ammonium Persulphate; $(NH_4)_2S_2O_8$ = 228.2 (*7727-54-0*)

White or almost white, crystalline powder or granular crystals, freely soluble in water.

Ammonium Polysulfide Solution Ammonium polysulphide solution

Dissolve a sufficient quantity of *precipitated sulfur* to produce a deep orange solution in a solution prepared in the following manner. Immediately before use saturate 120 mL of 6M *ammonia* with *hydrogen sulfide* and add 80 mL of 6M *ammonia*.

Ammonium Pyrrolidinedithiocarbamate Ammonium tetramethylenedithiocarbamate; $C_5H_{12}N_2S_2$ = 164.3 (*5108-96-3*)

White or pale yellow, crystalline powder, sparingly soluble in water, very slightly soluble in ethanol (96 per cent).

Storage: in a bottle containing a piece of ammonium carbonate in a muslin bag.

Ammonium Pyrrolidinedithiocarbamate Solution

A 1.0% w/v solution of *ammonium pyrrolidinedithiocarbamate* that has been washed immediately before use with three 25-mL quantities of *4-methylpentan-2-one*.

Ammonium Reineckate Ammonium tetrathiocyanatodiamminochromate(III) monohydrate; $NH_4[Cr(NCS)_4(NH_3)_2],H_2O$ = 354.4 (*13573-16-5*)

Red powder or crystals, sparingly soluble in cold water, soluble in hot water and in ethanol (96 per cent).

Ammonium Reineckate Solution

A 10 g/L solution of *ammonium reineckate R*. Prepare immediately before use.

Ammonium Sulfamate Ammonium sulphamate; $NH_2SO_3NH_4$ = 114.1 (*7773-06-0*)

White or almost white, crystalline powder or colourless crystals, hygroscopic, very soluble in water, slightly soluble in ethanol (96 per cent).

mp: about 130 °C.

Storage: in an airtight container.

Ammonium Sulfate Ammonium sulphate; $(NH_4)_2SO_4$ = 132.1 (*7783-20-2*)

Colourless crystals or white or almost white granules, very soluble in water, practically insoluble in acetone and in ethanol (96 per cent).

pH (*2.2.3*): 4.5 to 6.0 for a 50 g/L solution in *carbon dioxide-free water R*.

Sulfated ash (*2.4.14*): maximum 0.1 per cent.

Ammonium Sulfide Solution Ammonium sulphide solution

Saturate 120 mL of *dilute ammonia R1* with *hydrogen sulfide R* and add 80 mL of *dilute ammonia R1*. Prepare immediately before use.

Ammonium Thiocyanate NH_4SCN = 76.1 (*1762-95-4*)

Colourless crystals, deliquescent, very soluble in water, soluble in ethanol (96 per cent).

Storage: in an airtight container.

Ammonium Thiocyanate Solution

A 76 g/L solution of *ammonium thiocyanate R*.

Amoxicillin Trihydrate See *Amoxicillin trihydrate (0260)*.

Amyl Acetate $C_7H_{14}O_2$ = 130.2

Consists principally of 3-methylbutyl acetate with a small proportion of 2-methylbutyl acetate.

bp: about 140°.

Analytical reagent grade of commerce.

A colourless liquid; weight per mL, about 0.87 g.

Amyl Alcohol Isoamyl alcohol; $C_5H_{12}O$ = 88.1 (*123-51-3*)

Colourless liquid, slightly soluble in water, miscible with ethanol (96 per cent).

bp: about 130 °C.

α-Amylase 1,4-α-D-glucane-glucanohydrolase (EC 3.2.1.1)

White or light brown powder.

α-Amylase Solution

A solution of *α-amylase R* with an activity of 800 FAU/g.

β-Amyrin Olean-12-en-3β-ol; $C_{30}H_{50}O$ = 426.7 (*559-70-6*)

White or almost white powder.

mp: 187 °C to 190 °C.

L-Analyl-L-proline $C_8H_{14}N_2O_3$ = 186.2 (*13485-59-1*)

General reagent grade of commerce.

Andrographolide (3*E*,4*S*)-3-[2-[(1*R*,4a*S*,5*R*,6*R*,8a*S*)-6-Hydroxy-5-(hydroxymethyl)-5,8a-dimethyl-2-methylenedecahydronaphthalen-1-yl]ethylidene]-4-hydroxydihydrofuran-2(3*H*)-one; $C_{20}H_{30}O_5$ = 350.4 (*5508-58-7*)

Anethole 1-Methoxy-4-(propen-1-yl)benzene; $C_{10}H_{12}O$ = 148.2 (*4180-23-8*)

White or almost white, crystalline mass up to 20 °C to 21 °C, liquid above 23 °C, practically insoluble in water, freely soluble in anhydrous ethanol, soluble in ethyl acetate and in light petroleum.

n_D^{25}: about 1.56.

bp: about 230 °C.

Anethole used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Anise oil (0804)*.

Test solution. The substance to be examined.

Content: minimum 99.0 per cent of *trans*-anethole (retention time: about 41 min), calculated by the normalisation procedure.

cis-Anethole (*Z*)-1-Methoxy-4-prop-1-enylbenzene; $C_{10}H_{12}O$ = 148.2

n_D^{25}: about 1.56.

bp: about 230°.

General reagent grade of commerce.

A white crystalline mass at 20°; liquid above 23°.

Cis-anethole used in gas chromatography complies with the following test.

Assay Examine by *gas chromatography*, Appendix III B, under the conditions described in the test for Chromatographic profile in the monograph for Anise Oil using the reagent being examined as solution (1).

The area of the principal peak is not less than 92.0% of the total area of the peaks.

Anhydrous Colloidal Silica (*7631-86-9*)

See *Anhydrous colloidal silica (0434)*.

Anhydrous Trisodium Orthophosphate Tribasic Sodium Phosphate; Na_3PO_4 = 163.94 (*7601-54-9*)

mp: about 75°

General reagent grade of commerce.

Aniline Benzeneamine; C_6H_7N = 93.1 (*62-53-3*)

Colourless or slightly yellowish liquid, soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 1.02.

bp: 183 °C to 186 °C.

Storage: protected from light.

Aniline Hydrochloride Benzenamine hydrochloride; C_6H_8ClN = 129.6 (*142-04-1*)

Crystals. It darkens on exposure to air and light.

mp: about 198 °C.

Storage: protected from light.

Content: minimum 97.0 per cent.

Aniline Hydrochloride Solution

Dissolve 2 g of *aniline hydrochloride* in a mixture of 65 mL of *ethanol (96%)* and 35 mL of *water* and add 2 mL of *hydrochloric acid*.

Use within one day of preparation.

Anion Exchange Resin

Resin in chlorinated form with a quaternary ammonium funtionalised latex cross-linked with divinylbenzene.

Wash the resin with *1 M sodium hydroxide* on a sintered-glass filter (40) (*2.1.2*) until the washings are free from chloride, then wash with *water R* until the washings are neutral. Suspend in freshly prepared *ammonium-free water R* and protect from atmospheric carbon dioxide.

Anion Exchange Resin, Strongly Basic

Gel-type resin in hydroxide form containing quaternary ammonium groups [$CH_2N^+(CH_3)_3$, type 1] attached to a polymer lattice consisting of polystyrene cross-linked with 8 per cent of divinylbenzene.

Brown transparent beads.

Particle size: 0.2 mm to 1.0 mm.

Moisture content: about 50 per cent.

Total exchange capacity: minimum 1.2 meq/mL.

Anion Exchange Resin for Chromatography, Strongly Basic

Resin with a quaternary ammonium functionalised latex cross-linked with divinylbenzene.

Anion-exchange Resin for Chromatography, Strongly Basic R1

Non-porous resin agglomerated with a 100 nm alkyl quaternary ammonium functionalised latex.

Anion-exchange Resin for Chromatography, Strongly Basic R2

Resin agglomerated with a quaternary ammonium functionalised latex cross-linked with ethylvinylbenzene-divinylbenzene.

Anion Exchange Resin R1

Resin containing quaternary ammonium groups [$CH_2N^+(CH_3)_3$] attached to a lattice consisting of methacrylate.

Anion Exchange Resin R2

Conjugate of homogeneous 10 µm hydrophilic polyether particles, and a quaternary ammonium salt, providing a matrix suitable for strong anion-exchange chromatography of proteins.

Anion Exchange Resin R3

Resin with quaternary ammonium groups attached to a lattice of ethylvinylbenzene crosslinked with 55 per cent of divinylbenzene.

Anion Exchange Resin, Weak

Resin with diethylaminoethyl groups attached to a lattice consisting of poly(methyl methacrylate).

Anisaldehyde 4-Methoxybenzaldehyde; $C_8H_8O_2$ = 136.1 (*123-11-5*)

Oily liquid, very slightly soluble in water, miscible with ethanol (96 per cent).

bp: about 248 °C.

Anisaldehyde used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Anise oil (0804)*.

Test solution. The substance to be examined.

Content: minimum 99.0 per cent, calculated by the normalisation procedure.

Anisaldehyde Solution

Mix in the following order, 0.5 mL of *anisaldehyde R*, 10 mL of *glacial acetic acid R*, 85 mL of *methanol R* and 5 mL of *sulfuric acid R*.

Anisaldehyde Solution R1

To 10 mL of *anisaldehyde R* add 90 mL of *ethanol (96 per cent) R*, mix, add 10 mL of *sulfuric acid R* and mix again.

Anisaldehyde Solution R2

To 170 mL of cold *methanol R* add 20 mL of *glacial acetic acid R* and 10 mL of *sulfuric acid R*. Mix well. Cool to room temperature and add 1.0 mL of *anisaldehyde R*.

Anise Ketone 1-(4-Methoxyphenyl)propan-2-one; $C_{10}H_{12}O_2$ = 164.2 (*122-84-9*)

***p*-Anisidine** 4-Methoxyaniline; C_7H_9NO = 123.2 (*104-94-9*)

White or almost white crystals, sparingly soluble in water, soluble in anhydrous ethanol.

Content: minimum 97.0 per cent.

Caution: skin irritant, sensitiser.

Storage: protected from light, at 0 °C to 4 °C.

On storage, *p*-anisidine tends to darken as a result of oxidation. A discoloured reagent can be reduced and decolorised in the following way: dissolve 20 g of *p-anisidine R* in 500 mL of *water R* at 75 °C. Add 1 g of *sodium sulfite heptahydrate R* and 10 g of *activated charcoal R* and stir for 5 min. Filter, cool the filtrate to about 0 °C and allow to stand at this temperature for at least 4 h. Filter, wash the crystals with a small quantity of *water R* at about 0 °C and dry the crystals *in vacuo* (*2.2.32*).

Anolyte for Isoelectric Focusing pH 3 to 5

0.1M glutamic acid, 0.5M phosphoric acid. Dissolve 14.71 g of *glutamic acid* in *water*, add 33 mL of *orthophosphoric acid* and dilute to 1000 mL with *water*.

Anthracene $C_{14}H_{10}$ = 178.2 (*120-12-7*)

White or almost white, crystalline powder, practically insoluble in water, slightly soluble in chloroform.

mp: about 218 °C.

Anthranilic Acid 2-Aminobenzoic acid; $C_7H_7NO_2$ = 137.1 (*118-92-3*)

A white or pale-yellow, crystalline powder, sparingly soluble in cold water, freely soluble in hot water, in ethanol (96 per cent) and in glycerol. Solutions in ethanol (96 per cent) or in ether and, particularly, in glycerol show a violet fluorescence.

mp: about 145 °C.

Anthrone 9(10*H*)-Anthracenone; $C_{14}H_{10}O$ = 194.2 (*90-44-8*)

Pale yellow, crystalline powder.

mp: about 155 °C. When used in an assay for glucose or dextrans, complies with the following test.

Sensitivity to glucose Add, carefully, 6 mL of a 0.2% w/v solution in a mixture of 19 mL of sulfuric acid and 1 mL of water to 3 mL of a solution containing 5 µg of D-glucose per mL and heat in a water bath for 5 minutes. The solution is a darker green than a solution prepared in the same manner but omitting the glucose.

Anthrone Reagent

A 0.2% w/v solution of *anthrone* in *nitrogen-free sulfuric acid*. The solution should be allowed to stand for 4 hours before use and should be discarded after 7 days.

Antimony Potassium Tartrate Antimony potassium oxide (+)-tartrate; $C_8H_4K_2O_{12}Sb_2,3H_2O$ = 668 (*28300-74-5*)

White or almost white, granular powder or colourless, transparent crystals, soluble in water and in glycerol, freely soluble in boiling water, practically insoluble in ethanol (96 per cent). The aqueous solution is slightly acid.

Antimony Trichloride $SbCl_3$ = 228.1 (*10025-91-9*)

Colourless crystals or a transparent crystalline mass, hygroscopic, freely soluble in anhydrous ethanol. Antimony trichloride is hydrolysed by water.

Storage: in an airtight container, protected from moisture.

Antimony Trichloride in Dichloroethane Solution

Prepare a 22.0% w/v solution of *antimony trichloride* in dry *1,2-dichloroethane* that has been purified by passing it down a column of *silica gel* and allow the solution to stand for 24 hours. To 100 mL add 2.5 mL of *acetyl chloride* and allow to stand for a further 24 hours before use.

Antimony Trichloride Solution

Rapidly wash 30 g of *antimony trichloride R* with two quantities, each of 15 mL, of *ethanol-free chloroform R*, drain off the washings, and dissolve the washed crystals immediately in 100 mL of *ethanol-free chloroform R*, warming slightly.

Storage: over a few grams of *anhydrous sodium sulfate R*.

Antithrombin III ATIII; (*90170-80-2*)

Antithrombin III is purified from human plasma by heparin agarose chromatography and should have a specific activity of at least 6 IU/mg.

Antithrombin III Solution R1

Reconstitute *antithrombin III R* as directed by the manufacturer and dilute with *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R* to 1 IU/mL.

Antithrombin III Solution R2

Reconstitute *antithrombin III R* as directed by the manufacturer and dilute with *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R* to 0.5 IU/mL.

Antithrombin III Solution R3

Reconstitute *antithrombin III R* as directed by the manufacturer and dilute to 0.3 IU/mL with *phosphate buffer solution pH 6.5 R*.

Antithrombin III Solution R4

Reconstitute *antithrombin III R* as directed by the manufacturer and dilute to 0.1 IU/mL with *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4 R*.

Antithrombin III Solution R5

Reconstitute *antithrombin III R* as directed by the manufacturer and dilute to 0.125 IU/mL with

tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4 R1.

Antithrombin III Solution R6

Reconstitute *antithrombin III R* as directed by the manufacturer and dilute to 1.0 IU/mL with *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4 R1.*

Apigenin 4′,5,7-Trihydroxyflavone; $C_{15}H_{10}O_5$ = 270.2 (*520-36-5*)

Light yellowish powder, practically insoluble in water, sparingly soluble in ethanol (96 per cent).

mp: about 310 °C, with decomposition.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Roman chamomile flower (0380)*: apply 10 µL of a 0.25 g/L solution in *methanol R*; the chromatogram shows in the upper third a principal zone of yellowish-green fluorescence.

Apigenin-7-glucoside Apigetrin; 7-(β-D-Glucopyranosyloxy)-5-hydroxy-2-(4-hydroxyphenyl)-4*H*-1-benzopyran-4-one; $C_{21}H_{20}O_{10}$ = 432.4 (*578-74-5*)

Light yellowish powder, practically insoluble in water, sparingly soluble in ethanol (96 per cent).

mp: 198 °C to 201 °C.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Roman chamomile flower (0380)*: apply 10 µL of a 0.25 g/L solution in *methanol R*; the chromatogram shows in the middle third a principal zone of yellowish fluorescence.

Apigenin-7-glucoside used in liquid chromatography complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Matricaria flower (0404)*.

Test solution. Dissolve 10.0 mg in *methanol R* and dilute to 100.0 mL with the same solvent.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Apiole Apiol; apioline; parsley apiole; 5-allyl-4,7-dimethoxy-1,3-benzodioxol; $C_{12}H_{14}O_4$ = 222.24 (*484-31-1*)

General reagent grade of commerce.

Aprotinin (*9087-70-1*)

See *Aprotinin (0580)*.

L-Arabinose Arabinose; $C_5H_{10}O_5$ = 150.1 (*87-72-9*)

White or almost white, crystalline powder, freely soluble in water.

$[\alpha]_D^{20}$: + 103 to + 105, determined on a 50 g/L solution in *water R* containing about 0.05 per cent of NH_3.

Arachidic Alcohol Eicosan-1-ol; Arachidyl alcohol; Arachidyl alcohol; $C_{20}H_{42}O$ = 298.5 (*629-96-9*)

mp: about 65 °C.

Content: minimum 96 per cent of $C_{20}H_{42}O$.

Arachis Oil

Of the British Pharmacopoeia.

Arbutin Arbutoside; 4-Hydroxyphenyl-β-D-glucopyranoside; $C_{12}H_{16}O_7$ = 272.3 (*497-76-7*)

Fine, white or almost white, shiny needles, freely soluble in water, very soluble in hot water, soluble in ethanol (96 per cent).

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Bearberry leaf (1054)*; the chromatogram shows only one principal spot.

Arginine L-Arginine; (*74-79-3*)

See *Arginine (0806)*.

Argon Ar = 39.95 (*7440-37-1*)

Content: minimum 99.995 per cent *V/V*.

Carbon monoxide (*2.5.25, Method I*): maximum 0.6 ppm *V/V*; after passage of 10 L of *argon R* at a flow rate of 4 L/h, not more than 0.05 mL of *0.002 M sodium thiosulfate* is required for the titration.

Argon R1 Ar = 39.95 (*7440-37-1*)

Content: minimum 99.99990 per cent *V/V*.

Argon for Chromatography Ar = 39.95 (*7440-37-1*)

Content: minimum 99.95 per cent *V/V*.

Aromadendrene (1*R*,2*S*,4*R*,8*R*,11*R*)-3,3,11-Trimethyl-7-methylenetricyclo- [6.3.0.$0^{2,4}$]undecane; $C_{15}H_{24}$ = 204.4 (*489-39-4*)

Clear, almost colourless liquid.

d_4^{20}: about 0.911.

n_D^{20}: about 1.497.

$[\alpha]_D^{20}$: about + 12.

bp: about 263 °C.

Aromadendrene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph on *Tea tree oil (1837)*.

Content: minimum 92 per cent, calculated by the normalisation procedure.

Arsenazo III 3,6-Bis[(2-arsonophenyl)diazenyl]-4,5-dihydroxynaphthalene-2,7-disulfonic acid; $C_{22}H_{18}As_2N_4O_{14}S_2$ = 776 (*1668-00-4*)

Brown powder.

Arsenious Trioxide Arsenic trioxide; As_2O_3 = 197.8 (*1327-53-3*)

Crystalline powder or a white or almost white mass, slightly soluble in water, soluble in boiling water.

Arsenite Solution

Dissolve 0.50 g of *arsenious trioxide* in 5 mL of 2M *sodium hydroxide* solution, add 2.0 g of *sodium hydrogen carbonate* and dilute to 100 mL with *water*.

L-Ascorbic Acid Ascorbic acid; (*50-81-7*)

See *Ascorbic acid (0253)*.

Ascorbic Acid Solution

Dissolve 50 mg in 0.5 mL of *water R* and dilute to 50 mL with *dimethylformamide R*.

Asiaticoside *O*-6-Deoxy-α-L-mannopyranosyl-(1→4)-*O*-β-D-glucopyranosyl-(1→6)-β-D-glucopyranosyl 2α,3β,23-trihydroxy-4α-urs-12-en-28-oate; $C_{48}H_{78}O_{19}$ = 959 (*16830-15-2*)

White or almost white powder, hygroscopic, soluble in methanol, slightly soluble in anhydrous ethanol, insoluble in acetonitrile.

mp: about 232 °C, with decomposition.

Water (*2.5.12*): 6.0 per cent.

Asiaticoside used in liquid chromatography complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Centella (1498)*.

Content: minimum 97.0 per cent, calculated by the normalisation procedure.

Storage: protected from humidity.

Asparagine $C_4H_8N_2O_3$ = 132.12 (*70-47-3*)

Aspartic Acid (*56-84-8*)

See *Aspartic acid (0797)*.

D-Aspartic Acid $C_4H_7NO_4$ = 133.1 (*1783-96-6*)

L-Aspartyl-L-phenylalanine Aspartame; $C_{13}H_{16}N_2O_5$ = 280.3 (*13433-09-5*)

White or almost white powder.

mp: about 210 °C, with decomposition.

Astragaloside IV (20*R*,24*S*)-20,24-Epoxy-16β,25-dihydroxy-3β-(β-D-xylopyranosyloxy)-9,19-cyclolanostan-6α-yl β-D-glucopyranoside; $C_{41}H_{68}O_{14}$ = 785 (*84687-43-4*)

Atenolol $C_{14}H_{22}N_2O_3$ = 266.3 (*56715-13-0*)

General reagent grade of commerce.

Atropine Sulfate Atropine sulphate; (*5908-99-6*)

See *Atropine sulfate (0068)*.

Aucubin [1*S*,4a*R*,5*S*,7a*S*)-5-Hydroxy-7-(hydroxymethyl)-1,4a,5,7a-tetrahydrocyclopenta[*c*]pyran-1-yl β-D-glucopyranoside; $C_{15}H_{22}O_9$ = 346.3 (*479-98-1*)

Crystals, soluble in water, in ethanol (96 per cent) and in methanol, practically insoluble in light petroleum.

mp: about 181 °C.

Azadirachtin $C_{35}H_{44}O_{16}$ = 720.7 (*11141-17-6*)

mp: about 165°.

General reagent grade of commerce.

Azobenzene $C_{12}H_{10}N_2$ = 182.2 (*103-33-3*)

mp: about 69°.

Use a grade of commerce suitable for chromatographic standardisations.

Azomethine H Monosodium salt hydrate; $C_{17}H_{12}NNaO_8S_2$ = 445.4 (*5941-07-1*)

Azomethine H Solution

Dissolve 0.45 g of *azomethine H R* and 1 g of *ascorbic acid R* with gentle heating in *water R* and dilute to 100 mL with the same solvent.

Baicalin $C_{21}H_{18}O_{11}$ = 446.4 (*21967-41-9*)

5,6-Dihydroxy-4-oxo-2-phenyl-4*H*-1-benzopyran-7-yl-β-D-glucopyranosiduronic acid.

Barbaloin Aloin; 1,8-Dihydroxy-3-hydroxymethyl-10-β-D-glucopyranosyl-10*H*-anthracen-9-one; $C_{21}H_{22}O_9$, H_2O = 436.4 (*1415-73-2*)

Yellow to dark-yellow, crystalline powder, or yellow needles, darkening on exposure to air and light, sparingly soluble in water and in ethanol (96 per cent), soluble in acetone, in ammonia and in solutions of alkali hydroxides.

$A^{1\%}_{1\,cm}$: about 192 at 269 nm, about 226 at 296.5 nm, about 259 at 354 nm, determined on a solution in *methanol R* and calculated with reference to the anhydrous substance.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Frangula bark (0025)*; the chromatogram shows only one principal spot.

Barbitone Sodium Barbital sodium; $C_8H_{11}N_2NaO_3$ = 206.2 (*144-02-5*)

Content: minimum 98.0 per cent.

A white or almost white, crystalline powder or colourless crystals, freely soluble in water, slightly soluble in ethanol (96 per cent).

Barbitone Barbital; (*57-44-3*)

See *Barbital (0170)*.

Barbituric Acid 2,4,6-Trihydroxypyrimidine; $C_4H_4N_2O_3$ = 128.1 (*67-52-7*)

White or almost white powder, slightly soluble in water, freely soluble in boiling water and in dilute acids.

mp: about 253 °C.

Barium Acetate Barium diacetate; $C_4H_6BaO_4$ = 255.4 (*543-80-6*)

White or almost white powder, soluble in water.

d^{20}_{20}: 2.47.

Barium Carbonate $BaCO_3$ = 197.3 (*513-77-9*)

White or almost white powder or friable masses, practically insoluble in water.

Barium Chloride Barium dichloride; $BaCl_2,2H_2O$ = 244.3 (*10326-27-9*)

Colourless crystals, freely soluble in water, slightly soluble in ethanol (96 per cent).

Barium Chloride Solution

A 10.0% w/v solution of *barium chloride*.

Barium Chloride Solution R1

A 61 g/L solution of *barium chloride R*.

Barium Chloride Solution R2

A 36.5 g/L solution of *barium chloride R*.

Barium Hydroxide Barium dihydroxide; $Ba(OH)_2,8H_2O$ = 315.5 (*12230-71-6*)

Colourless crystals, soluble in water.

Barium Hydroxide Solution

A 47.3 g/L solution of *barium hydroxide R*.

Barium Nitrate $Ba(NO_3)_2$ = 261.3 (*10022-31-8*)

Crystals or crystalline powder, freely soluble in water, very slightly soluble in ethanol (96 per cent) and in acetone.

mp: about 590 °C.

Barium Sulfate (*7727-43-7*)

See *Barium sulfate (0010)*.

Benzaldehyde C_7H_6O = 106.1 (*100-52-7*)

Colourless or slightly yellow liquid, slightly soluble in water, miscible with ethanol (96 per cent).

d^{20}_{20}: about 1.05.

n^{20}_D: about 1.545.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 177 °C and 180 °C.

Storage: protected from light.

Benzalkonium Chloride

Of the British Pharmacopoeia.

Benzalkonium Chloride Solution

Of the British Pharmacopoeia.

Benzalphthalide 3-Benzylidenephthalide; $C_{15}H_{10}O_2$ = 222.24 (*575-61-1*)

Light yellow powder or crystals.

Analytical reagent grade of commerce.

Benzene C_6H_6 = 78.1 (*71-43-2*)

Clear, colourless, flammable liquid, practically insoluble in water, miscible with ethanol (96 per cent).

bp: about 80 °C.

Where benzene is used to prepare a reference solution, for safety reasons, the pure reagent may be replaced by a commercially available reference material containing a certified amount of benzene.

Where benzene is used to prepare a reference solution, for safety reasons, the pure reagent may be replaced by a commercially available reference material containing a certified amount of benzene.

Benzene-1,2,4-triol Hydroxyhydroquinone; Hydroxyquinol; $C_6H_6O_3$ = 126.1 (*533-73-3*)

Freely soluble in water, in ethanol (96 per cent) and in ethyl acetate.

mp: about 140 °C.

Benzethonium Chloride Benzyldimethyl[2-[2-[4-(1,1,3,3-tetramethylbutyl)phenoxy]ethoxy]ethyl]ammonium chloride; $C_{27}H_{42}ClNO_2$ = 448.1 (*121-54-0*)

Fine, white or almost white powder or colourless crystals, soluble in water and in ethanol (96 per cent).

mp: about 163 °C.

Storage: protected from light.

Benzidine Biphenyl-4,4′-diamine; $C_{12}H_{12}N_2$ = 184.2 (*92-87-5*)

Content: minimum 95 per cent.

White or slightly yellowish or reddish powder, darkening on exposure to air and light.

mp: about 120 °C.

Storage: protected from light.

Benzil Diphenylethanedione; $C_{14}H_{10}O_2$ = 210.2 (*134-81-6*)

Yellow, crystalline powder, practically insoluble in water, soluble in ethanol (96 per cent), ethyl acetate and toluene.

mp: 95 °C.

Benzocaine $C_9H_{11}NO_2$ = 165.2 (*94-09-7*)

See *Benzocaine (0011)*.

Benzohydrazide Benzoyldiazane; $C_7H_8N_2O$ = 136.2 (*613-94-5*)

Benzoic Acid (*65-85-0*)

See *Benzoic acid (0066)*.

Benzoin α-Hydroxy-α-phenylacetophenone; $C_{14}H_{12}O_2$ = 212.3 (*579-44-2*)

Slightly yellowish crystals, very slightly soluble in water, freely soluble in acetone, soluble in hot ethanol (96 per cent).

mp: about 137 °C.

Benzophenone Diphenylmethanone; $C_{13}H_{10}O$ = 182.2 (*119-61-9*)

Prismatic crystals, practically insoluble in water, freely soluble in ethanol (96 per cent).

mp: about 48 °C.

1,4-Benzoquinone Cyclohexa-2,5-diene-1,4-dione; $C_6H_4O_2$ = 108.1 (*106-51-4*)

Content: minimum 98.0 per cent.

Benzoylarginine Ethyl Ester Hydrochloride *N*-Benzoyl-L-arginine ethyl ester hydrochloride; Ethyl (*S*)-2-benzamido-5-guanidinovalerate hydrochloride; $C_{15}H_{23}ClN_4O_3$ = 342.8 (*2645-08-1*)

White or almost white, crystalline powder, very soluble in water and in anhydrous ethanol.

$[\alpha]_D^{20}$: −15 to −18, determined on a 10 g/L solution.

mp: about 129 °C.

$A_{1\,cm}^{1\%}$: 310 to 340, determined at 227 nm using a 0.01 g/L solution.

Benzoyl Chloride C_7H_5ClO = 140.6 (*98-88-4*)

Colourless, lachrymatory liquid, decomposed by water and by ethanol (96 per cent).

d_{20}^{20}: about 1.21.

bp: about 197 °C.

Benzoylecgonine Hydrate $C_{16}H_{19}NO_4,H_2O$ = 307.3 (*519-09-5*)

General reagent grade of commerce.

Benzoyl Peroxide $C_{14}H_{10}O_4$ = 242.2 (*94-36-0*)

mp: after drying, about 104°.

White or almost white granules.

General reagent grade of commerce.

For safety Benzoyl Peroxide should be kept moistened with about 23% w/w of water.

***N*-Benzoyl-L-prolyl-L-phenylalanyl-L-arginine 4-Nitroanilide Acetate** $C_{35}H_{42}N_8O_8$ = 703

3-Benzoylpropionic Acid 4-Oxo-4-phenylbutanoic acid; $C_{10}H_{10}O_3$ = 178.2 (*2051-95-8*)

mp: about 118 °C.

2-Benzoylpyridine Benzoylpyridine; $C_{12}H_9NO$ = 183.2 (*91-02-1*)

Colourless crystals, soluble in ethanol (96 per cent).

mp: about 43 °C.

Benzyl Alcohol (*100-51-6*)

See *Benzyl alcohol (0256)*.

Benzyl Benzoate (*120-51-4*)

See *Benzyl benzoate (0705)*.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Peru balsam (0754)*: apply 20 µL of a 0.3 per cent *V/V* solution in *ethyl acetate R*; after spraying and heating, the chromatogram shows a principal band with an R_F of about 0.8.

Benzyl Cinnamate Benzyl 3-phenylprop-2-enoate; $C_{16}H_{14}O_2$ = 238.3 (*103-41-3*)

Colourless or yellowish crystals, practically insoluble in water, soluble in ethanol (96 per cent).

mp: about 39 °C.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Peru balsam (0754)*: apply 20 µL of a 3 g/L solution in *ethyl acetate R*; after spraying and heating, the chromatogram shows a principal band with an R_F of about 0.6.

Benzyl Cyanide Phenylacetonitrile; C_8H_7N = 117.2 (*140-29-4*)

Content: minimum 95.0 per cent.

Clear, colourless or light yellow liquid.

n_D^{20}: about 1.523.

bp: about 233 °C.

Benzyl Ether Dibenzyl ether; $C_{14}H_{14}O$ = 198.3 (*103-50-4*)

Clear, colourless liquid, practically insoluble in water, miscible with acetone and with anhydrous ethanol.

d_{20}^{20}: about 1.043.

n_D^{20}: about 1.562.

bp: about 296 °C, with decomposition.

Benzylpenicillin Sodium (*69-57-8*)

See *Benzylpenicillin sodium (0114)*.

2-Benzylpyridine $C_{12}H_{11}N$ = 169.2 (*101-82-6*)

Content: minimum 98.0 per cent.

Yellow liquid.

mp: 13 °C to 16 °C.

4-Benzylpyridine $C_{12}H_{11}N$ = 169.2 (*2116-65-6*)

Content: minimum 98.0 per cent.

Yellow liquid.

mp: 72 °C to 78 °C.

Benzyltrimethylammonium Chloride
Trimethylphenylmethanaminium chloride; $C_{10}H_{16}ClN$ = 185.7 (*56-93-9*)

White or almost white powder, soluble in water.

mp: about 230 °C, with decomposition.

Berberine Chloride 9,10-Dimethoxy-5,6-dihydrobenzo[*g*]-1,3-benzodioxolo[5,6-*a*]quinolizinium chloride; $C_{20}H_{18}ClNO_4,2H_2O$ = 407.8 (*5956-60-5*)

Yellow crystals, slightly soluble in water, practically insoluble in ethanol (96 per cent).

mp: 204 °C to 206 °C.

Berberine chloride used in liquid chromatography complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Goldenseal rhizome (1831)*.

Content: minimum 95 per cent, calculated by the normalisation procedure.

Bergapten 5-Methoxypsoralen; $C_{12}H_8O_4$ = 216.2 (*484-20-8*)

Colourless crystals, practically insoluble in water, sparingly soluble in ethanol (96 per cent) and slightly soluble in glacial acetic acid.

mp: about 188 °C.

Beta-cyclodextrin Derivative of Silica Gel for Chiral Separation

Substituted beta-cyclodextrin coated on a very finely divided silica gel for chiral separation.

β-Cyclodextrin Derivative of Silica Gel for Chiral Separation See *Beta-cyclodextrin derivative of silica gel for chiral separation R*.

Betamethasone 9α-Fluoro-11β,17α,21-trihydroxy-16β-methylpregna-1,4-diene-3,20-dione; $C_{22}H_{29}FO_5$ = 392.5 (*378-44-9*)

mp: about 236°.

General reagent grade of commerce.

Betulin Lup-20(39)-ene-3β,28-diol; $C_{30}H_{50}O_2$ = 442.7 (*473-98-3*)

White or almost white, crystalline powder.

mp: 248 °C to 251 °C.

Bibenzyl 1,2-Diphenylethane; $C_{14}H_{14}$ = 182.3 (*103-29-7*)

White or almost white, crystalline powder, practically insoluble in water, very soluble in methylene chloride, freely soluble in acetone, soluble in ethanol (96 per cent).

mp: 50 °C to 53 °C.

Biphenyl $C_{12}H_{10}$ = 154.2 (*92-52-4*)

mp: 68 °C to 70 °C.

Biphenyl-4-ol 4-Phenylphenol; $C_{12}H_{10}O$ = 170.2 (*90-43-7*)

mp: 164° to 167°.

White or almost white, crystalline powder, practically insoluble in water.

(-)-α-Bisabolol Levomenol; $C_{15}H_{26}O$ = 222.4 (*23089-26-1*)

Colourless, viscous liquid with a slight, characteristic odour, practically insoluble in water, freely soluble in ethanol (96 per cent), in methanol, in toluene, in fatty oils and in essential oils.

d_{20}^{20}: 0.925 to 0.935.

n_D^{20}: 1.492 to 1.500.

$[\alpha]_D^{20}$: −54.5 to −58.0, determined on a 50 g/L solution in *ethanol (96 per cent) R*.

(−)-α-Bisabolol used for gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Matricaria oil (1836)*.

Test solution. A 4 g/L solution in *cyclohexane R*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

1,3-bis(2-Acetyl-3-hydroxyphenoxy)-2-propanol $C_{19}H_{20}O_7$ = 360.4 g/mol (*16150-44-0*)

Analytical reagent grade of commerce.

Bisbenzimide 4-[5-[5-(4-Methylpiperazin-1-yl) benzimidazol-2-yl]benzimidazol-2-yl]phenol trihydrochloride pentahydrate; $C_{25}H_{27}Cl_3N_6O,5H_2O$ = 624 (*23491-44-3*)

Bisbenzimide Stock Solution

Dissolve 5 mg of *bisbenzimide R* in *water R* and dilute to 100 mL with the same solvent.

Storage: in the dark.

Bisbenzimide Working Solution

Immediately before use, dilute 100 µL of *bisbenzimide stock solution R* to 100 mL with *phosphate buffered saline pH 7.4 R*.

Bis(diphenylmethyl) Ether $C_{26}H_{22}O$ = 350.5 (*574-42-5*)

[Oxybis(methanetriyl)]tetrakisbenzene. 1,1′,1″,1‴-(Oxymethylidyne)tetrakisbenzene.

Bismuth Nitrate Pentahydrate $Bi(NO_3)_3,5H_2O$ = 485.1 (*10035-06-0*)

mp: about 30 °C.

Bismuth Oxycarbonate Bismuth subcarbonate; (*5892-10-4*)

A basic salt corresponding approximately to the formula $(BiO)_2CO_3,½H_2O$, containing the equivalent of about 91% of Bi_2O_3.

Bismuth Oxynitrate Bismuth subnitrate; $4BiNO_3(OH)_2$, $BiO(OH)$ = 1462 (*1304-85-4*)

White or almost white powder, practically insoluble in water.

Bismuth Oxynitrate R1 Bismuth subnitrate R1

Content: 71.5 per cent to 74.0 per cent of bismuth (Bi), and 14.5 per cent to 16.5 per cent of nitrate, calculated as nitrogen pentoxide (N_2O_5).

Bismuth Oxynitrate Solution
Bismuth subnitrate solution

Dissolve 5 g of *bismuth subnitrate R1* in a mixture of 8.4 mL of *nitric acid R* and 50 mL of *water R* and dilute to 250 mL with *water R*. Filter if necessary.

Acidity. To 10 mL add 0.05 mL of *methyl orange solution R*. 5.0 mL to 6.25 mL of *1 M sodium hydroxide* is required to change the colour of the indicator.

Bismuth Subcarbonate See *Bismuth oxycarbonate*.

***N,O*-Bis(trimethylsilyl)acetamide** $C_8H_{21}NOSi_2$ = 203.4 (*10416-59-8*)

Colourless liquid.

d_{20}^{20}: about 0.83.

Bis(trimethylsilyl)trifluoroacetamide
N,O-bis(Trimethylsilyl)trifluoroacetamide;
$C_8H_{18}F_3NOSi_2$ = 257.4 (*25561-30-2*)

Colourless liquid.

d_{20}^{20}: about 0.97.

n_D^{20}: about 1.38.

bp_{12mm}: about 40 °C

Biuret $C_2H_5N_3O_2$ = 103.1 (*108-19-0*)

White or almost white crystals, hygroscopic, soluble in water, sparingly soluble in ethanol (96 per cent).

mp: 188 °C to 190 °C, with decomposition.

Storage: in an airtight container.

Biuret Reagent

Dissolve 1.5 g of *copper sulfate pentahydrate R* and 6.0 g of *sodium potassium tartrate R* in 500 mL of *water R*.
Add 300 mL of a carbonate-free 100 g/L solution of *sodium hydroxide R*, dilute to 1000 mL with the same solution and mix.

Blocking Solution

A 10 per cent *V/V* solution of *acetic acid R*.

Blue Dextran 2000 (*9049-32-5*)

Prepared from dextran having an average relative molecular mass of 2×10^6 by introduction of a polycyclic chromophore that colours the substance blue. The degree of substitution is 0.017.

It is freeze-dried and dissolves rapidly and completely in water and aqueous saline solutions.

Absorbance (*2.2.25*). A 1 g/L solution in a *phosphate buffer solution pH 7.0 R* shows an absorption maximum at 280 nm.

Boldine 1,10-Dimethoxy-6aα-aporphine-2,9-diol;
$C_{19}H_{21}NO_4$ = 327.3 (*476-70-0*)

White or almost white crystalline powder, very slightly soluble in water, soluble in ethanol (96 per cent) and in dilute solutions of acids.

$[\alpha]_D^{25}$: about + 127, determined on a 1 g/L solution in *anhydrous ethanol R*.

mp: about 163 °C.

Borate Solution

Dissolve 9.55 g of *disodium tetraborate R* in *sulfuric acid R*, heating on a water-bath, and dilute to 1 L with the same acid.

Boric Acid (*10043-35-3*)

See *Boric acid (0001)*.

Boric Acid Solution

Dissolve 5 g of *boric acid* in a mixture of 20 mL of *water* and 20 mL of *absolute ethanol* and dilute to 250 mL with *absolute ethanol*.

Boric Acid Solution, Cold Saturated

To 3 g of *boric acid R* add 50 mL of *water R* and shake for 10 min. Place the solution for 2 h in the refrigerator.

D-Borneol Borneol; $C_{10}H_{18}O$ = 154.3 (*507-70-0*)

Colourless crystals, readily sublimes, practically insoluble in water, freely soluble in ethanol (96 per cent) and in light petroleum.

mp: about 208 °C.

Chromatography. Thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance. Apply to the plate 10 µL of a 1 g/L solution in *toluene R*. Develop over a path of 10 cm using *chloroform R*. Allow the plate to dry in air, spray with *anisaldehyde solution R*, using 10 mL for a plate 200 mm square, and heat at 100-105 °C for 10 min.
The chromatogram obtained shows only one principal spot.

D-Bornyl Acetate Bornyl acetate; $C_{12}H_{20}O_2$ = 196.3 (*5655-61-8*)

Colourless crystals or a colourless liquid, very slightly soluble in water, soluble in ethanol (96 per cent).

mp: about 28 °C.

Chromatography. Thin-layer chromatography (*2.2.27*), using *silica gel G R* as the coating substance. Apply to the plate 10 µL of a 2 g/L solution in *toluene R*. Develop over a path of 10 cm using *chloroform R*. Allow the plate to dry in air, spray with *anisaldehyde solution R*, using 10 mL for a plate 200 mm square, and heat at 100-105 °C for 10 min.
The chromatogram obtained shows only one principal spot.

Boron Trichloride BCl_3 = 117.2 (*10294-34-5*)

Colourless gas. Reacts violently with water. Available as solutions in suitable solvents (2-chloroethanol, methylene chloride, hexane, heptane, methanol).

n_D^{20}: about 1.420.

bp: about 12.6 °C.

Caution: toxic and corrosive.

Boron Trichloride-Methanol Solution

A 12 per cent *m/m* solution of *boron trichloride R* in *methanol R*.

Storage: protected from light at −20 °C, preferably in sealed tubes.

Boron Trifluoride BF_3 = 67.8 (*7637-07-2*)

Colourless gas.

Boron Trifluoride Solution Boron trifluoride-methanol solution

A 140 g/L solution of *boron trifluoride R* in *methanol R*.

Bovine Coagulation Factor Xa (*9002-05-5*)

An enzyme which converts prothrombin to thrombin.
The semi-purified preparation is obtained from liquid bovine plasma and it may be prepared by activation of the zymogen factor X with a suitable activator such as Russell's viper venom.

Storage: freeze-dried preparation at −20 °C and frozen solution at a temperature lower than −20 °C.

Bovine Factor Xa Solution

Reconstitute as directed by the manufacturer and dilute with *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R*.

Any change in the absorbance of the solution, measured at 405 nm (*2.2.25*) against *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R* and from which the blank absorbance has been substracted, is not more than 0.20 per minute.

Bovine Factor Xa Solution R1

Reconstitute as directed by the manufacturer and dilute to 1.4 nkat/mL with *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4 R*.

Bovine Factor Xa Solution R2

Reconstitute as directed by the manufacturer and dilute with *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4 R1* to obtain a solution that gives an absorbance between 0.65 and 1.25 at 405 nm when determining the blank amidolytic activity according to general chapter *2.7.5* using the end-point method.

Brilliant Blue (*6104-59-2*)

See *acid blue 83 R*.

Brilliant Green CI 42040; basic green 1; $C_{27}H_{34}N_2O_4S$ = 482.6 (*633-03-4*)

Technical grade of commerce.

Small, glistening golden crystals.

Bromelains (*37189-34-7*)

Concentrate of proteolytic enzymes derived from *Ananas comosus* Merr.

Dull-yellow powder.

Activity. 1 g liberates about 1.2 g of amino-nitrogen from a solution of *gelatin R* in 20 min at 45 °C and pH 4.5.

Bromelains Solution

A 10 g/L solution of *bromelains R* in a mixture of 1 volume of *phosphate buffer solution pH 5.5 R* and 9 volumes of a 9 g/L solution of *sodium chloride R*.

Bromine Br_2 = 159.8 (*7726-95-6*)

Brownish-red fuming liquid, slightly soluble in water, soluble in ethanol (96 per cent).

d_{20}^{20}: about 3.1.

To prepare 0.05M bromine dissolve 3 g of *potassium bromate* and 5 g of *potassium bromide* in sufficient *water* to produce 1000 mL. Weaker solutions should be prepared using proportionately lesser amounts of reagents or by appropriate dilution.

Bromine Solution

Dissolve 30 g of *bromine R* and 30 g of *potassium bromide R* in *water R* and dilute to 100 mL with the same solvent.

Bromine Solution, Acetic

Dissolve 100 g of *potassium acetate* in *glacial acetic acid* and add 4 mL of *bromine* and sufficient *glacial acetic acid* to produce 1000 mL.

Bromine Water

Shake 3 mL of *bromine R* with 100 mL of *water R* to saturation.

Storage: over an excess of *bromine R*, protected from light.

Bromine Water R1

Shake 0.5 mL of *bromine R* with 100 mL of *water R*.

Storage: protected from light; use within 1 week.

Bromobenzene C_6H_5Br = 157.0 (*108-86-1*)

n_D^{20}: about 1.56.

bp: about 156°.

General reagent grade of commerce.

A colourless to pale yellow liquid; weight per mL, about 1.50 g.

Bromocresol Green 3′,3″,5′,5″-Tetrabromo-*m*-cresolsulfonphthalein; 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene)bis(2,6-dibromo-3-methylphenol)-*S*,*S*-dioxide; $C_{21}H_{14}Br_4O_5S$ = 698 (*76-60-8*)

Brownish-white powder, slightly soluble in water, soluble in ethanol (96 per cent) and in dilute solutions of alkali hydroxides.

Bromocresol Green-Methyl Red Solution

Dissolve 0.15 g of *bromocresol green R* and 0.1 g of *methyl red R* in 180 mL of *anhydrous ethanol R* and dilute to 200 mL with *water R*.

Bromocresol Green Solution

Dissolve 50 mg of *bromocresol green R* in 0.72 mL of *0.1 M sodium hydroxide* and 20 mL of *ethanol (96 per cent) R* and dilute to 100 mL with *water R*.

Test for sensitivity. To 0.2 mL of the bromocresol green solution add 100 mL of *carbon dioxide-free water R*. The solution is blue. Not more than 0.2 mL of *0.02 M hydrochloric acid* is required to change the colour to green.

Colour change: pH 3.6 (yellow) to pH 5.2 (blue).

Bromocresol Purple 3′,3″-Dibromo-*o*-cresolsulfonphthalein; 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene) bis(2-bromo-6-methylphenol)-*S*,*S*-dioxide; $C_{21}H_{16}Br_2O_5S$ = 540.2 (*115-40-2*)

Pinkish powder, practically insoluble in water, soluble in ethanol (96 per cent) and in dilute solutions of alkali hydroxides.

Bromocresol Purple Solution

Dissolve 50 mg of *bromocresol purple R* in 0.92 mL of *0.1 M sodium hydroxide* and 20 mL of *ethanol (96 per cent) R* and dilute to 100 mL with *water R*.

Test for sensitivity. To 0.2 mL of the bromocresol purple solution add 100 mL of *carbon dioxide-free water R* and 0.05 mL of *0.02 M sodium hydroxide*. The solution is bluish-violet. Not more than 0.2 mL of *0.02 M hydrochloric acid* is required to change the colour to yellow.

Colour change: pH 5.2 (yellow) to pH 6.8 (bluish-violet).

5-Bromo-2′-deoxyuridine 5-Bromo-1-(2-deoxy-β-d-*erythro*-pentofuranosyl)-1*H*,3*H*-pyrimidine-2,4-dione; $C_9H_{11}BrN_2O_5$ = 307.1 (*59-14-3*)

mp: about 194 °C.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Idoxuridine (0669)*: apply 5 µL of a 0.25 g/L solution; the chromatogram shows only one principal spot.

Bromomethoxynaphthalene 2-Bromo-6-methoxynaphthalene; $C_{11}H_9BrO$ = 237.1 (*5111-65-9*)

mp: about 109 °C.

Bromophenol Blue 3′,3″,5′,5″-Tetrabromophenolsulfonphthalein; 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene)bis(2,6-dibromophenol) *S*,*S*-dioxide; $C_{19}H_{10}Br_4O_5S$ = 670 (*115-39-9*)

Light orange-yellow powder, very slightly soluble in water, slightly soluble in ethanol (96 per cent), freely soluble in solutions of alkali hydroxides.

Bromophenol Blue Solution

Dissolve 0.1 g of *bromophenol blue R* in 1.5 mL of *0.1 M sodium hydroxide* and 20 mL of *ethanol (96 per cent) R* and dilute to 100 mL with *water R*.

Test for sensitivity. To 0.05 mL of the bromophenol blue solution add 20 mL of *carbon dioxide-free water R* and 0.05 mL of *0.1 M hydrochloric acid*. The solution is yellow. Not more than 0.1 mL of *0.1 M sodium hydroxide* is required to change the colour to bluish-violet.

Colour change: pH 2.8 (yellow) to pH 4.4 (bluish-violet).

Bromophenol Blue Solution R1

Dissolve 50 mg of *bromophenol blue R* with gentle heating in 3.73 mL of *0.02 M sodium hydroxide* and dilute to 100 mL with *water R*.

Bromophenol Blue Solution R2

Dissolve with heating 0.2 g of *bromophenol blue R* in 3 mL of *0.1 M sodium hydroxide* and 10 mL of *ethanol (96 per cent) R*. After solution is effected, allow to cool and dilute to 100 mL with *ethanol (96 per cent) R*.

Bromophos $C_8H_8BrCl_2O_3PS$ = 366.0 (*2104-96-3*)

A suitable certified reference solution (10 ng/µL in iso-octane) may be used.

Bromophos-ethyl $C_{10}H_{12}BrCl_2O_3PS$ = 394.0 (*4824-78-6*)

A suitable certified reference solution (10 ng/µL in iso-octane) may be used.

Bromothymol Blue 3′,3″-Dibromothymolsulfonphthalein; 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene)bis(2-bromo-6-isopropyl-3-methylphenol) *S*,*S*-dioxide; $C_{27}H_{28}Br_2O_5S$ = 624 (*76-59-5*)

Reddish-pink or brownish powder, practically insoluble in water, soluble in ethanol (96 per cent) and in dilute solutions of alkali hydroxides.

Bromothymol Blue Solution R1

Dissolve 50 mg of *bromothymol blue R* in a mixture of 4 mL of *0.02 M sodium hydroxide* and 20 mL of *ethanol (96 per cent) R* and dilute to 100 mL with *water R*.

Test for sensitivity. To 0.3 mL of *bromothymol blue solution R1* add 100 mL of *carbon dioxide-free water R*. The solution is yellow. Not more than 0.1 mL of *0.02 M sodium hydroxide* is required to change the colour to blue.

Colour change: pH 5.8 (yellow) to pH 7.4 (blue).

Bromothymol Blue Solution R2

A 10 g/L solution of *bromothymol blue R* in *dimethylformamide R*.

Bromothymol Blue Solution R3

Warm 0.1 g of *bromothymol blue R* with 3.2 mL of *0.05 M sodium hydroxide* and 5 mL of *ethanol (90 per cent V/V) R*. After solution is effected, dilute to 250 mL with *ethanol (90 per cent V/V) R*.

Bromothymol Blue Solution R4

Dissolve 100 mg of *bromothymol blue R* in a mixture of equal volumes of *ethanol (96 per cent) R* and *water R* and dilute to 100 mL with the same mixture of solvents. Filter if necessary.

BRP Indicator Solution

Dissolve 0.1 g of *bromothymol blue R*, 20 mg of *methyl red R* and 0.2 g of *phenolphthalein R* in *ethanol (96 per cent) R* and dilute to 100 mL with the same solvent. Filter.

Brucine 10,11-Dimethoxystrychnine; $C_{23}H_{26}N_2O_4$ = 394.5 (*357-57-3*)

Colourless crystals, slightly soluble in water, freely soluble in ethanol (96 per cent).

mp: about 178 °C.

Butanal Butyraldehyde; C_4H_8O = 72.1 (*123-72-8*)

d_{20}^{20}: 0.806.

n_D^{20}: 1.380.

bp: 75 °C.

***i*-Butane** Isobutane; 2-Methylpropane; C_4H_{10} = 58.12 (*75-28-5*)

Content: minimum 99.0 per cent *V/V*.

***N*-Butane** Butane; C_4H_{10} = 58.12 (*106-97-8*)

Content: minimum 99.0 per cent *V/V*.

Butane-1,3-diol $C_4H_{10}O_2$ = 90.1 (*6290-03-5*)

n_D^{20}: about 1.440.

bp: about 203°.

General reagent grade of commerce.

Butane-1,4-diol $HO(CH_2)_4OH$ = 90.12 (*110-63-4*)

Butan-1-ol 1-Butanol; *N*-Butanol; *N*-Butyl alcohol; Butanol; $C_4H_{10}O$ = 74.1 (*71-36-3*)

Clear, colourless liquid, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.81.

bp: 116 °C to 119 °C.

Butan-2-ol *sec*-Butyl alcohol; 2-butanol; $C_4H_{10}O$ = 74.12 (*78-92-2*)

d_{20}^{20}: about 0.81.

bp: about 99°.

Analytical reagent grade of commerce.

A colourless liquid.

Butan-2-ol R1 sec-Butyl alcohol; 2-Butanol R1; $C_4H_{10}O$ = 74.1 (*78-92-2*)

Content: minimum 99.0 per cent.

Clear, colourless liquid, soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.81.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 99 °C and 100 °C.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Isopropyl alcohol (0970)*.

Butan-2-one Methyl ethyl ketone; Ethyl methyl ketone; (*78-93-3*)

See *methyl ethyl ketone R*.

Butyl Acetate $C_6H_{12}O_2$ = 116.2 (*123-86-4*)

Clear, colourless liquid, flammable, slightly soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.88.

n_D^{20}: about 1.395.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 123 °C and 126 °C.

Butyl Acetate R1

Content: minimum 99.5 per cent, determined by gas chromatography.

Clear, colourless liquid, flammable, slightly soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.883.

n_D^{20}: about 1.395.

Butanol: maximum 0.2 per cent, determined by gas chromatography.

n-Butyl formate: maximum 0.1 per cent, determined by gas chromatography.

n-Butyl propionate: maximum 0.1 per cent, determined by gas chromatography.

Water: maximum 0.1 per cent.

***N*-Butylamine** 1-Butanamine; Butylamine; $C_4H_{11}N$ = 73.1 (*109-73-9*)

Distil and use within one month.

Colourless liquid, miscible with water, with ethanol (96 per cent).

n_D^{20}: about 1.401.

bp: about 78 °C.

***tert*-Butylamine** (*75-64-9*)

See *1,1-dimethylethylamine R*.

4-(Butylamino)benzoic Acid $C_{11}H_{15}NO_2$ = 193.2 (*4740-24-3*)

White or almost white powder.

Content: 96.5 per cent to 103.5 per cent.

Butylated Hydroxyanisole 2-*tert*-Butyl-4-methoxyphenol; $C_{11}H_{16}O_2$ = 180.2 (*25013-16-5*)

mp: about 61°.

General reagent grade of commerce.

A white or almost white, crystalline powder.

Butylated Hydroxytoluene (*128-37-0*)

See *Butylhydroxytoluene R*.

Butylboronic Acid $C_4H_{11}BO_2$ = 101.9 (*4426-47-5*)

Content: minimum 98 per cent.

mp: 90 °C to 92 °C.

Butyl Chloride See *1-Chlorobutane*.

***tert*-Butylhydroperoxide**
1,1-Dimethylethylhydroperoxide; $C_4H_{10}O_2$ = 90.1 (*75-91-2*)

Flammable liquid, soluble in organic solvents.

d_{20}^{20}: 0.898.

n_D^{20}: 1.401.

bp: 35 °C.

Butyl 4-hydroxybenzoate (*94-26-8*)

See *Butyl parahydroxybenzoate R*.

Butylhydroxytoluene (*128-37-0*)

See *Butylhydroxytoluene (0581)*.

2-Butyloctanol (2*S*)-2-Butyloctan-1-ol; $C_{12}H_{26}O$ = 186.3 (*3913-02-8*)

Butyl Parahydroxybenzoate (*94-26-8*)

See *Butyl parahydroxybenzoate (0881)*.

***tert*-Butyl Methyl Ether** (*1634-04-4*)

See *1,1-dimethylethyl methyl ether R*.

Butyl Methacrylate Butyl 2-methylpropenoate; $C_8H_{14}O_2$ = 142.2 (*97-88-1*)

Clear, colourless solution.

d_4^{20}: about 0.894.

n_D^{20}: about 1.424.

bp: about 163 °C.

Butyric Acid *N*-Butyric acid; $C_4H_8O_2$ = 88.1 (*107-92-6*)

Content: minimum 99.0 per cent.

Oily liquid, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: about 0.96.

n_D^{20}: about 1.398.

bp: about 163 °C.

Butyrolactone Dihydro-2(3*H*)-furanone; γ-Butyrolactone; $C_4H_6O_2$ = 86.1 (*96-48-0*)

Oily liquid, miscible with water, soluble in methanol.

n_D^{25}: about 1.435.

bp: about 204 °C.

Cadmium Cd = 112.4 (*7440-43-9*)

Silvery-white, lustrous metal, practically insoluble in water, freely soluble in nitric acid and in hot hydrochloric acid.

Cadmium Acetate $C_4H_6O_4Cd,2H_2O$ = 266.5 (*5743-04-4*)

Analytical reagent grade of commerce.

Cadmium and Ninhydrin Solution

Dissolve 50 mg of *cadmium acetate* in a mixture of 5 mL of *water* and 1 mL of *glacial acetic acid* and dilute with *butan-2-one* to 50 mL. Immediately before use add and dissolve sufficient *ninhydrin* to produce a solution containing 0.2% w/v.

Cadmium Iodide CdI_2 = 366.2 (*7790-80-9*)

Analytical reagent grade of commerce.

Cadmium Iodide Solution

A 5.0% w/v solution of *cadmium iodide*.

Cadmium Nitrate Tetrahydrate
$Cd(NO_3)_2,4H_2O$ = 308.5 (*10022-68-1*)

Hygroscopic orthorhombic crystals, very soluble in water, soluble in acetone and in ethanol (96 per cent).

mp: about 59.5 °C.

Caesium Chloride CsCl = 168.4 (*7647-17-8*)

White or almost white powder, very soluble in water, freely soluble in methanol, practically insoluble in acetone.

Caffeic Acid 3,4-Dihydroxycinnamic acid; $C_9H_8O_4$ = 180.2 (*331-39-5*)

White or almost white crystals or plates, freely soluble in hot water and in ethanol (96 per cent), sparingly soluble in cold water.

Absorbance (*2.2.25*). A freshly prepared solution at pH 7.6 shows 2 absorption maxima at about 288 nm and about 313 nm.

Caffeine (*58-08-2*)

See *Caffeine (0267)*.

Calciferol Ergocalciferol; vitamin D_2; $C_{28}H_{44}O$ = 396.7 (*50-14-6*)

$[\alpha]_D^{20}$: about +105 (4% w/v in ethanol).

mp: about 117°.

Crystalline reagent grade of commerce.

Colourless crystals or a white, crystalline powder.

Calcium Acetate Calcium diacetate; See Calcium acetate (2128); $C_4H_6CaO_4$ = 158.2 (*62-54-4*)

Calcium Acetate, Dried $C_4H_6O_4Ca$ = 158.2 (*62-54-4*)

General reagent grade of commerce.

Calcium bis(formyl homotaurine) Calcium bis(3-formamidopropane-1-sulfonate); $C_8H_{16}CaN_2O_8S_2$ = 372.4

White or almost white powder.

Content: minimum 80.0 per cent.

Calcium Carbonate (*471-34-1*)

See *Calcium carbonate (0014)*.

Calcium Carbonate R1

Complies with the requirements prescribed for *calcium carbonate R* with the following additional requirement.

Chlorides (*2.4.4*): maximum 50 ppm.

Calcium Chloride Calcium Chloride Dihydrate; (*10035-04-8*)

See *Calcium chloride (0015)*.

Calcium Chloride, Anhydrous $CaCl_2$ = 111.0 (*10043-52-4*)

Content: minimum 98.0 per cent (dried substance).

White or almost white granules, deliquescent, very soluble in water, freely soluble in ethanol (96 per cent) and in methanol.

Loss on drying (*2.2.32*): maximum 5.0 per cent, determined by drying in an oven at 200 ± 10 °C.

Storage: in an airtight container, protected from moisture.

Calcium Chloride R1 Calcium chloride tetrahydrate; $CaCl_2,4H_2O$ = 183.1

Iron: maximum 0.05 ppm.

Calcium Chloride Solution

A 73.5 g/L solution of *calcium chloride R*.

Calcium Chloride Solution, 0.01M

Dissolve 0.147 g of *calcium chloride R* in *water R* and dilute to 100.0 mL with the same solvent.

Calcium Chloride Solution, 0.02M

Dissolve 2.94 g of *calcium chloride R* in 900 mL of *water R*, adjust to pH 6.0 to 6.2 and dilute to 1000.0 mL with *water R*.

Storage: at 2 °C to 8 °C.

Calcium Chloride Solution, 0.025M

Dissolve 0.368 g of *calcium chloride R* in *water R* and dilute to 100.0 mL with the same solvent.

Calcium Hydroxide Calcium dihydroxide; $Ca(OH)_2$ = 74.1 (*1305-62-0*)

White or almost white powder, almost completely soluble in 600 parts of water.

Calcium Hydroxide Solution

A freshly prepared saturated solution.

Calcium Lactate Calcium lactate pentahydrate; (*41372-22-9*)

See *Calcium lactate pentahydrate (0468)*.

Calcium Phosphate Monobasic Monohydrate Calcium tetrahydrogen bisphosphate monohydrate; Phosphoric acid calcium salt (2:1) monohydrate; $CaH_4O_8P_2,H_2O$ = 252.1 (*10031-30-8*)

White or almost white, crystalline powder, soluble in water.

Calcium Sulfate Calcium sulphate hemihydrate; Calcium sulphate; Plaster of Paris; $CaSO_4,{}^1/_2H_2O$ = 145.1 (*10034-76-1*)

White or almost white powder, soluble in about 1500 parts of water, practically insoluble in ethanol (96 per cent). When mixed with half its mass of water it rapidly solidifies to a hard and porous mass.

Calcium Sulfate Solution Calcium sulphate solution

Shake 5 g of *calcium sulfate R* with 100 mL of *water R* for 1 h and filter.

Calconcarboxylic Acid Patton and Reeder's reagent; 2-Hydroxy-1-(2-hydroxy-4-sulfo-1-naphthylazo)naphthalene-3-carboxylic acid; Calconecarboxylic acid; $C_{21}H_{14}N_2O_7S$ = 438.4 (*3737-95-9*)

Brownish-black powder, slightly soluble in water, very slightly soluble in acetone and in ethanol (96 per cent), sparingly soluble in dilute solutions of sodium hydroxide.

Calconcarboxylic Acid Triturate

Calconecarboxylic acid triturate

Mix 1 part of *calconecarboxylic acid R* with 99 parts of *sodium chloride R*.

Test for sensitivity. Dissolve 50 mg of calconecarboxylic acid triturate in a mixture of 2 mL of *strong sodium hydroxide solution R* and 100 mL of *water R*. The solution is blue but becomes violet on addition of 1 mL of a 10 g/L solution of *magnesium sulfate R* and 0.1 mL of a 1.5 g/L solution of *calcium chloride R* and turns pure blue on addition of 0.15 mL of *0.01 M sodium edetate*.

Camphene 2,2-Dimethyl-3-methylenebicyclo[2.2.1]heptane; $C_{10}H_{16}$ = 136.2 (*79-92-5*)

Camphene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Rosemary Oil (1846)*.

Content: minimum 90 per cent, calculated by the normalisation procedure.

Camphor (*76-22-2*)

See *Camphor, racemic (0655)*.

Camphor used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Lavender oil (1338)*.

Test solution. A 10 g/L solution of the substance to be examined in *hexane R*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

(1S)-(+)-10-Camphorsulfonic Acid (1S)-(+)-10-Camphorsulphonic Acid; $C_{10}H_{16}O_4S$ = 232.3 (*3144-16-9*)

Prismatic crystals, hygroscopic, soluble in water.

Content: minimum 99.0 per cent of (1*S*)-(+)-10-camphorsulfonic acid.

$[\alpha]_D^{20}$: + 20 ± 1, determined on a 43 g/L solution.

mp: about 194 °C, with decomposition.

ΔA (*2.2.41*): 10.2 × 10^3 determined at 290.5 nm on a 1.0 g/L solution.

Capric Acid Decanoic acid; $C_{10}H_{20}O_2$ = 172.3 (*334-48-5*)

Crystalline solid, very slightly soluble in water, soluble in anhydrous ethanol.

bp: about 270 °C.

mp: about 31.4 °C.

Capric acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 98 per cent, calculated by the normalisation procedure.

Caproic Acid Hexanoic acid; $C_6H_{12}O_2$ = 116.2 (*142-62-1*)

Oily liquid, sparingly soluble in water.

d_4^{20}: about 0.926.

n_D^{20}: about 1.417.

bp: about 205 °C.

Caproic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 98 per cent, calculated by the normalisation procedure.

ε-Caprolactam Hexane-6-lactam; $C_6H_{11}NO$ = 113.2 (*105-60-2*)

Hygroscopic flakes, freely soluble in water, in anhydrous ethanol and in methanol.

mp: about 70 °C.

Capryl Alcohol Decan-1-ol; Decanol; Capric alcohol; See *Decanol R*.

Capsaicin (*E*)-*N*-[(4-Hydroxy-3-methoxyphenyl)methyl]-8-methylnon-6-enamide; $C_{18}H_{27}NO_3$ = 305.4 (*404-86-4*)

White or almost white, crystalline powder, practically insoluble in water, freely soluble in anhydrous ethanol.

mp: about 65 °C.

Capsaicin used in the assay in Capsicum (1859) complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Capsicum (1859)*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Carbazole Dibenzopyrrole; $C_{12}H_9N$ = 167.2 (*86-74-8*)

Crystals, practically insoluble in water, freely soluble in acetone, slightly soluble in anhydrous ethanol.

mp: about 245 °C.

Carbomer (*9007-20-9*)

A cross-linked polymer of acrylic acid; it contains a large proportion (56 per cent to 68 per cent) of carboxylic acid (CO_2H) groups after drying at 80 °C for 1 h. Average relative molecular mass about 3×10^6.

pH (*2.2.3*): about 3 for a 10 g/L suspension.

Carbon Dioxide (*124-38-9*)

See *Carbon dioxide (0375)*.

Carbon Dioxide R1 CO_2 = 44.01 (*124-38-9*)

Content: minimum 99.995 per cent *V/V*.

Carbon monoxide: less than 5 ppm.

Oxygen: less than 25 ppm.

Nitric oxide: less than 1 ppm.

Carbon Dioxide R2 CO_2 = 44.01 (*124-38-9*)

Content: minimum 99 per cent *V/V*.

Carbon Disulfide Carbon disulphide; CS_2 = 76.1 (*75-15-0*)

Colourless or yellowish, flammable liquid, practically insoluble in water, miscible with anhydrous ethanol.

d_{20}^{20}: about 1.26.

bp: 46 °C to 47 °C.

Carbon for Chromatography, Graphitised

Carbon chains having a length greater than C_9 .

Particle size: 400 µm to 850 µm.

Relative density: 0.72.

Surface area: 10 m^2/g.

Do not use at a temperature higher than 400 °C.

Carbon for Chromatography, Graphitised R1

Porous spherical carbon particles comprised of flat sheets of hexagonally arranged carbon atoms.

Particle size: 5 µm to 7 µm.

Pore volume: 0.7 cm^3/g.

Carbon Monoxide CO = 28.01 (*630-08-0*)

Content: minimum 99.97 per cent *V/V*.

Carbon Monoxide R1 CO = 28.01 (*630-08-0*)

Content: minimum 99 per cent *V/V*.

Carbon Tetrachloride Tetrachloromethane; CCl_4 = 153.8 (*56-23-5*)

Clear, colourless liquid, practically insoluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: 1.595 to 1.598.

bp: 76 °C to 77 °C.

Carbophenothion *O,O*-Diethyl *S*-[[(4-chlorophenyl)thio] methyl]-phosphorodithioate; $C_{11}H_{16}ClO_2PS_3$ = 342.9 (*786-19-6*)

Yellowish liquid, practically insoluble in water, miscible with organic solvents.

d_4^{25}: about 1.27.

For the monograph *Wool Fat (0134)*, a suitable certified reference solution (10 ng/µL in iso-octane) may be used.

5-Carboxyuracil 2,4-Dioxo-1,2,3,4-tetrahydropyrimidine-5-carboxylic acid; Uracil-5-carboxylic acid; $C_5H_4N_2O_4$ = 156.1 (*23945-44-0*)

mp: about 283 °C.

Car-3-ene 3,7,7-Trimethylbicyclo[4.1.0]hept-3-ene; 4,7,7-Trimethyl-3-norcarene; $C_{10}H_{16}$ = 136.2 (*498-15-7*)

Liquid with a pungent odour, slightly soluble in water, soluble in organic solvents.

d_{20}^{20}: about 0.864.

n_D^{20}: 1.473 to 1.474.

$[\alpha]_D^{20}$: + 15 to + 17.

bp: 170 °C to 172 °C.

Car-3-ene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Nutmeg oil (1552)*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Carminic Acid 7-α-D-Glucopyranosyl-3,5,6,8-tetrahydroxy-1-methyl-9,10-dioxo-9,10-dihydroanthracene-2-carboxylic acid; $C_{22}H_{20}O_{13}$ = 492.4 (*1260-17-9*)

Dark red powder, very slightly soluble in water, soluble in dimethyl sulfoxide, very slightly soluble in ethanol (96 per cent).

Carob Bean Gum Locust bean gum

The ground endosperm of the fruit kernels of *Ceratonia siliqua* L. Taub.

White or almost white powder containing 70 per cent to 80 per cent of a water-soluble gum consisting mainly of galactomannoglycone.

Carvacrol 5-Isopropyl-2-methylphenol; $C_{10}H_{14}O$ = 150.2 (*499-75-2*)

Brownish liquid, practically insoluble in water, very soluble in ethanol (96 per cent).

d_{20}^{20}: about 0.975.

n_D^{20}: about 1.523.

bp: about 237 °C.

Carvacrol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. Dissolve 0.1 g in about 10 mL of *acetone R*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Carveol *p*-Mentha-1(6),8-dien-2-ol; 2-Methyl-5-(1-methylethenyl)cyclohex-2-enol; $C_{10}H_{16}O$ = 152.2 (*99-48-9*)

The substance contains a variable content of *trans*- and *cis*-carveol.

Carveol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the test for chromatographic profile in the monograph *Caraway oil (1817)*.

Content: minimum 97 per cent, calculated by the normalisation procedure.

Carvone (+)-*p*-Mentha-6,8-dien-2-one; (5*S*)-2-Methyl-5-(1-methylethenyl)-cyclohex-2-enone; $C_{10}H_{14}O$ = 150.2 (*2244-16-8*)

Liquid, practically insoluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.965

n_D^{20}: about 1.500.

$[\alpha]_D^{20}$: about + 61.

bp: about 230 °C.

Carvone used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)* using the substance to be examined as the test solution.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Carvone R1

Complies with the requirements prescribed for *carvone R* with the following additional requirement.

Assay. Gas chromatography (*2.2.28*) as prescribed in the test for chiral purity in the monograph *Caraway oil (1817)*.

Content: minimum 98 per cent.

(-)-Carvone (−)-*p*-Mentha-1(6),8-dien-2-one; (5*R*)-2-Methyl-5-(1-methylethenyl)cyclohex-2-enone; $C_{10}H_{14}O$ = 150.2 (*6485-40-1*)

Liquid.

d_{20}^{20}: about 0.965.

n_D^{20}: about 1.4988.

$[\alpha]_D^{20}$: about −62.

bp: about 230 °C.

Assay. Gas chromatography (*2.2.28*) as prescribed in the test for chiral purity in the monograph *Caraway oil (1817)*.

Content: minimum 99 per cent.

β-Caryophyllene (*E*)-(1*R*,9*S*)-4,11,11-Trimethyl-8-methylenebicyclo[7.2.0]undec-4-ene; $C_{15}H_{24}$ = 204.4 (*87-44-5*)

Oily liquid, practically insoluble in water, miscible with ethanol (96 per cent).

β-Caryophyllene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Clove oil (1091)*.

Test solution. The substance to be examined.

Content: minimum 90.0 per cent, calculated by the normalisation procedure.

Caryophyllene Oxide (-)-β-Caryophyllene epoxide; (1*R*,4*R*,6*R*,10*S*)-4,12,12-Trimethyl-9-methylene-5-oxatricyclo[8.2.0.$0^{4,6}$]dodecane; $C_{15}H_{24}O$ = 220.4 (*1139-30-6*)

Colourless, fine crystals with lumps.

mp: 62 °C to 63 °C.

Caryophyllene oxide used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Turpentine oil, Pinus pinaster type (1627)*.

Content: minimum 99.0 per cent, calculated by the normalisation procedure.

Casein (*9000-71-9*)

Mixture of related phosphoproteins obtained from milk.

White or almost white, amorphous powder or granules, very slightly soluble in water and in non-polar organic solvents. It dissolves in concentrated hydrochloric acid giving a pale-violet solution. It forms salts with acids and bases.
Its isoelectric point is at about pH 4.7. Alkaline solutions are laevorotatory.

Casein Substrate, Concentrated

Suspend a quantity of *casein EPBRP* equivalent to 2.5 g in 5 mL of *water*, add 18 mL of 0.1M *sodium hydroxide* and stir for 1 minute. Add 60 mL of *water* and stir with a magnetic stirrer until the solution is practically clear. Adjust the pH of the solution to 8.0 with either 0.1M *sodium hydroxide* or 0.1M *hydrochloric acid* and add sufficient *water* to produce 100 mL.

Use on the day of preparation.

Casticin 5-Hydroxy-2-(3-hydroxy-4-methoxyphenyl)-3,6,7-trimethoxy-4*H*-1-benzopyran-4-one; $C_{19}H_{18}O_8$ = 374.3 (*479-91-4*)

Yellow crystals.

Catalpol (1a*S*,1b*S*,2*S*,5a*R*,6*S*,6a*S*)-6-Hydroxy-1a-(hydroxymethyl)-1a,1b,2,5a,6,6a-hexahydrooxireno[4,5]cyclopenta[1,2-*c*]pyran-2-yl β-D-glucopyranoside; $C_{15}H_{22}O_{10}$ = 362.3 (*2415-24-9*)

mp: 203 °C to 205 °C.

Catechin (+)-(2*R*,3*S*)-2-(3,4-Dihydroxyphenyl)-3,4-dihydro-2*H*-chromene-3,5,7-triol; Catechol; Cianidanol; Cyanidol; $C_{15}H_{14}O_6$,xH_2O = 290.3 for the anhydrous substance (*154-23-4*)

Catechol Pyrocatechol; $C_6H_6O_2$ = 110.1 (*120-80-9*)

Colourless or slightly yellow crystals, soluble in water, in acetone and in ethanol (96 per cent).

mp: about 102 °C.

Storage: protected from light.

Cathine Hydrochloride (1*S*,2*S*)-2-Amino-1-phenylpropan-1-ol hydrochloride; Norpseudoephedrine hydrochloride; $C_9H_{14}ClNO$ = 187.7 (*2153-98-2*)

White or almost white solid.

Content: minimum 95.0 per cent.

Catholyte for Isoelectric Focusing pH 3 to 5

(0.1M *β-Alanine*) Dissolve 8.9 g of alanine in sufficient *water* to produce 1000 mL.

Cation Exchange Resin

A resin in protonated form with sulfonic acid groups attached to a polymer lattice consisting of polystyrene cross-linked with 8 per cent of divinylbenzene. It is available as spherical beads.

Cation Exchange Resin R1

A resin in protonated form with sulfonic acid groups attached to a polymer lattice consisting of polystyrene cross-linked with 4 per cent of divinylbenzene. It is available as spherical beads.

Cation Exchange Resin R2

Resin containing strongly acidic propylenesulfonic acid groups.

Cation Exchange Resin, Strong

Strong cation-exchange resin in protonated form with sulfonic acid groups attached to a polymer lattice consisting of polystyrene cross-linked with divinylbenzene.

Cation-exchange Resin, Weak

Resin with a carboxylate functionalised latex cross-linked with ethylvinylbenzene-divinylbenzene.

Cation Exchange Resin (Calcium Form), Strong

Resin in calcium form with sulfonic acid groups attached to a polymer lattice consisting of polystyrene cross-linked with 8 per cent of divinylbenzene.

Cation Exchange Resin (Sodium Form), Strong

Resin in sodium form with sulfonic acid groups attached to a polymer lattice consisting of polystyrene cross-linked with divinylbenzene.

Cationic Resin, Weak

Polymethacrylic resin, slightly acid, with carboxyl groups present in a protonated form.

Particle size: 75 µm to 160 µm.

pH limits of use: 5 to 14.

Maximum temperature of use: 120 °C.

Cedarwood Oil

A grade of commerce for microscopy thickened as necessary in temperate or tropical climates.

Cellulose Cellulose for chromatography; (*9004-34-6*)

Fine, white or almost white, homogeneous powder with an average particle size less than 30 µm.

Preparation of a thin layer. Suspend 15 g in 100 mL of *water R* and homogenise in an electric mixer for 60 s. Coat carefully cleaned plates with a layer 0.1 mm thick using a spreading device. Allow to dry in air.

Cellulose F_{254} Cellulose for chromatography F_{254}

Microcrystalline cellulose F_{254}. A fine, white or almost white, homogeneous powder with an average particle size less than 30 µm, containing a fluorescent indicator having an optimal intensity at 254 nm.

Preparation of a thin layer. Suspend 25 g in 100 mL of *water R* and homogenise using an electric mixer for 60 s. Coat carefully cleaned plates with a layer 0.1 mm thick using a spreading device. Allow to dry in air.

Cellulose, Microcrystalline Cellulose for chromatography R1

Microcrystalline cellulose.

Preparation of a thin layer. Suspend 25 g in 90 mL of *water R* and homogenise in an electric mixer for 60 s. Coat carefully cleaned plates with a layer 0.1 mm thick using a spreading device. Allow to dry in air.

Cephaëline Dihydrochloride (*R*)-1-[(2*S*,3*R*,11b*S*)-3-Ethyl-1,3,4,6,7,11b-hexahydro-9,10-dimethoxy-2*H*- benzo[*a*] quinolizinylmethyl]-1,2,3,4-tetrahydro-7- methoxyisoquinolin-6-ol dihydrochloride heptahydrate; $C_{28}H_{40}Cl_2N_2O_4,7H_2O$ = 666 (*5884-43-5*)

$[\alpha]_D^{20}$: about +25 (2% w/v in *water*).

General reagent grade of commerce.

Cephalin Reagent

Solvents used to prepare this reagent should contain a suitable antioxidant such as *butylated hydroxyanisole* at a concentration of 0.002% w/v.

To 0.5 to 1 g of *acetone-dried ox brain* add 20 mL of *acetone* and leave for 2 hours. Centrifuge for 2 minutes at 500 g and decant the supernatant liquid. Dry the residue under reduced pressure and extract the dried material with 20 mL of *chloroform* for 2 hours, shaking the mixture frequently. After removal of the solid material by filtration or centrifugation, evaporate the chloroform from the extract under reduced pressure. Suspend the residue in 5 to 10 mL of *saline solution*. This stock emulsion may be stored frozen or freeze-dried for 3 months.

Cerium(III) Nitrate Cerium trinitrate hexahydrate; Cerous nitrate; $Ce(NO_3)_3,6H_2O$ = 434.3 (*10294-41-4*)

Colourless or pale yellow, crystalline powder, freely soluble in water and in ethanol (96 per cent).

Cerium(III) Nitrate Solution

Dissolve 0.22 g of *cerium(III) nitrate* in 50 mL of *water*, add 0.1 mL of *nitric acid* and 50 mg of *hydroxylamine hydrochloride* and dilute to 1000 mL with *water*.

Cerium(IV) Sulfate Ceric sulfate; Ceric sulphate; Cerium(IV) sulfate tetrahydrate; Cerium sulfate; $Ce(SO_4)_2,4H_2O$ = 404.3 (*10294-42-5*)

Yellow or orange-yellow, crystalline powder or crystals, very slightly soluble in water, slowly soluble in dilute acids.

Cetostearyl Alcohol (*67762-27-0*)

See *Cetostearyl alcohol (0702)*.

Cetrimide (*8044-71-1*)

See *Cetrimide (0378)*.

Cetirizine N-Oxide $C_{21}H_{25}ClN_2O_4$ = 404.9 (*1076199-80-8*)

Cetyl Alcohol Hexadecan-1-ol; $C_{16}H_{34}O$ = 242.4 (*36653-82-4*)

Content: minimum 95.0 per cent.

mp: about 48 °C.

Cetylpyridinium Chloride Monohydrate 1-Hexadecylpyridinium chloride monohydrate; $C_{21}H_{38}ClN$, H_2O = 358.0 (*6004-24-6*)

White or almost white powder, freely soluble in water and in ethanol (96 per cent).

mp: 80 °C to 83 °C.

Cetyltrimethylammonium Bromide Cetrimonium bromide; *N*-Hexadecyl-*N,N,N*-trimethylammonium bromide; $C_{19}H_{42}BrN$ = 364.5 (*57-09-0*)

White or almost white, crystalline powder, soluble in water, freely soluble in ethanol (96 per cent).

mp: about 240 °C.

Chamazulene 7-Ethyl-1,4-dimethylazulene; $C_{14}H_{16}$ = 184.3 (*529-05-5*)

Blue liquid, very slightly soluble in water, soluble in ethanol (96 per cent), miscible with fatty oils, with essential oils and with liquid paraffin, soluble with discolouration in phosphoric acid (85 per cent *m/m*) and sulfuric acid (50 per cent *V/V*).

Appearance of solution. 50 mg is soluble in 2.5 mL of *hexane R*. The blue solution is clear in a thin-layer obtained by tilting the test-tube.

Chamazulene used for gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Matricaria oil (1836)*.

Test solution: a 4 g/L solution in *cyclohexane R*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Charcoal, Activated (*64365-11-3*)

See *Activated charcoal (0313)*.

Chloral Hydrate (*302-17-0*)

See *Choral hydrate (0265)*.

Chloral Hydrate Solution

A solution of 80 g in 20 mL of *water R*.

Chloramine Solution

A 20 g/L solution of *chloramine R*. Prepare immediately before use.

Chloramine Solution R1

A 0.1 g/L solution of *chloramine R*. Prepare immediately before use.

Chloramine Solution R2

A 0.2 g/L solution of *chloramine R*. Prepare immediately before use.

Chloramine T The sodium salt of *N*-chlorotoluene-*p*-sulfonamide; Chloramine; (*7080-50-4*)

See *Tosylchloramide sodium (0381)*.

Chlordane $C_{10}H_6Cl_8$ = 409.8 (*12789-03-6*)

bp: about 175 °C.

mp: about 106 °C.

A suitable certified reference solution of technical grade (10 ng/µL in iso-octane) may be used.

Chlordiazepoxide (*58-25-3*)

See *Chlordiazepoxide (0656)*.

Chlorfenvinphos $C_{12}H_{14}Cl_3O_4P$ = 359.6 (*470-90-6*)

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Chlorhexidine Acetate Chlorhexidine diacetate; $C_{22}H_{30}Cl_2N_{10},2C_2H_4O_2$ = 625.6 (*56-95-1*)

mp: about 154°.

General reagent grade of commerce.

Chlorhexidine Hydrochloride Chlorhexidine dihydrochloride; $C_{22}H_{30}Cl_2N_{10},2HCl$ (*3697-42-5*)

General reagent grade of commerce.

4′-Chloroacetanilide Chloroacetanilide; C_8H_8ClNO = 169.6 (*539-03-7*)

Content: minimum 95 per cent.

Crystalline powder, practically insoluble in water, soluble in ethanol (96 per cent).

mp: about 178 °C.

Chloroacetic Acid $C_2H_3ClO_2$ = 94.5 (*79-11-8*)

Colourless or white or almost white crystals, deliquescent, very soluble in water, soluble in ethanol (96 per cent).

Storage: in an airtight container.

3-Chloroaniline C_6H_6ClN = 127.6 (*108-42-9*)

n_D^{20}: about 1.594.

General reagent grade of commerce.

4-Chloroaniline Chloroaniline; C_6H_6ClN = 127.6 (*106-47-8*)

Crystals, soluble in hot water, freely soluble in ethanol (96 per cent).

mp: about 71 °C.

Chloroauric Acid Gold chloride; hydrogen tetrachloroaurate; $HAuCl_4$ + aq (*27988-77-8*)

General reagent grade of commerce.

Brown, deliquescent masses.

Chloroauric Acid Solution

General reagent grade of commerce containing about 2% w/v of $HAuCl_4,3H_2O$, or a 2.0% w/v solution of *chloroauric acid* in *water*.

Chlorobenzene C_6H_5Cl = 112.6 (*108-90-7*)

bp: about 131°.

Analytical reagent grade of commerce.

A colourless liquid.

4-Chlorobenzenesulfonamide 4-Chlorobenzenesulphonamide; $C_6H_6ClNO_2S$ = 191.6 (*98-64-6*)

White or almost white powder.

mp: about 145 °C.

2-Chlorobenzoic Acid $C_7H_5ClO_2$ = 156.6 (*118-91-2*)

Slightly soluble in water, soluble in hot water, very soluble in anhydrous ethanol.

bp: about 285 °C.

mp: about 140 °C.

4-Chlorobenzoic Acid $C_7H_5ClO_2$ = 156.57 (*74-11-3*)

mp: about 240°.

General reagent grade of commerce.

3-(4-Chlorobenzoyl)propionic Acid $C_{10}H_9ClNO_3$ = 212.6 (*3984-34-7*)

mp: about 129°.

General reagent grade of commerce.

4-Chlorobenzophenone $C_{13}H_9ClO$ = 216.66 (*134-85-0*)

bp: about 195°.

mp: about 75°.

***p*-Chlorobenzyhydrylpiperazine** 1-(4-Chlorobenzhydryl) piperazine; $C_{17}H_{19}ClN_2$ = 286.80 (*303-26-4*)

bp: about 180°.

mp: about 67°.

General reagent grade of commerce.

1-Chlorobutane Butyl chloride; C_4H_9Cl = 92.57 (*109-69-3*)

n_D^{20}: about 1.402.

bp: about 78°.

General reagent grade of commerce.

Weight per mL, about 0.886 g.

Chlorobutanol Anhydrous chlorbutol; 1,1,1-trichloro-2-methylpropan-2-ol; (*57-15-8*)

See *Chlorobutanol (0382)*.

4-Chloro-*o*-cresol 4-Chloro-2-methylphenol; C_7H_7ClO = 142.6 (*1570-64-5*)

mp: about 144°.

General reagent grade of commerce.

2-Chloro-2-deoxy-D-glucose $C_6H_{11}ClO_5$ = 198.6 (*14685-79-1*)

White or almost white crystalline, very hygroscopic powder, soluble in water and in dimethyl sulfoxide, practically insoluble in ethanol (96 per cent).

1-Chloro-2,4-dinitrobenzene $C_6H_3ClN_2O_4$ = 202.6 (*97-00-7*)

mp: about 51°.

Analytical reagent grade of commerce.

Pale yellow crystals or crystalline powder.

2-Chloroethanol Ethylene chlorohydrin; C_2H_5ClO = 80.5 (*107-07-3*)

Colourless liquid, soluble in ethanol (96 per cent).

d_{20}^{20}: about 1.197.

n_D^{20}: about 1.442.

bp: about 130 °C.

mp: about −89 °C.

2-Chloroethanol Solution

Dissolve 125 mg of *2-chloroethanol R* in *2-propanol R* and dilute to 50 mL with the same solvent. Dilute 5 mL of the solution to 50 mL with *2-propanol R*.

Chloroethylamine Hydrochloride 2-Chloroethanamine hydrochloride; $C_2H_7Cl_2N$ = 116.0 (*870-24-6*)

mp: about 145 °C.

(2-Chloroethyl)diethylamine Hydrochloride 2-Diethylaminoethyl chloride hydrochloride; $C_6H_{15}Cl_2N$ = 172.1 (*869-24-9*)

White or almost white, crystalline powder, very soluble in water and in methanol, freely soluble in methylene chloride, practically insoluble in hexane.

mp: about 211 °C.

Chloroform Trichloromethane; $CHCl_3$ = 119.4 (*67-66-3*)

Clear, colourless liquid, slightly soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: 1.475 to 1.481.

bp: about 60 °C.

Ethanol: 0.4 per cent *m/m* to 1.0 per cent *m/m*.

Chloroform, Acidified

To 100 mL of *chloroform R* add 10 mL of *hydrochloric acid R*. Shake, allow to stand and separate the 2 layers.

Chloroform, Ethanol-free

Shake 200 mL of *chloroform R* with four quantities, each of 100 mL, of *water R*. Dry over 20 g of *anhydrous sodium sulfate R* for 24 h. Distil the filtrate over 10 g of *anhydrous sodium sulfate R*. Discard the first 20 mL of distillate. Prepare immediately before use.

Chloroform IR

Spectroscopic reagent grade of commerce.

Chloroform Stabilised with Amylene $CHCl_3$ = 119.4

Clear, colourless liquid, slightly soluble in water, miscible with ethanol (96%).

Water maximum 0.05%.

Residue on evaporation maximum 0.001%.

Minimum transmittance (*2.2.25*) using *water* as compensation liquid : 50% at 255 nm, 80% at 260 nm, 98% at 300 nm.

Content, minimum 99.8% of $CHCl_3$, determined by gas chromatography.

Chloroform Water

Shake 2.5 mL of *chloroform* with 900 mL of *water* until dissolved and dilute to 1000 mL with *water*.

Chlorogenic Acid (1*S*,3*R*,4*R*,5*R*)-3-[(3,4-Dihydroxycinnamoyl)oxy]-1,4,5-trihydroxycyclohexanecarboxylic acid; $C_{16}H_{18}O_9$ = 354.3 (*327-97-9*)

White or almost white, crystalline powder or needles, freely soluble in boiling water, in acetone and in ethanol (96 per cent).

$[\alpha]_D^{26}$: about −35.2.

mp: about 208 °C.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed on Identification A in the monograph *Belladonna leaf dry extract, standardised (1294)*; the chromatogram shows only one principal zone.

Chlorogenic acid used in liquid chromatography complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Artichoke Leaf (1866)*.

Content: minimum 97.0 per cent.

5-Chloro-8-hydroxyquinoline 5-Chloroquinolin-8-ol; C_9H_6ClNO = 179.6 (*130-16-5*)

Sparingly soluble in cold dilute hydrochloric acid.

mp: about 123 °C.

Content: minimum 95.0 per cent.

3-Chloro-2-methylaniline 6-Chloro-2-toluidine; C_7H_8ClN = 141.6 (*87-60-5*)

Not miscible with water, slightly soluble in anhydrous ethanol.

d_{20}^{20}: about 1.171.

n_D^{20}: about 1.587.

bp: about 115 °C.

mp: about 2 °C.

2-Chloro-*N*-(2,6-dimethylphenyl)acetamide $C_{10}H_{12}ClNO$ = 197.7 (*1131-01-7*)

2-Chloronicotinic Acid 2-Chloropyridine-3-carboxylic acid; $C_6H_4ClNO_2$ = 157.6 (*2942-59-8*)

White or almost white powder.

mp: about 177 °C.

Content: minimum 95 per cent.

2-Chloro-4-nitroaniline $C_6H_5ClN_2O_2$ = 172.6 (*121-87-9*)

Yellow, crystalline powder, freely soluble in methanol.

mp: about 107 °C.

Storage: protected from light.

2-Chloro-5-Nitrobenzoioc Acid $C_7H_4ClNO_4$ = 201.6 (*2516-96-3*)

mp: 165 °C to 168 °C.

4-Chlorophenol Chlorophenol; C_6H_5ClO = 128.6 (*106-48-9*)

Colourless or almost colourless crystals, slightly soluble in water, very soluble in ethanol (96 per cent) and in solutions of alkali hydroxides.

mp: about 42 °C.

2-[2-(4-Chlorophenyl)acetyl]benzoic Acid $C_{15}H_{11}ClO_3$ = 274.7 (*53242-76-5*)

Chloroplatinic(IV) Acid Platinic chloride; Chloroplatinic acid; $H_2Cl_6Pt,6H_2O$ = 517.9 (*18497-13-7*)

Content: minimum 37.0 per cent *m/m* of platinum (A_r 195.1).

Brownish-red crystals or a crystalline mass, very soluble in water, soluble in ethanol (96 per cent).

Assay. Ignite 0.200 g to constant mass at 900 ± 50 °C and weigh the residue (platinum).

Storage: protected from light.

Chloroplatinic Acid Solution

A solution of *chloroplatinic(IV) acid* in *water*, containing the equivalent of 5.0% w/v of $H_2PtCl_6,6H_2O$.

3-Chloropropane-1,2-diol $C_3H_7ClO_2$ = 110.5 (*96-24-2*)

Colourless liquid, soluble in water and ethanol (96 per cent).

d_{20}^{20}: about 1.322.

n_D^{20}: about 1.480.

bp: about 213 °C.

1-Chloropropyl(dimethylamine) Hydrochloride 3-Dimethylaminopropyl chloride hydrochloride; $C_5H_{12}ClN$ = 158.1 (*5407-04-5*)

mp: about 142°.

General reagent grade of commerce.

4-Chlororesorcinol 4-Chlorobenzene-1,3-diol; 1,3-Dihydroxy-4-chlorobenzene; $C_6H_5ClO_2$ = 144.6 (*95-88-5*)

mp: 106 °C to 108 °C.

5-Chlorosalicylic Acid $C_7H_5ClO_3$ = 172.6 (*321-14-2*)

White or almost white, crystalline powder, soluble in methanol.

mp: about 173 °C.

4-Chlorosulfamoylbenzoic Acid $C_7H_6ClNO_4S$ = 235.7 (*1205-30-7*)

General reagent grade of commerce.

Chlorothiazide 6-Chloro-2*H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide; $C_7H_6ClN_3O_4S_2$ = 295.7 (*58-94-6*)

Content: minimum 98.0 per cent.

White or almost white, crystalline powder, very slightly soluble in water, sparingly soluble in acetone, slightly soluble in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

Chlorotriphenylmethane Triphenylchloromethane; triphenylmethyl chloride; $C_{19}H_{15}Cl$ = 278.8 (*76-83-5*)

mp: about 112°.

General reagent grade of commerce.

A pale yellow or buff, crystalline solid.

Chlorpyriphos $C_9H_{11}Cl_3NO_3PS$ = 350.6 (*2921-88-2*)

bp: about 200 °C.

mp: 42 °C to 44 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Chlorpyriphos-methyl $C_7H_7Cl_3NO_3PS$ = 322.5 (*5598-13-0*)

mp: 45 °C to 47 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Chlortetracycline Hydrochloride

See *Chlortetracycline hydrochloride (0173)*.

(5α)-Cholestane $C_{27}H_{48}$ = 372.7 (*481-21-0*)

Slightly soluble in anhydrous ethanol.

mp: about 81 °C.

Cholesterol (*57-88-5*)

See *Cholesterol (0993)*.

Cholesteryl Benzoate 5-Cholesten-3β-ol-3-benzoate; $C_{34}H_{50}O_2$ = 490.8 (*604-32-0*)

mp: about 150°.

General reagent grade of commerce.

Choline Chloride (2-Hydroxyethyl)trimethylammonium chloride; $C_5H_{14}ClNO$ = 139.6 (*67-48-1*)

Deliquescent crystals, very soluble in water and in ethanol (96 per cent).

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Suxamethonium chloride (0248)*: apply 5 µL of a 0.2 g/L solution in *methanol R*; the chromatogram shows one principal spot.

Storage: in an airtight container.

Chondroitinase ABC

Pectin lyase-like enzyme secreted by *Flavobacterium heparinum*. Available in vials containing 5-10 units. It cleaves both glucuronate-containing disaccharides, e.g. chondroitin sulfate, and iduronate-containing disaccharides, e.g. dermatan sulfate.

Chondroitinase AC

Pectin lyase-like enzyme secreted by *Flavobacterium heparinum*. Available in vials containing 5-10 units. It cleaves only glucuronate-containing disaccharides, e.g. chondroitin sulfate.

Chrome Azurol S Trisodium 5-[(3-carboxylato- 5-methyl-4-oxocyclohexa-2,5-dien-1-ylidene)(2,6-dichloro-3-sulfonatophenyl)methyl]-2-hydroxy-3-methylbenzoate; Chromazurol S; $C_{23}H_{13}Cl_2Na_3O_9S$ = 605 (*1667-99-8*)

Schultz No. 841

Colour Index No. 43825

Brownish-black powder, soluble in water, slightly soluble in ethanol (96 per cent).

Chromic Acid Cleansing Mixture

See Chromic-sulfuric acid mixture.

Chromic-Sulfuric Acid Mixture

Chromic-sulphuric acid mixture

A saturated solution of *chromium(VI) oxide* in *sulfuric acid*.

Chromium(III) Acetylacetonate (*OC*-6-11)-Tris(2,4-pentanedionato-κ*O*,κ*O*′)chromium; $C_{15}H_{21}CrO_6$ = 349.3 (*21679-31-2*)

Chromium(VI) Oxide Chromium trioxide; CrO_3 = 100.0 (*1333-82-0*)

Dark brownish-red needles or granules, deliquescent, very soluble in water.

Storage: in an airtight glass container.

Chromium(III) Potassium Sulfate Chrome alum; Chromic potassium sulphate; Chromium(III) potassium sulphate; Chromic potassium sulfate; $CrK(SO_4)_2,12H_2O$ = 499.4 (*7788-99-0*)

Large, violet-red or black crystals, freely soluble in water, practically insoluble in ethanol (96 per cent).

Chromium(III) Trichloride Hexahydrate $[Cr(H_2O)_4Cl_2]Cl,2H_2O$ = 266.5 (*10060-12-5*)

Dark green crystalline powder, hygroscopic.

Storage: protected from humidity and oxidising agents.

Chromogenic Substrate R4

Dissolve D-phenylalanyl-L-pipecolyl-L-arginine-4-nitroanilide dihydrochloride in *water R* to give a 0.008 M solution. Dilute to 0.0025 M with *phosphate buffer solution pH 8.5 R* before use.

Chromogenic Substrate R5

Dissolve *N*-benzoyl-L-isoleucyl-L-glutamyl-glycyl-L-arginine-4-nitroanilide hydrochloride in *water R* to give a 0.003 M solution.

Chromophore Substrate R1 Chromogenic substrate R1

Dissolve *N*-α-benzyloxycarbonyl-D-arginyl-L-glycyl-L-arginine-4-nitroanilide dihydrochloride in *water R* to give a 0.003 M solution. Dilute in *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4 R* to 0.0005 M before use.

Chromophore Substrate R2 Chromogenic substrate R2

Dissolve D-phenylalanyl-L-pipecolyl-L-arginine-4-nitroanilide dihydrochloride in *water R* to give a 0.003 M solution. Dilute before use in titrating in *tris(hydroxymethyl)aminomethane-EDTA buffer solution pH 8.4 R* to give a 0.0005 M solution.

Chromophore Substrate R3 Chromogenic substrate R3

Dissolve D-valyl-leucyl-lysyl-4-nitroanilide dihydrochloride in *water R* to give a 0.003 M solution.

Chromotrope IIB Chromotrope 2B; $C_{16}H_9N_3Na_2O_{10}S_2$ = 513.4 (*548-80-1*)

Schultz No. 67

Colour Index No. 16575

Reddish-brown powder, soluble in water giving a yellowish-red colour, practically insoluble in ethanol (96 per cent).

Chromotrope IIB Solution Chromotrope 2B solution

A 0.05 g/L solution of *chromotrope II B R* in *sulfuric acid R*.

Chromotropic Acid 4,5-Dihydroxy-2,7-naphthalenedisulfonic acid; $C_{10}H_8O_8S_2$ = 320.3 (*148-25-4*)

mp: about 300°.

General reagent grade of commerce.

Chromotropic Acid Sodium Salt Disodium 1,8-dihydroxynaphthalene-3,6-disulfonate dihydrate; $C_{10}H_6Na_2O_8S_2,2H_2O$ = 400.3 (*5808-22-0*)

Schultz No. 1136

A yellowish-white powder, soluble in water, practically insoluble in ethanol (96 per cent).

Chromotropic Acid, Sodium Salt Solution

Dissolve 0.60 g of *chromotropic acid, sodium salt R* in about 80 mL of *water R* and dilute to 100 mL with the same solvent. Use this solution within 24 h.

Chromotropic Acid Solution

Dissolve 0.5 g of *chromotropic acid* in sufficient *water* to produce 100 mL.

Use the solution within 24 hours.

Chromotropic Acid-Sulfuric Acid Solution Chromotropic Acid-Sulphuric Acid Solution

Dissolve 5 mg of *chromotropic acid, sodium salt R* in 10 mL of a mixture of 9 mL of *sulfuric acid R* and 4 mL of *water R*.

Chrysanthemin Cyanidin 3-*O*-glucoside chloride; Kuromanin chloride; 2-(3,4-Dihydroxyphenyl)-3-(β-D-glucopyranosyl)oxy-5,7-dihydroxy-1-benzopyrylium chloride; $C_{21}H_{21}ClO_{11}$ = 485.8 (*7084-24-4*)

Reddish-brown crystalline powder, soluble in water and in ethanol (96 per cent).

Absorbance (*2.2.25*). A 0.01 g/L solution in a mixture of 1 volume of *hydrochloric acid R* and 999 volumes of *methanol R* shows an absorption maximum at 528 nm.

α-Chymotrypsin for Peptide Mapping

α-Chymotrypsin of high purity, treated to eliminate tryptic activity.

Cimifugin (2*S*)-7-(Hydroxymethyl)-2-(1-hydroxy-1-methylethyl)-4-methoxy-2,3-dihydro-5*H*-furo[3,2-*g*][1]benzopyran-5-one; $C_{16}H_{18}O_6$ = 306.3 (*37921-38-3*)

Cinchonidine (*R*)-(Quinol-4-yl)[(2*S*,4*S*,5*R*)-5-vinylquinuclidin-2-yl]methanol; $C_{19}H_{22}N_2O$ = 294.4 (*485-71-2*)

White or almost white, crystalline powder, very slightly soluble in water and in light petroleum, soluble in ethanol (96 per cent).

$[\alpha]_D^{20}$: −105 to −110, determined on a 50 g/L solution in *ethanol (96 per cent) R*.

mp: about 208 °C, with decomposition.

Storage: protected from light.

Cinchonine (*S*)-(Quinol-4-yl)[(2*R*,4*S*,5*R*)-5-vinylquinuclidin-2-yl]methanol; $C_{19}H_{22}N_2O$ = 294.4 (*118-10-5*)

White or almost white, crystalline powder, very slightly soluble in water, sparingly soluble in ethanol (96 per cent) and in methanol.

$[\alpha]_D^{20}$: + 225 to + 230, determined on a 50 g/L solution in *ethanol (96 per cent) R*.

mp: about 263 °C.

Storage: protected from light.

Cineole 1,8-Cineole; Eucalyptol; 1,8-Epoxy-*p*-menthane; $C_{10}H_{18}O$ = 154.3 (*470-82-6*)

Colourless liquid, practically insoluble in water, miscible with anhydrous ethanol.

d_{20}^{20}: 0.922 to 0.927.

n_D^{20}: 1.456 to 1.459.

Freezing point (*2.2.18*): 0 °C to 1 °C.

Distillation range (*2.2.11*): 174 °C to 177 °C.

Phenol. Shake 1 g with 20 mL of *water R*. Allow to separate and add to 10 mL of the aqueous layer 0.1 mL of *ferric chloride solution R1*. No violet colour develops.

Turpentine oil. Dissolve 1 g in 5 mL of *ethanol (90 per cent V/V) R*. Add dropwise freshly prepared *bromine water R*. Not more than 0.5 mL is required to give a yellow colour lasting for 30 min.

Residue on evaporation: maximum 0.05 per cent.

To 10.0 mL add 25 mL of *water R*, evaporate on a water-bath and dry the residue to constant mass at 100-105 °C.

Cineole used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. The substance to be examined.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

1,4-Cineole 1-Methyl-4-(1-methylethyl)-7-oxabicyclo [2.2.1]heptane; 1-Isopropyl-4-methyl-7-oxabicyclo[2.2.1] heptane; $C_{10}H_{18}O$ = 154.3 (*470-67-7*)

Colourless liquid.

d_4^{20}: about 0.900.

n_D^{20}: about 1.445.

bp: about 173 °C.

Cinnamaldehyde 3-Phenylpropenal; Cinnamic aldehyde; C_9H_8O = 132.2 (*104-55-2*)

Yellowish or greenish-yellow, oily liquid, slightly soluble in water, very soluble in ethanol (96 per cent).

n_D^{20}: about 1.620.

Storage: protected from light.

Cinnamamide (*E*)-3-Phenylprop-2-enamide; C_9H_9NO = 147.2 (*621-79-4*)

White or almost white powder.

mp: about 149 °C.

Cinnamic Acid *trans*-3-Phenylacrylic acid; (2E)-3-Phenylprop-2-enoic acid; *trans*-Cinnamic acid; $C_9H_8O_2$ = 148.2 (*140-10-3*)

Colourless crystals, very slightly soluble in water, freely soluble in ethanol (96 per cent).

mp: 133 °C.

***trans*-Cinnamic Aldehyde** (*E*)-3-Phenylprop-2-enal; C_9H_8O = 132.2 (*14371-10-9*)

trans-Cinnamic aldehyde used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Cassia oil (1496)*.

Content: minimum 99.0 per cent, calculated by the normalisation procedure.

Cinnamyl Acetate 3-Phenylprop-2-en-1-yl acetate; $C_{11}H_{12}O_2$ = 176.2 (*103-54-8*)

n_D^{20}: about 1.542.

bp: about 262 °C.

Cinnamyl acetate used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Cassia oil (1496)*.

Content: minimum 99.0 per cent, calculated by the normalisation procedure.

Citral 3,7-Dimethylocta-2,6-dienal; $C_{10}H_{16}O$ = 152.2 (*5392-40-5*)

Light yellow liquid, practically insoluble in water, miscible with ethanol (96 per cent) and with propylene glycol.

Chromatography. Thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance: apply to the plate 10 µL of a 1 g/L solution in *toluene R*. Develop over a path of 15 cm using a mixture of 15 volumes of *ethyl acetate R* and 85 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram shows only one principal spot.

Citral used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Citronella oil (1609)*.

Content of citral (neral + geranial): minimum 95.0 per cent, calculated by the normalisation procedure.

Citrate Buffered Saline

Dissolve 11.76 g of *sodium citrate* in 1800 mL of water, adjust to pH 7.0 with 1M *hydrochloric acid* and add suffient *water* to produce 2000 mL.

Citrated Rabbit Plasma

Collect blood by intracardiac puncture from a rabbit kept fasting for 12 h, using a plastic syringe with a No. 1 needle containing a suitable volume of 38 g/L solution of *sodium citrate R* so that the final volume ratio of citrate solution to blood is 1: 9. Separate the plasma by centrifugation at 1500 *g* to 1800 *g* at 15 °C to 20 °C for 30 min.

Storage: at 0 °C to 6 °C; use within 4 h of collection.

Citric Acid Citric acid monohydrate; (*5949-29-1*)

See *Citric acid monohydrate (0456)*.

When used in the test for iron, it complies with the following additional requirement.

Dissolve 0.5 g in 10 mL of *water R*, add 0.1 mL of *thioglycollic acid R*, mix and make alkaline with *ammonia R*. Dilute to 20 mL with *water R*. No pink colour appears in the solution.

Citric Acid, Anhydrous (*77-92-9*)

See *Citric acid (0455)*.

Citric-Molybdic Acid Solution

Mix 54 g of *molybdenum(VI) oxide* with 200 mL of *water*, add 11 g of *sodium hydroxide* and heat, with stirring, until almost complete solution has been obtained. Dissolve 60 g of *citric acid* in 250 mL of *water* and add 140 mL of *hydrochloric acid*. Add the first solution to the second, stirring continuously, cool, filter if necessary, dilute to 1000 mL with *water* and add, dropwise, sufficient of a 1% w/v solution of *potassium bromate* to discharge the green colour.

Store in a well-closed container, protected from light.

Citronellal 3,7-Dimethyl-6-octenal; $C_{10}H_{18}O$ = 154.3 (*106-23-0*)

Very slightly soluble in water, soluble in ethanol (96 per cent).

d_{20}^{20}: 0.848 to 0.856.

n_D^{20}: about 1.446.

Citronellal used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Citronella oil (1609)*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Citronellol 3,7-Dimethyloct-6-en-1-ol; $C_{10}H_{20}O$ = 156.3 (*106-22-9*)

Clear, colourless liquid, practically insoluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: 0.857.

n_D^{20}: 1.456.

bp: 220 °C to 222 °C.

Citronellol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Citronella oil (1609)*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Storage: in an airtight container, protected from light.

Citronellyl Acetate 3,7-Dimethyl-6-octen-1-yl acetate; $C_{12}H_{22}O_2$ = 198.3 (*150-84-5*)

d_{20}^{20}: 0.890.

n_D^{20}: 1.443.

bp: 229 °C.

Citronellyl acetate used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Citronella oil (1609)*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Storage: in an airtight container, protected from light.

Citropten 5,7-Dimethoxycoumarin; $C_{11}H_{10}O_4$ = 206.2 (*487-06-9*)

Needle-shaped crystals, practically insoluble in water and in light petroleum, freely soluble in acetone and in ethanol (96 per cent).

mp: about 145 °C.

Chromatography. Thin-layer chromatography (*2.2.27*), using *silica gel* GF_{254} *R* as the coating substance: apply to the plate 10 µL of a 1 g/L solution in *toluene R*. Develop over a path of 15 cm using a mixture of 15 volumes of *ethyl acetate R* and 85 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram obtained shows only one principal spot.

Clobetasol Propionate 21-Chloro-9-fluoro-11β,17-dihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17-propionate; $C_{25}H_{32}ClFO_5$ = 467.0 (*25122-46-7*)

White or almost white crystalline powder, insoluble in water, soluble in ethanol (96 per cent) and in acetone.

$[\alpha]_D^{20}$: about + 104 (in dioxan).

mp: about 196 °C.

Coagulation Factor V Solution Clotting factor V solution

Coagulation factor V solution may be prepared by the following method or by any other method which excludes factor VIII.

Prepare the factor V reagent from fresh oxalated bovine plasma, by fractionation at 4 °C with a saturated solution of

ammonium sulfate R prepared at 4 °C. Separate the fraction which precipitates between 38 per cent and 50 per cent of saturation, which contains factor V without significant contamination with factor VIII. Remove the ammonium sulfate by dialysis and dilute the solution with a 9 g/L solution of *sodium chloride R* to give a solution containing between 10 per cent and 20 per cent of the quantity of factor V present in fresh human normal plasma.

Assay of factor V. Prepare two dilutions of the preparation of factor V in *imidazole buffer solution pH 7.3 R* containing 1 volume of the preparation in 10 volumes and in 20 volumes of the buffer solution respectively. Test each dilution as follows: mix 0.1 mL of *plasma substrate deficient in factor V R*, 0.1 mL of the solution to be examined, 0.1 mL of *thromboplastin R* and 0.1 mL of a 3.5 g/L solution of *calcium chloride R* and measure the coagulation times, i.e. the interval between the moment at which the calcium chloride solution is added and the first indication of the formation of fibrin, which may be observed visually or by means of a suitable apparatus.

In the same manner, determine the coagulation time (in duplicate) of four dilutions of human normal plasma in *imidazole buffer solution pH 7.3 R*, containing respectively, 1 volume in 10 (equivalent to 100 per cent of factor V), 1 volume in 50 (20 per cent), 1 volume in 100 (10 per cent), and 1 volume in 1000 (1 per cent). Using two-way logarithmic paper plot the average coagulation times for each dilution of human plasma against the equivalent percentage of factor V and read the percentage of factor V for the two dilutions of the factor V solution by interpolation. The mean of the two results gives the percentage of factor V in the solution to be examined.

Storage: in the frozen state at a temperature not higher than −20 °C.

Cobalt(II) Acetate Cobaltous acetate; $(CH_3CO_2)_2Co,4H_2O$ = 249.1 (*6147-53-1*)

General reagent grade of commerce.

Cobalt(II) Chloride Cobaltous chloride; Cobalt chloride; $CoCl_2,6H_2O$ = 237.9 (*7791-13-1*)

Red, crystalline powder or deep-red crystals, very soluble in water, soluble in ethanol (96 per cent).

Cobalt(II) Nitrate Cobaltous nitrate; Cobalt nitrate; $Co(NO_3)_2,6H_2O$ = 291.0 (*10026-22-9*)

Small garnet-red crystals, very soluble in water.

Codeine (*6059-47-8*)

See *Codeine monohydrate (0076)*.

Codeine Phosphate (*52-28-8*)

See *Codeine phosphate hemihydrate (0074)*.

2,4,6-Collidine 2,4,6-Trimethylpyridine; $C_8H_{11}N$ = 121.2 (*108-75-8*)

bp: about 170°.

General reagent grade of commerce.

A colourless to pale yellow liquid; weight per mL, about 0.92 g.

It may be stabilised by the addition of aluminium oxide.

Columbin (1*R*,4*R*,4a*R*,6a*R*,9*S*,10a*S*,10b*S*)-9-(3-Furanyl)-1,4,4a,5,6,6a,9,10,10a,10b-decahydro-4-hydroxy-4a,10a-dimethyl-1,4-etheno-3*H*,7*H*-benzo[1,2-c:3,4-c']dipyran-3,7-dione; $C_{20}H_{22}O_6$ = 358.4 (*546-97-4*)

Reagent grade of commerce.

Crystalline solid.

Congo Red Disodium (biphenyl-4,4′-diyl-bis-2,2′-azo) bis(1-aminonaphthalene-4-sulfonate); $C_{32}H_{22}N_6Na_2O_6S_2$ = 697 (*573-58-0*)

Schultz No. 360

Colour Index No. 22120

Brownish-red powder, soluble in water.

Congo Red Fibrin Fibrin congo red

Take 1.5 g of fibrin and leave overnight in 50 mL of a 20 g/L solution of *congo red R* in *ethanol (90 per cent V/V) R*. Filter, rinse the fibrin with *water R* and store under *ether R*.

Congo Red Paper

Immerse strips of filter paper for a few minutes in *congo red solution R*. Allow to dry.

Congo Red Solution

Dissolve 0.1 g of *congo red R* in a mixture of 20 mL of *ethanol (96 per cent) R* and *water R* and dilute to 100 mL with *water R*.

Test for sensitivity. To 0.2 mL of the congo red solution add 100 mL of *carbon dioxide-free water R* and 0.3 mL of *0.1 M hydrochloric acid*. The solution is blue. Not more than 0.3 mL of *0.1 M sodium hydroxide* is required to change the colour to pink.

Colour change: pH 3.0 (blue) to pH 5.0 (pink).

Convallatoxin 3β-[(6-Deoxy-α-L-mannopyranosyl)oxy]-5,14-dihydroxy-19-oxo-5β-card-20(22)-enolide; 5,14-Dihydroxy-19-oxo-3β-[(α-L-rhamnopyranosyl)oxy]-5β-card-20(22)-enolide; $C_{29}H_{42}O_{10}$ = 550.6 (*508-75-8*)

White or slightly yellow, crystalline powder, slightly soluble in water, soluble in ethanol, and in acetone, slightly soluble in ethyl acetate.

mp: 235-242 °C.

Coomassie Blue (*3861-73-2*)

See *acid blue 92 R*.

Coomassie Blue Solution See *acid blue 92 solution R*.

Coomassie Staining Solution

A 1.25 g/L solution of *acid blue 83 R* in a mixture consisting of 1 volume of *glacial acetic acid R*, 4 volumes of *methanol R* and 5 volumes of *water R*. Filter.

Coomassie Staining Solution R1

Dissolve 0.275 g of *acid blue 83 R* in 200 mL of *methanol R*. Stir until complete dissolution of the crystals (for about 2 h). Add 750 mL of *water R* and 50 mL of *glacial acetic acid R*. Stir overnight (for at least 16 h); filter.

Copper Cu = 63.55 (*7440-50-8*)

Cleaned foil, turnings, wire or powder of the pure metal of electrolytic grade.

Copper(II) Acetate Cupric acetate; Copper acetate; $C_4H_6CuO_4,H_2O$ = 199.7 (*6046-93-1*)

Blue-green crystals or powder, freely soluble in boiling water, soluble in water and in ethanol (96 per cent), slightly soluble in glycerol (85 per cent).

Copper Carbonate Approximately $CuCO_3,Cu(OH)_2,H_2O$ (*12069-69-1*)

General reagent grade of commerce.

Copper(II) Chloride Cupric chloride; $CuCl_2,2H_2O$ = 170.5 (*10125-13-0*)

Greenish-blue powder or crystals, deliquescent in moist air, efflorescent in dry air, freely soluble in water, in ethanol (96 per cent) and in methanol, sparingly soluble in acetone.

Storage: in an airtight container.

Copper Chloride-Pyridine Reagent

Dissolve 40 mg of *copper(II) chloride* in *pyridine*, warming until complete dissolution is effected, and cool. Add 1 mL of *carbon disulfide* and sufficient *pyridine* to produce 100 mL.

Copper Edetate Solution

To 2 mL of a 20 g/L solution of *copper acetate R* add 2 mL of *0.1 M sodium edetate* and dilute to 50 mL with *water R*.

Copper(II) Nitrate Chloride dinitrate trihydrate; Cupric nitrate; Copper nitrate; $Cu(NO_3)_2,3H_2O$ = 241.6 (*10031-43-3*)

Dark blue crystals, hygroscopic, very soluble in water giving a strongly acid reaction, freely soluble in ethanol (96 per cent) and in dilute nitric acid.

Storage: in an airtight container.

Copper Oxide Solution, Ammoniacal

Triturate 0.5 g of *copper carbonate* with 10 mL of *water* and gradually add 10 mL of 13.5M *ammonia*.

Copper(II) Sulfate Copper Sulfate; Copper sulphate; Copper(II) sulphate; Cupric sulfate; Cupric sulphate; Copper sulfate pentahydrate; $CuSO_4,5H_2O$ = 249.7 (*7758-99-8*)

Blue powder or deep-blue crystals, slowly efflorescent, very soluble in water, slightly soluble in ethanol (96 per cent).

Copper Sulfate, Anhydrous $CuSO_4$ = 159.6 (*7758-98-7*)

Greenish-grey powder, hygroscopic, freely soluble in water, slightly soluble in methanol and practically insoluble in ethanol (96 per cent).

Copper Sulfate-Pyridine Reagent

Copper sulphate-pyridine reagent

Dissolve 4 g of *copper(II) sulfate* in 90 mL of *water* and add 30 mL of *pyridine*.

Prepare immediately before use.

Copper Sulfate Solution Copper sulphate solution

A 125 g/L solution of *copper sulfate pentahydrate R*.

Copper Sulfate Solution R1

To 600 mL of *water R* slowly add 80 mL of *phosphoric acid R*. Dissolve with stirring 100 g of *anhydrous copper sulfate R* and dilute to 1 L with *water R*.

Copper Sulfate Solution, Weak

Copper sulphate solution, weak

A 10% w/v solution of *copper(II) sulfate*.

Copper Tetrammine, Ammoniacal Solution of

Dissolve 34.5 g of *copper sulfate pentahydrate R* in 100 mL of *water R* and, whilst stirring, add dropwise *concentrated ammonia R* until the precipitate which forms dissolves completely. Keeping the temperature below 20 °C, add dropwise with continuous shaking 30 mL of *strong sodium hydroxide solution R*. Filter through a sintered-glass filter (40) (*2.1.2*), wash with *water R* until the filtrate is clear and take up the precipitate with 200 mL of *concentrated ammonia R*. Filter through a sintered-glass filter (*2.1.2*) and repeat the filtration to reduce the residue to a minimum.

Corallin Sodium salt of rosolic acid; (*603-45-2*)

Colour Index No. 43811

General reagent grade of commerce.

Hard, dull red masses.

Corallin Solution, Alkaline

Dissolve 5 g of *corallin* in 100 mL of *ethanol (90%)*. Immediately before use add 1 mL of the solution to 20 mL of a 20% w/v solution of *sodium carbonate*.

Cortisone $C_{21}H_{28}O_5$ = 360.4 (*53-06-5*)

Content: minimum 95.0 per cent.

mp: 223-228 °C.

Cortisone Acetate (*50-04-4*)

See *Cortisone acetate (0321)*.

Corydaline (13*S*,13a*R*)-5,8,13,13a-Tetrahydro-2,3,9,10-tetramethoxy-13-methyl-6*H*-dibenzo[*a*,*g*]quinolizine; $C_{22}H_{27}NO_4$ = 369.4 (*518-69-4*)

Costunolide (3a*S*,6*E*,10*E*,11a*R*)-6,10-Dimethyl-3-methylene-3a,4,5,8,9,11a-hexahydrocyclodeca[*b*]furan-2(3*H*)-one; $C_{15}H_{20}O_2$ = 232.3 (*553-21-9*)

Coumaphos $C_{14}H_{16}ClO_5PS$ = 362.8 (*56-72-4*)

mp: 91 °C to 92 °C.

A suitable certified reference solution (10 ng/µL in iso-octane) may be used.

***o*-Coumaric Acid** (*E*)-2-Hydroxycinnamic acid; (2*E*)-3-(2-Hydroxyphenyl)prop-2-enoic acid; $C_9H_8O_3$ = 164.2 (*614-60-8*)

White or almost white powder.

mp: about 217 °C.

Coumarin 2*H*-Chromen-2-one; 2*H*-1-Benzopyran-2-one; $C_9H_6O_2$ = 146.1 (*91-64-5*)

Colourless, crystalline powder or orthorhombic or rectangular crystals, very soluble in boiling water, soluble in ethanol (96 per cent). It dissolves in solutions of alkali hydroxides.

mp: 68 °C to 70 °C.

Coumarin used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Cassia oil (1496)*.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Coumestrol $C_{15}H_8O_5$ = 268.22 (*479-13-0*)

General reagent grade of commerce.

***m*-Cresol** (*108-39-4*)

See *metacresol (2077)*.

***o*-Cresol** Cresol; C_7H_8O = 108.1 (*95-48-7*)

Crystals or a super-cooled liquid becoming dark on exposure to light and air, miscible with anhydrous ethanol, soluble in about 50 parts of water and soluble in solutions of alkali hydroxides.

d_{20}^{20}: about 1.05.

n_D^{20}: 1.540 to 1.550.

bp: about 190 °C.

Freezing point (*2.2.18*): minimum 30.5 °C.

Residue on evaporation: maximum 0.1 per cent *m/m*, determined by evaporating on a water-bath and drying in an oven at 100-105 °C.

Storage: protected from light, moisture and oxygen.

Distil before use.

***p*-Cresol** 4-Methylphenol; C_7H_8O = 108.1 (*106-44-5*)

Colourless or white or almost white crystals or crystalline mass.

d_{20}^{20}: about 1.02.

bp: about 202 °C.***m*-Cresol Purple**

m-Cresolsulfonphthalein; $C_{21}H_{18}O_5S$ = 382.44 (*2303-01-7*)

Olive-green, crystalline powder, slightly soluble in water, soluble in ethanol (96 per cent), in glacial acetic acid and in methanol.

***m*-Cresol Purple Solution**

Dissolve 0.1 g of *m-cresol purple R* in 13 mL of *0.01 M sodium hydroxide*, dilute to 100 mL with *water R* and mix.

Colour change: pH 1.2 (red) to pH 2.8 (yellow); pH 7.4 (yellow) to pH 9.0 (purple).

Cresol Red Cresolsulfonphthalein; 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene)bis-(2-methylphenol) *S*,*S*-dioxide; $C_{21}H_{18}O_5S$ = 382.4 (*1733-12-6*)

A reddish-brown crystalline powder, slightly soluble in water, soluble in ethanol (96 per cent) and in dilute solutions of alkali hydroxides.

Cresol Red Solution

Dissolve 0.1 g of *cresol red R* in a mixture of 2.65 mL of *0.1 M sodium hydroxide* and 20 mL of *ethanol (96 per cent) R* and dilute to 100 mL with *water R*.

Test for sensitivity. A mixture of 0.1 mL of the cresol red solution and 100 mL of *carbon dioxide-free water R* to which 0.15 mL of *0.02 M sodium hydroxide* has been added is purple-red. Not more than 0.15 mL of *0.02 M hydrochloric acid* is required to change the colour to yellow.

Colour change: pH 7.0 (yellow) to pH 8.6 (red).

Crystal Violet Basic violet 3; $C_{25}H_{30}ClN_3$ = 408.0 (*548-62-9*)

Schultz No. 78

Colour Index No. 42555

Dark-green powder or crystals, soluble in water and in ethanol (96 per cent).

Crystal Violet Solution

Dissolve 0.5 g of *crystal violet R* in *anhydrous acetic acid R* and dilute to 100 mL with the same solvent.

Test for sensitivity. To 50 mL of *anhydrous acetic acid R* add 0.1 mL of the crystal violet solution. On addition of 0.1 mL of *0.1 M perchloric acid* the bluish-purple solution turns bluish-green.

Cupri-citric Solution

Dissolve 25 g of *copper sulfate pentahydrate R*, 50 g of *citric acid monohydrate R* and 144 g of *anhydrous sodium carbonate R* in *water R* and dilute to 1000 mL with the same solvent.

Cupri-citric Solution R1

Dissolve 25 g of *copper sulfate pentahydrate R*, 50 g of *citric acid monohydrate R* and 144 g of *anhydrous sodium carbonate R* in *water R* and dilute to 1000 mL with the same solvent.

Adjust the solution so that it complies with the following requirements.

a) To 25.0 mL add 3 g of *potassium iodide R*. Add 25 mL of a 25 per cent *m/m* solution of *sulfuric acid R* with precaution and in small quantities. Titrate with *0.1 M sodium thiosulfate* using 0.5 mL of *starch solution R*, added towards the end of the titration, as indicator.

24.5 mL to 25.5 mL of *0.1 M sodium thiosulfate* is used in the titration.

b) Dilute 10.0 mL to 100.0 mL with *water R* and mix. To 10.0 mL of the solution, add 25.0 mL of *0.1 M hydrochloric acid* and heat for 1 h on a water-bath. Cool, adjust with *water R* to the initial volume and titrate with *0.1 M sodium hydroxide*, using 0.1 mL of *phenolphthalein solution R1* as indicator.

5.7 mL to 6.3 mL of *0.1 M sodium hydroxide* is used in the titration.

c) Dilute 10.0 mL to 100.0 mL with *water R* and mix. Titrate 10.0 mL of the solution with *0.1 M hydrochloric acid*, using 0.1 mL of *phenolphthalein solution R1* as indicator.

6.0 mL to 7.5 mL of *0.1 M hydrochloric acid* is used in the titration.

Cupriethylenediamine Hydroxide Solution (*14552-35-3*)

The molar ratio of ethylenediamine to copper is 2.00 ± 0.04.

This solution is commercially available.

Cupri-tartaric Solution

Solution A. Dissolve 34.6 g of *copper sulfate pentahydrate R* in *water R* and dilute to 500 mL with the same solvent.

Solution B. Dissolve 173 g of *sodium potassium tartrate R* and 50 g of *sodium hydroxide R* in 400 mL of *water R*. Heat to boiling, allow to cool and dilute to 500 mL with *carbon dioxide-free water R*.

Mix equal volumes of the 2 solutions immediately before use.

Cupri-tartaric Solution R1

Fehling's solution

Solution A Dissolve 34.6 g of *copper(II) sulfate* in a mixture of 0.5 mL of *sulfuric acid* and sufficient *water* to produce 500 mL.

Solution B Dissolve 176 g of *potassium sodium (+)-tartrate* and 77 g of *sodium hydroxide* in sufficient *water* to produce 500 mL.

Mix equal volumes of solutions A and B immediately before use.

Cupri-tartaric Solution R2 Dilute potassium cupri-tartrate solution

Add 1 mL of a solution containing 5 g/L of *copper sulfate pentahydrate R* and 10 g/L of *potassium tartrate R* to 50 mL of *sodium carbonate solution R1*. Prepare immediately before use.

Cupri-tartaric Solution R3

Prepare a solution containing 10 g/L of *copper sulfate pentahydrate R* and 20 g/L of *sodium tartrate R*. To 1.0 mL of the solution add 50 mL of *sodium carbonate solution R2*. Prepare immediately before use.

Cupri-tartaric Solution R4

Solution A. 150 g/L *copper sulfate pentahydrate R*.

Solution B. Dissolve 2.5 g of *anhydrous sodium carbonate R*, 2.5 g of *sodium potassium tartrate R*, 2.0 g of *sodium hydrogen carbonate R*, and 20.0 g of *anhydrous sodium sulfate R* in *water R* and dilute to 100 mL with the same solvent.

Mix 1 part of solution A with 25 parts of solution B immediately before use.

Curcumin 1,7-Bis(4-hydroxy-3-methoxyphenyl)hepta-1,6-diene-3,5-dione; $C_{21}H_{20}O_6$ = 368.4 (*458-37-7*)

Orange-brown, crystalline powder, practically insoluble in water, soluble in glacial acetic acid.

mp: about 183 °C.

Curcuminoids

A mixture of curcumin ($C_{21}H_{20}O_6$; M_r 368.4), demethoxycurcumin ($C_{20}H_{18}O_5$; M_r 338.4) and bis-demethoxycurcumin ($C_{19}H_{16}O_4$; M_r 308.3).

Cyanoacetic Acid Malonic acid mononitrile; $C_3H_3NO_2$ = 85.1 (*372-09-8*)

White or yellowish-white, hygroscopic crystals, very soluble in water.

Storage: in an airtight container.

Cyanocobalamin Coα-[α-(5,6-Dimethylbenzimidazolyl)]-Coβ-cyanocobamide; Vitamin B_{12}; (*68-19-9*)

See *Cyanocobalamin (0547)*.

Cyanogen Bromide Solution (*506-68-3*)

Add dropwise, with cooling *0.1 M ammonium thiocyanate* to *bromine water R* until the yellow colour disappears. Prepare immediately before use.

1-Cyanoguanidine Dicyandiamide; Cyanoguanidine; $C_2H_4N_4$ = 84.1 (*461-58-5*)

White or almost white, crystalline powder, sparingly soluble in water and in ethanol (96 per cent), practically insoluble in methylene chloride.

mp: about 210 °C.

Cyanopropyl(3)phenyl(3)methyl(94)polysiloxane

Polysiloxane substituted with 3 per cent of cyanopropyl groups, 3 per cent of phenyl groups and 94 per cent of methyl groups.

Cyanopropyl(7)phenyl(7)methyl(86)polysiloxane

Polysiloxane substituted with 7 per cent of cyanopropyl groups, 7 per cent of phenyl groups and 86 per cent of methyl groups.

Cyanopropyl(25)phenyl(25)methyl(50)polysiloxane

Polysiloxane substituted with 25 per cent of cyanopropyl groups, 25 per cent of phenyl groups and 50 per cent of methyl groups.

Cyanopropylpolysiloxane

Polysiloxane substituted with 100 per cent of cyanopropyl groups.

Cyasterone (2β,3β,5β,22*R*,24*S*,24^1*R*,25*S*)-24^1,26-Epoxy-2,3,14,20,22-pentahydroxystigmast-7-ene-6,26-dione; $C_{29}H_{44}O_8$ = 520.7 (*17086-76-9*)

Cyclobutane-1,1-dicarboxylic Acid $C_6H_{10}O_4$ = 144.1 (*5445-51-2*)

mp: about 160°.

General reagent grade of commerce.

α-Cyclodextrin Cyclohexakis-(1→4)-(α-D-glucopyranosyl); Cyclomaltohexaose; Alfadex; $C_{36}H_{60}O_{30}$ = 972 (*10016-20-3*)

β-Cyclodextrin (*7585-39-9*)

See *Betadex (1070)*.

γ-Cyclodextrin Gamma-cyclodextrin $C_{48}H_{80}O_{40}$ = 1297 (*17465-86-0*)

General reagent grade of commerce.

β-Cyclodextrin for Chiral Chromatography, Modified

30 per cent of 2,3-di-*O*-ethyl-6-*O*-*tert*-butyldimethylsilyl-β-cyclodextrin dissolved in polysiloxane substituted with 15 per cent of phenyl groups and 85 per cent of methyl groups.

β-Cyclodextrin for Chiral Chromatography, Modified R1

30 per cent of 2,3-di-*O*-acetyl-6-*O*-*tert*-butylsilyl-β-cyclodextrin dissolved in polysiloxane substituted with 15 per cent of phenyl groups and 85 per cent of methyl groups.

β-Cyclodextrin Hydroxypropyl Ether Derivative for Chiral Chromatography

Beta cyclodextrin, R,S-hydroxypropyl ether derivative, bonded to porous silica particles, 3 to 10 µm in diameter.

Cyclohexane C_6H_{12} = 84.2 (*110-82-7*)

Clear, colourless, flammable liquid, practically insoluble in water, miscible with organic solvents.

d_{20}^{20}: about 0.78.

bp: about 80.5 °C.

Cyclohexane used in spectrophotometry complies with the following additional test.

Absorbance (*2.2.25*): maximum 0.35 at 220 nm, 0.16 at 235 nm, 0.05 at 240 nm, 0.01 at 250 nm, determined using *water R* as compensation liquid.

Cyclohexane R1

Complies with the requirements prescribed for *cyclohexane R* with the following additional requirement.

The fluorescence, measured at 460 nm, under illumination with an excitant light beam at 365 nm, is not more intense than that of a solution containing 0.002 ppm of *quinine R* in *dilute sulfuric acid R1*.

Cyclohexylamine Cyclohexanamine; $C_6H_{13}N$ = 99.2 (*108-91-8*)

Colourless liquid, soluble in water, miscible with usual organic solvents.

n_D^{20}: about 1.460.

bp: 134 °C to 135 °C.

Cyclohexylenedinitrilotetra-acetic Acid (±)-trans-1,2-Diaminocyclohexane-N,N,N′,N′-tetra-acetic acid; $C_{14}H_{22}N_2O_8,H_2O$ = 364.4

White or almost white, crystalline powder.

mp: about 204 °C.

Cyclohexylmethanol Cyclohexylcarbinol; $C_7H_{14}O$ = 114.2 (*100-49-2*)

Liquid with a slight odour of camphor, soluble in ethanol (96 per cent).

n_D^{25}: about 1.464.

bp: about 185 °C.

3-Cyclohexylpropionic Acid $C_9H_{16}O_2$ = 156.2 (*701-97-3*)

Clear liquid.

d_{20}^{20}: about 0.998.

n_D^{20}: about 1.4648.

bp: about 130 °C.

Cyhalothrin $C_{23}H_{19}ClF_3NO_3$ = 449.9 (*91465-08-6*)

bp: 187 °C to 190 °C.

mp: about 49 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Cymarin 3β-[(2,6-Dideoxy-3-*O*-methyl-β-D-*ribo*-hexopyranosyl)oxy]-5β,14-dihydroxy-19-oxocard-20(22)-enolide; $C_{30}H_{44}O_9$ = 548.7 (*508-77-0*)

White or slightly yellow powder, slightly soluble in water, soluble in methanol.

mp: about 148 °C.

***p*-Cymene** 4-Isopropyltoluene; $C_{10}H_{14}$ = 134.2 (*99-87-6*)

Colourless liquid, practically insoluble in water, soluble in ethanol (96 per cent).

d_{20}^{20}: about 0.858.

n_D^{20}: about 1.4895.

bp: 175 °C to 178 °C.

p-Cymene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. The substance to be examined.

Content: minimum 96.0 per cent, calculated by the normalisation procedure.

Cynarin (1R,3R,4S,5R)-1,3-Bis[[3-(3,4- dihydroxyphenyl) propenoyl]oxy]-4,5- dihydroxycyclohexanecarboxylic acid; $C_{25}H_{24}O_{12}$ = 516.4 (*30964-13-7*)

White or almost white amorphous mass, odourless.

Cypermethrin $C_{22}H_{19}Cl_2NO_3$ = 416.3 (*52315-07-8*)

bp: 170 °C to 195 °C.

mp: 60 °C to 80 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

L-Cysteine $C_3H_7NO_2S$ = 121.1 (*52-90-4*)

Powder, freely soluble in water, in ethanol (96 per cent) and in acetic acid, practically insoluble in acetone.

Cysteine Hydrochloride (*7048-04-6*)

See *Cysteine hydrochloride monohydrate (0895)*.

L-Cystine $C_6H_{12}N_2O_4S_2$ = 240.3 (*56-89-3*)

White or almost white, crystalline powder, practically insoluble in water and in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

$[\alpha]_D^{20}$: −218 to −224, determined in *1 M hydrochloric acid*.

mp: 250 °C, with decomposition.

Cytochrome c Ferricytochrome c (oxidized state); (*9007-43-6*)

Purity, minimum 95%.

Cytosine $C_4H_5N_3O$ = 111.1 (*71-30-7*)

Content: minimum 95.0 per cent.

Daidzein 7-Hydroxy-3-(4-hydroxyphenyl)-4*H*-1-benzopyran-4-one; $C_{15}H_{10}O_4$ = 254.2 (*486-66-8*)

Daidzin Daidzein-7-*O*-glucoside; 7-(β-D-Glucopyranosyloxy)-3-(4-hydroxyphenyl)-4*H*-1-benzopyran-4-one; $C_{21}H_{20}O_9$ = 416.4 (*552-66-9*)

***o,p'*-DDD** 1-(2-Chlorophenyl)-1-(4-chlorophenyl)-2,2-dichloroethane; $C_{14}H_{10}Cl_4$ = 320.0 (*53-19-0*)

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

***p,p'*-DDD** 1,1-Bis(4-chlorophenyl)-2,2-dichloroethane; $C_{14}H_{10}Cl_4$ = 320.0 (*72-54-8*)

bp: about 193 °C.

mp: about 109 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

***o,p'*-DDE** $C_{14}H_8Cl_4$ = 318.0 (*3424-82-6*)

1-(2-Chlorophenyl)-1-(4-chlorophenyl)-2,2-dichloroethylene.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

***p,p'*-DDE** 1,1-Bis(4-chlorophenyl)-2,2-dichloroethylene; $C_{14}H_8Cl_4$ = 318.0 (*72-55-9*)

bp: 316 °C to 317 °C.

mp: 88 °C to 89 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

***o,p'*-DDT** 1-(2-Chlorophenyl)-1-(4-chlorophenyl)-2,2,2-trichloroethane; $C_{14}H_9Cl_5$ = 354.5 (*789-02-6*)

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

***p,p'*-DDT** 1,1-Bis(4-chlorophenyl)-2,2,2-trichloroethane; $C_{14}H_9Cl_5$ = 354.5 (*50-29-3*)

bp: about 260 °C.

mp: 108 °C to 109 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Decanal Decyl aldehyde; $C_{10}H_{20}O$ = 156.3 (*112-31-2*)

Oily, colourless liquid, practically insoluble in water.

Decanal used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Sweet orange oil (1811)*.

Content: minimum 97 per cent, calculated by the normalisation procedure.

***N*-Decane** Decane; $C_{10}H_{22}$ = 142.3 (*124-18-5*)

Colourless liquid, practically insoluble in water.

n_D^{20}: about 1.411.

bp: about 174 °C.

Decan-1-ol Capryl Alcohol; Capric alcohol; Decanol; $C_{10}H_{22}O$ = 158.3 (*112-30-1*)

Viscous liquid, solidifying at about 6 °C, practically insoluble in water, soluble in ethanol (96 per cent).

n_D^{20}: about 1.436.

bp: about 230 °C.

Decloxizine Hydrochloride 2-[2-(4-benzhydryl-1-piperazinyl)ethoxy]ethanol; $C_{21}H_{28}N_2O_2.2HCl$ = 413.39 (*3733-63-9*)

Analytical reagent grade of commerce.

Defluorohydroxy-PSMA-1007 (3*S*,10*S*,14*S*)-1-[4-[[(2*S*)-4-Carboxy-2-[(2*S*)-4-carboxy-2-(6-hydroxypyridin-3-amido) butanamido]butanamido]methyl]phenyl]-3-[(naphthalen-2-yl) methyl]-1,4,12-trioxo-2,5,11,13-tetraazahexadecane-10,14,16-tricarboxylic acid; $C_{49}H_{56}N_8O_{17}$ = 1029

White or almost white powder.

Defluorotrimethylaminium-PSMA-1007 Trifluoroacetate 5-[[(2*S*)-4-Carboxy-1-[[(2*S*)-4-carboxy-1-[[[4-[(3*S*,10*S*,14*S*)-10,14-dicarboxy-17-hydroxy-3-[(naphthalen-2-yl)methyl]-1,4,12,17-tetraoxo-2,5,11,13-tetraazaheptadecan-1-yl]phenyl]methyl]amino]-1-oxobutan-2-yl]amino]-1-oxobutan-2-yl]carbamoyl]-*N*,*N*,*N*-trimethylpyridin-2-aminium trifluoroacetate; $C_{54}H_{64}F_3N_9O_{18}$ = 1184 (*2226894-58-0*)

White or almost white powder.

Dehydrocostus Lactone (3a*S*,6a*R*,9a*R*,9b*S*)-3,6,9-Trismethylenedecahydroazuleno[4,5-*b*]furan-2(3*H*)-one; $C_{15}H_{18}O_2$ = 230.3 (*477-43-0*)

Deltamethrin $C_{22}H_{19}Br_2NO_3$ = 505.2 (*52918-63-5*)

bp: about 300 °C.

mp: about 98 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Demeclocycline Hydrochloride

See *Demeclocycline hydrochloride (0176)*.

Demethylflumazenil Ethyl 8-fluoro-6-oxo-5,6-dihydro-4*H*-imidazo[1,5-*a*][1,4]benzodiazepine-3-carboxylate; $C_{14}H_{12}FN_3O_3$ = 289.3 (*79089-72-8*)

Colourless needles, soluble in dimethyl sulfoxide and in hot methanol.

mp: about 288 °C.

14-Deoxy-11,12-didehydroandrographolide 3-[(1*E*)-2-[(1*R*,4a*S*,5*R*,6*R*,8a*R*)-6-Hydroxy-5-(hydroxymethyl)-5,8a-dimethyl-2-methylenedecahydronaphthalen-1-yl]ethenyl] furan-2(5*H*)-one; $C_{20}H_{28}O_4$ = 332.4 (*42895-58-9*)

2′-Deoxyuridine 1-(2-Deoxy-β-d-*erythro*-pentofuranosyl)-1*H*,3*H*-pyrimidine-2,4-dione; $C_9H_{12}N_2O_5$ = 228.2 (*951-78-0*)

mp: about 165 °C.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Idoxuridine (0669)*: apply 5 µL of a 0.25 g/L solution; the chromatogram shows only one principal spot.

4-Desoxypyridoxine Hydrochloride 5-(Hydroxymethyl)-2,4-dimethylpyridin-3-ol; 4-Deoxypyridoxine hydrochloride; $C_8H_{12}NO_2Cl$ = 189.6 (*148-51-6*)

Destaining Solution

A mixture consisting of 1 volume of *glacial acetic acid R*, 4 volumes of *methanol R* and 5 volumes of *water R*.

Desmethylmisonidazole (2*RS*)-3-(2-Nitro-1*H*-imidazol-1-yl)propane-1,2-diol; $C_6H_9N_3O_4$ = 187.2 (*13551-92-3*)

Content: minimum 95 per cent.

Yellow powder.

Deuterated Acetic Acid $C_2D_4O_2$; $C_2{}^2H_4O_2$ = 64.1 (*1186-52-3*)

Degree of deuteration: minimum 99.7 per cent.

d_{20}^{20}: about 1.12.

n_D^{20}: about 1.368.

bp: about 115 °C.

mp: about 16 °C.

Deuterated Acetone C_3D_6O; Deuteroacetone; $C_3{}^2H_6O$ = 64.1 (*666-52-4*)

Degree of deuteration: minimum 99.5 per cent.

Clear, colourless liquid, miscible with water, with dimethylformamide, with anhydrous ethanol and with methanol.

d_{20}^{20}: about 0.87.

n_D^{20}: about 1.357.

bp: about 55 °C.

Water and deuterium oxide. Not more than 0.1 per cent.

Deuterated Acetonitrile $C_2{}^2H_3N$ = 44.1 (*2206-26-0*)

Degree of deuteration: minimum 99.8 per cent.

Clear, colourless liquid, miscible with water, with acetone and with methanol.

d_{20}^{20}: about 0.78.

n_D^{20}: about 1.344.

Deuterated Dimethyl Sulfoxide C_2D_6OS; Deuterated dimethyl sulphoxide; ($2H_6$)-dimethyl sulphoxide; $C_2{}^2H_6OS$ = 84.2 (*2206-27-1*)

Degree of deuteration: minimum 99.8 per cent.

Very hygroscopic liquid, practically colourless, viscous, soluble in water, in acetone and in anhydrous ethanol.

d_{20}^{20}: about 1.18.

mp: about 20 °C.

Water and deuterium oxide: maximum 0.1 per cent.

Storage: in an airtight container.

Deuterated Methanol CD4O; C^2H_4O = 36.1 (*811-98-3*)

Degree of deuteration: minimum 99.8 per cent.

Clear, colourless liquid miscible with water, with ethanol (96 per cent) and with methylene chloride.

d_{20}^{20}: about 0.888.

n_D^{20}: about 1.326.

bp: 65.4 °C.

Deuterated Sodium Trimethylsilylpropionate C6H9D4NaO2Si; $C_6H_9{}^2H_4NaO_2Si$ = 172.3 (*24493-21-8*)

Degree of deuteration: minimum 98 per cent.

White or almost white powder.

Deuterium Chloride DCl; ^2HCl = 37.47 (*7698-05-7*)

Gas.

Degree of deuteration: minimum 99 per cent.

Caution: *toxic*.

Deuterium Chloride Solution

Dilute 1 mL of *deuterium chloride R* (38 per cent *m/m*) with 5 mL of *deuterium oxide R*.

Deuterium Oxide D2O; ^2H_2O = 20.03 (*7789-20-0*)

Degree of deuteration: minimum 99.7 per cent.

d_{20}^{20}: about 1.11.

n_D^{20}: about 1.328.

bp: about 101 °C.

Deuterium Oxide, Isotopically Pure

Deuterium oxide R1; ^2H_2O = 20.03 (*7789-20-0*)

Degree of deuteration: minimum 99.95 per cent.

Deuterochloroform (2H)-Chloroform; Chloroform-d; CDCl3; Deuterated chloroform; C^2HCl_3 = 120.4 (*865-49-6*)

Degree of deuteration: minimum 99.7 per cent.

Clear, colourless liquid, practically insoluble in water, miscible with acetone and with ethanol (96 per cent). It may be stabilised over silver foil.

d_{20}^{20}: about 1.51.

n_D^{20}: about 1.445.

bp: about 60 °C.

Water and deuterium oxide: maximum 0.05 per cent.

Devarda's Alloy (*8049-11-4*)

Copper, 50 parts; aluminium, 45 parts; zinc, 5 parts.

General reagent grade of commerce containing not more than 20 ppm of nitrogen as NH_4.

Developer Solution

Dilute 2.5 mL of a 20 g/L solution of *citric acid monohydrate R* and 0.27 mL of *formaldehyde R* to 500.0 mL with *water R*.

Dexamethasone $C_{22}H_{29}FO_5$ = 392.5 (*50-02-2*)

mp: about 263°.

General reagent grade of commerce.

Dextran for Chromatography R2, Cross-linked

Bead-form dextran with a fraction range suitable for the separation of peptides and proteins with relative molecular masses of 15 × 10^2 to 30 × 10^3. When dry, the beads have a diameter of 20-80 µm.

Dextran for Chromatography R3, Cross-linked

Bead-form dextran with a fraction range suitable for the separation of peptides and proteins with relative molecular masses of 4 × 10^3 to 15 × 10^4. When dry, the beads have a diameter of 40-120 µm.

3,3′-Diaminobenzidine Tetrahydrochloride 3,3′,4,4′-Biphenyl-tetramine; $C_{12}H_{18}Cl_4N_4$, $2H_2O$ = 396.1 (*7411-49-6*)

Almost white or slightly pink powder, soluble in water.

mp: about 280 °C, with decomposition.

1,2-Diamino-4,5-methylenedioxybenzene Dihydrochloride 2*H*-1,3-Benzodioxole-5,6-diamine dihydrochloride; $C_7H_{10}Cl_2N_2O_2$ = 225.1 (*81864-15-5*)

Content: minimum 99 per cent (HPLC).

Diammonium 2,2′-azinobis(3-ethylbenzothiazoline-6-sulfonate) Diammonium 2,2′-azinobis(3-ethylbenzothiazoline-6-sulphonate); $C_{18}H_{24}N_6O_6S_4$ = 548.7 (*30931-67-0*)

Chromogenic substrate suitable for use in ELISA procedures.

Green tablets, freely soluble in water.

pH (*2.2.3*): 4.2 to 5.8 for a 0.1 g/L solution.

Diammonium Hydrogen Orthophosphate Ammonium phosphate; $(NH_4)_2HPO_4$ = 132.1 (*7783-28-0*)

White or almost white crystals or granules, hygroscopic, very soluble in water, practically insoluble in ethanol (96 per cent).

pH (*2.2.3*): about 8 for a 200 g/L solution.

Storage: in an airtight container.

Diatomaceous Filter-aid, Washed, Flux-calcined

To 500 g of flux-calcined, diatomaceous filter-aid (Celite 545 is suitable), add 2000 mL of *hydrochloric acid*, mix, allow to stand with occasional stirring for 12 hours, filter and wash the residue with *water* until the washings are neutral to *litmus paper*. Continue washing the residue on the filter paper, using 500 mL of *methanol* followed by 1000 mL of a mixture of equal volumes of *methanol* and *ether*. Finally dry the washed residue at 100° until the odour of solvent is no longer detectable. It should be stored in an airtight container.

Diatomaceous Support Diatomaceous earth; (*91053-39-3*)

White or almost white, fine granular powder, made up of siliceous frustules of fossil diatoms or of debris of fossil diatoms, practically insoluble in water and in ethanol (96 per cent).

The substance may be identified by microscopic examination with a magnification of × 500.

Diatomaceous Support, Acid-washed Diatomaceous earth for gas chromatography

White or almost white, fine granular powder, practically insoluble in water and in ethanol (96 per cent), made up of siliceous frustules of fossil diatoms or of debris of fossil diatoms. The substance may be identified by microscopic examination with a magnification of × 500. The substance is acid-washed, then water-washed until neutral.

Diatomaceous Support, Alkali-washed

Diatomaceous support that has been treated with potassium hydroxide solution to reduce peak-tailing of basic compounds.

Diatomaceous Support, Silanised Diatomaceous earth for gas chromatography, silanised

Diatomaceous earth for gas chromatography R silanised with dimethyldichlorosilane or other suitable silanising agents.

Diazinon $C_{12}H_{21}N_2O_3PS$ = 304.3 (*333-41-5*)

bp: about 306 °C.

A suitable certified reference solution (10 ng/µL in iso-octane) may be used.

Diazobenzenesulfonic Acid Solution

Diazobenzenesulphonic acid solution

Heat 0.2 g of *sulfanilic acid* with 20 mL of 1M *hydrochloric acid* until dissolved, cool to about 4° and add, dropwise, 2.2 mL of a 4% w/v solution of *sodium nitrite*, swirling continuously. Allow to stand in ice for 10 minutes and add 1 mL of a 5% w/v solution of *sulfamic acid*.

Diazobenzenesulfonic Acid Solution R1

Diazobenzenesulphonic acid solution R1

Dissolve 0.9 g of *sulfanilic acid R* in a mixture of 30 mL of *dilute hydrochloric acid R* and 70 mL of *water R*. To 3 mL of the solution add 3 mL of a 50 g/L solution of *sodium nitrite R*. Cool in an ice-bath for 5 min, add 12 mL of the sodium nitrite solution and cool again. Dilute to 100 mL with *water R* and keep the reagent in an ice-bath. Prepare extemporaneously but allow to stand for 15 min before use.

Dibenzosuberone Dibenzo[*a*,*d*]cyclohepta-1,4-dien-3-one; *H*-dibenzo[*a*,*d*]cyclohepten-5-one; $C_{15}H_{12}O$ = 208.3 (*1210-35-1*)

mp: about 34°.

General reagent grade of commerce.

Dibromomethane CH_2Br_2 = 173.8 (*74-95-3*)

Colourless liquid, slightly soluble in water.

bp: about 96 °C.

Di-*N*-butylamine *N*-Butylbutan-1-amine; Dibutylamine; $C_8H_{19}N$ = 129.3 (*111-92-2*)

Colourless liquid.

n_D^{20}: about 1.417.

bp: about 159 °C.

Dibutylammonium Phosphate for Ion-pairing

A colourless solution of 10 per cent to 15 per cent *V/V* of di-*n*-butylamine and 12 per cent to 17 per cent *V/V* of phosphoric acid in water, suitable for ion-pairing in liquid chromatography.

Dibutyl Ether $C_8H_{18}O$ = 130.2 (*142-96-1*)

Colourless, flammable liquid, practically insoluble in water, miscible with anhydrous ethanol.

d_{20}^{20}: about 0.77.

n_D^{20}: about 1.399.

Do not distil if the dibutyl ether does not comply with the test for peroxides.

Peroxides. Place 8 mL of *potassium iodide and starch solution R* in a 12 mL ground-glass-stoppered cylinder about 1.5 cm in diameter. Fill completely with the substance to be examined, shake vigorously and allow to stand protected from light for 30 min. No colour is produced.

The name and concentration of any added stabiliser are stated on the label.

Dibutyl Phthalate Di-*N*-butyl phthalate; $C_{16}H_{22}O_4$ = 278.3 (*84-74-2*)

Clear, colourless or faintly coloured, oily liquid, very slightly soluble in water, miscible with acetone and with ethanol (96 per cent).

d_{20}^{20}: 1.043 to 1.048.

n_D^{20}: 1.490 to 1.495.

Dicarboxidine Hydrochloride 4,4′-[(4,4′-Diaminobiphenyl-3,3′-diyl)dioxy]dibutanoic acid dihydrochloride; $C_{20}H_{26}Cl_2N_2O_6$ = 461.3 (*56455-90-4*)

Dichlofenthion $C_{10}H_{13}Cl_2O_3PS$ = 315.2 (*97-17-6*)

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Dichloroacetic Acid $C_2H_2Cl_2O_2$ = 128.9 (*79-43-6*)

Colourless liquid, miscible with water and ethanol (96 per cent).

d_{20}^{20}: about 1.566.

n_D^{20}: about 1.466.

bp: about 193 °C.

Dichloroacetic Acid Solution

Dilute 67 mL of *dichloroacetic acid R* to 300 mL with *water R* and neutralise to *blue litmus paper R* using *ammonia R*. Cool, add 33 mL of *dichloroacetic acid R* and dilute to 600 mL with *water R*.

3,5-Dichloroaniline 3,5-dichlorophenylamine; $C_6H_5Cl_2N$ = 162.0 (*626-43-7*)

mp: 46 °C to 52 °C.

1,2-Dichlorobenzene Dichlorobenzene; $C_6H_4Cl_2$ = 147.0 (*95-50-1*)

Colourless, oily liquid, practically insoluble in water, soluble in anhydrous ethanol.

d_{20}^{20}: about 1.31.

bp: about 180 °C.

2,4-Dichlorobenzoic Acid $C_7H_4Cl_2O_2$ = 191.0 (*50-84-0*)

Faintly beige powder.

mp: about 160 °C.

2,3-Dichloro-5,6-dicyanobenzoquinone 4,5-Dichloro-3,6-dioxo-cyclohexa-1,4-diene-1,2-dicarbonitrile; $C_8Cl_2N_2O_2$ = 227.0 (*84-58-2*)

Yellow or orange crystals, soluble in dioxan and in acetic acid, slightly soluble in methylene chloride. It decomposes in water.

mp: about 214 °C.

Storage: at a temperature of 2 °C to 8 °C.

(*S*)-3,5-Dichloro-2,6-dihydroxy-*N*-[(1-ethylpyrrolidin-2-yl)methyl]benzamide Hydrobromide $C_{14}H_{19}BrCl_2N_2O_3$ = 414.1 (*113310-88-6*)

White or almost white, crystalline powder.

$[\alpha]_D^{22}$: + 11.4, determined on a 15.0 g/L solution in *anhydrous ethanol R*.

mp: about 212 °C.

1,2-Dichloroethane Ethylene chloride; $C_2H_4Cl_2$ = 99.0 (*107-06-2*)

Clear, colourless liquid, soluble in about 120 parts of water and in 2 parts of ethanol (96 per cent).

d_{20}^{20}: about 1.25.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 82 °C and 84 °C.

2,7-Dichlorofluorescein 2-(2,7-dichloro-6-hydroxy-3-oxo-3H-xanthen-9-yl)benzoic acid; Dichlorofluorescein; $C_{20}H_{10}Cl_2O_5$ = 401.2 (*76-54-0*)

Yellowish-brown or yellow-orange powder, slightly soluble in water, freely soluble in ethanol (96 per cent) and in dilute solutions of alkali hydroxides giving a solution showing a yellowish-green fluorescence.

5,7-Dichloro-8-hydroxyquinoline 5,7-Dichlorooxine; 5,7-Dichloroquinolin-8-ol; $C_9H_5Cl_2NO$ = 214.1 (*773-76-2*)

Yellow, crystalline powder, soluble in acetone, slightly soluble in ethanol (96 per cent).

mp: about 179 °C.

Content: minimum 95.0 per cent.

Dichloromethane Methylene chloride; CH_2Cl_2 = 84.9 (*75-09-2*)

Colourless liquid, sparingly soluble in water, miscible with ethanol (96 per cent).

bp: 39 °C to 42 °C.

Methylene chloride used in fluorimetry complies with the following additional test.

Fluorescence. Under irradiation at 365 nm, the fluorescence (*2.2.21*) measured at 460 nm in a 1 cm cell is not more intense than that of a solution containing 0.002 ppm of *quinine R* in *0.5 M sulfuric acid* measured in the same conditions.

Dichloromethane, Acidified Methylene chloride, acidified

To 100 mL of *methylene chloride R* add 10 mL of *hydrochloric acid R*, shake, allow to stand and separate the two layers. Use the lower layer.

Dichloromethane IR

Spectroscopic reagent grade of commerce.

Dichloromethane Reagent

Add 50 g of *sodium hydrogen carbonate* to 1000 mL of *dichloromethane*, allow to stand overnight and filter.

2,4-Dichloro-1-naphthol $C_{10}H_6Cl_2O$ = 213.1 (*2050-76-2*)

mp: about 107°.

General reagent grade of commerce.

2,6-Dichlorophenol $C_6H_4Cl_2O$ = 163.0 (*87-65-0*)

mp: 64 °C to 66 °C.

2,6-Dichlorophenolindophenol Sodium Salt The sodium derivative of 2,6-dichloro-*N*-(4-hydroxyphenyl)-1,4-benzoquinone monoimine; Tillman's reagent; Dichlorophenolindophenol, sodium salt; $C_{12}H_6Cl_2NNaO_2,2H_2O$ = 326.1 (*620-45-1*)

Dark-green powder, freely soluble in water and in anhydrous ethanol. The aqueous solution is dark blue; when acidified it becomes pink.

2,6-Dichlorophenolindophenol Solution

Warm 0.1 g of *2,6-dichlorophenolindophenol sodium salt* with 100 mL of *water* and filter.

Use within 3 days of preparation.

2,6-Dichlorophenolindophenol Solution, Double-strength Standard

Dissolve 0.1 g of *2,6-dichlorophenolindophenol sodium salt* in 100 mL of *water*, filter, standardise by the method described under *standard dichlorophenolindophenol solution* and dilute the solution with *water* so that 1 mL is equivalent to 0.2 mg of ascorbic acid.

Use within 3 days of preparation and standardise immediately before use.

Dichlorophenolindophenol Solution, Standard

Dissolve 50.0 mg of *dichlorophenolindophenol, sodium salt R* in 100.0 mL of *water R* and filter.

Assay. Dissolve 20.0 mg of *ascorbic acid R* in 10 mL of a freshly prepared 200 g/L solution of *metaphosphoric acid R* and dilute to 250.0 mL with *water R*. Titrate 5.0 mL rapidly with the dichloro-phenolindophenol standard solution, added from a microburette graduated in 0.01 mL, until the pink colour persists for 10 s, the titration occupying not more than 2 min. Dilute the dichlorophenolindophenol solution with *water R* to make 1 mL of the solution equivalent to 0.1 mg of ascorbic acid ($C_6H_8O_6$).

Storage: use within 3 days.

Standardise immediately before use.

2,6-Dichloroquinone-4-chloroimide

Dichloroquinonechlorimide; $C_6H_2Cl_3NO$ = 210.4 (*101-38-2*)

Pale yellow or greenish-yellow crystalline powder, practically insoluble in water, soluble in ethanol (96 per cent) and in dilute alkaline solutions.

mp: about 66 °C.

Dichlorvos 2,2-Dichlorovinyl dimethyl phosphate; $C_4H_7Cl_2O_4P$ = 221 (*62-73-7*)

Colourless or brownish-yellow liquid, soluble in water, miscible with most organic solvents.

n_D^{25}: about 1.452.

Di-2-cyanoethyl Ether (2-Cyanoethyl) ether; $C_6H_8N_2O$ = 124.1 (*1656-48-0*)

n_D^{20}: 1.4400.

bp: about 111°.

Chromatographic grade of commerce.

Dicyclohexyl Bicyclohexyl; $C_{12}H_{22}$ = 166.3 (*92-51-3*)

d_{20}^{20}: about 0.864.

bp: about 227 °C.

mp: about 4 °C.

Dicyclohexylamine *N,N*-Dicyclohexylamine; $C_{12}H_{23}N$ = 181.3 (*101-83-7*)

Colourless liquid, sparingly soluble in water, miscible with the usual organic solvents.

n_D^{20}: about 1.484.

bp: about 256 °C.

Freezing point (*2.2.18*): 0 °C to 1 °C.

1,3-Dicyclohexylurea Dicyclohexylurea; $C_{13}H_{24}N_2O$ = 224.4 (*2387-23-7*)

White or almost white, crystalline powder.

mp: about 232 °C.

Didocosahexaenoin Diglyceride of docosahexaenoic acid (C22:6); Glycerol didocosahexaenoate; (*all-Z*)-Docosahexaenoic acid, diester with propane-1,2,3-triol; $C_{47}H_{68}O_5$ = 713.0 (*88315-12-2*)

The reagent from Nu-Chek Prep, Inc. has been found suitable

Didodecyl 3,3′-thiodipropionate $C_{30}H_{58}O_4S$ = 514.8 (*123-28-4*)

White or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone and in light petroleum, slightly soluble in ethanol (96 per cent).

mp: about 39 °C.

Dieldrin $C_{12}H_8Cl_6O$ = 380.9 (*60-57-1*)

bp: about 385 °C.

mp: about 176 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Diethanolamine 2,2′-Iminobisethanol; $C_4H_{11}NO_2$ = 105.1 (*111-42-2*)

Viscous, clear, slightly yellow liquid or deliquescent crystals melting at about 28 °C, very soluble in water, in acetone and in methanol.

d_{20}^{20}: about 1.09.

pH (*2.2.3*): 10.0 to 11.5 for a 50 g/L solution.

Diethanolamine used in the test for alkaline phosphatase complies with the following additional test.

Ethanolamine. Gas chromatography (*2.2.28*).

Internal standard solution. Dissolve 1.00 g of *3-aminopropanol R* in *acetone R* and dilute to 10.0 mL with the same solvent.

Test solution (a). Dissolve 5.00 g of the substance to be examined in *acetone R* and dilute to 10.0 mL with the same solvent.

Test solution (b). Dissolve 5.00 g of the substance to be examined in *acetone R*, add 1.0 mL of the internal standard solution and dilute to 10.0 mL with the same solvent.

Reference solutions. Dissolve 0.50 g of *ethanolamine R* in *acetone R* and dilute to 10.0 mL with the same solvent. To 0.5 mL, 1.0 mL and 2.0 mL of this solution, add 1.0 mL of the internal standard solution and dilute to 10.0 mL with *acetone R*.

Column:
— *size: l* = 1 m, Ø = 4 mm;
— *stationary phase: diphenylphenylene oxide polymer R* (180-250 µm).

Carrier gas: nitrogen for chromatography R.

Flow rate: 40 mL/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 → 3	125
	3 → 17.6	125 → 300
Injection port		250
Detector		280

Detection: flame-ionisation.

Injection: 1.0 µL.

Limit:
— *ethanolamine:* maximum 1.0 per cent.

2,5-Diethoxytetrahydrofuran Diethoxytetrahydrofuran, a mixture of the cis and trans Isomers; $C_8H_{16}O_3$ = 160.2 (*3320-90-9*)

Clear, colourless or slightly yellowish liquid, practically insoluble in water, soluble in ethanol (96 per cent) and in most other organic solvents.

d_{20}^{20}: about 0.98.

n_D^{20}: about 1.418.

Diethylamine $C_4H_{11}N$ = 73.1 (*109-89-7*)

Clear, colourless, flammable liquid, strongly alkaline, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: about 0.71.

bp: about 55 °C.

Diethylamine R1 *N*-Ethylethanamine; $C_4H_{11}N$ = 73.1 (*109-89-7*)

Content: minimum 99.5 per cent.

Clear, colourless, flammable liquid, strongly alkaline, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: about 0.71.

bp: about 55 °C.

Diethylaminoethyldextran

Anion-exchange resin presented as the hydrochloride.

Powder forming gels with water.

***N,N*-Diethylaniline** $C_{10}H_{15}N$ = 149.2 (*91-66-7*)

d_{20}^{20}: about 0.938.

bp: about 217 °C.

mp: about −38 °C.

Diethylene Glycol Digol; $C_4H_{10}O_3$ = 106.1 (*111-46-6*)

Content: minimum 99.5 per cent *m/m*.

Clear, colourless liquid, hygroscopic, miscible with water, with acetone and with ethanol (96 per cent).

d_{20}^{20}: about 1.118.

n_D^{20}: about 1.447.

bp: 244 °C to 246 °C.

Storage: in an airtight container.

N,N-Diethylethane-1,2-diamine
N,N-Diethylethylenediamine; $C_6H_{16}N_2$ = 116.2 (*100-36-7*)

Content: minimum 98.0 per cent.

Slightly oily liquid, colourless or slightly yellow, strong odour of ammonia, irritant to the skin, eyes and mucous membranes.

d_{20}^{20}: 0.827.

bp: 145 °C to 147 °C.

Water (*2.5.12*): maximum 1.0 per cent, determined on 0.500 g.

Di(2-ethylhexyl)Phthalate Dioctyl phthalate; $C_{24}H_{38}O_4$ = 390.5

Colourless, oily liquid, practically insoluble in water, soluble in organic solvents.

d_{20}^{20}: about 0.98.

n_D^{20}: about 1.486.

Viscosity (*2.2.9*): about 80 mPa·s.

Diethyl Phthalate $C_{12}H_{14}O_4$ = 222.2 (*84-66-2*)

bp: about 298°.

General reagent grade of commerce.

N,N-Diethyl-*p*-phenylenediamine Sulfate *N,N*-Diethyl-*p*-phenylenediamine sulphate; Diethylphenylenediamine sulphate; Diethylphenylenediamine sulfate; $C_{10}H_{18}N_2O_4S$ = 262.3 (*6283-63-2*)

White or slightly yellow powder, soluble in water.

mp: about 185 °C, with decomposition.

Storage: protected from light.

Diethylphenylenediamine Sulfate Solution
Diethylphenylenediamine sulphate solution

To 250 mL of *water R* add 2 mL of *sulfuric acid R* and 25 mL of *0.02 M sodium edetate*. Dissolve in this solution 1.1 g of *diethylphenylenediamine sulfate R* and dilute to 1000 mL with *water R*.

Do not use if the solution is not colourless.

Storage: protected from light and heat for 1 month.

Diethyl Sulfone 1-(Ethylsulfonyl)ethane; 1-(Ethanesulfonyl)ethane; $C_4H_{10}O_2S$ = 122.2 (*597-35-3*)

Content: minimum 97 per cent.

Crystalline powder.

mp: about 73 °C.

Diflubenzuron 1-(4-Chlorophenyl)-3-(2,6-difluorobenzoyl)urea; $C_{14}H_9ClF_2N_2O_2$ = 310.7 (*35367-38-5*)

Colourless or white or almost white crystals, practically insoluble in water, freely soluble in dimethyl sulfoxide, slightly soluble in acetone.

mp: 230 to 232 °C.

Digitonin 3β-[*O*-β-D-Glucopyranosyl-(1→3)-*O*-β-D-galactopyranosyl-(1→2)-*O*-[β-D-xylopyranosyl-(1→3)]-*O*-β-D-galactopyranosyl-(1→4)-*O*-β-D-galactopyranosyloxy]-(25*R*)-5α-spirostan-2α,15β-diol; $C_{56}H_{92}O_{29}$ = 1229 (*11024-24-1*)

Crystals, practically insoluble in water, sparingly soluble in anhydrous ethanol, slightly soluble in ethanol (96 per cent).

Digitoxin (*71-63-6*)

See *Digitoxin (0078)*.

Diglycine 2-[(2-Aminoacetyl)amino]acetic acid; Glycylglycine; $C_4H_8N_2O_3$ = 132.1 (*556-50-3*)

Digoxin See *Digoxin (0079)*.=

Digoxin Reagent

Add 98 mL of *glacial acetic acid* to 2 mL of *sulfuric acid* and add 0.1 mL of a 5% w/v solution of *anhydrous iron(III) chloride* in *glacial acetic acid*.

Dihydrocapsaicin *N*-[(4-Hydroxy-3-methoxyphenyl) methyl]-8-methylnonanamide; $C_{18}H_{29}NO_3$ = 307.4 (*19408-84-5*)

White or almost white, crystalline powder, practically insoluble in cold water, freely soluble in anhydrous ethanol.

10,11-Dihydrocarbamazepine 10,11-Dihydro-5*H*-dibenzo[*b,f*]azepine-5-carboxamide; $C_{15}H_{14}N_2O$ = 238.3 (*3564-73-6*)

mp: 205 °C to 210 °C.

Dihydrocarvone *p*-Menth-8-en-2-one; 2-Methyl-5-(1-methylethenyl)cyclohexanone; $C_{10}H_{16}O$ = 152.2 (*7764-50-3*)

Dihydrocarvone used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the test for chromatographic profile in the monograph *Caraway oil (1817)*.

Content calculated by the normalisation procedure:
— *major component (trans-dihydrocarvone)*: minimum 70 per cent;
— *sum of cis- and trans-dihydrocarvone*: minimum 98 per cent.

1,8-Dihydroxyanthraquinone Danthron; Dihydroxyanthraquinone; 1,8-Dihydroxyanthracene-9,10-dione; Dantron; $C_{14}H_8O_4$ = 240.2 (*117-10-2*)

Crystalline orange powder, practically insoluble in water, slightly soluble in ethanol (96 per cent), soluble in solutions of alkali hydroxides.

mp: about 195 °C.

2,4-Dihydroxybenzaldehyde β-Resorcylaldehyde; $C_7H_6O_3$ = 138.1 (*95-01-2*)

2,5-Dihydroxybenzoic Acid Gentisic acid; $C_7H_6O_4$ = 154.1 (*490-79-9*)

Light yellow crystals.

mp: about 200 °C.

5,7-Dihydroxy-4-methylcoumarin 5,7-Dihydroxy-4-methyl-2*H*-1-benzopyran-2-one; $C_{10}H_8O_4$ = 192.2 (*2107-76-8*)

Light yellowish powder, practically insoluble in water, sparingly soluble in ethanol (96 per cent).

mp: 295 °C to 303 °C.

1,3-Dihydroxynaphthalene Naphthalene-1,3-diol; $C_{10}H_8O_2$ = 160.2 (*132-86-5*)

Crystalline, generally brownish-violet powder, freely soluble in water and in ethanol (96 per cent).

mp: about 125 °C.

5,7-Di-iodo-8-hydroxyquinoline 5,7-Diiodoquinolin-8-ol; $C_9H_5I_2NO$ = 397.0 (*83-73-8*)

Yellowish-brown powder, sparingly soluble in acetone and in ethanol (96 per cent).

Content: minimum 95.0 per cent.

1,5-Di-iodopentane $C_5H_{10}I_2$ = 323.9 (*628-77-3*)

bp: about 101°.

General reagent grade of commerce.

A colourless liquid.

Di-isobutyl Ketone 2,6-Dimethyl-4-heptanone; $C_9H_{18}O$ = 142.2 (*108-83-8*)

Clear, colourless liquid, slightly soluble in water, miscible with most organic solvents.

n_D^{20}: about 1.414

bp: about 168 °C.

Di-isopropyl Ether Isopropyl ether; $C_6H_{14}O$ = 102.2 (*108-20-3*)

Clear, colourless liquid, very slightly soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: 0.723 to 0.728.

bp: 67 °C to 69 °C.

Do not distil if the di-isopropyl ether does not comply with the test for peroxides.

Peroxides. Place 8 mL of *potassium iodide and starch solution R* in a 12 mL ground-glass-stoppered cylinder about 1.5 cm in diameter. Fill completely with the substance to be examined, shake vigorously and allow to stand protected from light for 30 min. No colour is produced.

The name and concentration of any added stabiliser are stated on the label.

Storage: protected from light.

Di-isopropyl Ether, Stabiliser-free

Di-isopropyl ether that is free from stabiliser.

Reagent grade of commerce.

Di-isopropylethylamine Ethyldi-isopropylamine; $C_8H_{20}N_2$ = 144.3 (*7087-68-5*)

n_D^{20}: about 1.414.

bp: about 127°.

General reagent grade of commerce.

***N,N*-Diisopropylethylamine** *N*-Ethyl-*N*-(propan-2-yl) propan-2-amine; *N*-Ethyldiisopropylamine; $C_8H_{19}N$ = 129.2 (*7087-68-5*)

Clear, colourless or light yellow liquid.

bp: 127 °C.

***N,N'*-Di-isopropylethylenediamine** *N,N'*-Bis(1-methylethyl)-1,2-ethanediamine; $C_8H_{20}N_2$ = 144.3 (*4013-94-9*)

Colourless or yellowish, corrosive, flammable, hygroscopic liquid.

d_{20}^{20}: about 0.798.

n_D^{20}: about 1.429.

bp: about 170 °C.

Dillapiole 6-Allyl-4,5-dimethoxy-1,3-benzodioxole; $C_{12}H_{14}O_4$ = 222.24 (*523-80-8*)

General reagent grade of commerce.

2,5-Dimethoxybenzaldehyde $C_9H_{10}O_3$ = 166.2 (*93-02-7*)

mp: about 50°.

General reagent grade of commerce.

4,4'-Dimethoxybenzophenone Bis(4-methoxyphenyl) methanone; $C_{15}H_{14}O_3$ = 242.3 (*90-96-0*)

White or almost white powder, practically insoluble in water and slightly soluble in ethanol (96 per cent).

mp: about 142 °C.

3,4-Dimethoxyphenethylamine $C_{10}H_{15}NO_2$ = 181.2 (*120-20-7*)

n_D^{20}: about 1.546.

An oily liquid; weight per mL, about 1.07 g.

General reagent grade of commerce.

3,4-Dimethoxy-L-phenylalanine (2*S*)-2-Amino-3-(3,4-dimethoxyphenyl)propanoic acid; $C_{11}H_{15}NO_4$ = 225.2 (*32161-30-1*)

Content: minimum 95 per cent.

White or almost white powder.

2,2-Dimethoxypropane Dimethoxypropane; $C_5H_{12}O_2$ = 104.1 (*77-76-9*)

Colourless liquid, decomposing on exposure to moist air or water.

d_{20}^{20}: about 0.847.

n_D^{20}: about 1.378.

bp: about 83 °C.

Dimethylacetamide *N,N*-Dimethylacetamide; C_4H_9NO = 87.1 (*127-19-5*)

Content: minimum 99.5 per cent.

Colourless liquid, miscible with water and with many organic solvents.

d_{20}^{20}: about 0.94.

n_D^{20}: about 1.437.

bp: about 165 °C.

Dimethylamine *N*-Methylmethanamine; C_2H_7N = 45.09 (*124-40-3*)

Content: minimum 98.0 per cent.

Colourless, flammable gas.

Dimethylamine Hydrochloride C_2H_8ClN = 81.6 (*506-59-2*)

mp: about 172°.

General reagent grade of commerce.

Dimethylamine Solution

A 400 g/L solution of *dimethylamine R*.

Clear, colourless solution.

Density: about 0.89.

bp: about 54 °C.

mp: about −37 °C.

4-Dimethylaminobenzaldehyde

Dimethylaminobenzaldehyde; $C_9H_{11}NO$ = 149.2 (*100-10-7*)

White or yellowish-white crystals, soluble in ethanol (96 per cent) and in dilute acids.

mp: about 74 °C.

Dimethylaminobenzaldehyde Reagent

Dissolve 0.5 g of *4-dimethylaminobenzaldehyde* in a cooled mixture of 53 mL of *sulfuric acid* and 50 mL of *water* and add 0.5 mL of *iron(III) chloride solution R1*.

Allow to stand for 2 hours before use.

Dimethylaminobenzaldehyde Solution, Alcoholic

Dissolve 1 g of *4-dimethylaminobenzaldehyde* in 30 mL of *ethanol (96%)* and add 180 mL of *butan-1-ol* and 30 mL of *hydrochloric acid*.

Prepare immediately before use and discard if a pink colour develops.

Dimethylaminobenzaldehyde Solution R1

Dissolve 0.2 g of *dimethylaminobenzaldehyde R* in 20 mL of *ethanol (96 per cent) R* and add 0.5 mL of *hydrochloric acid R*. Shake the solution with *activated charcoal R* and filter. The colour of the reagent is less intense than that of *iodine solution R3*. Prepare immediately before use.

Dimethylaminobenzaldehyde Solution R2

Dissolve 0.2 g of *dimethylaminobenzaldehyde R*, without heating, in a mixture of 4.5 mL of *water R* and 5.5 mL of *hydrochloric acid R*. Prepare immediately before use.

Dimethylaminobenzaldehyde Solution R6

Dissolve 0.125 g of *dimethylaminobenzaldehyde R* in a cooled mixture of 35 mL of *water R* and 65 mL of *sulfuric acid R*. Add 0.1 mL of a 50 g/L solution of *ferric chloride R*. Before use allow to stand for 24 h, protected from light.

Storage: when stored at room temperature, use within 1 week; when stored in a refrigerator use within several months.

Dimethylaminobenzaldehyde Solution R7

Dissolve 1.0 g of *dimethylaminobenzaldehyde R* in 50 mL of *hydrochloric acid R* and add 50 mL of *ethanol (96 per cent) R*.

Storage: protected from light; use within 4 weeks.

Dimethylaminobenzaldehyde Solution R8

Dissolve 0.25 g of *dimethylaminobenzaldehyde R* in a mixture of 5 g of *phosphoric acid R*, 45 g of *water R* and 50 g of *anhydrous acetic acid R*. Prepare immediately before use.

Dimethylaminobenzaldehyde Solution R9

Dissolve 1.0 g of *dimethylaminobenzaldehyde R* in 3.5 mL of perchloric acid (600 g/L $HClO_4$) and slowly add 6.5 mL of *2-propanol R*. Prepare immediately before use.

4-Dimethylaminocinnamaldehyde 3-(4-Dimethylaminophenyl)prop-2-enal; $C_{11}H_{13}NO$ = 175.2 (*6203-18-5*)

Orange or orange-brown crystals or powder. Sensitive to light.

mp: about 138 °C.

4-Dimethylaminocinnamaldehyde Solution

Dissolve 2 g of *4-dimethylaminocinnamaldehyde R* in a mixture of 100 mL of *hydrochloric acid R1* and 100 mL of *anhydrous ethanol R*. Dilute the solution to four times its volume with *anhydrous ethanol R* immediately before use.

Dimethylaminoethanol 2-(Dimethylamino)ethan-1-ol; $C_4H_{11}NO$ = 89.1 (*108-01-0*)

Colourless or slightly yellow liquid, miscible with water.

bp: about 135 °C.

2-(Dimethylamino)ethyl Methacrylate 2-(Dimethylamino)ethyl 2-methylpropenoate; $C_8H_{15}NO_2$ = 157.2 (*2867-47-2*)

d_4^{20}: about 0.930.

bp: about 187 °C.

Dimethylaminonaphthalenesulfonyl Chloride Dimethylaminonaphthalenesulphonyl chloride; 5-Dimethylaminonaphthalene-1-sulphonyl chloride; Dansyl chloride; $C_{12}H_{12}ClNO_2S$ = 269.8 (*605-65-2*)

Yellow, crystalline powder, slightly soluble in water, soluble in methanol.

mp: about 70 °C.

3-Dimethylaminophenol 3-(Dimethylamino)phenol; $C_8H_{11}NO$ = 137.2 (*99-07-0*)

Grey powder, slightly soluble in water.

mp: about 80 °C.

2-(Dimethylamino)thioacetamide Hydrochloride $C_4H_{11}ClN_2S$ = 154.7 (*27366-72-9*)

Dimethylaniline *N,N*-Dimethylaniline; (*121-69-7*)

See *N,N-Dimethylaniline R*.

***N,N*-Dimethylaniline** $C_8H_{11}N$ = 121.2 (*121-69-7*)

Clear, oily liquid, almost colourless when freshly distilled, darkening on storage to reddish-brown, practically insoluble in water, freely soluble in ethanol (96 per cent).

n_D^{20}: about 1.558.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 192 °C and 194 °C.

2,3-Dimethylaniline 2,3-Xylidine; $C_8H_{11}N$ = 121.2 (*87-59-2*)

Yellowish liquid, sparingly soluble in water, soluble in ethanol (96 per cent).

d_{20}^{20}: 0.993 to 0.995.

n_D^{20}: about 1.569.

bp: about 224 °C.

2,4-Dimethylaniline 2,4-Xylidene; $C_8H_{11}N$ = 121.2 (*95-68-1*)

General reagent grade of commerce.

2,6-Dimethylaniline 2,6-Xylidine; $C_8H_{11}N$ = 121.2 (*87-62-7*)

Colourless liquid, sparingly soluble in water, soluble in ethanol (96 per cent).

d_{20}^{20}: about 0.98.

2,6-Dimethylaniline Hydrochloride 2,6-Dimethylbenzenamide hydrochloride; 2,6-Xylidine hydrochloride; $C_8H_{12}ClN$ = 157.6 (*21436-98-6*)

Content: minimum 98.0 per cent.

2,4-Dimethyl-6-*tert*-butylphenol 6-*tert*-Butyl-2,4-dimethylphenol; $C_{12}H_{18}O$ = 178.3 (*1879-09-0*)

Dimethyl Carbonate Carbonic acid dimethyl ester; $C_3H_6O_3$ = 90.1 (*616-38-6*)

Liquid, insoluble in water, miscible with ethanol (96 per cent).

d_4^{17}: 1.065.

n_D^{20}: 1.368.

bp: about 90 °C.

Dimethyl-β-cyclodextrin Heptakis(2,6-di-*O*-methyl) cyclomaltoheptaose; Cycloheptakis-(1→4)-(2,6-di-*O*-methyl-α-D-glucopyranosyl); $2^A,2^B,2^C,2^D,2^E,2^F,2^G,6^A,6^B,6^C,6^D,6^E,6^F,6^G$-Tetradeca-*O*-methyl-β-cyclodextrin; $C_{56}H_{98}O_{35}$ = 1331 (*51166-71-3*)

White or almost white powder.

Dimethyldecylamine *N,N*-dimethyldecylamine; $C_{12}H_{27}N$ = 185.4 (*1120-24-7*)

Content: minimum 98.0 per cent *m/m*.

bp: about 234 °C.

1,7-dimethyl-3,7-dihydro-1*H*-purine-2,6-dione paraxanthine; 1,7-dimethylxanthine; $C_7H_8N_4O_2$ = 180.16 (*611-59-6*)

mp: about 298°

General reagent grade of commerce.

***N,N*-Dimethyldodecylamine *N*-oxide** $C_{14}H_{31}NO$ = 229.4 (*1643-20-5*)

mp: about 132°.

General reagent grade of commerce.

1,1-Dimethylethylamine 2-Amino-2-methylpropane; *tert*-Butylamine; $C_4H_{11}N$ = 73.1 (*75-64-9*)

Liquid, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.694.

n_D^{20}: about 1.378.

bp: about 46 °C.

1,1-Dimethylethyl Methyl Ether *tert*-Butyl methyl ether; 2-methoxy-2-methylpropane; $C_5H_{12}O$ = 88.1 (*1634-04-4*)

Colourless, clear, flammable liquid.

n_D^{20}: about 1.376.

Absorbance (*2.2.25*): maximum 0.30 at 240 nm, 0.10 at 255 nm, 0.01 at 280 nm, determined using *water R* as compensation liquid.

1,1-Dimethylethyl Methyl Ether R1 2-Methoxy-2-methylpropane; *tert*-Butyl methyl ether; $C_5H_{12}O$ = 88.1 (*1634-04-4*)

Content: minimum 99.5 per cent.

d_{20}^{20}: about 0.741.

n_D^{20}: about 1.369.

bp: about 55 °C.

Dimethylformamide C_3H_7NO = 73.1 (*68-12-2*)

Clear, colourless neutral liquid, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: 0.949 to 0.952.

bp: about 153 °C.

Water (*2.5.12*): maximum 0.1 per cent.

Dimethylformamide Diethylacetal *N,N*-Dimethylformamide diethylacetal; $C_7H_{17}NO_2$ = 147.2 (*1188-33-6*)

n_D^{20}: about 1.40.

bp: 128 °C to 130 °C.

***N,N*-Dimethylformamide Dimethylacetal** 1,1-Dimethoxytrimethylamine; $C_5H_{13}NO_2$ = 119.2 (*4637-24-5*)

Clear, colourless liquid.

d_{20}^{20}: about 0.896.

n_D^{20}: about 1.396.

bp: about 103 °C.

Dimethylglyoxime 2,3-Butanedione dioxime; $C_4H_8N_2O_2$ = 116.1 (*95-45-4*)

White or almost white, crystalline powder or colourless crystals, practically insoluble in cold water, very slightly soluble in boiling water, soluble in ethanol (96 per cent).

mp: about 240 °C, with decomposition.

Sulfated ash (*2.4.14*): maximum 0.05 per cent.

1,3-Dimethyl-2-imidazolidinone *N,N'*-Dimethylethylene urea; 1,3-Dimethyl-2-imidazolidone; $C_5H_{10}N_2O$ = 114.2 (*80-73-9*)

n_D^{20}: 1.4720.

bp: about 224 °C.

***N,N*-Dimethyl-*p*-nitrosoaniline** $C_8H_{10}N_2O$ = 150.2 (*138-89-6*)

mp: about 86°.

General reagent grade of commerce.

Green crystals or a green, crystalline powder.

***N,N*-Dimethyloctylamine** Octyldimethylamine; $C_{10}H_{23}N$ = 157.3 (*7378-99-6*)

Colourless liquid.

d_{20}^{20}: about 0.765.

n_D^{20}: about 1.424.

bp: about 195 °C.

2,5-Dimethylphenol *p*-Xylenol; $C_8H_{10}O$ = 122.2 (*95-87-4*)

White or almost white crystals.

2,6-Dimethylphenol $C_8H_{10}O$ = 122.2 (*576-26-1*)

Colourless needles, slightly soluble in water, very soluble in ethanol (96 per cent).

bp: about 203 °C.

mp: 46 °C to 48 °C.

3,4-Dimethylphenol $C_8H_{10}O$ = 122.2 (*95-65-8*)

White or almost white crystals, slightly soluble in water, freely soluble in ethanol (96 per cent).

bp: about 226 °C.

mp: 25 °C to 27 °C.

***N,N*-Dimethyl-L-phenylalanine** (2*S*)-2-(Dimethylamino)-3-phenylpropanoic acid; $C_{11}H_{15}NO_2$ = 193.2 (*17469-89-5*)

mp: about 226 °C.

***N,N*-Dimethyl-*p*-phenylenediamine Dihydrochloride** $C_8H_{12}N_2,2HCl$ = 209.1 (*536-46-9*)

General reagent grade of commerce.

Darkens readily on exposure to air.

Dimethyl Phthalate $C_{10}H_{10}O_4$ = 194.2 (*131-11-3*)

General reagent grade of commerce.

A colourless or faintly coloured liquid; weight per mL, about 1.19 g.

N,N'-Dimethylpiperazine 1,4-Dimethylpiperazine; Dimethylpiperazine; $C_6H_{14}N_2$ = 114.2 (*106-58-1*)

A colourless liquid, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: about 0.85.

n_D^{20}: about 1.446.

bp: about 131 °C.

Dimethylstearamide Dimethylstearylamide; *N,N*-dimethyloctadecanamide; $C_{20}H_{41}NO$ = 311.6

White or almost white solid mass, soluble in many organic solvents, including acetone.

mp: about 51 °C.

Dimethylstearylamide See *dimethylstearamide R*.

Dimethyl Sulfone Dimethyl sulphone; $C_2H_6O_2S$ = 94.1 (*67-71-0*)

White or almost white, crystalline powder, freely soluble in water, soluble in acetone and ethanol (96 per cent).

mp: 108 °C to 110 °C.

Dimethyl Sulfoxide Dimethyl sulphoxide; (*67-68-5*)

See *Dimethyl sulfoxide (0763)*.

Dimethyl sulfoxide used in spectrophotometry complies with the following additional test.

Absorbance (*2.2.25*): maximum 1.00 at 262 nm, 0.46 at 270 nm, 0.16 at 290 nm, 0.01 at 340 nm and higher wavelengths, determined using *water R* as compensation liquid.

Dimethyl Sulfoxide R1 Dimethyl sulphoxide R1

Content: minimum 99.7 per cent, determined by gas chromatography.

Dimethyl Sulfoxide R2 Dimethyl sulphoxide R2

Content: minimum 99.9 per cent, determined by gas chromatography.

Residue on evaporation: maximum 0.0005 per cent.

Water (2.5.32): maximum 0.005 per cent.

N,N-Dimethyltetradecylamine $C_{16}H_{35}N$ = 241.5

d_{20}^{20}: about 0.80.

bp: about 260°.

General reagent grade of commerce containing 98.0 to 101.0% w/w of $C_{16}H_{35}N$.

A clear or almost clear, colourless or slightly yellow liquid.

Complies with the following tests.

Water Not more than 0.3%, Appendix IX C, Method I A.

Assay Dissolve 0.2 g in 10 mL of *ethanol (96%)* and titrate with *0.1M hydrochloric acid VS* using *methyl red solution* as indicator until a red colour is produced. Each mL of *0.1M hydrochloric acid VS* is equivalent to 24.15 mg of $C_{16}H_{35}N$.

Dimethyl Yellow CI 11020; 4-dimethylaminoazobenzene; $C_{14}H_{15}N_3$ = 225.3 (*60-11-7*)

Produces a red colour in moderately acidic alcoholic solutions and a yellow colour in weakly acidic and alkaline solutions (pH range, 2.8 to 4.6).

Complies with the following test.

Homogeneity Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and *dichloromethane* as the mobile phase. Apply to the plate 10 µL of a 0.01% w/v solution in *dichloromethane*. The chromatogram shows only one spot.

Dimethyl Yellow and Oracet Blue Solution

Dissolve 10 mg of *dimethyl yellow* and 10 mg of *oracet blue B* in 300 mL of *dichloromethane*.

Dimethyl Yellow and Oracet Blue 2R Solution

Dissolve 10 mg of *dimethyl yellow* and 10 mg of *oracet blue 2R* in 300 mL of *dichloromethane*.

Dimethyl Yellow Solution

A 0.2% w/v solution of *dimethyl yellow* in *ethanol (90%)*.

Complies with the following test.

Sensitivity A solution containing 2 g of *ammonium chloride* in 25 mL of *carbon dioxide-free water* to which is added 0.1 mL of the dimethyl yellow solution is yellow. Not more than 0.10 mL of *0.1M hydrochloric acid VS* is required to change the colour of the solution to red (pH range, 2.8 to 4.6).

Dimeticone (*9006-65-9*)

See *Dimeticone (0138)*.

Dimidium Bromide 3,8-Diamino-5-methyl-6-phenylphenanthridinium bromide; $C_{20}H_{18}BrN_3$ = 380.3 (*518-67-2*)

Dark-red crystals, slightly soluble in water at 20 °C, sparingly soluble in water at 60 °C and in ethanol (96 per cent).

Dimidium Bromide-Sulfan Blue Mixed Solution

Dimidium bromide-sulphan blue mixed solution

Dissolve separately 0.5 g of *dimidium bromide R* and 0.25 g of *sulfan blue R* in 30 mL of a hot mixture of 1 volume of *anhydrous ethanol R* and 9 volumes of *water R*, stir, mix the two solutions, and dilute to 250 mL with the same mixture of solvents. Mix 20 mL of this solution with 20 mL of a 14.0 per cent *V/V* solution of *sulfuric acid R* previously diluted with about 250 mL of *water R* and dilute to 500 mL with *water R*.

Storage: protected from light.

1,3-Dinitrobenzene Dinitrobenzene; $C_6H_4N_2O_4$ = 168.1 (*99-65-0*)

Yellowish crystalline powder or crystals, practically insoluble in water, slightly soluble in ethanol (96 per cent).

mp: about 90 °C.

Dinitrobenzene Solution

A 10 g/L solution of *dinitrobenzene R* in *ethanol (96 per cent) R*.

3,5-Dinitrobenzoic Acid Dinitrobenzoic acid; $C_7H_4N_2O_6$ = 212.1 (*99-34-3*)

Almost colourless crystals, slightly soluble in water, very soluble in ethanol (96 per cent).

mp: about 206 °C.

Dinitrobenzoic Acid Solution

A 20 g/L solution of *dinitrobenzoic acid R* in *ethanol (96 per cent) R*.

Dinitrobenzoyl Chloride 3,5-Dinitrobenzoyl chloride; $C_7H_3ClN_2O_5$ = 230.6 (*99-33-2*)

Translucent, yellow or greenish-yellow powder or yellowish crystals, soluble in acetone and in toluene.

mp: about 68 °C.

Suitability test. To 1 mL of *anhydrous ethanol R* and 0.1 g of *dinitrobenzoyl chloride R* add 0.05 mL of *dilute sulfuric acid R* and boil under a reflux condenser for 30 min. After evaporation on a water-bath add 5 mL of *heptane R* to the residue and heat to boiling. Filter the hot solution. Wash the crystals formed on cooling to room temperature with a small quantity of *heptane R* and dry in a desiccator. The crystals melt (*2.2.14*) between 92 °C and 95 °C.

2,4-Dinitrophenylhydrazine Dinitrophenylhydrazine; $C_6H_6N_4O_4$ = 198.1 (*119-26-6*)

Reddish-orange crystals, very slightly soluble in water, slightly soluble in ethanol (96 per cent).

mp: about 203 °C (instantaneous method).

Dinitrophenylhydrazine-aceto-hydrochloric Solution

Dissolve 0.2 g of *dinitrophenylhydrazine R* in 20 mL of *methanol R* and add 80 mL of a mixture of equal volumes of *acetic acid R* and *hydrochloric acid R1*. Prepare immediately before use.

Dinitrophenylhydrazine-hydrochloric Solution

Dissolve by heating 0.50 g of *dinitrophenylhydrazine R* in *dilute hydrochloric acid R* and dilute to 100 mL with the same solvent. Allow to cool and filter. Prepare immediately before use.

Dinitrophenylhydrazine-sulfuric Acid Solution

Dinitrophenylhydrazine-sulphuric acid solution

Dissolve 1.5 g of *dinitrophenylhydrazine R* in 50 mL of a 20 per cent *V/V* solution of *sulfuric acid R*. Prepare immediately before use.

Dinonyl Phthalate $C_{26}H_{42}O_4$ = 418.6 (*28553-12-0*)

Colourless to pale yellow, viscous liquid.

d_{20}^{20}: 0.97 to 0.98.

n_D^{20}: 1.482 to 1.489.

Acidity. Shake 5.0 g with 25 mL of *water R* for 1 min. Allow to stand, filter the separated aqueous layer and add 0.1 mL of *phenolphthalein solution R*. Not more than 0.3 mL of *0.1 M sodium hydroxide* is required to change the colour of the solution (0.05 per cent, calculated as phthalic acid).

Water (*2.5.12*): maximum 0.1 per cent.

Dioctadecyl Disulfide Dioctadecyl disulphide; $C_{36}H_{74}S_2$ = 571.1 (*2500-88-1*)

White or almost white powder, practically insoluble in water.

mp: 53 °C to 58 °C.

2,2′-Di(octadecyloxy)-5,5′-spirobi(1,3,2-dioxaphosphorinane) 2,2′-Di(octadecyloxy)-5,5′-spirobi(1,3,2-dioxaphosphorin-ane); $C_{41}H_{82}O_6P_2$ = 733

White or almost white, waxy solid, practically insoluble in water, soluble in hydrocarbons.

mp: 40 °C to 70 °C.

Dioctadecyl 3,3′-Thiodipropionate $C_{42}H_{82}O_4S$ = 683 (*693-36-7*)

White or almost white, crystalline powder, practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in acetone, in ethanol (96 per cent) and in light petroleum.

mp: 58 °C to 67 °C.

Di-*n*-octyl Phthalate Dioctyl benzene-1,2-dicarboxylate; $C_{24}H_{38}O_4$ = 390.6 (*117-84-0*)

Colourless viscous liquid, insoluble in water.

Density: about 0.98 g/mL (20 °C).

Dioctyl Sodium Sulfosuccinate Docusate sodium; Sodium 1,4-bis[(2-ethylhexyl)oxy]-1,4-dioxobutane-2-sulfonate; 1,4-bis(2-ethylhexyl) sulfobutanedioate sodium salt; Sodium dioctyl sulfosuccinate; $C_{20}H_{37}NaO_7S$ = 444.6 (*577-11-7*)

White or almost white, waxy solid.

Diosgenin (25*R*)-Spirost-5-en-3β-ol; $C_{27}H_{42}O_3$ = 414.6 (*512-04-9*)

1,4-Dioxan Dioxan; $C_4H_8O_2$ = 88.1 (*123-91-1*)

Clear, colourless liquid, miscible with water and with most organic solvents.

d_{20}^{20}: about 1.03.

Freezing point (*2.2.18*): minimum 11.0 °C.

Water (*2.5.12*): maximum 0.5 per cent.

Do not distil if the dioxan does not comply with the test for peroxides.

Peroxides. Place 8 mL of *potassium iodide and starch solution R* in a 12 mL ground-glass-stoppered cylinder about 1.5 cm in diameter. Fill completely with the substance to be examined, shake vigorously and allow to stand in the dark for 30 min. No colour is produced.

Dioxan used for liquid scintillation is of a suitable analytical grade.

Dioxan Solution

Dissolve 1.00 g of *dioxan R* in *water R* and dilute to 100.0 mL with the same solvent. Dilute 5.0 mL of this solution to 100.0 mL with *water R* (0.5 mg/mL of dioxan).

Dioxan Solution R1

Dilute 10.0 mL of *dioxan solution R* to 50.0 mL with *water R*. (0.1 mg/mL of dioxan).

Dioxan Solution R2

Dilute 2.0 mL of *dioxan solution R* to 50.0 mL with *water R* (0.02 mg/mL of dioxan).

Diphenylamine $C_{12}H_{11}N$ = 169.2 (*122-39-4*)

White or almost white crystals, slightly soluble in water, soluble in ethanol (96 per cent).

mp: about 55 °C.

Storage: protected from light.

Diphenylamine Solution

A 1 g/L solution of *diphenylamine R* in *sulfuric acid R*.

Storage: protected from light.

Diphenylamine Solution R1

A 10 g/L solution of *diphenylamine R* in *sulfuric acid R*. The solution is colourless.

Diphenylamine Solution R2

Dissolve 1 g of *diphenylamine R* in 100 mL of *glacial acetic acid R* and add 2.75 mL of *sulfuric acid R*. Use immediately.

9,10-Diphenylanthracene Diphenylanthracene; $C_{26}H_{18}$ = 330.4 (*1499-10-1*)

Yellowish or yellow, crystalline powder, practically insoluble in water.

mp: about 248 °C.

***N,N′*-Diphenylbenzidine** *N,N′*-Diphenylbiphenyl-4,4′-diamine; Diphenylbenzidine; $C_{24}H_{20}N_2$ = 336.4 (*531-91-9*)

White or faintly grey, crystalline powder, practically insoluble in water, slightly soluble in acetone and in ethanol (96 per cent).

mp: about 248 °C.

Nitrates. Dissolve 8 mg in a cooled mixture of 5 mL of *water R* and 45 mL of *nitrogen-free sulfuric acid R*. The solution is colourless or very pale blue.

Sulfated ash (*2.4.14*): maximum 0.1 per cent.

Storage: protected from light.

Diphenylboric Acid Aminoethyl Ester $C_{14}H_{16}BNO$ = 225.1 (*524-95-8*)

White or slightly yellow, crystalline powder, practically insoluble in water, soluble in ethanol (96 per cent).

mp: about 193 °C.

1,5-Diphenylcarbazide 1,5-diphenylcarbonodihydrazide; Diphenylcarbazide; $C_{13}H_{14}N_4O$ = 242.3 (*140-22-7*)

White or almost white, crystalline powder which gradually becomes pink on exposure to air, very slightly soluble in water, soluble in acetone, in ethanol (96 per cent) and in glacial acetic acid.

mp: about 170 °C.

Sulfated ash (*2.4.14*): maximum 0.1 per cent.

Storage: protected from light.

Diphenylcarbazide Solution

Dissolve 0.2 g of *diphenylcarbazide R* in 10 mL of *glacial acetic acid R* and dilute to 100 mL with *anhydrous ethanol R*. Prepare immediately before use.

1,5-Diphenylcarbazone Diphenylcarbazone; $C_{13}H_{12}N_4O$ = 240.3 (*538-62-5*)

Orange-yellow, crystalline powder, practically insoluble in water, freely soluble in ethanol (96 per cent).

mp: about 157 °C, with decomposition.

Diphenylcarbazone Mercuric Reagent

Solution A. Dissolve 0.1 g of *diphenylcarbazone R* in *anhydrous ethanol R* and dilute to 50 mL with the same solvent.

Solution B. Dissolve 1 g of *mercuric chloride R* in *anhydrous ethanol R* and dilute to 50 mL with the same solvent.

Mix equal volumes of the two solutions.

2,2-Diphenylglycine Amino(diphenyl)acetic acid; $C_{14}H_{13}NO_2$ = 227.26 (*3060-50-2*)

1,2-Diphenylhydrazine Hydrazobenzene; 1,2-Diphenyldiazane; $C_{12}H_{12}N_2$ = 184.3 (*122-66-7*)

Orange powder.

mp: about 125 °C.

Diphenylmethanol Benzhydrol; $C_{13}H_{12}O$ = 184.2 (*91-01-0*)

White or almost white, crystalline powder.

mp: about 66 °C.

Diphenyloxazole 2,5-Diphenyloxazole; $C_{15}H_{11}NO$ = 221.3 (*92-71-7*)

White or almost white powder, practically insoluble in water, soluble in methanol, sparingly soluble in dioxan and in glacial acetic acid.

mp: about 70 °C.

$A_{1\,cm}^{1\%}$: about 1260 determined at 305 nm in *methanol R*.

Diphenyloxazole used for liquid scintillation is of a suitable analytical grade.

Diphenylphenylene Oxide Polymer 2,6-Diphenyl-*p*-phenylene oxide polymer

White or almost white, porous beads. The size range of the beads is specified after the name of the reagent in the tests where it is used.

Dipotassium Edetate Dipotassium dihydrogen ethylenediaminetetra-acetate; $C_{10}H_{14}N_2K_2O_8,2H_2O$ = 404.5 (*25102-12-9*)

General reagent grade of commerce.

Dipotassium Hydrogen Orthophosphate Dipotassium hydrogen phosphate; K_2HPO_4 = 174.2 (*7758-11-4*)

White or almost white, crystalline powder, hygroscopic, very soluble in water, slightly soluble in ethanol (96 per cent).

Storage: in an airtight container.

Dipotassium Hydrogen Phosphate Trihydrate $K_2HPO_4,3H_2O$ = 228.2 (*16788-57-1*)

Colourless or white or almost white powder or crystals, freely soluble in water.

Dipotassium Sulfate Potassium sulfate; Dipotassium sulphate; Potassium sulphate; K_2SO_4 = 174.3 (*7778-80-5*)

Colourless crystals, soluble in water.

Dipotassium (+)-Tartrate Potassium tartrate; $C_4H_4K_2O_6,{}^1/_2H_2O$ = 235.3 (*921-53-9*)

White or almost white, granular powder or crystals, very soluble in water, very slightly soluble in ethanol (96 per cent).

2,2′-Dipyridyl 2,2′-Bipyridine; $C_{10}H_8N_2$ = 156.2 (*366-18-7*)

mp: about 72°.

General reagent grade of commerce.

2,2′-Dipyridylamine *N*-(Pyridin-2-yl)pyridin-2-amine; $C_{10}H_9N_3$ = 171.2 (*1202-34-2*)

mp: about 95 °C.

Disodium Arsenate Sodium arsenate heptahydrate; $Na_2HAsO_4,7H_2O$ = 312.0 (*10048-95-0*)

Crystals, efflorescent in warm air, freely soluble in water, soluble in glycerol, slightly soluble in ethanol (96 per cent). The aqueous solution is alcaline to litmus.

d_{20}^{20}: about 1.87.

mp: about 57 °C when rapidly heated.

Disodium Bicinchoninate 2,2′-Biquinoline-4-4′-dicarboxylate disodium salt; $C_{20}H_{10}N_2Na_2O_4$ = 388.3 (*979-88-4*)

Disodium Catechol-3,5-disulfonate 4,5-Dihydroxy-1,3-benzene disulfonic acid disodium salt monohydrate, 4,5-dihydroxy-1,3-benzene disulphonic acid disodium salt monohydrate, disodium catechol-3,5- disulphonate; $C_6H_4O_8Na,H_2O$ = 332 (*149-45-1*)

General reagent grade of commerce.

Disodium Edetate Disodium dihydrogen ethylenediaminetetra-acetate, dihydrate; Sodium edetate; (*6381-92-6*)

See *Disodium edetate (0232)*.

Disodium Ethanedisulfonate Disodium ethanedisulphonate; 1,2-ethanedisulfonic acid disodium salt; 1,2-ethanedisulphonic acid disodium salt; $C_2H_4Na_2O_6S_2$ = 234.2 (*5325-43-9*)

General reagent grade of commerce.

Disodium Hydrogen Citrate Sodium acid citrate; Disodium hydrogen 2-hydroxypropane-1,2,3-tricarboxylate sesquihydrate; $C_6H_6Na_2O_7,1{}^1/_2H_2O$ = 263.1 (*144-33-2*)

White or almost white powder, soluble in less than 2 parts of water, practically insoluble in ethanol (96 per cent).

Disodium Hydrogen Orthophosphate Disodium Hydrogen Phosphate; Disodium hydrogen phosphate dodecahydrate; (*10039-32-4*)

See *Disodium phosphate dodecahydrate (0118)*.

Disodium Hydrogen Orthophosphate, Anhydrous Disodium hydrogen phosphate, anhydrous; Na_2HPO_4 = 142.0 (*7558-79-4*)

Disodium Hydrogen Orthophosphate Dihydrate Disodium hydrogen phosphate dihydrate; (*10028-24-7*)

See *Disodium phosphate dihydrate (0602)*.

Disodium Hydrogen Orthophosphate Heptahydrate Disodium hydrogen phosphate heptahydrate; $Na_2HPO_4,7H_2O$ = 268.1 (*7782-85-6*)

Disodium Hydrogen Phosphate Heptahydrate $Na_2HPO_4,7H_2O$ = 268.1 (*7782-85-6*)

Disodium Hydrogen Phosphate Solution

A 90 g/L solution of *disodium hydrogen phosphate dodecahydrate R*.

Ditalimphos *O,O*-Diethyl (1,3-dihydro-1,3-dioxo-2*H*-isoindol-2-yl)phosphonothioate; $C_{12}H_{14}NO_4PS$ = 299.3 (*5131-24-8*)

Very slightly soluble in water, in ethyl acetate and in anhydrous ethanol.

A suitable certified reference solution may be used.

5,5′-Dithiobis(2-nitrobenzoic) Acid 3-Carboxy-4-nitrophenyldisulphide; $C_{14}H_8N_2O_8S_2$ = 396.4 (*69-78-3*)

Yellow powder sparingly soluble in ethanol (96 per cent).

mp: about 242 °C.

Dithioerythritol $C_4H_{10}O_2S_2$ = 154.3 (*6892-68-8*)

(2*R*,3*S*)-1,4-Disulfanylbutane-2,3-diol. DTE.

mp: about 83 °C.

Dithiol Toluene-3,4-dithiol; 4-Methylbenzene-1,2-dithiol; $C_7H_8S_2$ = 156.3 (*496-74-2*)

White or almost white crystals, hygroscopic, soluble in methanol and in solutions of alkali hydroxides.

mp: about 30 °C.

Storage: in an airtight container.

Dithiol Reagent Toluenedithiol reagent

To 1 g of *dithiol R* add 2 mL of *thioglycollic acid R* and dilute to 250 mL with a 20 g/L solution of *sodium hydroxide R*. Prepare immediately before use.

Dithiothreitol *threo*-1,4-Dimercaptobutane-2,3-diol; $C_4H_{10}O_2S_2$ = 154.2 (*27565-41-9*)

Slightly hygroscopic needles, freely soluble in water, in acetone and in anhydrous ethanol.

Storage: in an airtight container.

Dithizone 1,5-Diphenylthiocarbazone; $C_{13}H_{12}N_4S$ = 256.3 (*60-10-6*)

A bluish-black, brownish-black or black powder, practically insoluble in water, soluble in ethanol (96 per cent).

Storage: protected from light.

Dithizone R1 1,5-Diphenylthiocarbazone; $C_{13}H_{12}N_4S$ = 256.3 (*60-10-6*)

Content: minimum 98.0 per cent.

Bluish-black, brownish-black or black powder, practically insoluble in water, soluble in ethanol (96 per cent).

Storage: protected from light.

Dithizone Solution

A 0.5 g/L solution of *dithizone R* in *chloroform R*. Prepare immediately before use.

Dithizone Solution R2

Dissolve 40.0 mg of *dithizone R* in *chloroform R* and dilute to 1000.0 mL with the same solvent. Dilute 30.0 mL of the solution to 100.0 mL with *chloroform R*.

Assay. Dissolve a quantity of *mercuric chloride R* equivalent to 0.1354 g of $HgCl_2$ in a mixture of equal volumes of *dilute sulfuric acid R* and *water R* and dilute to 100.0 mL with the same mixture of solvents. Dilute 2.0 mL of this solution to 100.0 mL with a mixture of equal volumes of *dilute sulfuric acid R* and *water R*. (This solution contains 20 ppm of Hg). Transfer 1.0 mL of the solution to a separating funnel and add 50 mL of *dilute sulfuric acid R*, 140 mL of *water R* and 10 mL of a 200 g/L solution of *hydroxylamine hydrochloride R*. Titrate with the dithizone solution; after each addition, shake the mixture twenty times and towards the end of the titration allow to separate and discard the chloroform layer. Titrate until a bluish-green colour is obtained. Calculate the equivalent in micrograms of mercury per millilitre of the dithizone solution from the expression $20/V$, where V is the volume in millilitres of the dithizone solution used in the titration.

Divanadium Pentoxide Vanadium(V) oxide; V_2O_5 = 181.9 (*1314-62-1*)

Content: minimum 98.5 per cent.

Yellow-brown or rust-brown powder, slightly soluble in water, soluble in strong mineral acids and in solutions of alkali hydroxides with formation of salts.

Appearance of solution. Heat 1 g for 30 min with 10 mL of *sulfuric acid R*. Allow to cool and dilute to 10 mL with the same acid. The solution is clear (*2.2.1*).

Sensitivity to hydrogen peroxide. Dilute 1.0 mL of the solution prepared for the test for appearance of solution cautiously to 50.0 mL with *water R*. To 0.5 mL of the solution add 0.1 mL of a solution of hydrogen peroxide (0.1 g/L of H_2O_2) prepared from *dilute hydrogen peroxide solution R*. The solution has a distinct orange colour compared with a blank prepared from 0.5 mL of the solution to be examined and 0.1 mL of *water R*. After the addition of 0.4 mL of a solution of hydrogen peroxide (0.1 g/L of H_2O_2) prepared from *dilute hydrogen peroxide solution R*, the orange solution becomes orange-yellow.

Loss on ignition: maximum 1.0 per cent, determined on 1.00 g at 700 ± 50 °C.

Assay. Dissolve 0.200 g with heating in 20 mL of a 70 per cent *m/m* solution of *sulfuric acid R*. Add 100 mL of *water R* and *0.02 M potassium permanganate* until a reddish colour is obtained. Decolorise the excess of potassium permanganate by the addition of a 30 g/L solution of *sodium nitrite R*. Add 5 g of *urea R* and 80 mL of a 70 per cent *m/m* solution of *sulfuric acid R*. Cool. Using 0.1 mL of *ferroin R* as indicator, titrate the solution immediately with *0.1 M ferrous sulfate* until a greenish-red colour is obtained.

1 mL of *0.1 M ferrous sulfate* is equivalent to 9.095 mg of V_2O_5.

Divanadium Pentoxide Solution in Sulfuric Acid
Divanadium Pentoxide Solution in Sulphuric Acid

Dissolve 0.2 g of *divanadium pentoxide R* in 4 mL of *sulfuric acid R* and dilute to 100 mL with *water R*.

Divinylbenzene and Vinylpyrrolidone Copolymer for Chromatography

Chromatographic reagent grade of commerce.

Spherical particles (30 µm) of an *m*-divinylbenzene and *N*-vinylpyrrolidone copolymer.

Docosahexaenoic Acid Methyl Ester DHA methyl ester; Cervonic acid methyl ester; (all-*Z*)-Docosa-4,7,10,13,16,19-hexaenoic acid methyl ester; $C_{23}H_{34}O_2$ = 342.5 (*301-01-9*)

Content: minimum 90.0 per cent, determined by gas chromatography.

Docusate Sodium (*577-11-7*)

See *Docusate sodium (1418)*.

Dodecan-1-ol Lauryl alcohol; $C_{12}H_{26}O$ = 186.3 (*112-53-8*)

d_{20}^{20}: about 0.820.

mp: 24 °C to 27 °C.

Content: minimum 98.0 per cent, determined by gas chromatography.

4-Dodecylresorcinol $CH_3(CH_2)_{11}C_6H_3$-1,3-$(OH)_2$ = 278.43 (*24305-56-4*)

General reagent grade of commerce.

Dodecyltrimethylammonium Bromide *N,N,N*-Trimethyldodecan-1-aminium bromide; $C_{15}H_{34}BrN$ = 308.4 (*1119-94-4*)

White or almost white crystals.

mp: about 246 °C.

Domiphen Bromide Dodecyldimethyl-2-phenoxyethylammonium bromide; $C_{22}H_{40}BrNO$ = 414.5 (*538-71-6*)

General reagent grade of commerce.

D-Dopa (2*R*)-2-Amino-3-(3,4-dihydroxyphenyl)propanoic acid; 3-Hydroxy-D-tyrosine; 3,4-Dihydroxy-D-phenylalanine; $C_9H_{11}NO_4$ = 197.2 (*5796-17-8*)

$[\alpha]_D^{20}$: + 9.5 to + 11.5, determined on a 10 g/L solution in *1 M hydrochloric acid*.

mp: about 277 °C.

Dotriacontane *n*-Dotriacontane; $C_{32}H_{66}$ = 450.9 (*544-85-4*)

White or almost white plates, practically insoluble in water, sparingly soluble in hexane.

mp: about 69 °C.

Impurities. Not more than 0.1 per cent of impurities with the same t_R value as α-tocopherol acetate, determined by the gas chromatographic method prescribed in the monograph *α-Tocopherol acetate (0439)*.

Doxycycline

See *Doxycycline monohydrate (0820)*.

β-Ecdysterone (2β,3β,5β,22*R*)-2,3,14,20,22,25-Hexahydroxycholest-7-en-6-one; $C_{27}H_{44}O_7$ = 480.6 (*5289-74-7*)

Echinacoside β-(3′,4′-Dihydroxyphenyl)-ethyl-*O*-α-L-rhamnopyranosyl (1→3)-*O*-β-D-[β-D-glucopyranosyl(1→6)]-(4-*O*-caffeoyl)-glucopyranoside; $C_{35}H_{46}O_{20}$ = 787 (*82854-37-3*)

Pale yellow powder, odourless.

Edotreotide *N*-[[4,7,10-Tris(carboxymethyl)-1,4,7,10-tetraazacyclododecan-1-yl]acetyl]-D-phenylalanyl-L-cysteinyl-L-tyrosyl-D-tryptophyl-L-lysyl-L-threonyl-*N*-[(1*R*,2*R*)-2-hydroxy-1-(hydroxymethyl)propyl]-L-cysteinamide cyclic (2→7)-disulfide; DOTATOC; DOTA-[Tyr^3]-octreotide; $C_{65}H_{92}N_{14}O_{18}S_2$ = 1422 (*204318-14-9*)

White or almost white powder.

Content: minimum 95.0 per cent.

***n*-Eicosane** $C_{20}H_{42}$ = 282.6 (*112-95-8*)

mp: about 37°.

General reagent grade of commerce.

Electrolyte Reagent for the Determination of Water
Electrolyte reagent for the micro determination of water

Commercially available anhydrous reagent or a combination of anhydrous reagents for the coulometric titration of water, containing suitable organic bases, sulfur dioxide and iodide dissolved in a suitable solvent.

Embonic Acid $C_{23}H_{16}O_6$ = 388.4 (*130-85-8*)

General reagent grade of commerce.

Emodin 1,3,8-Trihydroxy-6-methylanthraquinone; $C_{15}H_{10}O_5$ = 270.2 (*518-82-1*)

Orange-red needles, practically insoluble in water, soluble in ethanol (96 per cent) and in solutions of alkali hydroxides.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Rhubarb (0291)*; the chromatogram shows only one principal spot.

Endoprotease LysC

Microbial extracellular proteolytic enzyme secreted by *Achromobacter lyticus*. A lyophilised powder, free of salts.

α-Endosulfan α-Endosulphan; $C_9H_6Cl_6O_3S$ = 406.9 (*959-98-8*)

bp: about 200 °C.

mp: about 108 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

β-Endosulfan β-Endosulphan; $C_9H_6Cl_6O_3S$ = 406.9 (*33213-65-9*)

bp: about 390 °C.

mp: about 207 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Endrin $C_{12}H_8Cl_6O$ = 380.9 (*72-20-8*)

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Eosin CI 45380; acid red 87; $C_{20}H_6Br_4Na_2O_5$ = 691.9 (*17372-87-1*)

General reagent grade of commerce.

A red powder.

(−)-Epicatechin (2*R*,3*R*)-2-(3,4-Dihydroxyphenyl)-3,4-dihydro-2*H*-1-benzopyran-3,5,7-triol; $C_{15}H_{14}O_6$ = 290.3 (*490-46-0*)

4-epichlortetracycline hydrochloride $C_{22}H_{23}ClN_2O_8 \cdot HCl$ = 515.34 (*101342-45-4*)

General reagent grade of commerce.

(−)-Epigallocatechin-3-*O*-gallate (2*R*,3*R*)-5,7-Dihydroxy-2-(3,4,5-trihydroxyphenyl)-3,4-dihydro-2*H*-1-benzopyran-3-yl 3,4,5-trihydroxybenzoate; $C_{22}H_{18}O_{11}$ = 458.4 (*989-51-5*)

Epilactose $C_{12}H_{22}O_{11}$ = 342.3 (*20869-27-6*)

4-*O*-β-D-Galactopyranosyl-D-mannopyranose.

Content: minimum 98 per cent.

4-Epioxytetracycline $C_{22}H_{24}N_2O_9$ = 460.4 (*14206-58-7*)

Analytical reagent grade of commerce.

Erucamide (*Z*)-Docos-13-enoamide; $C_{22}H_{43}NO$ = 337.6 (*112-84-5*)

Yellowish or white powder or granules, practically insoluble in water, very soluble in methylene chloride, soluble in anhydrous ethanol.

mp: about 70 °C.

Erythritol (*149-32-6*)

See *Erythritol (1803)*.

Esculetin 6,7-Dihydroxy-2*H*-1-benzopyran-2-one; Aesculetin; $C_9H_6O_4$ = 178.1 (*305-01-1*)

Esculin 6-(β-D-Glucopyranosyloxy)-7-hydroxy-2*H*-chromen-2-one; $C_{15}H_{16}O_9, 1^1/_2H_2O$ = 367.3 (*531-75-9*)

White or almost white powder or colourless crystals, sparingly soluble in water and in ethanol (96 per cent), freely soluble in hot water and in hot ethanol (96 per cent).

Chromatography (*2.2.27*). Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Eleutherococcus (1419)*; the chromatogram shows only one principal spot.

Estradiol Estra-1,3,5(10)-triene-3,17β-diol; β-Estradiol; $C_{18}H_{24}O_2$ = 272.4 (*50-28-2*)

Prisms stable in air, practically insoluble in water, freely soluble in ethanol (96 per cent), soluble in acetone and in dioxan, sparingly soluble in vegetable oils.

mp: 173 °C to 179 °C.

17α-Estradiol $C_{18}H_{24}O_2$ = 272.4 (*57-91-0*)

White or almost white, crystalline powder or colourless crystals.

mp: 220 °C to 223 °C.

Estragole 4-Allylanisole; $C_{10}H_{12}O$ = 148.2 (*140-67-0*)

Liquid, miscible with ethanol (96 per cent).

n_D^{20}: about 1.52.

bp: about 216 °C.

Estragole used in gas chromatography complies with the following test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Anise oil (0804)*.

Test solution. The substance to be examined.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Ethane C_2H_6 = 30.07 (*74-84-0*)

Content: minimum 99.0 per cent *V/V*.

Ethane-1,2-diol Ethylene glycol; $C_2H_6O_2$ = 62.1 (*107-21-1*)

Content: minimum 99.0 per cent.

Colourless, slightly viscous liquid, hygroscopic, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: 1.113 to 1.115.

n_D^{20}: about 1.432.

bp: about 198 °C.

mp: about −12 °C.

Acidity. To 10 mL add 20 mL of *water R* and 1 mL of *phenolphthalein solution R*. Not more than 0.15 mL of *0.02 M sodium hydroxide* is required to change the colour of the indicator to pink.

Water (*2.5.12*): maximum 0.2 per cent

Ethanol Absolute ethanol; (*64-17-5*)

See *Ethanol, anhydrous R*.

Ethanol, Absolute Ethanol; C_2H_6O = 46.07 (*64-17-5*)

d_{20}^{20}: 0.791 to 0.794.

bp: 78° to 79°.

Analytical reagent grade of commerce containing not less than 99.5% v/v of C_2H_6O.

A colourless, hygroscopic liquid.

Store protected from light at a temperature not exceeding 30°.

Ethanol, Anhydrous (*64-17-5*)

See *Ethanol, anhydrous (1318)*.

Ethanol R1, Absolute Ethanol R1

Complies with the requirements prescribed for the monograph *Ethanol, anhydrous (1318)* with the following additional requirement.

Methanol. Gas chromatography (*2.2.28*).

Test solution. The substance to be examined.

Reference solution. Dilute 0.50 mL of *anhydrous methanol R* to 100.0 mL with the substance to be examined. Dilute 1.0 mL of this solution to 100.0 mL with the substance to be examined.

Column:
— *material*: glass;
— *size*: *l* = 2 m, Ø = 2 mm;
— *stationary phase*: *ethylvinylbenzene-divinylbenzene copolymer R* (75-100 µm).

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 30 mL/min.

Temperature:
— *column*: 130 °C;
— *injection port*: 150 °C;
— *detector*: 200 °C.

Detection: flame-ionisation.

Injection: 1 µL of the test solution and 1 µL of the reference solution, alternately, three times.

After each chromatography, heat the column to 230 °C for 8 min. Integrate the methanol peak. Calculate the percentage methanol content from the following expression:

$$\frac{a \times b}{c - b}$$

a = percentage *V/V* content of methanol in the reference solution,
b = area of the methanol peak in the chromatogram obtained with the test solution,
c = area of the methanol peak in the chromatogram obtained with the reference solution.

Limit:
— *methanol*: maximum 0.005 per cent *V/V*.

Ethanol (96 per cent) (*64-17-5*)

See *Ethanol (96 per cent) (1317)*.

Ethanol (96%)

Alcohol

Analytical reagent grade ethanol of commerce containing not less than 95.1% v/v and not more than 96.9% v/v of C_2H_6O.

A colourless liquid; weight per mL, about 0.81 g.

Diluted ethanols may be prepared by diluting the volumes of *ethanol (96%)* indicated in the following table to 1000 mL with *water*.

Strength % v/v	Volume of *ethanol (96%)* (approx) ml	Weight per ml g
90	934	0.83
85	885	0.85
80	831	0.86
70	727	0.89
65	676	0.90
60	623	0.91
50	519	0.93
45	468	0.94
25	259	0.97
20	207	0.975
10	104	0.986

Ethanol (96%), Aldehyde-free

Aldehyde-free alcohol

Mix 1200 mL of *ethanol (96%)* with 5 mL of a 40% w/v solution of *silver nitrate* and 10 mL of a cooled 50% w/v solution of *potassium hydroxide*. Shake, allow to stand for a few days and filter. Distil the filtrate immediately before use.

Ethanol (*x*% v/v)

Mix appropriate volumes of *water R* and *ethanol (96 per cent) R*, allowing for the effects of warming and volume contraction inherent to the preparation of such a mixture, to obtain a solution whose final content of ethanol corresponds to the value of *x*.

Ethanolamine 2-Aminoethanol; C_2H_7NO = 61.1 (*141-43-5*)

Clear, colourless, viscous, hygroscopic liquid, miscible with water and with methanol.

d_{20}^{20}: about 1.014.

n_D^{20}: about 1.454.

mp: about 11 °C.

Storage: in an airtight container.

Ether Diethyl ether; $C_4H_{10}O$ = 74.1 (*60-29-7*)

Clear, colourless, volatile and very mobile liquid, very flammable, hygroscopic, soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: 0.713 to 0.715.

bp: 34 °C to 35 °C.

Do not distil if the ether does not comply with the test for peroxides.

Peroxides. Place 8 mL of *potassium iodide and starch solution R* in a 12 mL ground-glass-stoppered cylinder about 1.5 cm in diameter. Fill completely with the substance to be examined, shake vigorously and allow to stand in the dark for 30 min. No colour is produced.

The name and concentration of any added stabilisers are stated on the label.

Storage: in an airtight container, protected from light, at a temperature not exceeding 15 °C.

Ether, Peroxide-free See *Anaesthetic ether (0367)*.

Shake 1000 mL of *ether* with 20 mL of a solution of 30 g of *iron(II) sulfate* in 55 mL of *water* and 3 mL of *sulfuric acid*. Continue shaking until a small sample no longer produces a

blue colour when shaken with an equal volume of a 2% w/v solution of *potassium iodide* and 0.1 mL of *starch mucilage*.

Ethion $C_9H_{22}O_4P_2S_4$ = 384.5 (*563-12-2*)

mp: −24 °C to −25 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Ethoxychrysoidine Hydrochloride 4-*p*-Ethoxyphenylazo-*m*-phenylenediamine hydrochloride; $C_{14}H_{17}ClN_4O$ = 292.8 (*2313-87-3*)

Reddish powder, soluble in ethanol (96 per cent).

Ethoxychrysoidine Solution

A 1 g/L solution of *ethoxychrysoidine hydrochloride R* in *ethanol (96 per cent) R*.

Test for sensitivity. To a mixture of 5 mL of *dilute hydrochloric acid R* and 0.05 mL of the ethoxy-chrysoidine solution add 0.05 mL of *0.0167 M bromide-bromate*. The colour changes from red to light yellow within 2 min.

2-Ethoxyethanol Ethylene glycol monoethyl ether; $C_4H_{10}O_2$ = 90.1 (*110-80-5*)

Content: minimum 99.0 per cent.

Clear, colourless liquid, miscible with water, with acetone and with ethanol (96 per cent).

d_{20}^{20}: about 0.93.

n_D^{25}: about 1.406.

bp: about 135 °C.

(2-ethoxyphenoxy) acetic acid $C_{10}H_{12}O_4$ = 196.2 g/mol (*3251-30-7*)

General reagent grade of commerce

Ethyl Acetate $C_4H_8O_2$ = 88.1 (*141-78-6*)

Clear, colourless liquid, soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: 0.901 to 0.904.

bp: 76 °C to 78 °C.

Ethyl Acetate, Treated

Disperse 200 g of *sulfamic acid R* in *ethyl acetate R* and make up to 1000 mL with the same solvent. Stir the suspension obtained for three days and filter through a filter paper.

Storage: use within 1 month.

Ethyl Acetate R1 $C_4H_8O_2$ = 88.1 (*141-78-6*)

Suitable for gas chromatography ECD and FID.

Liquid, miscible in water (i.e. 85.3 g/L).

d_{20}^{20}: 0.90.

Content: minimum 99.8 per cent.

Evaporation residue: maximum 3.0 mg/L.

Water: maximum 0.02 per cent.

Ethyl Acrylate Ethyl prop-2-enoate; $C_5H_8O_2$ = 100.1 (*140-88-5*)

Colourless liquid.

d_{20}^{20}: about 0.924.

n_D^{20}: about 1.406.

bp: about 99 °C.

mp: about −71 °C.

Ethyl Benzoate $C_9H_{10}O_2$ = 150.2 (*93-89-0*)

A clear, colourless, refractive liquid, practically insoluble in water, miscible with ethanol (96 per cent) and with light petroleum.

d_4^{25}: about 1.050.

n_D^{20}: about 1.506.

bp: 211 °C to 213 °C.

Ethyl 5-Bromovalerate Ethyl 5-bromopentanoate; $C_7H_{13}BrO_2$ = 209.1 (*14660-52-7*)

Clear, colourless liquid.

d_{20}^{20}: about 1.321.

bp: 104 °C to 109 °C.

Ethyl Cinnamate $C_{11}H_{12}O_2$ = 176.2 (*103-36-6*)

General reagent grade of commerce.

A colourless or very pale yellow liquid; weight per mL, about 1.05 g.

Ethyl Clorazepate Ethyl (3*RS*)-7-chloro-2-oxo-5-phenyl-2,3-dihydro-1*H*-1,4-benzodiazepine-3-carboxylate; $C_{18}H_{15}ClN_2O_3$ = 342.8 (*5606-55-3*)

Ethyl Cyanoacetate $C_5H_7NO_2$ = 113.1 (*105-56-6*)

Colourless or pale yellow liquid, slightly soluble in water, miscible with ethanol (96 per cent).

bp: 205 °C to 209 °C, with decomposition.

Ethyl Formate Ethyl methanoate; $C_3H_6O_2$ = 74.1 (*109-94-4*)

Clear, colourless, flammable liquid, freely soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.919.

n_D^{20}: about 1.36.

bp: about 54 °C.

Ethyl 4-Hydroxybenzoate (*120-47-8*)

See *Ethyl parahydroxybenzoate R*.

Ethyl Methanesulfonate $C_3H_8O_3S$ = 124.2 (*62-50-0*)

Clear, colourless liquid.

Content: minimum 99.0 per cent.

Density: about 1.206 g/cm^3 (20 °C).

n_D^{20}: about 1.418.

bp: about 213 °C.

Ethyl Parahydroxybenzoate Ethyl 4-hydroxybenzoate; (*120-47-8*)

See *Ethyl parahydroxybenzoate (0900)*.

4-[(Ethylamino)methyl]pyridine $C_8H_{12}N_2$ = 136.2 (*33403-97-3*)

Pale yellow liquid.

d_{20}^{20}: about 0.98.

n_D^{20}: about 1.516.

bp: about 98 °C.

Ethylbenzene C_8H_{10} = 106.2 (*100-41-4*)

Content: minimum 99.5 per cent *m/m*, determined by gas chromatography.

Clear, colourless liquid, practically insoluble in water, soluble in acetone, and in ethanol (96 per cent).

d_{20}^{20}: about 0.87.

n_D^{20}: about 1.496.

bp: about 135 °C.

Ethyl Benzenesulfonate $C_8H_{10}O_3S$ = 186.2 (*515-46-8*)

Content: minimum 97.0 per cent.

Colourless or slightly yellow liquid, slightly soluble in water, miscible with ethanol (96 per cent).

Density: about 1.22 g/mL (25 °C).

4-Ethylcatechol 3,4-Dihydroxyethylbenzene; $C_8H_{10}O_2$ = 138.2

General reagent grade of commerce.

Ethylene Bis[3,3-di(3-(1,1-dimethyl)ethyl-4-hydroxyphenyl)butyrate] Ethylene bis[3,3-di(3-*tert*-butyl-4-hydroxyphenyl)butyrate]; $C_{50}H_{66}O_8$ = 795 (*32509-66-3*)

Crystalline powder, practically insoluble in water and in light petroleum, very soluble in acetone and in methanol.

mp: about 165 °C.

Ethylene Bis[3,3-di(3-*tert*-butyl-4-hydroxyphenyl) butyrate] (*32509-66-3*)

See *ethylene bis[3,3-di(3-(1,1-dimethylethyl)-4-hydroxyphenyl) butyrate] R*.

Ethylene Glycol Monododecyl Ether 2-(Dodecyloxy) ethan-1-ol; $C_{14}H_{30}O_2$ = 230.4 (*4536-30-5*)

Colourless or faintly green liquid.

Ethylene Oxide Oxirane; C_2H_4O = 44.05 (*75-21-8*)

Colourless, flammable gas, very soluble in water and in anhydrous ethanol.

Liquefaction point: about 12 °C.

Ethylene Oxide Solution

Weigh a quantity of cool *ethylene oxide stock solution R* equivalent to 2.5 mg of ethylene oxide into a cool flask and dilute to 50.0 g with *macrogol 200 R1*. Mix well and dilute 2.5 g of this solution to 25.0 mL with *macrogol 200 R1* (5 µg of ethylene oxide per gram of solution). *Prepare immediately before use.*

The solution can be prepared using commercially available reagents instead of *ethylene oxide stock solution R*, making appropriate dilutions.

Ethylene Oxide Solution R1

Dilute 1.0 mL of cooled *ethylene oxide stock solution R* (check the exact volume by weighing) to 50.0 mL with *macrogol 200 R1*. Mix well and dilute 2.5 g of this solution to 25.0 mL with *macrogol 200 R1*. Calculate the exact amount of ethylene oxide in parts per million from the volume determined by weighing and taking the relative density of *macrogol 200 R1* as 1.127. *Prepare immediately before use.*

The solution can be prepared using commercially available reagents instead of *ethylene oxide stock solution R*, making appropriate dilutions.

Ethylene Oxide Solution R2

Weigh 1.00 g of cold *ethylene oxide stock solution R* (equivalent to 2.5 mg of ethylene oxide) into a cold flask containing 40.0 g of cold *macrogol 200 R1*. Mix and determine the exact mass and dilute to a calculated mass to obtain a solution containing 50 µg of ethylene oxide per gram of solution. Weigh 10.00 g into a flask containing about 30 mL of *water R*, mix and dilute to 50.0 mL with *water R* (10 µg/mL of ethylene oxide). *Prepare immediately before use.*

The solution can be prepared using commercially available reagents instead of *ethylene oxide stock solution R*, making appropriate dilutions.

Ethylene Oxide Solution R3

Dilute 10.0 mL of *ethylene oxide solution R2* to 50.0 mL with *water R* (2 µg/mL of ethylene oxide). *Prepare immediately before use.*

Ethylene Oxide Solution R4

Dilute 1.0 mL of *ethylene oxide stock solution R1* to 100.0 mL with *water R*. Dilute 1.0 mL of this solution to 25.0 mL with *water R*.

Ethylene Oxide Solution R5

A 50 g/L solution of *ethylene oxide R* in *methylene chloride R*.

Either use a commercially available reagent or prepare the solution corresponding to the above-mentioned composition.

Ethylene Oxide Stock Solution

All operations carried out in the preparation of these solutions must be conducted in a fume cupboard. The operator must protect both hands and face by wearing polyethylene protective gloves and an appropriate face mask.

Store all solutions in an airtight container in a refrigerator at 4 °C to 8 °C. Carry out all determinations three times.

Into a dry, clean test-tube, cooled in a mixture of 1 part of *sodium chloride R* and 3 parts of crushed ice, introduce a slow current of *ethylene oxide R* gas, allowing condensation onto the inner wall of the test-tube. Using a glass syringe, previously cooled to −10 °C, inject about 300 µL (corresponding to about 0.25 g) of liquid *ethylene oxide R* into 50 mL of *macrogol 200 R1*. Determine the absorbed quantity of ethylene oxide by weighing before and after absorption (M_{eo}). Dilute to 100.0 mL with *macrogol 200 R1*. Mix well before use.

Assay. To 10 mL of a 500 g/L suspension of *magnesium chloride R* in *anhydrous ethanol R* add 20.0 mL of *0.1 M alcoholic hydrochloric acid R* in a flask. Stopper and shake to obtain a saturated solution and allow to stand overnight to equilibrate. Weigh 5.00 g of ethylene oxide stock solution (2.5 g/L) into the flask and allow to stand for 30 min. Titrate with 0.1 M alcoholic potassium hydroxide R determining the end-point potentiometrically (*2.2.20*).

Carry out a blank titration, replacing the substance to be examined with the same quantity of *macrogol 200 R1*.

Ethylene oxide content in milligrams per gram is given by:

$$\frac{(V_0 - V_1) \times f \times 4.404}{m}$$

V_0, V_1 = volumes of *0.1 M alcoholic potassium hydroxide* used respectively for the blank titration and the assay,
f = factor of the alcoholic potassium hydroxide solution,
m = mass of the sample taken, in grams.

Ethylene Oxide Stock Solution R1

A 50 g/L solution of *ethylene oxide R* in *methanol R*.

Either use a commercially available reagent or prepare the solution corresponding to the aforementioned composition.

Ethylene Oxide Stock Solution R2

A 50 g/L solution of *ethylene oxide R* in *methylene chloride R*.

Either use a commercially available reagent or prepare the solution corresponding to the aforementioned composition.

Ethylenediamine 1,2-Diaminoethane; $C_2H_8N_2$ = 60.1 (*107-15-3*)

Clear, colourless, fuming liquid, strongly alkaline, miscible with water and with ethanol (96 per cent).

bp: about 116 °C.

Ethylenediaminetetra-acetic Acid (Ethylenedinitrilo) tetra-acetic acid; $C_{10}H_{16}N_2O_8$ = 292.2 (*60-00-4*)

White or almost white crystalline powder, very slightly soluble in water.

mp: about 250 °C, with decomposition.

2-Ethylhexane-1,3-diol $C_8H_{18}O_2$ = 146.2 (*94-96-2*)

Slightly oily liquid, soluble in anhydrous ethanol, 2-propanol, propylene glycol and castor oil.

d_{20}^{20}: about 0.942.

n_D^{20}: about 1.451.

bp: about 244 °C.

2-Ethylhexanoic Acid 2-Ethylhexoic acid; $C_8H_{16}O_2$ = 144.2 (*149-57-5*)

Colourless liquid.

d_{20}^{20}: about 0.91.

n_D^{20}: about 1.425.

Related substances. Gas chromatography (*2.2.28*).

Injection: 1 µL of the test solution.

Test solution: suspend 0.2 g of the 2-ethylhexanoic acid in 5 mL of *water R*, add 3 mL of *dilute hydrochloric acid R* and 5 mL of *hexane R*, shake for 1 min, allow the layers to separate and use the upper layer. Carry out the chromatographic procedure as prescribed in the test for 2-ethylhexanoic acid in the monograph on *Amoxicillin sodium (0577)*.

Limit: the sum of the area of any peaks, apart from the principal peak and the peak due to the solvent, is not greater than 2.5 per cent of the area of the principal peak.

1,1′-Ethylidenebis(tryptophan) $C_{24}H_{26}N_4O_4$ = 434.5 (*132685-02-0*)

mp: about 223°, with decomposition.

General reagent grade of commerce containing not less than 98.0% of $C_{24}H_{26}N_4O_4$.

Assay Proceed as described in the test for 1,1′-Ethylidenebis(tryptophan) and other related substances in the monograph for Tryptophan. The area of the principal peak in the chromatogram obtained with reference solution (a) is not less than 98.0% of the area of all the peaks.

***N*-Ethylmaleimide** 1-Ethyl-1*H*-pyrrole-2,5-dione; $C_6H_7NO_2$ = 125.1 (*128-53-0*)

Colourless crystals, sparingly soluble in water, freely soluble in ethanol (96 per cent).

mp: 41 °C to 45 °C.

Storage: at a temperature of 2 °C to 8 °C.

2-Ethyl-2-methylsuccinic Acid 2-Ethyl-2-methylbutanedioic acid; $C_7H_{12}O_4$ = 160.2 (*631-31-2*)

mp: 104 °C to 107 °C.

2-Ethylpyridine C_7H_9N = 107.2 (*100-71-0*)

Colourless or brownish liquid.

d_{20}^{20}: about 0.939.

n_D^{20}: about 1.496.

bp: about 149 °C.

1-Ethylquinaldinium Iodide 1-Ethyl-2-methylquinolinium iodide; $C_{12}H_{14}IN$ = 299.2 (*606-55-3*)

General reagent grade of commerce.

Ethyl Toluenesulfonate Ethyl 4-methylbenzenesulfonate; Ethyl tosilate; $C_9H_{12}O_3S$ = 200.3 (*80-40-0*)

Content: minimum 97.0 per cent.

Density: about 1.17 g/mL (25 °C).

bp: about 160 °C.

mp: about 33 °C.

Ethylvinylbenzene-Divinylbenzene Copolymer

Porous, rigid, cross-linked polymer beads. Several grades are available with different sizes of bead. The size range of the beads is specified after the name of the reagent in the tests where it is used.

Eugenol 4-Allyl-2-methoxyphenol; $C_{10}H_{12}O_2$ = 164.2 (*97-53-0*)

Colourless or pale yellow, oily liquid, darkening on exposure to air and light and becoming more viscous, practically insoluble in water, miscible with ethanol (96 per cent) and with fatty and essential oils.

d_{20}^{20}: about 1.07.

bp: about 250 °C.

Eugenol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Clove oil (1091)*.

Test solution. The substance to be examined.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Storage: protected from light.

Euglobulins, Bovine

Use fresh bovine blood collected into an anticoagulant solution (for example, sodium citrate solution). Discard any haemolysed blood. Centrifuge at 1500-1800 *g* at 15-20 °C to obtain a supernatant plasma poor in platelets.

To 1 L of bovine plasma add 75 g of *barium sulfate R* and shake for 30 min. Centrifuge at not less than 1500-1800 *g* at 15-20 °C and draw off the clear supernatant. Add 10 mL of a 0.2 mg/mL solution of *aprotinin R* and shake to ensure mixing. In a container with a minimum capacity of 30 L in a chamber at 4 °C introduce 25 L of *distilled water R* at 4 °C and add about 500 g of solid carbon dioxide. Immediately add, while stirring, the supernatant obtained from the plasma. A white precipitate is formed. Allow to settle at 4 °C for 10-15 h. Remove the clear supernatant solution by siphoning. Collect the precipitate by centrifuging at 4 °C. Suspend the precipitate by dispersing mechanically in 500 mL of *distilled water R* at 4 °C, shake for 5 min and collect the precipitate by centrifuging at 4 °C. Disperse the precipitate mechanically in 60 mL of a solution containing 9 g/L of *sodium chloride R* and 0.9 g/L *sodium citrate R* and adjust to pH 7.2-7.4 by adding a 10 g/L solution of *sodium hydroxide R*. Filter through a sintered glass filter (*2.1.2*); to facilitate the dissolution of the precipitate crush the particles of the precipitate with a suitable instrument. Wash the filter and the instrument with 40 mL of the chloride-citrate solution described above and dilute to 100 mL with the same solution. Freeze-dry the solution. The yields are generally 6 g to 8 g of euglobulins per litre of bovine plasma.

Test for suitability. For this test, prepare the solutions using *phosphate buffer solution pH 7.4 R* containing 30 g/L of *bovine albumin R*.

Into a test-tube 8 mm in diameter placed in a water-bath at 37 °C introduce 0.2 mL of a solution of a reference preparation of urokinase containing 100 IU/mL and 0.1 mL of a solution of *human thrombin R* containing 20 IU/mL. Add rapidly 0.5 mL of a solution containing 10 mg of bovine euglobulins per millilitre. A firm clot forms in less than 10 s. Note the time that elapses between the addition of the solution of bovine euglobulins and the lysis of the clot. The lysis time does not exceed 15 min.

Storage: protected from moisture at 4 °C; use within 1 year.

Euglobulins, Human

For the preparation, use fresh human blood collected into an anticoagulant solution (for example sodium citrate solution) or human blood for transfusion that has been collected in plastic blood bags and which has just reached its expiry date. Discard any haemolysed blood. Centrifuge at 1500-1800 *g* at 15 °C to obtain a supernatant plasma poor in platelets. Iso-group plasmas may be mixed.

To 1 L of the plasma add 75 g of *barium sulfate R* and shake for 30 min. Centrifuge at not less than 15 000 *g* at 15 °C and draw off the clear supernatant. Add 10 mL of a solution of *aprotinin R* containing 0.2 mg/mL and shake to ensure mixing. In a container with a minimum capacity of 30 L in a chamber at 4 °C introduce 25 L of *distilled water R* at 4 °C and add about 500 g of solid carbon dioxide. Immediately add while stirring the supernatant obtained from the plasma. A white precipitate is formed. Allow to settle at 4 °C for 10-15 h. Remove the clear supernatant solution by siphoning. Collect the precipitate by centrifuging at 4 °C. Suspend the precipitate by dispersing mechanically in 500 mL of *distilled water R* at 4 °C, shake for 5 min and collect the precipitate by centrifuging at 4 °C. Disperse the precipitate mechanically in 60 mL of a solution containing 9 g/L of *sodium chloride R* and 0.9 g/L of *sodium citrate R*, and adjust the pH to 7.2-7.4 by adding a 10 g/L solution of *sodium hydroxide R*. Filter through a sintered-glass filter (*2.1.2*); to facilitate the dissolution of the precipitate crush the particles of the precipitate with a suitable instrument. Wash the filter and the instrument with 40 mL of the chloride-citrate solution described above and dilute to 100 mL with the same solution. Freeze-dry the solution. The yields are generally 6 g to 8 g of euglobulins per litre of human plasma.

Test for suitability. For this test, prepare the solutions using *phosphate buffer solution pH 7.2 R* containing 30 g/L of *bovine albumin R*. Into a test-tube 8 mm in diameter placed in a water-bath at 37 °C introduce 0.1 mL of a solution of a reference preparation of streptokinase containing 10 IU of streptokinase activity per millilitre and 0.1 mL of a solution of *human thrombin R* containing 20 IU/mL. Add rapidly 1 mL of a solution containing 10 mg of human euglobulins per millilitre. A firm clot forms in less than 10 s. Note the time that elapses between the addition of the solution of human euglobulins and the lysis of the clot. The lysis time does not exceed 15 min.

Storage: in an airtight container at 4 °C; use within 1 year.

Evodiamine (13b*S*)-14-Methyl-8,13,13b,14-tetrahydroindolo[2′,3′:3,4]pyrido[2,1-*b*]quinazolin-5(7*H*)-one; $C_{19}H_{17}N_3O$ = 303.4 (*518-17-2*)

Extraction Resin

Solid phase extraction resin containing 2,2′-oxybis(*N*,*N*-dioctylacetamide) (*N*,*N*,*N*′,*N*′-tetra-*n*-octyldiglycolamide).

Fargesin $C_{21}H_{22}O_6$ = 370.4 (*31008-19-2*)

5-[(3*SR*,3a*RS*,6*RS*,6a*RS*)-6-(3,4-Dimethoxyphenyl)-1,3,3a,4,6,6a-hexahydrofuro[3,4-*c*]furan-3-yl]-1,3-benzodioxole.

(*E*,*E*)-Farnesol *trans*,*trans*-Farnesol; (2*E*,6*E*)-3,7,11-Trimethyldodeca-2,6,10-trien-1-ol; $C_{15}H_{26}O$ = 222.4 (*106-28-5*)

Fast Blue B Salt 3,3′-Dimethoxy(biphenyl)-4,4′-bisdiazonium dichloride; $C_{14}H_{12}Cl_2N_4O_2$ = 339.2 (*84633-94-3*)

Schultz No. 490

Colour Index No. 37235

Dark green powder, soluble in water. It is stabilised by addition of zinc chloride.

Storage: in an airtight container, at a temperature between 2 °C and 8 °C.

Fast Blue B Salt Solution

Dissolve 140 mg of *fast blue B salt R* in 10 mL of *water R* and mix with 50 mL of *methylene chloride R* and 140 mL of *methanol R*.

Storage: protected from light at a temperature of 4 °C; use within 1 week.

Fast Red B Salt 2-Methoxy-4-nitrobenzenediazonium hydrogen naphthalene-1,5-disulfonate; $C_{17}H_{13}N_3O_9S_2$ = 467.4 (*49735-71-9*)

Schultz No. 155

Colour Index No. 37125

Orange-yellow powder, soluble in water, slightly soluble in ethanol (96 per cent).

Storage: in an airtight container, protected from light, at 2 °C to 8 °C.

Fenbufen $C_{16}H_{14}O_3$ = 254.3 (*36330-85-5*)

General reagent grade of commerce.

Fenchlorphos $C_8H_8Cl_3O_3PS$ = 321.5 (*299-84-3*)

mp: about 35 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Fenchone (1*R*)-1,3,3-Trimethylbicyclo[2.2.1]heptan-2-one; $C_{10}H_{16}O$ = 152.2 (*7787-20-4*)

Oily liquid, miscible with ethanol (96 per cent), practically insoluble in water.

n_D^{20}: about 1.46.

bp_{15mm}: 192 °C to 194 °C.

Fenchone used in gas chromatography complies with the following test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Bitter fennel (0824)*.

Test solution. The substance to be examined.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Fenvalerate $C_{25}H_{22}ClNO_3$ = 419.9 (*51630-58-1*)

bp: about 300 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Ferric Chloride-ferricyanide-arsenite Reagent

Immediately before use mix 10 mL of a 27 g/L solution of *ferric chloride R* in *dilute hydrochloric acid R*, 7 mL of *potassium ferricyanide solution R*, 3 mL of *water R* and 10 mL of *sodium arsenite solution R*.

Ferric Chloride Solution R3

Dissolve 2.0 g of *ferric chloride R* in *anhydrous ethanol R* and dilute to 100.0 mL with the same solvent.

Ferric Chloride Solution, Radiolabelled [^{59}Fe], Concentrated

A commercially available solution of [^{59}Fe]ferric chloride (approximate specific activity: 100-1000 MBq/mg of Fe).

Ferric Chloride Solution, Radiolabelled [^{59}Fe]

Dilute the *concentrated radiolabelled [^{59}Fe]ferric chloride solution* in *sodium citrate buffer solution pH 7.8* to obtain a solution with an activity of 3.7×10^4 Bq/mL

Ferrocyphen Dicyanobis(1,10-phenanthroline)iron(II); Ferrocyphene; $C_{26}H_{16}FeN_6$ = 468.3 (*14768-11-7*)

Violet-bronze, crystalline powder, practically insoluble in water and in ethanol (96 per cent).

Storage: protected from light and moisture.

Ferrocyphen Solution

Dissolve, without warming, 0.5 g of *ferrocyphen* in 50 mL of *sulfuric acid*.

Ferroin Solution Ferroin; (*14634-91-4*)

Dissolve 0.7 g of *ferrous sulfate R* and 1.76 g of *phenanthroline hydrochloride R* in 70 mL of *water R* and dilute to 100 mL with the same solvent.

Test for sensitivity. To 50 mL of *dilute sulfuric acid R* add 0.1 mL of *ferroin R*. After the addition of 0.1 mL of *0.1 M ammonium and cerium nitrate* the colour changes from red to light blue.

Ferulic Acid 4-Hydroxy-3-methoxycinnamic acid; 3-(4-Hydroxy-3-methoxyphenyl)propenoic acid; $C_{10}H_{10}O_4$ = 194.2 (*1135-24-6*)

Faint yellow powder, freely soluble in methanol.

mp: 172.9 °C to 173.9 °C.

Ferulic acid used in the assay of eleutherosides in Eleutherococcus (1419) complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Eleutherococcus (1419)*.

Content: minimum 99 per cent, calculated by the normalisation procedure.

Fibrin Blue

Mix 1.5 g of fibrin with 30 mL of a 5 g/L solution of *indigo carmine R* in 1 per cent *V/V dilute hydrochloric acid R*. Heat the mixture to 80 °C and maintain at this temperature whilst stirring for about 30 min. Allow to cool. Filter. Wash extensively by resuspension in 1 per cent *V/V dilute hydrochloric acid R* and mixing for about 30 min; filter. Repeat the washing operation three times. Dry at 50 °C. Grind.

Fibrinogen (*9001-32-5*)

See *Human fibrinogen, freeze-dried (0024)*.

Fixing Solution

To 250 mL of *methanol R*, add 0.27 mL of *formaldehyde R* and dilute to 500.0 mL with *water R*.

Fixing Solution for Isoelectric Focusing in Polyacrylamide Gel

A solution containing 35 g of *sulfosalicylic acid R* and 100 g of *trichloroacetic acid R* per litre of *water R*.

Flufenamic Acid 2-[[3-(Trifluoromethyl)phenyl]amino] benzoic acid; $C_{14}H_{10}F_3NO_2$ = 281.2 (*530-78-9*)

Pale yellow, crystalline powder or needles, practically insoluble in water, freely soluble in ethanol (96 per cent).

mp: 132 °C to 135 °C.

Flumazenil (*78755-81-4*)

See *Flumazenil (1326)*.

Flunitrazepam (*1622-62-4*)

See *Flunitrazepam (0717)*.

Fluoranthene $C_{16}H_{10}$ = 202.3 (*206-44-0*)

bp: about 384°.

mp: 105° to 110°.

General reagent grade of commerce.

Fluorene Diphenylenemethane; $C_{13}H_{10}$ = 166.2 (*86-73-7*)

White or almost white crystals, freely soluble in anhydrous acetic acid, soluble in hot ethanol (96 per cent).

mp: 113 °C to 115 °C.

9-Fluorenone $C_{13}H_{18}O$ = 180.2 (*486-25-9*)

mp: about 83°.

General reagent grade of commerce.

Fluorenone Solution

Dissolve 50 mg of *9-fluorenone* in 10 mL of warm *methanol*, transfer to a 500-mL graduated flask with the aid of 190 mL of *methanol* and add sufficient *water* to produce 500 mL. The solution should be clear. Immediately before use dilute 10 mL of this solution to 100 mL with *methanol*.

(9-Fluorenyl)methyl Chloroformate Fluoren-9-ylmethyl chloromethanoate; $C_{15}H_{11}ClO_2$ = 258.7 (*28920-43-6*)

mp: about 63 °C.

Fluorescamine 4-Phenylspiro[furan-2(3*H*),1'(3'*H*)-isobenzofuran]-3,3'-dione; $C_{17}H_{10}O_4$ = 278.3 (*38183-12-9*)

mp: 154 °C to 155 °C.

Fluorescein 3',6'-Dihydroxyspiro[isobenzofurane-1(3*H*),9'-[9*H*]xanthen]-3-one; $C_{20}H_{12}O_5$ = 332.3 (*2321-07-5*)

Orange-red powder, practically insoluble in water, soluble in warm ethanol (96 per cent), soluble in alkaline solutions. In solution, fluorescein displays a green fluorescence.

mp: about 315 °C.

Fluorescein Sodium Disodium 2-(3-oxo-6-oxido-3H-xanthen-9-yl)benzoate; Sodium fluoresceinate; $C_{20}H_{10}Na_2O_5$ = 376.3 (*518-47-8*)

Schultz No. 880

Colour Index No. 45350

Orange-red powder, freely soluble in water. Aqueous solutions display an intense yellowish-green fluorescence.

Fluorocholine Chloride *N*-(Fluoromethyl)-2-hydroxy-*N*,*N*-dimethylethan-1-aminium chloride; $C_5H_{13}ClFNO$ = 157.6 (*459424-38-5*)

Colourless, hygroscopic crystals.

mp: about 184 °C.

2-Fluoro-2-deoxy-D-glucose $C_6H_{11}FO_5$ = 182.2 (*86783-82-6*)

White or almost white crystalline powder.

mp: 174 °C to 176 °C.

2-Fluoro-2-deoxy-D-mannose $C_6H_{11}FO_5$ = 182.1 (*38440-79-8*)

Colourless semi-solid.

1-Fluoro-2,4-dinitrobenzene 2,4-Dinitrofluorobenzene; Fluorodinitrobenzene; $C_6H_3FN_2O_4$ = 186.1 (*70-34-8*)

Pale yellow liquid or crystals, soluble in propylene glycol.

mp: about 29 °C.

Content: minimum 99.0 per cent, determined by gas chromatography.

1-Fluoro-2,4-dinitrophenyl-5-L-alaninamide N^{α}-(5-Fluoro-2,4-dinitrophenyl)-L-alaninamide; Marfey's reagent; FDAA; $C_9H_9FN_4O_5$ = 272.2 (*95713-52-3*)

Yellow or orange powder.

mp: about 228 °C.

Enantiomeric purity: minimum 99.5 per cent.

DL-6-Fluorodopa Hydrochloride (2*RS*)-2-Amino-3-(2-fluoro-4,5-dihydroxyphenyl)propanoic acid hydrochloride; 2-Fluoro-5-hydroxy-DL-tyrosine hydrochloride; $C_9H_{11}ClFNO_4$ = 251.6

White or almost white powder.

Fluoroethyl(2-hydroxyethyl)dimethylammonium Chloride *N*-(2-Fluoroethyl)-2-hydroxy-*N*,*N*-dimethylethan-1-aminium chloride; $C_6H_{15}ClFNO$ = 171.6 (*479407-08-4*)

Slightly yellow powder.

Fluoroethyl-D-tyrosine Hydrochloride (2*R*)-2-Amino-3-[4-(2-fluoroethoxy)phenyl]propanoic acid hydrochloride; $C_{11}H_{15}FNO_3Cl$ = 263.7

Content: minimum 95 per cent.

Colourless or almost colourless crystals.

Fluoroethyl-L-tyrosine Hydrochloride (2*S*)-2-Amino-3-[4-(2-fluoroethoxy)phenyl]propanoic acid hydrochloride; $C_{11}H_{15}FNO_3Cl$ = 263.7

Content: minimum 95 per cent.

Colourless or almost colourless crystals.

6-Fluorolevodopa Hydrochloride (2*S*)-2-Amino-3-(2-fluoro-4,5-dihydroxyphenyl)propanoic acid hydrochloride; 2-Fluoro-5-hydroxy-L-tyrosine hydrochloride; $C_9H_{11}ClFNO_4$ = 251.6 (*144334-59-8*)

Colourless or almost colourless solid, soluble in water.

Fluoromisonidazole (2*RS*)-1-Fluoro-3-(2-nitro-1*H*-imidazol-1-yl)propan-2-ol; FMISO; $C_6H_8FN_3O_3$ = 189.1 (*13551-89-8*)

Content: minimum 95 per cent.

Yellow crystals.

1-Fluoro-2-nitro-4-trifluoromethylbenzene 4-Fluoro-3-nitrobenzotrifluoride; 1-Fluoro-2-nitro-4-(trifluoromethyl) benzene; $C_7H_3F_4NO_2$ = 209.1 (*367-86-2*)

mp: about 197 °C.

Folic Acid (*75708-92-8*)

See *Folic acid hydrate (0067)*.

Formaldehyde (*50-00-0*)

See *Formaldehyde solution R*.

Formaldehyde Solution R1

Complies with the requirements prescribed in the monograph *Formaldehyde solution (35 per cent) (0826)* with the following modification.

Content: 36.5 per cent *m/m* to 38.0 per cent *m/m* of formaldehyde (CH_2O; M_r 30.03).

Formaldehyde Solution See *Formaldehyde solution (35 per cent) (0826)*.

Formamide CH_3NO = 45.0 (*75-12-7*)

Clear, colourless, oily liquid, hygroscopic, miscible with water and with ethanol (96 per cent). It is hydrolysed by water.

d_{20}^{20}: about 1.134.

bp: about 210 °C.

Content: minimum 99.5 per cent.

Storage: in an airtight container.

Formamide R1

Complies with the requirements prescribed for *formamide R* with the following additional requirement.

Water (*2.5.12*): maximum 0.1 per cent determined with an equal volume of *anhydrous methanol R*.

Formamide, Treated

Disperse 1.0 g of *sulfamic acid R* in 20.0 mL of *formamide R* containing 5 per cent *V/V* of *water R*.

Formic Acid Formic acid, anhydrous; CH_2O_2 = 46.03 (*64-18-6*)

Content: minimum 98.0 per cent *m/m*.

Colourless liquid, corrosive, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: about 1.22.

Assay. Weigh accurately a conical flask containing 10 mL of *water R*, quickly add about 1 mL of the acid and weigh again. Add 50 mL of *water R* and titrate with *1 M sodium hydroxide*, using 0.5 mL of *phenolphthalein solution R* as indicator.

1 mL of *1 M sodium hydroxide* is equivalent to 46.03 mg of CH_2O_2.

Formononetin 7-Hydroxy-3-(4-methoxyphenyl)-4-benzopyrone; 7-Hydroxy-3-(4-methoxyphenyl)chromone; 7-Hydroxy-4′-methoxyisoflavone; $C_{16}H_{12}O_4$ = 268.26 (*485-72-3*)

General reagent grade of commerce.

Forsythoside A (2*R*,3*S*,4*R*,5*R*,6*R*)-6-[2-(3,4-Dihydroxyphenyl)ethoxy]-4,5-dihydroxy-2-[[[(2*R*,3*R*,4*R*,5*R*,6*S*)-3,4,5-trihydroxy-6-methyloxan-2-yl]oxy]methyl]oxan-3-yl (2*E*)-3-(3,4-dihydroxyphenyl)prop-2-enoate; 2-(3,4-Dihydroxyphenyl)ethyl 6-*O*-(6-deoxy-α-L-mannopyranosyl)-4-*O*-[(2*E*)-3-(3,4-dihydroxyphenyl)prop-2-enoyl]-β-D-glucopyranoside; $C_{29}H_{36}O_{15}$ = 625 (*79916-77-1*)

D-Fructose Laevulose; Fructose; (*57-48-7*)

See *Fructose (0188)*.

Fuchsin, Basic (*632-99-5*)

A mixture of rosaniline hydrochloride ($C_{20}H_{20}ClN_3$; M_r 337.9; Colour Index No. 42510; Schultz No. 780) and *para*-rosaniline hydrochloride ($C_{19}H_{18}ClN_3$; M_r 323.8; Colour Index No. 42500; Schultz No. 779).

If necessary, purify in the following manner. Dissolve 1 g in 250 mL of *dilute hydrochloric acid R*. Allow to stand for 2 h at room temperature, filter and neutralise with *dilute sodium hydroxide solution R* and add 1 mL to 2 mL in excess. Filter the precipitate through a sintered-glass filter (40) (*2.1.2*) and wash with *water R*. Dissolve the precipitate in 70 mL of *methanol R*, previously heated to boiling, and add 300 mL of *water R* at 80 °C. Allow to cool to room temperature, filter and dry the crystals *in vacuo*.

Crystals with a greenish-bronze sheen, soluble in water and in ethanol (96 per cent).

Storage: protected from light.

Fuchsin Solution, Basic

Dissolve 0.1 g of *basic fuchsin* in 3 mL of *methanol*, dilute to 100 mL with *water*, mix and filter.

Fuchsin Solution, Decolorised

Dissolve 0.1 g of *basic fuchsin R* in 60 mL of *water R*. Add a solution containing 1 g of *anhydrous sodium sulfite R* or 2 g of *sodium sulfite heptahydrate R* in 10 mL of *water R*. Slowly and with continuous shaking add 2 mL of *hydrochloric acid R*. Dilute to 100 mL with *water R*. Allow to stand protected from light for at least 12 h, decolorise with *activated charcoal R* and filter. If the solution becomes cloudy, filter before use. If on standing the solution becomes violet, decolorise again by adding *activated charcoal R*.

Test for sensitivity. To 1.0 mL add 1.0 mL of *water R* and 0.1 mL of *aldehyde-free alcohol R*. Add 0.2 mL of a solution containing 0.1 g/L of formaldehyde (CH_2O, M_r 30.03). A pale-pink colour develops within 5 min.

Storage: protected from light.

Fuchsin Solution R1, Decolorised

To 1 g of *basic fuchsin R* add 100 mL of *water R*. Heat to 50 °C and allow to cool with occasional shaking. Allow to stand for 48 h, shake and filter. To 4 mL of the filtrate add 6 mL of *hydrochloric acid R*, mix and dilute to 100 mL with *water R*. Allow to stand for at least 1 h before use.

L-Fucose Fucose; $C_6H_{12}O_5$ = 164.2 (*6696-41-9*)

White or almost white powder, soluble in water and in ethanol (96 per cent).

$[\alpha]_D^{20}$: about −76, determined on a 90 g/L solution 24 h after dissolution.

mp: about 140 °C.

Fumaric Acid (*E*)-Butenedioic acid; $C_4H_4O_4$ = 116.1 (*110-17-8*)

White or almost white crystals, slightly soluble in water, soluble in ethanol (96 per cent), slightly soluble in acetone.

mp: about 300 °C.

Furfuraldehyde Furan-2-aldehyde; Furfural; $C_5H_4O_2$ = 96.1 (*98-01-1*)

Clear, colourless to brownish-yellow, oily liquid, miscible in 11 parts of water, miscible with ethanol (96 per cent).

d_{20}^{20}: 1.155 to 1.161.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 159 °C and 163 °C.

Storage: in a dark place.

Gadolinium Chloride Hexahydrate Gadolinium trichloride hexahydrate; $GdCl_3,6H_2O$ = 371.7 (*13450-84-5*)

Content: minimum 99.9 per cent.

Gadolinium Sulfate Octahydrate $Gd_2(SO_4)_3,8H_2O$ = 747 (*13450-87-8*)

Colourless, crystalline powder.

D-Galactose Galactose; $C_6H_{12}O_6$ = 180.2 (*59-23-4*)

White or almost white, crystalline powder, freely soluble in water.

$[\alpha]_D^{20}$: + 79 to + 81, determined on a 100 g/L solution in *water R* containing about 0.05 per cent of NH_3.

1,6-Galactosylgalactose 6-*O*-β-D-Galactopyranosyl-D-galactopyranose; $C_{12}H_{22}O_{11}$ = 342.3 (*5077-31-6*)

White or almost white powder.

Galacturonic Acid D-(+)-galacturonic acid; (2*S*,3*R*,4*S*,5*R*)-2,3,4,5-Tetrahydroxy-6-oxo-hexanoic acid; $C_6H_{10}O_7$ = 194.1 (*685-73-4*)

$[\alpha]_D^{20}$: about + 53°, determined on a 100 g/L solution.

Gallic Acid 3,4,5-Trihydroxybenzoic acid monohydrate; $C_7H_6O_5,H_2O$ = 188.1 (*5995-86-8*)

Crystalline powder or long needles, colourless or slightly yellow, soluble in water, freely soluble in hot water, in ethanol (96 per cent) and in glycerol.

It loses its water of crystallisation at 120 °C.

mp: about 260 °C, with decomposition.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Bearberry leaf (1054)*; the chromatogram shows only one principal spot.

Gallium (^{68}Ga) Chloride Solution $^{68}GaCl_3$ = 174.3

Solution containing gallium-68 in the form of gallium chloride in *dilute hydrochloric acid R*.

Content: 90 per cent to 110 per cent of the declared gallium-68 radioactivity at the date and time stated on the label.

Gallium PSMA-11 $C_{44}H_{59}GaN_6O_{17}$ = 1014

Complex of gallium with (3*S*,7*S*)-22-[3-[[[2-[[[5-(2-carboxyethyl)-2-hydroxyphenyl]methyl](carboxymethyl)amino]ethyl](carboxymethyl)amino]methyl]-4-hydroxyphenyl]-5,13,20-trioxo-4,6,12,19-tetraazadocosane-1,3,7-tricarboxylic acid (PSMA-11).

Colourless or almost white powder.

Content: minimum 95.0 per cent (anhydrous and trifluoroacetic acid-free substance).

Ganoderic Acid A (25*R*)-7β,15α-Dihydroxy-3,11,23-trioxolanost-8-en-26-oic acid; $C_{30}H_{44}O_7$ = 516.7 (*81907-62-2*)

Gastric Juice, Artificial

Dissolve 2.0 g of *sodium chloride R* and 3.2 g of *pepsin powder R* in *water R*. Add 80 mL of *1 M hydrochloric acid* and dilute to 1000 mL with *water R*.

Gastrodin 4-(Hydroxymethyl)phenyl α-D-glucopyranoside; (2*R*,3*S*,4*S*,5*R*,6*S*)-2-(Hydroxymethyl)-6-[4-(hydroxymethyl)phenoxy]oxane-3,4,5-triol; $C_{13}H_{18}O_7$ = 286.3 (*62499-27-8*)

GC Concentrical Column

A commercially available system consisting of 2 concentrically arranged tubes. The outer tube is packed with molecular sieves and the inner tube is packed with a porous polymer mixture. The main application is the separation of gases.

Gelatin (*9000-70-8*)

See *Gelatin (0330)*.

Gelatin, Hydrolysed

Dissolve 50 g of *gelatin R* in 1000 mL of *water R*. Autoclave in saturated steam at 121 °C for 90 min and freeze dry.

Geniposide Methyl (1*S*,4a*S*,7a*S*)-1-(β-D-glucopyranosyloxy)-7-(hydroxymethyl)-1,4a,5,7a-tetrahydrocyclopenta[*c*]pyran-4-carboxylate; $C_{17}H_{24}O_{10}$ = 388.4 (*24512-63-8*)

Geraniol (*E*)-3,7-Dimethylocta-2,6-dien-1-ol; $C_{10}H_{18}O$ = 154.2 (*106-24-1*)

Oily liquid, slight odour of rose, practically insoluble in water, miscible with ethanol (96 per cent).

Geraniol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Citronella oil (1609)*.

Content: minimum 98.5 per cent, calculated by the normalisation procedure.

Storage: in an airtight container, protected from light

Geranyl Acetate (*E*)-3,7-Dimethylocta-2,6-dien-1-yl acetate; $C_{12}H_{20}O_2$ = 196.3 (*105-87-3*)

Colourless or slightly yellow liquid, slight odour of rose and lavender.

Geranyl acetate used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Bitter-orange-flower oil (1175)*.

Test solution. The substance to be examined.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Ginsenoside Rb1 (20*S*)-3β-Di-D-glucopyranosyl-20-di-D-glucopyranosylprotopanaxadiol; (20*S*)-3β-[(2-*O*-β-D-Glucopyranosyl-β-D-glucopyranosyl)oxy]-20-[(6-*O*-β-D-glucopyranosyl-β-D-glucopyranosyl)oxy]-5α-dammar-24-en-12β-ol; (20*S*)-3β-[(2-*O*-β-D-Glucopyranosyl-β-D-glucopyranosyl)oxy]-20-[(6-*O*-β-D-glucopyranosyl-β-D-glucopyranosyl)oxy]-4,4,8,14-tetramethyl-18-nor-5α-cholest-24-en-12β-ol; $C_{54}H_{92}O_{23},3H_2O$ = 1163 (*41753-43-9*)

A colourless solid, soluble in water, in anhydrous ethanol and in methanol.

$[\alpha]_D^{20}$: + 11.3 determined on a 10 g/L solution in *methanol R*.

mp: about 199 °C.

Water (2.5.12): maximum 6.8 per cent.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Ginseng (1523)*.

Test solution. Dissolve 3.0 mg, accurately weighed, of *ginsenoside Rb1* in 10 mL of *methanol R*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Ginsenoside Re (3β,6α,12β)-20-(β-D-Glucopyranosyloxy)-3,12-dihydroxydammar-24-en-6-yl 2-*O*-(6-deoxy-α-L-mannopyranosyl)-β-D-glucopyranoside; $C_{48}H_{82}O_{18}$ = 947.2 (*52286-59-6*)

Colourless solid, soluble in water, in ethanol (96 per cent) and in methanol.

Ginsenoside Rf (20*S*)-6-*O*-[β-D-Glucopyranosyl-(1→2)-β-D-glycopyranoside]-dammar-24-ene-3β,6α,12β,20-tetrol; $C_{42}H_{72}O_{14},2H_2O$ = 837 (*52286-58-5*)

A colourless solid, soluble in water, in anhydrous ethanol and in methanol.

$[\alpha]_D^{20}$: + 12.8 determined on a 10 g/L solution in *methanol R*.

mp: about 198 °C.

Ginsenoside Rg1 (20*S*)-6β-D-Glucopyranosyl-D-glucopyranosylprotopanaxatriol; (20*S*)-6α,20-Bis(β-D-glucopyranosyloxy)-5α-dammar-24-ene-3β,12β-diol; (20*S*)-6α,20-Bis(β-D-glucopyranosyloxy)-4,4,8,14-tetramethyl-18-nor-5α-cholest-24-ene-3β,12β-diol; $C_{42}H_{72}O_{14},2H_2O$ = 837 (*22427-39-0*)

A colourless solid, soluble in water, in anhydrous ethanol and in methanol.

$[\alpha]_D^{20}$: + 31.2 determined on a 10 g/L solution in *methanol R*.

mp: 188 °C to 191 °C.

Water (2.5.12): maximum 4.8 per cent.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Ginseng (1523)*.

Test solution. Dissolve 3.0 mg, accurately weighed, of *ginsenoside Rg1* in 10 mL of *methanol R*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Ginsenoside Rg2 3β,12β,20-Trihydroxydammar-24-en-6α-yl 2-*O*-(6-deoxy-α-L-mannopyranosyl)-β-D-glucopyranoside; $C_{42}H_{72}O_{13}$ = 785 (*52286-74-5*)

Ginsenoside Ro (3β)-28-(β-D-Glucopyranosyloxy)-28-oxoolean-12-en-3-yl 2-*O*-β-D-glucopyranosyl-β-D-glucopyranosiduronic acid; $C_{48}H_{76}O_{19}$ = 957 (*34367-04-9*)

Gitoxin Glycoside of *Digitalis purpurea* L; 3β-(*O*-2,6-Dideoxy-β-d-*ribo*-hexopyranosyl-(1→4)-*O*-2,6-dideoxy-β-d-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-d-*ribo*-hexopyranosyloxy)-14,16β-dihydroxy-5β,14β-card-20(22)-enolide; $C_{41}H_{64}O_{14}$ = 781 (*4562-36-1*)

A white or almost white, crystalline powder, practically insoluble in water and in most common organic solvents, soluble in pyridine.

$[\alpha]_D^{20}$: + 20 to + 24, determined on a 5 g/L solution in a mixture of equal volumes of *chloroform R* and *methanol R*.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Digitalis leaf (0117)*; the chromatogram shows only one principal spot.

Glucosamine Hydrochloride D-Glucosamine hydrochloride; $C_6H_{14}ClNO_5$ = 215.6 (*66-84-2*)

Crystals, soluble in water.

$[\alpha]_D^{20}$: + 100, decreasing to + 47.5 after 30 min, determined on a 100 g/L solution.

Glucose (*50-99-7*)

See *Glucose (0177)*.

D-Glucose Dextrose; (*50-99-7*)

See *glucose R*.

D-Glucose Monohydrate $C_6H_{12}O_6,H_2O$ = 198.2 (*5996-10-1*)

$[\alpha]_D^{20}$: about +52.5 (anhydrous) (10% w/v in water containing about 0.2% of NH_3).

General reagent grade of commerce.

Colourless crystals or a white to cream, crystalline powder.

D-Glucuronic Acid $C_6H_{10}O_7$ = 194.1 (*6556-12-3*)

Content: minimum 96.0 per cent, calculated with reference to the substance dried *in vacuo* (*2.2.32*).

Soluble in water and in ethanol (96 per cent).

Shows mutarotation: $[\alpha]_D^{24}$: + 11.7 → + 36.3.

Assay. Dissolve 0.150 g in 50 mL of *anhydrous methanol R* while stirring under nitrogen. Titrate with *0.1 M tetrabutylammonium hydroxide*, protecting the solution from atmospheric carbon dioxide throughout solubilisation and titration. Determine the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M tetrabutylammonium hydroxide* is equivalent to 19.41 mg of $C_6H_{10}O_7$.

Glutamic Acid (*56-86-0*)

See *Glutamic acid (0750)*.

L-Glutamine (*S*)-2,5-Diamino-5-oxopentanoic acid; $C_5H_{10}N_2O_3$ = 146.2 (*56-85-9*)

White crystalline powder.

mp: about 185 °C, with decomposition.

Glutamyl Endopeptidase for Peptide Mapping Endoproteinase Glu-C of high purity from *Staphylococcus aureus* strain V8 (EC 3.4.21.19); (*137010-42-5*)

L-γ-Glutamyl-L-cysteine $C_8H_{14}N_2O_5S$ = 250.3 (*636-58-8*)

Glutaraldehyde $C_5H_8O_2$ = 100.1 (*111-30-8*)

Oily liquid, soluble in water.

n_D^{25}: about 1.434.

bp: about 188 °C.

Glutaric Acid Pentanedioic acid; $C_5H_8O_4$ = 132.1 (*110-94-1*)

White or almost white, crystalline powder.

L-Glutathione, Oxidised Bis(L-γ-glutamyl-L-cysteinylglycine) disulfide; $C_{20}H_{32}N_6O_{12}S_2$ = 612.6 (*27025-41-8*)

Glycerol Propane-1,2,3-triol; (*56-81-5*)

See *Glycerol (0496)*.

Glycerol R1

Complies with the requirements prescribed for the monograph *Glycerol (0496)* and free from diethylene glycol when examined as prescribed in the test for impurity A and related substances in that monograph.

Glycerol (85%) See *Glycerol (85 per cent) (0497)*.

Glycerol (85 per cent) R1

Complies with the requirements prescribed for the monograph *Glycerol 85 per cent (0497)* and free from diethylene glycol when examined as prescribed in the test for impurity A and related substances in that monograph.

Glycerol 1-decanoate (2*RS*)-2,3-Dihydroxypropyl decanoate; α-Monocaprin; 1-Monodecanoyl-*rac*-glycerol; $C_{13}H_{26}O_4$ = 246.3 (*2277-23-8*)

Content: about 99 per cent.

Glycerol 1-octanoate (2*RS*)-2,3-Dihydroxypropyl octanoate; α-Monocaprylin; 1-Monooctanoyl-*rac*-glycerol; $C_{11}H_{22}O_4$ = 218.3 (*502-54-5*)

Content: about 99 per cent.

Glycidol $C_3H_6O_2$ = 74.1 (*556-52-5*)

Slightly viscous liquid, miscible with water.

d_4^{20}: about 1.115.

n_D^{20}: about 1.432.

Glycine Aminoacetic acid; (*56-40-6*)

See *Glycine (0614)*.

Glycine Anhydride Piperazine-2,5-dione (2,5-DKP); $C_4H_6N_2O_2$ = 114.1 (*106-57-0*)

Glycolic Acid 2-Hydroxyacetic acid; $C_2H_4O_3$ = 76.0 (*79-14-1*)

Crystals, soluble in water, in acetone, in ethanol (96 per cent) and in methanol.

mp: about 80 °C.

18α-Glycyrrhetinic Acid (20β)-3β-Hydroxy-11-oxo-18α-olean-12-en-29-oic acid; $C_{30}H_{46}O_4$ = 470.7 (*1449-05-4*)

White or almost white powder, practically insoluble in water, soluble in anhydrous ethanol, sparingly soluble in methylene chloride.

β-Glycyrrhetinic Acid Glycyrrhetinic Acid; Glycyrrhetic acid; $C_{30}H_{46}O_4$ = 470.7 (*471-53-4*)

A mixture of α- and β-glycyrrhetic acids in which the β-isomer is predominant.

White or yellowish-brown powder, practically insoluble in water, soluble in anhydrous ethanol and in glacial acetic acid.

$[\alpha]_D^{20}$: + 145 to + 155, determined on a 10.0 g/L solution in *anhydrous ethanol R*.

Chromatography. Thin-layer chromatography (*2.2.27*) using *silica gel* GF_{254} *R* as the coating substance; prepare the slurry using a 0.25 per cent *V/V* solution of *phosphoric acid R*. Apply to the plate 5 µL of a 5 g/L solution of the glycyrrhetic acid in a mixture of equal volumes of *chloroform R* and *methanol R*. Develop over a path of 10 cm using a mixture of 5 volumes of *methanol R* and 95 volumes of *chloroform R*. Examine the chromatogram in ultraviolet light at 254 nm. The chromatogram shows a dark spot (R_F about 0.3) corresponding to β-glycyrrhetic acid and a smaller spot (R_F about 0.5) corresponding to α-glycyrrhetic acid. Spray with *anisaldehyde solution R* and heat at 100-105 °C for 10 min. Both spots are coloured bluish-violet. Between them a smaller bluish-violet spot may be present.

Glycyrrhizic Acid $C_{42}H_{62}O_{16}$ = 822.93 (*1405-86-3*)

Analytical reagent grade of commerce.

Glyoxal Bis(2-hydroxyanil) Bis(2-hydroxyphenylimino) ethane; Glyoxalhydroxyanil; $C_{14}H_{12}N_2O_2$ = 240.3 (*1149-16-2*)

White or almost white crystals, soluble in hot ethanol (96 per cent).

mp: about 200 °C.

Glyoxal Sodium Bisulfite Glyoxal sodium bisulphite; $C_2H_4Na_2O_8S_2,H_2O$ = 284.2

General reagent grade of commerce.

A white or cream powder.

Glyoxal Solution (*107-22-2*)

Contains about 40 per cent (*m/m*) glyoxal.

Assay. In a ground-glass stoppered flask place 1.000 g of glyoxal solution, 20 mL of a 70 g/L solution of *hydroxylamine hydrochloride R* and 50 mL of *water R*. Allow to stand for 30 min and add 1 mL of *methyl red mixed solution R* and titrate with *1 M sodium hydroxide* until the colour changes from red to green. Carry out a blank titration.

1 mL of *1 M sodium hydroxide* is equivalent to 29.02 mg of glyoxal ($C_2H_2O_2$).

Gonadotrophin, Chorionic (*9002-61-3*)

See *Chorionic gonadotrophin (0498)*.

Gonadotrophin, Serum See *Equine serum gonadotrophin for veterinary use (0719)*.

Gramine 1-(1*H*-Indol-3-yl)-*N*,*N*-dimethylmethanamine; $C_{11}H_{14}N_2$ = 174.2 (*87-52-5*)

Flakes, practically insoluble in water, soluble in ethanol (96 per cent), slightly soluble in acetone.

mp: 132 °C to 134 °C.

Guaiacol 2-Methoxyphenol; 1-Hydroxy-2-methoxybenzene; $C_7H_8O_2$ = 124.1 (*90-05-1*)

Crystalline mass or colourless or yellowish liquid, hygroscopic, slightly soluble in water, very soluble in methylene chloride, freely soluble in ethanol (96 per cent).

bp: about 205 °C.

mp: about 28 °C.

Guaiacum Resin Gum guaiac

Resin obtained from the heartwood of *Guaiacum officinale* L. and *Guaiacum sanctum* L.

Reddish-brown or greenish-brown, hard, glassy fragments; fracture shiny.

Guaiazulene 1,4-Dimethyl-7-isopropylazulene; $C_{15}H_{18}$ = 198.3 (*489-84-9*)

Dark-blue crystals or blue liquid, very slightly soluble in water, miscible with fatty and essential oils and with liquid paraffin, sparingly soluble in ethanol (96 per cent), soluble in 500 g/L sulfuric acid and 80 per cent *m/m* phosphoric acid, giving a colourless solution.

mp: about 30 °C.

Storage: protected from light and air.

Guaiphenesin Guaifenesin; guaiacol glyceryl ether; $C_{10}H_{14}O_4$ = 198.2 (*93-14-1*)

mp: about 79°.

General reagent grade of commerce.

Guanidine Hydrochloride CH_5N_3HCl = 95.5 (*50-01-1*)

Crystalline powder, freely soluble in water and in ethanol (96 per cent).

Guanine 2-Aminopurin-6-one; $C_5H_5N_5O$ = 151.1 (*73-40-5*)

Amorphous white or almost white powder, practically insoluble in water, slightly soluble in ethanol (96 per cent). It dissolves in ammonia and in dilute solutions of alkali hydroxides.

Haemoglobin (*9008-02-0*)

Nitrogen: 15 per cent to 16 per cent.

Iron: 0.2 per cent to 0.3 per cent.

Loss on drying (*2.2.32*): maximum 2 per cent.

Sulfated ash (*2.4.14*): maximum 1.5 per cent.

Haemoglobin Solution

Transfer 2 g of *haemoglobin R* to a 250 mL beaker and add 75 mL of *dilute hydrochloric acid R2*. Stir until solution is complete. Adjust the pH to 1.6 ± 0.1 using *1 M hydrochloric acid*. Transfer to a 100 mL flask with the aid of *dilute hydrochloric acid R2*. Add 25 mg of *thiomersal R*. Prepare daily, store at 5 ± 3 °C and readjust to pH 1.6 before use.

Storage: at 2 °C to 8 °C.

Hamamelitannin (2*R*,3*R*,4*R*)-2-Formyl-2,3,4-trihydroxypentane-1,5-diyl bis(3,4,5-trihydroxybenzoate); 2-*C*-[(Galloyloxy)methyl]-D-ribose 5-gallate; $C_{20}H_{20}O_{14}$ = 484.4 (*469-32-9*)

Harpagoside $C_{24}H_{30}O_{11}$ = 494.5

White or almost white, crystalline powder, very hygroscopic, soluble in water and in ethanol (96 per cent).

Storage: in an airtight container.

Hederacoside C *O*-6-Deoxy-α-L-mannopyranosyl-(1→4)-*O*-β-D-glucopyranosyl-(1→6)-β-D-glucopyranosyl (4*R*)-3β-[[2-*O*(-6-deoxy-α-L-mannopyranosyl)-α-L-arabinopyranosyl] oxy]-23-hydroxyolean-12-en-28-oate; $C_{59}H_{96}O_{26}$ = 1221 (*14216-03-6*)

Colourless crystals or white or almost white powder.

mp: about 220 °C.

Hederacoside C used in liquid chromatography complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Ivy leaf (2148)*.

Test solution. Dissolve 5.0 mg of hederacoside C in 5.0 mL of *methanol R*.

Content: minimum 95 per cent, calculated by the normalisation procedure.

Hederagenin Astrantiagenin E; Caulosapogenin; 3β,23-Dihydroxy-4α-olean-12-en-28-oic acid; $C_{30}H_{48}O_4$ = 472.7 (*465-99-6*)

α-Hederin (+)-(4*R*)-3β-[[2-*O*-(6-Deoxy-α-L-mannopyranosyl)-α-L-arabinopyranosyl]oxy]-23-hydroxyolean-12-en-28-oic acid; $C_{41}H_{66}O_{12}$ = 751.0 (*27013-91-8*)

White or almost white powder.

mp: about 256 °C.

Helium Helium for chromatography; He = 4.003 (*7440-59-7*)

Content: minimum 99.995 per cent *V/V* of He.

Heparin (*9041-08-1*)

See *Heparin sodium (0333)*.

Heparinase I Heparin lyase (EC 4.2.2.7); (*9025-39-2*)

Enzyme from *Flavobacterium heparinum* that performs eliminative cleavage of polysaccharides containing (1→4)-linked D-glucuronate or L-iduronate residues and (1→4)-α-linked 2-sulfoamino-2-deoxy-6-sulfo-D-glucose residues to give oligosaccharides with terminal 4-deoxy-α-D-gluc-4-enuronosyl groups at their non-reducing ends.

Heparinase II (*149371-12-0*)

Enzyme from *Flavobacterium heparinum* that depolymerises sulfated polysaccharide chains containing 1→4 linkages between hexosamines and uronic acid residues (both iduronic and glucuronic acid residues). The reaction yields oligosaccharide products (mainly disaccharides) containing unsaturated uronic acids.

Heparinase III Heparin-sulfate lyase (EC 4.2.2.8); (*37290-86-1*)

Enzyme from *Flavobacterium heparinum* that depolymerises selectively sulfated polysaccharide chains containing 1→4 linkages between hexosamines and glucuronic acid residues to give oligosaccharide products (mainly disaccharides) containing unsaturated uronic acids.

Heptachlor $C_{10}H_5Cl_7$ = 373.3 (*76-44-8*)

bp: about 135 °C.

mp: about 95 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Heptachlor Epoxide $C_{10}H_5Cl_7O$ = 389.3 (*1024-57-3*)

bp: about 200 °C.

mp: about 160 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Heptafluorobutyric Acid HFBA; $C_4HF_7O_2$ = 214.0 (*375-22-4*)

Clear, colourless liquid. Corrosive.

d_{20}^{20}: about 1.645.

n_D^{20}: about 1.300.

bp: about 120 °C.

Content: minimum 99.5 per cent.

Heptafluorobutyric Anhydride $C_8F_{14}O_3$ = 410.1 (*336-59-4*)

n_D^{20}: about 1.287.

bp: about 108°.

Use a grade of commerce suitable for derivatisation.

Heptafluoro-*N*-methyl-*N*-(trimethylsilyl)butanamide 2,2,3,3,4,4,4-Heptafluoro-*N*-methyl-*N*-(trimethylsilyl)butyramide; $C_8H_{12}F_7NOSi$ = 299.3 (*53296-64-3*)

Clear, colourless liquid, flammable.

n_D^{20}: about 1.351.

bp: about 148 °C.

***N*-Heptane** Heptane; C_7H_{16} = 100.2 (*142-82-5*)

Colourless, flammable liquid, practically insoluble in water, miscible with anhydrous ethanol.

d_{20}^{20}: 0.683 to 0.686.

n_D^{20}: 1.387 to 1.388.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 97 °C and 98 °C.

***n*-Heptylamine** $C_7H_{17}N$ = 115.22 (*111-68-2*)

General reagent grade of commerce.

Boiling point, about 156 °C.

2-Heptylamine 2-Aminoheptane; $C_7H_{17}N$ = 115.2

bp: about 143°.

General reagent grade of commerce.

Hesperidin (*S*)-7-[[6-*O*-(6-Deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-5-hydroxy-2-(3-hydroxy-4-methoxyphenyl)-2,3-dihydro-4*H*-1-benzopyran-4-one; $C_{28}H_{34}O_{15}$ = 611 (*520-26-3*)

Hygroscopic powder, slightly soluble in water and in methanol.

mp: 258 °C to 262 °C.

Hexachlorobenzene C_6Cl_6 = 284.8 (*118-74-1*)

bp: about 332 °C.

mp: about 230 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

α-Hexachlorocyclohexane $C_6H_6Cl_6$ = 290.8 (*319-84-6*)

bp: about 288 °C.

mp: about 158 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

β-Hexachlorocyclohexane $C_6H_6Cl_6$ = 290.8 (*319-85-7*)

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

δ-Hexachlorocyclohexane $C_6H_6Cl_6$ = 290.8 (*319-86-8*)

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Hexacosane $C_{26}H_{54}$ = 366.7 (*630-01-3*)

Colourless or white or almost white flakes.

mp: about 57 °C.

Hexadimethrine Bromide 1,5-Dimethyl-1,5-diazaundecamethylene polymethobromide; Poly(1,1,5,5-tetramethyl-1,5-azonia-undecamethylene dibromide); $(C_{13}H_{30}Br_2N_2)_n$ (*28728-55-4*)

White or almost white, amorphous powder, hygroscopic, soluble in water.

Storage: in an airtight container.

2,2′,2″,6,6′,6″-Hexa-(1,1-dimethylethyl)-4,4′,4″-[2,4,6-trimethyl-1,3,5-benzenetriyltrismethylene]triphenol 2,2′,2″,6,6′,6″-Hexa-*tert*-butyl-4,4′,4″-[(2,4,6-trimethyl-1,3,5-benzenetriyl)trismethylene]triphenol; $C_{54}H_{78}O_3$ = 775

Crystalline powder, practically insoluble in water, soluble in acetone, slightly soluble in ethanol (96 per cent).

mp: about 244 °C.

1,1,1,3,3,3-Hexafluoropropan-2-ol $C_3H_2F_6O$ = 168.0 (*920-66-1*)

Content: minimum 99.0 per cent, determined by gas chromatography.

Clear, colourless liquid, miscible with water and with anhydrous ethanol.

d_{20}^{20}: about 1.596.

bp: about 59 °C.

Hexamethyldisilazane $C_6H_{19}NSi_2$ = 161.4 (*999-97-3*)

Clear, colourless liquid.

d_{20}^{20}: about 0.78.

n_D^{20}: about 1.408.

bp: about 125 °C.

Storage: in an airtight container.

Hexamine 1,3,5,7-tetra-azatricyclo [3.3.1.13,7]decane; Hexamethylenetetramine; $C_6H_{12}N_4$ = 140.2 (*100-97-0*)

Colourless, crystalline powder, very soluble in water.

***n*-Hexane** Hexane; C_6H_{14} = 86.2 (*110-54-3*)

Colourless, flammable liquid, practically insoluble in water, miscible with anhydrous ethanol.

d_{20}^{20}: 0.659 to 0.663.

n_D^{20}: 1.375 to 1.376.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 67 °C and 69 °C.

Hexane used in spectrophotometry complies with the following additional test.

Absorbance (*2.2.25*): maximum 0.01 from 260 nm to 420 nm, determined using *water R* as compensation liquid.

Hexane, Purified

A grade of *hexane* containing not more than 0.002% w/v of non-volatile matter.

Hexylamine Hexan-1-amine; $C_6H_{15}N$ = 101.2 (*111-26-2*)

Colourless liquid, slightly soluble in water, soluble in ethanol (96 per cent).

d_{20}^{20}: about 0.766.

n_D^{20}: about 1.418.

bp: 127 °C to 131 °C.

Hibifolin 2-(3,4-Dihydroxyphenyl)-3,5,7-trihydroxy-4-oxo-4*H*-1-benzopyran-8-yl β-D-glucopyranosiduronic acid; Gossypetin 8-*O*-glucuronide; Gossypetin 8-*O*-β-D-glucuropyranoside; $C_{21}H_{18}O_{14}$ = 494.4 (*55366-56-8*)

Storage: protected from light, at a temperature not exceeding 8 °C, in a dry place.

Histamine Dihydrochloride (*56-92-8*)

See *Histamine dihydrochloride (0143)*.

Histamine Phosphate Histamine acid phosphate; $C_5H_9N_3,2H_3PO_4$ = 307.1 (*23297-93-0*)

Of the British Pharmacopoeia.

Histamine Solution

A 9 g/L solution of *sodium chloride R* containing 0.1 µg per millilitre of histamine base (as the phosphate or dihydrochloride).

Histidine (2*S*)-2-Amino-3-(1*H*-imidazol-4-yl)propanoic acid; (*71-00-1*)

Histidine Monohydrochloride (*RS*)-2-Amino-3-(imidazol-4-yl)propionic acid hydrochloride monohydrate; $C_6H_{10}ClN_3O_2,H_2O$ = 209.6 (*123333-71-1*)

Crystalline powder or colourless crystals, soluble in water.

mp: about 250 °C, with decomposition.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Histamine dihydrochloride (0143)*; the chromatogram shows only one principal spot.

Holmium Oxide Diholmium trioxide; Ho_2O_3 = 377.9 (*12055-62-8*)

Yellowish powder, practically insoluble in water.

Holmium Perchlorate Solution

A 40 g/L solution of *holmium oxide R* in a solution of *perchloric acid R* containing 141 g/L of $HClO_4$.

DL-Homocysteine (2*RS*)-2-Amino-4-sulfanylbutanoic acid; $C_4H_9NO_2S$ = 135.2 (*454-29-5*)

White or almost white, crystalline powder.

mp: about 232 °C.

L-Homocysteine Thiolactone Hydrochloride (3*S*)-3-Aminodihydrothiophen-2(3*H*)-one hydrochloride; C_4H_8ClNOS = 153.6 (*31828-68-9*)

White or almost white, crystalline powder.

mp: about 202 °C.

Homoorientin 2-(3,4-Dihydroxyphenyl)-6-β-D-glucopyranosyl-5,7-dihydroxy-4*H*-1-benzopyran-4-one; Isoorientin; Luteolin-6-*C*-glucoside; $C_{21}H_{20}O_{11}$ = 448.4 (*4261-42-1*)

Honokiol 3′,5-Di(prop-2-enyl)biphenyl-2,4′-diol; 3′,5-Diallyl-2,4′-dihydroxybiphenyl; 3′,5-Di-2-propenyl-[1,1′-biphenyl]-2,4′-diol; $C_{18}H_{18}O_2$ = 266.3 (*35354-74-6*)

Human Tissue Factor Solution

Solution containing human tissue factor, which may be produced by recombinant DNA technology, combined with

phospholipids and calcium buffers. Suitable stabilisers may be added.

Hyaluronate Solution

Dilute *potassium hyaluronate stock solution* with an equal volume of *phosphate-buffered saline pH 6.4*.

Use on the day of preparation.

Hyaluronidase Diluent

Mix 100 mL of *phosphate buffer solution pH 6.4 R* with 100 mL of *water R*. Dissolve 0.140 g of *hydrolysed gelatin R* in the solution at 37 °C.

Storage: use within 2 h.

Hydrastine Hydrochloride (3*S*)-6,7-Dimethoxy-3-[(5*R*)-6-methyl-5,6,7,8-tetrahydro-1,3-dioxolo[4,5-*g*]isoquinolin-5-yl]isobenzofuran-1(3*H*)-one hydrochloride; $C_{21}H_{22}ClNO_6$ = 419.9 (*5936-28-7*)

White or almost white powder, hygroscopic, very soluble in water and in ethanol (96 per cent).

$[\alpha]_D^{17}$: about + 127.

mp: about 116 °C.

Hydrastine hydrochloride used in liquid chromatography complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Goldenseal rhizome (1831)*.

Content: minimum 98 per cent, calculated by the normalisation procedure.

Hydrazine Diazane; H_4N_2 = 32.05 (*302-01-2*)

Slightly oily liquid, colourless, with a strong odour of ammonia, miscible with water. Dilute solutions in water are commercially available.

n_D^{20}: about 1.470.

bp: about 113 °C.

mp: about 1.5 °C.

Caution: toxic and corrosive.

Hydrazine Hydrate N_2H_4,H_2O = 50.06 (*10217-52-4*)

Analytical reagent grade of commerce.

A colourless liquid; weight per mL, about 1.03 g.

Hydrazine Sulfate Hydrazine sulphate; $H_6N_2O_4S$ = 130.1 (*10034-93-2*)

Colourless crystals, sparingly soluble in cold water, soluble in hot water (50 °C) and freely soluble in boiling water, practically insoluble in ethanol (96 per cent).

Content: minimum 99 per cent.

Hydrindantin 2,2′-Dihydroxy-2,2′-bi-indan-1,1′,3,3′-tetraone dihydrate; $C_{18}H_{10}O_6,2H_2O$ = 358.3 (*5950-69-6*)

mp: about 258°.

General reagent grade of commerce.

Hydriodic Acid HI = 127.9 (*10034-85-2*)

Prepare by distilling hydriodic acid over red phosphorus, passing *carbon dioxide R* or *nitrogen R* through the apparatus during the distillation. Use the colourless or almost colourless, constant-boiling mixture (55 per cent to 58 per cent of HI) distilling between 126 °C and 127 °C.

Place the acid in small, amber, glass-stoppered bottles previously flushed with *carbon dioxide R* or *nitrogen R*, seal with paraffin.

Storage: in a dark place.

Hydrobromic Acid, 30 per cent (*10035-10-6*)

A 30 per cent solution of hydrobromic acid in *glacial acetic acid R*.

Degas with caution the contents before opening.

Hydrobromic Acid, 47 per cent

A 47 per cent *m/m* solution of hydrobromic acid.

Hydrobromic Acid, Dilute

Place 5.0 mL of *30 per cent hydrobromic acid R* in amber vials equipped with polyethylene stoppers. Seal under *argon R* and store in the dark. Add 5.0 mL of *glacial acetic acid R* immediately before use. Shake.

Storage: in the dark.

Hydrobromic Acid RI, Dilute

Contains 7,9 g/L of HBr.

Dissolve 16.81 g of *47 per cent hydrobromic acid R* in *water R* and dilute to 1000 mL with the same solvent.

Hydrocarbons (Type L), Low-vapour-pressure

Unctuous mass, soluble in benzene and in toluene.

Hydrochloric Acid (*7647-01-0*)

See *Concentrated hydrochloric acid (0002)*.

Solutions of molarity *x*M should be prepared by diluting 85*x* mL of hydrochloric acid to 1000 mL with *water*.

0.1M Hydrochloric Acid, Alcoholic

Dilute 9.0 mL of *hydrochloric acid R* to 1000.0 mL with *aldehyde-free alcohol R*.

2M Hydrochloric Acid

Dilute 206.0 g of *hydrochloric acid R* to 1000.0 mL with *water R*.

3M Hydrochloric Acid

Dilute 309.0 g of *hydrochloric acid R* to 1000.0 mL with *water R*.

6M Hydrochloric Acid

Dilute 618.0 g of *hydrochloric acid R* to 1000.0 mL with *water R*.

Hydrochloric Acid, Brominated

To 1 mL of *bromine solution R* add 100 mL of *hydrochloric acid R*.

Hydrochloric Acid, Dilute

Contains 73 g/L of HCl.

Dilute 20 g of *hydrochloric acid R* to 100 mL with *water R*.

Hydrochloric Acid, Dilute, Heavy Metal-free

Complies with the requirements prescribed for *dilute hydrochloric acid R* with the following maximum contents of heavy metals.

As: 0.005 ppm.

Cd: 0.003 ppm.

Cu: 0.003 ppm.

Fe: 0.05 ppm.

Hg: 0.005 ppm.

Ni: 0.004 ppm.

Pb: 0.001 ppm.

Zn: 0.005 ppm.

Hydrochloric Acid, Ethanolic

Dilute 5.0 mL of *1 M hydrochloric acid* to 500.0 mL with *ethanol (96 per cent) R*.

Solutions of the requisite molarity may be obtained by diluting *hydrochloric acid* with *ethanol (96%)* in place of water as directed under *hydrochloric acid*.

Hydrochloric Acid, Heavy Metal-free

Complies with the requirements prescribed for *hydrochloric acid R* with the following maximum contents of heavy metals.

As: 0.005 ppm.

Cd: 0.003 ppm.

Cu: 0.003 ppm.

Fe: 0.05 ppm.

Hg: 0.005 ppm.

Ni: 0.004 ppm.

Pb: 0.001 ppm.

Zn: 0.005 ppm.

Hydrochloric Acid, Lead-free

Complies with the requirements prescribed for *hydrochloric acid R* with the following additional requirement.

Lead: maximum 20 ppb.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution. In a quartz crucible evaporate 200 g of the acid to be examined almost to dryness. Take up the residue in 5 mL of nitric acid prepared by sub-boiling distillation of *nitric acid R* and evaporate to dryness. Take up the residue in 5 mL of nitric acid prepared by sub-boiling distillation of *nitric acid R*.

Reference solutions. Prepare the reference solutions using *lead standard solution (0.1 ppm Pb) R* diluted with nitric acid prepared by sub-boiling distillation of *nitric acid R*.

Wavelength: 220.35 nm.

Hydrochloric Acid, Methanolic

Dilute 4.0 mL of *hydrochloric acid R* to 1000.0 mL with *methanol R2*.

Hydrochloric Acid R1

Contains 250 g/L of HCl.

Dilute 70 g of *hydrochloric acid R* to 100 mL with *water R*.

Hydrochloric Acid R1, Dilute

Contains 0.37 g/L of HCl.

Dilute 1.0 mL of *dilute hydrochloric acid R* to 200.0 mL with *water R*.

Hydrochloric Acid R2, Dilute

Dilute 30 mL of *1 M hydrochloric acid* to 1000 mL with *water R*; adjust to pH 1.6 ± 0.1.

Hydrochloric Acid, Dilute R3

Contains 3.7 g/L of HCl.

Dilute 10.0 mL of *dilute hydrochloric acid R* to 200.0 mL with *water R*.

Hydrochloric Acid, Stannated

Use stannated hydrochloric acid low in arsenic, grade of commerce, or prepare by adding 1 mL of *tin(II) chloride solution* to 100 mL of *hydrochloric acid*.

Hydrocortisone $C_{21}H_{30}O_5$ = 362.5 (*50-23-7*)

mp: about 214°, with decomposition.

General reagent grade of commerce.

Hydrocortisone Acetate (*50-03-3*)

See *Hydrocortisone acetate (0334)*.

Hydrofluoric Acid HF = 20.01 (*7664-39-3*)

Content: minimum 40.0 per cent *m/m*.

Clear, colourless liquid.

Loss on ignition: not more than 0.05 per cent *m/m*; evaporate the hydrofluoric acid in a platinum crucible and gently ignite the residue to constant mass.

Assay. Weigh accurately a glass-stoppered flask containing 50.0 mL of *1 M sodium hydroxide*. Introduce 2 g of the hydrofluoric acid and weigh again. Titrate the solution with *0.5 M sulfuric acid*, using 0.5 mL of *phenolphthalein solution R* as indicator.

1 mL of *1 M sodium hydroxide* is equivalent to 20.01 mg of HF.

Storage: in a polyethylene container.

Hydrogen Hydrogen for chromatography; H_2 = 2.016 (*1333-74-0*)

Content: minimum 99.95 per cent *V/V*.

Hydrogen Peroxide Solution (200 vol) H_2O_2 = 34.02 (*7724-84-1*)

General reagent grade of commerce containing about 60% w/v of H_2O_2.

A colourless liquid; weight per mL, about 1.18 g.

Hydrogen Peroxide Solution (100 vol) See *Strong hydrogen peroxide solution*

Hydrogen Peroxide Solution (20 vol)

Analytical reagent grade of commerce containing about 6% w/v of H_2O_2 or *hydrogen peroxide solution (100 vol)* diluted with 4 volumes of *water*.

A colourless liquid; weight per mL, about 1.02 g.

Hydrogen Peroxide Solution (10 vol) See *Dilute hydrogen peroxide solution*

Hydrogen Peroxide Solution, Dilute (*7722-84-1*)

See *Hydrogen peroxide solution (3 per cent) (0395)*.

Hydrogen Peroxide Solution, Strong (*7722-84-1*)

See *Hydrogen peroxide solution (30 per cent) (0396)*.

Hydrogen Sulfide Hydrogen sulphide; H_2S = 34.08 (*7783-06-4*)

Gas, slightly soluble in water.

Hydrogen Sulfide R1 Hydrogen sulphide R1; H_2S = 34.08 (*7783-06-4*)

Content: minimum 99.7 per cent *V/V*.

Hydrogen Sulfide Solution Hydrogen sulphide solution

A recently prepared solution of *hydrogen sulfide R* in *water R*. The saturated solution contains about 0.4 per cent to 0.5 per cent of H_2S at 20 °C.

Hydroquinone Quinol; $C_6H_6O_2$ = 110.1 (*123-31-9*)

Fine, colourless or white or almost white needles, darkening on exposure to air and light, soluble in water and in ethanol (96 per cent).

mp: about 173 °C.

Storage: protected from light and air.

Hydroquinone Solution

Dissolve 0.5 g of *hydroquinone R* in *water R*, add 20 µL of *sulfuric acid R* and dilute to 50 mL with *water R*.

4′-Hydroxyacetophenone 1-(4-Hydroxyphenyl)ethan-1-one; $C_8H_8O_2$ = 136.2 (*99-93-4*)

4-Hydroxybenzaldehyde $C_7H_6O_2$ = 122.2 (*123-08-0*)

mp: about 118°.

General reagent grade of commerce.

Colourless needles.

2-Hydroxybenzimidazole 1*H*-benzimidazol-2-ol; $C_7H_6N_2O$ = 134.1 (*615-16-7*)

4-Hydroxybenzohydrazide *p*-Hydroxybenzohydrazide; $C_7H_8N_2O_2$ = 152.2 (*5351-23-5*)

4-Hydroxybenzoic Acid Parahydroxybenzoic acid; $C_7H_6O_3$ = 138.1 (*99-96-7*)

Crystals, slightly soluble in water, very soluble in ethanol (96 per cent), soluble in acetone.

mp: 214 °C to 215 °C.

4-Hydroxybiphenyl See *Biphenyl-4-ol*

4-Hydroxycoumarin 4-Hydroxy-2*H*-1-benzopyran-2-one; $C_9H_6O_3$ = 162.2 (*1076-38-6*)

White or almost white powder, freely soluble in methanol.

Content: minimum 98.0 per cent.

6-Hydroxydopa (2*RS*)-2-Amino-3-(2,4,5-trihydroxyphenyl)propanoic acid; 2,5-Dihydroxy-DL-tyrosine; $C_9H_{11}NO_5$ = 213.2 (*21373-30-8*)

mp: about 257 °C.

2-[4-(2-Hydroxyethyl)piperazin-1-yl]ethane-1-sulfonic Acid 2-[4-(2-hydroxyethyl)piperazin-1-yl]ethanesulphonic acid; HEPES; $C_8H_{18}N_2O_4S$ = 238.3 (*7365-45-9*)

White or almost white powder.

mp: about 236 °C, with decomposition

4-Hydroxyisophthalic Acid 4-Hydroxybenzene-1,3-dicarboxylic acid; $C_8H_6O_5$ = 182.1 (*636-46-4*)

Needles or platelets, very slightly soluble in water, freely soluble in ethanol (96 per cent).

mp: about 314 °C, with decomposition.

Hydroxylamine Hydrochloride Hydroxylammonium chloride; NH_4ClO = 69.5 (*5470-11-1*)

White or almost white, crystalline powder, very soluble in water, soluble in ethanol (96 per cent).

Hydroxylamine Hydrochloride Solution R2

Dissolve 2.5 g of *hydroxylamine hydrochloride R* in 4.5 mL of hot *water R* and add 40 mL of *ethanol (96 per cent) R* and 0.4 mL of *bromophenol blue solution R2*. Add *0.5 M alcoholic potassium hydroxide* until a greenish-yellow colour is obtained. Dilute to 50.0 mL with *ethanol (96 per cent) R*.

Hydroxylamine Solution, Alcoholic

Dissolve 3.5 g of *hydroxylamine hydrochloride R* in 95 mL of *ethanol (60 per cent V/V) R*, add 0.5 mL of a 2 g/L solution of *methyl orange R* in *ethanol (60 per cent V/V) R* and sufficient *0.5 M potassium hydroxide in alcohol (60 per cent V/V)* to give a pure yellow colour. Dilute to 100 mL with *ethanol (60 per cent V/V) R*.

Hydroxylamine Solution, Alkaline

Immediately before use, mix equal volumes of a 139 g/L solution of *hydroxylamine hydrochloride R* and a 150 g/L solution of *sodium hydroxide R*.

Hydroxylamine Solution R1, Alkaline

Solution A. Dissolve 12.5 g of *hydroxylamine hydrochloride R* in *methanol R* and dilute to 100 mL with the same solvent.

Solution B. Dissolve 12.5 g of *sodium hydroxide R* in *methanol R* and dilute to 100 mL with the same solvent.

Mix equal volumes of solution A and solution B immediately before use.

Hydroxymethylfurfural 5-Hydroxymethylfurfural; $C_6H_6O_3$ = 126.1 (*67-47-0*)

Acicular crystals, freely soluble in water, in acetone and in ethanol (96 per cent).

mp: about 32 °C.

Hydroxynaphthol Blue, Sodium Salt Trisodium 2,2′-dihydroxy-1,1′-azonaphthalene-3′,4,6′-trisulfonate; $C_{20}H_{11}N_2Na_3O_{11}S_3$ = 620 (*63451-35-4*)

4-(4-Hydroxyphenyl)butan-2-one $C_{10}H_{12}O_2$ = 164.2 (*5471-51-2*)

mp: about 82°.

General reagent grade of commerce.

2-Hydroxypropylbetadex for Chromatography Betacyclodextrin modified by the bonding of (*R*) or (*RS*) propylene oxide groups on the hydroxyl groups; **Hydroxypropyl-β-cyclodextrin** (*94035-02-6*)

See *Hydroxypropylbetadex (1804)*.

pH (*2.2.3*): 5.0 to 7.5 for a 20 g/L solution.

8-Hydroxyquinoline Quinolin-8-ol; Hydroxyquinoline; C_9H_7NO = 145.2 (*148-24-3*)

White or slightly yellowish, crystalline powder, slightly soluble in water, freely soluble in acetone, in ethanol (96 per cent) and in dilute mineral acids.

mp: about 75 °C.

Sulfated ash (*2.4.14*): maximum 0.05 per cent.

12-Hydroxystearic Acid 12-Hydroxyoctadecanoic acid; $C_{18}H_{36}O_3$ = 300.5 (*106-14-9*)

White or almost white powder.

mp: 71 °C to 74 °C.

5-Hydroxyuracil 2,4,5-trihydroxypyrimidine; $C_4H_4N_2O_3$ = 128.1 (*496-76-4*)

White or almost white, crystalline powder.

mp: about 310 °C, with decomposition.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Fluorouracil (0611)*; the chromatogram shows a principal spot with an R_F of about 0.3.

Storage: in an airtight container.

Hyoscine Hydrobromide Scopolamine hydrobromide; (*6533-68-2*)

See *Hyoscine hydrobromide (0106)*.

Hyoscyamine Sulfate Hyoscyamine sulphate; (*620-61-1*)

See *Hyoscyamine sulfate (0501)*.

Hypericin 1,3,4,6,8,13-Hexahydroxy-10,11-dimethylphenanthro[1,10,9,8-*opqra*]perylene-7,14-dione; $C_{30}H_{16}O_8$ = 504.4 (*548-04-9*)

Content: minimum 85 per cent.

Hyperoside 2-(3,4-Dihydroxyphenyl)-3-β-D-galactopyranosyloxy-5,7-dihydroxychromen-4-one; $C_{21}H_{20}O_{12}$ = 464.4

Faint yellow needles, soluble in methanol.

Absorbance (*2.2.25*). A solution in *methanol R* shows 2 absorption maxima at about 257 nm and at about 359 nm.

Hypophosphorous Reagent

Dissolve with the aid of gentle heat, 10 g of *sodium hypophosphite R* in 20 mL of *water R* and dilute to 100 mL with *hydrochloric acid R*. Allow to settle and decant or filter through glass wool.

Hypoxanthine 6-Hydroxypurine; $C_5H_4N_4O$ = 136.1 (*68-94-0*)

White or almost white, crystalline powder, very slightly soluble in water, sparingly soluble in boiling water, soluble in dilute acids and in dilute alkali hydroxide solutions, decomposes without melting at about 150 °C.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Mercaptopurine (0096)*; the chromatogram shows only one principal spot.

Ibuprofen (*15687-27-1*)

See *Ibuprofen (0721)*.

Imidazole Glyoxaline; $C_3H_4N_2$ = 68.1 (*288-32-4*)

White or almost white, crystalline powder, soluble in water and in ethanol (96 per cent).

mp: about 90 °C.

Imidazole, Recrystallised

Twice recrystallise 25 g of *imidazole* from 100 mL of *toluene*, cool in ice with stirring, wash with *ether* and dry at room temperature at a pressure of 2 kPa over *anhydrous silica gel*, or use a purified grade of commerce.

Complies with the following test.

Light absorption *Absorbance* of an 8% w/v solution at 325 nm, not more than 0.10, Appendix II B.

Imidazole Solution

Dissolve 8.25 g of *recrystallised imidazole* in 60 mL of *water*, adjust the pH to 6.75 to 6.85 with 5M *hydrochloric acid* and add sufficient *water* to produce 100 mL.

The hydrochloric acid used in preparing this reagent must be free from stabilising mercury compounds.

Imidazole–Mercury Reagent

Dissolve 8.25 g of *recrystallised imidazole* in 60 mL of *water* and add 10 mL of 5M *hydrochloric acid*. Stir the solution magnetically and add, dropwise, 10 mL of a 0.27% w/v solution of *mercury(II) chloride*. If a cloudy solution results, discard and prepare a further solution adding the mercury chloride solution more slowly. Adjust the pH to 6.75 to 6.85 with 5M *hydrochloric acid* (about 4 mL is required) and add sufficient *water* to produce 100 mL.

Iminodiacetic Acid 2,2′-Iminodiacetic acid; $C_4H_7NO_4$ = 133.1 (*142-73-4*)

Iminodibenzyl 10,11-Dihydrodibenz[*b*,*f*]azepine; $C_{14}H_{13}N$ = 195.3 (*494-19-9*)

Pale yellow, crystalline powder, practically insoluble in water, freely soluble in acetone.

mp: about 106 °C.

Imipramine Hydrochloride (*113-52-0*)

See *Imipramine hydrochloride (0029)*.

Imperatorin 9-[(3-Methylbut-2-enyl)oxy]-7*H*-furo[3,2-*g*][1]benzopyran-7-one; $C_{16}H_{14}O_4$ = 270.3 (*482-44-0*)

2-Indanamine Hydrochloride 2-Aminoindane hydrochloride; $C_9H_{12}ClN$ = 169.7 (*2338-18-3*)

2,3-Dihydro-1*H*-inden-2-amine hydrochloride.

Indian Sandalwood Oil Sandalwood Oil; East Indian Sandalwood Oil; Santalum Album; $C_{30}H_{48}O_2$ = 440.70 (*8006-87-9*)

General reagent grade of commerce.

Indigo Indigotin; 1,1′,3,3′-Tetrahydro-2-2′-bi(indolylidene)-3,3′-dione; $C_{16}H_{10}N_2O_2$ = 262.3 (*482-89-3*)

Indigo Carmine Acid blue 74; $C_{16}H_8N_2Na_2O_8S_2$ = 466.3 (*860-22-0*)

Schultz No. 1309

Colour Index No. 73015

It usually contains sodium chloride.

Blue or violet-blue powder or blue granules with a coppery lustre, sparingly soluble in water, practically insoluble in ethanol (96 per cent). It is precipitated from an aqueous solution by sodium chloride.

Indigo Carmine Solution

To a mixture of 10 mL of *hydrochloric acid R* and 990 mL of 200 g/L *nitrogen-free sulfuric acid R* add 0.2 g of *indigo carmine R*.

The solution complies with the following test: add 10 mL to a solution of 1.0 mg of *potassium nitrate R* in 10 mL of *water R*, rapidly add 20 mL of *nitrogen-free sulfuric acid R* and heat to boiling. The blue colour is discharged within 1 min.

Indigo Carmine Solution R1

Dissolve 4 g of *indigo carmine R* in about 900 mL of *water R* added in several portions. Add 2 mL of *sulfuric acid R* and dilute to 1000 mL with *water R*.

Assay. Place in a 100 mL conical flask with a wide neck 10.0 mL of *nitrate standard solution (100 ppm NO_3) R*, 10 mL of *water R*, 0.05 mL of the *indigo carmine solution R1*, and then in a single addition, but with caution, 30 mL of *sulfuric acid R*. Titrate the solution immediately, using the *indigo carmine solution R1*, until a stable blue colour is obtained.

The number of millilitres used, *n*, is equivalent to 1 mg of NO_3.

Indirubin $C_{16}H_{10}N_2O_2$ = 262.3 (*479-41-4*)

1,1′,2′,3-Tetrahydro-2,3′-bi(indolylidene)-2′,3-dione.

Indometacin (*53-86-1*)

See *Indometacin (0092)*.

Industrial Methylated Spirit (95%)

Of the British Pharmacopoeia.

Inosine 9-β-D-Ribofuranosylhypoxanthine; 9-β-D-Ribofuranosyl-1,9-dihydro-6*H*-purin-6-one; $C_{10}H_{12}N_4O_5$ = 268.2 (*58-63-9*)

mp: 222 °C to 226 °C.

***myo*-Inositol**

See *myo-Inositol (1805)*.

Iodic Acid HIO_3 = 175.9 (*7782-68-5*)

Analytical reagent grade of commerce.

Iodine (*7553-56-2*)

See *Iodine (0031)*.

To prepare 0.05M iodine dissolve 20 g of *potassium iodide* in the minimum amount of *water*, add 13 g of *iodine*, allow to dissolve and add sufficient *water* to produce 1000 mL. Weaker solutions should be prepared using proportionately lesser amounts of reagents or by appropriate dilution.

Iodine-123 and Ruthenium-106 Spiking Solution

Prepare immediately before use. Mix 3.5 mL of an 18.5 kBq/mL solution of ruthenium-106 in the form of ruthenium trichloride in a mixture of equal volumes of *glacial acetic acid R* and *water R* with 200 µL of a 75 kBq/mL solution of iodine-123 in the form of sodium iodide in *water R*.

Iodine Bromide IBr = 206.8 (*7789-33-5*)

Bluish-black or brownish-black crystals, freely soluble in water, in ethanol (96 per cent) and in glacial acetic acid.

bp: about 116 °C.

mp: about 40 °C.

Storage: protected from light.

Iodine Bromide Solution

Dissolve 20 g of *iodine bromide R* in *glacial acetic acid R* and dilute to 1000 mL with the same solvent.

Storage: protected from light.

Iodine Chloride ICl = 162.4 (*7790-99-0*)

Black crystals, soluble in water, in acetic acid and in ethanol (96 per cent).

bp: about 97.4 °C.

Iodine Chloride Solution

Dissolve 1.4 g of *iodine chloride R* in *glacial acetic acid R* and dilute to 100 mL with the same acid.

Storage: protected from light.

Iodine Monochloride Reagent, Strong

Dissolve 10 g of *potassium iodide* and 6.4 g of *potassium iodate* in 75 mL of *water*, add 75 mL of *hydrochloric acid* and 5 mL of *chloroform*, shake and, if necessary, add dropwise with vigorous shaking 0.1M *potassium iodide* until a faint iodine colour appears in the chloroform layer. Add in the same manner 0.001M *potassium iodate* until the chloroform is just colourless.

Before use, readjust with either 0.1M *potassium iodide* or 0.001M *potassium iodate* as required.

Store in a cool place protected from light.

Iodine Monochloride Solution

Dissolve 8 g of *iodine trichloride* in about 200 mL of *glacial acetic acid* and separately dissolve 9 g of *iodine* in 300 mL of *dichloromethane*. Mix the two solutions and dilute to 1000 mL with *glacial acetic acid*.

Store in a stoppered bottle, protected from light and at a temperature not exceeding 15°.

Iodine Pentoxide, Recrystallised Iodine pentoxide; I_2O_5 = 333.8 (*12029-98-0*)

Content: minimum 99.5 per cent.

White or almost white, crystalline powder, or white or greyish-white granules, hygroscopic, very soluble in water forming HIO_3.

Stability on heating. Dissolve 2 g, previously heated for 1 h at 200 °C, in 50 mL of *water R*. A colourless solution is obtained.

Assay. Dissolve 0.100 g in 50 mL of *water R*, add 3 g of *potassium iodide R* and 10 mL of *dilute hydrochloric acid R*. Titrate the liberated iodine with *0.1 M sodium thiosulfate*, using 1 mL of *starch solution R* as indicator.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 2.782 mg of I_2O_5.

Storage: in an airtight container, protected from light.

Iodine Solution, Alcoholic

A 10 g/L solution of *iodine R* in *ethanol (96 per cent) R*.

Storage: protected from light.

Iodine Solution, Chloroformic

A 5 g/L solution of *iodine R* in *chloroform R*.

Storage: protected from light.

Iodine Solution R1

To 10.0 mL of *0.05 M iodine* add 0.6 g of *potassium iodide R* and dilute to 100.0 mL with *water R*. Prepare immediately before use.

Iodine Solution R2

To 10.0 mL of *0.05 M iodine* add 0.6 g of *potassium iodide R* and dilute to 1000.0 mL with *water R*. Prepare immediately before use.

Iodine Solution R3

Dilute 2.0 mL of *iodine solution R1* to 100.0 mL with *water R*. Prepare immediately before use.

Iodine Solution R4

Dissolve 14 g of *iodine R* in 100 mL of a 400 g/L solution of *potassium iodide R*, add 1 mL of *dilute hydrochloric acid R* and dilute to 1000 mL with *water R*.

Storage: protected from light.

Iodine Solution R5

Dissolve 12.7 g of *iodine R* and 20 g of *potassium iodide R* in *water R* and dilute to 1000.0 mL with the same solvent (0.05 M solution).

Iodine Trichloride ICl_3 = 233.3 (*865-44-1*)

Analytical reagent grade of commerce.

Reddish orange crystals.

Iodoacetamide 2-Iodoacetamide; C_2H_4INO = 185.0 (*144-48-9*)

Slightly yellow, crystalline powder, soluble in water.

mp: about 92 °C.

Iodoacetic Acid $C_2H_3IO_2$ = 185.9 (*64-69-7*)

Colourless or white or almost white crystals, soluble in water and in ethanol (96 per cent).

mp: 82 °C to 83 °C.

2-Iodobenzoic Acid $C_7H_5IO_2$ = 248.0 (*88-67-5*)

White or slightly yellow, crystalline powder, slightly soluble in water, soluble in ethanol (96 per cent).

mp: about 160 °C.

Chromatography. Thin-layer chromatography (*2.2.27*), using cellulose for chromatography f_{254} R as the coating substance: apply to the plate 20 µL of a solution of the 2-iodobenzoic acid, prepared by dissolving 40 mg in 4 mL of *0.1 M sodium hydroxide* and diluting to 10 mL with *water R*. Develop over a path of about 12 cm using as the mobile phase the upper layer obtained by shaking together 20 volumes of *water R*, 40 volumes of *glacial acetic acid R* and 40 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram shows only one principal spot.

3-Iodobenzylammonium Chloride 1-(3-Iodophenyl) methanamine hydrochloride; 1-(3-Iodophenyl) methanaminium chloride; *m*-Iodobenzylamine hydrochloride; C_7H_9ClIN = 269.5 (*3718-88-5*)

White or almost white crystals.

mp: 188 °C to 190 °C.

Iodoethane C_2H_5I = 156.0 (*75-03-6*)

Content: minimum 99 per cent.

Colourless or slightly yellowish liquid, darkening on exposure to air and light, miscible with ethanol (96 per cent) and most organic solvents.

d_{20}^{20}: about 1.95.

n_D^{20}: about 1.513.

bp: about 72 °C.

Storage: in an airtight container, protected from light.

2-Iodohippuric Acid 2-(2-Iodobenzamido)acetic acid; $C_9H_8INO_3,2H_2O$ = 341.1 (*147-58-0*)

White or almost white, crystalline powder, sparingly soluble in water.

mp: about 170 °C.

Water (*2.5.12*): 9 per cent to 13 per cent, determined on 1.000 g.

Chromatography. Thin-layer chromatography (*2.2.27*), using *cellulose for chromatography F_{254} R* as the coating substance: apply to the plate 20 µL of a solution of the 2-iodohippuric acid, prepared by dissolving 40 mg in 4 mL of *0.1 M sodium hydroxide* and diluting to 10 mL with *water R*. Develop over a path of about 12 cm using as the mobile phase the upper layer obtained by shaking together 20 volumes of *water R*, 40 volumes of *glacial acetic acid R* and 40 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The chromatogram shows only one principal spot.

Iodomethane Methyl iodide; CH_3I = 141.9 (*74-88-4*)

Content: minimum 99.0 per cent.

Iodoplatinate Reagent

To 3 mL of a 100 g/L solution of *chloroplatinic acid R* add 97 mL of *water R* and 100 mL of a 60 g/L solution of *potassium iodide R*.

Storage: protected from light.

Iodoplatinate Reagent R1

Mix 2.5 mL of a 50 g/L solution of *chloroplatinic acid R*, 22.5 mL of a 100 g/L solution of *potassium iodide R* and 50 mL of *water R*.

Storage: protected from light, at a temperature of 2-8 °C.

2-Iodopropane Isopropyl iodide; C_3H_7I = 170.0 (*75-30-9*)

Content: minimum 99 per cent.

5-Iodouracil 5-Iodo-1*H*,3*H*-pyrimidine-2,4-dione; $C_4H_3IN_2O_2$ = 238.0 (*696-07-1*)

mp: about 276 °C, with decomposition.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Idoxuridine (0669)*: apply 5 µL of a 0.25 g/L solution; the chromatogram obtained shows only one principal spot.

Ion-exchange Resin, Strongly Acidic

Resin in protonated form with sulfonic acid groups attached to a lattice consisting of polystyrene cross-linked with 8 per cent of divinylbenzene. It is available as spherical beads; unless otherwise prescribed, the particle size is 0.3 mm to 1.2 mm.

Capacity. 4.5 mmol to 5 mmol per gram, with a water content of 50 per cent to 60 per cent.

Preparation of a column. Unless otherwise prescribed, use a tube with a fused-in sintered glass disc having a length of 400 mm, an internal diameter of 20 mm and a filling height of about 200 mm. Introduce the resin, mixing it with *water R* and pouring the slurry into the tube, ensuring that no air bubbles are trapped between the particles. When in use, the liquid must not be allowed to fall below the surface of the resin. If the resin is in its protonated form, wash with *water R* until 50 mL requires not more than 0.05 mL of *0.1 M sodium hydroxide* for neutralisation, using 0.1 mL of *methyl orange solution R* as indicator.

If the resin is in its sodium form or if it requires regeneration, pass about 100 mL of a mixture of equal volumes of *hydrochloric acid R1* and *water R* slowly through the column and then wash with *water R* as described above.

Ion-exclusion Resin for Chromatography

Resin with a sulfonate funtionalised latex cross-linked with divinylbenzene.

Irisflorentin 9-Methoxy-7-(3,4,5-trimethoxyphenyl)-8*H*-1,3-dioxolo[4,5-*g*][1]benzopyran-8-one; $C_{20}H_{18}O_8$ = 386.4 (*41743-73-1*)

Iron Fe = 55.85 (*7439-89-6*)

Grey powder or wire, soluble in dilute mineral acids.

Iron(III) Chloride, Anhydrous Iron(III) chloride; anhydrous ferric chloride; $FeCl_3$ = 162.2 (*7705-08-0*)

General reagent grade of commerce.

Greenish black crystals or crystalline powder turning orange on exposure to moist air.

Iron(III) Chloride Hexahydrate Iron trichloride hexahydrate; Ferric chloride; $FeCl_3,6H_2O$ = 270.3 (*10025-77-1*)

Yellowish-orange or brownish crystalline masses, deliquescent, very soluble in water, soluble in ethanol (96 per cent). On exposure to light, ferric chloride and its solutions are partly reduced.

Storage: in an airtight container.

Iron(III) Chloride Solution

Analytical reagent grade of commerce, diluted to contain about 15% w/v of $FeCl_3$.

Iron(III) Chloride Solution, Ethanolic

Carefully add 25 mL of *sulfuric acid* dropwise to 75 mL of well-cooled *absolute ethanol*, stirring constantly. Add 2 g of *anhydrous iron(III) chloride*, stir and filter.

Iron(III) Chloride Solution R1 Ferric chloride solution R1

A 105 g/L solution of *ferric chloride R*.

Iron(III) Chloride Solution R2 Ferric chloride solution R2

A 13 g/L solution of *ferric chloride R*.

Iron(III) Chloride-Sulfamic Acid Reagent Ferric chloride-sulfamic acid reagent

A solution containing 10 g/L of *ferric chloride R* and 16 g/L of *sulfamic acid R*.

Iron(III) Nitrate Ferric nitrate; $Fe(NO_3)_3,9H_2O$ = 404 (*7782-61-8*)

Content: minimum 99.0 per cent *m/m* of $Fe(NO_3)_3,9H_2O$.

Light-purple crystals or crystalline mass, very soluble in water.

Free acid: not more than 0.3 per cent (as HNO_3).

Iron(III) Nitrate Solution

A 0.1% w/v solution of *iron(III) nitrate* in 0.1% v/v *nitric acid*.

Iron Salicylate Solution

Dissolve 0.1 g of *ferric ammonium sulfate R* in a mixture of 2 mL of *dilute sulfuric acid R* and 48 mL of *water R* and dilute to 100 mL with *water R*. Add 50 mL of a 11.5 g/L solution of *sodium salicylate R*, 10 mL of *dilute acetic acid R*, 80 mL of a 136 g/L solution of *sodium acetate R* and dilute to 500 mL with *water R*. The solution should be recently prepared.

Storage: in an airtight container, protected from light.

Iron(II) Sulfate Ferrous sulphate; Iron(III) sulphate; Ferrous sulfate; (*7782-63-0*)

See *Ferrous sulfate heptahydrate (0083)*.

Iron(III) Sulfate Ferric sulphate; Iron(III) sulphate; Iron(III)trisulfate hydrated; Iron(III)trisulphate hydrated; Ferric sulfate; $Fe_2(SO_4)_3,xH_2O$ (*15244-10-7*)

Yellowish-white powder, very hygroscopic, decomposes in air, slightly soluble in water and in ethanol (96 per cent).

Storage: in an airtight container, protected from light.

Iron(III) Sulfate Pentahydrate Ferric sulphate pentahydrate; Iron(III) sulphate pentahydrate; Ferric sulfate pentahydrate; $Fe_2(SO_4)_3,5H_2O$ = 489.9 (*142906-29-4*)

White or yellowish powder.

Iron(III) Sulfate Solution Ferric sulfate solution

Dissolve 50 g of *ferric sulfate R* in an excess of *water R*, add 200 mL of *sulfuric acid R* and dilute to 1000 mL with *water R*.

Iron(II) Sulfate Solution R2 Ferrous sulfate solution R2

Dissolve 0.45 g of *ferrous sulfate R* in 50 mL of *0.1 M hydrochloric acid* and dilute to 100 mL with *carbon dioxide-free water R*. Prepare immediately before use.

Iron(II) Sulfate-Citrate Solution

Iron(II) sulphate-citrate solution

Dissolve 1 g of *sodium metabisulfite* in 200 mL of *water* and add 0.5 mL of 2M *hydrochloric acid*, 1.5 g of *iron(II) sulfate* and 10 g of *sodium citrate*.

Prepare immediately before use.

Isatin Indoline-2,3-dione; $C_8H_5NO_2$ = 147.1 (*91-56-5*)

Small, yellowish-red crystals, slightly soluble in water, soluble in hot water and in ethanol (96 per cent), soluble in solutions of alkali hydroxides giving a violet colour becoming yellow on standing.

mp: about 200 °C, with partial sublimation.

Sulfated ash (*2.4.14*): maximum 0.2 per cent.

Isatin Reagent

Dissolve 6 mg of *ferric sulfate R* in 8 mL of *water R* and add cautiously 50 mL of *sulfuric acid R*. Add 6 mg of *isatin R* and stir until dissolved.

The reagent should be pale yellow, but not orange or red.

Isoandrosterone Epiandrosterone; 3β-Hydroxy-5α-androstan-17-one; $C_{19}H_{30}O_2$ = 290.4 (*481-29-8*)

White or almost white powder, practically insoluble in water, soluble in organic solvents.

$[\alpha]_D^{20}$: + 88, determined on 20 g/L solution in *methanol R*.

mp: 172 °C to 174 °C.

ΔA (*2.2.41*): 14.24 × 10^3, determined at 304 nm on a 1.25 g/L solution.

Isobutyl Acetate $C_6H_{12}O_2$ = 116.2 (*110-19-0*)

bp: about 118°.

General reagent grade of commerce.

A colourless liquid; weight per mL, about 0.87 g.

***N*-Isobutyldodecatetraenamide** (*2E,4E,8Z,10EZ*)-*N*-2-(Methylpropyl)dodeca-2,4,8,10-tetraenamide; $C_{16}H_{25}NO$ = 247.4 (*866602-52-0*)

White or almost white or non-coloured crystals.

mp: about 70 °C.

***N*-Isobutyldodecatetraenamide Solution**

A solution of *N-isobutyldodecatetraenamide R*, exactly weighed, in *methanol R* at a concentration of about 10 mg/mL.

Isodrin 1,2,3,4,10,10-Hexachloro-1,4,4a,5,8,8a-hexahydro-*endo,endo*-1,4:5,8-dimethanonaphthalene; $C_{12}H_8Cl_6$ = 364.9 (*465-73-6*)

Practically insoluble in water, soluble in common organic solvents such as acetone.

A suitable certified reference solution may be used.

Isoeugenol 2-Methoxy-4-[(1*E*)-prop-1-en-1-yl]phenol; $C_{10}H_{12}O_2$ = 164.2 (*97-54-1*)

Isoeugenyl Acetate $C_{12}H_{14}O_3$ = 206.24 (*93-29-8*)

Analytical reagent grade of commerce.

Isoleucine (*73-32-5*)

See *Isoleucine (0770)*.

Isomalt $C_{12}H_{24}O_{11}$ = 344.3 (*64519-82-0*)

Mixture of 6-*O*-α-D-glucopyranosyl-D-glucitol and of 1-*O*-α-D-glucopyranosyl-D-mannitol.

White or almost white powder or granules, freely soluble in water.

Isomaltitol 6-*O*-α-D-Glucopyranosyl-D-glucitol; $C_{12}H_{24}O_{11}$ = 344.3 (*534-73-6*)

White or almost white powder, freely soluble in water.

Isomenthol (+)-*Isomenthol:* (1*S*,2*R*,5*R*)-2-isopropyl-5-methylcyclohexanol; (±)-*Isomenthol:* a mixture of equal parts of (1*S*,2*R*,5*R*)- and (1*R*,2*S*,5*S*)-2-isopropyl-5-methylcyclohexanol; $C_{10}H_{20}O$ = 156.3 (*23283-97-8*)

Colourless crystals, practically insoluble in water, very soluble in ethanol (96 per cent).

$[\alpha]_D^{20}$: (+)-*Isomenthol*: about + 24, determined on a 100 g/L solution in *ethanol (96 per cent) R*.

bp: (+)-*Isomenthol*: about 218 °C. (±)-*Isomenthol*: about 218 °C.

mp: (+)-*Isomenthol*: about 80 °C. (±)-*Isomenthol*: about 53 °C.

(+)-Isomenthone (1*R*)-*cis*-*p*-Menthan-3-one; (1*R*)-*cis*-2-Isopropyl-5-methylcyclohexanone; $C_{10}H_{18}O$ = 154.2

Contains variable amounts of menthone. A colourless liquid, very slightly soluble in water, soluble in ethanol (96 per cent).

d_{20}^{20}: about 0.904.

n_D^{20}: about 1.453.

$[\alpha]_D^{20}$: about + 93.2.

Isomenthone used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. The substance to be examined.

Content: minimum 80.0 per cent, calculated by the normalisation procedure.

Isomethyleugenol 1,2-Dimethoxy-4-prop-1-enylbenzene; $C_{11}H_{14}O_2$ = 178.2 (*93-16-3*)

Isomethyleugenol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Niaouli oil, cineole type (2468)*.

Content: minimum 97.0 per cent, calculated by the normalisation procedure.

Isoniazid Isonicotinohydrazide; $C_6H_7N_3O$ = 137.1 (*54-85-3*)

mp: about 171°.

General reagent grade of commerce.

Colourless crystals or a white, crystalline powder.

Isoniazid Solution

Dissolve 0.1 g of *isoniazid* in 150 mL of *methanol*, add 0.12 mL of *hydrochloric acid* and dilute to 200 mL with *methanol*.

Isonicotinamide 4-Pyridinecarboxamide; Pyridine-4-carboxamide; $C_6H_6N_2O$ = 122.1 (*1453-82-3*)

White or almost white, crystalline powder, soluble in water.

Isonicotinic Acid Pyridine-4-carboxylic acid; $C_6H_5NO_2$ = 123.1 (*55-22-1*)

Creamish-white powder, sparingly soluble in water.

mp: about 311 °C.

Isopentyl Benzoate 3-Methylbutyl benzoate; Isoamyl benzoate; $C_{12}H_{16}O_2$ = 192.3 (*94-46-2*)

n_D^{20}: about 1.494.

bp: about 261 °C.

Colourless or pale yellow liquid.

Isopropylamine 2-Propylamine; C_3H_9N = 59.1 (*75-31-0*)

Colourless, highly volatile, flammable liquid.

n_D^{20}: about 1.374.

bp: 32 °C to 34 °C.

Isopropyl Methanesulfonate 1-methylethyl methanesulfonate; $C_4H_{10}O_3S$ = 138.2 (*926-06-7*)

Clear, colourless liquid.

Content: minimum 99.0 per cent.

Density: about 1.129 g/cm^3 (20 °C).

n_D^{20}: 1.418-1.421.

bp: about 82 °C at 6 mm Hg.

Isopropyl Myristate Isopropyl tetradecanoate; (*110-27-0*)

See *Isopropyl myristate (0725)*.

4-Isopropylphenol $C_9H_{12}O$ = 136.2 (*99-89-8*)

Content: minimum 98 per cent.

bp: about 212 °C.

mp: 59 °C to 61 °C.

Isopropyl Toluenesulfonate 1-Methylethyl 4-methylbenzenesulfonate; Propan-2-yl 4-methylbenzenesulfonate; Isopropyl tosilate; $C_{10}H_{14}O_3S$ = 214.3 (*2307-69-9*)

Content: minimum 97.0 per cent.

Clear liquid.

mp: about 20 °C.

Isopulegol (−)-Isopulegol; (1*R*,2*S*,5*R*)-2-Isopropenyl-5-methylcyclohexanol; $C_{10}H_{18}O$ = 154.2 (*89-79-2*)

d_4^{20}: about 0.911.

n_D^{20}: about 1.472.

bp: about 210 °C.

Isopulegol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Mint oil, partly dementholised (1838)*.

Content: minimum 99 per cent, calculated by the normalisation procedure.

Isoquercitrin 2-(3,4-Dihydroxyphenyl)-3-(β-D-glucopyranosyloxy)-5,7-dihydroxy-4*H*-1-benzopyran-4-one; $C_{21}H_{20}O_{12}$ = 464.4 (*482-35-9*)

Isoquercitroside Isoquercitrin; 3,3′,4′,5,7-Pentahydroxyflavone-3-glucoside; $C_{21}H_{20}O_{12}$ = 464.4 (*21637-25-2*)

Isorhamnetin-3-*O*-neohesperidoside 3-[6-Deoxy-α-L-mannopyranosyl-(1→2)-β-D-glucopyranosyloxy]-5,7-dihydroxy-2-(4-hydroxy-3-methoxyphenyl)-4*H*-1-benzopyran-4-one; $C_{28}H_{32}O_{16}$ = 625 (*55033-90-4*)

Isorhamnetin-3-O-rutinoside 3-*O*-Methylquercetin-3-rutinoside; Narcissoside; $C_{28}H_{32}O_{16}$ = 625 (*604-80-8*)

Isorhynchophylline Methyl (16*E*)-17-methoxy-2-oxo-16,17-didehydro-20α-corynoxan-16-carboxylate; Methyl (16*E*)-16-(methoxymethylidene)-2-oxo-20α-corynoxan-17-oate; $C_{22}H_{28}N_2O_4$ = 384.5 (*6859-01-4*)

Isosilibinin 3,5,7-Trihydroxy-2-[2-(4-hydroxy-3-methoxyphenyl)-3-hydroxymethyl-2,3-dihydro-1,4-benzodioxin-6-yl]chroman-4-one; $C_{25}H_{22}O_{10}$ = 482.4 (*72581-71-6*)

White to yellowish powder, practically insoluble in water, soluble in acetone and in methanol.

Isovitexin 6-β-D-Glucopyranosyl-5,7-dihydroxy-2-(4-hydroxyphenyl)-4*H*-1-benzopyran-4-one; Apigenin 6-*C*-β-glucopyranoside; $C_{21}H_{20}O_{10}$ = 432.4 (*38953-85-4*)

Kaempferol 3,5,7-Trihydroxy-2-(4-hydroxyphenyl)-4*H*-1-benzopyran-4-one; $C_{15}H_{10}O_6$ = 286.2 (*520-18-3*)

Kaolin, Light (*1332-58-7*)

A purified native hydrated aluminium silicate. It contains a suitable dispersing agent.

Light, white or almost white powder free from gritty particles, unctuous to the touch, practically insoluble in water and in mineral acids.

Coarse particles: maximum 0.5 per cent.

Place 5.0 g in a ground-glass-stoppered cylinder about 160 mm long and 35 mm in diameter and add 60 mL of a 10 g/L solution of *sodium pyrophosphate R*. Shake vigorously and allow to stand for 5 min. Using a pipette, remove 50 mL of the liquid from a point about 5 cm below the surface. To the remaining liquid add 50 mL of *water R*, shake, allow to stand for 5 min and remove 50 mL as before. Repeat the operations until a total of 400 mL has been removed. Transfer the remaining suspension to an evaporating dish. Evaporate to dryness on a water-bath and dry the residue to constant mass at 100-105 °C. The residue weighs not more than 25 mg.

Fine particles. Disperse 5.0 g in 250 mL of *water R* by shaking vigorously for 2 min. Immediately pour into a glass cylinder 50 mm in diameter and, using a pipette, transfer 20 mL to a glass dish, evaporate to dryness on a water-bath and dry to constant mass at 100-105 °C. Allow the remainder of the suspension to stand at 20 °C for 4 h and, using a pipette with its tip exactly 5 cm below the surface, withdraw a further 20 mL without disturbing the sediment, place in a glass dish, evaporate to dryness on a water-bath and dry to constant mass at 100-105 °C. The mass of the second residue is not less than 70 per cent of that of the first residue.

Kerosene, Deodorised

General grade of commerce.

11-Keto-β-boswellic Acid 3α-Hydroxy-11-oxours-12-en-24-oic acid; (4β)-3α-Hydroxy-11-oxours-12-en-23-oic acid; $C_{30}H_{46}O_4$ = 470.7 (*17019-92-0*)

White or almost white powder, insoluble in water, soluble in acetone, in anhydrous ethanol and in methanol.

mp: 195 °C to 197 °C.*11-Keto-β-boswellic acid used in liquid chromatography complies with the following additional test.*

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Indian frankincense (2310)*.

Content: minimum 90 per cent, calculated by the normalisation procedure.

Kieselguhr

Acid-purified grade of commerce.

Kieselguhr for Chromatography

White or yellowish-white, light powder, practically insoluble in water, in dilute acids and in organic solvents.

Filtration rate. Use a chromatography column 0.25 m long and 10 mm in internal diameter with a sintered-glass (100) plate and two marks at 0.10 m and 0.20 m above the plate. Place sufficient of the substance to be examined in the column to reach the first mark and fill to the second mark with *water R*. When the first drops begin to flow from the column, fill to the second mark again with *water R* and measure the time required for the first 5 mL to flow from the column. The flow rate is not less than 1 mL/min.

Appearance of the eluate. The eluate obtained in the test for filtration rate is colourless (*2.2.2, Method I*).

Acidity or alkalinity. To 1.00 g add 10 mL of *water R*, shake vigorously and allow to stand for 5 min. Filter the suspension on a filter previously washed with hot *water R* until the

washings are neutral. To 2.0 mL of the filtrate add 0.05 mL of *methyl red solution R*; the solution is yellow. To 2.0 mL of the filtrate add 0.05 mL of *phenolphthalein solution R1*; the solution is at most slightly pink.

Water-soluble substances. Place 10.0 g in a chromatography column 0.25 m long and 10 mm in internal diameter and elute with *water R*. Collect the first 20 mL of eluate, evaporate to dryness and dry the residue at 100 °C to 105 °C. The residue weighs not more than 10 mg.

Iron (*2.4.9*): maximum 200 ppm.

To 0.50 g add 10 mL of a mixture of equal volumes of *hydrochloric acid R1* and *water R*, shake vigorously, allow to stand for 5 min and filter. 1.0 mL of the filtrate complies with the test for iron.

Loss on ignition: maximum 0.5 per cent. During heating to red heat (600 ± 50 °C) the substance does not become brown or black.

Kieselguhr G

Consists of kieselguhr treated with hydrochloric acid and calcined, to which is added about 15 per cent of calcium sulfate hemihydrate.

A fine greyish-white powder; the grey colour becomes more pronounced on triturating with water. The average particle size is 10-40 µm.

Calcium sulfate content. Determine by the method prescribed for *silica gel G R*.

pH (*2.2.3*). Shake 1 g with 10 mL of *carbon dioxide-free water R* for 5 min. The pH of the suspension is 7 to 8.

Chromatographic separation. Thin-layer chromatography (*2.2.27*). Prepare plates using a slurry of the kieselguhr G with a 2.7 g/L solution of *sodium acetate R*. Apply 5 µL of a solution containing 0.1 g/L of lactose, sucrose, glucose and fructose in *pyridine R*. Develop over a path of 14 cm using a mixture of 12 volumes of *water R*, 23 volumes of *2-propanol R* and 65 volumes of *ethyl acetate R*.
The migration time of the solvent is about 40 min. Dry, spray onto the plate about 10 mL of *anisaldehyde solution R* and heat for 5-10 min at 100-105 °C. The chromatogram shows four well-defined spots without tailing and well separated from each other.

Lactic Acid (*50-21-5*)

See *Lactic acid (0458)*.

Lactic Reagent Lactic acid reagent

Solution A. To 60 mL of *lactic acid R* add 45 mL of previously filtered *lactic acid R* saturated without heating with *Sudan red G R*; as lactic acid saturates slowly without heating, an excess of colorant is always necessary.

Solution B. Prepare 10 mL of a saturated solution of *aniline R*. Filter.

Solution C. Dissolve 75 mg of *potassium iodide R* in water and dilute to 70 mL with the same solvent. Add 10 mL of *ethanol (96 per cent) R* and 0.1 g of *iodine R*. Shake.

Mix solutions A and B. Add solution C.

Lactobionic Acid $C_{12}H_{22}O_{12}$ = 358.3 (*96-82-2*)

White or almost white, crystalline powder, freely soluble in water, practically insoluble in ethanol (96 per cent).

mp: about 115 °C.

Lactose Lactose monohydrate; (*5989-81-1*)

See *Lactose monohydrate (0187)*.

β-Lactose β-D-Lactose; $C_{12}H_{22}O_{11}$ = 342.3 (*5965-66-2*)

White or slightly yellowish powder.

Content: minimum 99 per cent.

α-D-Lactose: not greater than 35 per cent.

Assay. Gas chromatography (*2.2.28*): use the normalisation procedure.

Column:
— *size*: *l* = 30 m, Ø = 0.25 mm;
— *stationary phase*: *cyanopropyl(3)phenyl(3)methyl(94) polysiloxane R* (film thickness 1 µm).

Carrier gas: *helium for chromatography R*.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 32.5	20 → 280
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: an appropriate derivatised sample.

α-Lactose Monohydrate α-D-Lactose monohydrate; $C_{12}H_{22}O_{11},H_2O$ = 360.3 (*5989-81-1*)

White or almost white powder.

Content: minimum 97 per cent.

β-D-Lactose: less than 3 per cent.

Assay. Gas chromatography (*2.2.28*): use the normalisation procedure.

Column:
— *size*: *l* = 30 m, Ø = 0.25 mm;
— *stationary phase*: *methylpolysiloxane R* (film thickness 1 µm).

Carrier gas: *helium for chromatography R*.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 12.5	230 → 280
Injection port		250
Detector		280

Detection: flame ionisation.

Injection: an appropriate derivatised sample.

Lactulose (*4618-18-2*)

See *Lactulose (1230)*.

Lanatoside C 3β-[(β-D-Glucopyranosyl-(1→4)-3-*O*-acetyl-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-*ribo*-hexopyranosyl)oxy]-12β,14-dihydroxy-5β-card-20(22)-enolide; $C_{49}H_{76}O_{20}$ = 985 (*17575-22-3*)

Long, flat prisms obtained after recrystallisation in ethanol (96 per cent), freely soluble in pyridine and in dioxan.

Lanthanum Chloride Heptahydrate
$LaCl_3,7H_2O$ = 371.4

White or almost white powder or colourless crystals, freely soluble in water.

Lanthanum Chloride Solution

To 58.65 g of *lanthanum trioxide R* slowly add 100 mL of *hydrochloric acid R*. Heat to boiling. Allow to cool and dilute to 1000.0 mL with *water R*.

Lanthanum Nitrate Lanthanum trinitrate hexahydrate; $La(NO_3)_3,6H_2O$ = 433.0 (*10277-43-7*)

Colourless crystals, deliquescent, freely soluble in water.

Storage: in an airtight container.

Lanthanum Nitrate Solution

A 50 g/L solution of *lanthanum nitrate R*.

Lanthanum Trioxide Lanthanum oxide; La_2O_3 = 325.8 (*1312-81-8*)

An almost white, amorphous powder, practically insoluble in *water R*. It dissolves in dilute solutions of mineral acids and absorbs atmospheric carbon dioxide.

Calcium: maximum 5 ppm.

Lauric Acid Dodecanoic acid; $C_{12}H_{24}O_2$ = 200.3 (*143-07-7*)

White or almost white, crystalline powder, practically insoluble in water, freely soluble in ethanol (96 per cent).

mp: about 44 °C.

Lauric acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 98 per cent, calculated by the normalisation procedure.

Lavandulol 2-Isopropenyl-5-methylhex-4-en-1-ol; $C_{10}H_{18}O$ = 154.2 (*498-16-8*)

Oily liquid with a characteristic odour.

Lavandulol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Lavender oil (1338)*.

Test solution. The substance to be examined.

Content: minimum 90.0 per cent, calculated by the normalisation procedure.

Lavandulyl Acetate 2-Isopropenyl-5-methylhex-4-en-1-yl acetate; $C_{12}H_{20}O_2$ = 196.3 (*25905-14-0*)

Colourless liquid with a characteristic odour.

Lavandulyl acetate used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Lavender oil (1338)*.

Test solution. The substance to be examined.

Content: minimum 93.0 per cent, calculated by the normalisation procedure.

Lead(II) Acetate Lead di-acetate; Lead acetate; $C_4H_6O_4Pb,3H_2O$ = 379.3 (*6080-56-4*)

Colourless crystals, efflorescent, freely soluble in water, soluble in ethanol (96 per cent).

Lead Acetate Cotton

Immerse absorbent cotton in a mixture of 1 volume of *dilute acetic acid R* and 10 volumes of *lead acetate solution R*. Drain off the excess of liquid, without squeezing the cotton, by placing it on several layers of filter paper. Allow to dry in air.

Storage: in an airtight container.

Lead Acetate Paper

Immerse filter paper (about 80 g/m^2) in a mixture of 1 volume of *dilute acetic acid R* and 10 volumes of *lead acetate solution R*. Dry, then cut the paper into strips 15 mm by 40 mm.

Lead Acetate Solution

A 95 g/L solution of *lead acetate R* in *carbon dioxide-free water R*.

Lead(II) Nitrate Lead dinitrate; Lead nitrate; $Pb(NO_3)_2$ = 331.2 (*10099-74-8*)

White or almost white, crystalline powder or colourless crystals, freely soluble in water.

Lead Nitrate Solution

A 33 g/L solution of *lead nitrate R*.

Lead(IV) Oxide Lead dioxide; PbO_2 = 239.2 (*1309-60-0*)

Dark brown powder, evolving oxygen when heated, practically insoluble in water, soluble in hydrochloric acid with evolution of chlorine, soluble in dilute nitric acid in the presence of hydrogen peroxide, oxalic acid or other reducing agents, soluble in hot, concentrated alkali hydroxide solutions.

Lead Subacetate Solution Basic lead acetate solution; (*1335-32-6*)

Content: 16.7 per cent *m/m* to 17.4 per cent *m/m* of Pb (A_r 207.2) in a form corresponding approximately to the formula $C_8H_{14}O_{10}Pb_3$.

Dissolve 40.0 g of *lead acetate R* in 90 mL of *carbon dioxide-free water R*. Adjust the pH to 7.5 with *strong sodium hydroxide solution R*. Centrifuge and use the clear colourless supernatant solution.

The solution remains clear when stored in a well-closed container.

L-α-Lecithin from egg yolk L-α-Phosphatidylcholine; (*8002-43-5*)

General reagent grade of commerce.

Leiocarposide 2-(β-D-Glucopyranosyloxy)benzyl 3-(β-D-glucopyranosyloxy)-6-hydroxy-2-methoxybenzoate; 2-[[[3-(β-D-Glucopyranosyloxy)-6-hydroxy-2-methoxybenzoyl]oxy]methyl]phenyl-β-D-glucopyranoside; $C_{27}H_{34}O_{16}$ = 614.5 (*71953-77-0*)

White or almost white powder, soluble in water, freely soluble in methanol, slightly soluble in ethanol (96 per cent).

mp: 190 °C to 193 °C.

Lemon Oil See *Lemon oil (0620)*.

L-Leucine Leucine; (*61-90-5*)

See *Leucine (0771)*.

Levodopa (*59-92-7*)

See *Levodopa (0038)*.

(*Z*)-Ligustilide (3*Z*)-3-Butylidene-1,3,4,5-tetrahydroisobenzofuran-1-one; $C_{12}H_{14}O_2$ = 190.2 (*81944-09-4*)

Limonene D-Limonene; (+)-*p*-Mentha-1,8-diene; (*R*)-4-Isopropenyl-1-methylcyclohex-1-ene; $C_{10}H_{16}$ = 136.2 (*5989-27-5*)

Colourless liquid, practically insoluble in water, soluble in ethanol (96 per cent).

d_{20}^{20}: about 0.84.

n_D^{20}: 1.471 to 1.474.

$[\alpha]_D^{20}$: about + 124.

bp: 175 °C to 177 °C.

Limonene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. The substance to be examined.

Content: minimum 99.0 per cent, calculated by the normalisation procedure.

Linalool (*RS*)-3,7-Dimethylocta-1,6-dien-3-ol; Linalol; $C_{10}H_{18}O$ = 154.2 (*78-70-6*)

Mixture of two stereoisomers (licareol and coriandrol).

Liquid, practically insoluble in water.

d_{20}^{20}: about 0.860.

n_D^{20}: about 1.462.

bp: about 200 °C.

Linalol used in gas chromatography complies with the following test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Anise oil (0804)*.

Test solution. The substance to be examined.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Linalyl Acetate (*RS*)-1,5-Dimethyl-1-vinylhex-4-enyl acetate; $C_{12}H_{20}O_2$ = 196.3 (*115-95-7*)

Colourless or slightly yellow liquid with a strong odour of bergamot and lavender.

d_{25}^{25}: 0.895 to 0.912.

n_D^{20}: 1.448 to 1.451.

bp: about 215 °C.

Linalyl acetate used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Bitter-orange-flower oil (1175)*.

Test solution. The substance to be examined.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Lindane γ-Hexachlorocyclohexane; $C_6H_6Cl_6$ = 290.8 (*58-89-9*)

For the monograph *Wool fat (0134)*, a suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Linoleic Acid (9*Z*,12*Z*)-Octadeca-9,12-dienoic acid; $C_{18}H_{32}O_2$ = 280.5 (*60-33-3*)

Colourless, oily liquid.

d_4^{20}: about 0.903.

n_D^{20}: about 1.470.

Linoleic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 98 per cent, calculated by the normalisation procedure.

Linolenic Acid (9*Z*,12*Z*,15*Z*)-Octadeca-9,12,15-trienoic acid; α-Linolenic acid; $C_{18}H_{30}O_2$ = 278.4 (*463-40-1*)

Colourless liquid, practically insoluble in water, soluble in organic solvents.

d_4^{20}: about 0.915.

n_D^{20}: about 1.480.

Linolenic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 98 per cent, calculated by the normalisation procedure.

Linolenyl Alcohol $C_{18}H_{32}O$ = 264.4 (*506-44-5*)

(9*Z*,12*Z*,15*Z*)-Octadeca-9,12,15-trien-1-ol. α-Linolenyl alcohol.

Content: minimum 96 per cent.

Linoleyl Alcohol (9*Z*,12*Z*)-Octadeca-9,12-dien-1-ol; $C_{18}H_{34}O$ = 266.5 (*506-43-4*)

Relative density: 0.830.

Content: minimum 85 per cent.

Linsidomine Hydrochloride 3-(Morpholin-4-yl) sydnonimine hydrochloride; 3-(Morpholin-4-yl)-1,2,3-oxadiazol-3-ium-5-aminide hydrochloride; $C_6H_{11}ClN_4O_2$ = 206.6 (*16142-27-1*)

White or almost white powder.

Lipase Solvent Maleate buffer solution pH 7.0

Dissolve 10.0 g of *sodium chloride R*, 6.06 g of *tris(hydroxymethyl)aminomethane R* and 4.90 g of *maleic anhydride R* in 900 mL of *water R*. Adjust the pH using a 170 g/L solution of *sodium hydroxide R*. Dilute to 1000.0 mL with *water R*.

Storage: at 2 °C to 8 °C; use within 3 days.

Liquid Scintillation Cocktail

Commercially available solution for the determination of radioactivity by liquid scintillation counting. It contains one or more fluorescent agents and mostly one or more emulsifying agents in a suitable organic solvent or mixture of organic solvents.

Liquid Scintillation Cocktail R1

To 1000 mL of *dioxan R*, add 0.3 g of *methylphenyloxazolylbenzene R*, 7 g of *diphenyloxazole R* and 100 g of *naphthalene R*.

Lithium Li = 6.94 (*7439-93-2*)

A soft metal whose freshly cut surface is silvery-grey. It rapidly tarnishes in contact with air. It reacts violently with water, yielding hydrogen and giving a solution of lithium hydroxide; soluble in methanol, yielding hydrogen and a solution of lithium methoxide; practically insoluble in light petroleum.

Storage: under light petroleum or liquid paraffin.

Lithium Carbonate Dilithium carbonate; Li_2CO_3 = 73.9 (*554-13-2*)

White or almost white, light powder, sparingly soluble in water, very slightly soluble in ethanol (96 per cent). A saturated solution at 20 °C contains about 13 g/L of Li_2CO_3.

Lithium Chloride LiCl = 42.39 (*7447-41-8*)

Crystalline powder or granules or cubic crystals, deliquescent, freely soluble in water, soluble in acetone and in ethanol (96 per cent). Aqueous solutions are neutral or slightly alkaline.

Storage: in an airtight container.

Lithium Hydroxide Lithium hydroxide monohydrate; $LiOH,H_2O$ = 41.96 (*1310-66-3*)

White or almost white, granular powder, strongly alkaline, it rapidly absorbs water and carbon dioxide, soluble in water, sparingly soluble in ethanol (96 per cent).

Storage: in an airtight container.

Lithium Metaborate, Anhydrous $LiBO_2$ = 49.75 (*13453-69-5*)

Lithium Sulfate Lithium sulphate; Li_2SO_4,H_2O = 128.0 (*10102-25-7*)

Colourless crystals, freely soluble in water, practically insoluble in ethanol (96 per cent).

Lithium Trifluoromethanesulfonate Lithium trifluoromethanesulphonate; CF_3LiO_3S = 156.0 (*33454-82-9*)

Litmus (*1393-92-6*)

Schultz No. 1386

Indigo-blue fragments prepared from various species of Rocella, Lecanora or other lichens, soluble in water, practically insoluble in ethanol (96 per cent).

Colour change: pH 5 (red) to pH 8 (blue).

Litmus Paper

Use *red litmus paper* or *blue litmus paper*, as appropriate.

Litmus Paper, Blue

Boil 10 parts of coarsely powdered *litmus R* for 1 h with 100 parts of *ethanol (96 per cent) R*. Decant the alcohol and add to the residue a mixture of 45 parts of *ethanol (96 per cent) R* and 55 parts of *water R*. After 2 days decant the clear liquid. Impregnate strips of filter paper with the solution and allow to dry.

Test for sensitivity. Immerse a strip measuring 10 mm by 60 mm in a mixture of 10 mL of *0.02 M hydrochloric acid* and 90 mL of *water R*. On shaking the paper turns red within 45 s.

Litmus Paper, Red

To the blue litmus extract, add *dilute hydrochloric acid R* dropwise until the blue colour becomes red. Impregnate strips of filter paper with the solution and allow to dry.

Test for sensitivity. Immerse a strip measuring 10 mm by 60 mm in a mixture of 10 mL of *0.02 M sodium hydroxide* and 90 mL of *water R*. On shaking the paper turns blue within 45 s.

Litmus Solution

Boil 25 g of coarsely powdered *litmus* with 100 mL of *ethanol (90%)* under a reflux condenser for 1 hour, discard the clear liquid and repeat this operation using two 75-mL quantities of *ethanol (90%)*. Digest the extracted litmus with 250 mL of *water* and filter.

Loganin Methyl (1*S*,4a*S*,6*S*,7*R*,7a*S*)-1-(β-D-glucopyranosyloxy)-6-hydroxy-7-methyl-1,4a,5,6,7,7a-hexahydrocyclopenta[*c*]pyran-4-carboxylate; $C_{17}H_{26}O_{10}$ = 390.4 (*18524-94-2*)

mp: 220 °C to 221 °C.

Longifolene (1*S*,3a*R*,4*S*,8a*S*)-4,8,8-Trimethyl-9-methylenedecahydro-1,4-methanoazulene; $C_{15}H_{24}$ = 204.4 (*475-20-7*)

Oily, colourless liquid, practically insoluble in water, miscible with ethanol (96 per cent).

d_4^{18}: 0.9319.

n_D^{20}: 1.5050.

$[\alpha]_D^{20}$: + 42.7.

bp: 254 °C to 256 °C.

Longifolene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Turpentine oil, Pinus pinaster type (1627)*.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Lumiflavine 7,8,10-Trimethylbenzo[*g*]pteridine-2,4(3*H*,10*H*)-dione; $C_{13}H_{12}N_4O_2$ = 256.3 (*1088-56-8*)

Yellow powder or orange crystals, very slightly soluble in water, freely soluble in methylene chloride.

Luteolin 2-(3,4-Dihydroxyphenyl)-5,7-dihydroxy-4*H*-1-benzopyran-4-one; $C_{15}H_{10}O_6$ = 286.2 (*491-70-3*)

Luteolin-7-glucoside 2-(3,4-Dihydroxyphenyl)-7-(β-D-glucopyranosyloxy)-5-hydroxy-4*H*-1-benzopyran-4-one; $C_{21}H_{20}O_{11}$ = 448.4 (*5373-11-5*)

Yellow powder.

Absorbance (*2.2.25*). A solution in *methanol R* shows absorption maxima at 255 nm, 267 nm and 350 nm.

mp: about 247 °C.

Lysine Hydrochloride (2*S*)-2,6-Diaminohexanoic acid hydrochloride; $C_6H_{15}ClN_2O_2$ = 182.7 (*657-27-2*)

White or almost white, crystalline powder or colourless crystals, freely soluble in water, slightly soluble in ethanol (96 per cent).

Lysyl Endopeptidase (*78642-25-8*)

Achromobacter endoproteinase I. Lysyl bond specific proteinase (EC 3.4.21.50).

It belongs to the serine endopeptidase family. Initially isolated from *Achromobacter lyticus*. Enzymes with similar specificity are produced by *Lysobacter enzymogenes* (endoproteinase Lys-C) and *Pseudomonas aeruginosa* (Ps-1). It cleaves peptide bonds at the carboxy-terminal of both lysine residues and *S*-aminoethylcysteine residues with a high degree of specificity. 1 amidase unit (U) is the amount of enzyme that will produce 1 micromole of *p*-nitroaniline from *N*-benzoyl-DL-lysine-*p*-nitroaniline per minute at 30 °C at pH 9.5.

Lutetium Chloride Hexahydrate $LuCl_3,6H_2O$ = 389.4 (*15230-79-2*)

White to yellow, crystalline powder, freely soluble in water.

Macrogol 23 Lauryl Ether See *Macrogol lauryl ether (1124)*, the number of moles of ethylene oxide reacted per mole of lauryl alcohol being 23 (nominal value).

Macrogol 600 Polyethyleneglycol 600; (*25322-68-3*)

See *Macrogols (1444)*.

Macrogol 4000 Polyethyleneglycol 4000; (*25322-68-3*)

See *Macrogols (1444)*.

Macrogol 6000 Polyethyleneglycol 6000; (*25322-68-3*)

White or almost white solid with a waxy or paraffin-like appearance, very soluble in water and in methylene chloride, practically insoluble in ethanol (96 per cent), in fatty oils and in mineral oils.

Macrogol 20,000 2-Nitroterephthalate Polyethylene Glycol 20,000 2-Nitroterephthalate

Polyethyleneglycol 20 000 with embedded 2-nitroterephthalate groups.

Macrogol, Base-deactivated

Base-deactivated polyethyleneglycol.

Macrogol Cetostearyl Ether See *Macrogol cetostearyl ether (1123)*.

Macrogol, Polar-deactivated

Polar-deactivated polyethyleneglycol.

Magnesium Mg = 24.30 (*7439-95-4*)

Silver-white ribbon, turnings or wire, or a grey powder.

Magnesium Acetate Magnesium diacetate tetrahydrate; $C_4H_6MgO_4,4H_2O$ = 214.5 (*16674-78-5*)

Colourless crystals, deliquescent, freely soluble in water and in ethanol (96 per cent).

Storage: in an airtight container.

Magnesium Chloride (*7791-18-6*)

See *Magnesium chloride hexahydrate (0402)*.

Magnesium Nitrate Magnesium nitrate hexahydrate; $Mg(NO_3)_2,6H_2O$ = 256.4 (*13446-18-9*)

Colourless, clear crystals, deliquescent, very soluble in water, freely soluble in ethanol (96 per cent).

Storage: in an airtight container.

Magnesium Nitrate Solution

Dissolve 17.3 g of *magnesium nitrate R* in 5 mL of *water R* warming gently and add 80 mL of *ethanol (96 per cent) R*. Cool and dilute to 100.0 mL with the same solvent.

Magnesium Oxide (*1309-48-4*)

See *Light magnesium oxide (0040)*.

Magnesium Oxide, Heavy (*1309-48-4*)

See *Heavy magnesium oxide (0041)*.

Magnesium Oxide R1

Complies with the requirements prescribed for *magnesium oxide R* with the following modifications.

Arsenic (*2.4.2, Method A*): maximum 2 ppm.

Dissolve 0.5 g in a mixture of 5 mL of *water R* and 5 mL of *hydrochloric acid R1*.

Heavy metals (*2.4.8*): maximum 10 ppm.

Dissolve 1.0 g in a mixture of 3 mL of *water R* and 7 mL of *hydrochloric acid R1*. Add 0.05 mL of *phenolphthalein solution R* and *concentrated ammonia R* until a pink colour is obtained. Neutralise the excess of ammonia by the addition of *glacial acetic acid R*. Add 0.5 mL in excess and dilute to 20 mL with *water R*. Filter, if necessary. 12 mL of the solution complies with test A. Prepare the reference solution using a mixture of 5 mL of *lead standard solution (1 ppm Pb) R* and 5 mL of *water R*.

Iron (*2.4.9*): maximum 50 ppm.

Dissolve 0.2 g in 6 mL of *dilute hydrochloric acid R* and dilute to 10 mL with *water R*.

Magnesium Silicate for Pesticide Residue Analysis (*1343-88-0*)

Magnesium silicate for chromatography (60-100 mesh).

Magnesium Sulfate Magnesium sulphate; (*10034-99-8*)

See *Magnesium sulfate heptahydrate (0044)*.

Magneson Azo violet; 4-(4-nitrophenylazo)resorcinol; $C_{12}H_9N_3O_4$ = 259.2 (*74-39-5*)

Indicator grade of commerce.

When used for titration in non-aqueous media, it changes from orange (acidic) through pink (neutral) to blue (basic).

Magneson Reagent

A 0.1% w/v solution of *magneson* in a 1% w/v solution of *sodium hydroxide*.

Magneson Solution

A 0.2% w/v solution of *magneson* in *toluene*.

Magnolin $C_{23}H_{28}O_7$ = 416.5 (*31008-18-1*)

(3*S*,3a*R*,6*S*,6a*R*)-3-(3,4-Dimethoxyphenyl)-6-(3,4,5-trimethoxyphenyl)-1,3,3a,4,6,6a-hexahydrofuro[3,4-*c*]furan.

Magnolol 5,5′-Di(prop-2-enyl)biphenyl-2,2′-diol; 5,5′-Diallyl-2,2′-dihydroxybiphenyl; 5,5′-Di-2-propenyl-[1,1′-biphenyl]-2,2′-diol; $C_{18}H_{18}O_2$ = 266.3 (*528-43-8*)

Maize Oil See *Maize oil, refined (1342)*.

Makisterone A (22*R*)-2β,3β,14,20,22,25-Hexahydroxy-5β-ergost-7-en-6-one; $C_{28}H_{46}O_7$ = 494.7 (*20137-14-8*)

Malachite Green Basic green 4; $C_{23}H_{25}ClN_2$ = 364.9 (*123333-61-9*)

Schultz No. 754

Colour Index No. 42000

Green crystals with a metallic lustre, very soluble in water giving a bluish-green solution, soluble in ethanol (96 per cent) and in methanol.

Absorbance (*2.2.25*). A 0.01 g/L solution in *ethanol (96 per cent) R* shows an absorption maximum at 617 nm.

Malachite Green Solution

A 5 g/L solution of *malachite green R* in *anhydrous acetic acid R*.

Malathion $C_{10}H_{19}O_6PS_2$ = 330.3 (*121-75-5*)

bp: about 156 °C.

A suitable certified reference solution (10 ng/µL in iso-octane) may be used.

Maleic Acid (*Z*)-But-2-ene-1,4-dioic acid; (*110-16-7*)

See *Maleic acid (0365)*.

Maleic Anhydride Furan-2,5-dione; $C_4H_2O_3$ = 98.1 (*108-31-6*)

White or almost white crystals, soluble in water forming maleic acid, very soluble in acetone and in ethyl acetate, freely soluble in toluene, soluble in ethanol (96 per cent) with ester formation, very slightly soluble in light petroleum.

mp: about 52 °C.

Any residue insoluble in toluene does not exceed 5 per cent (maleic acid).

Maleic Anhydride Solution

Dissolve 5 g of *maleic anhydride R* in *toluene R* and dilute to 100 mL with the same solvent. Use within one month. If the solution becomes turbid, filter.

Malic Acid (*6915-15-7*)

See *Malic acid (2080)*.

Maltitol (*585-88-6*)

See *Maltitol (1235)*.

Maltol 3-Hydroxy-2-methyl-4*H*-pyran-4-one; $C_6H_6O_3$ = 126.1 (*118-71-8*)

White or almost white crystalline powder, soluble in hot water.

mp: 161 °C to 162 °C.

Maltose Monohydrate 4-*O*-α-D-glucopyranosyl-D-glucopyranose monohydrate; $C_{12}H_{22}O_{11},H_2O$ = 360.3 (*6363-53-7*)

Maltotriose α-D-Glucopyranosyl-(1→4)-α-D-glucopyranosyl-(1→4)-D-glucose; $C_{18}H_{32}O_{16}$ = 504.4 (*1109-28-0*)

White or almost white, crystalline powder, very soluble in water.

mp: about 134 °C.

Mandelic Acid 2-Hydroxy-2-phenylacetic acid; $C_8H_8O_3$ = 152.1 (*90-64-2*)

White crystalline flakes, soluble in water.

mp: 118 to 121 °C.

Manganese(IV) Oxide, Pre-washed Manganese(IV) Oxide Activated; MnO_2 = 86.9 (*1313-13-9*)

mp: about 535°.

General reagent grade of commerce.

Manganese(II) Sulfate Manganese sulphate; Manganese(II) sulphate; Manganese sulfate; $MnSO_4$, H_2O = 169.0 (*10034-96-5*)

Pale-pink, crystalline powder or crystals, freely soluble in water, practically insoluble in ethanol (96 per cent).

Loss on ignition: 10.0 per cent to 12.0 per cent, determined on 1.000 g at 500 ± 50 °C.

D-Mannitol Mannitol; (*69-65-8*)

See *Mannitol (0559)*.

D-Mannose Mannose; $C_6H_{12}O_6$ = 180.2 (*3458-28-4*)

white or almost white, crystalline powder or small crystals, very soluble in water, slightly soluble in anhydrous ethanol.

$[\alpha]_D^{20}$: + 13.7 + 14.7, determined on a 200 g/L solution in *water R* containing about 0.05 per cent of NH_3.

mp: about 132 °C, with decomposition.

Marrubiin (2a*S*,5a*S*,6*R*,7*R*,8a*R*,8b*R*)-6-[2-(Furan-3-yl) ethyl]-6-hydroxy-2a,5a,7-trimethyldecahydro-2*H*-naphtho [1,8-*bc*]furan-2-one; $C_{20}H_{28}O_4$ = 332.4 (*465-92-9*)

Colourless, microcrystalline powder.

Marrubiin used in liquid chromatography complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *White horehound (1835)*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Mebendazole $C_{16}H_{13}N_3O_3$ = 295.3 (*31431-39-7*)

General reagent grade of commerce.

Meclozine Hydrochloride Meclozine dihydrochloride; (*1104-22-9*)

See *Meclozine dihydrochloride (0622)*.

Medronic Acid (*1984-15-2*)

See *Medronic acid for radiopharmaceutical preparations (2350)*.

Melamine 1,3,5-Triazine-2,4,6-triamine; $C_3H_6N_6$ = 126.1 (*108-78-1*)

A white or almost white, amorphous powder, very slightly soluble in water and in ethanol (96 per cent).

Menthofuran 3,9-Epoxy-*p*-mentha-3,8-diene; 3,6-Dimethyl-4,5,6,7-tetrahydro-benzofuran; $C_{10}H_{14}O$ = 150.2 (*17957-94-7*)

Slightly bluish liquid, very slightly soluble in water, soluble in ethanol (96 per cent).

d_{15}^{20}: about 0.965.

n_D^{20}: about 1.480.

$[\alpha]_D^{20}$: about + 93.

bp: 196 °C.

Menthofuran used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. The substance to be examined.

Content: minimum 97.0 per cent, calculated by the normalisation procedure.

Menthol (–)-*p*-Menthan-3-ol (2216-51-5); (±)-*p*-menthan-3-ol; (*2216-51-5*)

See *Levomenthol (0619)* and *Racemic menthol (0623)*.

Menthol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the related substances test included in the monograph *Racemic menthol (0623)*.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Menthone (2*S*,5*R*)-2-Isopropyl-5-methylcyclohexanone; (–)-*trans*-*p*-Menthan-3-one; $C_{10}H_{18}O$ = 154.2 (*14073-97-3*)

Contains variable amounts of isomenthone.

Colourless liquid, very slightly soluble in water, very soluble in ethanol (96 per cent).

d_{20}^{20}: about 0.897.

n_D^{20}: about 1.450.

Menthone used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. The substance to be examined.

Content: minimum 90.0 per cent, calculated by the normalisation procedure.

Menthyl Acetate (1*R*,2*S*,5*R*)-5-Methyl-2-(propan-2-yl) cyclohexyl acetate; $C_{12}H_{22}O_2$ = 198.3 (*2623-23-6*)

Colourless liquid, slightly soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.92.

n_D^{20}: about 1.447.

bp: about 228 °C.

Menthyl acetate used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. The substance to be examined.

Content: minimum 97.0 per cent, calculated by the normalisation procedure.

Mercaptoacetic Acid Thioglycollic acid; $C_2H_4O_2S$ = 92.1 (*68-11-1*)

Colourless liquid, miscible with water, soluble in ethanol (96 per cent).

2-Mercaptobenzimidazole 1*H*-benzimidazole-2-thiol; $C_7H_6N_2S$ = 150.2 (*583-39-1*)

mp: about 302 °C.

2-Mercaptoethanol C_2H_6OS = 78.1 (*60-24-2*)

Liquid, miscible with water.

d_{20}^{20}: about 1.116.

bp: about 157 °C.

6-Mercaptopurine Purine-6-thiol; Mercaptopurine; (*6112-76-1*)

See *Mercaptopurine monohydrate (0096)*.

Mercuric Oxide Yellow mercury(II) oxide; Mercury(II) Oxide, Yellow; HgO = 216.6 (*21908-53-2*)

A yellow to orange-yellow powder, practically insoluble in water and in ethanol (96 per cent).

Storage: protected from light.

Mercury Hg = 200.6 (*7439-97-6*)

d_{20}^{20}: about 13.5.

bp: about 357°.

Silver-white liquid, breaking into spherical globules which do not leave a metallic trace when rubbed on paper.

Mercury(II) Acetate Mercury diacetate; Mercuric acetate; $C_4H_6HgO_4$ = 318.7 (*1600-27-7*)

White or almost white crystals, freely soluble in water, soluble in ethanol (96 per cent).

Mercury(II) Acetate Solution Mercuric acetate solution

Dissolve 3.19 g of *mercuric acetate R* in *anhydrous acetic acid R* and dilute to 100 mL with the same acid. If necessary, neutralise the solution with *0.1 M perchloric acid* using 0.05 mL of *crystal violet solution R* as indicator.

Mercury(II) Chloride Mercuric chloride; (*7487-94-7*)

See *Mercuric chloride (0120)*.

Mercury(II) Chloride Solution Mercuric chloride solution

A 54 g/L solution of *mercuric chloride R*.

Mercury(II) Iodide Mercury di-iodide; Mercuric iodide; HgI_2 = 454.4 (*7774-29-0*)

Dense, scarlet, crystalline powder, slightly soluble in water, sparingly soluble in acetone and in ethanol (96 per cent), soluble in an excess of *potassium iodide solution R*.

Storage: protected from light.

Mercury(II) Nitrate Mercury dinitrate monohydrate; Mercuric nitrate; $Hg(NO_3)_2,H_2O$ = 342.6 (*7783-34-8*)

Colourless or slightly coloured crystals, hygroscopic, soluble in water in the presence of a small quantity of nitric acid.

Storage: in an airtight container, protected from light.

Mercury, Nitric Acid Solution of

Carefully dissolve 3 mL of *mercury* in 27 mL of *fuming nitric acid*. Dilute the solution with an equal volume of *water*.

Store protected from light, use within 2 months.

Mercury(II) Sulfate Solution Mercuric sulphate solution; Mercury(II) sulphate solution; Mercuric sulfate solution; (*7783-35-9*)

Dissolve 1 g of *mercuric oxide R* in a mixture of 20 mL of *water R* and 4 mL of *sulfuric acid R*.

Mercury(II) Thiocyanate Mercury di(thiocyanate); Mercuric thiocyanate; $Hg(SCN)_2$ = 316.7 (*592-85-8*)

White or almost white, crystalline powder, very slightly soluble in water, slightly soluble in ethanol (96 per cent), soluble in solutions of sodium chloride.

Mercury(II) Thiocyanate Solution Mercuric thiocyanate solution

Dissolve 0.3 g of *mercuric thiocyanate R* in *anhydrous ethanol R* and dilute to 100 mL with the same solvent.

Storage: use within 1 week.

Mesalazine (*89-57-6*)

See *Mesalazine (1699)*.

Mesityl Oxide 4-Methylpent-3-en-2-one; $C_6H_{10}O$ = 98.1 (*141-79-7*)

Colourless, oily liquid, soluble in 30 parts of water, miscible with most organic solvents.

d_{20}^{20}: about 0.858.

bp: 129 °C to 130 °C.

Metanil Yellow 4′-anilinoazobenzene-3-sulfonic acid sodium salt; $C_{18}H_{14}N_3NaO_3S$ = 375.4 (*587-98-4*)

Schultz No. 169

Colour Index No. 13065

A brownish-yellow powder, soluble in water and in ethanol (96 per cent).

Metanil Yellow Solution

A 1 g/L solution of *metanil yellow R* in *methanol R*.

Test for sensitivity. To 50 mL of *anhydrous acetic acid R* add 0.1 mL of the metanil yellow solution. Add 0.05 mL of *0.1 M perchloric acid*; the colour changes from pinkish-red to violet.

Colour change: pH 1.2 (red) to pH 2.3 (orange-yellow).

Metaphosphoric Acid $(HPO_3)_x$ (*37267-86-0*)

Glassy lumps or sticks containing a proportion of sodium metaphosphate, hygroscopic, very soluble in water.

Nitrates. Boil 1.0 g with 10 mL of *water R*, cool, add 1 mL of *indigo carmine solution R*, 10 mL of *nitrogen-free sulfuric acid R* and heat to boiling. The blue colour is not entirely discharged.

Reducing substances: maximum 0.01 per cent, calculated as H_3PO_3.

Dissolve 35.0 g in 50 mL of *water R*. Add 5 mL of a 200 g/L solution of *sulfuric acid R*, 50 mg of *potassium bromide R* and 5.0 mL of *0.02 M potassium bromate* and heat on a water-bath for 30 min. Allow to cool and add 0.5 g of *potassium iodide R*. Titrate the liberated iodine with *0.1 M sodium thiosulfate*, using 1 mL of *starch solution R* as indicator. Carry out a blank test.

1 mL of *0.02 M potassium bromate* is equivalent to 4.10 mg of H_3PO_3.

Storage: in an airtight container.

Methacrylic Acid 2-Methylprop-2-enoic acid; $C_4H_6O_2$ = 86.1 (*79-41-4*)

Colourless liquid.

n_D^{20}: about 1.431.

bp: about 160 °C.

mp: about 16 °C.

Methane CH_4 = 16 (*74-82-8*)

Content: minimum 99.0 per cent *V/V*.

Methane R1 CH_4 = 16 (*74-82-8*)

Content: minimum 99.995 per cent *V/V*.

Methanesulfonic Acid Methanesulphonic acid; CH_4O_3S = 96.1 (*75-75-2*)

Clear, colourless liquid, solidifying at about 20 °C, miscible with water, slightly soluble in toluene, practically insoluble in hexane.

d_{20}^{20}: about 1.48.

n_D^{20}: about 1.430.

Methanesulfonic Acid, Methanolic

Methanesulphonic acid, methanolic

Solutions of the requisite molarity may be obtained by dissolving the appropriate quantity of *methanesulfonic acid* in *methanol*.

Methanesulfonyl Chloride Methanesulphonyl chloride; CH_3ClO_2S = 114.6 (*124-63-0*)

Clear, colourless or slightly yellow liquid.

Content: minimum 99.0 per cent.

Density: 1.48 g/cm^3.

n_D^{20}: about 1.452.

bp: about 161 °C.

Methanol Methyl alcohol; CH_4O = 32.04 (*67-56-1*)

Clear, colourless, flammable liquid, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: 0.791 to 0.793.

bp: 64 °C to 65 °C.When 'methanol' is followed by a percentage figure, an instruction to use methanol diluted with water to produce the specified percentage v/v of methanol is implied.

Methanol, Acidified

To 900 mL of *methanol* add 18 mL of *glacial acetic acid* and dilute to 1000 mL with *water*.

Methanol, Aldehyde-free

Dissolve 25 g of *iodine R* in 1 L of *methanol R* and pour the solution, with constant stirring, into 400 mL of *1 M sodium hydroxide*. Add 150 mL of *water R* and allow to stand for 16 h. Filter. Boil under a reflux condenser until the odour of

iodoform disappears. Distil the solution by fractional distillation.

Aldehydes and ketones: maximum 0.001 per cent.

Methanol, Anhydrous (*67-56-1*)

Treat 1000 mL of *methanol R* with 5 g of *magnesium R*. If necessary initiate the reaction by adding 0.1 mL of *mercuric chloride solution R*. When the evolution of gas has ceased, distil the liquid and collect the distillate in a dry container protected from moisture.

Water (*2.5.12*): maximum 0.3 g/L.

Methanol, Hydrochloric

Dilute 1.0 mL of *hydrochloric acid R1* to 100.0 mL with *methanol R*.

Methanol R1

Complies with the requirements prescribed for *methanol R* with the following additional requirement.

Absorbance (*2.2.25*): maximum 0.70 at 210 nm, 0.30 at 220 nm, 0.13 at 230 nm, 0.02 at 250 nm, 0.01 at 260 nm and higher wavelengths, determined using *water R* as compensation liquid.

Methanol R2

Complies with the requirements prescribed for *methanol R* and the following additional requirements.

Content: minimum 99.8 per cent.

Absorbance (2.2.25): maximum 0.17, determined at 225 nm using *water R* as the compensation liquid.

Methimazole 1-Methyl-1H-imidazole-2-thiol; Thiamazole; $C_4H_6N_2S$ = 114.2 (*60-56-0*)

White or almost white, crystalline powder, freely soluble in water, soluble in ethanol (96 per cent) and in methylene chloride.

mp: about 145 °C.

DL-Methionine (*59-51-8*)

See *DL-Methionine (0624)*.

L-Methionine (*63-68-3*)

See *Methionine (1027)*.

L-Methionine Sulfoxide (2*S*)-2-Amino-4-[(*RS*)-methylsulfinyl]butanoic acid; $C_5H_{11}NO_3S$ = 165.2 (*3226-65-1*)

(*RS*)-Methotrexate (*RS*)-2-[4-[[(2,4-diaminopteridin-6-yl)methyl]methylamino]benzoylamino]pentanedioic acid; $C_{20}H_{22}N_8O_5$ (*60388-53-6*)

Content: minimum 96.0 per cent.

mp: about 195 °C.

Methoxyazobenzene $C_{13}H_{12}NO$ = 212.2 (*2396-60-3*)

mp: about 55°.

Use a grade of commerce suitable for chromatographic separations.

Methoxychlor 1,1-(2,2,2-Trichloroethylidene)-bis(4-methoxybenzene); $C_{16}H_{15}Cl_3O_2$ = 345.7 (*72-43-5*)

Practically insoluble in water, freely soluble in most organic solvents.

bp: about 346 °C.

mp: 78 °C to 86 °C.

A suitable certified reference solution (10 ng/µL in iso-octane) may be used.

***trans*-2-Methoxycinnamaldehyde** $C_{10}H_{10}O_2$ = 162.2 (*60125-24-8*)

mp: 44 °C to 46 °C.

trans-2-Methoxycinnamaldehyde used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Cassia oil (1496)*.

Content: minimum 96.0 per cent, calculated by the normalisation procedure.

2-Methoxyethanol Ethylene glycol monomethyl ether; $C_3H_8O_2$ = 76.1 (*109-86-4*)

Content: minimum 99.0 per cent.

Clear, colourless liquid, miscible with water, with acetone and with ethanol (96 per cent).

d_{20}^{20}: about 0.97.

n_D^{20}: about 1.403.

bp: about 125 °C.

(1*RS*)-1-(6-Methoxynaphthalen-2-yl)ethanol 6-Methoxy-α-methyl-2-naphthalenemethanol; $C_{13}H_{14}O_2$ = 202.3 (*77301-42-9*)

White or almost white powder.

mp: about 113 °C.

1-(6-Methoxynaphthalen-2-yl)ethanone 6′-Methoxy-2′-acetonaphthone; $C_{13}H_{12}O_2$ = 200.2 (*3900-45-6*)

White or almost white powder.

mp: about 108 °C.

6-Methoxy-2-naphthoic Acid 6-Methoxynaphthalene-2-carboxylic acid; $C_{12}H_{10}O_3$ = 202.2 (*2471-70-7*)

White or almost white, crystalline powder.

mp: 201 °C to 206 °C.

Methoxyphenylacetic Acid (*RS*)-2-Methoxy-2-phenylacetic acid; $C_9H_{10}O_3$ = 166.2 (*7021-09-2*)

White, crystalline powder or white or almost white crystals, sparingly soluble in water, freely soluble in ethanol (96 per cent).

mp: about 70 °C.

Methoxyphenylacetic Reagent

Dissolve 2.7 g of *methoxyphenylacetic acid R* in 6 mL of *tetramethylammonium hydroxide solution R* and add 20 mL of *anhydrous ethanol R*.

Storage: in a polyethylene container.

3-Methoxy-L-tyrosine $C_{10}H_{13}NO_4H_2O$ = 229.2 (*200630-46-2*)

Off-white or yellow powder.

Methyl Acetate $C_3H_6O_2$ = 74.1 (*79-20-9*)

Clear, colourless liquid, soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.933.

n_D^{20}: about 1.361.

bp: 56 °C to 58 °C.

Methyl 4-acetylbenzoate $C_{10}H_{10}O_3$ = 178.2 (*3609-53-8*)

mp: about 94 °C.

Methyl 4-acetylbenzoate Reagent

Dissolve 0.25 g of *methyl 4-acetylbenzoate R* in a mixture of 5 mL of *sulfuric acid R* and 85 mL of cooled *methanol R*.

Methyl Acrylate Methyl prop-2-enoate; $C_4H_6O_2$ = 86.1 (*96-33-3*)

Clear, colourless liquid.

bp: about 80 °C.

Methylal Dimethoxymethane; Dioxapentane; Formaldehyde dimethyl acetal; Methylene dimethyl ether; $C_3H_8O_2$ = 76.1 (*109-87-5*)

Clear, colourless, volatile, flammable liquid, soluble in water and miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.860.

n_D^{20}: about 1.354.

bp: about 41 °C.

Methylal used in gas chromatography complies with the following additional test.

Content: minimum 99.5 per cent, determined by gas chromatography.

Methylamine Hydrochloride Methanamine hydrochloride; CH_6ClN = 67.5 (*593-51-1*)

White or almost white powder.

Content: minimum 98.0 per cent.

Methyl 4-aminobenzoate $C_8H_9NO_2$ = 151.2 (*619-45-4*)

mp: 110 °C to 113 °C.

4-Methylaminophenol Sulfate $C_{14}H_{20}N_2O_6S$ = 344.4 (*55-55-0*)

Colourless crystals, very soluble in water, slightly soluble in ethanol (96 per cent).

mp: about 260 °C.

Methylaminophenol-Sulfite Reagent

Methylaminophenol-sulfite reagent

Dissolve 0.1 g of *4-methylaminophenol sulfate*, 20 g of *sodium metabisulfite* and 0.5 g of *anhydrous sodium sulfite* in sufficient *water* to produce 100 mL.

3-(Methylamino)-1-phenylpropan-1-ol $C_{10}H_{15}NO$ = 165.2 (*42142-52-9*)

White or almost white powder.

mp: 59 °C to 64 °C.

Methylamphetamine Hydrochloride Methamphetamine hydrochloride; $C_{10}H_{16}ClN$ = 185.7

General reagent grade of commerce.

Methyl Anthranilate Methyl 2-aminobenzoate; $C_8H_9NO_2$ = 151.2 (*134-20-3*)

Colourless crystals or a colourless or yellowish liquid, soluble in water, freely soluble in ethanol (96 per cent).

mp: 24 °C to 25 °C.

Methyl anthranilate used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Bitter-orange-flower oil (1175)*.

Test solution. The substance to be examined.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Methyl Arachidate Methyl eicosanoate; $C_{21}H_{42}O_2$ = 326.6 (*1120-28-1*)

Content: minimum 98.0 per cent, determined by gas chromatography (*2.4.22*).

White or yellow, crystalline mass, soluble in ethanol (96 per cent) and in light petroleum.

mp: about 46 °C.

Methyl Benzenesulfonate Ethyl benzenesulfonate; $C_7H_8O_3S$ = 172.2 (*80-18-2*)

Content: minimum 98.0 per cent.

Clear, colourless liquid.

bp: about 148 °C.

Methyl Benzoate Benzoic acid, methyl ester; $C_8H_8O_2$ = 136.2 (*93-58-3*)

Colourless liquid.

d_4^{20}: 1.088.

bp: about 200 °C.

3-Methylbenzothiazolin-2-one Hydrazone Hydrochloride 3-Methylbenzothiazol-2(3H)-one hydrazone hydrochloride monohydrate; Methylbenzothiazolone hydrazone hydrochloride; $C_8H_{10}ClN_3S,H_2O$ = 233.7 (*38894-11-0*)

Almost white or yellowish, crystalline powder.

mp: about 270 °C.

Suitability for determination of aldehydes. To 2 mL of *aldehyde-free methanol R* add 60 µL of a 1 g/L solution of *propionaldehyde R* in *aldehyde-free methanol R* and 5 mL of a 4 g/L solution of methylbenzothiazolone hydrazone hydrochloride. Mix. Allow to stand for 30 min. Prepare a blank omitting the propionaldehyde solution. Add 25.0 mL of a 2 g/L solution of *ferric chloride R* to the test solution and to the blank, dilute to 100.0 mL with *acetone R* and mix. The absorbance (*2.2.25*) of the test solution, measured at 660 nm using the blank as compensation liquid, is not less than 0.62.

(R)-(+)-α-Methylbenzyl Isocyanate (+)-(*R*)-α-Methylbenzyl isocyanate; (+)-[(1*R*)-1-Isocyanatoethyl] benzene; (+)-(1*R*)-1-Phenylethyl isocyanate; C_9H_9NO = 147.2 (*33375-06-3*)

Content: minimum 99.0 per cent.

Colourless liquid.

d_{20}^{20}: about 1.045.

n_D^{20}: about 1.513.

bp: 55 °C to 56 °C at 2.5 mm Hg.

Enantiomeric purity: minimum 99.5.

Storage: at a temperature of 2 °C to 8 °C.

(S)-(-)-α-Methylbenzyl Isocyanate (−)-(*S*)-α-Methylbenzyl isocyanate; (−)-[(1*S*)-1-Isocyanatoethyl] benzene; (−)-(1*S*)-1-Phenylethyl isocyanate; C_9H_9NO = 147.2 (*14649-03-7*)

Content: minimum 99.0 per cent.

Colourless liquid.

d_{20}^{20}: about 1.045.

n_D^{20}: about 1.514.

bp: 55 °C to 56 °C at 2.5 mm Hg.

Enantiomeric purity: minimum 99.5 per cent.

Storage: at a temperature of 2 °C to 8 °C.

NOTE: do not use the reagent if it is coloured.

1-Methylbiguanide Hydrochloride $C_3H_9N_5$ = 151.6 (*1674-62-0*)

2-Methylbutane Isopentane; C_5H_{12} = 72.2 (*78-78-4*)

Content: minimum 99.5 per cent of C_5H_{12}.

Very flammable colourless liquid.

d_{20}^{20}: about 0.621.

n_D^{20}: about 1.354.

bp: about 29 °C.

Water (2.5.12): maximum 0.02 per cent.

Residue on evaporation: maximum 0.0003 per cent.

Absorbance (2.2.25): maximum 0.30 at 210 nm, 0.07 at 220 nm, 0.01 at 240 nm and higher wavelengths, determined using *water R* as compensation liquid.

2-Methylbut-2-ene C_5H_{10} = 70.1 (*513-35-9*)

Very flammable liquid, practically insoluble in water, miscible with ethanol (96 per cent).

bp: 37.5 °C to 38.5 °C.

Methyl 4-(butylamino)benzoate $C_{12}H_{17}NO_2$ = 207.3 (*71839-12-8*)

White or almost white solid.

Content: minimum 99.9 per cent.

Methyl Caprate Methyl Decanoate

See *Methyl decanoate R*.

Methyl Caproate Methyl hexanoate; $C_7H_{14}O_2$ = 130.2 (*106-70-7*)

d_{20}^{20}: about 0.885.

n_D^{20}: about 1.405.

bp: 150 °C to 151 °C.

Methyl Caprylate Methyl octanoate; $C_9H_{18}O_2$ = 158.2 (*111-11-5*)

d_{20}^{20}: about 0.876.

n_D^{20}: about 1.417.

bp: 193 °C to 194 °C.

Methylcellulose 450 (*9004-67-5*)

See *Methylcellulose (0345)*.

Nominal viscosity: 450 mPa·s.

Methyl Cinnamate $C_{10}H_{10}O_2$ = 162.2 (*103-26-4*)

Colourless crystals practically insoluble in water, soluble in ethanol (96 per cent).

n_D^{20}: about 1.56.

bp: about 260 °C.

mp: 34 °C to 36 °C.

Methylcodeine $C_{19}H_{23}NO_3$ = 313.4 g/mol (*2859-16-7*)

Analytical reagent grade of commerce.

Content: minimum 95.0 per cent

Methylcyclohexane C_7H_{14} = 98.2 (*108-87-2*)

Methyl Decanoate Methyl Caprate; $C_{11}H_{22}O_2$ = 186.3 (*110-42-9*)

Content: minimum 99.0 per cent.

Clear, colourless or yellow liquid, soluble in light petroleum.

d_{20}^{20}: 0.871 to 0.876.

n_D^{20}: 1.425 to 1.426.

Methyl Docosanoate Methyl behenate; $C_{23}H_{46}O_2$ = 354.6 (*929-77-1*)

mp: 54 °C to 55 °C.

Methyldopa, Racemic $C_{10}H_{13}NO_4$,1½H_2O = 238.2

Mixture of equal volumes of (2*S*)- and (2*R*)-2-amino-3-(3,4-dihydroxyphenyl)-2-methylpropanoic acids.

3-*O*-Methyldopamine Hydrochloride 4-(2-Aminoethyl)-2-methoxyphenol hydrochloride; $C_9H_{14}ClNO_2$ = 203.7 (*1477-68-5*)

mp: 213 °C to 215 °C.

4-*O*-Methyldopamine Hydrochloride 5-(2-Aminoethyl)-2-methoxyphenol hydrochloride; $C_9H_{14}ClNO_2$ = 203.7 (*645-33-0*)

mp: 207 °C to 208 °C.

Methyl Eicosenoate Methyl (11*Z*)-eicos-11-enoate; $C_{21}H_{40}O_2$ = 324.5 (*2390-09-2*)

Methylenebisacrylamide *N,N'*-Methylenebispropenamide; $C_7H_{10}N_2O_2$ = 154.2 (*110-26-9*)

Fine, white or almost white powder, slightly soluble in water, soluble in ethanol (96 per cent).

mp: 300 °C, with decomposition.

4,4'-Methylenebis-N,N-dimethylaniline Tetramethyldiaminodiphenylmethane; $C_{17}H_{22}N_2$ = 254.4 (*101-61-1*)

White or bluish-white crystals or leaflets, practically insoluble in water, slightly soluble in ethanol (96 per cent), soluble in mineral acids.

mp: about 90 °C.

4,4'-Methylenebis-N,N-dimethylaniline Reagent Tetramethyldiaminodiphenylmethane reagent

Solution A. Dissolve 2.5 g of *tetramethyldiaminodiphenylmethane R* in 10 mL of *glacial acetic acid R* and add 50 mL of *water R*.

Solution B. Dissolve 5 g of *potassium iodide R* in 100 mL of *water R*.

Solution C. Dissolve 0.30 g of *ninhydrin R* in 10 mL of *glacial acetic acid R* and add 90 mL of *water R*.

Mix solution A, solution B and 1.5 mL of solution C.

Methylene Blue 3,7-Dimethylaminophenothiazin-5-ium chloride; It occurs in different hydrated forms and may contain up to 22 per cent of water; $C_{16}H_{18}ClN_3S$, xH_2O = 319.9 for the anhydrous substance (*122965-43-9*)

Schultz No. 1038

Colour Index No. 52015

Dark-green or bronze, crystalline powder, freely soluble in water, soluble in ethanol (96 per cent).

Methylene Blue Solution

Dissolve 3 mg of *methylene blue R*, 1.2 g of *sulfuric acid R* and 5.0 g of *anhydrous sodium sulfate R* in 100 mL of *water R*.

Methyl Erucate Methyl cis-13-docosenoate; $C_{23}H_{44}O_2$ = 352.6 (*1120-34-9*)

d_{20}^{20}: about 0.871.

n_D^{20}: about 1.456.

3-*O*-Methylestrone 3-Methoxy-1,3,5(10)-estratrien-17-one; $C_{19}H_{24}O_2$ = 284.4 (*1624-62-0*)

White to yellowish-white powder.

$[\alpha]_D^{20}$: about + 157.

mp: about 173 °C.

Methyl Ethyl Ketone Ethyl methyl ketone; 2-Butanone; C_4H_8O = 72.1 (*78-93-3*)

Clear, colourless, flammable liquid, very soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.81.

bp: 79 °C to 80 °C.

Methyleugenol 1,2-Dimethoxy-4-prop-2-enylbenzene; $C_{11}H_{14}O_2$ = 178.2 (*93-15-2*)

Methyleugenol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Niaouli oil, cineole type (2468)*.

Content: minimum 97.0 per cent, calculated by the normalisation procedure.

***N*-Methylglucamine** Meglumine; $C_7H_{17}NO_5$ = 195.2 (*6284-40-8*)

mp: about 130°.

General reagent grade of commerce.

Methyl Green CI 42585; basic blue 20, 4-[[4-(Dimethylamino)phenyl][4-(dimethyliminio)cyclohexa-2,5-dienylidene]-methylphenyl]trimethylammonium dichloride; $C_{26}H_{33}Cl_2N_3$ = 458.5 (*7114-03-6*)

Green powder, soluble in water, soluble in sulfuric acid giving a yellow solution turning green on dilution with water.

Methyl Green-Iodomercurate Paper

Immerse thin strips of suitable filter paper in a 4% w/v solution of *methyl green* and allow to dry in air. Immerse the strips for 1 hour in a solution containing 14% w/v of *potassium iodide* and 20% w/v of *mercuric iodide*. Wash with *distilled water* until the washings are practically colourless and allow to dry in air.

Store protected from light; use within 48 hours.

Methyl 4-Hydroxybenzoate *(99-76-3)*

See *Methyl parahydroxybenzoate R*.

1-Methylimidazole 1-Methyl-1*H*-imidazole; $C_4H_6N_2$ = 82.1 *(616-47-7)*

Colourless or slightly yellowish liquid.

n_D^{20}: about 1.495.

bp: 195 °C to 197 °C.

Storage: in an airtight container, protected from light.

1-Methylimidazole R1

Complies with the requirements prescribed for *1-methylimidazole R* with the following additional requirement.

Content: minimum 95.0 per cent.

2-Methylimidazole $C_4H_6N_2$ = 82.1 *(693-98-1)*

White or almost white, crystalline powder.

mp: about 145 °C.

Methyl Isobutyl Ketone, Water-saturated

Shake *methyl isobutyl ketone R* with *water R* prior to use.

Methyl Laurate Methyl dodecanoate; $C_{13}H_{26}O_2$ = 214.4 *(111-82-0)*

Content: minimum 98.0 per cent, determined by gas chromatography *(2.4.22)*.

Colourless or yellow liquid, soluble in ethanol (96 per cent) and in light petroleum.

d_{20}^{20}: about 0.87.

n_D^{20}: about 1.431.

mp: about 5 °C.

Methyl Lignocerate Methyl tetracosanoate; $C_{25}H_{50}O_2$ = 382.7 *(2442-49-1)*

Flakes.

mp: about 58 °C.

Methyl Linoleate Methyl (9*Z*,12*Z*)-octadeca-9,12-dienoate; $C_{19}H_{34}O_2$ = 294.5 *(112-63-0)*

d_{20}^{20}: about 0.888.

n_D^{20}: about 1.466.

bp: 207 °C to 208 °C.

Methyl Linolenate Methyl (9*Z*,12*Z*,15*Z*)-octadeca-9,12,15-trienoate; Methyl α-linolenate; $C_{19}H_{32}O_2$ = 292.5 *(301-00-8)*

d_{20}^{20}: about 0.901.

n_D^{20}: about 1.471.

bp: about 207 °C.

Methyl γ-linolenate Methyl (6*Z*,9*Z*,12*Z*)-octadeca-6,9,12-trienoate; $C_{19}H_{32}O_2$ = 292.5 *(16326-32-2)*

Content: minimum 99.0 per cent, determined by gas chromatography.

Methyl Margarate Methyl heptadecanoate; $C_{18}H_{36}O_2$ = 284.5 *(1731-92-6)*

White or almost white powder.

mp: 32 °C to 34 °C.

Methyl margarate used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography *(2.2.28)* as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 97 per cent, calculated by the normalisation procedure.

Methyl Methacrylate Methyl 2-methylprop-2-enoate; $C_5H_8O_2$ = 100.1 *(80-62-6)*

Colourless liquid.

n_D^{20}: about 1.414.

bp: about 100 °C.

mp: about −48 °C.

It contains a suitable stabilising reagent.

Methyl Methanesulfonate $C_2H_6O_3S$ = 110.1 *(66-27-3)*

Clear, colourless or slightly yellow liquid.

Content: minimum 99.0 per cent.

Density: about 1.3 g/cm^3 (25 °C).

n_D^{20}: about 1.414.

bp: about 202 °C.

Methyl 2-Methoxybenzoate $C_9H_{10}O_3$ = 166.2 *(606-45-1)*

Colourless liquid.

Methyl 4-Methoxybenzoate $C_9H_{10}O_3$ = 166.2 *(121-98-2)*

White or almost white powder.

Methyl *N*-methylanthranilate Methyl 2-(methylamino) benzoate; $C_9H_{11}NO_2$ = 165.2 *(85-91-6)*

Pale yellow liquid.

d_4^{20}: about 1.128.

n_D^{20}: about 1.579.

bp: 255 °C to 258 °C.

Methyl N-methylanthranilate used in gas chromatography complies with the following additional test.

Assay. Gas chromatography *(2.2.28)* as prescribed in the monograph *Mandarin oil (2355)*.

Test solution. The substance to be examined.

Content: minimum 97 per cent, calculated by the normalisation procedure.

Methyl Myristate Methyl tetradecanoate; $C_{15}H_{30}O_2$ = 242.4 *(124-10-7)*

Content: minimum 98.0 per cent, determined by gas chromatography *(2.4.22)*.

Colourless or slightly yellow liquid, soluble in ethanol (96 per cent) and in light petroleum.

d_{20}^{20}: about 0.87.

n_D^{20}: about 1.437.

mp: about 20 °C.

2-Methyl-1,4-naphthoquinone Menadione; *(58-27-5)*

See *Menadione (0507)*.

Methyl Nervonate *(2733-88-2)*

See *Tetracos-15-enoic acid methyl ester R*.

2-Methyl-5-nitroimidazole $C_4H_5N_3O_2$ = 127.1 *(88054-22-2)*

mp: 252° to 254°.

White to light yellow powder.

Content, minimum 98.0%.

2-Methyl-2-nitropropane-1,3-diol 2-Nitro-2-methyl-1,3-propanediol; $C_4H_9NO_4$ = 135.1 (*77-49-6*)

mp: about 148°.

General reagent grade of commerce.

Methyl Oleate Methyl (9*Z*)-octadec-9-enoate; $C_{19}H_{36}O_2$ = 296.4 (*112-62-9*)

Content: minimum 98.0 per cent, determined by gas chromatography (*2.4.22*).

Colourless or slightly yellow liquid, soluble in ethanol (96 per cent) and in light petroleum.

d_{20}^{20}: about 0.88.

n_D^{20}: about 1.452.

Methylophiopogonanone A (3*R*)-3-[(1,3-Benzodioxol-5-yl)methyl]-2,3-dihydro-5,7-dihydroxy-6,8-dimethyl-4*H*-1-benzopyran-4-one; $C_{19}H_{18}O_6$ = 342.3 (*74805-92-8*)

Methyl Orange Sodium 4′-(dimethylamino)azobenzene-4-sulfonate; $C_{14}H_{14}N_3NaO_3S$ = 327.3 (*547-58-0*)

Schultz No. 176

Colour Index No. 13025

Orange-yellow, crystalline powder, slightly soluble in water, practically insoluble in ethanol (96 per cent).

Methyl Orange Mixed Solution

Dissolve 20 mg of *methyl orange R* and 0.1 g of *bromocresol green R* in 1 mL of *0.2 M sodium hydroxide* and dilute to 100 mL with *water R*.

Colour change: pH 3.0 (orange) to pH 4.4 (olive-green).

Methyl Orange Solution

Dissolve 0.1 g of *methyl orange R* in 80 mL of *water R* and dilute to 100 mL with *ethanol (96 per cent) R*.

Test for sensitivity. A mixture of 0.1 mL of the methyl orange solution and 100 mL of *carbon dioxide-free water R* is yellow. Not more than 0.1 mL of *1 M hydrochloric acid* is required to change the colour to red.

Colour change: pH 3.0 (red) to pH 4.4 (yellow).

Methyl Orange-Xylene Cyanol FF Solution

Dissolve 0.1 g of *methyl orange* and 0.26 g of *xylene cyanol FF* in 50 mL of *ethanol (96%)* and add sufficient *water* to produce 100 mL.

Methyl Palmitate Methyl hexadecanoate; $C_{17}H_{34}O_2$ = 270.5 (*112-39-0*)

Content: minimum 98.0 per cent, determined by gas chromatography (*2.4.22*).

White or yellow, crystalline mass, soluble in ethanol (96 per cent) and in light petroleum.

mp: about 30 °C.

Methyl Palmitoleate Methyl cis-9-hexadecenoate; $C_{17}H_{32}O_2$ = 268.4 (*1120-25-8*)

d_{20}^{20}: about 0.876.

n_D^{20}: about 1.451.

Methyl Parahydroxybenzoate (*99-76-3*)

See *Methyl parahydroxybenzoate (0409)*.

Methyl Pelargonate Methyl nonanoate; $C_{10}H_{20}O_2$ = 172.3 (*1731-84-6*)

Clear, colourless liquid.

d_4^{20}: about 0.873.

n_D^{20}: about 1.422.

bp: 91 °C to 92 °C.

Methyl pelargonate used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 98 per cent, calculated by the normalisation procedure.

2-Methylpentane C_6H_{14} = 86.2 (*107-83-5*)

Isohexane.

d_{20}^{20}: about 0.653.

bp: about 60.0 °C.

Colourless, flammable liquid, practically insoluble in water, miscible with anhydrous ethanol.

3-Methylpentan-2-one sec-Butyl methyl ketone; $C_6H_{12}O$ = 100.2 (*565-61-7*)

Colourless, flammable liquid.

d_{20}^{20}: about 0.815.

n_D^{20}: about 1.400.

bp: about 118 °C

4-Methylpentan-2-ol 4-Methyl-2-pentanol; $C_6H_{14}O$ = 102.2 (*108-11-2*)

Clear, colourless, volatile liquid.

d_4^{20}: about 0.802.

n_D^{20}: about 1.411.

bp: about 132 °C.

4-Methylpentan-2-one Methyl isobutyl ketone; $C_6H_{12}O$ = 100.2 (*108-10-1*)

Clear, colourless liquid, slightly soluble in water, miscible with most organic solvents.

d_{20}^{20}: about 0.80.

bp: about 115 °C.

Distillation range (*2.2.11*). Distil 100 mL. The range of temperature of distillation from 1 mL to 95 mL of distillate does not exceed 4.0 °C.

Residue on evaporation: maximum 0.01 per cent, determined by evaporating on a water-bath and drying at 100-105 °C.

4-Methylpentan-2-one R1 Methyl isobutyl ketone R1

Shake 50 mL of freshly distilled *methyl isobutyl ketone R* with 0.5 mL of *hydrochloric acid R1* for 1 min. Allow the phases to separate and discard the lower phase. Prepare immediately before use.

4-Methylpentan-2-one R3 Methyl isobutyl ketone R3

Complies with the requirements for *methyl isobutyl ketone R* and with the following limits.

Cr: maximum 0.02 ppm.

Cu: maximum 0.02 ppm.

Pb: maximum 0.1 ppm.

Ni: maximum 0.02 ppm.

Sn: maximum 0.1 ppm.

4-Methylphenazone 1,5-Dimethyl-2-(4-methylphenyl)-1,2-dihydro-3*H*-pyrazol-3-one; $C_{12}H_{14}N_2O$ = 202.3 (*56430-08-1*)

Methylphenyloxazolylbenzene 1,4-Bis[2-(4-methyl-5-phenyl)oxazolyl]benzene; $C_{26}H_{20}N_2O_2$ = 392.5 (*3073-87-8*)

Fine, greenish-yellow powder with a blue fluorescence or small crystals, soluble in ethanol (96 per cent), sparingly soluble in xylene.

mp: about 233 °C.

Methylphenyloxazolylbenzene used for liquid scintillation is of a suitable analytical grade.

1-Methyl-4-phenyl-1,2,3,6-tetrahydropyridine MPTP; $C_{12}H_{15}N$ = 173.3 (*28289-54-5*)

White or almost white, crystalline powder, slightly soluble in water.

mp: about 41 °C.

N-Methylpiperazine 1-Methylpiperazine; Methylpiperazine; $C_5H_{12}N_2$ = 100.2 (*109-01-3*)

Colourless liquid, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: about 0.90.

n_D^{20}: about 1.466.

bp: about 138 °C.

4-(4-Methylpiperidin-1-yl)pyridine 4-(4-Methylpiperidino)pyridine; $C_{11}H_{16}N_2$ = 176.3 (*80965-30-6*)

Clear liquid.

n_D^{20}: about 1.565.

Methylpolysiloxane

Polysiloxane substituted with 100 per cent of methyl groups.

Methylprednisolone 11β,17,21-Trihydroxy-6α-methylpregna-1,4-diene-3,20-dione; $C_{22}H_{30}O_5$ = 374.5 (*83-43-2*)

White or almost white, crystalline powder.

2-Methylpropan-1-ol Isobutyl alcohol; 2-Methylpropanol; $C_4H_{10}O$ = 74.1 (*78-83-1*)

Clear colourless liquid, soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.80.

n_D^{15}: 1.397 to 1.399.

bp: about 107 °C.

Distillation range (*2.2.11*). Not less than 96 per cent distils between 107 °C and 109 °C.

2-Methylpropan-2-ol *tert*-Butyl alcohol; 1,1-Dimethyl ethyl alcohol; 2-Methyl-2-propanol; $C_4H_{10}O$ = 74.1 (*75-65-0*)

Clear, colourless liquid or crystalline mass, soluble in water, miscible with ethanol (96 per cent).

Freezing point (*2.2.18*): about 25 °C.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 81 °C and 83 °C.

(15R)-15-Methylprostaglandin $F_{2\alpha}$ (5*Z*)-7-[(1*R*,2*R*,3*R*,5*S*)-3,5-Dihydroxy-2-[(1*E*)-(3*R*)-3-hydroxy-3-methyloct-1-enyl]cyclopentyl]hept-5-enoic acid; $C_{21}H_{36}O_5$ = 368.5 (*35864-81-4*)

Available as a 10 g/L solution in *methyl acetate R*.

Storage: at a temperature below −15 °C.

2-Methylpyridine C_6H_7N = 93.1 (*109-06-8*)

Colourless or light yellow liquid.

Content: minimum 97.5 per cent.

5-Methylpyridin-2-amine 6-Amino-3-picoline; $C_6H_8N_2$ = 108.1 (*1603-41-4*)

White or yellow crystals or crystalline powder.

mp: about 76 °C.

5-Methylpyridin-2(1*H*)-one C_6H_7NO = 109.1 (*1003-68-5*)

White or almost white powder, soluble in anhydrous ethanol and in methanol.

mp: about 181 °C.

Storage: at a temperature of 2 °C to 8 °C.

***N*-Methylpyrrolidine** $C_5H_{11}N$ = 85.2 (*120-94-5*)

Content: minimum 97.0 per cent.

bp: about 80 °C.

***N*-Methylpyrrolidone** 1-Methylpyrrolidin-2-one; C_5H_9NO = 99.1 (*872-50-4*)

d_{20}^{20}: about 1.028.

bp: about 202 °C.

mp: about −24 °C.

Methyl Red 2-(4-Dimethylamino-phenylazo)benzoic acid; $C_{15}H_{15}N_3O_2$ = 269.3 (*493-52-7*)

Schultz No. 250

Colour Index No. 13020

Dark-red powder or violet crystals, practically insoluble in water, soluble in ethanol (96 per cent).

Methyl Red Mixed Solution

Dissolve 0.1 g of *methyl red R* and 50 mg of *methylene blue R* in 100 mL of *ethanol (96 per cent) R*.

Colour change: pH 5.2 (red-violet) to pH 5.6 (green).

Methyl Red Solution

Dissolve 50 mg of *methyl red R* in a mixture of 1.86 mL of *0.1 M sodium hydroxide* and 50 mL of *ethanol (96 per cent) R* and dilute to 100 mL with *water R*.

Test for sensitivity. To 0.1 mL of the methyl red solution add 100 mL of *carbon dioxide-free water R* and 0.05 mL of *0.02 M hydrochloric acid*. The solution is red. Not more than 0.1 mL of *0.02 M sodium hydroxide* is required to change the colour to yellow.

Colour change: pH 4.4 (red) to pH 6.0 (yellow).

Methyl Salicylate (*119-36-8*)

See *Methyl salicylate (0230)*

When used in the Assay of Methyl Salicylate preparations, use a grade containing not less than 99.0% of $C_8H_8O_3$.

Methyl Stearate Methyl octadecanoate; $C_{19}H_{38}O_2$ = 298.5 (*112-61-8*)

Content: minimum 98.0 per cent, determined by gas chromatography (*2.4.22*).

White or yellow, crystalline mass, soluble in ethanol (96 per cent) and in light petroleum.

mp: about 38 °C.

Methyl Thymol Blue Tetrasodium 2,2′,2″,2‴-[3H-2,1-benzoxathiol-3-ylidenebis[[6-hydroxy-2-methyl-5-(1-methylethyl)-3,1-phenylene]methylenenitrilo]]tetraacetate S,S-dioxide; Methylthymol blue; $C_{37}H_{40}N_2Na_4O_{13}S$ = 845 (*1945-77-3*)

Produces a blue colour with calcium in alkaline solution.

Methylthymol Blue Mixture

A mixture of 1 part of *methylthymol blue R* and 100 parts of *potassium nitrate R*.

Methyl Toluenesulfonate Methyl 4-methylbenzenesulfonate; Methyl tosilate; $C_8H_{10}O_3S$ = 186.2 (*80-48-8*)

Content: minimum 97.0 per cent.

Density: about 1.234 g/mL (25 °C).

bp: about 292 °C.

mp: 25 °C to 28 °C.

***N*-Methyl-*m*-toluidine** *N*,3-Dimethylaniline; *N*,3-Dimethylbenzenamine; Methyl-*m*-tolylamine; $C_8H_{11}N$ = 121.2 (*696-44-6*)

Content: minimum 97 per cent.

Methyl Tricosanoate Tricosanoic acid methyl ester; $C_{24}H_{48}O_2$ = 368.6 (*2433-97-8*)

Content: minimum 99.0 per cent.

White or almost white crystals, practically insoluble in water, soluble in hexane.

mp: 55 °C to 56 °C.

Methyl Tridecanoate $C_{14}H_{28}O_2$ = 228.4 (*1731-88-0*)

Colourless or slightly yellow liquid, soluble in ethanol (96 per cent) and in light petroleum.

d_{20}^{20}: about 0.86.

n_D^{20}: about 1.441.

mp: about 6 °C.

Methyl 3,4,5-Trimethoxybenzoate $C_{11}H_{14}O_5$ = 226.23 (*1916-07-0*)

***N*-Methyltrimethylsilyl-trifluoroacetamide** 2,2,2-Trifluoro-*N*-methyl-*N*-(trimethylsilyl)acetamide; $C_6H_{12}F_3NOSi$ = 199.3 (*24589-78-4*)

n_D^{20}: about 1.380.

bp: 130 °C to 132 °C.

Minocycline Hydrochloride

See *Minocycline hydrochloride (1030)*.

Molecular Sieve (*70955-01-0*)

Molecular sieve composed of sodium aluminosilicate. It is available as beads or powder with a pore size of 0.4 nm.

When reused, it is recommended that the molecular sieve be regenerated according to the manufacturer's instructions.

Molecular Sieve for Chromatography

Molecular sieve composed of sodium aluminosilicate. The pore size is indicated after the name of the reagent in the tests where it is used. If necessary, the particle size is also indicated.

Molybdenum(VI) Oxide Molybdenum trioxide; MoO_3 = 143.9 (*1313-27-5*)

Analytical reagent grade of commerce.

Molybdovanadic Reagent

In a 150 mL beaker, mix 4 g of finely powdered *ammonium molybdate R* and 0.1 g of finely powdered *ammonium vanadate R*. Add 70 mL of *water R* and grind the particles using a glass rod. A clear solution is obtained within a few minutes. Add 20 mL of *nitric acid R* and dilute to 100 mL with *water R*.

Monodocosahexaenoin Monoglyceride of docosahexaenoic acid (C22:6); Glycerol monodocosahexaenoate; (*all-Z*)-Docosa-4,7,10,13,16,19-hexaenoic acid, monoester with propane-1,2,3-triol; $C_{25}H_{38}O_4$ = 402.6 (*124516-13-8*)

The reagent from Nu-Chek Prep, Inc. has been found suitable.

Mordant Black 11 Eriochrome black T; Solochrome black; $C_{20}H_{12}N_3NaO_7S$ = 461.4 (*1787-61-7*)

Schultz No. 241

Colour Index No. 14645

Brownish-black powder, soluble in water and in ethanol (96 per cent).

Storage: in an airtight container, protected from light.

Mordant Black 11 Mixed Triturate

A mixture of 1 g of *mordant black 11*, 0.4 g of *methyl orange* and 100 g of *sodium chloride*.

Complies with the following test.

Sensitivity to magnesium Dissolve 50 mg in 100 mL of *water*; a brown colour is produced. Add 0.3 mL of 6M *ammonia*; the colour changes to pale green. Add 0.1 mL of a 1.0% w/v solution of *magnesium sulfate*; the colour changes to red.

Mordant Black 11 Solution

A 0.1% w/v solution of *mordant black 11* in *ethanol (96%)*.

Mordant Black 11 Triturate

Mix 1 g of *mordant black 11 R* with 99 g of *sodium chloride R*.

Test for sensitivity. Dissolve 50 mg in 100 mL of *water R*. The solution is brownish-violet. On addition of 0.3 mL of *dilute ammonia R1* the solution turns blue. On the subsequent addition of 0.1 mL of a 10 g/L solution of *magnesium sulfate R*, it turns violet.

Storage: in an airtight container, protected from light.

Mordant Black 11 Triturate R1

Mix 1.0 g of *mordant black 11 R*, 0.4 g of *methyl orange R* and 100 g of *sodium chloride R*.

Mordant Blue 3 Chromoxane cyanine; (*3564-18-9*)

Colour Index No. 43820

General reagent grade of commerce.

A dark red or reddish brown powder.

Produces an intense purple colour with aluminium in weakly acidic solutions. When metal ions are absent, for example, in the presence of an excess of disodium edetate, the solution is pale pink.

Morphine, Anhydrous

Add 5M *ammonia*, in slight excess, to a solution of *morphine sulfate* in *water*, wash the precipitated morphine with *water* until free from ammonium salts and dry at 110°.

Morphine Hydrochloride See *Morphine hydrochloride (0097)*.

Morpholine Tetrahydro-1,4-oxazine; C_4H_9NO = 87.1 (*110-91-8*)

Colourless, hygroscopic liquid, flammable, soluble in water and in ethanol (96 per cent).

d_{20}^{20}: about 1.01.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 126 °C and 130 °C.

Storage: in an airtight container.

Morpholine for Chromatography

Complies with the requirements prescribed for *morpholine R* with the following additional requirement.

Content: minimum 99.5 per cent.

2-[N-Morpholino]ethanesulfonic Acid 2-(Morpholin-4-yl)sulfonic acid; MES; $C_6H_{13}NO_4S$ = 195.2 (*4432-31-9*)

White or almost white, crystalline powder, soluble in water.

mp: about 300 °C.

Murexide 5,5′-Nitrilobis(pyrimidine-2,4,6(1*H*,3*H*,5*H*)-trione) monoammonium salt; $C_8H_8N_6O_6,H_2O$ = 302.2

Brownish-red crystalline powder, sparingly soluble in cold water, soluble in hot water, practically insoluble in ethanol (96 per cent), soluble in solutions of potassium hydroxide or sodium hydroxide giving a blue colour.

Myosmine 3-(4,5-Dihydro-3*H*-pyrrol-2-yl)pyridine; $C_9H_{10}N_2$ = 146.2 (*532-12-7*)

Colourless crystals.

mp: about 45 °C.

β-Myrcene 7-Methyl-3-methylenocta-1,6-diene; $C_{10}H_{16}$ = 136.2 (*123-35-3*)

Oily liquid with a pleasant odour, practically insoluble in water, miscible with ethanol (96 per cent), soluble in glacial acetic acid. It dissolves in solutions of alkali hydroxides.

d_4^{20}: about 0.794.

n_D^{20}: about 1.470.

β-Myrcene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. The substance to be examined.

Content: minimum 90.0 per cent, calculated by the normalisation procedure.

Myristic Acid Tetradecanoic acid; $C_{14}H_{28}O_2$ = 228.4 (*544-63-8*)

Colourless or white or almost white flakes.

mp: about 58.5 °C.

Myristic acid used in the assay of total fatty acids inSaw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 97 per cent, calculated by the normalisation procedure.

Myristicine 5-Allyl-1-methoxy-2,3-methylenedioxybenzene; 4-Methoxy-6-(prop-2-enyl)-1,3-benzodioxole; $C_{11}H_{12}O_3$ = 192.2 (*607-91-0*)

Oily colourless liquid, practically insoluble in water, slightly soluble in anhydrous ethanol, miscible with toluene and with xylene.

d_{20}^{20}: about 1.144.

n_D^{20}: about 1.540.

bp: 276 °C to 277 °C.

mp: about 173 °C.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Star anise (1153)*; the chromatogram shows only one principal spot.

Myristicine used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Nutmeg oil (1552)*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Storage: protected from light.

Myristyl Alcohol Tetradecan-1-ol; $C_{14}H_{30}O$ = 214.4 (*112-72-1*)

d_{20}^{20}: about 0.823.

mp: 38 °C to 40 °C.

Myrtillin Delphinidin 3-*O*-glucoside chloride; $C_{21}H_{21}ClO_{12}$ = 500.8 (*6906-38-3*)

Nalorphine Hydrochloride $C_{19}H_{21}NO_3$, HCl = 347.8 (*57-29-4*)

General reagent grade of commerce.

Naphthalene $C_{10}H_8$ = 128.2 (*91-20-3*)

White or almost white crystals, practically insoluble in water, soluble in ethanol (96 per cent).

mp: about 80 °C.

Naphthalene used for liquid scintillation is of a suitable analytical grade.

Naphthalene-1,3-diol 1,3-Dihydroxynaphthalene; Naphthoresorcinol; Dihydroxynaphthalene; (*132-86-5*)

See *1,3-dihydroxynaphthalene R*.

Naphthalene-2,7-diol 2,7-Dihydroxynaphthalene; $C_{10}H_8O_2$ = 160.2 (*582-17-2*)

Needles, soluble in water and in ethanol (96 per cent).

mp: about 190 °C.

2,3-Naphthalenediamine Naphthalene-2,3-diamine; 2,3-Diaminonaphthalene; $C_{10}H_{10}N_2$ = 158.2 (*771-97-1*)

Brownish-yellow crystalline powder, slightly soluble in ethanol (96 per cent), practically insoluble in acetone.

mp: 195 °C to 198 °C.

Naphthalenediol Reagent Solution

Dissolve 2.5 mg of *naphthalene-2,7-diol* in 90 mL of *methanol* and add 10 mg of *potassium hexacyanoferrate(III)* and 50 mg of *potassium cyanide* dissolved in 10 mL of *water*. Allow to stand for 30 minutes and add 100 mL of 0.05M *sodium hydroxide*.

Naphthalenediol Solution

2,7-Dihydroxynaphthalene solution

Dissolve 10 mg of *2,7-dihydroxynaphthalene R* in 100 mL of *sulfuric acid R* and allow to stand until decolorised.

Storage: use within 2 days.

Naphtharson Thorin; Disodium 4-[(2-arsonophenyl)azo]-3-hydroxynaphthalene-2,7-disulfonate; $C_{16}H_{11}AsN_2Na_2O_{10}S_2$ = 576.3 (*3688-92-4*)

Red powder, soluble in water.

Naphtharson Solution

A 0.58 g/L solution of *naphtharson R*.

Test for sensitivity. To 50 mL of *ethanol (96 per cent) R*, add 20 mL of *water R*, 1 mL of *dilute sulfuric acid R1* and 1 mL of the naphtharson solution. Titrate with *0.025 M barium perchlorate*; the colour changes from orange-yellow to orange-pink.

Storage: protected from light; use within 1 week.

Naphtharson Solution R1

A 1 g/L solution in *deionised distilled water R*.

Test for sensitivity. To 50 mL of *ethanol (96 per cent) R*, add 20 mL of *water R*, 1 mL of *dilute sulfuric acid R1* and 1 mL of *naphtharson solution R1*. Titrate with *0.025 M barium perchlorate*; the colour changes from orange-yellow to orange-pink.

Storage: protected from light; use within 1 week.

β-Naphthol Solution R1

Dissolve 3.0 mg of *β-naphthol R* in 50 mL of *sulfuric acid R* and dilute to 100.0 mL with the same acid. Use the recently prepared solution.

1-Naphthol α-Naphthol; $C_{10}H_8O$ = 144.2 (*90-15-3*)

White or almost white, crystalline powder or colourless or white or almost white crystals, darkening on exposure to light, slightly soluble in water, freely soluble in ethanol (96 per cent).

mp: about 95 °C.

Storage: protected from light.

2-Naphthol β-Naphthol; $C_{10}H_8O$ = 144.2 (*135-19-3*)

White or slightly pink plates or crystals, very slightly soluble in water, very soluble in ethanol (96 per cent).

mp: about 122 °C.

Storage: protected from light.

1-Naphthol Solution α-Naphthol solution

Dissolve 0.10 g of *α-naphthol R* in 3 mL of a 150 g/L solution of *sodium hydroxide R* and dilute to 100 mL with *water R*. Prepare immediately before use.

1-Naphthol Solution, Strong

Dissolve 1 g of *1-naphthol* in a solution of 6 g of *sodium hydroxide* and 16 g of *anhydrous sodium carbonate* in 100 mL of *water*.

2-Naphthol Solution β-Naphthol solution

Dissolve 5 g of freshly recrystallised *β-naphthol R* in 40 mL of *dilute sodium hydroxide solution R* and dilute to 100 mL with *water R*. Prepare immediately before use.

1-Naphtholbenzein Phenylbis(4-hydroxynaphthyl) methanol; Naphtholbenzein; $C_{27}H_{18}O_2$ = 374.4 (*145-50-6*)

Brownish-red powder or shiny brownish-black crystals, practically insoluble in water, soluble in ethanol (96 per cent) and in glacial acetic acid.

1-Naphtholbenzein Solution Naphtholbenzein solution

A 2 g/L solution of *naphtholbenzein R* in *anhydrous acetic acid R*.

Test for sensitivity. To 50 mL of *glacial acetic acid R* add 0.25 mL of the naphtholbenzein solution. The solution is brownish-yellow. Not more than 0.05 mL of *0.1 M perchloric acid* is required to change the colour to green.

Naphthol Yellow 2,4-Dinitro-1-naphthol, sodium salt; $C_{10}H_5N_2NaO_5$ = 256.2

Orange-yellow powder or crystals, freely soluble in water, slightly soluble in ethanol (96 per cent).

Naphthol Yellow S 8-Hydroxy-5,7-dinitro-2-naphthalenesulfonic acid disodium salt; Disodium 5,7-dinitro-8-oxidonaphthalene-2-sulfonate; $C_{10}H_4N_2Na_2O_8S$ = 358.2 (*846-70-8*)

Colour Index No. 10316

Yellow or orange-yellow powder, freely soluble in water.

1-Naphthylacetic Acid (Naphthalen-1-yl)acetic acid; $C_{12}H_{10}O_2$ = 186.2 (*86-87-3*)

White or yellow crystalline powder, very slightly soluble in water, freely soluble in acetone.

mp: about 135 °C.

2-Naphthylacetic Acid 2-Naphthaleneacetic acid; $C_{12}H_{10}O_2$ = 186.2 (*581-96-4*)

mp: about 142°.

General reagent grade of commerce.

Light yellow to light brown crystals.

1-Naphthylamine 1-Aminonaphthalene; Naphthylamine; $C_{10}H_9N$ = 143.2 (*134-32-7*)

White or almost white, crystalline powder, turning pink on exposure to light and air, slightly soluble in water, freely soluble in ethanol (96 per cent).

mp: about 51 °C.

Storage: protected from light.

***N*-(1-Naphthyl)ethylenediamine Dihydrochloride** *N*-(1-Naphthyl)ethane-diamine dihydrochloride; Naphthylethylenediamine dihydrochloride; $C_{12}H_{16}Cl_2N_2$ = 259.2 (*1465-25-4*)

It may contain methanol of crystallisation.

White or yellowish-white powder, soluble in water, slightly soluble in ethanol (96 per cent).

Naphthylethylenediamine Dihydrochloride Solution

Dissolve 0.1 g of *naphthylethylenediamine dihydrochloride R* in *water R* and dilute to 100 mL with the same solvent. Prepare immediately before use.

Naringin 7-[[2-*O*-(6-Deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-5-hydroxy-2-(4-hydroxyphenyl)-2,3-dihydro-4*H*-chromen-4-one; $C_{27}H_{32}O_{14}$ = 580.5 (*10236-47-2*)

White or almost white crystalline powder, slightly soluble in water, soluble in methanol and in dimethylformamide.

mp: about 171 °C.

Absorbance (*2.2.25*). Naringin dissolved in a 5 g/L solution of *dimethylformamide R* in *methanol R* shows an absorption maximum at 283 nm.

Neohesperidin Hesperetin-7-neohesperidoside; (2*S*)-7-[[2-*O*-(6-Deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]oxy]-5-hydroxy-2-(3-hydroxy-4-methoxyphenyl)-2,3-dihydro-4*H*-1-benzopyran-4-one; $C_{28}H_{34}O_{15}$ = 610.6 (*13241-33-3*)

***trans*-Nerolidol** 3,7,11-Trimethyldodeca-1,6,10-trien-3-ol; $C_{15}H_{26}O$ = 222.4 (*40716-66-3*)

Slightly yellow liquid, slight odour of lily and lily of the valley, practically insoluble in water and in glycerol, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.876.

n_D^{20}: about 1.479.

bp_{12}: 145 °C to 146 °C.

trans-Nerolidol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Bitter-orange-flower oil (1175)*.

Test solution. The substance to be examined.

Content: minimum 90.0 per cent, calculated by the normalisation procedure.

Neryl Acetate (*Z*)-3,7-Dimethylocta-2,6-dienyl acetate; $C_{12}H_{20}O_2$ = 196.3 (*141-12-8*)

Colourless, oily liquid.

d_{20}^{20}: about 0.907.

n_D^{20}: about 1.460.

bp_{25}: 134 °C.

Neryl acetate used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Bitter-orange-flower oil (1175)*.

Test solution. The substance to be examined.

Content: minimum 93.0 per cent, calculated by the normalisation procedure.

Neutral Red CI 50040; basic red 5; $C_{15}H_{17}ClN_4$ = 288.8 (*553-24-2*)

Produces a red colour with acids and an orange colour with alkalis.

Neutral Red Solution

A 0.1% w/v solution of *neutral red* in *ethanol (50%)* (pH range, 6.8 to 8.0).

Nickel-Aluminium Alloy Raney nickel catalyst

Contains 48 per cent to 52 per cent of aluminium (Al; A_r 26.98) and 48 per cent to 52 per cent of nickel (Ni; A_r 58.70).

Before use, reduce to a fine powder (180) (*2.9.12*).

It is practically insoluble in water and soluble in mineral acids.

Nickel-Aluminium Alloy (Halogen-free)

Contains 48 per cent to 52 per cent of aluminium (Al; A_r 26.98) and 48 per cent to 52 per cent of nickel (Ni; A_r 58.71).

Fine, grey powder, practically insoluble in water, soluble in mineral acids with formation of salts.

Chlorides: maximum 10 ppm.

Dissolve 0.400 g in 40 mL of a mixture of 67 volumes of *sulfuric acid R* and 33 volumes of *dilute nitric acid R*. Evaporate the solution nearly to dryness, dissolve the residue in *water R* and dilute to 20.0 mL with the same solvent. To one half-aliquot of the solution, add 1.0 mL of *0.1 M silver nitrate*. Filter after 15 min and add 0.2 mL of sodium chloride solution (containing 10 µg of chlorides per millilitre) to the filtrate. After 5 min the solution is more opalescent than a mixture of the second half-aliquot of the solution with 1.0 mL of *0.1 M silver nitrate*.

Nickel(II) Chloride Anhydrous nickel chloride; Nickel chloride; $NiCl_2$ = 129.6 (*7718-54-9*)

Yellow, crystalline powder, very soluble in water, soluble in ethanol (96 per cent). It sublimes in the absence of air and readily absorbs ammonia. The aqueous solution is acid.

Nickel(II) Chloride Hexahydrate $NiCl_2,6H_2O$ = 237.7 (*7791-20-0*)

Analytical reagent grade of commerce.

Nickel Nitrate Hexahydrate $Ni(NO_3)_2,6H_2O$ = 290.8 (*13478-00-7*)

Nickel(II) Sulfate Nickel(II) sulphate; Nickel sulfate heptahydrate; Nickel sulfate; $NiSO_4,7H_2O$ = 280.9 (*10101-98-1*)

Green, crystalline powder or crystals, freely soluble in water, slightly soluble in ethanol (96 per cent).

Nicotinamide-adenine Dinucleotide NAD^+; $C_{21}H_{27}N_7O_{14}P_2$ = 663 (*53-84-9*)

White or almost white powder, very hygroscopic, freely soluble in water.

Nicotinamide-adenine Dinucleotide Solution

Dissolve 40 mg of *nicotinamide-adenine dinucleotide R* in *water R* and dilute to 10 mL with the same solvent. Prepare immediately before use.

Nicotinic Acid (*59-67-6*)

See *Nicotinic acid (0459)*.

Nicotinoyl Hydrazide Pyridine-3-carbohydrazide; $C_6H_7N_3O$ = 137.1 (*553-53-7*)

White or almost white powder or crystalline powder, soluble in water.

mp: about 160 °C.

Nile Blue A 5-Amino-9-(diethylamino)benzo[*a*] phenoxazinylium hydrogen sulfate; $C_{20}H_{21}N_3O_5S$ = 415.5 (*3625-57-8*)

Schultz No. 1029

Colour Index No. 51180

Green, crystalline powder with a bronze lustre, sparingly soluble in ethanol (96 per cent), in glacial acetic acid and in pyridine.

Absorbance (*2.2.25*). A 0.005 g/L solution in *ethanol (50 per cent V/V) R* shows an absorption maximum at 640 nm.

Nile Blue A Solution

A 10 g/L solution of *Nile blue A R* in *anhydrous acetic acid R*.

Test for sensitivity. To 50 mL of *anhydrous acetic acid R* add 0.25 mL of the Nile blue A solution. The solution is blue. On the addition of 0.1 mL of *0.1 M perchloric acid*, the colour changes to blue-green.

Colour change: pH 9.0 (blue) to pH 13.0 (red).

Aqueous Nile Blue A Solution

Dissolve 40 mg of *Nile Blue A* in 200 mL of *water*, shake with 100 mL of n-*heptane* in a 500 mL separating funnel and discard the heptane layer. Repeat the extraction with four 100 mL quantities of n-*heptane* and mix 20 mL of the aqueous solution with 180 mL of *ethanol*.

Ninhydrin Indane-1,2,3-trione; $C_9H_4O_3,H_2O$ = 178.1 (*485-47-2*)

White or very pale yellow, crystalline powder, soluble in water and in ethanol (96 per cent).

Storage: protected from light.

Ninhydrin and Stannous Chloride Reagent

Dissolve 0.2 g of *ninhydrin R* in 4 mL of hot *water R*, add 5 mL of a 1.6 g/L solution of *stannous chloride R*, allow to stand for 30 min, then filter and store at a temperature of 2 °C to 8 °C. Immediately before use dilute 2.5 mL of the solution with 5 mL of *water R* and 45 mL of *2-propanol R*.

Ninhydrin and Stannous Chloride Reagent R1

Dissolve 4 g of *ninhydrin* in 100 mL of *ethylene glycol monomethyl ether*. Shake gently with 1 g of *cation exchange resin* (300 µm to 840 µm) and filter (solution A). Dissolve 0.16 g of *stannous chloride* in 100 mL of *buffer solution pH 5.5* (solution B). Immediately before use, mix equal volumes of each solution.

Ninhydrin Reagent I Transfer 10 litres of *2-methoxyethanol* to a clean, dry 20-litre bottle and purge with *oxygen-free nitrogen* for 2 to 3 minutes. Continue the nitrogen flow and add 10 g of *hydrindantin* and 100 g of *ninhydrin*and allow to dissolve

Transfer 10 litres of *2-methoxyethanol* to a clean, dry 20-litre bottle and purge with *oxygen-free nitrogen* for 2 to 3 minutes. Continue the nitrogen flow and add 10 g of *hydrindantin* and 100 g of *ninhydrin* and allow to dissolve; the solution will be straw coloured when dissolution is complete. Add 2 litres of a solution prepared by dissolving 5.444 kg of *sodium acetate* in 5 litres of *water*, adding 1 litre of *glacial acetic acid*, adjusting the pH to 5.5 with *glacial acetic acid* and adding sufficient *water* to produce 10 litres. Add 6.5 litres of *water* and 20 mL of a 20% w/v solution of *polyoxyethylene 23 lauryl ether*.

The deep red reagent is stable for at least 8 weeks when stored under nitrogen and protected from light; avoid exposure to ammonia.

Ninhydrin Solution

A 2 g/L solution of *Ninhydrin R* in a mixture of 5 volumes of *dilute acetic acid R* and 95 volumes of *butanol R*.

Ninhydrin Solution R1

Dissolve 1.0 g of *ninhydrin R* in 50 mL of *ethanol (96 per cent) R* and add 10 mL of *glacial acetic acid R*.

Ninhydrin Solution R2

Dissolve 3 g of *ninhydrin R* in 100 mL of a 45.5 g/L solution of *sodium metabisulfite R*.

Ninhydrin Solution R3

A 4 g/L solution in a mixture of 5 volumes of *anhydrous acetic acid R* and 95 volumes of *butanol R*.

Ninhydrin Solution R4

A 3 g/L solution of *ninhydrin R* in a mixture of 5 volumes of *glacial acetic acid R* and 95 volumes of *2-propanol R*.

Nitrazepam (*146-22-5*)

See *Nitrazepam (0415)*.

Nitrazepam Impurity A 3-Amino-6-nitro-4-phenylquinol-2(1*H*)-one; *H*)-Quinolinone,-3-amino-6-nitro-4-phenyl; $C_{15}H_{11}N_3O_3$ = 281.3 (*36020-93-6*)

General reagent grade of commenrce.

Nitric Acid HNO_3 = 63.0 (*7697-37-2*)

Content: 63.0 per cent *m/m* to 70.0 per cent *m/m*.

Clear, colourless or almost colourless liquid, miscible with water.

d_{20}^{20}: 1.384 to 1.416.

A 10 g/L solution is strongly acid and gives the reaction of nitrates (*2.3.1*).

Appearance. Nitric acid is clear (*2.2.1*) and not more intensely coloured than reference solution Y_6 (*2.2.2, Method II*).

Chlorides (*2.4.4*): maximum 0.5 ppm.

To 5 g add 10 mL of *water R* and 0.3 mL of *silver nitrate solution R2* and allow to stand for 2 min protected from light. Any opalescence is not more intense than that of a standard prepared in the same manner using 13 mL of *water R*, 0.5 mL of *nitric acid R*, 0.5 mL of *chloride standard solution (5 ppm Cl) R* and 0.3 mL of *silver nitrate solution R2*.

Sulfates (*2.4.13*): maximum 2 ppm.

Evaporate 10 g to dryness with 0.2 g of *sodium carbonate R*. Dissolve the residue in 15 mL of *distilled water R*. Prepare the standard using a mixture of 2 mL of *sulfate standard solution (10 ppm SO_4) R* and 13 mL of *distilled water R*.

Arsenic (*2.4.2, Method A*): maximum 0.02 ppm.

Gently heat 50 g with 0.5 mL of *sulfuric acid R* until white fumes begin to evolve. To the residue add 1 mL of a 100 g/L solution of *hydroxylamine hydrochloride R* and dilute to 2 mL with *water R*. Prepare the standard using 1.0 mL of *arsenic standard solution (1 ppm As) R*.

Iron (*2.4.9*): maximum 1 ppm.

Dissolve the residue from the determination of sulfated ash in 1 mL of *dilute hydrochloric acid R* and dilute to 50 mL with *water R*. Dilute 5 mL of this solution to 10 mL with *water R*.

Heavy metals (*2.4.8*): maximum 2 ppm.

Dilute 10 mL of the solution prepared for the limit test for iron to 20 mL with *water R*. 12 mL of the solution complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Sulfated ash: maximum 0.001 per cent.

Carefully evaporate 100 g to dryness. Moisten the residue with a few drops of *sulfuric acid R* and heat to dull red.

Assay. To 1.50 g add about 50 mL of *water R* and titrate with *1 M sodium hydroxide*, using 0.1 mL of *methyl red solution R* as indicator.

1 mL of *1 M sodium hydroxide* is equivalent to 63.0 mg of HNO_3.

Storage: protected from light.

Nitric Acid, Cadmium- and Lead-free

Complies with the requirements prescribed for *nitric acid R* and with the following additional test.

Test solution. To 100 g add 0.1 g of *anhydrous sodium carbonate R* and evaporate to dryness. Dissolve the residue in *water R* heating slightly, and dilute to 50.0 mL with the same solvent.

Cadmium: maximum 0.1 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

Source: cadmium hollow-cathode lamp.

Wavelength: 228.8 nm.

Atomisation device: air-acetylene or air-propane flame.

Lead: maximum 0.1 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

Source: lead hollow-cathode lamp.

Wavelength: 283.3 nm or 217.0 nm.

Atomisation device: air-acetylene flame.

Nitric Acid, Dilute

Contains about 125 g/L of HNO_3 (M_r 63.0).

Dilute 20 g of *nitric acid R* to 100 mL with *water R*.

Nitric Acid, Dilute R1

Dilute 40 g of *nitric acid R* to 100 mL with *water R*.

Nitric Acid, Dilute R2

Dilute 30 g of *nitric acid R* to 100 mL with *water R*.

Nitric Acid, Fuming (*7697-37-2*)

Clear, slightly yellowish liquid, fuming on contact with air.

d_{20}^{20}: about 1.5.

Nitric Acid, Heavy Metal-free

Complies with the requirements prescribed for *nitric acid R* with the following maximum contents of heavy metals.

As: 0.005 ppm.

Cd: 0.005 ppm.

Cu: 0.001 ppm.

Fe: 0.02 ppm.

Hg: 0.002 ppm.

Ni: 0.005 ppm.

Pb: 0.001 ppm.

Zn: 0.01 ppm.

Nitric Acid, Dilute, Heavy Metal-free

Complies with the requirements prescribed for *dilute nitric acid R* with the following maximum contents of heavy metals.

As: 0.005 ppm.

Cd: 0.005 ppm.

Cu: 0.001 ppm.

Fe: 0.02 ppm.

Hg: 0.002 ppm.

Ni: 0.005 ppm.

Pb: 0.001 ppm.

Zn: 0.01 ppm.

Nitric Acid, Lead-free, Dilute

Dilute 5 g of *lead-free nitric acid R1* to 100 mL with *deionised distilled water R*.

Nitric Acid, Lead-free

Complies with the requirements prescribed for *Nitric acid R* with the following additional test.

Lead: maximum 0.1 ppm.

Atomic absorption spectrometry (*2.2.23, Method II*).

Test solution. To 100 g add 0.1 g of *anhydrous sodium carbonate R* and evaporate to dryness. Dissolve the residue in *water R*, heating slightly, and dilute to 50.0 mL with the same solvent.

Source: lead hollow-cathode lamp.

Wavelength: 283.3 nm or 217.0 nm.

Atomisation device: air-acetylene flame.

Nitric Acid, Lead-free R1

Nitric acid R containing not more than 1 µg/kg of lead.

Nitric Acid, Nickel-free

Complies with the requirements prescribed for *nitric acid R* with the following additional requirement.

Nickel: maximum 0.005 ppm.

Nitrilotriacetic Acid $C_6H_9NO_6$ = 191.1 (*139-13-9*)

White or almost white crystalline powder, practically insoluble in water and in most organic solvents.

mp: about 240 °C, with decomposition.

4-Nitroaniline Nitroaniline; $C_6H_6N_2O_2$ = 138.1 (*100-01-6*)

Bright yellow, crystalline powder, very slightly soluble in water, sparingly soluble in boiling water, soluble in ethanol (96 per cent), forms water-soluble salts with strong mineral acids.

mp: about 147 °C.

Nitroaniline Solution, Diazotised

Dissolve 0.4 g of *4-nitroaniline* in 60 mL of 1M *hydrochloric acid* with the aid of heat, cool to 15° and add a 10% w/v solution of *sodium nitrite* until one drop of the mixture turns *starch iodide paper* blue.

Prepare immediately before use.

2-Nitrobenzaldehyde Nitrobenzaldehyde; $C_7H_5NO_3$ = 151.1 (*552-89-6*)

Yellow needles, slightly soluble in water, freely soluble in ethanol (96 per cent), volatile in steam.

mp: about 42 °C.

4-Nitrobenzaldehyde $C_7H_5NO_3$ = 151.1 (*555-16-8*)

Nitrobenzaldehyde Paper

Dissolve 0.2 g of *nitrobenzaldehyde R* in 10 mL of a 200 g/L solution of *sodium hydroxide R*. Use the solution within 1 h. Immerse the lower half of a slow filter paper strip 10 cm long and 0.8-1 cm wide. Absorb the excess reagent between two sheets of filter paper. Use within a few minutes of preparation.

Nitrobenzaldehyde Solution

Add 0.12 g of powdered *nitrobenzaldehyde R* to 10 mL of *dilute sodium hydroxide solution R*; allow to stand for 10 min shaking frequently and filter. Prepare immediately before use.

Nitrobenzene $C_6H_5NO_2$ = 123.1 (*98-95-3*)

Colourless or very slightly yellow liquid, practically insoluble in water, miscible with ethanol (96 per cent).

bp: about 211 °C.

Dinitrobenzene. To 0.1 mL add 5 mL of *acetone R*, 5 mL of *water R* and 5 mL of *strong sodium hydroxide solution R*. Shake and allow to stand. The upper layer is almost colourless.

4-Nitrobenzoic Acid $C_7H_5NO_4$ = 167.1 (*62-23-7*)

Yellow crystals.

mp: about 240 °C.

4-Nitrobenzyl Bromide $C_7H_6BrNO_2$ = 216.0 (*100-11-8*)

mp: about 99°.

General reagent grade of commerce.

Pale yellow crystals with a lachrymatory vapour.

Nitrobenzoyl Chloride 4-Nitrobenzoyl chloride; $C_7H_4ClNO_3$ = 185.6 (*122-04-3*)

Yellow crystals or a crystalline mass, decomposing in moist air, completely soluble in sodium hydroxide solution giving a yellowish-orange colour.

mp: about 72 °C.

4-Nitrobenzyl Chloride Nitrobenzyl chloride; $C_7H_6ClNO_2$ = 171.6 (*100-14-1*)

Pale-yellow crystals, lachrymatory, practically insoluble in water, very soluble in ethanol (96 per cent).

4-(4-Nitrobenzyl)pyridine $C_{12}H_{10}N_2O_2$ = 214.2 (*1083-48-3*)

Yellow powder.

mp: about 70 °C.

Nitrochromic Reagent

Dissolve 0.7 g of *potassium dichromate* in *nitric acid* and dilute to 100 mL with the same acid.

Nitroethane $C_2H_5NO_2$ = 75.1 (*79-24-3*)

Clear, oily, colourless liquid.

bp: about 114 °C.

2-Nitroethanol $C_2H_5NO_3$ = 91.1 (*625-48-9*)

bp: about 205°.

General reagent of commerce.

Nitrofurantoin (*67-20-9*)

See *Nitrofurantoin (0101)*.

(5-Nitro-2-furyl)methylene Diacetate Nitrofurfural diacetate; 5-nitrofurfurylidene diacetate; $C_9H_9NO_7$ = 243.2 (*92-55-7*)

mp: about 90°.

Yellow crystals.

Nitrogen N_2 = 28.01 (*7727-37-9*)

Nitrogen, washed and dried.

Nitrogen Dioxide NO_2 = 46.01 (*10102-44-0*)

Content: minimum 98.0 per cent *V/V*.

Nitrogen for Chromatography N_2 = 28.01 (*7727-37-9*)

Content: minimum 99.95 per cent *V/V*.

Nitrogen Gas Mixture Nitric oxide

Nitrogen R containing 1 per cent *V/V* of each of the following gases: *carbon dioxide R2*, *carbon monoxide R1* and *oxygen R1*.

Nitrogen Monoxide NO = 30.01

Content: minimum 98.0 per cent *V/V*.

Nitrogen, Oxygen-free

Nitrogen R which has been freed from oxygen by passing it through *alkaline pyrogallol solution R*.

Nitrogen R1 N_2 = 28.01 (*7727-37-9*)

Content: minimum 99.999 per cent *V/V*.

Carbon monoxide: less than 5 ppm.

Oxygen: less than 5 ppm.

Nitromethane CH_3NO_2 = 61.0 (*75-52-5*)

Clear, colourless, oily liquid, slightly soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: 1.132 to 1.134.

n_D^{20}: 1.381 to 1.383.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 100 °C and 103 °C.

4-Nitrophenol *p*-Nitrophenol; $C_6H_5NO_3$ = 139.1 (*100-02-7*)

Content: minimum 95 per cent.

Colourless or slightly yellow powder, sparingly soluble in water and in methanol.

mp: about 114 °C.

3-Nitrosalicylic Acid 2-Hydroxy-3-nitrobenzoic acid; $C_7H_5NO_5$ = 183.1 (*85-38-1*)

Yellowish crystals, slightly soluble in water, freely soluble in ethanol (96 per cent).

mp: 142 °C to 147 °C.

5-Nitrosalicylic Acid 2-Hydroxy-5-nitrobenzoic acid; $C_7H_5NO_5$ = 183 (*96-97-9*)

General reagent grade of commerce.

***N*-Nitrosodiethanolamine** 2,2′-(Nitrosoimino)diethanol; $C_4H_{10}N_2O_3$ = 134.1 (*1116-54-7*)

Yellow liquid, miscible with anhydrous ethanol.

n_D^{20}: about 1.485.

bp: about 125 °C.

***N*-Nitrosodiisopropanolamine** 1,1′-(Nitrosoimino) bispropan-2-ol; $C_6H_{14}N_2O_3$ = 162.2 (*53609-64-6*)

bp: 122-124 °C.

Nitrosodipropylamine Dipropylnitrosamine; $C_6H_{14}N_2O$ = 130.2 (*621-64-7*)

Liquid, soluble in anhydrous ethanol and in strong acids.

d_{20}^{20}: about 0.915.

bp: about 78 °C.

Appropriate grade for chemiluminescence determination.

Nitrosodipropylamine Solution

Inject 78.62 g of *anhydrous ethanol R* through the septum of a vial containing *nitrosodipropylamine R*. Dilute 1/100 in *anhydrous ethanol R* and place 0.5 mL aliquots in crimp-sealed vials.

Storage: in the dark at 5 °C.

Nitrotetrazolium Blue 3,3′-(3,3′-Dimethoxy-4,4′-diphenylene)di[2-(4-nitrophenyl)-5-phenyl-2*H*-tetrazolium] dichloride; *p*-Nitro-tetrazolium blue; $C_{40}H_{30}Cl_2N_{10}O_6$ = 818 (*298-83-9*)

Crystals, soluble in methanol, giving a clear, yellow solution.

mp: about 189 °C, with decomposition.

Nitrous Oxide N_2O = 44.01

Content: minimum 99.99 per cent *V/V*.

Nitrogen monoxide: less than 1 ppm.

Carbon monoxide: less than 1 ppm.

Nitro-vanado-molybdic Reagent Nitro-molybdovanadic reagent

Solution A. Dissolve 10 g of *ammonium molybdate R* in *water R*, add 1 mL of *ammonia R* and dilute to 100 mL with *water R*.

Solution B. Dissolve 2.5 g of *ammonium vanadate R* in hot *water R*, add 14 mL of *nitric acid R* and dilute to 500 mL with *water R*.

To 96 mL of *nitric acid R* add 100 mL of solution A and 100 mL of solution B and dilute to 500 mL with *water R*.

Nonivamide *N*-[(4-Hydroxy-3-methoxyphenyl)methyl] nonanamide; $C_{17}H_{27}NO_3$ = 293.4 (*2444-46-4*)

White or almost white, crystalline powder, practically insoluble in cold water, freely soluble in anhydrous ethanol.

Nonivamide used in the test for nonivamide in the monograph Capsicum (1859) complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Capsicum (1859)*.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Nonylamine Nonan-1-amine; 1-Aminononane; $C_9H_{21}N$ = 143.3 (*112-20-9*)

Corrosive, colourless, clear liquid.

d_4^{20}: about 0.788.

n_D^{20}: about 1.433.

Noradrenaline Acid Tartrate Noradrenaline bitartrate; $C_8H_{11}NO_3,C_4H_6O_6$ = 319.3 (*69815-49-2*)

mp: about 102°.

General reagent grade of commerce.

A white, crystalline powder.

Nordazepam 7-Chloro-2,3-dihydro-5-phenyl-1*H*-1,4-benzodiazepin-2-one; $C_{15}H_{11}ClN_2O$ = 270.7 (*1088-11-5*)

White or pale yellow, crystalline powder, practically insoluble in water, slightly soluble in ethanol (96 per cent).

mp: about 216 °C.

DL-Norleucine (*RS*)-2-Aminohexanoic acid; $C_6H_{13}NO_2$ = 131.2 (*616-06-8*)

Shiny crystals, sparingly soluble in water and in ethanol (96 per cent), soluble in acids.

Noroxymorphone $C_{16}H_{17}NO_4$ = 287.3 (*33522-95-1*)

General reagent grade of commerce.

Norpseudoephedrine Hydrochloride $C_9H_{13}NO$, HCl = 187.7 (*53643-20-2*)

mp: 180° to 181°.

General reagent grade of commerce.

A crystalline powder.

Noscapine Hydrochloride (*912-60-7*)

See *Noscapine hydrochloride (0515)*.

Nystose $C_{24}H_{42}O_{21}$ = 666.6 (*13133-07-8*)

β-D-Fructofuranosyl-(2→1)-β-D-fructofuranosyl-(2→1)-β-D-fructofuranosyl α-D-glucopyranoside.

Ochratoxin A Solution

50 µg/mL solution of (2*S*)-2-([[(3*R*)-5-chloro-8-hydroxy-3-methyl-1-oxo-3,4-dihydro-1*H*-2-benzopyran-7-yl]carbonyl] amino)-3-phenylpropanoic acid (ochratoxin A) in a mixture of 1 volume of *acetic acid R* and 99 volumes of *benzene R*.

Octadecan-1-ol Stearyl alcohol; $C_{18}H_{38}O$ = 270.5 (*112-92-5*)

mp: about 60 °C.

Content: minimum 95 per cent.

Octadecyl [3-[3,5-bis(1,1-dimethylethyl)-4-hydroxyphenyl]-propionate] Octadecyl 3-(3,5-di-*tert*-butyl-4-hydroxyphenyl)propionate; $C_{35}H_{62}O_3$ = 530.9 (*2082-79-3*)

White or slightly yellowish, crystalline powder, practically insoluble in water, very soluble in acetone and in hexane, slightly soluble in methanol.

mp: 49 °C to 55 °C.

Octanal Octyl aldehyde; $C_8H_{16}O$ = 128.2 (*124-13-0*)

Oily, colourless liquid. Practically insoluble in water.

Octanal used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Sweet orange oil (1811)*.

Content: minimum 99 per cent, calculated by the normalisation procedure.

***N*-Octane** Octane; C_8H_{18} = 114.2 (*111-65-9*)

Content: minimum 99 per cent.

Octanoic Acid Caprylic acid; $C_8H_{16}O_2$ = 144.2 (*124-07-2*)

Slightly yellow, oily liquid.

d_4^{20}: about 0.910.

n_D^{20}: about 1.428.

bp: about 239.7 °C.

mp: about 16.7 °C.

Caprylic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 98 per cent, calculated by the normalisation procedure.

Octan-1-ol Caprylic alcohol; 1-Octanol; Octanol; $C_8H_{18}O$ = 130.2 (*111-87-5*)

Colourless liquid, practically insoluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.828.

bp: about 195 °C.

Octan-2-ol *sec*-Octyl alcohol; $C_8H_{18}O$ = 130.2 (*6169-06-8*)

bp: about 178°.

General reagent grade of commerce.

An oily liquid; weight per mL, about 0.82 g.

3-Octanone Octan-3-one; Ethylpentylketone; $C_8H_{16}O$ = 128.2 (*106-68-3*)

Colourless liquid with a characteristic odour.

d_{20}^{20}: about 0.822.

n_D^{20}: about 1.415.

bp: about 167 °C.

3-Octanone used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Lavender oil (1338)*.

Test solution. The substance to be examined.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Octoxinol 10 α-[4-(1,1,3,3-Tetramethylbutyl)phenyl]-ω-hydroxypoly-(oxyethylene); $C_{34}H_{62}O_{11}$ (average) = 647 (*9002-93-1*)

Clear, pale-yellow, viscous liquid, miscible with water, with acetone and with ethanol (96 per cent), soluble in toluene.

Storage: in an airtight container.

Octreotide Acetate (Acetate-free peptide: M_r 1019; [83150-76-9]); D-Phenylalanyl-L-cysteinyl-L-phenylalanyl-D-tryptophyl-L-lysyl-L-threonyl-*N*-[(1*R*,2*R*)-2-hydroxy-1-(hydroxymethyl)propyl]-L-cysteinamide cyclic (2→7)-disulfide acetate; It contains a variable quantity of acetic acid; White or almost white powder, freely soluble in water and acetic acid; $C_{49}H_{66}N_{10}O_{10}S_2.xC_2H_4O_2$ (*79517-01-4*)

Content: minimum 96.0 per cent.

Octylamine 1-Amino-octane; *N*-Octylamine; $C_8H_{19}N$ = 129.2 (*111-86-4*)

Colourless liquid.

d_{20}^{20}: about 0.782.

bp: 175 °C to 179 °C.

Oleamide (9*Z*)-Octadec-9-enoamide; $C_{18}H_{35}NO$ = 281.5

Yellowish or white powder or granules, practically insoluble in water, very soluble in methylene chloride, soluble in anhydrous ethanol.

mp: about 80 °C.

Oleanolic Acid 3β-Hydroxyolean-12-en-28-oic acid; Astrantiagenin C; $C_{30}H_{48}O_3$ = 456.7 (*508-02-1*)

Oleic Acid (9*Z*)-Octadec-9-enoic acid; $C_{18}H_{34}O_2$ = 282.5 (*112-80-1*)

Clear, colourless liquid, practically insoluble in water.

d_4^{20}: about 0.891.

n_D^{20}: about 1.459.

mp: 13 °C to 14 °C.

Oleic acid used in the assay of total fatty acids in the monograph Saw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 98 per cent, calculated by the normalisation procedure.

Oleuropein 2-(3,4-Dihydroxyphenyl)ethyl[(2*S*,3*E*,4*S*)-3-ethylidene-2-(β-D-glucopyranosyloxy)-5-(methoxycarbonyl)-3,4-dihydro-2*H*-pyran-4-yl]acetate; $C_{25}H_{32}O_{13}$ = 540.5 (*32619-42-4*)

Powder, soluble in methanol.

Oleuropein used in Olive leaf (1878) complies with the following test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Olive leaf (1878)*.

Content: minimum 80 per cent, calculated by the normalisation procedure.

Oleyl Alcohol (9*Z*)-Octadec-9-en-1-ol; $C_{18}H_{36}O$ = 268.5 (*143-28-2*)

bp: about 207 °C.

n_D^{20}: 1.460.

Content: minimum 85 per cent.

Olive Oil (*8001-25-0*)

See *Olive oil, virgin (0518)*.

Olive Oil Substrate Emulsion

Homogenise 40 mL of *olive oil*, 330 mL of *acacia solution* and 30 mL of *water* in an 800-mL beaker placed in a vessel containing a mixture of ice and ethanol as cooling mixture. Emulsify using a mixer at an average speed of 1000 to 2000 revolutions per minute. Cool to 5° to 10°. Increase the mixing speed to 8000 revolutions per minute. Mix for 30 minutes keeping the temperature below 25° by the continuous addition of crushed ice into the cooling mixture (a mixture of calcium chloride and crushed ice is also suitable). Store this preparation (the stock emulsion) in a refrigerator and use within 14 days. The emulsion must not separate into two distinct layers. Check the diameter of the globules of the emulsion under a microscope. At least 90% have a diameter below 3 µm and none has a diameter greater than 10 µm. Shake the emulsion thoroughly before preparing the substrate emulsion.

For 10 determinations mix the following solutions in the order indicated: 100 mL of the stock emulsion, 80 mL of *tris-chloride buffer solution*, 20 mL of a freshly prepared 8% w/v solution of *sodium taurocholate EPBRP* and 95 mL of *water*.

Use on the day of preparation.

Oracet Blue B

Solvent blue 19

A mixture of 1-methylamino-4-anilinoanthraquinone ($C_{21}H_{16}N_2O_2$) and 1-amino-4-anilinoanthraquinone ($C_{20}H_{14}N_2O_2$). When used for titration in non-aqueous media, it changes from blue (basic) through purple (neutral) to pink (acidic).

Oracet Blue B Solution

A 0.5% w/v solution of *oracet blue B* in *anhydrous acetic acid*.

Oracet Blue 2R 1-Amino-4-(phenylamino)anthracene-9,10-dione; CI 61110; $C_{20}H_{14}N_2O_2$ = 314.3 (*4395-65-7*)

mp: about 194°.

Oracet Blue 2R Solution

A 0.5% w/v solution of *oracet blue 2R* in *anhydrous acetic acid*.

Orcinol 5-Methylbenzene-1,3-diol monohydrate; $C_7H_8O_2$, H_2O = 142.2 (*6153-39-5*)

Crystalline powder, sensitive to light.

bp: about 290 °C.

mp: 58 °C to 61 °C.

Organosilica Polymer, Amorphous, Octadecylsilyl

Synthetic, spherical hybrid particles, containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by trifunctionally bonded octadecylsilyl groups.

Organosilica Polymer, Amorphous, Octadecylsilyl, End-capped

Synthetic, spherical hybrid particles, containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by trifunctionally bonded octadecylsilyl groups. To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups. The particle size is indicated after the name of the reagent in the tests where it is used.

Organosilica Polymer, Amorphous, Polar-embedded Octadecylsilyl, End-capped

Synthetic, spherical hybrid particles containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by the bonding of polar-embedded octadecylsilyl groups. To minimise any interaction with basic compounds, they are carefully end-capped to cover most of the remaining silanol groups.

Organosilica Polymer, Amorphous, Propyl-2-phenylsilyl, End-capped

Synthetic, spherical hybrid particles containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by the bonding of propyl-2-phenylsilyl groups. To minimise any interaction with basic compounds, they are carefully end-capped to cover most of the remaining silanol groups.

Organosilica Polymer Compatible with 100% Aqueous Mobile Phases, Octadecylsilyl, Solid Core, End-capped

Silica gel with spherical silica particles containing a solid non-porous silica core surrounded by a thin outer organosilica polymer coating with octadecylsilyl groups, suitable for use with highly aqueous mobile phases including 100 per cent aqueous phases. To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups.

Organosilica Polymer for Mass Spectrometry, Amorphous, Octadecylsilyl, End-capped Organosilica Polymer for Chromatography, Amorphous, Octadecylsilyl, End-capped

Synthetic, spherical hybrid particles containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by the bonding of octadecylsilyl groups. To minimise any interaction with basic compounds, they are carefully end-capped to cover most of the remaining silanol groups.

Organosilica Polymer, Multi-layered, Octadecylsilyl, End-capped

Synthetic, spherical hybrid particles, multi-layered, containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by the bonding of octadecylsilyl groups. To minimise any interaction with basic compounds, they are carefully end-capped to cover most of the remaining silanol groups.

Orientin 2-(3,4-Dihydroxyphenyl)-8-β-D-glucopyranosyl-5,7-dihydroxy-4*H*-1-benzopyran-4-one; 8-β-D-Glucopyranosyl-3′,4′,5,7-tetrahydroxyflavone; Luteolin-8-*C*-β-D-glucopyranoside; Luteolin-8-glucoside; $C_{21}H_{20}O_{11}$ = 448.4 (*28608-75-5*)

Orthophosphoric Acid Phosphoric acid; (*7664-38-2*)

See *Concentrated phosphoric acid (0004)*.

Orthophosphorous Acid Phosphorous acid; H_3PO_3 = 82.0 (*13598-36-2*)

White or almost white, very hygroscopic and deliquescent crystalline mass; slowly oxidised by oxygen (air) to H_3PO_4.

Unstable, orthorhombic crystals, soluble in water, in ethanol (96 per cent) and in a mixture of 3 volumes of ether and 1 volume of ethanol (96 per cent).

d_4^{21}: 1.651.

mp: about 73 °C.

Osthole 7-Methoxy-8-(3-methylbut-2-enyl)-2*H*-1-benzopyran-2-one; 7-Methoxy-8-isopentenylcoumarin; $C_{15}H_{16}O_3$ = 244.3 (*484-12-8*)

Oxalic Acid Ethanedioic acid dihydrate; $C_2H_2O_4,2H_2O$ = 126.1 (*6153-56-6*)

White or almost white crystals, soluble in water, freely soluble in ethanol (96 per cent).

Oxalic Acid and Sulfuric Acid Solution Oxalic acid and sulphuric acid solution

A 50 g/L solution of *oxalic acid R* in a cooled mixture of equal volumes of *sulfuric acid R* and *water R*.

Oxazepam (*604-75-1*)

See *Oxazepam (0778)*.

Ox Brain, Acetone-dried

Cut into small pieces a fresh ox brain previously freed from vascular and connective tissue. Place in *acetone R* for preliminary dehydration. Complete the dehydration by pounding in a mortar 30 g of this material with successive quantities, each of 75 mL, of *acetone R* until a dry powder is obtained after filtration. Dry at 37 °C for 2 h or until the odour of acetone is no longer present.

2,2′-Oxybis(N,N-dimethylethylamine) Bis(2-dimethylaminoethyl) ether; $C_8H_{20}N_2O$ = 160.3 (*3033-62-3*)

Colourless, corrosive liquid.

d_{20}^{20}: about 0.85.

n_D^{20}: about 1.430.

Oxygen O_2 = 32.00

Content: minimum 99.99 per cent *V/V*.

Nitrogen and argon: less than 100 ppm.

Carbon dioxide: less than 10 ppm.

Carbon monoxide: less than 5 ppm.

Oxygen R1 O_2 = 32.00

Content: minimum 99 per cent *V/V*.

Oxytetracycline Hydrochloride

See *Oxytetracycline hydrochloride (0198)*.

Paeoniflorin [(1*R*,2*S*,3*R*,5*R*,6*R*,8*S*)-3-(β-D-Glucopyranosyloxy)6-hydroxy-8-methyl-9,10-dioxatetracyclo [4.3.1.$0^{2,5}$.$0^{3,8}$]decan-2-yl]methyl benzoate; $C_{23}H_{28}O_{11}$ = 480.5 (*23180-57-6*)

Paeonol 1-(2-Hydroxy-4-methoxyphenyl)ethan-1-one; 2′-Hydroxy-4′-methoxyacetophenone; $C_9H_{10}O_3$ = 166.2 (*552-41-0*)

Palladium Pd = 106.4 (*7440-05-3*)

Grey white metal, soluble in hydrochloric acid.

Palladium(II) Chloride Palladium chloride; $PdCl_2$ = 177.3 (*7647-10-1*)

Red crystals.

mp: 678 °C to 680 °C.

Palladium Chloride Solution

Dissolve 1 g of *palladium chloride R* in 10 mL of warm *hydrochloric acid R*. Dilute the solution to 250 mL with a mixture of equal volumes of *dilute hydrochloric acid R* and *water R*. Dilute this solution immediately before use with 2 volumes of *water R*.

Palmatine 2,3,9,10-Tetramethoxy-5,6-dihydro-7λ^5-isoquinolino[3,2-*a*]isoquinolin-7-ylium; 7,8,13,13a-Tetradehydro-2,3,9,10-tetramethoxyberbinium; $C_{21}H_{22}NO_4^+$ = 352.4 (*3486-67-7*)

Palmatine Chloride Berbericine Chloride; $C_{21}H_{22}NO_4$, Cl = 387.86 (*10605-02-4*)

General reagent grade of commerce.

Palmitic Acid Hexadecanoic acid; $C_{16}H_{32}O_2$ = 256.4 (*57-10-3*)

White or almost white, crystalline scales, practically insoluble in water, freely soluble in hot ethanol (96 per cent).

mp: about 63 °C.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Chloramphenicol palmitate (0473)*; the chromatogram shows only one principal spot.

Palmitic acid used in the assay of total fatty acids in the monograph Saw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 98 per cent, calculated by the normalisation procedure.

Palmitoleic Acid (9*Z*)-Hexadec-9-enoic acid; $C_{16}H_{30}O_2$ = 254.4 (*373-49-9*)

Clear, colourless liquid.

bp: about 162 °C.

Palmitoleic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 98 per cent, calculated by the normalisation procedure.

Palmityl Alcohol Hexadecan-1-ol; Cetyl alcohol; $C_{16}H_{34}O$ = 242.4 (*36653-82-4*)

mp: about 48 °C.

Content: minimum 96 per cent.

Pancreas Powder See *Pancreas powder (0350)*.

Papain (*9001-73-4*)

A proteolytic enzyme obtained from the latex of the green fruit and leaves of *Carica papaya* L.

Papaverine Hydrochloride (*61-25-6*)

See *Papaverine hydrochloride (0102)*.

Paper Chromatography Performance Test Solutions

Test solution (A). Sodium pertechnetate (^{99m}Tc) injection (fission) (0124) or *Sodium pertechnetate (^{99m}Tc) injection (non-fission) (0283)*.

Test solution (B). In a closed vial mix 100 µL of a 5 g/L solution of *stannous chloride R* in *0.05 M hydrochloric acid* and 100 MBq to 200 MBq of *Sodium pertechnetate (^{99m}Tc) injection (fission) (0124)* or *Sodium pertechnetate (^{99m}Tc) injection (non-fission) (0283)* in a volume not exceeding 2 mL.

Paper for Chromatography

Pure cellulose grade thin paper with a smooth surface and a thickness of about 0.2 mm.

Chromatographic separation. To 2 strips of *paper for chromatography R* apply separately 2-5 µL of test solution (a) and test solution (b) of *paper chromatography performance test solutions R*. Develop over a pathlength of 3/4 of the paper height, using a mixture of equal volumes of *methanol R* and *water R*. Allow to dry and determine the distribution of radioactivity using a suitable detector. The paper is not satisfactory, unless the chromatogram obtained with test solution (a) shows a single radioactivity spot with an R_F value in the range 0.8-1.0 and the chromatogram obtained with test solution (b) shows a single radioactivity spot at the application point (R_F value in the range 0.0-0.1).

Paracetamol (*103-90-2*)

See *Paracetamol (0049)*.

Paracetamol, 4-Aminophenol-free

Recrystallise *paracetamol R* from *water R* and dry *in vacuo* at 70 °C; repeat the procedure until the product complies with the following test: dissolve 5 g of the dried substance in a mixture of equal volumes of *methanol R* and *water R* and dilute to 100 mL with the same mixture of solvents. Add 1 mL of a freshly prepared solution containing 10 g/L of *sodium nitroprusside R* and 10 g/L of *anhydrous sodium carbonate R*, mix and allow to stand for 30 min protected from light. No blue or green colour is produced.

Paraffin, Liquid (*8042-47-5*)

See *Liquid paraffin (0239)*.

Paraffin, White Soft

A semi-liquid mixture of hydrocarbons obtained from petroleum and bleached, practically insoluble in water and in ethanol (96 per cent), soluble in *light petroleum R1*, the solution sometimes showing a slight opalescence.

Paraldehyde (*123-63-7*)

See *Paraldehyde (0351)*.

Pararosaniline Hydrochloride Pararosaniline chloride; Basic red 9; $C_{19}H_{18}ClN_3$ = 323.8 (*569-61-9*)

Schultz No. 779

Colour Index No. 42500

Bluish-red, crystalline powder, slightly soluble in water, soluble in anhydrous ethanol. Solutions in water and anhydrous ethanol are deep-red; solutions in sulfuric acid and in hydrochloric acid are yellow.

mp: about 270 °C, with decomposition.

Pararosaniline Solution, Decolorised

To 0.1 g of *pararosaniline hydrochloride R* in a ground-glass-stoppered flask add 60 mL of *water R* and a solution of 1.0 g of *anhydrous sodium sulfite R* or 2.0 g of *sodium sulfite heptahydrate R* or 0.75 g of *sodium metabisulfite R* in 10 mL of *water R*. Slowly and with stirring add 6 mL of *dilute*

hydrochloric acid R, stopper the flask and continue stirring until dissolution is complete. Dilute to 100 mL with *water R*. Allow to stand for 12 h before use.

Storage: protected from light.

Parthenolide (4*E*)-(1a*R*,7a*S*,10a*S*,10b*S*)-1a,5-Dimethyl-8-methylene-2,3,6,7,7a,8,10a,10b-octahydro-oxireno[9,10] cyclodeca[1,2-*b*]furan-9(1a*H*)-one; (*E*)-(5*S*,6*S*)-4,5-Epoxygermacra-1(10),11(13)-dieno-12(6)-lactone; $C_{15}H_{20}O_3$ = 248.3 (*20554-84-1*)

White or almost white, crystalline powder, very slightly soluble in water, very soluble in methylene chloride, soluble in methanol.

$[\alpha]_D^{22}$: −71.4, determined on a 2.2 g/L solution in *methylene chloride R*.

mp: 115 °C to 116 °C.

Absorbance (*2.2.25*). A 0.01 g/L solution in *ethanol (96 per cent) R* shows an absorption maximum at 214 nm.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Feverfew (1516)*, at the concentration of the reference solution.

Content: minimum 90 per cent, calculated by the normalisation procedure.

L-Penicillamine Coated Silica Gel For Chiral Separations

A very finely divided silica gel for chromatography coated with L-penicillamine.

Penicillinase Solution

Dissolve 10 g of casein hydrolysate, 2.72 g of *potassium dihydrogen phosphate R* and 5.88 g of *sodium citrate R* in 200 mL of *water R*, adjust to pH 7.2 with a 200 g/L solution of *sodium hydroxide R* and dilute to 1000 mL with *water R*. Dissolve 0.41 g of *magnesium sulfate R* in 5 mL of *water R* and add 1 mL of a 1.6 g/L solution of *ferrous ammonium sulfate R* and sufficient *water R* to produce 10 mL. Sterilise both solutions by heating in an autoclave, cool, mix, distribute in shallow layers in conical flasks and inoculate with *Bacillus cereus* (NCTC 9946). Allow the flasks to stand at 18 °C to 37 °C until growth is apparent and then maintain at 35 °C to 37 °C for 16 h, shaking constantly to ensure maximum aeration. Centrifuge and sterilise the supernatant by filtration through a membrane filter. 1.0 mL of penicillinase solution contains not less than 0.4 microkatals (corresponding to the hydrolysis of not less than 500 mg of benzylpenicillin to benzylpenicilloic acid per hour) at 30 °C and pH 7, provided that the concentration of benzylpenicillin does not fall below the level necessary for enzyme saturation.

The Michaelis constant for benzylpenicillin of the penicillinase in penicillinase solution is approximately 12 µg/mL.

Sterility (*2.6.1*). It complies with the test for sterility.

Storage: at a temperature between 0 °C and 2 °C for 2 to 3 days. When freeze-dried and kept in sealed ampoules, it may be stored for several months.

Pentaerythrityl Tetrakis[3-(3,5-di-*tert*-butyl-4-hydroxyphenyl)propionate] Pentaerythrityl tetrakis [3-(3,5-di(1,1-dimethylethyl)-4-hydroxyphenyl)propionate]; $C_{73}H_{108}O_{12}$ = 1178 (*6683-19-8*)

White or slightly yellow, crystalline powder, practically insoluble in water, very soluble in acetone, soluble in methanol, slightly soluble in hexane.

mp: 110 °C to 125 °C.

α-form: 120 °C to 125 °C.

β-form: 110 °C to 115 °C.

Pentafluoropropanoic Acid $C_3HF_5O_2$ = 164.0 (*422-64-0*)

Clear, colourless liquid.

d_{20}^{20}: about 1.561.

n_D^{20}: about 1.284.

bp: about 97 °C.

Pentafluoropropionic Anhydride Pentafluoropropanoic anhydride; $C_6F_{10}O_3$ = 310.0 (*356-42-3*)

***N*-Pentane** Pentane; C_5H_{12} = 72.2 (*109-66-0*)

Clear, colourless, flammable liquid, very slightly soluble in water, miscible with acetone and with anhydrous ethanol.

d_{20}^{20}: about 0.63.

n_D^{20}: about 1.359.

bp: about 36 °C.

Pentane used in spectrophotometry complies with the following additional test.

Absorbance (*2.2.25*): maximum 0.70 at 200 nm, 0.30 at 210 nm, 0.07 at 220 nm, 0.03 at 230 nm, 0.01 at 240 nm, determined using *water R* as compensation liquid.

1,2-Pentanediol (2*RS*)-Pentane-1,2-diol; $C_5H_{12}O_2$ = 104.2 (*5343-92-0*)

d_4^{20}: about 0.971.

n_D^{20}: about 1.439.

bp: about 201 °C.

3-Pentanone Pentan-3-one; Diethyl ketone; $C_5H_{10}O$ = 86.13 (*96-22-0*)

Pentan-1-ol *N*-Pentyl alcohol; Pentanol; $C_5H_{12}O$ = 88.1 (*71-41-0*)

Colourless liquid, sparingly soluble in water, miscible with ethanol (96 per cent).

n_D^{20}: about 1.410.

bp: about 137 °C.

Pentetic Acid [[(Carboxymethyl)imino] bis(ethylenenitrilo)]tetraacetic acid; White or almost white powder, slightly soluble in water; $C_{14}H_{23}N_3O_{10}$ = 393.3 (*67-43-6*)

mp: 219 °C to 220 °C, with decomposition.

***tert*-Pentyl Alcohol** *tert*-Amyl alcohol; 2-Methyl-2-butanol; $C_5H_{12}O$ = 88.1 (*75-85-4*)

Volatile, flammable liquid, freely soluble in water, miscible with ethanol (96 per cent) and with glycerol.

d_{20}^{20}: about 0.81.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 100 °C and 104 °C.

Storage: protected from light.

Pepsin

A substance containing a proteolytic enzyme of the gastric secretion of animals, diluted, if necessary, by admixture with Lactose or Sucrose. Use a grade of commerce capable of digesting 2500 times its own weight of coagulated egg albumen.

Pepsin Powder (*9001-75-6*)

See *Pepsin powder (0682)*.

Peptide *N*-glycosidase F (*83534-39-8*)

Peptide-N^4-(*N*-acetyl-β-glucosaminyl)asparagine amidase (EC 3.5.1.52). PNGase F.

Perchloric Acid $HClO_4$ = 100.5 (*7601-90-3*)

Content: 70.0 per cent *m/m* to 73.0 per cent *m/m*.

Clear, colourless liquid, miscible with water.

d_{20}^{20}: about 1.7.

Assay. To 2.50 g add 50 mL of *water R* and titrate with *1 M sodium hydroxide*, using 0.1 mL of *methyl red solution R* as indicator.

1 mL of *1 M sodium hydroxide* is equivalent to 100.5 mg of $HClO_4$.

Perchloric Acid Solution

Dilute 8.5 mL of *perchloric acid R* to 100 mL with *water R*.

Perfluoroheptanoic Acid Tridecafluoroheptanoic acid; $C_7HF_{13}O_2$ = 364.1 (*375-85-9*)

Periodic Acetic Acid Solution

Dissolve 0.446 g of *sodium periodate R* in 2.5 mL of a 25 per cent *V/V* solution of *sulfuric acid R*. Dilute to 100.0 mL with *glacial acetic acid R*.

Periodic Acid H_5IO_6 = 227.9 (*10450-60-9*)

Crystals, freely soluble in water and soluble in ethanol (96 per cent).

mp: about 122 °C.

Periodic Acid Reagent

Dissolve 0.5 g of *sodium periodate* in 5 mL of *water*, add 1 mL of 2M *sulfuric acid* and dilute to 10 mL with *water*.

Prepare immediately before use.

Periodic Acid Solution

General reagent grade of commerce containing about 50% w/v of $HIO_4,2H_2O$.

Permethrin $C_{21}H_{20}Cl_2O_3$ = 391.3 (*52645-53-1*)

mp: 34 °C to 35 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Peroxide Test Strips

Use commercial test strips with a suitable scale in the range from 0 ppm to 25 ppm peroxide.

Peroxyacetic Acid Solution

Dilute 1 mL of *hydrogen peroxide (100 volumes)* to 100 mL with *glacial acetic acid*. Mix and allow to stand for 12 hours before use.

Discard 24 hours after preparation.

Perylene Dibenz[*de,kl*]anthracene; $C_{20}H_{12}$ = 252.3 (*198-55-0*)

Orange powder.

mp: about 279 °C.

Petroleum, Light Petroleum ether 50-70 °C; (*8032-32-4*)

Clear, colourless, flammable liquid without fluorescence, practically insoluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: 0.661 to 0.664.

Distillation range (*2.2.11*): 50 °C to 70 °C.

Petroleum R1, Light Petroleum ether 40-60 °C

Complies with the requirements prescribed for *light petroleum R*, with the following modifications.

d_{20}^{20}: 0.630 to 0.656.

Distillation range (*2.2.11*): 40 °C to 60 °C. It does not become cloudy at 0 °C.

Petroleum R2, Light Petroleum ether 30-40 °C

Complies with the requirements prescribed for *light petroleum R*, with the following modifications.

d_{20}^{20}: 0.620 to 0.630.

Distillation range (*2.2.11*): 30 °C to 40 °C. It does not become cloudy at 0 °C.

Petroleum R3, Light Petroleum ether 100-120 °C

Complies with the requirements prescribed for *light petroleum R*, with the following modifications.

d_{20}^{20}: about 0.720.

Distillation range (*2.2.11*): 100 °C to 120 °C.

Water (*2.5.12*): maximum 0.03 per cent.

Petroleum R4, Light Petroleum ether 80-100 °C

Complies with the requirements prescribed for *light petroleum R*, with the following modifications.

d_{20}^{20}: about 0.70.

Distillation range (*2.2.11*): 80 °C to 100 °C.

Petroleum Spirit Petroleum ether

Petroleum ether; light petroleum

Analytical reagent grades of commerce.

Colourless, volatile, highly flammable liquids obtained from petroleum, consisting of a mixture of the lower members of the paraffin series of hydrocarbons supplied in the following fractions:

boiling range, 30° to 40°; weight per mL, about 0.63 g,

boiling range, 40° to 60°; weight per mL, about 0.64 g,

boiling range, 50° to 70°; weight per mL, about 0.66 g,

boiling range, 60° to 80°; weight per mL, about 0.67 g,

boiling range, 80° to 100°; weight per mL, about 0.70 g,

boiling range, 100° to 120°; weight per mL, about 0.72 g,

boiling range, 120° to 160°; weight per mL, about 0.75 g.

Petroleum Spirit (boiling range, 40° to 60°), Aromatic-free

Petroleum spirit (boiling range, 40° to 60°) complying with the following additional test.

Light absorption *Absorbance* against air at 235 nm, not more than 0.7, Appendix II B.

pH Indicator Strip

Paper strip, or plastic strip containing multiple segments of different dye-impregnated papers, allowing visual determination of pH in the prescribed range, by comparison with the corresponding master chart.

α-Phellandrene (*R*)-5-Isopropyl-2-methyl-cyclohexa-1,3-diene; (–)-*p*-Mentha-1,5-diene; $C_{10}H_{16}$ = 136.2 (*4221-98-1*)

n_D^{20}: about 1.471.

bp: 171 °C to 174 °C.

α-Phellandrene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Eucalyptus oil (0390)*.

Test solution. The substance to be examined.

Content: 95.0 per cent, calculated by the normalisation procedure.

Phenacetin *p*-Ethoxyacetanilide; $C_{10}H_{13}NO_2$ = 179.2 (*62-44-2*)

mp: about 135°.

General reagent grade of commerce.

Phenanthrene $C_{14}H_{10}$ = 178.2 (*85-01-8*)

White or almost white crystals, practically insoluble in water, sparingly soluble in ethanol (96 per cent).

mp: about 100 °C.

Phenanthroline Hydrochloride 1,10-Phenanthroline hydrochloride monohydrate; $C_{12}H_9ClN_2,H_2O$ = 234.7 (*18851-33-7*)

White or almost white, crystalline powder, freely soluble in water, soluble in ethanol (96 per cent).

mp: about 215 °C, with decomposition.

Phenazone (*60-80-0*)

See *Phenazone (0421)*.

Phenol (*108-95-2*)

See *Phenol (0631)*.

Phenol, Liquefied

General reagent grade of commerce.

A solution of phenol in water containing about 80% w/w of C_6H_6O.

Phenol Red 4,4′-(3H-2,1-Benzoxathiol-3-ylidene) diphenol S,S-dioxide; Phenolsulfonphthalein; (*143-74-8*)

Bright red or dark red, crystalline powder, very slightly soluble in water, slightly soluble in ethanol (96 per cent).

Phenol Red Solution

Dissolve 0.1 g of *phenol red R* in a mixture of 2.82 mL of *0.1 M sodium hydroxide* and 20 mL of *ethanol (96 per cent) R* and dilute to 100 mL with *water R*.

Test for sensitivity. Add 0.1 mL of the phenol red solution to 100 mL of *carbon dioxide-free water R*. The solution is yellow. Not more than 0.1 mL of *0.02 M sodium hydroxide* is required to change the colour to reddish-violet.

Colour change: pH 6.8 (yellow) to pH 8.4 (reddish-violet).

Phenol Red Solution R1

Buffered phenol red solution

Dissolve 33 mg of *phenol red* in 1.5 mL of 2M *sodium hydroxide* and dilute to 100 mL with *water* (solution A). To 250 mL of 2M *sodium hydroxide* add 325 mL of 2M *acetic acid* and 575 mL of *water* (solution B). Mix 25 mL of solution A with 475 mL of solution B.

Phenol Red Solution R2

Solution A. Dissolve 33 mg of *phenol red R* in 1.5 mL of *dilute sodium hydroxide solution R* and dilute to 100 mL with *water R*.

Solution B. Dissolve 25 mg of *ammonium sulfate R* in 235 mL of *water R*; add 105 mL of *dilute sodium hydroxide solution R* and 135 mL of *dilute acetic acid R*.

Add 25 mL of solution A to solution B. If necessary, adjust the pH of the mixture to 4.7.

Phenol Red Solution R3

Solution A. Dissolve 33 mg of *phenol red R* in 1.5 mL of *dilute sodium hydroxide solution R* and dilute to 50 mL with *water R*.

Solution B. Dissolve 50 mg of *ammonium sulfate R* in 235 mL of *water R*; add 105 mL of *dilute sodium hydroxide solution R* and 135 mL of *dilute acetic acid R*.

Add 25 mL of solution A to solution B; if necessary, adjust the pH of the mixture to 4.7.

Phenoldisulfonic Acid Solution

Phenoldisulphonic acid solution

A clear liquid which may develop a pale brown colour on storage, prepared either by heating 3 g of *phenol* with 20 mL of *sulfuric acid* on a water bath for 6 hours and transferring the resulting liquid to a stoppered vessel, or by diluting a 25% w/v solution of commerce with *sulfuric acid* to contain 15% w/v of phenol. The solution complies with the following test.

Sensitivity to nitrate Evaporate a solution containing 0.1 mg of *potassium nitrate* to dryness in a porcelain dish on a water bath. To the cooled residue add 1 mL of the reagent and allow to stand for 10 minutes. Add 10 mL of *water*, cool, add 10 mL of 5M *ammonia* and dilute to 25 mL with *water*. A distinct yellow colour is produced when compared with a solution prepared in the same manner but omitting the potassium nitrate.

Phenolphthalein 3,3-Bis(4-hydroxyphenyl)-3*H*-isobenzofuran-1-one; $C_{20}H_{14}O_4$ = 318.3 (*77-09-8*)

White or yellowish-white powder, practically insoluble in water, soluble in ethanol (96 per cent).

Phenolphthalein Paper

Immerse strips of filter paper for a few minutes in *phenolphthalein solution R*. Allow to dry.

Phenolphthalein Solution

Dissolve 0.1 g of *phenolphthalein R* in 80 mL of *ethanol (96 per cent) R* and dilute to 100 mL with *water R*.

Test for sensitivity. To 0.1 mL of the phenolphthalein solution add 100 mL of *carbon dioxide-free water R*. The solution is colourless. Not more than 0.2 mL of *0.02 M sodium hydroxide* is required to change the colour to pink.

Colour change: pH 8.2 (colourless) to pH 10.0 (red).

Phenolphthalein Solution R1

A 10 g/L solution of *phenolphthalein R* in *ethanol (96 per cent) R*.

Phenolphthalein-Thymol Blue Solution

Dissolve 0.1 g of *thymol blue* in a mixture of 2.2 mL of 0.1M *sodium hydroxide* and 50 mL of *ethanol (96%)* and dilute to 100 mL with *water*. Mix 3 volumes of this solution with 2 volumes of *phenolphthalein solution*.

Phenoxyacetic Acid 2-Phenoxyethanoic acid; $C_8H_8O_3$ = 152.1 (*122-59-8*)

Almost white crystals, sparingly soluble in water, freely soluble in ethanol (96 per cent), and in glacial acetic acid.

mp: about 98 °C.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Phenoxymethylpenicillin (0148)*; the chromatogram shows only one principal spot.

2-Phenoxyaniline 2-Phenoxybenzenamine; 2-Aminophenyl phenyl ether; $C_{12}H_{11}NO$ = 185.2 (*2688-84-8*)**Phenoxybenzamine Hydrochloride** *N*-(2-Chloroethyl)-*N*-(1-methyl-2-phenoxyethyl)-benzylamine hydrochloride; $C_{18}H_{23}Cl_2NO$ = 340.3

Content: 97.0 per cent to 103.0 per cent (dried substance).

White or almost white, crystalline powder, sparingly soluble in water, freely soluble in ethanol (96 per cent).

mp: about 138 °C.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined by drying over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 24 h.

Assay. Dissolve 0.500 g in 50.0 mL of *ethanol-free chloroform R* and extract with three quantities, each of 20 mL, of *0.01 M hydrochloric acid*. Discard the acid extracts, filter the chloroform layer through cotton and dilute 5.0 mL of the filtrate to 500.0 mL with *ethanol-free chloroform R*. Measure the absorbance of the resulting solution in a closed cell at the maximum at 272 nm. Calculate the content of $C_{18}H_{23}Cl_2NO$, taking the specific absorbance to be 56.3.

Storage: protected from light.

2-Phenoxyethanol Phenoxyethanol; $C_8H_{10}O_2$ = 138.2 (*122-99-6*)

Clear, colourless, oily liquid, slightly soluble in water, freely soluble in ethanol (96 per cent).

d_{20}^{20}: about 1.11.

n_D^{20}: about 1.537.

Freezing point (*2.2.18*): minimum 12 °C.

Phenyl Benzoate $C_{13}H_{10}O_2$ = 198.2 (*93-99-2*)

mp: about 70°.

General reagent grade of commerce.

Phenyl Isothiocyanate C_7H_5NS = 135.2 (*103-72-0*)

Liquid, insoluble in water, soluble in ethanol (96 per cent).

d_{20}^{20}: about 1.13.

n_D^{20}: about 1.65.

bp: about 221 °C.

mp: about −21 °C.

Use a grade suitable for protein sequencing.

Phenyl(5)methyl(95)polysiloxane

Polysiloxane substituted with 5 per cent of phenyl groups and 95 per cent of methyl groups.

Phenyl(5)methyl(95)polysiloxane, Base-deactivated

Base-deactivated polysiloxane substituted with 5 per cent of phenyl groups and 95 per cent of methyl groups.

Phenyl(50)methyl(50)polysiloxane

Polysiloxane substituted with 50 per cent of phenyl groups and 50 per cent of methyl groups.

Phenylacetic Acid $C_8H_8O_2$ = 136.2 (*103-82-2*)

White or almost white powder, soluble in water.

bp: about 265 °C.

mp: about 75 °C.

L-Phenylalanine Phenylalanine; (*63-91-2*)

See *Phenylalanine (0782)*.

***o*-Phenylbenzoic Acid** 2-Biphenylcarboxylic acid; $C_{13}H_{10}O_2$ = 198 (*947-84-2*)

mp: about 113°.

General reagent grade of commerce.

2-Phenylbutanoic acid (2*RS*)-2-Phenylbutanoic acid (primidone impurity E); $C_{10}H_{12}O_2$ = 164.2 (*90-27-7*)

General reagent grade of commerce containing > 95.0% of $C_{10}H_{12}O_2$

(2-Phenylbutanoyl)urea *N*-Carbamoyl-2-phenylbutanamide; 2-Phenylbutyrylurea; Pheneturide; $C_{11}H_{14}N_2O_2$ = 206.2 (*90-49-3*)

General reagent grade of commerce containing > 95.0% of $C_{11}H_{14}N_2O_2$.

(*E*)-4-Phenylbut-3-en-2-one Benzalacetone; $C_{10}H_{10}O$ = 146.2 (*122-57-6*)

White or pale yellow mass.

Content: minimum 98.0 per cent.

bp: about 261 °C.

mp: about 39 °C.

***N*-Phenylcarbazole** $C_{18}H_{13}N$ = 243.3 (*1150-62-5*)

mp: about 96°.

General reagent grade of commerce.

A white to pale tan, crystalline powder.

***p*-Phenylenediamine Dihydrochloride** 1,4-Diaminobenzene dihydrochloride; $C_6H_{10}Cl_2N_2$ = 181.1 (*624-18-0*)

Crystalline powder or white or slightly coloured crystals, turning reddish on exposure to air, freely soluble in water, slightly soluble in ethanol (96 per cent).

D-Phenylglycine (2*R*)-2-Amino-2-phenylacetic acid; $C_8H_9NO_2$ = 151.2 (*875-74-1*)

Content: minimum 99 per cent.

White or almost white, crystalline powder.

DL-Phenylglycine 2-Amino-2-phenylacetic acid; α-Phenylglycine; $C_8H_9NO_2$ = 151.2 (*2835-06-5*)

Phenylhydrazine $C_6H_8N_2$ = 108.1 (*100-63-0*)

White or almost white, crystalline powder, becoming yellow or dark red on exposure to air, melting at room temperature giving an oily liquid, miscible with anhydrous ethanol, sparingly soluble in water.

bp: about 244 °C, with decomposition.

mp: about 20 °C.

Phenylhydrazine Hydrochloride Phenylhydrazinium chloride; $C_6H_9ClN_2$ = 144.6 (*59-88-1*)

White or almost white, crystalline powder, becoming brown on exposure to air, soluble in water and in ethanol (96 per cent).

mp: about 245 °C, with decomposition.

Storage: protected from light.

Phenylhydrazine Hydrochloride Solution Strong phenylhydrazine hydrochloride solution

Dissolve 0.9 g of *phenylhydrazine hydrochloride R* in 50 mL of *water R*. Decolorise with *activated charcoal R* and filter. To the filtrate add 30 mL of *hydrochloric acid R* and dilute to 250 mL with *water R*.

Phenylhydrazine-Sulfuric Acid Solution Phenylhydrazine-sulphuric acid solution

Dissolve 65 mg of *phenylhydrazine hydrochloride R*, previously recrystallised from *ethanol (85 per cent V/V) R*, in a mixture of 80 volumes of *water R* and 170 volumes of *sulfuric acid R* and dilute to 100 mL with the same mixture of solvents. Prepare immediately before use.

1-Phenylpiperazine $C_{10}H_{14}N_2$ = 162.2 (*92-54-6*)

Slightly viscous, yellow liquid, not miscible with water.

d_4^{20}: about 1.07.

n_D^{20}: about 1.588.

3-Phenylpropanoic Acid Dihydrocinnamic acid; $C_6H_5CH_2CH_2CO_2H$ = 150.17 (*501-52-0*)

mp: 47° - 50°.

White to off-white powder or crystals.

Analytical reagent grade of commerce.

1-Phenylpropan-2-ol (2*RS*)-1-Phenylpropan-2-ol; $C_9H_{12}O$ = 136.2 (*698-87-3*)

mp: 65 °C to 67 °C.

1-Phenyl-1,2,3,4-tetrahydroisoquinoline $C_{15}H_{15}N$ = 209.3 (*22990-19-8*)

Phloroglucide 2,3′,4,5′,6-Biphenylpentol; $C_{12}H_{10}O_5$ = 234.2 (*491-45-2*)

White or almost white powder, hygroscopic, light sensitive. Slowly discolours on exposure to light.

Phloroglucinol Benzene-1,3,5-triol; $C_6H_6O_3,2H_2O$ = 162.1 (*6099-90-7*)

White or yellowish crystals, slightly soluble in water, soluble in ethanol (96 per cent).

mp: about 223 °C (instantaneous method).

Phloroglucinol Solution

To 1 mL of a 100 g/L solution of *phloroglucinol R* in *ethanol (96 per cent) R*, add 9 mL of *hydrochloric acid R*.

Storage: protected from light.

Phosalone $C_{12}H_{15}ClNO_4PS_2$ = 367.8 (*2310-17-0*)

mp: 45 °C to 48 °C

A suitable certified reference solution (10 ng/µL in iso-octane) may be used.

Phospholipid

Wash a quantity of human or bovine brain freed from meninges and blood vessels and macerate in a suitable blender. Weigh 1000 to 1300 g of the macerate and measure its volume (*V* mL). Extract with three quantities, each of 4*V* mL, of *acetone*, filter by suction and dry the precipitate at 37° for 18 hours. Extract the dried precipitate with two quantities, each of 2*V mL*, of a mixture of 2 volumes of *petroleum spirit (boiling range, 30° to 40°)* and 3 volumes of *petroleum spirit (boiling range, 40° to 60°)*, filtering each extract through a filter paper previously washed with the petroleum spirit mixture. Combine the extracts and evaporate to dryness at 45° at a pressure not exceeding 0.7 kPa. Dissolve the residue in 0.2*V* mL of *ether* and allow to stand at 4° until a deposit is produced. Centrifuge and evaporate the clear supernatant liquid under reduced pressure until the volume is about 100 mL per kg of the original macerate. Allow to stand at 4° until a precipitate is produced (12 to 24 hours) and centrifuge. To the clear supernatant liquid add 5 volumes of *acetone*, centrifuge, discard the supernatant liquid, dry the precipitate and store protected from light in a vacuum desiccator.

Phosphomolybdic Acid Dodecamolybdophosphoric acid; $12MoO_3,H_3PO_4,xH_2O$ (*51429-74-4*)

Orange-yellow, fine crystals, freely soluble in water, soluble in ethanol (96 per cent).

Phosphomolybdic Acid Solution

Dissolve 4 g of *phosphomolybdic acid R* in *water R* and dilute to 40 mL with the same solvent. Add cautiously and with cooling 60 mL of *sulfuric acid R*. Prepare immediately before use.

Phosphomolybdic Acid Solution, Ethanolic

A 20% w/v solution of *phosphomolybdic acid* in *ethanol (96%)*.

Prepare immediately before use.

Phosphomolybdotungstic Reagent Lithium and sodium molybdotungstophosphate solution; Folin Ciocalteau phenol reagent of commerce

Dissolve 100 g of *sodium tungstate R* and 25 g of *sodium molybdate R* in 700 mL of *water R*. Add 100 mL of *hydrochloric acid R* and 50 mL of *phosphoric acid R*. Heat the mixture under a reflux condenser in a glass apparatus for 10 h. Add 150 g of *lithium sulfate R*, 50 mL of *water R* and a few drops of *bromine R*. Boil to remove the excess of bromine (15 min), allow to cool, dilute to 1000 mL with *water R* and filter. The reagent should be yellow in colour. If it acquires a greenish tint, it is unsatisfactory for use but may be regenerated by boiling with a few drops of *bromine R*. Care must be taken to remove the excess of bromine by boiling.

Storage: at 2 °C to 8 °C.

Phosphomolybdotungstic Reagent, Dilute

To 1 volume of *phosphomolybdotungstic reagent R* add 2 volumes of *water R*.

Phosphoric Acid, Dilute See *Dilute phosphoric acid (0005)*.

Phosphoric Acid, Dilute R1

Dilute 93 mL of *dilute phosphoric acid R* to 1000 mL with *water R*.

Phosphorus Pentoxide Diphosphorus pentoxide; P_2O_5 = 141.9 (*1314-56-3*)

White or almost white powder, amorphous, deliquescent. It is hydrated by water with the evolution of heat.

Storage: in an airtight container.

Phosphotungstic Acid Solution

Heat under a reflux condenser for 3 h, 10 g of *sodium tungstate R* with 8 mL of *phosphoric acid R* and 75 mL of *water R*. Allow to cool and dilute to 100 mL with *water R*.

Phthalaldehyde Benzene-1,2-dicarboxaldehyde; $C_8H_6O_2$ = 134.1 (*643-79-8*)

Yellow, crystalline powder.

mp: about 55 °C.

Storage: protected from light and air.

Phthalaldehyde Reagent

Dissolve 2.47 g of *boric acid R* in 75 mL of *water R*, adjust to pH 10.4 using a 450 g/L solution of *potassium hydroxide R* and dilute to 100 mL with *water R*. Dissolve 1.0 g of *phthalaldehyde R* in 5 mL of *methanol R*, add 95 mL of the boric acid solution and 2 mL of *thioglycollic acid R* and adjust to pH 10.4 with a 450 g/L solution of *potassium hydroxide R*.

Storage: protected from light; use within 3 days.

Phthalazine $C_8H_6N_2$ = 130.1 (*253-52-1*)

Pale yellow crystals, freely soluble in water, soluble in anhydrous ethanol, in ethyl acetate and in methanol.

mp: 89 °C to 92 °C.

Phthalein Purple Metalphthalein; 2,2′,2″,2‴-[*o*-Cresolphthalein-3′,3″-bis(methylenenitrilo)]tetra-acetic acid; (1,3-Dihydro-3-oxo-isobenzofuran-1-ylidene)bis[(6-hydroxy-5-methyl-3,1-phenylene)bis(methyleneimino)diacetic acid]; $C_{32}H_{32}N_2O_{12},xH_2O$ = 637, anhydrous substance (*2411-89-4*)

Yellowish-white or brownish powder, practically insoluble in water, soluble in ethanol (96 per cent). The product may be found in commerce in the form of the sodium salt: a yellowish-white to pink powder, soluble in water, practically insoluble in ethanol (96 per cent).

Test for sensitivity. Dissolve 10 mg in 1 mL of *concentrated ammonia R* and dilute to 100 mL with *water R*. To 5 mL of the solution add 95 mL of *water R*, 4 mL of *concentrated ammonia R*, 50 mL of *ethanol (96 per cent) R* and 0.1 mL of *0.1 M barium chloride*. The solution is blue-violet. Add 0.15 mL of *0.1 M sodium edetate*. The solution becomes colourless.

Phthalic Acid Benzene-1,2-dicarboxylic acid; $C_8H_6O_4$ = 166.1 (*88-99-3*)

White or almost white, crystalline powder, soluble in hot water and in ethanol (96 per cent).

Phthalic Anhydride Isobenzofuran-1,3-dione; $C_8H_4O_3$ = 148.1 (*85-44-9*)

Content: minimum 99.0 per cent.

White or almost white flakes.

mp: 130 °C to 132 °C.

Assay. Dissolve 2.000 g in 100 mL of *water R* and boil under a reflux condenser for 30 min. Cool and titrate with *1 M sodium hydroxide*, using *phenolphthalein solution R* as indicator.

1 mL of *1 M sodium hydroxide* is equivalent to 74.05 mg of $C_8H_4O_3$.

Phthalic Anhydride Solution

Dissolve 42 g of *phthalic anhydride R* in 300 mL of *anhydrous pyridine R*. Allow to stand for 16 h.

Storage: protected from light; use within 1 week.

Picein 1-[4-(β-D-Glucopyranosyloxy)phenyl]ethanone; *p*-(Acetylphenyl)-β-D-glucopyranoside; $C_{14}H_{18}O_7$ = 298.3 (*530-14-3*)

mp: 194 °C to 195 °C.

Picric Acid 2,4,6-Trinitrophenol; $C_6H_3N_3O_7$ = 229.1 (*88-89-1*)

Yellow prisms or plates, soluble in water and in ethanol (96 per cent).

Storage: moistened with *water R*.

Picric Acid Solution

A 10 g/L solution of *picric acid R*.

Picric Acid Solution R1

Prepare 100 mL of a saturated solution of *picric acid R* and add 0.25 mL of *strong sodium hydroxide solution R*.

Picrolonic Acid 3-Methyl-4-nitro-1-(4-nitrophenyl)-5-pyrazolone; $C_{10}H_8N_4O_5$ = 264.2 (*550-74-3*)

mp: about 116°.

General reagent grade of commerce.

Complies with the following test.

Sensitivity Dissolve 25 mg in 10 mL of warm *water* containing 0.1 mL of *glacial acetic acid*; to 1 mL of this solution add 1 mL of a 0.05% w/v solution of *calcium chloride* previously heated to 60°. A bulky precipitate is produced within 5 minutes.

A yellow or brownish yellow, crystalline powder.

Picrotin (1*R*,3*R*,5*S*,8*S*,9*R*,12*S*,13*R*,14*S*)-1-hydroxy-14-(2-hydroxypropan-2-yl)-13-methyl-4,7,10-trioxapentacyclo [6.4.1.1.^{9,12}.0^{3,5}.0^{5,13}]tetradecane-6,11-dione; $C_{15}H_{18}O_7$ = 310.3 (*21416-53-5*)

White or colourless crystalline powder or crystals, soluble in boiling water and in ethanol (96 per cent), practically insoluble in methylene chloride.

mp: 248 °C to 250 °C.

Picrotoxinin (1*R*,3*R*,5*S*,8*S*,9*R*,12*S*,13*R*,14*R*)-1-hydroxy-13-methyl-14-(prop-1-en-2-yl)-4,7,10-trioxapentacyclo [6.4.1.1^{9,12}.0^{3,5}.0^{5,13}]tetradecane-6,11-dione; $C_{15}H_{16}O_6$ = 292.2 (*17617-45-7*)

White or colourless crystalline powder or crystals, soluble in methylene chloride, in ethanol (96 per cent) and in alkaline solutions.

mp: 207 to 210 °C.

α-Pinene (1*R*,5*R*)-2,6,6-Trimethylbicyclo[3.1.1]hept-2-ene; $C_{10}H_{16}$ = 136.2 (*7785-70-8*)

Liquid not miscible with water.

d_{20}^{20}: about 0.859.

n_D^{20}: about 1.466.

bp: 154 °C to 156 °C.

α-Pinene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Bitter-orange-flower oil (1175)*.

Test solution. The substance to be examined.

Content: minimum 99.0 per cent, calculated by the normalisation procedure.

β-Pinene 6,6-Dimethyl-2-methylenebicyclo[3.1.1]heptane; $C_{10}H_{16}$ = 136.2 (*127-91-3*)

Colourless, oily liquid, odour reminiscent of turpentine, practically insoluble in water, miscible with ethanol (96 per cent).

β-Pinene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Bitter-orange-flower oil (1175)*.

Test solution. The substance to be examined.

Content: minimum 95.0 per cent.

1,4-Piperazinediethanesulfonic Acid Piperazine-1,4-bis(2-ethanesulfonic acid); 2,2′-(Piperazine-1,4-diyl) bis(ethanesulfonic acid); Piperazine-*N*,*N*′-bis(2-ethanesulfonic acid); PIPES; $C_8H_{18}N_2O_6S_2$ = 302.4 (*5625-37-6*)

Content: minimum 99 per cent.

White, crystalline powder.

Piperazine Dipicrate Solution

Dissolve 0.2 g of *piperazine hydrate* in 3.5 mL of 0.5M *sulfuric acid* and 10 mL of *water*. Add 100 mL of *picric acid solution R1*, heat on a water bath for 15 minutes, cool and filter. Wash the precipitate with *water* until the washings are free from sulfate. Shake the precipitate with *water* to produce a saturated solution and filter.

Piperazine Hydrate (*142-63-2*)

See *Piperazine hydrate (0425)*.

Piperidine Hexahydropyridine; $C_5H_{11}N$ = 85.2 (*110-89-4*)

Colourless to slightly yellow, alkaline liquid, miscible with water, with ethanol (96 per cent) and with light petroleum.

bp: about 106 °C.

Piperine (2*E*,4*E*)-1-(Piperidin-1-yl)-5-(1,3-benzodioxol-5-yl)penta-2,4-dien-1-one; 1-Piperoyl-piperidine; 1-[(2*E*,4*E*)-5-(3,4-Methylenedioxyphenyl)-1-oxo-2,4-pentadienyl] piperidine; $C_{17}H_{19}NO_3$ = 285.3 (*94-62-2*)

Piperitone 6-Isopropyl-3-methyl-cyclohex-2-en-1-one; $C_{10}H_{16}O$ = 152.2 (*89-81-6*)

Pirimiphos-ethyl $C_{13}H_{24}N_3O_3PS$ = 333.4 (*23505-41-1*)

mp: 15 °C to 18 °C.

A suitable certified reference solution (10 ng/μL in cyclohexane) may be used.

Plasma, Citrated Rabbit

Collect blood by intracardiac puncture from a rabbit that has been fasted for 12 hours prior to the collection, using a plastic syringe with a No. 1 needle containing a suitable volume of a 3.8% w/v solution of *sodium citrate* so that the final volume ratio of citrate solution to blood is 1:9. Separate the plasma by centrifugation at 1500 to 1800 *g* at 15° to 20° for 30 minutes.

Store at 0° to 6° and use within 4 hours of collection.

Plasma, Platelet-poor

Withdraw 45 mL of human blood into a 50 mL plastic syringe containing 5 mL of a sterile 38 g/L solution of *sodium citrate R*. Without delay, centrifuge at 1500 *g* at 4 °C for 30 min. Remove the upper two-thirds of the supernatant plasma using a plastic syringe and without delay centrifuge at 3500 *g* at 4 °C for 30 min. Remove the upper two-thirds of the liquid and freeze it rapidly in suitable amounts in plastic tubes at or below −40 °C. Use plastic or silicone-treated equipment.

Plasma Substrate Substrate plasma

Separate the plasma from human or bovine blood collected into one-ninth its volume of a 38 g/L solution of *sodium*

citrate R, or into two-sevenths its volume of a solution containing 20 g/L of *disodium hydrogen citrate R* and 25 g/L of *glucose R*. With the former, prepare the substrate on the day of collection of the blood. With the latter, prepare within two days of collection of the blood.

Storage: at −20 °C.

Plasma Substrate Deficient in Factor V

Use preferably a plasma which is congenitally deficient, or prepare it as follows: separate the plasma from human blood collected into one tenth of its volume of a 13.4 g/L solution of *sodium oxalate R*. Incubate at 37 °C for 24 h to 36 h. The coagulation time determined by the method prescribed for *coagulation factor V solution R* should be 70 s to 100 s. If the coagulation time is less than 70 s, incubate again for 12 h to 24 h.

Storage: in small quantities at a temperature of −20 °C or lower.

Factor VII-deficient Plasma

Plasma that is deficient in factor VII.

Plasma Substrate R1 Substrate plasma R1

Use water-repellent equipment (made from materials such as suitable plastics or suitably silicone-treated glass) for taking and handling blood.

Collect a suitable volume of blood from each of at least five sheep; a 285 mL volume of blood collected into 15 mL of anticoagulant solution is suitable but smaller volumes may be collected, taking the blood, either from a live animal or at the time of slaughter, using a needle attached to a suitable cannula which is long enough to reach the bottom of the collecting vessel. Discarding the first few millilitres and collecting only free-flowing blood, collect the blood in a sufficient quantity of an anticoagulant solution containing 8.7 g of *sodium citrate R* and 4 mg of *aprotinin R* per 100 mL of *water R* to give a final ratio of blood to anticoagulant solution of 19 to 1. During and immediately after collection, swirl the flask gently to ensure mixing but do not allow frothing to occur. When collection is complete, close the flask and cool to 10-15 °C. When cold, pool the contents of all the flasks with the exception of any that show obvious haemolysis or clots and keep the pooled blood at 10-15 °C.

As soon as possible and within 4 h of collection, centrifuge the pooled blood at 1000-2000 *g* at 10-15 °C for 30 min. Separate the supernatant and centrifuge it at 5000 *g* for 30 min. (Faster centrifugation, for example 20 000 *g* for 30 min, may be used if necessary to clarify the plasma, but filtration procedures should not be used.) Separate the supernatant and, without delay, mix thoroughly and distribute the plasma substrate into small stoppered containers in portions sufficient for a complete heparin assay (for example 10 mL to 30 mL). Without delay, rapidly cool to a temperature below −70 °C (for example by immersing the containers into liquid nitrogen) and store at a temperature below −30 °C.

The plasma is suitable for use as plasma substrate in the assay for heparin if, under the conditions of the assay, it gives a clotting time appropriate to the method of detection used and if it provides reproducible, steep log dose-response curves.

When required for use, thaw a portion of the plasma substrate in a water-bath at 37 °C, gently swirling until thawing is complete; once thawed it should be kept at 10-20 °C and used without delay. The thawed plasma substrate may be lightly centrifuged if necessary; filtration procedures should not be used.

Plasma Substrate R2

Prepare from human blood containing less than 1 per cent of the normal amount of factor IX. Collect the blood into one-ninth its volume of a 38 g/L solution of *sodium citrate R*.

Storage: in small amounts in plastic tubes at a temperature of −30 °C or lower.

Plasma Substrate R3

Prepare from human blood containing less than 1 per cent of the normal amount of factor XI. Collect the blood into one-ninth its volume of a 38 g/L solution of *sodium citrate R*.

Storage: in small amounts in plastic tubes at a temperature of −30 °C or lower.

Plasminogen, Human (*9001-91-6*)

A substance present in blood that may be activated to plasmin, an enzyme that lyses fibrin in blood clots.

Platelet Substitute

To 0.5 to 1 g of *phospholipid* add 20 mL of *acetone* and allow to stand for 2 hours with frequent shaking. Centrifuge for 2 minutes and discard the supernatant liquid. Dry the residue using a water pump, mix with 20 mL of *chloroform* and shake for 2 hours. Filter under vacuum and suspend the residue obtained in 5 to 10 mL of *saline solution*.

Prepare a dilution in *saline solution* so that it will give clotting time differences between consecutive dilutions of the reference preparation used in the Assay of factor IX fraction of about 10 seconds.

Store the dilute suspensions at −30° and use within 6 weeks.

Plutonium-242 Spiking Solution

Contains 50 Bq/L ^{242}Pu and a 134 mg/L solution of *lanthanum chloride heptahydrate R* in a 284 g/L solution of *nitric acid R*.

Poloxamer 124

General reagent grade of commerce.

Poloxamer 188 See *Poloxamers (1464)*.

Polyamine Grafted Poly(vinyl alcohol) Copolymer

Copolymer beads of poly(vinyl alcohol) to which polyamine is covalently bonded; The size range of the beads is specified after the name of the reagent in the tests where it is used;

Polydatin 3-Hydroxy-5-[2-(4-hydroxyphenyl)eth-1-en-1-yl] phenyl β-D-glucopyranoside; Resveratrol-3-β-mono-D-glucoside; $C_{20}H_{22}O_8$ = 390.4 (*65914-17-2*)

Polyether Hydroxylated Gel for Chromatography

Gel with a small particle size having a hydrophilic surface with hydroxyl groups. It has an exclusion limit for dextran of relative molecular mass 2×10^5 to 2.5×10^6.

Polyethylene Glycol 200 Macrogol 200; (*25322-68-3*)

Clear, colourless or almost colourless viscous liquid, very soluble in acetone and in anhydrous ethanol, practically insoluble in fatty oils.

d_{20}^{20}: about 1.127.

n_D^{20}: about 1.450.

Polyethylene Glycol 200 R1 Macrogol 200 R1

Introduce 500 mL of *macrogol 200 R* into a 1000 mL round bottom flask. Using a rotation evaporator remove any volatile components applying for 6 h a temperature of 60 °C and a vacuum with a pressure of 1.5-2.5 kPa.

Polyethylene Glycol 300 Macrogol 300; (*25322-68-3*)

See *Macrogols (1444)*.

Polyethylene Glycol 400 Macrogol 400; (*25322-68-3*)

See *Macrogols (1444)*.

Polyethylene Glycol 1000 Macrogol 1000; (*25322-68-3*)

See *Macrogols (1444)*.

Polyethylene Glycol 1500 Macrogol 1500; (*25322-68-3*)

See *Macrogols (1444)*.

Polyethylene Glycol 20,000 Macrogol 20 000

See *Macrogols (1444)*.

Polyethylene Glycol Adipate Macrogol adipate; Polyethyleneglycol adipate; $(C_8H_{12}O_4)_n$ = M_r $(172.2)_n$

White or almost white, wax-like mass, practically insoluble in water.

mp: about 43 °C.

Polyethylene Glycol Succinate Macrogol succinate; Polyethyleneglycol succinate; $(C_6H_8O_4)_n$ = M_r $(144.1)_n$

White or almost white, crystalline powder, practically insoluble in water.

mp: about 102 °C.

Polymethacrylate Gel

A methacrylate-based size-exclusion stationary phase for water-soluble samples.

Butylated Polymethacrylate Gel

Gel based on butylated methacrylic acid polymer.

Polymethacrylate Gel, Hydroxylated

Stationary phase for size-exclusion chromatography.

Gel based on hydroxylated methacrylic acid polymer.

Polyorganosiloxane for Oxygen-Containing Compounds

Combination of suitable polyorganosiloxanes with high affinity for oxygen-containing compounds.

Polyoxyethylated Castor Oil

Light yellow liquid. It becomes clear above 26 °C.

Polyoxyethylene 10 Lauryl Ether Decaethylene glycol monododecyl ether; $C_{32}H_{66}O_{11}$ = 626.9 (*9002-92-0*)

bp: about 100°

mp: about 24°

General reagent grade of commerce.

Polyoxyethylene 23 Lauryl Ether Brij 35; $C_{58}H_{120}O_{24}$ = 1199.6 (*9002-92-0*)

bp: about 100°.

mp: about 43°.

General reagent grade of commerce.

Polysorbate 20 (*9005-64-5*)

See *Polysorbate 20 (0426)*.

Polysorbate 65 (*9005-71-4*)

Polysorbate 80 (*9005-65-6*)

See *Polysorbate 80 (0428)*.

Polystyrene 900–1000 (*9003-53-6*)

Organic standard used for calibration in gas chromatography.

M_w: about 950.

M_w/M_n: 1.10.

Potassium Acetate (*127-08-2*)

See *Potassium acetate (1139)*.

Potassium Antimonate(v) Potassium pyroantimonate; $KSb(OH)_6$ = 262.9 (*12208-13-8*)

White or almost white, crystals or crystalline powder, sparingly soluble in water.

Potassium Antimonate(v) Solution Potassium pyroantimonate solution

Dissolve 2 g of *potassium pyroantimonate R* in 95 mL of hot *water R*. Cool quickly and add a solution containing 2.5 g of *potassium hydroxide R* in 50 mL of *water R* and 1 mL of *dilute sodium hydroxide solution R*. Allow to stand for 24 h, filter and dilute to 150 mL with *water R*.

Potassium Bicarbonate (*298-14-6*)

See *Potassium hydrogen carbonate R*.

Potassium Bicarbonate Solution, Saturated Methanolic See *potassium hydrogen carbonate solution, saturated methanolic R*.

Potassium Borohydride Potassium tetrahydroborate; KBH_4 = 53.94 (*13762-51-1*)

General reagent grade of commerce.

Potassium Bromate $KBrO_3$ = 167.0 (*7758-01-2*)

White or almost white granular powder or crystals, soluble in water, slightly soluble in ethanol (96 per cent).

Potassium Bromide (*7758-02-3*)

See *Potassium bromide (0184)*.

Potassium bromide used for infrared absorption spectrophotometry (2.2.24) also complies with the following additional test.

A disc 2 mm thick prepared from the substance previously dried at 250 °C for 1 h, has a substantially flat baseline over the range 4000 cm^{-1} to 620 cm^{-1}. It exhibits no maxima with absorbance greater than 0.02 above the baseline, except maxima for water at 3440 cm^{-1} and 1630 cm^{-1}.

Potassium Carbonate Anhydrous potassium carbonate; K_2CO_3 = 138.2 (*584-08-7*)

White or almost white, granular powder, hygroscopic, very soluble in water, practically insoluble in anhydrous ethanol.

Storage: in an airtight container.

Potassium Carbonate Sesquihydrate $K_2CO_3,1½H_2O$ = 165.2 (*6381-79-9*)

General reagent grade of commerce.

Potassium Chlorate $KClO_3$ = 122.6 (*3811-04-9*)

A white or almost white powder, granules or crystals, soluble in water.

Potassium Chloride (*7447-40-7*)

See *Potassium chloride (0185)*.

Potassium chloride used for infrared absorption spectrophotometry (2.2.24) also complies with the following additional test.

A disc 2 mm thick, prepared from the substance previously dried at 250 °C for 1 h, has a substantially flat baseline over the range 4000 cm^{-1} to 620 cm^{-1}. It exhibits no maxima with absorbance greater than 0.02 above the baseline, except maxima for water at 3440 cm^{-1} and 1630 cm^{-1}.

Potassium Chloride, 0.1M

A solution of *potassium chloride R* containing the equivalent of 7.45 g of KCl in 1000.0 mL.

Potassium Chromate Dipotassium chromate; K_2CrO_4 = 194.2 (*7789-00-6*)

Yellow crystals, freely soluble in water.

Potassium Chromate Solution

A 50 g/L solution of *potassium chromate R*.

Potassium Citrate (*6100-05-6*)

See *Potassium citrate (0400)*.

Potassium Cyanide KCN = 65.1 (*151-50-8*)

White or almost white, crystalline powder or white or almost white mass or granules, freely soluble in water, slightly soluble in ethanol (96 per cent).

Potassium Cyanide Solution

A 100 g/L solution of *potassium cyanide R*.

Potassium Cyanide Solution, Lead-free

Dissolve 10 g of *potassium cyanide R* in 90 mL of *water R*, add 2 mL of *strong hydrogen peroxide solution R* diluted 1 to 5. Allow to stand for 24 h, dilute to 100 mL with *water R* and filter.

The solution complies with the following test: take 10 mL of the solution, add 10 mL of *water R* and 10 mL of *hydrogen sulfide solution R*. No colour is evolved even after addition of 5 mL of *dilute hydrochloric acid R*.

Potassium Cyanide Solution PbT

Dissolve 10 g of *potassium cyanide* in 90 mL of *water*, add 2 mL of *hydrogen peroxide solution (20 vol)*, allow to stand for 24 hours, dilute to 100 mL with *water* and filter.

Potassium Dichromate Dipotassium dichromate; $K_2Cr_2O_7$ = 294.2 (*7778-50-9*)

Potassium dichromate used for the calibration of spectrophotometers (*2.2.25*) contains not less than 99.9 per cent of $K_2Cr_2O_7$, calculated with reference to the substance dried at 130 °C.

Orange-red crystals, soluble in water, practically insoluble in ethanol (96 per cent).

Assay. Dissolve 1.000 g in *water R* and dilute to 250.0 mL with the same solvent. To 50.0 mL of this solution add a freshly prepared solution of 4 g of *potassium iodide R*, 2 g of *sodium hydrogen carbonate R* and 6 mL of *hydrochloric acid R* in 100 mL of *water R* in a 500 mL flask. Stopper the flask and allow to stand protected from light for 5 min. Titrate with *0.1 M sodium thiosulfate*, using 1 mL of *iodide-free starch solution R* as indicator.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 4.903 mg of $K_2Cr_2O_7$.

Potassium Dichromate Solution

A 106 g/L solution of *potassium dichromate R*.

Potassium Dichromate Solution, Dilute

A 7.0% w/v solution of *potassium dichromate*.

Potassium Dichromate Solution R1

A 5 g/L solution of *potassium dichromate R*.

Potassium Dihydrogen Citrate $C_6H_7KO_7$ = 230.2

General reagent grade of commerce.

Potassium Dihydrogen Orthophosphate Potassium dihydrogen phosphate; (*7778-77-0*)

See *Potassium dihydrogen phosphate (0920)*.

Potassium Dihydrogen Phosphate, 0.2M

A solution of *potassium dihydrogen phosphate R* containing the equivalent of 27.22 g of KH_2PO_4 in 1000.0 mL.

Potassium Ferriperiodate Solution

Dissolve 1 g of *potassium periodate R* in 5 mL of a freshly prepared 120 g/L solution of *potassium hydroxide R*. Add 20 mL of *water R* and 1.5 mL of *ferric chloride solution R1*. Dilute to 50 mL with a freshly prepared 120 g/L solution of *potassium hydroxide R*.

Potassium Fluoride KF = 58.1 (*7789-23-3*)

Colourless crystals or white or almost white crystalline powder, deliquescent, soluble in water, practically insoluble in ethanol (96 per cent).

Potassium Hexacyanoferrate(II) Potassium ferrocyanide; $K_4[Fe(CN)_6],3H_2O$ = 422.4 (*14459-95-1*)

Transparent yellow crystals, freely soluble in water, practically insoluble in ethanol (96 per cent).

Potassium Hexacyanoferrate(III) Potassium ferricyanide; $K_3[Fe(CN)_6]$ = 329.3 (*13746-66-2*)

Red crystals, freely soluble in water.

Potassium Hexacyanoferrate(II) Solution Potassium ferrocyanide solution

A 53 g/L solution of *potassium ferrocyanide R*.

Potassium Hexacyanoferrate(III) Solution Potassium ferricyanide solution

Wash 5 g of *potassium ferricyanide R* with a little *water R*, dissolve and dilute to 100 mL with *water R*. Prepare immediately before use.

Potassium Hexacyanoferrate(III) Solution, Dilute

Wash about 1 g of *potassium hexacyanoferrate(III)* crystals with a little *water* and dissolve the washed crystals in 100 mL of *water*.

Produces a blue colour with solutions of iron(II) salts.

Prepare immediately before use.

Potassium Hyaluronate (*31799-91-4*)

General reagent grade of commerce obtained from human umbilical cords and freeze dried.

Protein, not more than 2%; chondroitin sulfate, not more than 3%.

Potassium Hyaluronate Stock Solution

A 0.05% w/v solution of *potassium hyaluronate*.

Store below 0° and use within 30 days.

Potassium Hydrogen Carbonate Potassium bicarbonate; $KHCO_3$ = 100.1 (*298-14-6*)

Transparent, colourless crystals, freely soluble in water, practically insoluble in ethanol (96 per cent).

Potassium Hydrogen Carbonate Solution, Saturated Methanolic

Dissolve 0.1 g of *potassium hydrogen carbonate R* in 0.4 mL of *water R*, heating on water-bath. Add 25 mL of *methanol R* and swirl, keeping the solution on the water-bath until dissolution is complete. Use a freshly prepared solution.

Potassium Hydrogen Phthalate Potassium hydrogen benzene-1,2-dicarboxylate; $C_8H_5KO_4$ = 204.2 (*877-24-7*)

White or almost white crystals, soluble in water, slightly soluble in ethanol (96 per cent).

Potassium Hydrogen Phthalate, 0.2M

A solution of *potassium hydrogen phthalate R* containing the equivalent of 40.84 g of $C_8H_5KO_4$ in 1000.0 mL.

Potassium Hydrogen Sulfate Potassium bisulfate; Potassium bisulphate; Potassium hydrogen sulphate; $KHSO_4$ = 136.2 (*7646-93-7*)

Colourless, transparent, hygroscopic crystals, freely soluble in water giving a strongly acid solution.

Storage: in an airtight container.

Potassium Hydrogen (+)-Tartrate Potassium hydrogen tartrate; $C_4H_5KO_6$ = 188.2 (*868-14-4*)

White or almost white, crystalline powder or colourless, slightly opaque crystals, slightly soluble in water, soluble in boiling water, practically insoluble in ethanol (96 per cent).

Potassium Hydroxide (*1310-58-3*)

See *Potassium hydroxide (0840)*.

Potassium Hydroxide, 2M Alcoholic

Dissolve 12 g of *potassium hydroxide R* in 10 mL of *water R* and dilute to 100 mL with *ethanol (96 per cent) R*.

Potassium Hydroxide, Ethanolic

Solutions of the requisite molarity may be obtained by dissolving the appropriate amount of *potassium hydroxide* in sufficient *ethanol (96%)* to produce 1000 mL.

Potassium Hydroxide in Alcohol (10% v/v), 0.5M

Dissolve 28 g of *potassium hydroxide R* in 100 mL of *ethanol (96 per cent) R* and dilute to 1000 mL with *water R*.

Potassium Hydroxide, Methanolic

Solutions of the requisite molarity may be obtained by dissolving the appropriate amount of *potassium hydroxide* in sufficient *methanol* to produce 1000 mL.

Potassium Hydroxide Solution, Alcoholic

Dissolve 3 g of *potassium hydroxide R* in 5 mL of *water R* and dilute to 100 mL with *aldehyde-free alcohol R*. Decant the clear solution. The solution should be almost colourless.

Potassium Hydroxide Solution R1, Alcoholic

Dissolve 6.6 g of *potassium hydroxide R* in 50 mL of *water R* and dilute to 1000 mL with *anhydrous ethanol R*.

Potassium Iodate KIO_3 = 214.0 *(7758-05-6)*

White or almost white, crystalline powder, soluble in water.

Potassium Iodide *(7681-11-0)*

See *Potassium iodide (0186)*.

Potassium Iodide and Starch Solution

Dissolve 0.75 g of *potassium iodide R* in 100 mL of *water R*. Heat to boiling and add whilst stirring a solution of 0.5 g of *soluble starch R* in 35 mL of *water R*. Boil for 2 min and allow to cool.

Test for sensitivity. A mixture of 15 mL of the potassium iodide and starch solution, 0.05 mL of *glacial acetic acid R* and 0.3 mL of *iodine solution R2* is blue.

Potassium Iodide Solution

A 166 g/L solution of *potassium iodide R*.

Potassium Iodide Solution, Dilute

A 10% w/v solution of *potassium iodide*.

Potassium Iodide Solution, Iodinated

Dissolve 2 g of *iodine R* and 4 g of *potassium iodide R* in 10 mL of *water R*. When solution is complete dilute to 100 mL with *water R*.

Potassium Iodide Solution, Iodinated R1

Dissolve 500 mg of *iodine R* and 1.5 g of *potassium iodide R* in *water R* and dilute to 25 mL with the same solvent.

Potassium Iodide Solution, Saturated

A saturated solution of *potassium iodide R* in *carbon dioxide-free water R*. Make sure the solution remains saturated as indicated by the presence of undissolved crystals.

Test by adding to 0.5 mL of the saturated potassium iodide solution 30 mL of a mixture of 2 volumes of *chloroform R* and 3 volumes of *glacial acetic acid R*, as well as 0.1 mL of *starch solution R*. Any blue colour formed should be discharged by the addition of 0.05 mL of *0.1 M sodium thiosulfate*.

Storage: protected from light.

Potassium Iodobismuthate Solution

To 0.85 g of *bismuth subnitrate R* add 40 mL of *water R*, 10 mL of *glacial acetic acid R* and 20 mL of a 400 g/L solution of *potassium iodide R*.

Potassium Iodobismuthate Solution, Acid

Dissolve 1.7 g of *bismuth oxynitrate* in a mixture of 80 mL of *water* and 20 mL of *glacial acetic acid*, warming if necessary, cool, add 100 mL of a 50% w/v solution of *potassium iodide* and mix. Dilute 10 mL to 100 mL with *water*, add 10 mL of *glacial acetic acid*, mix, add 0.12 g of *iodine* and shake until the iodine has completely dissolved.

Store at a temperature of 2° to 8° and use within 2 weeks.

Potassium Iodobismuthate Solution, Dilute

Dissolve 100 g of *tartaric acid R* in 500 mL of *water R* and add 50 mL of *potassium iodobismuthate solution R1*.

Storage: protected from light.

Potassium Iodobismuthate Solution R1

Dissolve 100 g of *tartaric acid R* in 400 mL of *water R* and add 8.5 g of *bismuth subnitrate R*. Shake for 1 h, add 200 mL of a 400 g/L solution of *potassium iodide R* and shake well. Allow to stand for 24 h and filter.

Storage: protected from light.

Potassium Iodobismuthate Solution R2

Stock solution. Suspend 1.7 g of *bismuth subnitrate R* and 20 g of *tartaric acid R* in 40 mL of *water R*. To the suspension add 40 mL of a 400 g/L solution of *potassium iodide R* and stir for 1 h. Filter. The solution may be kept for several days in brown bottles.

Spray solution. Mix immediately before use 5 mL of the stock solution with 15 mL of *water R*.

Potassium Iodobismuthate Solution R3

Dissolve 0.17 g of *bismuth subnitrate R* in a mixture of 2 mL of *glacial acetic acid R* and 18 mL of *water R*. Add 4 g of *potassium iodide R*, 1 g of *iodine R* and dilute to 100 mL with *dilute sulfuric acid R*.

Potassium Iodobismuthate Solution R4

Dissolve 1.7 g of *bismuth subnitrate R* in 20 mL of *glacial acetic acid R*. Add 80 mL of *distilled water R*, 100 mL of a 400 g/L solution of *potassium iodide R*, 200 mL of *glacial acetic acid R* and dilute to 1000 mL with *distilled water R*. Mix 2 volumes of this solution with 1 volume of a 200 g/L solution of *barium chloride R*.

Potassium Iodobismuthate Solution R5

To 0.85 g of *bismuth subnitrate R* add 10 mL of *glacial acetic acid R* and gently heat until completely dissolved. Add 40 mL of *water R* and allow to cool. To 5 mL of this solution, add 5 mL of a 400 g/L solution of *potassium iodide R*, 20 mL of *glacial acetic acid R* and 70 mL of *water R*.

Potassium Iodoplatinate Solution

Add 5 mL of a 5% w/v solution of *chloroplatinic(IV) acid* to 45 mL of *dilute potassium iodide solution* and dilute to 100 mL with *water*.

Store in an amber glass container.

Potassium Mercuri-iodide Solution, Alkaline

To 3.5 g of *potassium iodide* add 1.25 g of *mercury(II) chloride* dissolved in 80 mL of *water* and a cold, saturated solution of *mercury(II) chloride* in *water*, stirring continuously, until a slight red precipitate remains. Dissolve 12 g of *sodium hydroxide* in the resulting solution and add a little more of the saturated solution of mercury(II) chloride and sufficient *water* to produce 100 mL. Allow to stand and decant the clear, supernatant liquid.

Potassium Nitrate KNO_3 = 101.1 *(7757-79-1)*

Colourless crystals, very soluble in water.

Potassium Periodate Potassium metaperiodate; KIO_4 = 230.0 (*7790-21-8*)

White or almost white, crystalline powder or colourless crystals, soluble in water.

Potassium Permanganate (*7722-64-7*)

See *Potassium permanganate (0121)*.

Potassium Permanganate and Phosphoric Acid Solution

Dissolve 3 g of *potassium permanganate R* in a mixture of 15 mL of *phosphoric acid R* and 70 mL of *water R*. Dilute to 100 mL with *water R*.

Potassium Permanganate Solution

A 30 g/L solution of *potassium permanganate R*.

Potassium Permanganate Solution, Dilute

A 1.0% w/v solution of *potassium permanganate*.

Potassium Perrhenate $KReO_4$ = 289.3 (*10466-65-6*)

White or almost white, crystalline powder, soluble in water, slightly soluble in ethanol (96 per cent), in methanol and in propylene glycol.

Potassium Persulfate Dipotassium peroxodisulphate; Potassium persulphate; $K_2S_2O_8$ = 270.3 (*7727-21-1*)

Colourless crystals or white or almost white, crystalline powder, sparingly soluble in water, practically insoluble in ethanol (96 per cent). Aqueous solutions decompose at room temperature and more rapidly on warming.

Potassium Plumbite Solution

Dissolve 1.7 g of *lead acetate R*, 3.4 g of *potassium citrate R* and 50 g of *potassium hydroxide R* in *water R* and dilute to 100 mL with the same solvent.

Potassium Pyroantimonate Solution R1

Dissolve 2.0 g of *potassium pyroantimonate R* in 100 mL of hot *water R*. Boil for about 5 min, cool quickly and add 10 mL of a 150 g/L solution of *potassium hydroxide R*. Allow to stand for 24 h and filter.

Potassium Sodium (+)-Tartrate Sodium potassium (+)-tartrate; Sodium potassium tartrate; $C_4H_4KNaO_6,4H_2O$ = 282.2 (*6381-59-5*)

Colourless, prismatic crystals, very soluble in water.

Potassium Sorbate Sorbic acid potassium salt; $C_6H_7KO_2$ = 150.2 (*110-44-1*)

General reagent grade of commerce.

Potassium 4-sulfobenzoate 4-Sulfobenzoic acid potassium salt; Potassium 4-carboxybenzenesulfonate; $C_7H_5KO_5S$ = 240.3 (*5399-63-3*)

White, crystalline powder.

Potassium Tetraiodomercurate Solution

Dissolve 1.35 g of *mercuric chloride R* in 50 mL of *water R*. Add 5 g of *potassium iodide R* and dilute to 100 mL with *water R*.

Potassium Tetraiodomercurate Solution, Alkaline

Dissolve 11 g of *potassium iodide R* and 15 g of *mercuric iodide R* in *water R* and dilute to 100 mL with the same solvent. Immediately before use, mix 1 volume of this solution with an equal volume of a 250 g/L solution of *sodium hydroxide R*.

Potassium Tetroxalate Potassium trihydrogen dioxalate; $C_4H_3KO_8,2H_2O$ = 254.2 (*6100-20-5*)

White or almost white, crystalline powder, sparingly soluble in water, soluble in boiling water, slightly soluble in ethanol (96 per cent).

Potassium Thiocyanate KSCN = 97.2 (*333-20-0*)

Colourless crystals, deliquescent, very soluble in water and in ethanol (96 per cent).

Storage: in an airtight container.

Potassium Thiocyanate Solution

A 97 g/L solution of *potassium thiocyanate R*.

Povidone (*9003-39-8*)

See *Povidone (0685)*.

Prednisolone $C_{21}H_{28}O_5$ = 360.5 (*50-24-8*)

$[\alpha]_D^{20}$: about +97 (1% w/v in 1,4-dioxan).

mp: about 230°, with decomposition.

General reagent grade of commerce.

Hygroscopic crystalline powder.

Prednisolone 21-Acetate $C_{23}H_{30}O_6$ = 402.5 (*52-21-1*)

General reagent grade of commerce.

Procaine Hydrochloride See *Procaine hydrochloride (0050)*.

Proline (*147-85-3*)

See *Proline (0785)*.

D-Prolyl-L-phenylalanyl-L-arginine 4-Nitroanilide Hydrochloride D-Prolyl-L-phenylalanyl-L-arginine 4-nitroanilide dihydrochloride; $C_{26}H_{36}Cl_2N_8O_5$ = 612

Propane C_3H_8 = 44.10 (*74-98-6*)

Content: minimum 99.0 per cent *V/V*.

Propane-1,2-diol Propylene glycol; (*57-55-6*)

See *Propylene glycol (0430)*.

Propane-1,3-diol 1,3-Dihydroxypropane; $C_3H_8O_2$ = 76.1 (*504-63-2*)

Colourless, viscous liquid.

bp: about 214 °C.

mp: about −27 °C.

Bis-tris Propane 2,2′-(Propane-1,3-diyldiimino)bis [2-(hydroxymethyl)-1,3-propanediol; $C_{11}H_{26}N_2O_6$ = 282.3 (*64431-96-5*)

Content: minimum 99.0 per cent.

Propanol R1 (*71-23-8*)

See *Propanol (2036)*.

2-Propanol R1

Complies with the requirements prescribed for *2-propanol R* with the following additional requirements.

n_D^{20}: about 1.378.

Water (*2.5.12*): maximum 0.05 per cent, determined on 10 g.

Absorbance (*2.2.25*): maximum 0.60 at 210 nm, 0.26 at 220 nm, 0.13 at 230 nm, 0.02 at 250 nm, 0.01 at 260 nm, determined using *water R* as compensation liquid.

2-Propanol R2 (*67-63-0*)

See *Isopropyl alcohol (0970)*.

Propan-1-ol *N*-Propyl alcohol; Propanol; C_3H_8O = 60.1 (*71-23-8*)

Clear colourless liquid, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: about 0.802 to 0.806.

bp: about 97.2 °C.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 96 °C and 99 °C.

Propan-2-ol Isopropyl alcohol; 2-Propanol; C_3H_8O = 60.1 (*67-63-0*)

Clear, colourless, flammable liquid, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: about 0.785.

bp: 81 °C to 83 °C.

Propan-2-ol MB C_3H_8O = 60.10 (*67-63-0*)

Analytical grade for molecular biology.

Propan-2-ol R1

n_D^{20}, about 1.378.

Complies with the requirements prescribed for *2-propanol* with the following additional requirements.

Water (2.5.12) Maximum 0.05%, determined on 10 g.

Absorbance (2.2.25) Maximum 0.60 at 210 nm, 0.26 at 220 nm, 0.13 at 230 nm, 0.02 at 250 nm, 0.01 at 260 nm, determined using *water* as compensation liquid.

Propanolamine 3-Amino-1-propanol; 3-Aminopropan-1-ol; 3-Aminopropanol; C_3H_9NO = 75.1 (*156-87-6*)

Clear, colourless, viscous liquid.

d_{20}^{20}: about 0.99.

n_D^{20}: about 1.461.

mp: about 11 °C.

Propetamphos $C_{10}H_{20}NO_4PS$ = 281.3 (*31218-83-4*)

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

Propidium Iodide 3,8-Diamino-5-[3(diethylmethylammonio)propyl]-6-phenylphenanthridinium diiodide; $C_{27}H_{34}I_2N_4$ = 668.4 (*25535-16-4*)

Dark red solid.

Propionaldehyde Propanal; C_3H_6O = 58.1 (*123-38-6*)

Liquid freely soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.81.

n_D^{20}: about 1.365.

bp: about 49 °C.

mp: about −81 °C.

Propionic Acid $C_3H_6O_2$ = 74.1 (*79-09-4*)

Oily liquid, soluble in ethanol (96 per cent), miscible with water.

d_{20}^{20}: about 0.993.

n_D^{20}: about 1.387.

bp: about 141 °C.

mp: about −21 °C.

Propionic Anhydride $C_6H_{10}O_3$ = 130.1 (*123-62-6*)

Clear, colourless liquid, soluble in ethanol (96 per cent).

d_{20}^{20}: about 1.01.

bp: about 167 °C.

Propionic Anhydride Reagent

Dissolve 1 g of *toluenesulfonic acid R* in 30 mL of *glacial acetic acid R*, add 5 mL of *propionic anhydride R* and allow to stand for at least 15 min before use.

Storage: use within 24 h.

Propranolol Hydrochloride $C_{16}H_{21}NO_2$,HCl = 295.8 (*318-98-9*)

mp: about 164°.

General reagent grade of commerce.

Propyl Acetate $C_5H_{10}O_2$ = 102.1 (*109-60-4*)

d_{20}^{20}: about 0.888.

bp: about 102 °C.

mp: about −95 °C.

Propyl 4-Hydroxybenzoate Propyl parahydroxybenzoate; (*94-13-3*)

See *Propyl parahydroxybenzoate (0431)*.

Propylene Oxide C_3H_6O = 58.1 (*75-56-9*)

Colourless liquid, miscible with ethanol (96 per cent).

Protamine Sulfate (*53597-25-4 (salmine) 9007-31-2 (clupeine)*)

See *Protamine sulfate (0569)*.

Protopine Hydrochloride $C_{20}H_{20}ClNO_5$ = 389.8 (*6164-47-2*)

5-Methyl-4,6,7,14-tetrahydrobis[1,3]benzodioxolo[4,5-*c*:5′,6′-*g*]azecin-13(5*H*)-one hydrochloride.

PSMA-11 (3*S*,7*S*)-22-[3-[[[2-[[[5-(2-Carboxyethyl)-2-hydroxyphenyl]methyl](carboxymethyl)amino]ethyl](carboxymethyl)amino]methyl]-4-hydroxyphenyl]-5,13,20-trioxo-4,6,12,19-tetraazadocosane-1,3,7-tricarboxylic acid supplied as trifluoroacetate salt; $C_{44}H_{62}N_6O_{17}$ = 947 (*1366302-52-4*)

White or almost white powder, freely soluble in water.

Content: minimum 96.0 per cent (anhydrous and trifluoroacetic acid-free substance).

PSMA-1007 (3*S*,10*S*,14*S*)-1-[4-[[(2*S*)-4-Carboxy-2-[(2*S*)-4-carboxy-2-(6-fluoropyridin-3-amido)butanamido]butanamido]methyl]phenyl]-3-[(naphthalen-2-yl)methyl]-1,4,12-trioxo-2,5,11,13-tetraazahexadecane-10,14,16-tricarboxylic acid; $C_{49}H_{55}FN_8O_{16}$ = 1031

White or almost white powder.

Pteroic Acid 4-[[(2-Amino-4-oxo-1,4-dihydropteridin-6-yl)methyl]amino]benzoic acid; $C_{14}H_{12}N_6O_3$ = 312.3 (*119-24-4*)

Crystals, soluble in solutions of alkali hydroxides.

Puerarin 7,4′-Dihydroxy-8-*C*-glucosyliso-haloprone; 8-β-D-Glucopyranosyl-7-hydroxy-3-(4-hydroxyphenyl)-4*H*-1-benzopyran-4-one; $C_{21}H_{20}O_9$ = 416.4 (*3681-99-0*)

Pulegone (*R*)-2-Isopropylidene-5-methylcyclohexanone; (+)-*p*-Menth-4-en-3-one; $C_{10}H_{16}O$ = 152.2 (*89-82-7*)

Oily, colourless liquid, practically insoluble in water, miscible with ethanol (96 per cent).

d_{15}^{20}: about 0.936.

n_D^{20}: 1.485 to 1.489.

bp: 222 °C to 224 °C.

Pulegone used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. The substance to be examined.

Content: minimum 98.0 per cent, calculated by the normalisation procedure.

Pullulanase Pullulan-6-glucanohydrolase obtained from *Klebsiella pneumoniae*; (*9075-68-7*)

Content: minimum 30 units/mg of protein.

One unit represents the enzymatic activity required to produce 1.0 µmol of maltotriose from pullulan per minute at pH 5.0 at 30 °C.

DETERMINATION OF PULLULANASE ACTIVITY

Substrate. Dissolve 0.250 g of pullulan in 20.0 mL of *water R*, adding pullulan to the water.

Buffer solution A. 21 g/L solution of *citric acid monohydrate R* adjusted to pH 5.0 with a 27 g/L solution of *disodium hydrogen phosphate dodecahydrate R*.

Buffer solution B. Prepare a 136 g/L solution of *sodium acetate R* adjusted to pH 6.0 with *dilute acetic acid R*. Dilute 1 mL of this solution to 100 mL with *water R*.

Somogyi reagent. To 28 g of *anhydrous disodium hydrogen phosphate R* and 40 g of *sodium potassium tartrate R* add about 700 mL of *water R*. Add 100 mL of a 42 g/L solution of *sodium hydroxide R* and mix. Add 80 mL of a 100 g/L solution of *copper sulfate pentahydrate R*. Heat until complete dissolution. Add 180 g of *anhydrous sodium sulfate R* and adjust the volume to 1 L with *water R*. Allow to stand at room temperature for 1 or 2 days to let insoluble matter precipitate. Filter the solution and keep the filtrate in a brown-glass bottle with a ground-glass stopper.

Nelson reagent. Dissolve 50 g of *ammonium molybdate R* in 900 mL of *water R*. Add 42 g of *sulfuric acid R* and mix. Dissolve 6 g of *disodium arsenate R* in 50 mL of *water R*. Add the latter solution to the 1st solution, and allow to stand in a brown-glass bottle with a ground-glass stopper at 37 °C for 1 or 2 days.

Glucose standard solution. Dry *glucose R* at a pressure less than 6 kPa at 60 °C for 5 h, and calculate the water content. Transfer 10.00 g of dried glucose to a volumetric flask, dissolve with *water R*, dilute to 1.0 L with the same solvent, and mix. Transfer 10.0 mL of this solution to a volumetric flask and dilute to 1.0 L with *water R*. Each millilitre contains 100 µg of glucose.

Pullulanase diluent. Dilute *pullulanase R* with buffer solution B to prepare a solution with an enzyme activity of about 0.2 units/mL. The measurement range is between 0.1 and 0.4 units/mL. Record the dilution factor (D). This diluent is used as a diluted enzyme solution.

Procedure. Transfer 4.0 mL of substrate to a test tube and add 0.5 mL of buffer solution A, mix, and incubate at 30 °C. Add 0.5 mL of pullulanase diluent and mix thoroughly. After 30 s, transfer 1.0 mL of this solution to a test tube labelled "pullulan test solution 1", add 2.0 mL of Somogyi reagent, and mix. After 30.5 min, transfer 1.0 mL of the mixture of substrate and pullulanase diluent to a second test tube labelled "pullulan test solution 2", add 2.0 mL of Somogyi reagent, and mix. In a third test tube labelled "standard blank", mix 2.0 mL of Somogyi reagent and 1.0 mL of *water R*. In a fourth test tube labelled "glucose standard solution", mix 2.0 mL of Somogyi reagent and 1.0 mL of glucose standard solution, and add 1.0 mL of *water R*. Incubate the fourth test tube in a water-bath for exactly 10 min. Remove the tube and allow it to cool under running water. Add 2.0 mL of Nelson reagent, mix well, and allow the solution to stand for at least 15 min. Add 5.0 mL of *water R* to each of the 4 test tubes and mix thoroughly. Determine the absorbance at 520 nm of the standard blank (A_{blank}), the glucose standard solution (A_{Std}), pullulan test solution 1 (A_0) and pullulan test solution 2 (A_{30}), using *water R* as the blank. One unit is defined as the enzymatic activity required to produce 1 µmol of maltotriose (measured as glucose) from pullulan per minute. Calculate the pullulanase activity, P, in units/mL, using the following expression:

$$[(A_{30} - A_0)/(A_{Std} - A_{blank})] \times 0.185 \times D$$

MEASUREMENT OF PROTEIN CONTENT (MEASURED AS ALBUMINOID CONTENT) FOR THE CALCULATION OF SPECIFIC ACTIVITY

Reagent A. Prepare a solution having known concentrations of about 4 g/L of *sodium hydroxide R* and about 21 g/L of *anhydrous sodium carbonate R*.

Reagent B. Transfer 0.5 g of *copper sulfate pentahydrate R* and 1.0 g of *sodium citrate R* to a volumetric flask, dissolve in and dilute with *water R* to 100.0 mL, and mix.

Lowry solution. Mix 50 volumes of reagent A and 1 volume of reagent B.

Diluted Folin-Ciocalteu's phenol reagent (for albuminoid quantification). Prepare a two-fold dilution of the commercially available 2 N Folin-Ciocalteu's phenol reagent or prepare a solution by making an appropriate dilution of *phosphomolybdotungstic reagent R*.

Bovine albumin standard stock solution. Transfer 50.0 mg of *bovine albumin R* to a volumetric flask, dissolve in and dilute with *water R* to 500.0 mL, and mix. It contains 100 µg/mL of bovine albumin.

Standard solutions. Using appropriate dilutions of bovine albumin standard stock solution in *water R*, prepare 5 standard solutions having concentrations equally spaced between 5 µg/mL and 100 µg/mL of bovine albumin.

Test solution. Dilute *pullulanase R* with buffer solution B in order to obtain a solution having a concentration of 60-70 µg/mL of albuminoid. Water may be used as diluent. Record the dilution factor, D_f.

Procedure. Introduce into separate tubes 0.3 mL of each of the standard solutions, the test solution and *water R*. Add 3.0 mL of Lowry solution to each tube and mix. Incubate at room temperature for 10 min. Add 0.3 mL of diluted Folin-Ciocalteu's phenol reagent to each tube, mix immediately, and allow to stand at room temperature for 60 min. Determine the absorbances of the standard solutions and the test solution at the wavelength of maximum absorbance, about 750 nm, using *water R* as the blank.

Calculation. The relationship of absorbance to protein concentration is non-linear; however, if the standard curve concentration range is sufficiently small, it will approach linearity. Using linear regression method, plot the absorbances of the standard solutions versus the protein (bovine albumin) concentrations, in µg/mL. Using the plot, determine the concentration of protein (albuminoid content), $C_{albuminoid}$, in µg/mL, in the test solution. Calculate the albuminoid concentration, in mg/mL, in *pullulanase R* using the following expression:

$$C_{protein} = (C_{albuminoid} \times D_f)/1000$$

Calculate the specific activity, in units/mg, of pullulanase using the formula:

$$P/C_{protein}$$

P = pullulanase activity in units/mL.

Pumice Powder

Pumice of commerce, powdered and sifted, which passes through a 710 µm sieve, but is retained on a 250 µm sieve.

Putrescine 1,4-Butanediamine; Tetramethylenediamine; $C_4H_{12}N_2$ = 88.15 (*110-60-1*)

Colourless oily liquid, very soluble in water. Strong piperidine-like odour.

bp: about 159 °C.

mp: about 23 °C.

Pyrazine-2-carbonitrile 2-Cyanopyrazine; Clear, pale yellow liquid; $C_5H_3N_3$ = 105.1 (*19847-12-2*)

Content: minimum 99 per cent.

Pyridine C_5H_5N = 79.1 (*110-86-1*)

Clear, colourless liquid, hygroscopic, miscible with water and with ethanol (96 per cent).

bp: about 115 °C.

Storage: in an airtight container.

Pyridine, Anhydrous

Dry *pyridine R* over *anhydrous sodium carbonate R*. Filter and distil.

Water (*2.5.12*): maximum 0.01 per cent *m/m*.

Pyridine Bromide Solution

Dissolve 8 g of *pyridine* and 5.4 mL of *sulfuric acid* in 20 mL of *glacial acetic acid*, keeping the mixture cool. Add 2.6 mL of *bromine* dissolved in 20 mL of *glacial acetic acid* and dilute to 1000 mL with *glacial acetic acid*.

Prepare immediately before use.

Pyridine-4-carbonitrile 4-Cyanopyridine; $C_6H_4N_2$ = 104.1 (*100-48-1*)

White or almost white crystalline powder.

bp: 194 °C to 196 °C.

mp: 76 °C to 79 °C.

Pyridine-3-carboxaldehyde Nicotinaldehyde; C_6H_5NO = 107.1 (*500-22-1*)

General reagent grade of commerce.

Weight per mL, 1.14 g.

Pyridinium Hydrobromide Perbromide Pyridinium tribromide(1-); $C_5H_6Br_3N$ = 319.8 (*39416-48-3*)

Red crystals.

2-Pyridylamine Pyrid-2-ylamine; 2-Aminopyridine; Pyridin-2-amine; $C_5H_6N_2$ = 94.1 (*504-29-0*)

Large crystals soluble in water and in ethanol (96 per cent).

bp: about 210 °C.

mp: about 58 °C.

Pyridylazonaphthol PAN; $C_{15}H_{11}N_3O$ = 249.3 (*85-85-8*)

Brick-red powder, practically insoluble in water, soluble in ethanol (96 per cent), in methanol and in hot dilute alkali solutions.

mp: about 138 °C.

Pyridylazonaphthol Solution

A 1 g/L solution of *pyridylazonaphthol R* in *anhydrous ethanol R*.

Test for sensitivity. To 50 mL of *water R* add 10 mL of *acetate buffer solution pH 4.4 R*, 0.10 mL of *0.02 M sodium edetate* and 0.25 mL of the pyridylazonaphthol solution. After addition of 0.15 mL of a 5 g/L solution of *copper sulfate pentahydrate R*, the colour changes from light yellow to violet.

4-(2-Pyridylazo)resorcinol Monosodium Salt $C_{11}H_8N_3NaO_2$, H_2O = 255.2 (*16593-81-0*)

Orange crystalline powder.

Pyrogallol Benzene-1,2,3-triol; $C_6H_6O_3$ = 126.1 (*87-66-1*)

White or almost white crystals, becoming brownish on exposure to air and light, very soluble in water and in ethanol (96 per cent), slightly soluble in carbon disulfide.
On exposure to air, aqueous solutions, and more rapidly alkaline solutions, become brown owing to the absorption of oxygen.

mp: about 131 °C.

Storage: protected from light.

Pyrogallol Solution, Alkaline

Dissolve 0.5 g of *pyrogallol R* in 2 mL of *carbon dioxide-free water R*. Dissolve 12 g of *potassium hydroxide R* in 8 mL of *carbon dioxide-free water R*. Mix the two solutions immediately before use.

Pyrrolidine C_4H_9N = 71.1 (*123-75-1*)

Content: minimum 99 per cent.

bp: 87 °C to 88 °C.

2-Pyrrolidone Pyrrolidin-2-one; C_4H_7NO = 85.1 (*616-45-5*)

Liquid above 25 °C, miscible with water, with anhydrous ethanol and with ethyl acetate.

d_4^{25}: 1.116.

Water (*2.5.12*): maximum 0.2 per cent determined on 2.00 g.

Assay. Gas chromatography (*2.2.28*): use the normalisation procedure.

Test solution. Dissolve 1.0 g in *methanol R* and dilute to 10.0 mL with the same solvent.

Column:
— *material*: glass;
— *size*: *l* = 30 m; Ø = 0.53 mm;
— *stationary phase*: *macrogol 20 000 R* (1.0 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: adjusted so that the retention time of 2-pyrrolidone is about 10 min.

Split ratio: 1:20.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	80
	1 - 12	80 → 190
	12 - 32	190
Injection port		200

Detection: flame ionisation.

Injection: 1 µL of the test solution.

Content: minimum 98.0 per cent.

Pyruvic Acid 2-Oxopropanoic acid; $C_3H_4O_3$ = 88.1 (*127-17-3*)

Yellowish liquid, miscible with water and with anhydrous ethanol.

d_{20}^{20}: about 1.267.

n_D^{20}: about 1.43.

bp: about 165 °C.

Quercetin Dihydrate 2-(3,4-Dihydroxyphenyl)-3,5,7-trihydroxy-4*H*-1-benzopyran-4-one; $C_{15}H_{10}O_7$,$2H_2O$ = 338.2

Yellow crystals or yellowish powder, practically insoluble in water, soluble in acetone and in methanol.

Water (*2.5.12*): maximum 12.0 per cent, determined on 0.100 g.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Ginkgo leaf (1828)*.

Content:minimum 90 per cent (anhydrous substance) calculated by the normalisation procedure.

Storage: protected from light.

Quercitrin Quercetin 3-L-rhamnopyranoside; 3-[(6-Deoxy-α-L-mannopyranosyl)oxy]-2-(3,4-dihydroxyphenyl)-5,7-dihydroxy-4*H*-1-benzopyran-4-one; Quercitroside; $C_{21}H_{20}O_{11}$ = 448.4 (*522-12-3*)

Yellow crystals, practically insoluble in cold water, soluble in ethanol (96 per cent).

mp: 176 °C to 179 °C.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Goldenrod (1892)*: apply 20 µL of the solution; after spraying, the chromatogram shows a yellowish-brown fluorescent zone with an R_F of about 0.6.

Storage: at a temperature of 2 °C to 8 °C.

Quillaia Saponins, Purified

A mixture of related saponins obtained from the bark of *Quillaja saponaria* Molina *s.l.*

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Quillaia bark (1843)*: apply 5 µL of the solution; after treating with a 10 per cent *V/V* solution of *sulfuric acid R* in *methanol R*, heat at 120 °C for 5 min and examine in daylight; the chromatogram shows 3 principal zones in the upper part of the middle third.

Quinaldine Red 2-(4-dimethylaminostyryl)quinoline ethiodide; $C_{21}H_{23}IN_2$ = 430.3 (*117-92-0*)

Dark bluish-black powder, sparingly soluble in water, freely soluble in ethanol (96 per cent).

Quinaldine Red Solution

Dissolve 0.1 g of *quinaldine red R* in *methanol R* and dilute to 100 mL with the same solvent.

Colour change: pH 1.4 (colourless) to pH 3.2 (red).

Quinhydrone Equimolecular compound of 1,4-benzoquinone and hydroquinone; $C_{12}H_{10}O_4$ = 218.2 (*106-34-3*)

Dark green, lustrous crystals or a crystalline powder, slightly soluble in water, sparingly soluble in hot water, soluble in ethanol (96 per cent) and in concentrated ammonia.

mp: about 170 °C.

Quinidine (*S*)-(6-Methoxyquinol-4-yl)[(2*R*,4*S*,5*R*)-5-vinylquinuclidin-2-yl]methanol; $C_{20}H_{24}N_2O_2$ = 324.4 (*56-54-2*)

White or almost white crystals, very slightly soluble in water, sparingly soluble in ethanol (96 per cent), slightly soluble in methanol.

$[\alpha]_D^{20}$: about + 260, determined on a 10 g/L solution in *anhydrous ethanol R*.

mp: about 172 °C.

Storage: protected from light.

Quinidine Sulfate Quinidine sulphate; (*6591-63-5*)

See *Quinidine sulfate (0017)*.

Quinine (*R*)-(6-Methoxyquinol-4-yl)[(2*S*,4*S*,5*R*)-5-vinylquinuclidin-2-yl]methanol; $C_{20}H_{24}N_2O_2$ = 324.4 (*130-95-0*)

White or almost white, microcrystalline powder, very slightly soluble in water, slightly soluble in boiling water, very soluble in anhydrous ethanol.

$[\alpha]_D^{20}$: about −167, determined on a 10 g/L solution in *anhydrous ethanol R*.

mp: about 175 °C.

Storage: protected from light.

Quinine Hydrochloride (*6119-47-7*)

See *Quinine hydrochloride (0018)*.

Quinine Sulfate Quinine sulphate; (*6119-70-6*)

See *Quinine sulfate (0019)*.

Quinoline C_9H_7N = 129.2 (*91-22-5*)

n_D^{20}: 1.624 to 1.627.

A pale yellow liquid.

General reagent grade of commerce, suitable for phosphate assay.

Complies with the following requirement.

Tarry impurities Dissolve 1.0 g in a mixture of 2.5 mL of *water* and 2.5 mL of *hydrochloric acid*. Add 3 mL of *water* and 1 mL of *potassium chromate solution* and heat to boiling. The solution shows no darkening and no black deposit.

Store protected from light.

Quinoline Solution

Dissolve 50 mL of *quinoline* in a mixture of 60 mL of *hydrochloric acid* and 300 mL of *water* previously heated to 70°, cool and filter.

3-Quinuclidinol (3*R*)-1-Azabicyclo[2.2.2]octan-3-ol; $C_7H_{13}NO$ = 127.2 (*1619-34-7*)

Content: minimum 99 per cent.

Light yellow powder.

Rabbit Erythrocyte Suspension

Prepare a 1.6 per cent *V/V* suspension of rabbit erythrocytes as follows: defibrinate 15 mL of freshly drawn rabbit blood by shaking with glass beads, centrifuge at 2000 *g* for 10 min and wash the erythrocytes with three quantities, each of 30 mL, of a 9 g/L solution of *sodium chloride R*. Dilute 1.6 mL of the suspension of erythrocytes to 100 mL with a mixture of 1 volume of *phosphate buffer solution pH 7.2 R* and 9 volumes of a 9 g/L solution of *sodium chloride R*.

Rabies Antiserum, Fluorescein-conjugated

Immunoglobulin fraction with a high rabies antibody titre, prepared from the sera of suitable animals that have been immunised with inactivated rabies virus; the immunoglobulin is conjugated with fluorescein isothiocyanate.

Raclopride Tartrate Raclopride L-tartrate; $C_{19}H_{26}Cl_2N_2O_9$ = 497.3 (*98185-20-7*)

White or almost white solid, sensitive to light, soluble in water.

$[\alpha]_D^{25}$: + 0.3, determined on a 3 g/L solution.

mp: about 141 °C.

Raffinose β-D-Fructofuranosyl α-D-galactopyranosyl-(1→6)-α-D-glucopyranoside; $C_{18}H_{32}O_{16}$ = 504.4 (*512-69-6*)

Raffinose Pentahydrate β-D-Fructofuranosyl α-D-galactopyranosyl-(1→6)-α-D-glucopyranoside pentahydrate; $C_{18}H_{32}O_{16}$,$5H_2O$ = 594.5 (*17629-30-0*)

Content: minimum 98.0 per cent.

Crystalline powder.

mp: about 80 °C.

Raltegravir Potassium $C_{20}H_{20}FKN_6O_5$ (*871038-72-1*)

See *Raltegravir potassium (2887)*.

Rapeseed Oil See *Rapeseed oil, refined (1369)*.

Reducing Mixture Hydrazine reducing mixture

Grind the substances added in the following order to obtain a homogeneous mixture: 20 mg of *potassium bromide R*, 0.5 g of *hydrazine sulfate R* and 5 g of *sodium chloride R*.

Reichstein's Substance S $C_{21}H_{30}O_4$ = 346.5 (*152-58-9*)

Content: minimum 95.0 per cent.

mp: about 208 °C.

Reserpine Methyl 11,17α-dimethoxy-18β-[(3,4,5-trimethoxybenzoyl)oxy]-3β,20α-yohimban-16β-carboxylate; $C_{33}H_{40}N_2O_9$ = 609 (*50-55-5*)

General reagent grade of commerce.

Resin for Hydrophobic Interaction Chromatography

Non-porous resin consisting of spherical polymethacrylate particles bonded with butyl groups.

pH limits of use: 2 to 12.

Resin for Reversed-phase Ion Chromatography

A neutral, macroporous, high specific surface area with a non-polar character resin consisting of polymer lattice of polystyrene cross-linked with divinylbenzene.

Resin, Weak Cationic See *weak cationic resin R*.

Resorcinol Benzene-1,3-diol; (*108-46-3*)

See *Resorcinol (0290)*.

Resorcinol Reagent

To 80 mL of *hydrochloric acid R1* add 10 mL of a 20 g/L solution of *resorcinol R* and 0.25 mL of a 25 g/L solution of *copper sulfate pentahydrate R* and dilute to 100.0 mL with *water R*. Prepare the solution at least 4 h before use.

Storage: at 2 °C to 8 °C for 1 week.

Resveratrol 3,4′,5-Stilbenetriol; 5-[(*E*)-2-(4-Hydroxyphenyl)ethenyl]benzene-1,3-diol; $C_{14}H_{12}O_3$ = 228.2 (*501-36-0*)

L-Rhamnose (2R,3R,4R,5R,6S)-6-Methyltetrahydro-2H-pyran-2,3,4,5-tetrol monohydrate; 6-Deoxy-α-L-mannopyranose monohydrate; α-L-Rhamnopyranose monohydrate; L-(+)-Rhamnose monohydrate; Rhamnose; $C_6H_{12}O_5,H_2O$ = 182.2 (*6155-35-7*)

White or almost white, crystalline powder, freely soluble in water.

$[\alpha]_D^{20}$: + 7.8 to + 8.3, determined on a 50 g/L solution in *water R* containing about 0.05 per cent of NH_3.

Rhaponticin Rhapontin; 4′-methoxystilbene-3,3′,5-triol 3-glucoside; $C_{21}H_{24}O_9$ = 420.4 (*155-58-8*)

Yellowish-grey, crystalline powder, soluble in ethanol (96 per cent) and in methanol.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the monograph *Rhubarb (0291)*; the chromatogram shows only one principal spot.

Rhein 4,5-Dihydroxy-9,10-dioxo-9,10-dihydroanthracene-2-carboxylic acid; 1,8-Dihydroxy-3-carboxyanthraquinone; $C_{15}H_8O_6$ = 284.2 (*478-43-3*)

Rhodamine 6 G 9-[2-(Ethoxycarbonyl)phenyl]-3,6-bis(ethylamino)-2,7-dimethylxanthenylium chloride; $C_{28}H_{31}ClN_2O_3$ = 479.0 (*989-38-8*)

Colour Index No. 45160

Brownish-red powder.

Rhodamine B Basic violet 10; $C_{28}H_{31}ClN_2O_3$ = 479.0 (*81-88-9*)

Schultz No. 864

Colour Index No. 45170

Green crystals or reddish-violet powder, very soluble in water and in ethanol (96 per cent).

Rhynchophylline Methyl (16*E*)-17-methoxy-2-oxo-16,17-didehydro-7β,20α-corynoxan-16-carboxylate; Methyl (16*E*)-16-(methoxymethylidene)-2-oxo-7β,20α-corynoxan-17-oate; $C_{22}H_{28}N_2O_4$ = 384.5 (*76-66-4*)

Ribose D-Ribose; $C_5H_{10}O_5$ = 150.1 (*50-69-1*)

Soluble in water, slightly soluble in ethanol (96 per cent).

mp: 88 °C to 92 °C.

Ricinoleic Acid (9*Z*,12*R*)-12-Hydroxyoctadec-9-enoic acid; 12-Hydroxyoleic acid; $C_{18}H_{34}O_3$ = 298.5 (*141-22-0*)

Yellow or yellowish-brown viscous liquid, consisting of a mixture of fatty acids obtained by the hydrolysis of castor oil, practically insoluble in water, very soluble in anhydrous ethanol.

d_{20}^{20}: about 0.942.

n_D^{20}: about 1.472.

mp: about 285 °C, with decomposition.

Rosmarinic Acid $C_{18}H_{16}O_8$ = 360.3 (*20283-92-5*)

mp: 170 °C to 174 °C.

Rosuvastatin Ethyl Ester Ethyl (3*R*,5*S*,6*E*)-7-[4-(4-fluorophenyl)-2-(*N*-methylmethanesulfonamido)-6-(propan-2-yl)pyrimidin-5-yl]-3,5-dihydroxyhept-6-enoate; $C_{24}H_{32}FN_3O_6S$ = 509.6 (*851443-04-4*)

Content: minimum 98 per cent.

White or pale yellow powder.

Ruscogenins

Mixture of neoruscogenin ($C_{27}H_{40}O_4$ = 428.6) and ruscogenin ($C_{27}H_{42}O_4$ = 430.6)

General reagent grade of commerce.

Ruscogenins used in liquid chromatography complies with the following test.

Assay Carry out the method described in the monograph for Butcher's Broom. The content is not less than 90% of ruscogenins of which at least 60% consists of neoruscogenin, calculated by the *normalisation* procedure.

The reagent from Vinyals laboratory has been found suitable.

Rutecarpine 8,13-Dihydroindolo[2′,3′:3,4]pyrido[2,1-*b*]quinazolin-5(7*H*)-one; $C_{18}H_{13}N_3O$ = 287.3 (*84-26-4*)

Ruthenium Red Ammoniated ruthenium oxychloride; $[(NH_3)_5RuORu(NH_3)_4ORu(NH_3)_5]Cl_6,4H_2O$ = 858 (*11103-72-3*)

Brownish-red powder, soluble in water.

Ruthenium Red Solution

A 0.8 g/L solution of *ruthenium red R* in *lead acetate solution R*.

Rutin (*250249-75-3*)

See *Rutoside trihydrate R*.

Rutoside Trihydrate (*250249-75-3*)

See *Rutoside trihydrate (1795)*.

Sabinene Thuj-4(10)-ene; 4-Methylene-1-isopropylbicyclo[3.1.0]hexane; $C_{10}H_{16}$ = 136.2 (*3387-41-5*)

A colourless, oily liquid.

Sabinene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Bitter-orange-flower oil (1175)*.

Test solution. The substance to be examined.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Saccharin $C_7H_5NO_3S$ = 183.2 (*81-07-2*)

mp: about 230°.

General reagent grade of commerce.

Saccharin Sodium (*128-44-9*)

See *Saccharin sodium (0787)*.

Safrole 5-(Prop-2-enyl)-1,3-benzodioxole; 4-Allyl-1,2-(methylenedioxy)benzene; $C_{10}H_{10}O_2$ = 162.2 (*94-59-7*)

Colourless or slightly yellow, oily liquid, with the odour of sassafras, insoluble in water, very soluble in ethanol (96 per cent), miscible with hexane.

d_{20}^{20}: 1.095 to 1.096.

n_D^{20}: 1.537 to 1.538.

bp: 232 °C to 234 °C.

Freezing point: about 11 °C.

Safrole used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Cinnamon bark oil, Ceylon (1501)*.

Content: minimum 96.0 per cent, calculated by the normalisation procedure.

Saikosaponin A 13,28-Epoxy-16β,23-dihydroxy-4α-olean-11-en-3β-yl 6-deoxy-3-*O*-β-D-glucopyranosyl-β-D-galactopyranoside; $C_{42}H_{68}O_{13}$ = 781 (*20736-09-8*)

Saikosaponin D 13,28-Epoxy-16α,23-dihydroxy-4α-olean-11-en-3β-yl 6-deoxy-3-*O*-β-D-glucopyranosyl-β-D-galactopyranoside; $C_{42}H_{68}O_{13}$ = 781 (*20874-52-6*)

Salicin 2-(Hydroxymethyl)phenyl-β-D-glucopyranoside; Salicoside; $C_{13}H_{18}O_7$ = 286.3 (*138-52-3*)

$[\alpha]_D^{20}$: −62.5 ± 2.

mp: 199 °C to 201 °C.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Willow bark (1583)* at the concentration of the reference solution.

Content: minimum 99.0 per cent, calculated by the normalisation procedure.

Salicylaldehyde 2-Hydroxybenzaldehyde; $C_7H_6O_2$ = 122.1 (*90-02-8*)

Clear, colourless, oily liquid.

d_{20}^{20}: about 1.167.

n_D^{20}: about 1.574.

bp: about 196 °C.

mp: about −7 °C.

Salicylaldehyde Azine 2,2′-Azinodimethyldiphenol; $C_{14}H_{12}N_2O_2$ = 240.3 (*959-36-4*)

Dissolve 0.30 g of *hydrazine sulfate R* in 5 mL of *water R*, add 1 mL of *glacial acetic acid R* and 2 mL of a freshly prepared 20 per cent *V/V* solution of *salicylaldehyde R* in *2-propanol R*. Mix, allow to stand until a yellow precipate is formed. Shake with two quantities, each of 15 mL, of *methylene chloride R*. Combine the organic layers and dry over *anhydrous sodium sulfate R*. Decant or filter the solution and evaporate to dryness. Recrystallise from a mixture of 40 volumes of *methanol R* and 60 volumes of *toluene R* with cooling. Dry the crystals *in vacuo*.

mp: about 213 °C.

Chromatography. Thin-layer chromatography (*2.2.27*) as prescribed in the test for hydrazine in the monograph *Povidone (0685)*; the chromatogram shows only one principal spot.

Salicylic Acid (*69-72-7*)

See *Salicylic acid (0366)*.

Saline Solution

A 0.9% w/v solution of *sodium chloride* in freshly prepared *water*, sterilised by *heating in an autoclave*.

Salvianolic Acid B (2*R*)-2-[[(2*E*)-3-[(2*S*,3*S*)-3-[[(1*R*)-1-Carboxy-2-(3,4-dihydroxyphenyl)ethoxy]carbonyl]-2-(3,4-dihydroxyphenyl)-7-hydroxy-2,3-dihydrobenzofuran-4-yl]prop-2-enoyl]oxy]-3-(3,4-dihydroxyphenyl)propanoic acid; $C_{36}H_{30}O_{16}$ = 719 (*121521-90-2*)

Sand

White or slightly greyish grains of silica with a particle size between 150 µm and 300 µm.

Santonin $C_{15}H_{15}O_3$ = 246.3 (*481-06-1*)

$[\alpha]_D^{18}$: 173 in ethanol.

mp: 174° to 176°.

General reagent grade of commerce.

Chromatography Carry out Identification test C in the monograph for Arnica Flower using a 0.025% w/v solution of the reagent being examined in *methanol*. The chromatogram obtained with 10 µL of the solution shows a quenching zone with an Rf value of about 0.5. Spray the plate with *anisaldehyde solution* and examine while heating at 105° for 5 to 10 minutes. In daylight the quenching zone is at first a yellow zone that quickly changes to a violet-red zone.

Sarafloxacin Hydrochloride 6-Fluoro-1-(4-fluorophenyl)-4-oxo-7-piperazin-1-yl-1,4-dihydroquinoline-3-carboxylic acid hydrochloride; $C_{20}H_{18}ClF_2N_3O_3$ = 421.8 (*91296-87-6*)

Schisandrin Schisandrol A; Wuweizichun A; (6*S*,7*S*,12a*R*$_a$)-5,6,7,8-Tetrahydro-1,2,3,10,11,12-hexamethoxy-6,7-dimethyldibenzo[*a*,*c*]cyclooctan-6-ol; $C_{24}H_{32}O_7$ = 432.5 (*7432-28-2*)

White or almost white, crystalline powder.

Schisandrin used in the assay in the monograph *Schisandra fruit (2428)* complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Schisandra fruit (2428)*.

Content: minimum 95 per cent, calculated by the normalisation procedure.

Storage: in an airtight container, at −20 °C or below.

γ-Schisandrin Schisandrin B; Wuweizisu B; *rac*-(6*R*,7*S*,13a*R*$_a$)-1,2,3,13-Tetramethoxy-6,7-dimethyl-5,6,7,8-tetrahydrobenzo[3,4]cycloocta[1,2-*f*][1,3]benzodioxole; $C_{23}H_{28}O_6$ = 400.5 (*61281-37-6*)

White or almost white, crystalline powder.

Storage: in an airtight container, at −20 °C or below.

Sclareol (1*R*,2*R*,4a*S*,8a*S*)-1-[(3*R*)-3-Hydroxy-3-methylpent-4-enyl]-2,5,5,8a-tetramethyldecahydronaphthalen-2-ol; $C_{20}H_{36}O_2$ = 308.5 (*515-03-7*)

Odourless crystals.

$[\alpha]_D^{20}$: 6.7, determined with a solution in anhydrous ethanol.

$bp_{19\ mm}$: 218 °C to 220 °C.

mp: 96 °C to 98 °C.

Sclareol used in the chromatographic profile test in the monograph Clary sage oil (1850) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Clary sage oil (1850)*.

Content: minimum 97 per cent, calculated by the normalisation procedure.

Scopoletin 7-Hydroxy-6-methoxy-2*H*-1-benzopyran-2-one; 7-Hydroxy-6-methoxycoumarin; $C_{10}H_8O_4$ = 192.2 (*92-61-5*)

Faintly beige, fine crystals.

mp: 202 °C to 208 °C.

SDS-PAGE Running Buffer

Dissolve 151.4 g of *tris(hydroxymethyl)aminomethane R*, 721.0 g of *glycine R* and 50.0 g of *sodium laurilsulfate R* in *water R* and dilute to 5000 mL with the same solvent. Immediately before use, dilute to 10 times its volume with

water R and mix. Measure the pH (*2.2.3*) of the diluted solution. The pH is between 8.1 and 8.8.

SDS-PAGE Sample Buffer (Concentrated)

Dissolve 1.89 g of *tris(hydroxymethyl)aminomethane R*, 5.0 g of *sodium laurilsulfate R* and 50 mg of *bromophenol blue R* in *water R*. Add 25.0 mL of *glycerol R* and dilute to 100 mL with *water R*. Adjust the pH to 6.8 with *hydrochloric acid R*, and dilute to 125 mL with *water R*.

SDS-PAGE Sample Buffer for Reducing Conditions (Concentrated)

Dissolve 3.78 g of *tris(hydroxymethyl)aminomethane R*, 10.0 g of *sodium dodecyl sulfate R* and 100 mg of *bromophenol blue R* in *water R*. Add 50.0 mL of *glycerol R* and dilute to 200 mL with *water R*. Add 25.0 mL of *2-mercaptoethanol R*. Adjust to pH 6.8 with *hydrochloric acid R*, and dilute to 250.0 mL with *water R*.

Alternatively, dithiothreitol may be used as reducing agent instead of 2-mercaptoethanol. In this case prepare the sample buffer as follows: dissolve 3.78 g of *tris(hydroxymethyl) aminomethane R*, 10.0 g of *sodium dodecyl sulfate R* and 100 mg of *bromophenol blue R* in *water R*. Add 50.0 mL of *glycerol R* and dilute to 200 mL with *water R*. Adjust to pH 6.8 with *hydrochloric acid R*, and dilute to 250.0 mL with *water R*. Immediately before use, add *dithiothreitol R* to a final concentration of 100 mM.

Selenious Acid Selenous acid; Selenic(IV) acid; H_2SeO_3 = 129.0 (*7783-00-8*)

Deliquescent crystals, freely soluble in water.

Storage: in an airtight container.

Selenium Se = 79.0 (*7782-49-2*)

Brown-red or black powder or granules, practically insoluble in water and in ethanol (96 per cent), soluble in nitric acid.

mp: about 220 °C.

Selenium Dioxide SeO_2 = 111.0 (*7446-08-4*)

General reagent grade of commerce.

Semicarbazide Acetate Solution Triturate 2.5 g of *semicarbazide hydrochloride* with 3.3 g of *sodium acetate*, add 10 mL of *methanol*, mix, transfer to a flask with the aid of 20 mL of *methanol*and allow to stand at a temperature of about 4° for 30 minutes

Triturate 2.5 g of *semicarbazide hydrochloride* with 3.3 g of *sodium acetate*, add 10 mL of *methanol*, mix, transfer to a flask with the aid of 20 mL of *methanol* and allow to stand at a temperature of about 4° for 30 minutes; filter and add sufficient *methanol* to produce 100 mL.

Semicarbazide Hydrochloride CH_5N_3O,HCl = 111.5 (*563-41-7*)

mp: about 175°, with decomposition.

Analytical reagent grade of commerce.

A white, crystalline powder.

Sennoside A (9*R*,9′*R*)-5,5′-Bis(β-D-glucopyranosyloxy)-4,4′-dihydroxy-10,10′-dioxo-9,9′,10,10′-tetrahydro[9,9′-bianthracene]-2,2′-dicarboxylic acid; $C_{42}H_{38}O_{20}$ = 863 (*81-27-6*)

Sennoside B (9*R*,9′*S*)-5,5′-Bis(β-D-glucopyranosyloxy)-4,4′-dihydroxy-10,10′-dioxo-9,9′,10,10′-tetrahydro-9,9′-bianthracene-2,2′-dicarboxylic acid; $C_{42}H_{38}O_{20}$ = 863 (*128-57-4*)

Pale yellow crystals, practically insoluble in water, very slightly soluble in ethanol (96 per cent), soluble in dilute solutions of alkali hydroxides.

mp: 180 °C to 186 °C.

L-Serine Serine; (*56-45-1*)

See *Serine (0788)*.

Sesame Oil

General reagent grade of commerce.

Sialic Acid (*131-48-6*)

See *N-acetylneuraminic acid R*.

Silibinin Silybin; (2*R*,3*R*)-3,5,7-Trihydroxy-2-[(2*R*,3*R*)-3-(4-hydroxy-3-methoxyphenyl)-2-(hydroxymethyl)-2,3-dihydro-1,4-benzodioxin-6-yl]-2,3-dihydro-4*H*-1-benzopyran-4-one; $C_{25}H_{22}O_{10}$ = 482.4 (*22888-70-6*)

White or yellowish powder, practically insoluble in water, soluble in acetone and in methanol.

Silibinin used in the assay of Milk thistle fruit (1860) complies with the following additional test.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Milk thistle fruit (1860)*.

Test solution. Dissolve 5.0 mg of silibinin, dried *in vacuo*, in *methanol R* and dilute to 50.0 mL with the same solvent.

Silibinin A and silibinin B content: minimum 95.0 per cent, calculated by the normalisation procedure.

Silica for Chromatography, Porous

Porous silica with porous layer open tubular (PLOT) design.

Silica Gel

A fine, white, homogeneous powder of an average particle size of about 15 µm containing a suitable binding agent.

Silica Gel π-Acceptor/π-Donor for Chiral Separations

A very finely divided silica gel for chromatography consisting of spherical particles to which 1-(3,5-dinitrobenzamido)-1,2,3,4-tetrahydrophenantrene has been covalently bound, showing both π-electron acceptor and π-electron donor characteristics.

Silica Gel AGP for Chiral Chromatography See *α1-Acid-glycoprotein silica gel for chiral separation R*.

Silica Gel, Anhydrous (*112926-00-8*)

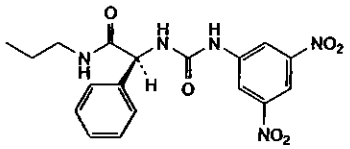
Partly dehydrated polymerised, amorphous silicic acid, absorbing at 20 °C about 30 per cent of its mass of water. Practically insoluble in water, partly soluble in solutions of sodium hydroxide. It contains a suitable indicator for detection of the humidity status, for which the colour change from the hydrated to anhydrous form is given on the label.

Silica Gel BC for Chiral Chromatography

A very finely divided silica gel for chromatography (5 µm) coated with β-cyclodextrin. Higher selectivity may be obtained when cyclodextrin has been derivatized with propylene oxide.

Silica Gel for Chiral Chromatography, Urea Type

A very finely divided silica gel (5 µm) coated with the following derivative:



Silica Gel for Chiral Separation, Amylose Derivative of

Substituted amylose coated on a very finely divided silica gel for chromatography.

Silica Gel for Chiral Separation, Cellulose Derivative of Silica Gel OD for Chiral Separations

Substituted cellulose coated on a very finely divided silica gel for chromatography.

Silica Gel for Chiral Separation, Protein Derivative of

A very finely divided silica gel for chromatography consisting of spherical particles coated with a protein derivative.

Silica Gel for Chiral Separation, Vancomycin-bonded

High-purity silica gel chemically modified by the bonding of vancomycin through multiple covalent linkages.

Silica Gel for Chromatography

A very finely divided silica gel.

Silica Gel for Chromatography, Alkyl-bonded for use with Highly Aqueous Mobile Phases

A very finely divided silica gel with bonded alkyl groups suitable for use with highly aqueous mobile phases.

Silica Gel for Chromatography, Alkyl-bonded for use with Highly Aqueous Mobile Phases, End-capped

A very finely divided silica gel with bonded alkyl groups suitable for use with highly aqueous mobile phases.
To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Alkylsilyl, Solid Core, End-capped

Silica gel with spherical silica particles containing a non-porous solid silica core surrounded by a thin outer porous silica coating with alkylsilyl groups. To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Amido-alkylsilyl Silica gel for chromatography, amidoalkylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of amidoalkylsilyl groups.

Silica Gel for Chromatography, Amidohexadecylsilyl

A very finely divided silica gel with a fine particle size, chemically modified at the surface by the bonding of amidohexadecylsilyl groups.

Silica Gel for Chromatography, Amidohexadecylsilyl, End-capped

A very finely divided silica gel, chemically modified at the surface by the bonding of amidohexadecylsilyl groups.
To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Aminopropylmethylsilyl

Silica gel with a fine particle size, chemically modified by bonding aminopropylmethylsilyl groups on the surface.

Silica Gel for Chromatography, Aminopropylsilyl

Silica gel with a fine particle size, chemically modified by bonding aminopropylsilyl groups on the surface.

Silica Gel for Chromatography R1, Aminopropylsilyl

Silica gel with a particle size of about 55 µm, chemically modified by bonding aminopropylsilyl groups on the surface.

Silica Gel for Chromatography, Amylose-derivative of

A very finely divided (10 µm) silica gel, chemically modified at the surface by the bonding of an amylose derivative.

Silica Gel for Chromatography, Butylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of butylsilyl groups.

Silica Gel for Chromatography, Butylsilyl, End-capped

A very finely divided silica, chemically modified at the surface by the bonding of butylsilyl groups. To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Carbamoylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of carbamoylsilyl groups.

Silica Gel for Chromatography Compatible with Highly Aqueous Mobile Phases, Octadecylsilyl Diol, End-capped

A very finely divided silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups and end-capping. Free diol groups are also present. For use with highly aqueous mobile phases.

Silica Gel for Chromatography, Crown-ether

Stationary phase for liquid chromatography.

Crown ether coated on silica gel.

Silica Gel for Chromatography, Cyanopropylsilyl, End-capped, Base-deactivated

A very finely divided silica gel, pre-treated by various techniques before the bonding of cyanopropylsilyl groups.
To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Cyanosilyl

A very finely divided silica gel chemically modified at the surface by the bonding of cyanosilyl groups.

Silica Gel for Chromatography, Cyanosilyl, End-capped

A very finely divided silica gel chemically modified at the surface by the bonding of cyanosilyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Cyanosilyl, End-capped, Base-deactivated

A very finely divided silica gel pre-treated before the bonding of cyanosilyl groups by washing and hydrolysing most of the superficial siloxane bridges, chemically modified at the surface by bonding of cyano groups. To further minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Di-isobutyloctadecylsilyl

A very finely divided silica gel chemically modified at the surface by the bonding of di-isobutyloctadecylsilyl groups.

Silica Gel for Chromatography, Diisopropylcyanosilyl Silica Gel for Chromatography, Diisopropylcyanopropylsilyl

A very finely divided silica gel chemically modified at the surface by the bonding of diisopropylcyanosilyl groups.

Silica Gel for Chromatography, 4-dimethylaminobenzylcarbamidesilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of 4-dimethylaminobenzylcarbamide groups.

Silica Gel for Chromatography, Dimethyloctadecylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of dimethyloctadecylsilyl groups.

Specific surface area: 300 m^2/g.

Silica Gel for Chromatography, Diol

Spherical silica particles to which dihydroxypropyl groups are bonded. Pore size 10 nm.

Silica Gel for Chromatography, Dodecylsilyl, End-capped

A very finely divided silica gel, chemically modified at the surface by the introduction of dodecylsilyl groups.
To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Hexadecylamidylsilyl

A very finely divided (5 µm) silica gel, chemically modified at the surface by the introduction of hexadecylcarboxamidopropyldimethylsilyl groups.

Silica Gel for Chromatography, Hexadecylamidylsilyl, End-capped

A very finely divided (5 µm) silica gel, chemically modified at the surface by the introduction of hexadecylcarboxamidopropyldimethylsilyl groups.
To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Hexylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of hexylsilyl groups.

Silica Gel for Chromatography, Hexylsilyl, End-capped

A very finely divided silica gel, chemically modified at the surface by the bonding of hexylsilyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography (Hybrid Material), Octadecylsilyl, Ethylene-bridged, Charged Surface, End-capped

Synthetic, spherical ethylene-bridged hybrid particles with a charged surface, containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by the bonding of octadecylsilyl groups.
To minimise any interaction with basic compounds they are carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography (hybrid material), Octylsilyl, Ethylene-bridged, End-capped

Synthetic, spherical ethylene-bridged hybrid particles, containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by the bonding of octylsilyl groups. To minimise any interaction with basic compounds they are carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography (Hybrid Material), Phenylhexylsilyl, Ethylene-bridged, Charged Surface, End-capped

Synthetic, spherical ethylene-bridged hybrid particles with a charged surface, containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by the bonding of phenylhexylsilyl groups.
To minimise any interaction with basic compounds they are carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography (Hybrid Material), Phenylsilyl, Ethylene-bridged, End-capped

Synthetic, spherical, ethylene-bridged hybrid particles, containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by the bonding of phenylsilyl groups. To minimise any interaction with basic compounds, they are carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography (Hybrid Material), Polar-embedded, Octadecylsilyl, Ethylene-bridged, End-capped

Synthetic, spherical, ethylene-bridged hybrid particles containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by the bonding of polar-embedded octadecylsilyl groups. To minimise any interaction with basic compounds, they are carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Hydrophilic

A very finely divided silica gel whose surface has been modified to provide hydrophilic characteristics.

Silica Gel for Chromatography, Hydroxypropylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of hydroxypropylsilyl groups.

Silica Gel for Chromatography, Methylsilyl

Liquid chromatographic reagent grade of commerce.

A very finely divided silica gel (3 to 10 µm) chemically modified at the surface by the introduction of methylsilyl groups. The particle size is specified after the name of the reagent in tests where it is used.

Silica Gel for Chromatography, Nitrile

A very finely divided silica gel, chemically modified at the surface by the bonding of cyanopropylsilyl groups.

Silica Gel for Chromatography, 4-Nitrophenylcarbamidesilyl

A very finely divided silica gel, chemically modified at the surface by bonding of 4-nitrophenylcarbamide groups.

Silica Gel for Chromatography, Octadecanoylaminopropylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of aminopropylsilyl groups which are acylated with octadecanoyl groups.

Silica Gel for Chromatography, Octadecylphenylsilyl, End-capped

A very finely divided silica gel, chemically modified at the surface by bonding of octadecylphenylsilyl groups.
To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octadecylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups.

Silica Gel for Chromatography, Octadecylsilyl, Base-deactivated

A very finely divided silica gel, pretreated by various techniques before the bonding of octadecylsilyl groups to minimise the interaction with basic components.

Silica Gel for Chromatography, Octadecylsilyl, Cross-linked, End-capped

A very finely divided silica gel, chemically modified at the surface by the cross-linking and bonding of octadecylsilyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octadecylsilyl, End-capped

A very finely divided silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octadecylsilyl, End-capped, Base-deactivated

A very finely divided silica gel, pretreated by various techniques before the bonding of octadecylsilyl groups. To further minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octadecylsilyl, Ethylene-Bridged (Hybrid Material)

Synthetic, spherical, ethylene-bridged hybrid particles, containing both inorganic (silica) and organic (organosiloxanes) components, chemically modified at the surface by the bonding of octadecylsilyl groups. To minimise any interaction with basic compounds, they are carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octadecylsilyl, Extra-dense Bonded, End-capped

A very finely divided silica gel, chemically modified at the surface by the extra-dense bonding of octadecylsilyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octadecylsilyl, for Separation of Polycyclic Aromatic Hydrocarbons

A very finely divided ultrapure silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups, optimised for the analysis of polycyclic aromatic hydrocarbons.

Silica gel for Chromatography, Octadecylsilyl, Monolithic

Monolithic rods of highly porous (greater than 80 per cent) metal-free silica with a bimodal pore structure, modified at the surface by the bonding of octadecylsilyl groups.

Silica Gel for Chromatography, Octadecylsilyl, Monolithic, End-capped

Monolithic rods of highly porous (greater than 80 per cent) metal-free silica with a bimodal pore structure, modified at the surface by the bonding of octadecylsilyl groups. To minimise any interaction with basic compounds, they are carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octadecylsilyl, Polar-embedded, Encapsulated

Silica gel chemically modified at the surface by the bonding of polar-embedded octadecylsilyl groups. To minimise any interaction with basic compounds, it is carefully encapsulated to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octadecylsilyl, Polar End-capped

A very finely divided silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups. To minimise any interaction with basic compounds it is carefully polar end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octadecylsilyl, Solid Core Silica gel with spherical silica particles containing a non-porous solid silica core surrounded by a thin outer porous silica coating with octadecylsilyl groups; **Silica Gel for Chromatography, Octadecylsilyl, Solid Core, End-capped**

Silica gel with spherical silica particles containing a non-porous solid silica core surrounded by a thin outer porous silica coating with octadecylsilyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octadecylsilyl, with Embedded Polar Groups, End-capped

A very finely divided silica gel, chemically modified at the surface by the bonding of polar-embedded octadecylsilyl groups. To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octadecylsilyl, with Extended pH Range, End-Capped

A very finely divided silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups resistant to bases up to pH 11. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of octylsilyl groups.

Silica Gel for Chromatography, Octylsilyl and Octadecylsilyl Multi-Alkyl

High purity base deactivated silica (10 µm particle sizes) chemically modified at the surface with binding of octylsilyl and octadecylsilyl groups.

Silica Gel for Chromatography, Octylsilyl, Base-deactivated

A very finely divided silica gel, pretreated by various techniques before the bonding of octylsilyl groups to minimise the interaction with basic components.

Silica Gel for Chromatography, Octylsilyl, End-capped

A very finely divided silica gel, chemically modified at the surface by the bonding of octylsilyl groups. To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octylsilyl, End-capped, Base-deactivated

A very finely divided silica gel, pre-treated by various techniques before the bonding of octylsilyl groups. To further minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octylsilyl, Extra-dense Bonded, End-capped

A very finely divided silica gel, chemically modified at the surface by the extra-dense bonding of octylsilyl groups. To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octylsilyl, Solid Core

Silica gel with spherical particles containing a non-porous solid silica core surrounded by a thin outer porous silica coating with octylsilyl groups.

Silica Gel for Chromatography, Octylsilyl, Solid Core, End-capped

Silica gel with spherical silica particles containing a non-porous solid silica core surrounded by a thin outer porous silica coating with octylsilyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Octylsilyl, with Embedded Polar Groups, End-capped

A very finely divided silica gel, chemically modified at the surface by the bonding of polar-embedded octylsilyl groups. To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Oxypropionitrilsilyl

A very finely divided silica gel chemically modified at the surface by the bonding of oxypropionitrilsilyl groups.

Silica Gel for Chromatography, Palmitamidopropylsilyl, End-capped

A very finely divided silica gel, chemically modified at the surface by the bonding of palmitamidopropyl groups and end-capped with acetamidopropyl groups.

Silica Gel for Chromatography, Pentafluorophenylpropylsilyl, Solid Core, End-capped

Silica gel with spherical silica particles containing a non-porous solid silica core surrounded by a thin outer porous silica coating with pentafluorophenylpropylsilyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Phenyl

Liquid chromatographic reagent grade of commerce.

A very finely divided silica gel, chemically modified at the surface by the bonding of phenyl groups. The particle size is indicated after the name of the reagent in the tests where it is used.

Silica Gel for Chromatography, Phenylethyl, End-capped

Liquid chromatographic reagent grade of commerce.

A very finely divided silica gel (2.5 to 10 µm) chemically modified at the surface by the introduction of ether-linked phenyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups. The particle size is specified after the name of the reagent in tests where it is used.

Silica Gel for Chromatography, Phenylhexylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of phenylhexyl groups.

Silica Gel for Chromatography, Phenylhexylsilyl, End-capped

A very finely divided silica gel, chemically modified at the surface by the bonding of phenylhexylsilyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Phenylhexylsilyl, Solid Core, End-capped

Silica gel with spherical silica particles containing a non-porous solid silica core surrounded by a thin outer porous silica coating with phenylhexylsilyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Phenylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of phenyl groups.

Silica Gel for Chromatography, Phenylsilyl, End-capped

A very finely divided silica gel, chemically modified at the surface by the bonding of phenyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Phenylsilyl, End-Capped, Base-Deactivated

A very finely divided silica gel, pre-treated by various techniques before the bonding of phenylsilyl groups. To further minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Phenylsilyl, Extra-dense Bonded, End-capped

A very finely divided silica gel, chemically modified at the surface by the extra-dense bonding of phenylsilyl groups. To minimise any interaction with basic compounds, it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography, Propoxybenzene, End-capped

A very finely divided silica gel, chemically modified at the surface by the bonding of propoxybenzene groups.

Silica Gel for Chromatography, Propylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of propylsilyl groups.

Silica Gel for Chromatography Compatible with 100% Aqueous Mobile Phases, Octadecylsilyl, End-capped

A very finely divided silica gel with bonded octadecylsilyl groups suitable for use with highly aqueous mobile phases including 100 per cent aqueous phases. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography compatible with 100 per cent Aqueous Mobile Phases, Octadecylsilyl

A very finely divided silica gel with bonded octadecylsilyl groups suitable for use with highly aqueous mobile phases including 100 per cent aqueous phases.

Silica Gel for Chromatography R1, Nitrile

A very finely divided silica gel consisting of porous, spherical particles with chemically bonded nitrile groups.

Silica Gel for Chromatography R1, Octadecylsilyl

A very finely divided ultrapure silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups.

Silica Gel for Chromatography R2, Octadecylsilyl

A very finely divided (15 nm pore size) ultrapure silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups (20 per cent carbon load), optimised for the analysis of polycyclic aromatic hydrocarbons.

Silica Gel for Chromatography R1, Octadecylsilyl, End-capped

A very finely divided ultrapure silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups. To minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography R1, Octadecylsilyl, End-capped, Base-deactivated

A very finely divided silica gel pre-treated before the bonding of octadecylsilyl groups by washing and hydrolysing most of the superficial siloxane bridges. To further minimise any interaction with basic compounds it is carefully end-capped to cover most of the remaining silanol groups.

Silica Gel for Chromatography R1, Octylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of octylsilyl and methyl groups (double bonded phase).

Silica Gel for Chromatography R2, Octylsilyl

Ultrapure very finely divided (10 nm pore size) silica gel, chemically modified at the surface by the bonding of octylsilyl groups (19 per cent carbon load). Less than 20 ppm of metals.

Silica Gel for Chromatography R3, Octylsilyl

A very finely divided ultrapure silica gel, chemically modified at the surface by the bonding of octylsilyl groups and sterically protected with branched hydrocarbons at the silanes.

Silica Gel for Chromatography, Strong-anion-exchange

A very finely divided silica gel, chemically modified at the surface by the bonding of quaternary ammonium groups.

pH limit of use: 2 to 8.

Silica Gel for Chromatography, Strong Cation-exchange

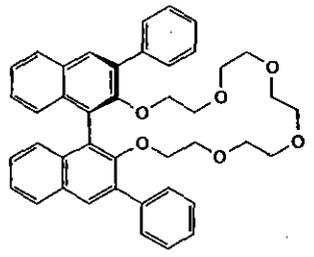
A very finely divided silica gel, chemically modified at the surface by the bonding of sulfonic acid groups.

Silica Gel for Chromatography, Trimethylsilyl

A very finely divided silica gel, chemically modified at the surface by the bonding of trimethylsilyl groups.

Crown-ether Silica Gel for Chiral Separation

A very finely divided silica gel for chromatography coated with the following chiral crown ether:



(R_a)-6,23-Diphenyl-8,9,11,12,14,15,17,18,20,21-decahydrodinaphtho[2,1-*q*:1′,2′-*s*][1,4,7,10,13,16]hexaoxacycloicosine.

Silica Gel for HPTLC, Octadecylsilyl

A finely divided silica gel, chemically modified at the surface by the bonding of octadecylsilyl groups.

Fine, white or almost white, homogeneous powder, practically insoluble in water and in ethanol (96%).

Silica Gel for Size-exclusion Chromatography

A very finely divided silica gel (10 µm) with a very hydrophilic surface. The average diameter of the pores is about 30 nm. It is compatible with aqueous solutions between pH 2 and 8 and with organic solvents. It is suitable for the separation of proteins with relative molecular masses of 1×10^3 to 3×10^5.

Silica Gel F_{254}

A fine, white, homogeneous powder of an average particle size of about 15 µm containing a suitable binding agent and about 1.5% of a florescent indicator having a maximum intensity at 254 nm. It complies with the following requirement.

Fluorescence Carry out the method for thin-layer chromatography using a mixture of 10 volumes of *anhydrous formic* acid and 90 volumes of *propan-2-ol* as the mobile phase, but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 10 quantities from 1 to 10 uL of a 0.1% w/v solution of *benzoic acid* in the mobile phase. After removal of the plate, dry it in a current of warm air and examine under ultraviolet light (254 nm). The benzoic acid appears as dark spots on a fluorescent background in the upper third of the chromatogram at levels of 2 µg and greater.

Silica Gel G (*112926-00-8*)

Contains about 13 per cent of calcium sulfate hemihydrate. The particle size is about 15 µm.

Calcium sulfate content. Place 0.25 g in a ground-glass stoppered flask, add 3 mL of *dilute hydrochloric acid R* and 100 mL of *water R* and shake vigorously for 30 min. Filter through a sintered-glass filter (*2.1.2*) and wash the residue. Carry out on the combined filtrate and washings the complexometric assay of calcium (*2.5.11*).

1 mL of *0.1 M sodium edetate* is equivalent to 14.51 mg of $CaSO_4,{}^1/_2H_2O$.

pH (*2.2.3*). Shake 1 g for 5 min with 10 mL of *carbon dioxide-free water R*. The pH of the suspension is about 7.

Silica Gel GF_{254} (*112926-00-8*)

Contains about 13 per cent of calcium sulfate hemihydrate and about 1.5 per cent of a fluorescent indicator having an optimal intensity at 254 nm. The particle size is about 15 µm.

Calcium sulfate content. Determine by the method prescribed for *silica gel G R*.

pH. Complies with the test prescribed for *silica gel G R*.

Fluorescence. Thin-layer chromatography (*2.2.27*) using *silica gel GF_{254} R* as the coating substance. Apply separately to the plate at ten points increasing volumes from 1 µL to 10 µL of a 1 g/L solution of *benzoic acid R* in a mixture of 10 volumes of *anhydrous formic acid R* and 90 volumes of *2-propanol R*. Develop over a path of 10 cm with the same mixture of solvents. After evaporating the solvents examine the chromatogram in ultraviolet light at 254 nm. The benzoic acid appears as dark spots on a fluorescent background in the upper third of the chromatogram for quantities of 2 µg and greater.

Silica Gel H (*112926-00-8*)

The particle size is of about 15 µm.

pH (2.2.3). Complies with the test prescribed for *silica gel G R*.

Silica Gel H, Silanised

Preparation of a thin layer. See *silanised silica gel HF_{254} R*

Chromatographic separation. Complies with the test prescribed for *silanised silica gel HF_{254} R.*

Silica Gel HF_{254}

Contains about 1.5 per cent of a fluorescent indicator having an optimal intensity at 254 nm. The particle size is about 15 µm.

pH. Complies with the test prescribed for *silica gel G R.*

Fluorescence. Complies with the test prescribed for *silica gel GF_{254} R.*

Silica Gel HF_{254}, Silanised

Contains about 1.5 per cent of a fluorescent indicator having an optimal intensity at 254 nm.

Preparation of a thin layer. Vigorously shake 30 g for 2 min with 60 mL of a mixture of 1 volume of *methanol R* and 2 volumes of *water R.* Coat carefully cleaned plates with a layer 0.25 mm thick using a spreading device. Allow the coated plates to dry in air and then heat in an oven at 100 °C to 105 °C for 30 min.

Chromatographic separation. Introduce 0.1 g each of *methyl laurate R, methyl myristate R, methyl palmitate R* and *methyl stearate R* into a 250 mL conical flask. Add 40 mL of *alcoholic potassium hydroxide solution R* and heat under a reflux condenser on a water-bath for 1 h. Allow to cool, transfer the solution to a separating funnel by means of 100 mL of *water R,* acidify (pH 2 to 3) with *dilute hydrochloric acid R* and shake with three quantities, each of 10 mL of *chloroform R.* Dry the combined chloroform extracts over *anhydrous sodium sulfate R,* filter and evaporate to dryness on a water-bath. Dissolve the residue in 50 mL of *chloroform R.* Examine by thin-layer chromatography (*2.2.27*), using silanised silica gel HF_{254} as the coating substance. Apply to the plate at each of three separate points 10 µL of the chloroformic solution. Develop over a path of 14 cm with a mixture of 10 volumes of *glacial acetic acid R,* 25 volumes of *water R* and 65 volumes of *dioxan R.* Dry the plate at 120 °C for 30 min. Allow to cool, spray with a 35 g/L solution of *phosphomolybdic acid R* in *2-propanol R* and heat at 150 °C until the spots become visible. Treat the plate with ammonia vapour until the background is white. The chromatograms show four clearly separated, well-defined spots.

Silica Gel OD for Chiral Separations

See *Cellulose derivative of silica gel for chiral separation R*

Silicotungstic Acid Dodecatungstosilicic acid; $H_4SiW_{12}O_{40},xH_2O$ (*11130-20-4*)

White or yellowish-white crystals, deliquescent, very soluble in water and in ethanol (96 per cent).

Storage: in an airtight container.

Silicristin (2*R*,3*R*)-3,5,7-Trihydroxy-2-[(2*R*,3*S*)-7-hydroxy-2-(4-hydroxy-3-methoxyphenyl)-3-hydroxymethyl-2,3-dihydro-1-benzofuran-5-yl]chroman-4-one; $C_{25}H_{22}O_{10}$ = 482.4 (*33889-69-9*)

White or yellowish powder, practically insoluble in water, soluble in acetone and in methanol.

Silidianin (3*R*,3a*R*,6*R*,7a*R*,8*R*)-7a-Hydroxy-8-(4-hydroxy-3-methoxyphenyl)-4-[(2*R*, 3*R*)-3,5,7-trihydroxy-4-oxochroman-2-yl]-2,3,3a,7a-tetrahydro-3,6-methano-1-benzofuran-7(6a*H*)-one; $C_{25}H_{22}O_{10}$ = 482.4 (*29782-68-1*)

White or yellowish powder, practically insoluble in water, soluble in acetone and in methanol.

Silver Diethyldithiocarbamate Silver diethylcarbamodithioate; $C_5H_{10}AgNS_2$ = 256.1 (*1470-61-7*)

Pale-yellow or greyish-yellow powder, practically insoluble in water, soluble in pyridine.

Storage below 8 °C is recommended.

It may be prepared as follows. Dissolve 1.7 g of *silver nitrate R* in 100 mL of *water R.* Separately dissolve 2.3 g of *sodium diethyldithiocarbamate R* in 100 mL of *water R.* Cool both solutions to 10 °C, then mix, and while stirring, collect the yellow precipitate on a sintered-glass filter (16) (*2.1.2*) and wash with 200 mL of cold *water R.* Dry the precipitate *in vacuo* for 10 h (*2.2.32*).

Silver Diethyldithiocarbamate Solution

Prepare the solution immediately before use. Dissolve 0.100 g of *silver diethyldithiocarbamate R* in *pyridine R* and dilute to 20.0 mL with the same solvent.

Suitability test. The solution is clear (*2.2.1*). The absorbance (*2.2.25*) of the solution is maximum 0.20 at 450 nm, maximum 0.01 at 510 nm and maximum 0.010 at 538 nm.

Silver Manganese Paper

Immerse strips of slow filter paper into a solution containing 8.5 g/L of *manganese sulfate R* and 8.5 g/L of *silver nitrate R.* Maintain for a few minutes and allow to dry over an appropriate desiccant, protected from acid and alkaline vapours.

Silver Nitrate (*7761-88-8*)

See *Silver nitrate (0009).*

Silver Nitrate Reagent

Prepare immediately before use. To a mixture of 3 mL of *concentrated ammonia R* and 40 mL of *1 M sodium hydroxide,* add 8 mL of a 200 g/L solution of *silver nitrate R,* dropwise, with stirring. Dilute to 200 mL with *water R.*

Silver Nitrate Solution

A freshly prepared 5.0% w/v solution of *silver nitrate.*

Store protected from light.

Silver Nitrate Solution, Ammoniacal

Dissolve 2.5 g of *silver nitrate R* in 80 mL of *water R* and add *dilute ammonia R1* dropwise until the precipitate has dissolved. Dilute to 100 mL with *water R.* Prepare immediately before use.

Silver Nitrate Solution in Pyridine

An 85 g/L solution of *silver nitrate R* in *pyridine R.*

Storage: protected from light.

Silver Nitrate Solution R1

A 42.5 g/L solution of *silver nitrate R.*

Storage: protected from light.

Silver Nitrate Solution R2

A 17 g/L solution of *silver nitrate R.*

Storage: protected from light.

Silver Oxide Disilver oxide; Ag_2O = 231.7 (*20667-12-3*)

Brownish-black powder, practically insoluble in water and in ethanol (96 per cent), freely soluble in dilute nitric acid and in ammonia.

Storage: protected from light.

Silver Sulfate Ag_2SO_4 = 311.8 (*10294-26-5*)

Content: minimum 99.0 per cent.

White or light grey powder, slightly soluble in water.

mp: about 652 °C.

Storage: protected from light.

Sinensetin 3′,4′,5,6,7-Pentamethoxyflavone; $C_{20}H_{20}O_7$ = 372.4 (*2306-27-6*)

White or almost white, crystalline powder, practically insoluble in water, soluble in ethanol (96 per cent).

mp: about 177 °C.

Absorbance (*2.2.25*). A solution in *methanol R* shows 3 absorption maxima, at 243 nm, 268 nm and 330 nm.

Assay. Liquid chromatography (*2.2.29*) as prescribed in the monograph *Java tea (1229)*.

Content: minimum 95 per cent, calculated by the normalisation procedure.

Sinomenine 7,8-Didehydro-4-hydroxy-3,7-dimethoxy-17-methyl-9α,13α,14α-morphinan-6-one; Cucoline; $C_{19}H_{23}NO_4$ = 329.4 (*115-53-7*)

Sirolimus Rapamycin; $C_{51}H_{79}NO_{13}$ = 914 (*53123-88-9*)

mp: 183 °C to 185 °C.

Sitostanol Dihydro-β-sitosterol; $C_{29}H_{52}O$ = 416.7 (*19466-47-8*)

Content: minimum 95.0 per cent.

β-Sitosterol Stigmast-5-en-3β-ol; 22,23-Dihydrostigmasterol; $C_{29}H_{50}O$ = 414.7 (*83-46-5*)

White or almost white powder, practically insoluble in water, sparingly soluble in tetrahydrofuran.

Content: minimum 75.0 per cent *m/m* (dried substance).

Assay. Gas chromatography (*2.2.28*), as prescribed in the monograph *Phytosterol (1911)*.

Test solution. Dissolve 0.100 g of the substance to be examined in *tetrahydrofuran R* and dilute to 10.0 mL with the same solvent. Introduce 100 µL of this solution into a suitable 3 mL flask and evaporate to dryness under *nitrogen R*. To the residue add 100 µL of a freshly prepared mixture of 50 µL of *1-methylimidazole R* and 1.0 mL of *heptafluoro-N-methyl-N-(trimethylsilyl)butanamide R*. Close the flask tightly and heat at 100 °C for 15 min. Allow to cool.

Injection: 1 µL of the test solution.

Sodium Na = 22.99 (*7440-23-5*)

A metal whose freshly cut surface is bright silver-grey. It rapidly tarnishes in contact with air and is oxidised completely to sodium hydroxide and converted to sodium carbonate. It reacts violently with water, yielding hydrogen and a solution of sodium hydroxide; soluble in anhydrous methanol, yielding hydrogen and a solution of sodium methoxide; practically insoluble in light petroleum.

Storage: under light petroleum or liquid paraffin.

Sodium Acetate (*6131-90-4*)

See *Sodium acetate trihydrate (0411)*.

Sodium Acetate, Anhydrous $C_2H_3NaO_2$ = 82.0 (*127-09-3*)

Colourless crystals or granules, very soluble in water, sparingly soluble in ethanol (96 per cent).

Loss on drying (*2.2.32*). Not more than 2.0 per cent, determined by drying in an oven at 105 °C.

Sodium Arsenite Sodium metaarsenite; $NaAsO_2$ = 129.9 (*7784-46-5*)

Sodium Arsenite Solution

Dissolve 5.0 g of *sodium arsenite R* in 30 mL of *1 M sodium hydroxide*. Cool to 0 °C and add, while stirring, 65 mL of *dilute hydrochloric acid R*.

Sodium Ascorbate Solution (*134-03-2*)

Dissolve 3.5 g of *ascorbic acid R* in 20 mL of *1 M sodium hydroxide*. Prepare immediately before use.

Sodium Azide NaN_3 = 65.0 (*26628-22-8*)

White or almost white, crystalline powder or crystals, freely soluble in water, slightly soluble in ethanol (96 per cent).

Sodium Benzenesulfonate $C_6H_5SO_3Na$ = 180.16 (*515-42-4*)

White crystalline powder, soluble in water.

Sodium Bicarbonate (*144-55-8*)

See *sodium hydrogen carbonate R*.

Sodium Bismuthate $NaBiO_3$ = 280.0 (*12232-99-4*)

Content: minimum 85.0 per cent.

Yellow or yellowish-brown powder, slowly decomposing when moist or at a high temperature, practically insoluble in cold water.

Assay. Suspend 0.200 g in 10 mL of a 200 g/L solution of *potassium iodide R* and add 20 mL of *dilute sulfuric acid R*. Using 1 mL of *starch solution R* as indicator, titrate with *0.1 M sodium thiosulfate* until an orange colour is obtained.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 14.00 mg of $NaBiO_3$.

Sodium Bromide (*7647-15-6*)

See *Sodium bromide (0190)*.

Sodium Butanesulfonate 1-Butanesulfonic acid sodium salt; 1-Butanesulfonic acid sodium salt; Sodium butanesulfonate; $C_4H_9NaO_3S$ = 160.2 (*2386-54-1*)

White or almost white, crystalline powder, soluble in water.

mp: greater than 300 °C.

Sodium Calcium Edetate (*62-33-9*)

See *sodium calcium edetate (0231)*.

Sodium Carbonate (*6132-02-1*)

See *Sodium carbonate decahydrate (0191)*.

Sodium Carbonate, Anhydrous Disodium carbonate; Na_2CO_3 = 106.0 (*497-19-8*)

White or almost white powder, hygroscopic, freely soluble in water.

When heated to about 300 °C it loses not more than 1 per cent of its mass.

Storage: in an airtight container.

Sodium Carbonate Monohydrate (*5968-11-6*)

See *Sodium carbonate monohydrate (0192)*.

Sodium Carbonate Solution

A 106 g/L solution of *anhydrous sodium carbonate R*.

Sodium Carbonate Solution, Dilute

A 10% w/v solution of *sodium carbonate*.

Sodium Carbonate Solution R1

A 20 g/L solution of *anhydrous sodium carbonate R* in *0.1 M sodium hydroxide*.

Sodium Carbonate Solution R2

A 40 g/L solution of *anhydrous sodium carbonate R* in *0.2 M sodium hydroxide*.

Sodium Cetostearyl Sulfate See *Sodium cetostearyl sulfate (0847)*.

Sodium Chloride (*7647-14-5*)

See *Sodium chloride (0193)*.

Sodium Chloride Solution

A 20 per cent *m/m* solution of *sodium chloride R*.

Sodium Chloride Solution, Saturated

Mix 1 part of *sodium chloride R* with 2 parts of *water R*, shake from time to time and allow to stand. Before use, decant the

solution from any undissolved substance and filter, if necessary.

Sodium Cholate Cholic acid sodium salt hydrate; $C_{24}H_{39}NaO_5$ = 430.5 (*73163-53-8*)

$[\alpha]_D^{20}$: +31.3 (0.5% w/v in water).

General reagent grade of commerce.

Sodium Citrate Trisodium citrate; (*6132-04-3*)

See *Sodium citrate (0412)*.

Sodium Cobaltinitrite Trisodium hexanitrocobaltate(III); $Na_3[Co(NO_2)_6]$ = 403.9 (*13600-98-1*)

Orange-yellow powder, freely soluble in water, slightly soluble in ethanol (96 per cent).

Sodium Cobaltinitrite Solution Sodium hexanitritocobaltate(III)

A 100 g/L solution of *sodium cobaltinitrite R*. Prepare immediately before use.

Sodium Decanesulfonate Sodium decanesulfonate; $C_{10}H_{21}NaO_3S$ = 244.3 (*13419-61-9*)

Crystalline powder or flakes, white or almost white, freely soluble in water, soluble in methanol.

Sodium Decyl Sulfate Sodium decyl sulfate; $C_{10}H_{21}NaO_4S$ = 260.3 (*142-87-0*)

Content: minimum 95.0 per cent.

White or almost white powder, freely soluble in water.

Sodium Deoxycholate Deoxycholic acid, sodium salt; $C_{24}H_{39}NaO_4$ = 414.6 (*302-95-4*)

Sodium Deoxyribonucleate About 85 per cent has a relative molecular mass of 2×10^7 or greater (*73049-39-5*)

White or almost white, fibrous preparation obtained from calf thymus.

Test for suitability. Dissolve 10 mg in *imidazole buffer solution pH 6.5 R* and dilute to 10.0 mL with the same buffer solution (solution A). Dilute 2.0 mL of solution A to 50.0 mL with *imidazole buffer solution pH 6.5 R*. The absorbance (*2.2.25*) of the solution, measured at 260 nm, is 0.4 to 0.8.

To 0.5 mL of solution A add 0.5 mL of *imidazole buffer solution pH 6.5 R* and 3 mL of perchloric acid (25 g/L $HClO_4$). A precipitate is formed. Centrifuge. The absorbance of the supernatant, measured at 260 nm using a mixture of 1 mL of *imidazole buffer solution pH 6.5 R* and 3 mL of perchloric acid (25 g/L $HClO_4$) as compensation liquid, is not greater than 0.3.

In each of two tubes, place 0.5 mL of solution A and 0.5 mL of a solution of a reference preparation of streptodornase containing 10 IU/mL in *imidazole buffer solution pH 6.5 R*. To one tube add immediately 3 mL of perchloric acid (25 g/L $HClO_4$). A precipitate is formed. Centrifuge and collect supernatant A. Heat the other tube at 37 °C for 15 min and add 3 mL of perchloric acid (25 g/L $HClO_4$). Centrifuge and collect supernatant B. The absorbance of supernatant B, measured at 260 nm with reference to supernatant A is not less than 0.15.

Sodium Diethyldithiocarbamate $C_5H_{10}NNaS_2,3H_2O$ = 225.3 (*20624-25-3*)

White or almost white or colourless crystals, freely soluble in water, soluble in ethanol (96 per cent). The aqueous solution is colourless.

Sodium Diethyldithiocarbamate Solution

A 0.1% w/v solution of *sodium diethyldithiocarbamate* in *water*.

Prepare immediately before use.

Sodium Dihydrogen Orthophosphate Sodium dihydrogen phosphate dihydrate; Sodium Dihydrogen Phosphate; (*13472-35-0*)

See *Sodium dihydrogen phosphate dihydrate (0194)*.

Sodium Dihydrogen Orthophosphate, Anhydrous Sodium dihydrogen phosphate, anhydrous; NaH_2PO_4 = 120.0 (*7558-80-7*)

White or almost white powder, hygroscopic.

Storage: in an airtight container.

Sodium Dihydrogen Orthophosphate Monohydrate Sodium dihydrogen phosphate monohydrate; NaH_2PO4, H_2O = 138.0 (*10049-21-5*)

White or almost white, slightly deliquescent crystals or granules, freely soluble in water, practically insoluble in ethanol (96 per cent).

Storage: in an airtight container.

Sodium Dithionite $Na_2S_2O_4$ = 174.1 (*7775-14-6*)

White or greyish-white, crystalline powder, oxidises in air, very soluble in water, slightly soluble in ethanol (96 per cent).

Storage: in an airtight container.

Sodium Dodecyl Sulfate Sodium dodecyl sulphate; Sodium lauryl sulfate; Sodium lauryl sulphate; Sodium laurilsulfate; (*151-21-3*)

See *Sodium laurilsulfate (0098)*.

Content: minimum 99.0 per cent.

Sodium Fluoride (*7681-49-4*)

See *Sodium fluoride (0514)*.

When used in the Assay of preparations containing Sodium Fluoride, use a grade containing not less than 99.9% of NaF.

Sodium Formate Sodium methanoate; $CHNaO_2$ = 68.0 (*141-53-7*)

White or almost white, crystalline powder or deliquescent granules, soluble in water and in glycerol, slightly soluble in ethanol (96 per cent).

mp: about 253 °C.

Sodium Glucuronate D-Glucuronic acid, sodium salt; $C_6H_9NaO_7,H_2O$ = 234.1

$[\alpha]_D^{20}$: about + 21.5, determined on a 20 g/L solution.

Sodium Glycocholate Sodium [(3,7,12-trihydroxy-5-cholan-24-oyl)amino]acetate dihydrate; *N*-[(3,5,7,12)-3,7,12-Trihydroxy-24-oxocholan-24-yl]glycine monosodium salt dihydrate; $C_{26}H_{42}NNaO_6,2H_2O$ = 523.6 (*207300-80-9*)

Content: minimum 97 per cent of $C_{26}H_{42}NNaO_6,2H_2O$.

Sodium Heptanesulfonate 1-Heptanesulfonic acid sodium salt; 1-Heptanesulphonic acid sodium salt; Sodium heptanesulphonate; $C_7H_{15}NaO_3S$ = 202.3 (*22767-50-6*)

White or almost white, crystalline mass, freely soluble in water, soluble in methanol.

Sodium Heptanesulfonate Monohydrate 1-Heptanesulfonic acid sodium salt monohydrate; 1-Heptanesulphonic acid sodium salt monohydrate; Sodium heptanesulphonate monohydrate; $C_7H_{15}NaO_3S,H_2O$ = 220.3

Content: minimum 96 per cent (anhydrous substance).

White or almost white, crystalline powder, soluble in water, very slightly soluble in anhydrous ethanol.

Water (2.5.12): maximum 8 per cent, determined on 0.300 g.

Assay. Dissolve 0.150 g in 50 mL of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M perchloric acid* is equivalent to 20.22 mg of $C_7H_{15}NaO_3S$.

Sodium Hexanesulfonate Hexanesulfonic acid sodium salt; Hexanesulphonic acid sodium salt; Sodium hexanesulphonate; $C_6H_{13}NaO_3S$ = 188.2 (*2832-45-3*)

White or almost white powder, freely soluble in water.

Sodium Hexanesulfonate Monohydrate Hexanesulfonic acid sodium salt monohydrate; Sodium hexanesulfonate monohydrate; $C_6H_{13}NaO_3S,H_2O$ = 206.2 (*207300-91-2*)

White or almost white powder, soluble in water.

Sodium Hexanesulfonate Monohydrate for Ion-pair Chromatography $C_6H_{13}NaO_3S,H_2O$ = 206.2 (*207300-91-2*)

Content: minimum 99.0 per cent.

Sodium Hydrogen Carbonate Sodium bicarbonate; (*144-55-8*)

See *Sodium hydrogen carbonate (0195)*.

Sodium Hydrogen Carbonate Solution

A 42 g/L solution of *sodium hydrogen carbonate R*.

Sodium Hydrogen Sulfate Sodium bisulphate; Sodium hydrogen sulphate; $NaHSO_4$ = 120.1 (*7681-38-1*)

Freely soluble in water, very soluble in boiling water. It decomposes in ethanol (96 per cent) into sodium sulfate and free sulfuric acid.

mp: about 315 °C.

Sodium Hydrogensulfite Sodium hydrogensulphite; $NaHO_3S$ = 104.1 (*7631-90-5*)

White or almost white, crystalline powder, freely soluble in water, sparingly soluble in ethanol (96 per cent).

On exposure to air, some sulfur dioxide is lost and the substance is gradually oxidated to sulfate.

Sodium Hydroxide (*1310-73-2*)

See *Sodium hydroxide (0677)*.

2M Sodium Hydroxide

Dissolve 84 g of *sodium hydroxide R* in *carbon dioxide-free water R* and dilute to 1000.0 mL with the same solvent.

4M Sodium Hydroxide

Dissolve 168 g of *sodium hydroxide R* in *carbon dioxide-free water R* and dilute to 1.0 L with the same solvent.

Sodium Hydroxide, Ethanolic

Solutions of the requisite molarity may be obtained by dissolving the appropriate amount of *sodium hydroxide* in sufficient *ethanol (96%)* to produce 1000 mL.

Sodium Hydroxide, Methanolic

Solutions of the requisite molarity may be obtained by dissolving the appropriate amount of *sodium hydroxide* in sufficient *methanol* to produce 1000 mL.

Sodium Hydroxide Solution

Dissolve 20.0 g of *sodium hydroxide R* in *water R* and dilute to 100.0 mL with the same solvent. Verify the concentration by titration with *1 M hydrochloric acid*, using *methyl orange solution R* as indicator, and adjust if necessary to 200 g/L.

Sodium Hydroxide Solution, Carbonate-free

Dissolve *sodium hydroxide R* in *carbon dioxide-free water R* to give a concentration of 500 g/L and allow to stand. Decant the clear supernatant, taking precautions to avoid the introduction of carbon dioxide.

Sodium Hydroxide Solution, Dilute

Dissolve 8.5 g of *sodium hydroxide R* in *water R* and dilute to 100 mL with the same solvent.

Sodium Hydroxide Solution, Methanolic

Dissolve 40 mg of *sodium hydroxide R* in 50 mL of *water R*. Cool and add 50 mL of *methanol R*.

Sodium Hydroxide Solution R1, Methanolic

Dissolve 200 mg of *sodium hydroxide R* in 50 mL of *water R*. Cool and add 50 mL of *methanol R*.

Sodium Hydroxide Solution, Strong

Dissolve 42 g of *sodium hydroxide R* in *water R* and dilute to 100 mL with the same solvent.

Sodium 2-Hydroxybutyrate Sodium (2*RS*)-2-hydroxybutanoate; $C_4H_7NaO_3$ = 126.1 (*19054-57-0*)

Sodium Hypobromite Solution

In a bath of iced water mix 20 mL of *strong sodium hydroxide solution R* and 500 mL of *water R*, add 5 mL of *bromine solution R* and stir gently until solution is complete. Prepare immediately before use.

Sodium Hypochlorite Solution

General reagent grade of commerce containing 10 to 14% w/v of available chlorine.

Sodium Hypochlorite Solution (3% Cl) Sodium hypochlorite solution, strong

Content: 25 g/L to 30 g/L of active chlorine.

Yellowish liquid with an alkaline reaction.

Assay. Introduce into a flask, successively, 50 mL of *water R*, 1 g of *potassium iodide R* and 12.5 mL of *dilute acetic acid R*. Dilute 10.0 mL of the substance to be examined to 100.0 mL with *water R*. Introduce 10.0 mL of this solution into the flask and titrate with *0.1 M sodium thiosulfate*, using 1 mL of *starch solution R* as indicator.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 3.546 mg of active chlorine.

Storage: protected from light.

see Strong Sodium Hypochlorite Solution

Sodium Hypochlorite Solution, Dilute

Dilute 35 mL of *sodium hypochlorite solution* to 100 mL with *water* immediately before use.

The solution contains approximately 3.5% w/v of available chlorine.

Sodium Hypophosphite Sodium phosphinate monohydrate; NaH_2PO_2,H_2O = 106.0 (*10039-56-2*)

White or almost white, crystalline powder or colourless crystals, hygroscopic, freely soluble in water, soluble in ethanol (96 per cent).

Storage: in an airtight container.

Sodium Iodide (*7681-82-5*)

See *Sodium iodide (0196)*.

Sodium Iodobismuthate Solution

Boil for a few minutes a mixture of 2.6 g of *bismuth oxycarbonate*, 7.0 g of *sodium iodide* and 25 mL of *glacial acetic acid*. Allow to stand for 12 hours and filter, if necessary, through sintered glass. To 20 mL of the filtrate add 80 mL of *ethyl acetate* (solution A). Immediately before use, mix 2 mL of solution A, 20 mL of *glacial acetic acid* and 40 mL of *ethyl acetate*.

For use in connection with thin-layer chromatography the sensitivity may be increased by spraying first with this solution and then with *sulfuric acid (0.2%)*.

Solution A should be kept in a well-closed container.

Sodium Laurilsulfate Sodium dodecyl sulphate; (*151-21-3*)

See *Sodium laurilsulfate (0098)*.

Sodium Laurilsulfate R1 (*151-21-3*)

Content: minimum 99.0 per cent.

Sodium Lauryl Sulfate (*151-21-3*)

See *Sodium laurilsulfate R*.

Sodium Laurylsulfonate for Chromatography Sodium laurylsulphonate for chromatography; $C_{12}H_{25}NaO_3S$ = 272.4 (*2386-53-0*)

White or almost white powder or crystals, freely soluble in water.

Absorbance $A_{1\ cm}^{5\%}$ (*2.2.25*), determined in *water R*: about 0.05 at 210 nm; about 0.03 at 220 nm; about 0.02 at 230 nm; about 0.02 at 500 nm.

Sodium Metabisulfite Sodium metabisulphite; Sodium pyrosulfite; Sodium pyrosulphite; (*7681-57-4*)

See *Sodium metabisulfite (0849)*.

Sodium Methanesulfonate Methanesulfonic acid, sodium salt; Methanesulphonic acid, sodium salt; Sodium methanesulphonate; CH_3SO_3Na = 118.1 (*2386-57-4*)

White or almost white, crystalline powder, hygroscopic.

Storage: in an airtight container.

Sodium 2-methyl-2-thiazoline-4-carboxylate $C_5H_6NNaO_2S$ = 167.2 (*15058-19-2*)

Sodium 2-methyl-4,5-dihydro-1,3-thiazole-4-carboxylate.

White solid.

Content: minimum 95 per cent.

Sodium Molybdate Disodium molybdate dihydrate; $Na_2MoO_4,2H_2O$ = 242.0 (*10102-40-6*)

White or almost white, crystalline powder or colourless crystals, freely soluble in water.

Sodium 1,2-Naphthoquinone-4-sulfonate Sodium naphthoquinonesulfonate; $C_{10}H_5NaO_5S$ = 260.2 (*521-24-4*)

Yellow or orange-yellow, crystalline powder, freely soluble in water, practically insoluble in ethanol (96 per cent).

Sodium Nitrate $NaNO_3$ = 85.0 (*7631-99-4*)

White or almost white powder or granules or colourless, transparent crystals, deliquescent in moist air, freely soluble in water, slightly soluble in ethanol (96 per cent).

Storage: in an airtight container.

Sodium Nitrite $NaNO_2$ = 69.0 (*7632-00-0*)

Content: minimum 97.0 per cent.

White or almost white, granular powder or a slightly yellow, crystalline powder, freely soluble in water.

Assay. Dissolve 0.100 g in 50 mL of *water R*. Add 50.0 mL of *0.02 M potassium permanganate* and 15 mL of *dilute sulfuric acid R*. Add 3 g of *potassium iodide R*. Titrate with *0.1 M sodium thiosulfate*, using 1.0 mL of *starch solution R* added towards the end of the titration as indicator.

1 mL of *0.02 M potassium permanganate* is equivalent to 3.450 mg of $NaNO_2$.

Sodium Nitrite Solution

A 100 g/L solution of *sodium nitrite R*. Prepare immediately before use.

Sodium Nitroprusside Sodium pentacyanonitrosylferrate(III) dihydrate; $Na_2[Fe(CN)_5(NO)],2H_2O$ = 298.0 (*13755-38-9*)

Reddish-brown powder or crystals, freely soluble in water, slightly soluble in ethanol (96 per cent).

Sodium Nitroprusside-Carbonate Solution

Dissolve 1 g of *sodium nitroprusside* and 1 g of *anhydrous sodium carbonate* in sufficient *water* to produce 100 mL.

Sodium Octanesulfonate Octanesulfonic acid sodium salt; Octanesulphonic acid sodium salt; Sodium octanesulphonate; $C_8H_{17}NaO_3S$ = 216.3 (*5324-84-5*)

Content: minimum 98.0 per cent.

White or almost white, crystalline powder or flakes, freely soluble in water, soluble in methanol.

Absorbance (*2.2.25*): maximum 0.10, determined at 200 nm and maximum 0.01, determined at 250 nm using a 54 g/L solution.

Sodium Octanesulfonate Monohydrate Sodium octanesulphonate monohydrate; $C_8H_{17}NaO_3S,H_2O$ = 234.3 (*207596-29-0*)

White or almost white powder.

Sodium Octyl Sulfate Octyl sulfate sodium salt; 4-Octyl sulphate sodium salt; Sodium octyl sulphate; $C_8H_{17}NaO_4S$ = 232.3 (*142-31-4*)

White or almost white, crystalline powder or flakes, freely soluble in water, soluble in methanol.

Sodium Oxalate $C_2Na_2O_4$ = 134.0 (*62-76-0*)

White or almost white, crystalline powder, soluble in water, practically insoluble in ethanol (96 per cent).

Sodium Oxidronate Sodium hydroxymethylenediphosphonate; $CH_4Na_2O_7P_2$ = 236.0 (*14255-61-9*)

White or almost white powder or colourless crystals, very soluble in water, very slightly soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

Sodium Pentanesulfonate 1-Pentanesulfonic acid sodium salt; 1-Pentanesulphonic acid sodium salt; Sodium pentanesulphonate; $C_5H_{11}NaO_3S$ = 174.2 (*22767-49-3*)

White or almost white, crystalline solid, soluble in water.

Sodium Pentanesulfonate Monohydrate 1-Pentanesulfonic acid sodium salt monohydrate; 1-Pentanesulphonic acid sodium salt monohydrate; Sodium pentanesulphonate monohydrate; $C_5H_{11}NaO_3S,H_2O$ = 192.2 (*207605-40-1*)

White or almost white crystalline solid, soluble in water.

Sodium Pentanesulfonate Monohydrate R1 Sodium pentanesulphonate monohydrate R1; $C_5H_{11}NaO_3S$, H_2O = 192.2 (*207605-40-1*)

Content: minimum 99 per cent of $C_5H_{11}NaO_3S,H_2O$.

Sodium Perchlorate $NaClO_4,H_2O$ = 140.5 (*7791-07-3*)

Content: minimum 99.0 per cent of $NaClO_4,H_2O$.

White or almost white, deliquescent crystals, very soluble in water.

Storage: in a well-closed container.

Sodium Periodate Sodium metaperiodate; $NaIO_4$ = 213.9 (*7790-28-5*)

Content: minimum 99.0 per cent.

White or almost white, crystalline powder or crystals, soluble in water and in mineral acids.

Sodium Periodate Solution

Dissolve 1.07 g of *sodium periodate R* in *water R*, add 5 mL of *dilute sulfuric acid R* and dilute to 100.0 mL with *water R*. Use a freshly prepared solution.

Sodium Phosphite Sodium phosphite pentahydrate; $Na_2HPO_3,5H_2O$ = 216.0 (*13517-23-2*)

White or almost white, crystalline powder, hygroscopic, freely soluble in water.

Storage: in an airtight container.

Sodium Picrate Solution, Alkaline

Mix 20 mL of *picric acid solution R* and 10 mL of a 50 g/L solution of *sodium hydroxide R* and dilute to 100 mL with *water R*.

Storage: use within 2 days.

Sodium 1-Propanesulfonate Sodium propane-1-sulfonate monohydrate; $C_3H_9SO_4Na$ = 164.2 (*304672-01-3*)

mp: about 250 °C.

Sodium Pyrophosphate Tetrasodium diphosphate decahydrate; $Na_4P_2O_7,10H_2O$ = 446.1 (*13472-36-1*)

Colourless, slightly efflorescent crystals, freely soluble in water.

Sodium Pyruvate 2-Oxopropanoic acid sodium salt; $C_3H_3NaO_3$ = 110.0 (*113-24-6*)

White or faint yellow powder, soluble in water (100 mg/mL).

mp: greater than 300 °C.

Sodium Rhodizonate Rhodizonic acid disodium salt; $C_6Na_2O_6$ = 214.0 (*523-21-7*)

Violet crystals, soluble in water with an orange-yellow colour.

Solutions are unstable and must be prepared on the day of use.

Sodium Salicylate (*54-21-7*)

See *Sodium salicylate (0413)*.

Sodium Stearyl Fumarate $C_{22}H_{39}NaO_4$ (*4070-80-8*)

See *Sodium stearyl fumarate (1567)*.

Sodium Sulfate Sodium sulfate decahydrate; $Na_2SO_4,10H_2O$ = 322.2 (*7727-73-3*)

See *Sodium sulfate decahydrate (0100)*.

Sodium Sulfate, Anhydrous Sodium sulphate, anhydrous; (*7757-82-6*)

Ignite at 600 °C to 700 °C anhydrous sodium sulfate complying with the requirements prescribed in the monograph on *Anhydrous sodium sulfate (0099)*.

Loss on drying (*2.2.32*): maximum 0.5 per cent, determined by drying in an oven at 130 °C.

Sodium Sulfate, Anhydrous R1

Complies with the requirements prescribed for *anhydrous sodium sulfate R* with the following maximum contents.

Cl: 20 ppm.

Pb: 10 ppm.

As: 3 ppm.

Ca: 50 ppm.

Fe: 10 ppm.

Mg: 10 ppm.

Sodium Sulfide Sodium sulphide; $Na_2S,9H_2O$ = 240.2 (*1313-84-4*)

Colourless, rapidly yellowing crystals, deliquescent, very soluble in water.

Storage: in an airtight container.

Sodium Sulfide Solution Sodium sulphide solution

Dissolve 12 g of *sodium sulfide R* with heating in 45 mL of a mixture of 10 volumes of *water R* and 29 volumes of *glycerol (85 per cent) R*, allow to cool and dilute to 100 mL with the same mixture of solvents.

The solution should be colourless.

Sodium Sulfide Solution R1 Sodium sulphide solution R1

Prepare by one of the following methods.

— Dissolve 5 g of *sodium sulfide R* in a mixture of 10 mL of *water R* and 30 mL of *glycerol R*.

— Dissolve 5 g of *sodium hydroxide R* in a mixture of 30 mL of *water R* and 90 mL of *glycerol R*. Divide the solution into 2 equal portions. Saturate 1 portion with *hydrogen sulfide R*, with cooling. Mix the 2 portions.

Storage: in a well-filled container, protected from light; use within 3 months.

Sodium Sulfite Sodium sulphite; Sodium sulfite heptahydrate; (*10102-15-5*)

See *Sodium sulfite heptahydrate (0776)*.

Sodium Sulfite, Anhydrous Sodium sulphite, anhydrous; (*7757-83-7*)

See *Sodium sulfite (0775)*.

Sodium (+)-Tartrate Disodium (2R,3R)-2,3-dihydroxybutanedioate dehydrate; Sodium tartrate; $C_4H_4Na_2O_6,2H_2O$ = 230.1 (*6106-24-7*)

White or almost white crystals or granules, very soluble in water, practically insoluble in ethanol (96 per cent).

Sodium Taurodeoxycholate Sodium 2-[(3,12-dihydroxy-5-cholan-24-oyl)amino]ethanesulfonate monohydrate; 2-[[(3,5,12)-3,12-Dihydroxy-24-oxocholan-24-yl]amino] ethanesulfonic acid monosodium salt monohydrate; $C_{26}H_{44}NNaO_6S,H_2O$ = 539.7 (*110026-03-4*)

Content: minimum 94 per cent of $C_{26}H_{44}NNaO_6S,H_2O$.

Sodium Tetraborate Borax; Disodium tetraborate; (*1303-96-4*)

See *Borax (0013)*.

Sodium Tetrahydroborate Sodium borohydride; $NaBH_4$ = 37.8 (*16940-66-2*)

Colourless, hygroscopic crystals, freely soluble in water, soluble in anhydrous ethanol, decomposing at higher temperature or in the presence of acids or certain metal salts forming borax and hydrogen.

Storage: in an airtight container.

Sodium Tetrahydroborate Reducing Solution

Introduce about 100 mL of *water R* into a 500 mL volumetric flask containing a stirring bar. Add 5.0 g of *sodium hydroxide R* in pellets and 2.5 g of *sodium tetrahydroborate R*. Stir until complete dissolution, dilute to 500.0 mL with *water R* and mix. Prepare immediately before use.

Sodium Tetraphenylborate $NaB(C_6H_5)_4$ = 342.2 (*143-66-8*)

White or slightly yellowish, bulky powder, freely soluble in water and in acetone.

Sodium Tetraphenylborate Solution

Filter before use if necessary.

A 10 g/L solution of *sodium tetraphenylborate R*.

Storage: use within 1 week.

Sodium Thioglycollate Sodium mercaptoacetate; $C_2H_3NaO_2S$ = 114.1 (*367-51-1*)

White or almost white, granular powder or crystals, hygroscopic, freely soluble in water and in methanol, slightly soluble in ethanol (96 per cent).

Storage: in an airtight container.

Sodium Thiosulfate Sodium thiosulphate; (*10102-17-7*)

See *Sodium thiosulfate (0414)*.

Sodium Thiosulfate, Anhydrous Disodium thiosulfate; $Na_2S_2O_3$ = 158.1 (*7772-98-7*)

Content: minimum 98.0 per cent.

Sodium Tungstate Disodium tungstate dihydrate; $Na_2WO_4,2H_2O$ = 329.9 (*10213-10-2*)

White or almost white, crystalline powder or colourless crystals, freely soluble in water forming a clear solution, practically insoluble in ethanol (96 per cent).

Solochrome Dark Blue CI 15705; calcon; mordant black 17; $C_{20}H_{13}N_2NaO_5S$ = 416.4 (*2538-85-4*)

General reagent grade of commerce.

A brownish black powder with a violet sheen. Produces a purplish red colour with calcium ions in alkaline solutions. When metal ions are absent, for example, in the presence of an excess of disodium edetate, the solution is blue.

Solochrome Dark Blue Mixture

A mixture of 1 part of *solochrome dark blue* with 99 parts of freshly ignited *anhydrous sodium sulfate*.

Complies with the following test.

Sensitivity to calcium Dissolve 0.2 g in 5 mL of *water*. To 1 mL of the solution add 50 mL of *water*, 10 mL of 1M *sodium hydroxide* and 1 mL of a 1% w/v solution of *magnesium sulfate*; a blue colour is produced. Add 0.1 mL of a 0.15% w/v solution of *calcium chloride*; a violet colour is produced. Add 0.1 mL of 0.01M *disodium edetate VS*; a pure blue colour is produced.

Sorbic Acid Hexa-2,4-dienoic acid; $C_6H_8O_2$ = 112.1 (*110-44-1*)

mp: about 136°.

General reagent grade of commerce.

D-Sorbitol Sorbitol; (*50-70-4*)

See *Sorbitol (0435)*.

Soya Bean Lecithin (*8030-76-0*)

Soya-bean Oil, Refined See *Soya-bean oil, refined (1473)*.

Sphingomyelin from Egg Yolk (*85187-10-6*)

(2*R*,3*S*,4*E*)-2-(Acylamino)-3-hydroxyoctadec-4-en-1-yl 2-(trimethylazaniumyl)ethyl phosphate.

Squalane (6*E*,10*E*,15*E*,19*E*)-2,6,10,15,19,23-Hexamethyltetracosane; Perhydrosqualene; $C_{30}H_{62}$ = 422.8 (*111-01-3*)

Colourless, oily liquid, freely soluble in fatty oils, slightly soluble in acetone, in ethanol (96 per cent), in glacial acetic acid and in methanol.

d_{20}^{20}: 0.811 to 0.813.

n_D^{20}: 1.451 to 1.453.

Stanolone 17β-Hydroxy-5α-androstan-3-one; $C_{19}H_{30}O_2$ = 290.4 (*521-18-6*)

White or almost white powder.

mp: about 180 °C.

Staphylococcus Aureus Strain V8 Protease Type XVII-B (*66676-43-5*)

Microbial extracellular proteolytic enzyme. A lyophilised powder containing 500 units to 1000 units per milligram of solid.

Starch

Potato starch of commerce.

Starch, Hydrolysed

Electrophoretic grade of commerce.

Starch Iodate Paper

Immerse strips of filter paper in 100 mL of *iodide-free starch solution R* containing 0.1 g of *potassium iodate R*. Drain and allow to dry protected from light.

Starch Iodide Paper

Immerse strips of filter paper in 100 mL of *potassium iodide and starch solution R*. Drain and allow to dry protected from light.

Test for sensitivity. Mix 0.05 mL of *0.1 M sodium nitrite* with 4 mL of *hydrochloric acid R* and dilute to 100 mL with *water R*. Apply one drop of the solution to starch iodide paper; a blue spot appears.

Starch Mucilage

Triturate 0.5 g of *starch* or *soluble starch* with 5 mL of *water* and add, stirring continuously, to sufficient *water* to produce about 100 mL. Boil for a few minutes, cool and filter.

Produces a blue colour with free iodine in the presence of a soluble iodide.

It must be recently prepared.

Starch, Soluble (*9005-84-9*)

White or almost white powder.

Starch Solution

Triturate 1.0 g of *soluble starch R* with 5 mL of *water R* and whilst stirring pour the mixture into 100 mL of boiling *water R* containing 10 mg of *mercuric iodide R*.

NOTE: commercially available reagents may be used; including mercury-free solutions or those containing alternative preservatives.

Carry out the test for sensitivity each time the reagent is used.

Test for sensitivity. To a mixture of 1 mL of the starch solution and 20 mL of *water R*, add about 50 mg of *potassium iodide R* and 0.05 mL of *iodine solution R1*. The solution is blue.

Starch Solution, Iodide-free

Prepare the solution as prescribed for *starch solution R* omitting the mercuric iodide. Prepare immediately before use.

Starch Solution R1

Mix 1 g of *soluble starch R* and a small amount of cold *water R*. Add this mixture, while stirring, to 200 mL of boiling *water R*. Add 0.25 g of *salicylic acid R* and boil for 3 min. Immediately remove from the heat and cool.

Storage: if long storage is required, the solution shall be stored at 4 °C to 10 °C. A fresh starch solution shall be prepared when the end-point of the titration from blue to colourless fails to be sharp. If stored under refrigeration, the starch solution is stable for about 2 to 3 weeks.

Test for sensitivity. A mixture of 2 mL of *starch solution R1*, 20 mL of *water R*, about 50 mg of *potassium iodide R* and 0.05 mL of *iodine solution R1* is blue.

Starch Solution R2

Triturate 1.0 g of *soluble starch R* with 5 mL of *water R* and whilst stirring pour the mixture into 100 mL of boiling *water R*. Use a freshly prepared solution.

Test for sensitivity. To a mixture of 1 mL of the starch solution and 20 mL of *water R*, add about 50 mg of *potassium iodide R* and 0.05 mL of *iodine solution R1*. The solution is blue.

Starch Substrate

Determine the water content of *starch EPBRP* by heating at 120° for 4 hours. Stir a quantity of *starch EPBRP* equivalent to 2.0 g of the dried substance with 10 mL of *water* and add, stirring continuously, to 160 mL of boiling *water*. Rinse the container with several 10-mL quantities of *water*, add the washings to the hot starch solution and heat to boiling, stirring continuously. Cool to 20° and add sufficient *water* to produce 200 mL.

Use on the day of preparation.

Stavudine (*3056-17-5*)

See *Stavudine (2130)*.

Stearic Acid Octadecanoic acid; $C_{18}H_{36}O_2$ = 284.5 (*57-11-4*)

White or almost white powder or flakes, greasy to the touch, practically insoluble in water, soluble in hot ethanol (96 per cent).

mp: about 70 °C.

Stearic acid used in the assay of total fatty acids in Saw palmetto fruit (1848) complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Saw palmetto fruit (1848)*.

Content: minimum 98 per cent, calculated by the normalisation procedure.

Stearic Anhydride $C_{36}H_{70}O_3$ = 551.0 (*638-08-4*)

mp: about 70°.

General reagent grade of commerce.

White, waxy flakes.

Stigmasterol (22*E*)-Stigmasta-5,22-dien-3β-ol; (22*E*)-24-Ethylcholesta-5,22-dien-3β-ol; $C_{29}H_{48}O$ = 412.7 (*83-48-7*)

White or almost white powder, insoluble in water.

mp: about 170 °C.

$[\alpha]_D^{22}$: about – 51, determined with a 20 g/L solution in *chloroform R*.

Streptomycin Sulfate Streptomycin sulphate; (*3810-74-0*)

See *Streptomycin sulfate (0053)*.

Strongly Acidic Ion-exchange Resin See *ion-exchange resin, strongly acidic R*.

Strontium Carbonate $SrCO_3$ = 147.6 (*1633-05-2*)

White or almost white, crystalline powder.

Content: minimum 99.5 per cent.

Strontium Chloride Strontium chloride hexahydrate; $SrCl_2,6H_2O$ = 266.6 (*10025-70-4*)

White or almost white crystals, very soluble in water.

mp: about 115 °C (loss of water) and 872 °C.

Strontium Selective Extraction Resin

Commercially available resin prepared by loading a suspension of 4,4′(5′)-di-*tert*-butylcyclohexano-18-crown-6 (crown ether) in octanol onto an inert chromatographic support. The bed density of this resin is approximately 0.35 g/mL.

Strontium-85 Spiking Solution

Dilute *strontium-85 standard solution R* to a radioactivity concentration of approximately 10 kBq/mL with a 0.27 g/L solution of *strontium chloride hexahydrate R* in a 1.03 g/L solution of *hydrochloric acid R*.

Strontium-85 Standard Solution

A solution of strontium-85 in the form of Sr^{2+} ions in a 51.5 g/L solution of *hydrochloric acid R*.

Strychnine $C_{21}H_{22}N_2O_2$ = 334.4 (*57-24-9*)

(4a*R*,4b*R*,5a*S*,8a*R*,13a*S*,15a*S*)-2,4a,4b,5,5a,7,8,13a,15,15a-Decahydro-4,6-methano-6*H*-indolo[3,2,1-*ij*]oxepino[2,3,4-*de*]pyrrolo[2,3-*h*]quinolin-14-one. Strychnidin-10-one.

White or almost white, crystalline powder, sparingly soluble in water.

mp: about 285 °C.

Styrene Ethenylbenzene; C_8H_8 = 104.2 (*100-42-5*)

bp: about 145 °C.

Colourless, oily liquid, very slightly soluble in water.

Styrene–Divinylbenzene Copolymer

Porous, rigid, cross-linked polymer beads. Several grades are available with different sizes of beads. The size range of the beads is specified after the name of the reagent in the tests where it is used.

Succinic Acid Butanedioic acid; $C_4H_6O_4$ = 118.1 (*110-15-6*)

White or almost white, crystalline powder or colourless crystals, soluble in water and in ethanol (96 per cent).

mp: 184 °C to 187 °C.

Sucrose (*57-50-1*)

See *Sucrose (0204)*.

Sudan Red CI 26100; sudan III; solvent red 23; 1-(4-phenylazophenylazo)-2-naphthol; $C_{22}H_{16}N_4O$ = 352.4 (*85-86-9*)

Technical reagent grade of commerce.

A reddish brown powder.

Sudan Red G Sudan red I; $C_{17}H_{14}N_2O_2$ = 278.3

Schultz No. 149

Colour Index No. 12150

Reddish-brown powder, practically insoluble in water.

Chromatography. Thin-layer chromatography (*2.2.27*) using *silica gel G R* as the coating substance: apply 10 µL of a 0.1 g/L solution in *methylene chloride R* and develop over a path of 10 cm with the same solvent; the chromatogram shows only one principal spot.

Sudan Red Solution

A 0.5% w/v solution of *sudan red* in *anhydrous acetic acid*.

Sudan Yellow 1-(phenylazo)naphthalen-2-ol; Sudan I; Sudan orange; $C_{16}H_{12}N_2O$ = 248.3 (*842-07-9*)

Colour Index No. 12055

Orange-red powder, practically insoluble in water, soluble in methylene chloride.

mp: about 131 °C.

Sudan Yellow Solution

A 0.2% w/v solution of *sudan yellow* in a mixture of 1 volume of *benzene* and 4 volumes of *petroleum spirit (boiling range, 60° to 80°)*.

Sulfanilamide 4-Aminobenzenesulphonamide; Sulphanilamide; $C_6H_8N_2O_2S$ = 172.2 (*63-74-1*)

White or almost white powder, slightly soluble in water, freely soluble in boiling water, in acetone, in dilute acids and in solutions of the alkali hydroxides, sparingly soluble in ethanol (96 per cent) and in light petroleum.

mp: about 165 °C.

Sulfathiazole 4-Amino-*N*-(thiazol-2-yl) benzenesulfonamide; $C_9H_9N_3O_2S_2$ = 255.3 (*72-14-0*)

White or yellowish-white powder or crystals, very slightly soluble in water, soluble in acetone, slightly soluble in

ethanol (96 per cent). It dissolves in dilute mineral acids and in solutions of alkali hydroxides and carbonates.

mp: about 200 °C.

Sulfamic Acid H_3NO_3S = 97.1 (*5329-14-6*)

White or almost white crystalline powder or crystals, freely soluble in water, sparingly soluble in acetone, in ethanol (96 per cent) and in methanol.

mp: about 205 °C, with decomposition.

Sulfan Blue Sulphan blue; $C_{27}H_{31}N_2NaO_6S_2$ = 566.6 (*129-17-9*)

Schultz No. 769

Colour Index No. 42045

Violet powder, soluble in water. Dilute solutions are blue and turn yellow on the addition of concentrated hydrochloric acid.

Sulfanilic Acid Sulphanilic acid; $C_6H_7NO_3S$ = 173.2 (*121-57-3*)

Colourless crystals, sparingly soluble in water, practically insoluble in ethanol (96 per cent).

Sulfanilic Acid Solution Sulphanilic acid solution

Dissolve 0.33 g of *sulfanilic acid R* in 75 mL of *water R* heating gently if necessary and dilute to 100 mL with *glacial acetic acid R*.

Sulfanilic Acid Solution R1 Sulphanilic acid solution R1

Dissolve 0.5 g of *sulfanilic acid R* in a mixture of 75 mL of *dilute acetic acid R* and 75 mL of *water R*.

Sulfanilic Acid Solution, Diazotised Sulphanilic acid solution, diazotised

Dissolve, with warming, 0.9 g of *sulfanilic acid R* in 9 mL of *hydrochloric acid R*, and dilute to 100 mL with *water R*. Cool 10 mL of this solution in iced water and add 10 mL of an ice-cold 45 g/L solution of *sodium nitrite R*. Allow to stand at 0 °C for 15 min (if stored at this temperature, the solution is stable for 3 days) and immediately before use add 20 mL of a 100 g/L solution of *sodium carbonate R*.

Sulfomolybdic Reagent R2 Sulphomolybdic reagent R2

Dissolve about 50 mg of *ammonium molybdate R* in 10 mL of *sulfuric acid R*.

Sulfomolybdic Reagent R3 Sulphomolybdic reagent R3

Dissolve with heating 2.5 g of *ammonium molybdate R* in 20 mL of *water R*. Dilute 28 mL of *sulfuric acid R* in 50 mL of *water R*, then cool. Mix the two solutions and dilute to 100 mL with *water R*.

Storage: in a polyethylene container.

Sulfosalicylic Acid 5-Sulfo-2-hydroxybenzoic acid; 5-Sulpho-2-hydroxybenzoic acid; 3-Sulpho-6-hydroxybenzoic acid; 3-Sulpho-6-hydroxybenzoic acid; Sulfosalicylic acid; $C_7H_6O_6S,2H_2O$ = 254.2 (*5965-83-3*)

White or almost white, crystalline powder or crystals, very soluble in water and in ethanol (96 per cent).

mp: about 109 °C.

Sulfur (*7704-34-9*)

See *Sulfur (0953)*.

Sulfur Dioxide Sulphur dioxide; SO_2 = 64.1 (*7446-09-5*)

A colourless gas. When compressed it is a colourless liquid.

Sulfur Dioxide R1 Sulphur dioxide R1; SO_2 = 64.1 (*7446-09-5*)

Content: minimum 99.9 per cent *V/V*.

Sulfur Dioxide Solution Sulphur dioxide solution, sulfurous acid, sulphurous acid; H_2SO_3 = 82.08

Use a solution of commerce containing about 5% w/v of SO_2; weight per mL, about 1.03 g.

Sulfuric Acid Sulphuric acid; H_2SO_4 = 98.1 (*7664-93-9*)

Content: 95.0 per cent *m/m* to 97.0 per cent *m/m*.

Colourless, caustic liquid with an oily consistency, highly hygroscopic, miscible with water and with ethanol (96 per cent) producing intense heat.

d_{20}^{20}: 1.834 to 1.837.

A 10 g/L solution is strongly acid and gives the reactions of sulfates (*2.3.1*).

Appearance. It is clear (*2.2.1*) and colourless (*2.2.2, Method II*).

Oxidisable substances. Pour 20 g cautiously, with cooling, into 40 mL of *water R*. Add 0.5 mL of *0.002 M potassium permanganate*. The violet colour persists for at least 5 min.

Chlorides: maximum 0.5 ppm.

Pour 10 g, carefully and while cooling, into 10 mL of *water R* and after cooling dilute to 20 mL with the same solvent. Add 0.5 mL of *silver nitrate solution R2*. Allow to stand for 2 min protected from bright light. The solution is not more opalescent than a standard prepared at the same time using a mixture of 1 mL of *chloride standard solution (5 ppm Cl) R*, 19 mL of *water R* and 0.5 mL of *silver nitrate solution R2*.

Nitrates: maximum 0.5 ppm.

Pour 50 g or 27.2 mL, carefully and while cooling, into 15 mL of *water R*. Add 0.2 mL of a freshly prepared 50 g/L solution of *brucine R* in *glacial acetic acid R*. After 5 min any colour is less intense than that of a reference mixture prepared in the same manner and containing 12.5 mL of *water R*, 50 g of *nitrogen-free sulfuric acid R*, 2.5 mL of *nitrate standard solution (10 ppm NO_3) R* and 0.2 mL of a 50 g/L solution of *brucine R* in *glacial acetic acid R*.

Ammonium: maximum 2 ppm.

Pour 2.5 g, carefully and while cooling, into *water R* and dilute to 20 mL with the same solvent. Cool, and add dropwise 10 mL of a 200 g/L solution of *sodium hydroxide R*, followed by 1 mL of *alkaline potassium tetraiodomercurate solution R*. The colour of the solution is less intense than that of a mixture of 5 mL of *ammonium standard solution (1 ppm NH_4) R*, 15 mL of *water R*, 10 mL of a 200 g/L solution of *sodium hydroxide R* and 1 mL of *alkaline potassium tetraiodomercurate solution R*.

Arsenic (*2.4.2, Method A*): maximum 0.02 ppm.

To 50 g add 3 mL of *nitric acid R* and evaporate carefully until the volume is reduced to about 10 mL. Cool, add to the residue 20 mL of *water R* and concentrate to 5 mL. Prepare the standard using 1.0 mL of *arsenic standard solution (1 ppm As) R*.

Iron (*2.4.9*): maximum 1 ppm.

Dissolve the residue on ignition with slight heating in 1 mL of *dilute hydrochloric acid R* and dilute to 50.0 mL with *water R*. Dilute 5 mL of this solution to 10 mL with *water R*.

Heavy metals (*2.4.8*): maximum 2 ppm.

Dilute 10 mL of the solution obtained in the test for iron to 20 mL with *water R*. 12 mL of the solution complies with test A. Prepare the reference solution using *lead standard solution (2 ppm Pb) R*.

Residue on ignition: maximum 0.001 per cent, determined on 100 g by evaporating cautiously in a small crucible over a naked flame and igniting the residue to redness.

Assay. Weigh accurately a ground-glass-stoppered flask containing 30 mL of *water R*, introduce 0.8 mL of the sulfuric acid, cool and weigh again. Titrate with *1 M sodium hydroxide*, using 0.1 mL of *methyl red solution R* as indicator.

1 mL of *1 M sodium hydroxide* is equivalent to 49.04 mg of H_2SO_4.

Storage: in a ground-glass-stoppered container made of glass or other inert material.

Sulfuric Acid, 5M Sulphuric acid, 5M

Dilute 28 mL of *sulfuric acid R* to 100 mL with *water R*.

Sulfuric Acid, Dilute Sulphuric acid, dilute

Contains 98 g/L of H_2SO_4.

Add 5.5 mL of *sulfuric acid R* to 60 mL of *water R*, allow to cool and dilute to 100 mL with the same solvent.

Assay. Into a ground-glass-stoppered flask containing 30 mL of *water R*, introduce 10.0 mL of the dilute sulfuric acid. Titrate with *1 M sodium hydroxide*, using 0.1 mL of *methyl red solution R* as indicator.

1 mL of *1 M sodium hydroxide* is equivalent to 49.04 mg of H_2SO_4.

Sulfuric Acid, Dilute R1

Contains 4.9 g/L of H_2SO_4.

Prepared from *sulfuric acid R*.

Sulfuric Acid, 2.5M Alcoholic Sulphuric acid, 2.5M alcoholic

Carefully and with constant cooling, stir 14 mL of *sulfuric acid R* into 60 mL of *anhydrous ethanol R*. Allow to cool and dilute to 100 mL with *anhydrous ethanol R*. Prepare immediately before use.

Sulfuric Acid, 0.25M Alcoholic Sulphuric acid, 0.25M alcoholic

Dilute 10 mL of *2.5 M alcoholic sulfuric acid R* to 100 mL with *anhydrous ethanol R*. Prepare immediately before use.

Sulfuric Acid, Alcoholic Solution of Sulphuric acid, alcoholic solution of

Carefully and with constant cooling, stir 20 mL of *sulfuric acid R* into 60 mL of *ethanol (96 per cent) R*. Allow to cool and dilute to 100 mL with *ethanol (96 per cent) R*. Prepare immediately before use.

Sulfuric Acid, Ethanolic

Sulphuric acid, ethanolic

Solutions of the requisite molarity may be obtained by mixing *sulfuric acid* with *ethanol (96%)* as directed under *sulfuric acid*.

When '*ethanolic sulfuric acid*' is followed by a percentage figure, an instruction to use *sulfuric acid* diluted with *ethanol (96%)* to produce the specified percentage v/v proportion of sulfuric acid is implied.

Sulfuric Acid–Formaldehyde Reagent Sulphuric acid–formaldehyde reagent

Mix 2 mL of *formaldehyde solution R* with 100 mL of *sulfuric acid R*.

Sulfuric Acid, Heavy Metal-free Sulphuric acid, heavy metal-free

Complies with the requirements prescribed for *sulfuric acid R* with the following maximum contents of heavy metals.

As: 0.005 ppm.

Cd: 0.002 ppm.

Cu: 0.001 ppm.

Fe: 0.05 ppm.

Hg: 0.005 ppm.

Ni: 0.002 ppm.

Pb: 0.001 ppm.

Zn: 0.005 ppm.

Sulfuric Acid, Methanolic

Sulphuric acid, methanolic

Solutions of the requisite molarity may be obtained by mixing *sulfuric acid* with *methanol* as directed under *sulfuric acid*.

When '*methanolic sulfuric acid*' is followed by a percentage figure, an instruction to use *sulfuric acid* diluted with *methanol* to produce the specified percentage v/v proportion of sulfuric acid is implied.

Sulfuric Acid, Nitrogen-free Sulphuric acid, nitrogen-free

Complies with the requirements prescribed for *sulfuric acid R* with the following additional test.

Nitrates. To 5 mL of *water R* add carefully 45 mL of the sulfuric acid, allow to cool to 40 °C and add 8 mg of *diphenylbenzidine R*. The solution is colourless or very pale blue.

Sulfuric Acid, Nitrogen-free R1

Complies with the requirements prescribed for *nitrogen-free sulfuric acid R*.

Content: 95.0 per cent *m/m* to 95.5 per cent *m/m*.

Sulfuric Acid R1 H_2SO_4 = 98.1 (*7664-93-9*)

Content: 75 per cent *V/V*.

Sunflower Oil See *Sunflower oil, refined (1371)*.

Swertiamarin Swertiamaroside; (4*R*,5*R*,6*S*)-5-Ethenyl-6-(β-D-glucopyranosyloxy)-4a-hydroxy-4,4a,5,6-tetrahydro-1*H*,3*H*-pyrano[3,4-*c*]pyran-1-one; $C_{16}H_{22}O_{10}$ = 374.3 (*17388-39-5*)

Tagatose D-*lyxo*-Hexulose; $C_6H_{12}O_6$ = 180.16 (*87-81-0*)

White or almost white powder.

$[\alpha]_D^{20}$: −2.3 determined on a 21.9 g/L solution.

mp: 134 °C to 135 °C.

Talc (*14807-96-6*)

See *Talc (0438)*.

Tannic Acid (*1401-55-4*)

Yellowish or light-brown, glistening scales or amorphous powder, very soluble in water, freely soluble in ethanol (96 per cent), soluble in acetone.

Storage: protected from light.

Tannic Acid Reagent

Dissolve 25 mg of *tannic acid* in 20 mL of *glacial acetic acid* and add 80 mL of *orthophosphoric acid*.

Prepare immediately before use.

Tanshinone IIA $C_{19}H_{18}O_3$ = 294.3 (*568-72-9*)

1,6,6-Trimethyl-6,7,8,9-tetrahydrophenanthro[1,2-*b*]furan-10,11-dione.

(+)-Tartaric Acid Tartaric acid; (*87-69-4*)

See *Tartaric acid (0460)*.

Taurodeoxycholic Acid Sodium Salt

$C_{26}H_{44}NaNO_6S$ = 521.7 (*1180-95-6*)

General reagent grade of commerce.

Taxifolin (2*R*,3*R*)-2-(3,4-Dihydroxyphenyl)-3,5,7-trihydroxy-2,3-dihydro-4*H*-1-benzopyran-4-one; $C_{15}H_{12}O_7$ = 304.3 (*480-18-2*)

White or almost white powder, slightly soluble in anhydrous ethanol.

Absorbance (2.2.25). A solution in *anhydrous ethanol R* shows an absorption maximum at 290 nm.

Tecnazene $C_6HCl_4NO_2$ = 260.9 (*117-18-0*)

bp: about 304 °C.

mp: 99 °C to 100 °C.

A suitable certified reference solution (10 ng/µL in cyclohexane) may be used.

***trans*-Terpin** (1*r*,4*r*)-4-(2-Hydroxypropan-2-yl)-1-methylcyclohexan-1-ol; *p*-Menthane-1,8-diol; $C_{10}H_{20}O_2$ = 172.3 (*565-50-4*)

mp: about 116 °C.

Terpinene 1-Isopropyl-4-methylcyclohexa-1,3-diene; α-Terpinene; $C_{10}H_{16}$ = 136.2 (*99-86-5*)

Clear, almost colourless liquid.

d_4^{20}: about 0.837.

n_D^{20}: about 1.478.

bp: about 174 °C.

α-Terpinene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Tea tree oil (1837)*.

Content: minimum 90 per cent, calculated by the normalisation procedure.

γ-Terpinene 1-Isopropyl-4-methylcyclohexa-1,4-diene; $C_{10}H_{16}$ = 136.2 (*99-85-4*)

Oily liquid.

γ-Terpinene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. The substance to be examined.

Content: minimum 93.0 per cent, calculated by the normalisation procedure.

Terpinen-4-ol 4-Methyl-1-(1-methylethyl)cyclohex-3-en-1-ol; *p*-Menth-1-en-4-ol; $C_{10}H_{18}O$ = 154.2 (*562-74-3*)

Oily, colourless liquid.

Terpinen-4-ol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Lavender oil (1338)*.

Test solution. The substance to be examined.

Content: minimum 90.0 per cent, calculated by the normalisation procedure.

α-Terpineol (*RS*)-2-(4-Methylcyclohex-3-enyl)-2-propanol; $C_{10}H_{18}O$ = 154.2 (*98-55-5*)

Colourless crystals, practically insoluble in water, soluble in ethanol (96 per cent).

d_{20}^{20}: about 0.935.

n_D^{20}: about 1.483.

$[\alpha]_D^{20}$: about 92.5.

mp: about 35 °C.

It may contain 1 to 3 per cent of β-terpineol.

α-Terpineol used in gas chromatography complies with the following test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Anise oil (0804)*.

Test solution. A 100 g/L solution in *hexane R*.

Content: minimum 97.0 per cent, calculated by the normalisation procedure.

Terpinolene *p*-Mentha-1,4(8)-diene; 4-Isopropylidene-1-methylcyclohexene; $C_{10}H_{16}$ = 136.2 (*586-62-9*)

Clear, almost colourless liquid.

d_4^{20}: about 0.863.

n_D^{20}: about 1.488.

bp: about 184 °C.

Terpinolene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Tea tree oil (1837)*.

Content: minimum 90 per cent, calculated by the normalisation procedure.

Testosterone (*58-22-0*)

See *Testosterone (1373)*.

Testosterone Propionate (*57-85-2*)

See *Testosterone propionate (0297)*.

1,2,3,4-Tetra-*O*-acetyl-β-D-glucopyranose $C_{14}H_{20}O_{10}$ = 348.3 (*13100-46-4*)

White or almost white powder, soluble in water with gentle heating.

$[\alpha]_D^{20}$: + 11, determined on a 6 g/L solution in *chloroform R*.

mp: 126 °C to 128 °C.

1,3,4,6-Tetra-*O*-acetyl-β-D-mannopyranose $C_{14}H_{20}O_{10}$ = 348.3 (*18968-05-3*)

Colourless or white powder or crystals.

mp: 160 °C to 161 °C.

$[\alpha]_D^{20}$: − 68, determined on a 7 g/L solution in *methylene chloride R*.

Tetrabutylammonium Bromide $C_{16}H_{36}BrN$ = 322.4 (*1643-19-2*)

White or almost white crystals.

mp: 102 °C to 104 °C.

Tetrabutylammonium Dihydrogen Orthophosphate Tetrabutylammonium dihydrogen phosphate; $C_{16}H_{38}NO_4P$ = 339.5 (*5574-97-0*)

White or almost white powder, hygroscopic.

pH (2.2.3): about 7.5 for a 170 g/L solution.

Absorbance (2.2.25): about 0.10 determined at 210 nm using a 170 g/L solution.

Storage: in an airtight container.

Tetrabutylammonium Dihydrogen Phosphate Solution

A 1.0 M solution of *tetrabutylammonium dihydrogen phosphate R*. This solution is commercially available.

Tetrabutylammonium Hydrogen Sulfate Tetrabutylammonium hydrogen sulphate; $C_{16}H_{37}NO_4S$ = 339.5 (*32503-27-8*)

Crystalline powder or colourless crystals, freely soluble in water and in methanol.

mp: 169 °C to 173 °C.

Absorbance (2.2.25): maximum 0.05, determined between 240 nm and 300 nm using a 50 g/L solution.

Tetrabutylammonium Hydrogen Sulfate R1 Tetrabutylammonium hydrogen sulphate R1

Complies with the requirements prescribed for *tetrabutylammonium hydrogen sulfate R* with the following additional requirement.

Absorbance (*2.2.25*): maximum 0.02, determined between 215 nm and 300 nm using a 50 g/L solution.

Tetrabutylammonium Hydroxide
$C_{16}H_{37}NO,30H_2O$ = 800 (*147741-30-8*)

Content: minimum 98.0 per cent of $C_{16}H_{37}NO,30H_2O$.

White or almost white crystals, soluble in water.

Assay. Dissolve 1.000 g in 100 mL of *water R*. Titrate immediately with *0.1 M hydrochloric acid* determining the end-point potentiometrically (*2.2.20*). Carry out a blank titration.

1 mL of *0.1 M hydrochloric acid* is equivalent to 80.0 mg of $C_{16}H_{37}NO,30H_2O$.

Tetrabutylammonium Hydroxide Solution

General reagent grade of commerce containing 40.0% w/v of $C_{16}H_{37}NO$.

Tetrabutylammonium Hydroxide Solution (104 g/L)

A solution containing 104 g/L of $C_{16}H_{37}NO$ (M_r 259.5), prepared by dilution of a suitable reagent grade.

Tetrabutylammonium Hydroxide Solution (400 g/L)

A solution containing 400 g/L of $C_{16}H_{37}NO$ (M_r 259.5) of a suitable grade.

Tetrabutylammonium Hydroxide, 0.4M

Use a grade of commerce suitable for chromatography.

Tetrabutylammonium Iodide $C_{16}H_{36}IN$ = 369.4 (*311-28-4*)

Content: minimum 98.0 per cent.

White or slightly coloured, crystalline powder or crystals, soluble in ethanol (96 per cent).

Sulfated ash (*2.4.14*): maximum 0.02 per cent.

Assay. Dissolve 1.200 g in 30 mL of *water R*. Add 50.0 mL of *0.1 M silver nitrate* and 5 mL of *dilute nitric acid R*. Titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate*, using 2 mL of *ferric ammonium sulfate solution R2* as indicator.

1 mL of *0.1 M silver nitrate* is equivalent to 36.94 mg of $C_{16}H_{36}IN$.

Tetrabutylammonium Perchlorate
$C_{16}H_{36}ClNO_4$ = 341.91 (*1923-70-2*)

General reagent grade of commerce containing not less than 98.0% of $C_{16}H_{36}ClNO_4$.

Tetrachloroethane 1,1,2,2-Tetrachloroethane; $C_2H_2Cl_4$ = 167.9 (*79-34-5*)

Clear, colourless liquid, slightly soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 1.59.

n_D^{20}: about 1.495.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 145 °C and 147 °C.

Tetrachlorvinphos $C_{10}H_9Cl_4O_4P$ = 366.0 (*22248-79-9*)

mp: about 95 °C.

A suitable certified reference solution (10 ng/µL in iso-octane) may be used.

Tetracos-15-enoic Acid Methyl Ester 15-Tetracosaenoic acid methyl ester; Methyl tetracos-15-enoate; Nervonic acid methyl ester; $C_{25}H_{48}O_2$ = 380.7 (*2733-88-2*)

Content: minimum 99.0 per cent, determined by gas chromatography.

Liquid.

Tetracycline $C_{22}H_{24}N_2O_8$ = 444.4 (*60-54-8*)

mp: about 176°.

General reagent grade of commerce.

Store protected from light.

Tetracycline Hydrochloride

See *Tetracycline hydrochloride (0210)*.

***N*-Tetradecane** Tetradecane; $C_{14}H_{30}$ = 198.4 (*629-59-4*)

Content: minimum 99.5 per cent *m/m*.

A colourless liquid.

d_{20}^{20}: about 0.76.

n_D^{20}: about 1.429.

bp: about 252 °C.

mp: about −5 °C.

Tetradecylammonium Bromide Tetrakis(decyl) ammonium bromide; $C_{40}H_{84}BrN$ = 659 (*14937-42-9*)

White or slightly coloured, crystalline powder or crystals.

mp: 88 °C to 89 °C.

Tetraethylammonium Hydrogen Sulfate
Tetraethylammonium hydrogen sulphate; $C_8H_{21}NO_4S$ = 227.3 (*16873-13-5*)

Hygroscopic powder.

mp: about 245 °C.

Tetraethylammonium Hydroxide Solution
$C_8H_{21}NO$ = 147.3 (*77-98-5*)

A 200 g/L solution.

Colourless liquid, strongly alkaline.

d_{20}^{20}: about 1.01.

n_D^{20}: about 1.372.

HPLC grade.

Tetraethylene Pentamine 3,6,9-Triazaundecan-1,11-diamine; $C_8H_{23}N_5$ = 189.3 (*112-57-2*)

Colourless liquid, soluble in acetone.

n_D^{20}: about1.506.

Storage: protected from humidity and heat.

Tetraheptylammonium Bromide $C_{28}H_{60}BrN$ = 490.7 (*4368-51-8*)

White or slightly coloured, crystalline powder or crystals.

mp: 89 °C to 91 °C.

Tetrahexylammonium Bromide *N,N,N*-Trihexylhexan-1-aminium bromide; $C_{24}H_{52}BrN$ = 434.6 (*4328-13-6*)

White or almost white, crystalline powder, hygroscopic.

mp: about 100 °C.

Tetrahexylammonium Hydrogen Sulfate
Tetrahexylammonium hydrogen sulphate; $C_{24}H_{53}NO_4S$ = 451.8 (*32503-34-7*)

White or almost white crystals.

mp: 100 °C to 102 °C.

Tetrahydrofuran Tetramethylene oxide; C_4H_8O = 72.1 (*109-99-9*)

Clear, colourless, flammable liquid, miscible with water, with ethanol (96 per cent).

d_{20}^{20}: about 0.89.

Do not distil if the tetrahydrofuran does not comply with the test for peroxides.

Peroxides. Place 8 mL of *potassium iodide and starch solution R* in a 12 mL ground-glass-stoppered cylinder about 1.5 cm in diameter. Fill completely with the substance to be examined, shake vigorously and allow to stand protected from light for 30 min. No colour is produced.

Tetrahydrofuran used in spectrophotometry complies with the following additional test.

Absorbance (*2.2.25*): maximum 0.70 at 255 nm, 0.10 at 270 nm, 0.01 at 310 nm, determined using *water R* as compensation liquid.

Tetrahydrofuran for Chromatography

Complies with the requirements prescribed for *tetrahydrofuran R* with the following additional requirements:

d_4^{20} = 0.8892.

bp: about 66 °C.

Content: minimum 99.8 per cent of C_4H_8O.

Tetrahydrofuran, Stabiliser-free

Tetrahydrofuran that is free from stabilisers and inhibitors.

Reagent grade of commerce.

Tetrahydropalmatine (13a*RS*)-5,8,13,13a-Tetrahydro-2,3,9,10-tetramethoxy-6*H*-dibenzo[*a*,*g*]quinolizine; $C_{21}H_{25}NO_4$ = 355.4 (*2934-97-6*)

D-Tetrahydropalmatine Hydrochloride $C_{21}H_{25}NO_4$, HCl = 391.90 (*6024-83-5*)

General reagent grade of commerce.

α-Tetralone 1-Oxotetraline; 3,4-Dihydronaphthalen-1(2*H*)-one; $C_{10}H_{10}O$ = 146.2 (*529-34-0*)

bp: about 115 °C.

mp: about 5 °C.

Tetramethylammonium Bromide *N,N,N*-Trimethylmethanaminium bromide; $C_4H_{12}BrN$ = 154.1 (*64-20-0*)

White or slightly yellow crystals, freely soluble in water.

mp: about 285 °C, with decomposition.

Tetramethylammonium Chloride $C_4H_{12}ClN$ = 109.6 (*75-57-0*)

Colourless crystals, soluble in water and in ethanol (96 per cent).

mp: about 300 °C, with decomposition.

Tetramethylammonium Hydrogen Sulfate Tetramethylammonium hydrogen sulphate; $C_4H_{13}NO_4S$ = 171.2 (*80526-82-5*)

Hygroscopic powder.

mp: about 295 °C.

Tetramethylammonium Hydroxide Pentahydrate Tetramethylammonium hydroxide; $C_4H_{13}NO,5H_2O$ = 181.2 (*10424-65-4*)

Suitable grade for HPLC.

Tetramethylammonium Hydroxide Solution (*75-59-2*)

Content: minimum 10.0 per cent *m/m* of $C_4H_{13}NO$. (M_r 91.2).

Clear, colourless or very pale yellow liquid, miscible with water and with ethanol (96 per cent).

Assay. To 1.000 g add 50 mL of *water R* and titrate with *0.05 M sulfuric acid*, using 0.1 mL of *methyl red solution R* as indicator.

1 mL of *0.05 M sulfuric acid* is equivalent to 9.12 mg of $C_4H_{13}NO$.

Tetramethylammonium Hydroxide Solution, Dilute

Dilute 10 mL of *tetramethylammonium hydroxide solution R* to 100 mL with *aldehyde-free alcohol R*. Prepare immediately before use.

Tetramethylbenzidine 3,3′,5,5′-Tetramethylbiphenyl-4,4′-diamine; $C_{16}H_{20}N_2$ = 240.3 (*54827-17-7*)

Powder, practically insoluble in water, very soluble in methanol.

mp: about 169 °C.

1,1,3,3-Tetramethylbutylamine 2-Amino-2,4,4-trimethylpentane; $C_8H_{19}N$ = 129.3 (*107-45-9*)

Clear, colourless liquid.

d_{20}^{20}: about 0.805.

n_D^{20}: about 1.424.

bp: about 140 °C.

Tetramethylethylenediamine Tetramethylethane-1,2-diamine; $C_6H_{16}N_2$ = 116.2 (*110-18-9*)

Colourless liquid, miscible with water and with ethanol (96 per cent).

d_{20}^{20}: about 0.78.

n_D^{20}: about 1.418.

bp: about 121 °C.

***N,N,N′,N′*-Tetramethyl-p-phenylenediamine Dihydrochloride** $C_{10}H_{16}N_2,2HCl$ = 237.2 (*637-01-4*)

General reagent grade of commerce.

Whitish grey crystals.

Tetramethylsilane TMS; $C_4H_{12}Si$ = 88.2 (*75-76-3*)

Clear, colourless liquid, very slightly soluble in water, soluble in acetone and in ethanol (96 per cent).

d_{20}^{20}: about 0.64.

n_D^{20}: about 1.358.

bp: about 26 °C.

Tetramethylsilane used in nuclear magnetic resonance spectrometry complies with the following additional test.

In the nuclear magnetic resonance spectrum of an approximately 10 per cent *V/V* solution of the tetramethylsilane in *deuterated chloroform R*, the intensity of any foreign signal, excluding those due to spinning side bands and to chloroform, is not greater than the intensity of the C-13 satellite signals located at a distance of 59.1 Hz on each side of the principal signal of tetramethylsilane.

Tetrandrine $C_{38}H_{42}N_2O_6$ = 623 (*518-34-3*)

1,2,3,4-Tetraphenylcyclopenta-1,3-diene $C_{29}H_{22}$ = 370.5 (*15570-45-3*)

mp: about 178°.

General reagent grade of commerce.

1,2,3,4-Tetraphenylcyclopenta-1,3-dienone Tetraphenylcyclopentadienone; $C_{29}H_{20}O$ = 384.5 (*479-33-4*)

mp: about 218°.

General reagent grade of commerce.

Tetraphenylethylene $C_{26}H_{20}$ = 332.5 (*632-51-9*)

mp: about 223°.

General reagent grade of commerce.

Tetrapropylammonium Chloride $C_{12}H_{28}ClN$ = 221.8 (*5810-42-4*)

White or almost white, crystalline powder, sparingly soluble in water.

mp: about 241 °C.

Tetrapropylammonium Hydrogen Sulfate *N,N,N*-Tripropylpropan-1-aminium hydrogen sulfate; $C_{12}H_{29}NO_4S$ = 283.4 (*56211-70-2*)

White or almost white, crystalline, hygroscopic powder.

Tetrazolium Blue Blue tetrazolium salt; $C_{40}H_{32}Cl_2N_8O_2$ = 728 (*1871-22-3*)

Yellow crystals, slightly soluble in water, freely soluble in ethanol (96 per cent) and in methanol, practically insoluble in acetone.

mp: about 245 °C, with decomposition.

Tetrazolium Blue Solution, Alkaline

Immediately before use mix 1 volume of a 0.2% w/v solution of *tetrazolium blue* in *methanol* with 3 volumes of a 12% w/v solution of *sodium hydroxide* in *methanol*.

Tetrazolium Bromide 3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide; MTT; $C_{18}H_{16}BrN_5S$ = 414.3 (*298-93-1*)

Tetrazolium Salt 5-(3-Carboxymethoxyphenyl)-3-(4,5-dimethylthiazol-2-yl)-2-(4-sulfophenyl)-2*H*-tetrazolium, inner salt; MTS; $C_{20}H_{17}N_5O_6S_2$ = 487.5 (*138169-43-4*)

Thallium(I) Nitrate Thallous nitrate; $TlNO_3$ = 266.4 (*10102-45-1*)

General reagent grade of commerce.

Thallium(I) Sulfate Thallium(I) sulphate; Thallous sulphate; Thallous sulfate; Tl_2SO_4 = 504.8 (*7446-18-6*)

White or almost white, rhomboid prisms, slightly soluble in water, practically insoluble in ethanol (96 per cent).

Thebaine (5*R*,9*R*,13*S*)-4,5-Epoxy-3,6-dimethoxy-9a-methylmorphina-6,8-diene; $C_{19}H_{21}NO_3$ = 311.4 (*115-37-7*)

White or pale yellow, crystalline powder, very slightly soluble in water, soluble in hot anhydrous ethanol and in toluene.

mp: about 193 °C.

Chromatography (*2.2.27*). Thin-layer chromatography (*2.2.27*) as prescribed in identification test B in the monograph *Raw opium (0777)*: apply to the plate as a band (20 mm × 3 mm) 20 µL of a 0.5 g/L solution; the chromatogram shows an orange-red or red principal band with an R_F of about 0.5.

Theobromine $C_7H_8N_4O_2$ = 180.2 (*83-67-0*)

A white or almost white powder, very slightly soluble in water and in anhydrous ethanol, slightly soluble in ammonia. It dissolves in dilute solutions of alkali hydroxides and in mineral acids.

Content: minimum 99.0 per cent.

Theophylline (*58-55-9*)

See *Theophylline (0299)*.

2-(2-Thienyl)acetic Acid 2-Thiopheneacetic acid; $C_6H_6O_2S$ = 142.1 (*1918-77-0*)

Brown powder.

mp: about 65 °C.

Thioacetamide C_2H_5NS = 75.1 (*62-55-5*)

Crystalline powder or colourless crystals, freely soluble in water and in ethanol (96 per cent).

mp: about 113 °C.

Thioacetamide Reagent

To 0.2 mL of *thioacetamide solution R* add 1 mL of a mixture of 5 mL of *water R*, 15 mL of *1 M sodium hydroxide* and 20 mL of *glycerol (85 per cent) R*. Heat in a water-bath for 20 s. Prepare immediately before use.

Thioacetamide Solution

A 40 g/L solution of *thioacetamide R*.

Thiobarbituric Acid 4,6-Dihydroxy-2-sulfanylpyrimidine; $C_4H_4N_2O_2S$ = 144.2 (*504-17-6*)

Thiodiglycol 2,2′-thiodiethanol; Thiodiethylene glycol; $C_4H_{10}O_2S$ = 122.2 (*111-48-8*)

Colourless or yellow, viscous liquid.

Content: minimum 99.0 per cent.

d_{20}^{20}: about 1.18.

Thiomalic Acid (2*RS*)-2-Sulfanylbutanedioic acid; $C_4H_6O_4S$ = 150.2 (*70-49-5*)

mp: 150 °C to 152 °C.

Thiomersal Sodium mercurothiolate; Sodium 2-[(ethylmercurio)thio]benzoate; $C_9H_9HgNaO_2S$ = 404.8 (*54-64-8*)

Light, yellowish-white, crystalline powder, very soluble in water, freely soluble in ethanol (96 per cent).

Thiourea CH_4N_2S = 76.1 (*62-56-6*)

White or almost white, crystalline powder or crystals, soluble in water and in ethanol (96 per cent).

mp: about 178 °C.

L-Threonine Threonine; (*72-19-5*)

See *Threonine (1049)*.

Thrombin Thrombin, human; (*9002-04-4*)

Dried human thrombin. A preparation of the enzyme which converts human fibrinogen into fibrin. It is obtained from liquid human plasma and may be prepared by precipitation with suitable salts and organic solvents under controlled conditions of pH, ionic strength and temperature.

Yellowish-white powder, freely soluble in a 9 g/L solution of sodium chloride forming a cloudy, pale yellow solution.

Storage: in a sealed, sterile container under nitrogen, protected from light, at a temperature below 25 °C.

Thrombin, Bovine (*9002-04-4*)

A preparation of the enzyme, obtained from bovine plasma, that converts fibrinogen into fibrin.

A yellowish-white powder.

Storage: at a temperature below 0 °C.

Thrombin Solution Thrombin solution, human

Reconstitute *human thrombin R* as directed by the manufacturer and dilute to 5 IU/mL with *tris(hydroxymethyl) aminomethane sodium chloride buffer solution pH 7.4 R*.

Thrombin Solution, Human R1

Reconstitute *human thrombin R* as directed by the manufacturer and dilute to 2.5 IU/mL with *phosphate buffer solution pH 6.5 R*.

Thrombin Solution, Human R2

Reconstitute *human thrombin R* as directed by the manufacturer and dilute to 5 IU/mL with *tris(hydroxymethyl) aminomethane-EDTA buffer solution pH 8.4 R1*.

Thromboplastin

A preparation containing the membrane glycoprotein tissue factor and phospholipid, either purified from animal brain (usually rabbit) or human placenta or manufactured using recombinant DNA technology with added phospholipid. The preparation is formulated for routine use in the prothrombin time test and may contain calcium.

Thromboplastin Reagent

Thrombokinase extract

Extract 1.5 g of acetone-dried ox brain with 60 mL of water for 10 to 15 minutes at 50°, centifuge for 2 minutes at 1500 revolutions per minute and decant the supernatant liquid. This extract will retain its activity for several days

when stored in a refrigerator. It may contain 0.3% w/v of o-cresol as an antimicrobial preservative.

Thujone 4-Methyl-1-(1-methylethyl)bicyclo[3.1.0]hexan-3-one; $C_{10}H_{16}O$ = 152.2 (*76231-76-0*)

Colourless or almost colourless liquid, practically insoluble in water, soluble in ethanol (96 per cent) and in many other organic solvents.

Thymidine 1-(2-Deoxy-β-D-*erythro*-pentofuranosyl)-5-methylpyrimidine-2,4(1*H*,3*H*)-dione; $C_{10}H_{14}N_2O_5$ = 242.2

Needles, soluble in water, in hot ethanol (96 per cent) and in glacial acetic acid.

Thymine 5-Methylpyrimidine-2,4(1*H*,3*H*)-dione; $C_5H_6N_2O_2$ = 126.1 (*65-71-4*)

Short needles or plates, slightly soluble in cold water, soluble in hot water. It dissolves in dilute solution of alkali hydroxides.

Thyminose 2-Deoxy-D-erythro-pentose; 2-Deoxy-D-ribose; $C_5H_{10}O_4$ = 134.1 (*533-67-5*)

Thymol 2-Isopropyl-5-methylphenol; (*89-83-8*)

Thymol used in gas chromatography complies with the following additional test.

Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Peppermint oil (0405)*.

Test solution. Dissolve 0.1 g in about 10 mL of *acetone R*.

Content: minimum 95.0 per cent, calculated by the normalisation procedure.

Thymol Blue Thymolsulfonphthalein; 4,4′-(3*H*-2,1-Benzoxathiol-3-ylidene)bis(2-isopropyl-5-methylphenol) *S*,*S*-dioxide; $C_{27}H_{30}O_5S$ = 466.6 (*76-61-9*)

Brownish-green or greenish-blue, crystalline powder, slightly soluble in water, soluble in ethanol (96 per cent) and in dilute solutions of alkali hydroxides.

Thymol Blue Solution

Dissolve 0.1 g of *thymol blue R* in a mixture of 2.15 mL of *0.1 M sodium hydroxide* and 20 mL of *ethanol (96 per cent) R* and dilute to 100 mL with *water R*.

Test for sensitivity. To 0.1 mL of the thymol blue solution add 100 mL of *carbon dioxide-free water R* and 0.2 mL of *0.02 M sodium hydroxide*. The solution is blue. Not more than 0.15 mL of *0.02 M hydrochloric acid* is required to change the colour to yellow.

Colour change: pH 1.2 (red) to pH 2.8 (yellow); pH 8.0 (olive-green) to pH 9.6 (blue).

Thymolphthalein 3,3-Bis(4-hydroxy-5-isopropyl-2-methylphenyl)phthalide; $C_{28}H_{30}O_4$ = 430.5 (*125-20-2*)

White or yellowish-white powder, practically insoluble in water, soluble in ethanol (96 per cent) and in dilute solutions of alkali hydroxides.

Thymolphthalein Solution

A 1 g/L solution of *thymolphthalein R* in *ethanol (96 per cent) R*.

Test for sensitivity. To 0.2 mL of the thymolphthalein solution add 100 mL of *carbon dioxide-free water R*. The solution is colourless. Not more than 0.05 mL of *0.1 M sodium hydroxide* is required to change the colour to blue.

Colour change: pH 9.3 (colourless) to pH 10.5 (blue).

Tin Granulated tin; Sn = 118.7 (*7440-31-5*)

Silvery-white granules, soluble in hydrochloric acid with release of hydrogen.

Arsenic (*2.4.2, Method A*): maximum 10 ppm, determined on 0.1 g.

Tin(II) Chloride Tin dichloride dehydrate; Stannous chloride; $SnCl_2,2H_2O$ = 225.6 (*10025-69-1*)

Content: minimum 97.0 per cent of $SnCl_2,2H_2O$.

Colourless crystals, very soluble in water, freely soluble in ethanol (96 per cent), in glacial acetic acid and in dilute and concentrated hydrochloric acid.

Assay. Dissolve 0.500 g in 15 mL of *hydrochloric acid R* in a ground-glass-stoppered flask. Add 10 mL of *water R* and 5 mL of *chloroform R*. Titrate rapidly with *0.05 M potassium iodate* until the chloroform layer is colourless.

1 mL of *0.05 M potassium iodate* is equivalent to 22.56 mg of $SnCl_2,2H_2O$.

Tin(II) Chloride Solution Stannous chloride solution

Heat 20 g of *tin R* with 85 mL of *hydrochloric acid R* until no more hydrogen is released. Allow to cool.

Storage: over an excess of *tin R*, protected from air.

Tin(II) Chloride Solution AsT

Stannous chloride solution, low in arsenic, of commerce, or prepare from *tin(II) chloride solution* by adding an equal volume of *hydrochloric acid*, reducing the original volume by boiling and filtering through a fine-grain filter paper.

Complies with the following test.

To 10 mL add 6 mL of *water* and 10 mL of *hydrochloric acid*, distil and collect 16 mL. To the distillate add 50 mL of *water*, 0.1 mL of the solution, 5 mL of 0.1M *potassium iodide* and 5 g of *activated zinc*. Using the apparatus and procedure described for the *limit test for arsenic*, Appendix VII, the colour obtained in the test-tube with the test solution is not more intense than that produced when the test is repeated with the addition of 1 mL of *arsenic standard solution (1 ppm As)*.

Tin(II) Chloride Solution R1 Stannous chloride solution R1

Immediately before use, dilute 1 volume of *stannous chloride solution R* with 10 volumes of *dilute hydrochloric acid R*.

Tin(II) Chloride Solution R2 Stannous chloride solution R2

To 8 g of *stannous chloride R* add 100 mL of a 20 per cent *V/V* solution of *hydrochloric acid R*. Shake until dissolved, heating, if necessary, on a water-bath at 50 °C. Pass a current of *nitrogen R* for 15 min. Prepare immediately before use.

Tin Test Kit, Semi-quantitative

Commercially available set of reagents consisting of tin test strips and a reagent mixture for the determination of tin in aqueous solutions, in a range of 10-200 µg/mL.

Tiron 4,5-Dihydroxy-1,3-benzenedisulfonic acid disodium salt monohydrate; $C_6H_4Na_2O_8S_2,H_2O$ = 332 (*270573-71-2*)

General reagent grade of commerce.

Tiron Indicator Solution

2% w/v solution of *tiron* in *water*.

Titan Yellow Thiazol yellow; Disodium 2,2′-[(1-triazene-1,3-diyl)di-4,1-phenylene]bis-[6-methylbenzothiazole-7-sulfonate]; $C_{28}H_{19}N_5Na_2O_6S_4$ = 696 (*1829-00-1*)

Schultz No. 280

Colour Index No. 19540

A yellowish-brown powder, freely soluble in water and in ethanol (96 per cent).

Titan Yellow Paper

Immerse strips of filter paper in *titan yellow solution R* and leave for a few minutes. Allow to dry at room temperature.

Titan Yellow Solution

A 0.5 g/L solution of *titan yellow R*.

Test for sensitivity. To 0.1 mL of the titan yellow solution add 10 mL of *water R*, 0.2 mL of *magnesium standard solution (10 ppm Mg) R* and 1.0 mL of *1 M sodium hydroxide*. A distinct pink colour is visible by comparison with a reference solution prepared in a similar manner omitting the magnesium.

Titanium Ti = 47.88 (*7440-32-6*)

Content: minimum 99 per cent.

Metal powder, fine wire (diameter not more than 0.5 mm), sponge.

mp: about 1668 °C.

Density: about 4.507 g/cm^3.

Titanium(III) Chloride Titanium trichloride; $TiCl_3$ = 154.3 (*7705-07-9*)

Reddish-violet crystals, deliquescent, soluble in water and in ethanol (96 per cent).

mp: about 440 °C.

Storage: in an airtight container.

Titanium(III) Chloride Solution Titanium trichloride solution

d_{20}^{20}: about 1.19.

A 150 g/L solution of *titanium trichloride R* in hydrochloric acid (100 g/L HCl).

Titanium(III) Chloride–Sulfuric Acid Reagent Titanium(III) chloride-sulphuric acid reagent; Titanium trichloride–sulphuric acid reagent; Titanium trichloride-sulfuric acid reagent

Carefully mix 20 mL of *titanium trichloride solution R* with 13 mL of *sulfuric acid R*. Add sufficient *strong hydrogen peroxide solution R* to give a yellow colour. Heat until white fumes are evolved. Allow to cool. Dilute with *water R* and repeat the evaporation and addition of *water R* until a colourless solution is obtained. Dilute to 100 mL with *water R*.

Titanium Dioxide Titanium(IV) oxide; (*13463-67-7*)

See *Titanium dioxide (0150)*.

TLC Aluminium Oxide G Plate

Support of metal, glass or plastic, coated with a layer of aluminium oxide (particle size 5-40 µm) containing about 10 per cent of calcium sulfate hemihydrate as a binder.

TLC Cellulose Plate

Support of glass, metal or plastic, coated with a layer of cellulose.

TLC Octadecylsilyl Silica Gel Plate

Support of glass, metal or plastic coated with a layer of octadecylsilyl silica gel. The plate may contain an organic binder.

TLC Octadecylsilyl Silica Gel F_{254} Plate

Support of glass, metal or plastic coated with a layer of octadecylsilyl silica gel.

It contains a fluorescent indicator having a maximum absorbance in ultraviolet light at 254 nm.

TLC Performance Test Solution

Prepare a mixture of 1.0 mL of each of the following solutions and dilute to 10.0 mL with *acetone R*: a 0.5 g/L solution of *Sudan red G R* in *toluene R*, a 0.5 g/L solution of *methyl orange R* in *ethanol R* prepared immediately before use, a 0.5 g/L solution of *bromocresol green R* in *acetone R* and a 0.25 g/L solution of *methyl red R* in *acetone R*.

TLC Silica Gel Plate Silica gel

Support of glass, metal or plastic, coated with a layer of silica gel of a suitable thickness and particle size (usually 2 µm to 10 µm for fine particle size [High Performance Thin-Layer Chromatography, HPTLC] plates and 5 µm to 40 µm for normal TLC plates). If necessary, the particle size is indicated after the name of the reagent in the tests where it is used.

The plate may contain an organic binder.

Chromatographic separation. Apply to the plate an appropriate volume (10 µL for a normal TLC plate and 1 µL to 2 µL for a fine particle size plate) of *TLC performance test solution R*. Develop over a pathlength two-thirds of the plate height, using a mixture of 20 volumes of *methanol R* and 80 volumes of *toluene R*. The plate is not satisfactory, unless the chromatogram shows four clearly separated spots, the spot of bromocresol green with an R_F value less than 0.15, the spot of methyl orange with an R_F value in the range of 0.1 to 0.25, the spot of methyl red with an R_F value in the range of 0.35 to 0.55 and the spot of Sudan red G with an R_F value in the range of 0.75 to 0.98.

TLC Silica Gel F_{254} Plate

Complies with the requirements prescribed for *TLC silica gel plate R* with the following modification.

It contains a fluorescent indicator having a maximum absorbance at 254 nm.

Fluorescence suppression. Apply separately to the plate at five points increasing volumes (1 µL to 10 µL for normal TLC plates and 0.2 µL to 2 µL for fine particle size plates) of a 1 g/L solution of *benzoic acid R* in a mixture of 15 volumes of *anhydrous ethanol R* and 85 volumes of *cyclohexane R*. Develop over a pathlength half of the plate height with the same mixture of solvents. After evaporating the solvents examine the chromatogram in ultraviolet light at 254 nm. For normal TLC plates the benzoic acid appears as dark spots on a fluorescent background approximately in the middle of the chromatogram for quantities of 2 µg and greater. For fine particle size plates the benzoic acid appears as dark spots on a fluorescent background approximately in the middle of the chromatogram for quantities of 0.2 µg and greater.

TLC Silica Gel F_{254} Silanised Plate

It complies with the requirements prescribed for *TLC silanised silica gel plate R* with the following modification.

It contains a fluorescent indicator having a maximum absorbance at 254 nm.

TLC Silica Gel G Plate

Complies with the requirements prescribed for *TLC silica gel plate R* with the following modification.

It contains calcium sulfate hemihydrate as binder.

TLC Silica Gel GF_{254} Plate

Complies with the requirements prescribed for *TLC silica gel plate R* with the following modifications.

It contains calcium sulfate hemihydrate as binder and a fluorescent indicator having a maximum absorbance at 254 nm.

Fluorescence suppression. Complies with the test prescribed for *TLC silica gel F_{254} plate R*.

TLC Silica Gel Plate for Aminopolyether Test

Immerse a *TLC silica gel plate R* in *iodoplatinate reagent R1* for 5-10 s. Dry at room temperature for 12 h, protected from light.

Storage: protected from light, in an open container; use within 30 days after preparation.

TLC Silica Gel Plate for Chiral Separations, Octadecylsilyl

Support of glass, metal or plastic, coated with a layer of octadecylsilyl silica gel, impregnated with Cu^{2+} ions and enantiomerically pure hydroxyproline. The plate may contain an organic binder.

TLC Silica Gel Silanised Plate

Support of glass, metal or plastic, coated with a layer of silanised silica gel of a suitable thickness and particle size (usually 2 µm to 10 µm for fine particle size [High Performance Thin-Layer Chromatography, HPTLC] plates and 5 µm to 40 µm for normal TLC plates). If necessary, the particle size is indicated after the name of the reagent in the tests where it is used.

The plate may contain an organic binder.

Chromatographic separation. Introduce 0.1 g each of *methyl laurate R, methyl myristate R, methyl palmitate R* and *methyl stearate R* into a 250 mL conical flask. Add 40 mL of *alcoholic potassium hydroxide solution R* and heat under a reflux condenser on a water-bath for 1 h. Allow to cool, transfer the solution to a separating funnel by means of 100 mL of *water R*, acidify (pH 2 to 3) with *dilute hydrochloric acid R* and shake with three quantitites each of 10 mL of *methylene chloride R*. Dry the combined methylene chloride extracts over *anhydrous sodium sulfate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 50 mL of *methylene chloride R*. Examine by thin-layer chromatography (*2.2.27*), using *TLC silanised silica gel plate R*. Apply an appropriate quantity (about 10 µL for normal TLC plates and about 1 µL to 2 µL for fine particle size plates) of the methylene chloride solution at each of three separate points. Develop over a pathlength two-thirds of the plate height with a mixture of 10 volumes of *glacial acetic acid R*, 25 volumes of *water R* and 65 volumes of *dioxan R*. Dry the plate at 120 °C for 30 min. Allow to cool, spray with a 35 g/L solution of *phosphomolybdic acid R* in *2-propanol R* and heat at 150 °C until the spots become visible. Treat the plate with ammonia vapour until the background is white.
The chromatograms show four clearly separated, well-defined spots.

α-Tocopherol (*10191-41-0*)

See *all-rac-α-Tocopherol (0692)*.

α-Tocopheryl Acetate (*7695-91-2*)

See *all-rac-α-Tocopheryl acetate (0439)*.

***o*-Tolidine** 3,3′-Dimethylbenzidine; $C_{14}H_{16}N_2$ = 212.3 (*119-93-7*)

Content: minimum 97.0 per cent.

Light brownish, crystalline power.

mp: about 130 °C.

***o*-Tolidine Solution**

Dissolve 0.16 g of *o-tolidine R* in 30.0 mL of *glacial acetic acid R*, add 1.0 g of *potassium iodide R* and dilute to 500.0 mL with *water R*.

Toluene Methylbenzene; C_7H_8 = 92.1 (*108-88-3*)

Clear, colourless, flammable liquid, very slightly soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: 0.865 to 0.870.

bp: about 110 °C.

Toluene, Sulfur-free Toluene, sulphur-free

Complies with the requirements prescribed for *toluene R* with the following additional requirements.

Sulfur compounds. To 10 mL add 1 mL of *anhydrous ethanol R* and 3 mL of *potassium plumbite solution R* and boil under a reflux condenser for 15 min. Allow to stand for 5 min. No darkening is produced in the aqueous layer.

Thiophen-related substances. Shake 2 mL with 5 mL of *isatin reagent R* for 5 min and allow to stand for 15 min. No blue colour is produced in the lower layer.

***p*-Toluenesulfonamide** (*70-55-3*)

See *toluenesulfonamide R*.

Toluene-*o*-sulfonamide Toluene-*o*-sulphonamide; *o*-Toluenesulphonamide; 2-Methylbenzenesulfonamide; 2-Methylbenzenesulphonamide; *o*-Toluenesulfonamide; $C_7H_9NO_2S$ = 171.2 (*88-19-7*)

White or almost white, crystalline powder, slightly soluble in water, soluble in ethanol (96 per cent) and in solutions of alkali hydroxides.

mp: about 156 °C.

Toluene-*p*-sulfonamide *p*-Toluenesulfonamide; Toluene sulfonamide; 4-Methylbenzenesulfonamide; Toluenesulfonamide; $C_7H_9NO_2S$ = 171.2 (*70-55-3*)

Content: minimum 99.0 per cent.

White or almost white, crystalline powder, slightly soluble in water, soluble in ethanol (96 per cent) and in solutions of alkali hydroxides.

mp: about 136 °C.

Toluene-*p*-sulfonic Acid Toluene-*p*-sulphonic acid; Toluenesulphonic acid; 4-Methylbenzenesulfonic acid; 4-Methylbenzenesulphonic acid; Toluenesulfonic acid; $C_7H_8O_3S,H_2O$ = 190.2 (*6192-52-5*)

Content: minimum 87.0 per cent of $C_7H_8O_3S$.

White or almost white, crystalline powder or crystals, freely soluble in water, soluble in ethanol (96 per cent).

Toluenesulfonylurea 4-Methylbenzenesulfonylurea; *p*-Toluenesulfonylurea; (4-Methylphenyl)sulfonylurea; $C_8H_{10}N_2O_3S$ = 214.2 (*1694-06-0*)

White or almost white, crystalline powder.

mp: 196 to 198 °C.

***o*-Toluic Acid** $C_8H_8O_2$ = 136.2 (*118-90-1*)

mp: about 104°.

General reagent grade of commerce.

A white, crystalline powder.

***o*-Toluidine** 2-Methylaniline; C_7H_9N = 107.2 (*95-53-4*)

Pale-yellow liquid becoming reddish-brown on exposure to air and light, slightly soluble in water, soluble in ethanol (96 per cent) and in dilute acids.

d_{20}^{20}: about 1.01.

n_D^{20}: about 1.569.

bp: about 200 °C.

Storage: in an airtight container, protected from light.

***p*-Toluidine** 4-Methylaniline; C_7H_9N = 107.2 (*106-49-0*)

Lustrous plates or flakes, slightly soluble in water, freely soluble in acetone and in ethanol (96 per cent).

mp: about 44 °C.

Toluidine Blue Toluidine Blue O; 3-Amino-7-dimethylamino-2-methylphenothiazin-5-ium chloride; $C_{15}H_{16}ClN_3S$ = 305.8 (*92-31-9*)

Schultz No. 1041

Colour Index No. 52040

Dark-green powder, soluble in water, slightly soluble in ethanol (96 per cent).

o-Toluidine Hydrochloride 2-Methylaniline hydrochloride; 2-Methylbenzenamine hydrochloride; $C_7H_{10}ClN$ = 143.6 (*636-21-5*)

Content: minimum 98.0 per cent.

mp: 215 °C to 217 °C.

Tosylarginine Methyl Ester Hydrochloride *N*-Tosyl-L-arginine methyl ester hydrochloride; Methyl (*S*)-5-guanidino-2-(4-methylbenzenesulfonamido)valerate hydrochloride; $C_{14}H_{23}ClN_4O_4S$ = 378.9 (*1784-03-8*)

$[\alpha]_D^{20}$: −12 to −16, determined on a 40 g/L solution.

mp: about 145 °C.

Tosylarginine Methyl Ester Hydrochloride Solution

To 98.5 mg of *tosylarginine methyl ester hydrochloride R* add 5 mL of *tris(hydroxymethyl)aminomethane buffer solution pH 8.1 R* and shake to dissolve. Add 2.5 mL of *methyl red mixed solution R* and dilute to 25.0 mL with *water R*.

Tosyl-lysyl-chloromethane Hydrochloride (3S)-7-Amino-1-chloro-3-tosylamido-2-heptanone hydrochloride; $C_{14}H_{22}Cl_2N_2O_3S$ = 369.3 (*4238-41-9*)

$[\alpha]_D^{20}$: −7 to −9, determined on a 20 g/L solution.

mp: about 155 °C, with decomposition.

$A_{1\,cm}^{1\%}$: 310 to 340, determined at 230 nm in *water R*.

Tosylphenylalanylchloromethane L-tosylaminophenethyl chloromethyl ketone; $C_{17}H_{18}ClNO_3S$ = 351.9 (*402-71-1*)

$[\alpha]_D^{20}$: −85 to −89, determined on a 10 g/L solution in *ethanol (96 per cent) R*.

mp: about 105 °C.

$A_{1\,cm}^{1\%}$: 290 to 320, determined at 228.5 nm in *ethanol (96 per cent) R*.

Toxaphene (*8001-35-2*)

A mixture of polychloro derivatives.

mp: 65 °C to 90 °C.

A suitable certified reference solution (10 ng/µL in iso-octane) may be used.

Tragacanth (*9000-65-1*)

See *Tragacanth (0532)*.

Triacetin Propane-1,2,3-triyl triacetate; Glycerol triacetate; $C_9H_{14}O_6$ = 218.2 (*102-76-1*)

Almost clear, colourless to yellowish liquid, soluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 1.16.

n_D^{20}: about 1.43.

bp: about 260 °C.

Triamcinolone 9-Fluoro-11β,16α,17,21-tetrahydroxypregna-1,4-diene-3,20-dione; $C_{21}H_{27}FO_6$ = 394.4 (*124-94-7*)

A crystalline powder.

mp: 262 °C to 263 °C.

Triamcinolone Acetonide (*76-25-5*)

See *Triamcinolone acetonide (0533)*.

Tribromophenol 2,4,6-Tribromophenol; $C_6H_3Br_3O$ = 330.8 (*118-79-6*)

Tributyl Citrate Tributyl 2-hydroxypropane-1,2,3-tricarboxylate; $C_{18}H_{32}O_7$ = 360.4 (*77-94-1*)

d_4^{20}: about 1.043.

n_D^{20}: about 1.445.

Tributyl Orthophosphate Tributoxyphosphine oxide; Tributoxyphosphane oxide; Tributyl phosphate; $C_{12}H_{27}O_4P$ = 266.3 (*126-73-8*)

Colourless liquid, slightly soluble in water, soluble in the usual organic solvents.

d_{25}^{25}: about 0.976.

n_D^{25}: about 1.422.

bp: about 289 °C, with decomposition.

Tributylphosphine $C_{12}H_{27}P$ = 202.3 (*998-40-3*)

Clear, colourless liquid.

bp: about 240 °C.

mp: about −60 °C.

Trichlorethylene Trichloroethylene; C_2HCl_3 = 131.4 (*79-01-6*)

Colourless liquid, practically insoluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 1.46.

n_D^{20}: about 1.477.

Trichloroacetic Acid $C_2HCl_3O_2$ = 163.4 (*76-03-9*)

Colourless crystals or a crystalline mass, very deliquescent, very soluble in water and in ethanol (96 per cent).

Storage: in an airtight container.

Trichloroacetic Acid Solution

Dissolve 40.0 g of *trichloroacetic acid R* in *water R* and dilute to 1000.0 mL with the same solvent. Verify the concentration by titration with *0.1 M sodium hydroxide* and adjust if necessary to 40 ± 1 g/L.

1,1,1-Trichloroethane Methylchloroform; $C_2H_3Cl_3$ = 133.4 (*71-55-6*)

Non-flammable liquid, practically insoluble in water, soluble in acetone and in methanol.

d_{20}^{20}: about 1.34.

n_D^{20}: about 1.438.

bp: about 74 °C.

Trichlorotrifluoroethane 1,1,2-Trichloro-1,2,2-trifluoroethane; $C_2Cl_3F_3$ = 187.4 (*76-13-1*)

Colourless, volatile liquid, practically insoluble in water, miscible with acetone.

d_{20}^{20}: about 1.58.

Distillation range (*2.2.11*). Not less than 98 per cent distils between 47 °C and 48 °C.

Tricine *N*-[2-Hydroxy-1,1-bis(hydroxymethyl)ethyl]glycine; $C_6H_{13}NO_5$ = 179.2 (*5704-04-1*)

Use electrophoresis-grade reagent.

mp: about 183 °C.

Tricosane $C_{23}H_{48}$ = 324.6 (*638-67-5*)

White or almost white crystals, practically insoluble in water, soluble in hexane.

mp: about 48 °C.

Tridecyl Alcohol Tridecanol; $C_{13}H_{28}O$ = 200.4 (*112-70-9*)

Tridocosahexaenoin Triglyceride of docosahexaenoic acid (C22:6); Glycerol tridocosahexaenoate; Propane-1,2,3-triyl tri-(*all-Z*)-docosa-4,7,10,13,16,19-hexaenoate; $C_{69}H_{98}O_6$ = 1023.5 (*124596-98-1*)

The reagent from Nu-Chek Prep, Inc. has been found suitable.

Triethanolamine (*102-71-6*)

See *Trolamine (1577)*.

Triethyl Phosphonoformate Ethyl (diethoxyphosphoryl) formate; $C_7H_{15}O_5P$ = 210.2 (*1474-78-8*)

Colourless liquid.

$bp_{12\ mm}$: about 135 °C.

Triethylamine *N,N*-Diethylethanamine; $C_6H_{15}N$ = 101.2 (*121-44-8*)

Colourless liquid, slightly soluble in water at a temperature below 18.7 °C, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.727.

n_D^{20}: about 1.401.

bp: about 90 °C.

Triethylamine R1 *N,N*-Diethylethanamine; $C_6H_{15}N$ = 101.2 (*121-44-8*)

Complies with the requirements prescribed for *triethylamine R* with the following additional requirements.

Content: minimum 99.5 per cent, determined by gas chromatography.

Water: maximum 0.1 per cent.

Use freshly distilled or from a freshly opened container.

Triethylamine R2 *N,N*-Diethylethanamine; $C_6H_{15}N$ = 101.2 (*121-44-8*)

Complies with the requirements prescribed for *triethylamine R* and with the following additional requirements.

Content: minimum 99.5 per cent, determined by gas chromatography.

Water: maximum 0.2 per cent.

It is suitable for gradient elution in liquid chromatography.

Use freshly distilled or from a freshly opened container.

Triethylamine Hydrogen Carbonate Solution

Pass a gentle current of *carbon dioxide* through a 5% w/v solution of *triethylamine* for 16 hours.

Triethylenediamine 1,4-Diazabicyclo[2.2.2]octane; $C_6H_{12}N_2$ = 112.2

Crystals, very hygroscopic, sublimes readily at room temperature, freely soluble in water, in acetone and in anhydrous ethanol.

bp: about 174 °C.

mp: about 158 °C.

Storage: in an airtight container.

Triflumuron 1-(2-Chlorobenzoyl)-3-(4-triflumoromethoxyphenyl)urea; $C_{15}H_{10}ClF_3N_2O_3$ = 358.7 (*64628-44-0*)

White or almost white crystalline powder, practically insoluble in water, sparingly soluble in acetone and in methylene chloride.

Trifluoroacetic Acid $C_2HF_3O_2$ = 114.0 (*76-05-1*)

Content: minimum 99 per cent.

Liquid, miscible with acetone and with ethanol (96 per cent).

d_{20}^{20}: about 1.53.

bp: about 72 °C.

Use a grade suitable for protein sequencing.

Storage: in an airtight container.

Trifluoroacetic Anhydride $C_4F_6O_3$ = 210.0 (*407-25-0*)

Colourless liquid.

d_{20}^{20}: about 1.5.

3-Trifluoromethylaniline 3-(Trifluoromethyl)aniline; α,α,α-Trifluoro-*m*-toluidine; 3-(Trifluoromethyl)benzenamide; $C_7H_6F_3N$ = 161.1 (*98-16-8*)

Colourless liquid.

Density: 1.30 g/cm^3 (20 °C).

4-Trifluoromethylphenol $C_7H_5F_3O$ = 162.1 (*402-45-9*)

White or light yellow, crystalline solid or powder.

mp: about 46 °C.

Trifluoropropylmethylpolysiloxane

Polysiloxane substituted with trifluoropropyl groups and methyl groups.

Triglycine 2-[[2-[(2-Aminoacetyl)amino]acetyl]amino] acetic acid; Glycylglycylglycine; $C_6H_{11}N_3O_4$ = 189.2 (*556-33-2*)

Trigonelline Hydrochloride 1-Methylpyridinium-3-carboxylate hydrochloride; $C_7H_8ClNO_2$ = 173.6 (*6138-41-6*)

Crystalline powder, very soluble in water, soluble in ethanol (96 per cent).

mp: about 258 °C.

1,2,4-Trimethylbenzene Pseudocumene; C_9H_{12} = 120.2 (*95-63-6*)

Trimethylchlorosilane Chlorotrimethylsilane; C_3H_9ClSi = 108.6 (*75-77-4*)

Clear, colourless liquid, fuming in air.

d_{20}^{20}: about 0.86.

n_D^{20}: about 1.388.

bp: about 57 °C.

2,2,4-Trimethylpentane Iso-octane; Trimethylpentane; C_8H_{18} = 114.2 (*540-84-1*)

Colourless, flammable liquid, practically insoluble in water, soluble in anhydrous ethanol.

d_{20}^{20}: 0.691 to 0.696.

n_D^{20}: 1.391 to 1.393.

Distillation range (*2.2.11*). Not less than 95 per cent distils between 98 °C and 100 °C.

Trimethylpentane used in spectrophotometry complies with the following additional test.

Absorbance (*2.2.25*): maximum 0.01 from 250 nm to 420 nm, determined using *water R* as compensation liquid.

Trimethylpentane for Chromatography

Complies with the requirements prescribed for *trimethylpentane R* with the following additional requirement.

Residue on evaporation: maximum 2 mg/L.

Trimethylpentane R1

Complies with the requirements prescribed for *trimethylpentane R* with the following modification.

Absorbance (2.2.25). Not more than 0.07 from 220 nm to 360 nm, determined using *water R* as the compensation liquid.

***N*-Trimethylsilylimidazole** 1-Trimethylsilylimidazole; $C_6H_{12}N_2Si$ = 140.3 (*18156-74-6*)

Colourless, hygroscopic liquid.

d_{20}^{20}: about 0.96.

n_D^{20}: about 1.48.

Storage: in an airtight container.

3-Trimethylsilyl-1-propanesulfonic Acid, Sodium Salt Sodium 3-(trimethylsilyl)-1-propanesulfonate; sodium 3-(trimethylsilyl)-1-propanesulphonate; 3-trimethylsilyl-1-propanesulphonic acid, sodium salt; $C_6H_{15}NaO_3SSi$ = 218.3 (*2039-96-5*)

mp: about 165°.

Beige powder; content, minimum 97.0 %.

Trimethylsulfonium Hydroxide Trimethylsulfonium hydroxide; $C_3H_{10}OS$ = 94.2 (*17287-03-5*)

d_4^{20}: about 0.81.

Trimethyltin Chloride Chlorotrimethylstannane; C_3H_9ClSn = 199.3 (*1066-45-1*)

2,4,6-Trinitrobenzenesulfonic Acid Picrylsulfonic acid; Picrylsulphonic acid; 2,4,6-Trinitrobenzenesulphonic acid; $C_6H_3N_3O_9S,3H_2O$ = 347.2 (*2508-19-2*)

White or almost white, crystalline powder, soluble in water.

mp: 190 °C to 195 °C.

Triolein Propane-1,2,3-triyl tris[(9*Z*)-octadec-9-enoate]; *sn*-Glyceryl trioleate; Glycerol trioleate; Oleyl triglyceride; $C_{57}H_{104}O_6$ = 885.4 (*122-32-7*)

Content: minimum 99.0 per cent.

Triphenylamine $C_{18}H_{15}N$ = 245.3 (*603-34-9*)

mp: about 126°.

General reagent grade of commerce.

A white, crystalline solid.

Triphenylethylene $C_{20}H_{16}$ = 256.4 (*58-72-0*)

mp: about 70°.

General reagent grade of commerce.

Triphenylmethanol Triphenylcarbinol; $C_{19}H_{16}O$ = 260.3 (*76-84-6*)

Colourless crystals, practically insoluble in water, freely soluble in ethanol (96 per cent).

2,3,5-Triphenyltetrazolium Chloride Tetrazolium Salt; Triphenyltetrazolium Chloride; $C_{19}H_{15}ClN_4$ = 334.8 (*298-96-4*)

Pale or dull-yellow powder, soluble in water, in acetone and in ethanol (96 per cent).

mp: about 240 °C, with decomposition.

Storage: protected from light.

Analytical reagent grade of commerce containing not less than 98.0 per cent of $C_{19}H_{15}ClN_4$

Assay Dissolve 1 g in a mixture of 5 mL of *dilute nitric acid* and 45 mL of *water*, add 50 mL of *0.1M silver nitrate VS* and heat to boiling. Allow to cool, add 3 mL of *dibutyl phthalate*, shake vigorously and titrate with *0.1M ammonium thiocyanate VS* using 2 mL of *ammonium iron(III) sulfate solution R2* as indicator. Each mL of *0.1M silver nitrate VS* is equivalent to 33.48 mg of $C_{19}H_{15}ClN_4$.

Triphenyltetrazolium Chloride Solution

A 0.5% w/v solution of *2,3,5-triphenyltetrazolium chloride* in *aldehyde-free ethanol (96%)*.

Store protected from light.

Tripotassium Phosphate Trihydrate $K_3PO_4,3H_2O$ = 266.3 (*22763-03-7*)

White or almost white crystalline powder, freely soluble in water.

Triscyanoethoxypropane 1,2,3-Tris(2-cyanoethoxy) propane; $C_{12}H_{17}N_3O_3$ = 251.3

Viscous, brown-yellow liquid, soluble in methanol. Used as a stationary phase in gas chromatography.

d_{20}^{20}: about 1.11.

Viscosity (*2.2.9*): about 172 mPa·s.

1,3,5-Tris(3,5-di-(1,1-dimethylethyl)-4-hydroxybenzyl)-1H,3H,5H-1,3,5-triazine-2,4,6-trione Tris(3,5-di-*tert*-butyl-4-hydroxybenzyl isocyanurate; 1,3,5-Tris[3,5-di(1,1-dimethylethyl)-4-hydroxybenzyl]-1,3,5-triazine-2,4,6(1H,3H,5H)-trione; $C_{48}H_{69}O_6N_3$ = 784.1 (*27676-62-6*)

White or almost white, crystalline powder.

mp: 218 °C to 222 °C.

Tris(2,4-di-(1,1-dimethylethyl)phenyl) Phosphite $C_{42}H_{63}O_3P$ = 647 (*31570-04-4*)

White or almost white powder.

mp: 182 °C to 186 °C.

Tris(hydroxymethyl)nitromethane $C_4H_9NO_5$ = 151 (*126-11-4*)

General reagent of commerce.

Tris(hydroxymethyl)aminomethane Hydrochloride 2-Amino-2-(hydroxymethyl)-1,3-propanediol hydrochloride; $NH_2C(CH_2OH)_3,HCl$ = 157.60 (*1185-53-1*)

Analytical reagent grade of commerce.

Tris(hydroxymethyl)aminomethane MB $C_4H_{11}NO_3$ = 121.14 (*77-86-1*)

Molecular biology grade.

Tris(hydroxymethyl)aminomethane Solution R1

Dissolve 60.6 mg of *tris(hydroxymethyl)aminomethane R* and 0.234 g of *sodium chloride R* in *water R* and dilute to 100 mL with the same solvent.

Storage: at 2 °C to 8 °C; use within 3 days.

Tris(hydroxymethyl)methylamine Tris(hydroxymethyl) aminomethane; (*77-86-1*)

See *Trometamol (1053)*.

Tris(hydroxymethyl)methylamine Solution Tris(hydroxymethyl)aminomethane solution

A solution containing the equivalent of 24.22 g of $C_4H_{11}NO_3$ in 1000.0 mL.

Tris(hydroxymethyl)methylamine Solution, Methanolic

Dissolve 6.07 g of *tris(hydroxymethyl)methylamine* in 900 mL of *methanol*, add 50 mL of 0.5M *hydrochloric acid* and dilute to 1000 mL with *water*.

Trisodium Orthophosphate Trisodium phosphate dodecahydrate; $Na_3PO_4,12H_2O$ = 380.1 (*10101-89-0*)

Colourless or white or almost white crystals, freely soluble in water.

Trometamol (*77-86-1*)

See *Tris(hydroxymethyl)aminomethane R*.

Tropic Acid (2*RS*)-3-Hydroxy-2-phenylpropanoic acid; $C_9H_{10}O_3$ = 166.17 (*529-64-6*)

Tropine (1*R*,3*r*,5*S*)-Tropan-3-ol; $C_8H_{15}NO$ = 141.2 (*120-29-6*)

mp: about 54°.

General reagent grade of commerce.

Colourless crystals.

Troxerutin Trihydroxyethylrutin; 3′,4′,7-Tris[*O*-(2-hydroxyethyl)]rutin; 2-[3,4-Bis(2-hydroxyethoxy)phenyl]-3-[[6-*O*-(6-deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl] oxy]-5-hydroxy-7-(2-hydroxyethoxy)-4*H*-1-benzopyran-4-one; $C_{33}H_{42}O_{19}$ = 743 (*7085-55-4*)

mp: 168 °C to 176 °C.

Trypsin *(9002-07-7)*

A proteolytic enzyme obtained by activation of trypsinogen extracted from the pancreas of beef (*Bos taurus* L.).

White or almost white, crystalline or amorphous powder, sparingly soluble in water.

Trypsin for Peptide Mapping *(9002-07-7)*

Trypsin of high purity treated to eliminate chymotryptic activity.

Tryptophan $C_{11}H_{12}N_2O_2$ = 204.2 *(73-22-3)*

White or yellowish-white, crystalline powder or colourless crystals, slightly soluble in water, very slightly soluble in ethanol (96 per cent).

$[\alpha]_D^{20}$: about −30, determined on a 10 g/L solution.

Typhaneoside 3-[6-Deoxy-α-L-mannopyranosyl-(1→2)-[6-deoxy-α-L-mannopyranosyl-(1→6)]-β-D-glucopyranosyloxy]-5,7-dihydroxy-2-(4-hydroxy-3-methoxyphenyl)-4*H*-1-benzopyran-4-one; $C_{34}H_{42}O_{20}$ = 771 *(104472-68-6)*

Tyramine 4-(2-Aminoethyl)phenol; $C_8H_{11}NO$ = 137.2 *(51-67-2)*

Crystals, sparingly soluble in water, soluble in boiling anhydrous ethanol.

mp: 164 °C to 165 °C.

L-Tyrosine 2-Amino-3-(4-hydroxyphenyl)propionic acid; Tyrosine; $C_9H_{11}NO_3$ = 181.2 *(60-18-4)*

White or almost white, crystalline powder, or colourless or white or almost white crystals, slightly soluble in water, practically insoluble in acetone and in anhydrous ethanol, soluble in dilute hydrochloric acid and in solutions of alkali hydroxides.

Umbelliferone 7-Hydroxycoumarin; 7-Hydroxy-2*H*-1-benzopyran-2-one; $C_9H_6O_3$ = 162.1 *(93-35-6)*

Needles from water.

mp: 225 °C to 228 °C.

Undecanoic Acid Hendecanoic acid; Undecylic acid; $C_{11}H_{22}O_2$ = 186.29 *(112-37-8)*

mp: about 30 °C.

Content: minimum 97.0 per cent of $C_{11}H_{22}O_2$.

Uracil $C_4H_4N_2O_2$ = 112.1 *(66-22-8)*

Content: minimum 95.0 per cent.

Urea *(57-13-6)*

See *Urea (0743)*.

Urease-active Meal *(9002-13-5)*

General reagent grade of commerce.

Activity Each mg of urease-active meal hydrolyses 3 mg of urea in 30 minutes at 37°.

Uridine 1-β-D-Ribofuranosyluracil; $C_9H_{12}N_2O_6$ = 244.2 *(58-96-8)*

White or almost white, crystalline powder, soluble in water.

mp: about 165 °C.

Ursolic Acid 3β-Hydroxyurs-12-en-28-oic acid; $C_{30}H_{48}O_3$ = 456.7 *(77-52-1)*

White or almost white powder, practically insoluble in water, sparingly soluble in methanol, slightly soluble in ethanol (96 per cent).

$[\alpha]_D^{21}$: about 67.50, determined on a 10 g/L solution in a 56.1 g/L solution of *potassium hydroxide R* in *ethanol (96 per cent) R*.

mp: 285 °C to 288 °C.

Urushiol I 3-Pentadecyl-1,2-benzenediol; $C_{21}H_{36}O_2$ = 320.51 *(492-89-7)*

General reagent grade of commerce.

Urushiol II 3-(8-Pentadecenyl)-1,2-benzenediol; $C_{21}H_{34}O_2$ = 318.26 *(2764-91-2)*

General reagent grade of commerce.

Valencene 4β*H*,5α-Eremophila-1(10),11-diene; (1*R*,7*R*,8a*S*)-1,8a-Dimethyl-7-(1-methylethenyl)-1,2,3,5,6,7,8,8a-octahydronaphthalene; $C_{15}H_{24}$ = 204.4 *(4630-07-3)*

Oily, colourless or pale yellow liquid, with a characteristic odour, practically insoluble in water, soluble in ethanol (96 per cent).

d_4^{20}: about 0.918.

n_D^{20}: about 1.508.

bp: about 123 °C.

Valencene used in gas chromatography complies with the following additional test.

Assay. Gas chromatography *(2.2.28)* as prescribed in the monograph *Sweet orange oil (1811)*.

Content: minimum 80 per cent, calculated by the normalisation procedure.

Valerenic Acid (2*E*)-3-[(4*S*,7*R*,7a*R*)-3,7-Dimethyl-2,4,5,6,7,7a-hexahydro-1*H*-inden-4-yl]-2-methylprop-2-enoic acid; $C_{15}H_{22}O_2$ = 234.3 *(3569-10-6)*

mp: 134 °C to 138 °C.

Valeric Acid *N*-Valeric acid; $C_5H_{10}O_2$ = 102.1 *(109-52-4)*

Colourless liquid, soluble in water, freely soluble in ethanol (96 per cent).

d_{20}^{20}: about 0.94.

n_D^{20}: about 1.409.

bp: about 186 °C.

Valine *(72-18-4)*

See *Valine (0796)*.

Vanillin 4-Hydroxy-3-methoxybenzaldehyde; *(121-33-5)*

See *Vanillin (0747)*.

Vanillin Reagent

Carefully add, dropwise, 2 mL of *sulfuric acid R* to 100 mL of a 10 g/L solution of *vanillin R* in *ethanol (96 per cent) R*.

Storage: use within 48 h.

Vanillin Solution, Phosphoric

Dissolve 1.0 g of *vanillin R* in 25 mL of *ethanol (96 per cent) R*. Add 25 mL of *water R* and 35 mL of *phosphoric acid R*.

Veratric Acid 3,4-Dimethoxybenzoic acid; $C_9H_{10}O_4$ = 182.2 *(93-07-2)*

mp: about 180°.

General reagent grade of commerce.

Veratrole 1,2-Dimethoxybenzene; $C_8H_{10}O_2$ = 138.2 *(91-16-7)*

d_4^{20}: 1.085.

n_D^{20}: 1.534.

bp: about 206 °C.

mp: about 22 °C.

Verbenone (1*S*,5*S*)-4,6,6-Trimethylbicyclo[3.1.1]hept-3-en-2-one; $C_{10}H_{14}O$ = 150.2 *(1196-01-6)*

Oil with a characteristic odour, practically insoluble in water, miscible with organic solvents.

d_{20}^{20}: about 0.978.

n_D^{18}: about 1.49.
$[\alpha]_D^{18}$: about + 249.6.
bp: 227 °C to 228 °C.
mp: about 6.5 °C.
Verbenone used in gas chromatography complies with the following additional test.
Assay. Gas chromatography (*2.2.28*) as prescribed in the monograph *Rosemary oil (1846)*.
Content: minimum 99 per cent, calculated by the normalisation procedure.

Vinyl Acetate Ethenyl acetate; $C_4H_6O_2$ = 86,10 (*108-05-4*)
d_{20}^{20}: about 0.930.
bp: about 72 °C.

Vinyl Chloride C_2H_3Cl = 62.5 (*75-01-4*)
Colourless gas, slightly soluble in organic solvents.

Vinyl Polymer for Chromatography, Amino Alkyl
Spherical particles (5 µm) of a vinyl alcohol copolymer chemically modified by bonding of amino alkyl groups.

Vinyl Polymer for Chromatography, Octadecyl
Spherical particles (5 µm) of a vinyl alcohol copolymer chemically modified by bonding of octadecyl groups on the hydroxyl groups.

Vinyl Polymer for Chromatography, Octadecylsilyl
Spherical particles (5 µm) of a vinyl alcohol copolymer bonded to an octadecylsilane. Carbon content of 17 per cent.

Vinyl(1)phenyl(5)methyl(94)polysiloxane
Polysiloxane substituted with 1 per cent of vinyl groups, 5 per cent of phenyl groups and 94 per cent of methyl groups.

2-Vinylpyridine C_7H_7N = 105.1 (*100-69-6*)
Yellow liquid, miscible in water.
d_{20}^{20}: about 0.97.
n_D^{20}: about 1.549.

4-Vinylpyridine 4-Ethenylpyridine; C_7H_7N = 105.1 (*100-43-6*)
Clear, deep yellowish-brown liquid.
bp: 58-61 °C.

1-Vinylpyrrolidin-2-one 1-Ethenylpyrrolidin-2-one; C_6H_9NO = 111.1 (*88-12-0*)
Content: minimum 99.0 per cent.
Clear colourless liquid.
Water (*2.5.12*): maximum 0.1 per cent, determined on 2.5 g. Use as the solvent, a mixture of 50 mL of *anhydrous methanol R* and 10 mL of *butyrolactone R*.
Assay. Gas chromatography (*2.2.28*): use the normalisation procedure.
Column:
— *material*: fused-silica;
— *size*: *l* = 30 m, Ø = 0.5 mm;
— *stationary phase*: *macrogol 20 000 R*.
Carrier gas: *helium for chromatography R*.
Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	80
	1 - 12	80 → 190
	12 - 27	190
Injection port		190

Detection: flame-ionisation.
Injection: 0.3 µL of the substance to be examined.
Adjust the flow rate of the carrier gas so that the retention time of the peak corresponding to 1-vinylpyrrolidin-2-one is about 17 min.

Vitexin Apigenin 8-glucoside; $C_{21}H_{20}O_{10}$ = 432.4 (*3681-93-4*)
Yellow powder.
Storage: in an airtight container, protected from light.

Vitexin-2''-O-rhamnoside 8-[2-*O*-(6-Deoxy-α-L-mannopyranosyl)-β-D-glucopyranosyl]-5,7-dihydroxy-2-(4-hydroxyphenyl)-4*H*-1-benzopyran-4-one; $C_{27}H_{30}O_{14}$. (M_r 578.5) (*64820-99-1*)

Water (*7732-18-5*)
See *Purified water (0008)*.

Water MB
Deionised, filtered and autoclaved water.

Water R1
Prepared from *distilled water R* by multiple distillation. Remove carbon dioxide by boiling for at least 15 min before use in a boiling flask of fused silica or borosilicate glass and cool. Any other suitable method may be used. The boiling flask has been already used for the test or has been filled with *water R* and kept in an autoclave at 121 °C for at least 1 h prior to first use. When tested immediately before use, *water R1* is neutral to *methyl red solution R*, i.e. it shall produce an orange-red (not a violet-red or yellow) colour corresponding to pH 5.5 ± 0.1 when 0.05 mL of *methyl red solution R* is added to 50 mL of the water to be examined.
Conductivity: maximum 1 µS·cm^{-1}, determined at 25 °C by an in-line conductivity meter (see *Purified water (0008)*).

Water, Ammonia-free Water, ammonium-free
To 100 mL of *water R* add 0.1 mL of *sulfuric acid R*. Distil using the apparatus described for the determination of *Distillation range* (*2.2.11*). Reject the first 10 mL and collect the following 50 mL.

Water, Carbon Dioxide-free
Water R which has been boiled for a few minutes and protected from the atmosphere during cooling and storage or deionised *water R* with a resistivity of not less than 0.18 MΩ·m, determined at 25 °C.

Water, Distilled
Water R prepared by distillation.

Water, Distilled, Deionised
Deionised *water R* prepared by distillation with a resistivity of not less than 0.18 MΩ·m, determined at 25 °C.

Water for Chromatography
Deionised water with a resistivity of not less than 0.18 MΩ·m, determined at 25 °C, prepared by distillation, ion exchange, reverse osmosis or any other suitable method, using water that complies with the regulations on water intended for human consumption, as laid down by the competent authority.
Its quality is such that no significant interfering peaks or loss of sensitivity are observed when used in chromatography. Isocratic elution with UV detection at low wavelengths (i.e. less than 230 nm), with evaporative detectors (e.g. light scattering detector, particle counter detector, charged aerosol detector) or mass detectors, or gradient elution, may require the use of water with a total organic carbon content of maximum 5 ppb.

Water for Injections See *Water for injections (0169)*.

Water, Nitrate-free

To 100 mL of *water R* add a few milligrams of *potassium permanganate R* and of *barium hydroxide R*. Distil using the apparatus described for the determination of *Distillation range (2.2.11)*. Reject the first 10 mL and collect the following 50 mL.

Water, Particle-free

Filter *water R* through a membrane with a pore size of 0.22 µm.

Water, Standard Solution for the Micro Determination of

Commercially available standard solution for the coulometric titration of water, containing a certified content of water in a suitable solvent.

Wedelolactone 1,8,9-Trihydroxy-3-methoxy-6*H*-benzofuro [3,2-*c*][1]benzopyran-6-one; $C_{16}H_{10}O_7$ = 314.3 (*524-12-9*)

White Beeswax See *White beeswax (0069)*.

Xanthine 2,6-Dihydroxypurine; $C_5H_4N_4O_2$ = 152.11 (*69-89-6*)

Xanthydrol 9-Hydroxyxanthene; Xanthen-9-ol; $C_{13}H_{10}O_2$ = 198.2 (*90-46-0*)

Content: minimum 90.0 per cent.

White or pale-yellow powder, very slightly soluble in water, soluble in ethanol (96 per cent) and in glacial acetic acid.

It is also available as a methanolic solution containing 90 g/L to 110 g/L of xanthydrol.

mp: about 123 °C.

Assay. In a 250 mL flask dissolve 0.300 g in 3 mL of *methanol R* or use 3.0 mL of solution. Add 50 mL of *glacial acetic acid R* and, dropwise with shaking, 25 mL of a 20 g/L solution of *urea R*. Allow to stand for 12 h, collect the precipitate on a sintered-glass filter (16) (*2.1.2*), wash with 20 mL of *ethanol (96 per cent) R*, dry in an oven at 100 °C to 105 °C and weigh.

1 g of precipitate is equivalent to 0.9429 g of xanthydrol.

Storage: protected from light. If a methanolic solution is used, store in small sealed ampoules and filter before use if necessary.

Xanthydrol R1

Complies with the requirements prescribed for *xanthydrol R* with the following requirement.

Content: minimum 98.0 per cent of $C_{13}H_{10}O_2$.

Xanthydrol Reagent

Dissolve about 0.125 g of *xanthydrol* in 100 mL of *anhydrous acetic acid*. Add 1 mL of *hydrochloric acid* immediately before use.

Xanthydrol Solution

To 0.1 mL of a 100 g/L solution of *xanthydrol R* in *methanol R* add 100 mL of *anhydrous acetic acid R* and 1 mL of *hydrochloric acid R*. Allow to stand for 24 h before using.

Xylene A mixture of o-, m- and p- isomers; C_8H_{10} = 106.2 (*1330-20-7*)

Mixture of isomers. Clear, colourless, flammable liquid, practically insoluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.867.

n_D^{20}: about 1.497.

bp: about 138 °C.

***m*-Xylene** 1,3-Dimethylbenzene; C_8H_{10} = 106.2 (*108-38-3*)

Clear, colourless, flammable liquid, practically insoluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.884.

n_D^{20}: about 1.497.

bp: about 139 °C.

mp: about −47 °C.

***o*-Xylene** 1,2-Dimethylbenzene; C_8H_{10} = 106.2 (*95-47-6*)

Clear, colourless, flammable liquid, practically insoluble in water, miscible with ethanol (96 per cent).

d_{20}^{20}: about 0.881.

n_D^{20}: about 1.505.

bp: about 144 °C.

mp: about −25 °C.

Xylene Cyanol FF (*2650-17-1*)

Colour Index No. 42135

A blue, alcohol-soluble dye used as a screening agent in *methyl orange–xylene cyanol FF solution.*

Xylenol Orange [3H-2,1-Benzoxathiol-3-ylidenebis(6-hydroxy-5-methyl-*m*-phenylene)methylenenitrilo]tetra-acetic acid S,S-dioxide tetrasodium salt; $C_{31}H_{28}N_2Na_4O_{13}S$ = 761 (*3618-43-7*)

Reddish-brown crystalline powder, soluble in water.

Xylenol Orange Solution

Dissolve 50.8 mg of *xylenol orange R* in *water R* and dilute to 100.0 mL with the same solvent.

Xylenol Orange Triturate

Triturate 1 part of *xylenol orange R* with 99 parts of *potassium nitrate R*.

Test for sensitivity. To 50 mL of *water R* add 1 mL of *dilute acetic acid R*, 50 mg of the xylenol orange triturate and 0.05 mL of *lead nitrate solution R*.
Add *hexamethylenetetramine R* until the colour changes from yellow to violet-red. After addition of 0.1 mL of *0.1 M sodium edetate* the colour changes to yellow.

Xylitol $C_5H_{12}O_5$ = 152.1 (*87-99-0*)

White or almost white, crystalline powder or crystals.

Content: minimum 96.0 per cent.

D-Xylose Xylose; (*58-86-6*)

See *Xylose (1278)*.

Zinc Zn = 65.4 (*7440-66-6*)

Content: minimum 99.5 per cent.

Silver-white cylinders, granules, pellets or filings with a blue sheen.

Arsenic (2.4.2, Method A): maximum 0.2 ppm.

Dissolve 5.0 g in a mixture of the 15 mL of *hydrochloric acid R* and 25 mL of *water R* prescribed.

Zinc Acetate Zinc acetate dihydrate; $(C_2H_3O_2)_2Zn,2H_2O$ = 219.5 (*5970-45-6*)

Bright white or almost white crystals, slightly efflorescent, freely soluble in water, soluble in ethanol (96 per cent). It loses its crystallisation water at 100 °C.

d_{20}^{20}: about 1.735.

mp: about 237 °C.

Zinc Acetate Solution

Mix 600 mL of *water R* with 150 mL of *glacial acetic acid R*, 54.9 g of *zinc acetate R* and stir to dissolve. Continue stirring while adding 150 mL of *concentrated ammonia R*. Cool to

room temperature and adjust with *ammonia R* to pH 6.4. Dilute the mixture to 1 L with *water R*.

Zinc, Activated

Place the zinc cylinders or pellets to be activated in a conical flask and add a sufficient quantity of a 50 ppm solution of *chloroplatinic acid R* to cover the metal. Allow the metal to remain in contact with the solution for 10 min, wash, drain and dry immediately.

Arsenic (2.4.2, Method A). To 5 g of the activated zinc add 15 mL of *hydrochloric acid R*, 25 mL of *water R*, 0.1 mL of *stannous chloride solution R* and 5 mL of *potassium iodide solution R*. No colour is produced during the test.

Activity. The requirements of the suitability test for arsenic (*2.4.2, Method A*) are met.

Zinc Chloride (*7646-85-7*)

See *Zinc chloride (0110)*.

Zinc Chloride–Formic Acid Solution

Dissolve 20 g of *zinc chloride R* in 80 g of an 850 g/L solution of *anhydrous formic acid R*.

Zinc Chloride Solution, Iodinated

Dissolve 20 g of *zinc chloride R* and 6.5 g of *potassium iodide R* in 10.5 mL of *water R*. Add 0.5 g of *iodine R* and shake for 15 min. Filter if necessary.

Storage: protected from light.

Zinc Iodide ZnI_2 = 319.2 (*10139-47-6*)

General reagent grade of commerce.

Zinc Iodide and Starch Solution

To a solution of 2 g of *zinc chloride R* in 10 mL of *water R* add 0.4 g of *soluble starch R* and heat until the starch has dissolved. After cooling to room temperature add 1.0 mL of a colourless solution containing 0.10 g *zinc R* as filings and 0.2 g of *iodine R* in *water R*. Dilute the solution to 100 mL with *water R* and filter.

Storage: protected from light.

Test for sensitivity. Dilute 0.05 mL of *sodium nitrite solution R* to 50 mL with *water R*. To 5 mL of this solution add 0.1 mL of *dilute sulfuric acid R* and 0.05 mL of the zinc iodide and starch solution and mix. The solution becomes blue.

Zinc Oxide (*1314-13-2*)

See *Zinc oxide (0252)*.

Zinc Powder Zn = 65.4 (*7440-66-6*)

Content: minimum 90.0 per cent.

Very fine, grey powder, soluble in *dilute hydrochloric acid R*.

Zinc Shot Zn = 65.38

Analytical reagent grade of commerce.

Shot, 0.5 to 2.0 mm (about 8 to 30 mesh).

Zinc Sulfate Zinc sulphate; Zinc Sulfate Heptahydrate; (*7446-20-0*)

See *Zinc sulfate (0111)*.

Zirconyl Chloride $ZrOCl_2,8H_2O$ = 322.3 (*15461-27-5*)

Content, minimum 96.0% of $ZrCl_2O,8H_2O$.

White or almost white, crystalline powder or crystals, freely soluble in water and in ethanol (96%).

Assay Dissolve 0.600 g in a mixture of 5 mL of *nitric acid* and 50 mL of *water*. Add 50.0 mL of *0.1 M silver nitrate* and 3 mL of *dibutyl phthalate* and shake. Using 2 mL of *ferric ammonium sulfate solution R2* as indicator, titrate with *0.1 M ammonium thiocyanate* until a reddish-yellow colour is obtained.

1 mL of *0.1 M silver nitrate* is equivalent to 16.11 mg of $ZrCl_2O,8H_2O$.

Zirconyl Nitrate A basic salt corresponding approximately to the formula $ZrO(NO_3)_2,2H_2O$ (*14985-18-3*)

A white or almost white powder or crystals, hygroscopic, soluble in water. The aqueous solution is a clear or at most slightly opalescent liquid.

Storage: in an airtight container.

Zirconyl Nitrate Solution

A 1 g/L solution in a mixture of 40 mL of *water R* and 60 mL of *hydrochloric acid R*.

B. Volumetric Reagents and Solutions

Terminology

Volumetric solutions are prepared according to the usual chemical analytical methods. The accuracy of the apparatus used is verified to ensure that it is appropriate for the intended use.

The concentration of volumetric solutions is indicated in terms of molarity. Molarity expresses, as the number of moles, the amount of substance dissolved in 1 L of solution. A solution which contains x moles of substance per litre is said to be x M.

Volumetric solutions do not differ from the prescribed strength by more than 10 per cent. The molarity of the volumetric solutions is determined by an appropriate number of titrations. The repeatability does not exceed 0.2 per cent (relative standard deviation).

Volumetric solutions are standardised by the methods described below. When a volumetric solution is to be used in an assay in which the end-point is determined by an electrochemical process (for example, amperometry or potentiometry) the solution is standardised by the same method. The composition of the medium in which a volumetric solution is standardised should be the same as that in which it is to be used.

Solutions more dilute than those described below are either prepared by adapting the quantities stated or by dilution, with *carbon dioxide-free water R* (unless otherwise prescribed), of a more concentrated solution that has been previously standardised. In the first case, the correction factor is determined on the volumetric solution to be used in the monograph. In the latter case, the correction factor of the dilute solution is the same as that of the standardised solution from which it was prepared.

Commercially available volumetric solutions traceable to a primary standard may be used provided their titre is determined or verified prior to first use.

Titres of volumetric solutions are verified at appropriate intervals that are defined in the quality system procedures.

British Pharmacopoeia monographs In assays and other quantitative tests, solutions to be standardised before use; include the letters VS after the name of the reagent.

Primary Standards

The following materials, after drying under the specified conditions, are recommended for use as primary standards in the standardisation of volumetric solutions. Analytical reagent grade materials of commerce must be used.

For primary standards from commercial sources, a pre-treatment step may be necessary. Follow the supplier's instructions.

A secondary standard may be used provided its traceability to a primary standard has been demonstrated.

For monographs of the European Pharmacopoeia, primary standards are indicated by the suffix RV.

Arsenic Trioxide Arsenious trioxide; As_2O_3 = 197.8 (*1327-53-3*)

Sublime *arsenious trioxide R* in a suitable apparatus.

Storage: over *anhydrous silica gel R*.

Benzoic Acid $C_7H_6O_2$ = 122.1 (*65-85-0*)

Sublime *benzoic acid R* in a suitable apparatus.

Ferrous Ethylenediammonium Sulfate Ethylenediammonium iron(II) disulfate tetrahydrate; Ethylenediammonium tetraaquabis(sulfato)iron(II); $Fe(C_2H_{10}N_2)(SO_4)_2,4H_2O$ = 382.1 (*113193-60-5*)

Content: minimum 99.5 per cent.

Potassium Bromate $KBrO_3$ = 167.0 (*7758-01-2*)

Crystallise *potassium bromate R* from boiling *water R*. Collect the crystals and dry to constant mass in an oven at 180 ± 10 °C (*2.2.32*).

Potassium Dichromate

Dry to constant weight at 150°.

Potassium Hydrogen Phthalate Potassium 2-carboxybenzoate; $C_8H_5KO_4$ = 204.2 (*877-24-7*)

Recrystallise *potassium hydrogen phthalate R* from boiling *water R*, collect the crystals at a temperature above 35 °C and dry to constant mass at 110 °C.

Potassium Iodate

Dry to constant weight at 130°.

Sodium Carbonate, Anhydrous Sodium Carbonate; Na_2CO_3 = 106.0 (*497-19-8*)

Filter at room temperature a saturated solution of *sodium carbonate R*. Introduce slowly into the filtrate a stream of *carbon dioxide R* with constant cooling and stirring. After about 2 h, collect the precipitate on a sintered-glass filter (*2.1.2*). Wash the filter with iced *water R* containing carbon dioxide. After drying at 100 °C to 105 °C, heat to constant mass at 270-300 °C, stirring from time to time.

Sodium Chloride NaCl = 58.44 (*7647-14-5*)

To 1 volume of the *saturated sodium chloride solution R* add 2 volumes of *hydrochloric acid R*. Collect the crystals formed and wash with *hydrochloric acid R1*. Remove the hydrochloric acid by heating on a water-bath and dry the crystals to constant mass at 300 °C.

Sulfanilic Acid 4-Aminobenzenesulfonic acid; $C_6H_7NO_3S$ = 173.2 (*121-57-3*)

Recrystallise *sulfanilic acid R* from boiling *water R*. Filter and dry to constant mass at 100-105 °C.

Trometamol 2-Amino-2-(hydroxymethyl)propane-1,3-diol; Tris(hydroxymethyl)aminomethane; $C_4H_{11}NO_3$ = 121.1 (*77-86-1*)

Content: minimum 99.5 per cent.

Zinc Zn = 65.4 (*7440-66-6*)

Content: minimum 99.9 per cent.

Preparation and Standardisation

For each solution the preparation and standardisation of the most commonly used strengths are described. Solutions more concentrated than those described are prepared and standardised using proportionate amounts of the reagents. Aqueous solutions less concentrated than those described are prepared by making an exact dilution of a more concentrated solution with *carbon dioxide-free water*. The correction factors of these solutions are the same as those from which the dilutions were prepared. Aqueous solutions of molarity below 0.1M are freshly prepared using *carbon dioxide-free water*.

The water used in preparing volumetric solutions complies with the requirements of the monograph for Purified Water. When used for the preparation of unstable solutions such as potassium permanganate and sodium thiosulfate, it should be freshly boiled and cooled. When a solution is to be used in an assay in which the end point is determined by an electrochemical process, the exact concentration of the

solution must be determined in the same way.
The composition of the medium in which a volumetric solution is standardised should be the same as that in which it is to be used.

All volumetric solutions should, if practicable, be prepared, standardised and used at 20°; if a titration is carried out at a markedly different temperature from that at which the standardisation took place, a suitable temperature correction should be made.

Acetic Acid VS $C_2H_4O_2$ = 60.1

Dilute 6.0 g of *glacial acetic acid R* to 1000.0 mL with *water R*.

Standardisation. To 25.0 mL of acetic acid add 0.5 mL of *phenolphthalein solution R* and titrate with 0.1M *sodium hydroxide*.

0.1M Ammonium Cerium(IV) Nitrate VS 0.1M ammonium and cerium nitrate

Shake for 2 min a solution containing 56 mL of *sulfuric acid R* and 54.82 g of *ammonium and cerium nitrate R*, then add 5 successive quantities, each of 100 mL, of *water R*, shaking after each addition. Dilute the clear solution to 1000.0 mL with *water R*. Standardise the solution after 10 days.

Standardisation. Dissolve 0.300 g of *ferrous ethylenediammonium sulfate RV* in 50 mL of a diluted solution of *sulfuric acid R* (49 g/L H_2SO_4). Titrate with the ammonium and cerium nitrate solution, determining the end-point potentiometrically (*2.2.20*) or using 0.1 mL of *ferroin R* as indicator.

1 mL of *0.1 M ammonium and cerium nitrate* is equivalent to 38.21 mg of $Fe(C_2H_{10}N_2)(SO_4)_2,4H_2O$.

Storage: protected from light.

0.1M Ammonium Cerium(IV) Sulfate VS 0.1M ammonium and cerium sulfate

Dissolve 65.0 g of *ammonium and cerium sulfate R* in a mixture of 500 mL of *water R* and 30 mL of *sulfuric acid R*. Allow to cool and dilute to 1000.0 mL with *water R*.

Standardisation. Dissolve 0.300 g of *ferrous ethylenediammonium sulfate RV* in 50 mL of a diluted solution of *sulfuric acid R* (49 g/L H_2SO_4). Titrate with the ammonium and cerium sulfate solution, determining the end-point potentiometrically (*2.2.20*) or using 0.1 mL of *ferroin R* as indicator.

1 mL of *0.1 M ammonium and cerium sulfate* is equivalent to 38.21 mg of $Fe(C_2H_{10}N_2)(SO_4)_2,4H_2O$.

Dilution. Use a diluted solution of *sulfuric acid R* (59 g/L H_2SO_4) while cooling the solution.

0.01M Ammonium Cerium(IV) Sulfate VS Ammonium and cerium sulfate

To 100 mL of *0.1M ammonium cerium(IV) sulfate VS* add, while cooling, 30 mL of *sulfuric acid* and sufficient water to produce 1000 mL.

Ammonium Iron(II) Sulfate VS Ammonium Iron(II) Sulphate; Ferrous Ammonium Sulfate; $(NH_4)_2Fe(SO_4)_2,6H_2O$ = 392.1

For a 0.1M solution Dissolve 40 g of *ammonium iron(II) sulfate* in 100 mL of 2M *sulfuric acid* and dilute with sufficient freshly boiled and cooled *water* to produce 1000 mL.

Ascertain its exact concentration in the following manner. To 25 mL add 10 mL of 1M *sulfuric acid* and 1 mL of *orthophosphoric acid* and titrate with 0.02M *potassium permanganate VS*. Each mL of 0.02M *potassium permanganate VS* is equivalent to 39.21 mg of $(NH_4)_2Fe(SO_4)_2,6H_2O$.

0.1M Ammonium Iron(III) Sulfate VS 0.1M Ferric Ammonium Sulfate

Dissolve 50.0 g of *ferric ammonium sulfate R* in a mixture of 6 mL of *sulfuric acid R* and 300 mL of *water R* and dilute to 1000.0 mL with *water R*.

Standardisation. To 10.0 mL of the ferric ammonium sulfate solution add 35 mL of *water R*, 3 mL of *hydrochloric acid R* and 1 g of *potassium iodide R*. Allow to stand for 10 min. Titrate with *0.1 M sodium thiosulfate*, determining the end-point potentiometrically (*2.2.20*) or using 1 mL of *starch solution R* as indicator.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 48.22 mg of $FeNH_4(SO_4)_2,12H_2O$.

0.1M Ammonium Thiocyanate VS

Dissolve 7.612 g of *ammonium thiocyanate R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. To 20.0 mL of *0.1 M silver nitrate* add 25 mL of *water R*, 2 mL of *dilute nitric acid R* and 2 mL of *ferric ammonium sulfate solution R2*. Titrate with the ammonium thiocyanate solution until a reddish-yellow colour is obtained.

0.1M Barium Chloride VS

Dissolve 24.4 g of *barium chloride R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. To 10.0 mL of the barium chloride solution add 60 mL of *water R*, 3 mL of *concentrated ammonia R* and 0.5-1 mg of *phthalein purple R*. Titrate with *0.1 M sodium edetate*. When the solution begins to decolorise, add 50 mL of *ethanol (96 per cent) R* and continue the titration until the blue-violet colour disappears.

0.05M Barium Perchlorate VS

Dissolve 15.8 g of *barium hydroxide R* in a mixture of 7.5 mL of *perchloric acid R* and 75 mL of *water R*, adjust the solution to pH 3 by adding *perchloric acid R* and filter if necessary. Add 150 mL of *ethanol (96 per cent) R* and dilute to 250 mL with *water R*. Dilute to 1000.0 mL with *buffer solution pH 3.7 R*.

Standardisation. To 5.0 mL of *0.05 M sulfuric acid* add 5 mL of *water R*, 50 mL of *buffer solution pH 3.7 R* and 0.5 mL of *alizarin S solution R*. Titrate with the barium perchlorate solution until an orange-red colour appears. Standardise immediately before use.

Dilution. Use *buffer solution pH 3.7 R*.

0.025M Barium Perchlorate VS

Dilute 500 mL of *0.05M barium perchlorate VS* to 1000 mL with *buffer solution pH 3.7*.

0.005M Barium Perchlorate VS

Dilute 10.0 mL of *0.05 M barium perchlorate* to 100.0 mL with a buffer solution prepared as follows: to 15.0 mL of *acetic acid R* add 60.0 mL of *2-propanol R*. Adjust to pH 3.7 with *ammonia R* and dilute to 100.0 mL with *water R*.

0.004M Benzethonium Chloride VS

Dissolve in *water R* 1.792 g of *benzethonium chloride R*, previously dried to constant mass at 100-105 °C, and dilute to 1000.0 mL with the same solvent.

Standardisation. Dissolve 0.350 g of the dried substance in 35 mL of a mixture of 30 volumes of *anhydrous acetic acid R* and 70 volumes of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, using 0.05 mL of *crystal violet solution R* as indicator. Carry out a blank titration.

1 mL of *0.1 M perchloric acid* is equivalent to 44.81 mg of $C_{27}H_{42}ClNO_2$.

0.01M Bismuth Nitrate VS

Dissolve 4.86 g of *bismuth nitrate pentahydrate R* in 60 mL of *dilute nitric acid R* and dilute to 1000.0 mL with *water R*.

Standardisation. To 25.0 mL of the bismuth nitrate solution, add 50 mL of *water R* and titrate with *0.01 M sodium edetate* using 0.05 mL of a 1 g/L solution of *xylenol orange R* as indicator.

0.05M Bromine VS 0.0167M bromide-bromate

Dissolve 2.7835 g of *potassium bromate RV* and 13 g of *potassium bromide R* in *water R* and dilute to 1000.0 mL with the same solvent.

0.1M Cerium(IV) Sulfate VS 0.1M Cerium Sulfate

Dissolve 40.4 g of *cerium sulfate R* in a mixture of 500 mL of *water R* and 50 mL of *sulfuric acid R*. Allow to cool and dilute to 1000.0 mL with *water R*.

Standardisation. Dissolve 0.300 g of *ferrous ethylenediammonium sulfate RV* in 50 mL of a diluted solution of *sulfuric acid R* (49 g/L H_2SO_4). Titrate with the cerium sulfate solution, determining the end-point potentiometrically (*2.2.20*) or using 0.1 mL of *ferroin R* as indicator.

1 mL of *0.1 M cerium sulfate* is equivalent to 38.21 mg of $Fe(C_2H_{10}N_2)(SO_4)_2,4H_2O$.

Cetylpyridinium Chloride VS $C_{21}H_{38}ClN,H_2O$ = 358.0

For a 0.005M solution Dissolve 1.8 g of *cetylpyridinium chloride* in 10 mL of *ethanol (96%)* and dilute to 1000 mL with *water*.

Ascertain its exact concentration in the following manner. Transfer 25 mL to a separating funnel, add 25 mL of *chloroform*, 10 mL of 0.01M *sodium hydroxide* and 10 mL of a freshly prepared 0.5% w/v solution of *potassium iodide*. Shake well, allow to separate and discard the chloroform layer. Shake the aqueous layer with three further 10-mL quantities of *chloroform* and discard the chloroform solutions. Add 40 mL of *hydrochloric acid*, cool and titrate with *0.005M potassium iodate VS* until the solution becomes pale brown in colour. Add 2 mL of *chloroform* and continue the titration, shaking vigorously and allowing the layers to separate after each addition, until the chloroform becomes colourless. Titrate a mixture of 20 mL of *water*, 10 mL of the potassium iodide solution and 40 mL of *hydrochloric acid* with *0.005M potassium iodate VS* in the same manner. The difference between the titrations represents the amount of potassium iodate required. Each mL of *0.005M potassium iodate VS* is equivalent to 3.580 mg of $C_{21}H_{38}ClN,H_2O$.

0.02M Copper Sulfate VS 0.02M Copper Sulphate VS

Dissolve 5.0 g of *copper sulfate pentahydrate R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. To 20.0 mL of the copper sulfate solution add 2 g of *sodium acetate R* and 0.1 mL of *pyridylazonaphthol solution R*. Titrate with *0.02 M sodium edetate* until the colour changes from violet-blue to bright green. Titrate slowly towards the end of the titration.

Cupriethylenediamine Hydroxide Solution Use a 1M solution in which the molar ratio of ethylenediamine to copper is 2.00 ± 0.04.

Dioctyl Sodium Sulfosuccinate VS Dioctyl Sodium Sulphosuccinate VS; $C_{20}H_{37}NaO_7S$ = 444.6

For a 0.01M solution Dissolve 4.5 g of *dioctyl sodium sulfosuccinate* in warm *water*, cool and dilute to 1000 mL with *water*.

Ascertain its exact concentration in the following manner. To 25 mL add 25 mL of a solution containing 20% w/v of *anhydrous sodium sulfate* and 2% w/v of *sodium carbonate*, 50 mL of *chloroform* and 1.5 mL of *bromophenol blue solution* and mix. Titrate with 0.01M *tetrabutylammonium iodide VS* until about 1 mL from the end point. Stopper the flask, shake vigorously for 2 minutes and continue the titration, in 0.05-mL increments, shaking vigorously and allowing the flask to stand for about 10 seconds after each addition. Continue the titration until a blue colour just appears in the chloroform layer. Each mL of 0.01M *tetrabutylammonium iodide VS* is equivalent to 4.446 mg of $C_{20}H_{37}NaO_7S$.

0.1M Disodium Edetate VS 0.1M Sodium Edetate VS

Dissolve 37.5 g of *sodium edetate R* in 500 mL of *water R*, add 100 mL of *1 M sodium hydroxide* and dilute to 1000.0 mL with *water R*.

Standardisation. Dissolve 0.120 g of *zinc RV* in 4 mL of *hydrochloric acid R1*. Add *dilute sodium hydroxide solution R* until the solution is weakly acid and carry out the assay of zinc by complexometry (*2.5.11*).

1 mL of *0.1 M sodium edetate* is equivalent to 6.538 mg of Zn.

Storage: in a polyethylene container.

0.05M Disodium Edetate VS 0.05M Sodium Edetate

Dissolve 18.6 g of *disodium edetate* in sufficient water to produce 1000 mL.

Ascertain its exact concentration in the following manner.

Dissolve 0.100 g of *zinc*, in granules, in 4 mL of 7M *hydrochloric acid* and add 0.1 mL of *bromine water*. Boil to remove excess bromine, cool and dilute to 100 mL with *water*. Dilute 25 mL of this solution to 200 mL with *water*, add about 50 mg of *xylenol orange triturate* and *hexamine* until the solution becomes violet-pink and add 2 g of *hexamine* in excess. Titrate with the disodium edetate solution until the violet-pink colour changes to yellow. Each mL of 0.05M disodium edetate VS is equivalent to 3.269 mg of Zn.

0.02M Disodium Edetate VS 0.02M Sodium Edetate

Dissolve 7.444 g of *disodium edetate* in sufficient water to produce 1000 mL.

Ascertain its exact concentration in the following manner.

Dissolve 0.100 g of *zinc*, in granules, in 4 mL of 7M *hydrochloric acid* and add 0.1 mL of *bromine water*. Boil to remove excess bromine, cool and dilute to 100 mL with *water*. Dilute 25 mL of this solution to 200 mL with *water*, add about 50 mg of *xylenol orange triturate* and *hexamine* until the solution becomes violet-pink and add 2 g of *hexamine* in excess. Titrate with the disodium edetate solution until the violet-pink colour changes to yellow. Each mL of 0.02M disodium edetate VS is equivalent to 1.308 mg of Zn.

0.01M Disodium Edetate VS 0.01M Sodium Edetate

Dissolve 3.722 g of *disodium edetate* in sufficient water to produce 1000 mL.

Ascertain its exact concentration in the following manner.

Dissolve 0.100 g of *zinc*, in granules, in 4 mL of 7M *hydrochloric acid* and add 0.1 mL of *bromine water*. Boil to remove excess bromine, cool and dilute to 100 mL with *water*. Dilute 10 mL of this solution to 200 mL with *water*, add about 50 mg of *xylenol orange triturate* and *hexamine* until the solution becomes violet-pink and add 2 g of *hexamine* in excess. Titrate with the disodium edetate solution until the violet-pink colour changes to yellow. Each mL of 0.01M disodium edetate VS is equivalent to 0.6538 mg of Zn.

6M Hydrochloric Acid VS

Dilute 618.0 g of *hydrochloric acid* to 1000 mL with *water*.

3M Hydrochloric Acid VS

Dilute 309.0 g of *hydrochloric acid* to 1000 mL with *water*.

2M Hydrochloric Acid VS

Dilute 206.0 g of *hydrochloric acid* to 1000 mL with *water*.

1M Hydrochloric Acid VS

Dilute 103.0 g of *hydrochloric acid R* to 1000.0 mL with *water R*.

Standardisation. Dissolve 0.950 g of *trometamol RV* in 50 mL of *water R*. Titrate with the hydrochloric acid solution, determining the end-point potentiometrically (*2.2.20*) or using 0.1 mL of *methyl orange solution R* as indicator until a yellowish-red colour is obtained.

1 mL of *1 M hydrochloric acid* is equivalent to 121.1 mg of $C_4H_{11}NO_3$.

0.1M Hydrochloric Acid VS

Dilute 100.0 mL of *1 M hydrochloric acid* to 1000.0 mL with *carbon dioxide-free water R*.

Standardisation. Carry out the titration described for *1 M hydrochloric acid* using 95 mg of *trometamol RV* dissolved in 50 mL of *water R*.

1 mL of *0.1 M hydrochloric acid* is equivalent to 12.11 mg of $C_4H_{11}NO_3$.

0.5M Iodine VS

Dissolve 127 g of *iodine R* and 200 g of *potassium iodide R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. To 2.0 mL of the iodine solution add 1 mL of *dilute acetic acid R* and 50 mL of *water R*. Titrate with *0.1 M sodium thiosulfate,* using *starch solution R* as indicator.

Storage: protected from light.

0.05M Iodine VS

Dissolve 12.7 g of *iodine R* and 20 g of *potassium iodide R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. To 10.0 mL of the iodine solution add 1 mL of *dilute acetic acid R* and 40 mL of *water R*. Titrate with *0.1 M sodium thiosulfate,* determining the end-point potentiometrically (*2.2.20*) or using *starch solution R* as indicator.

Storage: protected from light.

0.01M Iodine VS

Add 0.3 g of *potassium iodide R* to 20.0 mL of *0.05 M iodine* and dilute to 100.0 mL with *water R*.

0.1M Iron(II) Sulfate VS 0.1M Ferrous sulfate; 0.1M Iron(II) Sulphate VS

Dissolve 27.80 g of *ferrous sulfate R* in 500 mL of *dilute sulfuric acid R* and dilute to 1000.0 mL with *water R*.

Standardisation. To 25.0 mL of the ferrous sulfate solution add 3 mL of *phosphoric acid R* and titrate immediately with *0.02 M potassium permanganate.* Standardise immediately before use.

Karl Fischer Reagent VS

Iodosulfurous reagent

The apparatus, which must be kept closed and dry during the preparation, consists of a 3000- to 4000-mL round-bottomed flask with inlets for a thermometer and a stirrer and fitted with a drying tube. To 700 mL of *anhydrous pyridine* and 700 mL of *2-methoxyethanol* add, stirring constantly, 220 g of finely powdered *iodine,* previously dried over *phosphorus pentoxide.* Continue stirring until the iodine has completely dissolved (about 30 minutes), cool to −10° and add quickly, while stirring, 190 g of *sulfur dioxide.* Do not allow the temperature to exceed 30°; cool.

Determine the water-equivalent of the reagent immediately before use in the following manner. Transfer 20 mL of *anhydrous methanol* to the titration vessel and titrate to the electrometric end point with the reagent, Appendix IX C. Add in an appropriate form a suitable amount of water, accurately weighed, and titrate to the end point. Calculate the water-equivalent of the reagent in mg per mL.

The minimum water equivalent is 3.5 mg of water per mL of reagent. Work protected from humidity.

The composition of commercially available Karl Fischer reagents often differs from that above by the replacement of pyridine with other basic compounds. The use of these reagents must be validated in order to verify in each individual case the stoichiometry and the absence of incompatibility between the substance under test and the reagent.

0.1M Lanthanum Nitrate VS

Dissolve 43.30 g of *lanthanum nitrate R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. To 20.0 mL of the lanthanum nitrate solution, add 15 mL of *water R* and 25 mL of *0.1 M sodium edetate.* Add about 50 mg of *xylenol orange triturate R* and about 2 g of *hexamethylenetetramine R*. Titrate with *0.1 M zinc sulfate* until the colour changes from yellow to violet-pink.

1 mL of *0.1 M sodium edetate* is equivalent to 43.30 mg of $La(NO_3)_3,6H_2O$.

0.1M Lead Nitrate VS

Dissolve 33 g of *lead nitrate R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. Take 20.0 mL of the lead nitrate solution and carry out the determination of lead by complexometry (*2.5.11*).

0.05M Lead Nitrate VS

Dissolve 16.5 g of *lead(II) nitrate* in sufficient *water* to produce 1000 mL.

Ascertain its exact concentration in the following manner.

To 50 mL of the solution add 300 mL of *water* and carry out the method for the complexometric titration of lead, *Appendix VIII D*. Each mL of *0.1M disodium edetate VS* is equivalent to 33.12 mg of $Pb(NO_3)_2$.

0.1M Lithium Methoxide VS

Dissolve 0.694 g of *lithium R* in 150 mL of *anhydrous methanol R* and dilute to 1000.0 mL with *toluene R*.

Standardisation. To 10 mL of *dimethylformamide R* add 0.05 mL of a 3 g/L solution of *thymol blue R* in *methanol R* and titrate with the lithium methoxide solution until a pure blue colour is obtained. Immediately add 0.100 g of *benzoic acid RV*. Stir to effect solution and titrate with the lithium methoxide solution until the pure blue colour is again obtained. Protect the solution from atmospheric carbon dioxide throughout the titration. From the volume of titrant used in the second titration ascertain the exact strength of the lithium methoxide solution. Standardise immediately before use.

1 mL of *0.1 M lithium methoxide* is equivalent to 12.21 mg of $C_7H_6O_2$.

0.1M Magnesium Chloride VS

Dissolve 20.33 g of *magnesium chloride R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. Carry out the determination of magnesium by complexometry (*2.5.11*).

Magnesium Sulfate VS Magnesium Sulphate VS; $MgSO_4,7H_2O$ = 246.5

For a 0.05M solution Dissolve 12.5 g of *magnesium sulfate* in sufficient *water* to produce 1000 mL.

Ascertain its exact concentration by carrying out the method for the *complexometric titration of magnesium*, Appendix VIII D, using 40 mL of the magnesium sulfate solution. Each mL of 0.1M *disodium edetate VS* is equivalent to 24.65 mg of $MgSO_4,7H_2O$.

Mercury(II) Nitrate VS Mercuric nitrate

$Hg(NO_3)_2$+ aq

For a 0.02M solution Dissolve 6.85 g of *mercury(II) nitrate* in 20 mL of 1M *nitric acid* and add sufficient *water* to produce 1000 mL.

Ascertain its exact concentration in the following manner. Dissolve 15 mg of *sodium chloride* in 50 mL of *water* and titrate with the mercury nitrate solution determining the end point potentiometrically, using a platinum or mercury indicator electrode and a mercury–mercury(I) sulfate reference electrode. Each mL of 0.02M *mercury(II) nitrate VS* is equivalent to 2.338 mg of NaCl.

1M Nitric Acid VS

Dilute 96.6 g of *nitric acid R* to 1000.0 mL with *water R*.

Standardisation. Dissolve 0.950 g of *trometamol RV* in 50 mL of *water R*. Titrate with the nitric acid solution, determining the end-point potentiometrically (*2.2.20*) or using 0.1 mL of *methyl orange solution R* as indicator until a reddish-yellow colour is obtained.

1 mL of *1 M nitric acid* is equivalent to 121.1 mg of $C_4H_{11}NO_3$.

0.1M Perchloric Acid VS

Place 8.5 mL of *perchloric acid R* in a volumetric flask containing about 900 mL of *glacial acetic acid R* and mix. Add 30 mL of *acetic anhydride R*, dilute to 1000.0 mL with *glacial acetic acid R*, mix and allow to stand for 24 h. Determine the water content (*2.5.12*) without addition of methanol and, if necessary, adjust the water content to 0.1-0.2 per cent by adding either *acetic anhydride R* or *water R*. Allow to stand for 24 h.

Standardisation. Dissolve 0.170 g of *potassium hydrogen phthalate RV* in 50 mL of *anhydrous acetic acid R*, warming gently if necessary. Allow to cool protected from air, and titrate with the perchloric acid solution, determining the end-point potentiometrically (*2.2.20*) or using 0.05 mL of *crystal violet solution R* as indicator. Note the temperature of the perchloric acid solution at the time of the titration. If the temperature at which an assay is carried out is different from that at which the *0.1 M perchloric acid* has been standardised, the volume used in the assay becomes:

$$V_c = V[1 + (t_1 - t_2)0.0011]$$

t_1 = temperature during standardisation,
t_2 = temperature during the assay,
V_c = corrected volume,
V = observed volume.

1 mL of *0.1 M perchloric acid* is equivalent to 20.42 mg of $C_8H_5KO_4$.

Dilution. Use *anhydrous acetic acid R*.

Other strengths of perchloric acid should be prepared by diluting *0.1M perchloric acid VS* appropriately with anhydrous acetic acid.

0.02M Perchloric Acid VS

Dilute 20.0 mL of 0.1M perchloric acid to 100.0 mL with anhydrous acetic acid.

Other strengths of perchloric acid should be prepared by diluting 0.1M perchloric acid VS appropriately with anhydrous acetic acid.

0.033M Potassium Bromate VS

Dissolve 5.5670 g of *potassium bromate RV* in *water R* and dilute to 1000.0 mL with the same solvent.

0.02M Potassium Bromate VS

Dissolve 3.340 g of *potassium bromate* in sufficient *water* to produce 1000 mL.

0.0167M Potassium Bromate VS

Dissolve 2.783 g of *potassium bromate* in sufficient *water* to produce 1000 mL.

0.0083M Potassium Bromate VS

Prepare by appropriate dilution of *0.033M Potassium Bromate VS*.

Potassium Dichromate VS $K_2Cr_2O_7$ = 294.2

For a 0.0167M solution Dissolve 4.9 g of *potassium dichromate* in sufficient *water* to produce 1000 mL.

Ascertain its exact concentration in the following manner. To 20 mL of the solution add 1 g of *potassium iodide* and 7 mL of 2M *hydrochloric acid*. Add 250 mL of *water* and titrate with 0.1M *sodium thiosulfate VS*, using 3 mL of *starch solution* as indicator, until the colour changes from blue to light green. Each mL of 0.1M *sodium thiosulfate VS* is equivalent to 4.9 mg of $K_2Cr_2O_7$.

0.1M Potassium Hydrogen Phthalate VS

In a conical flask containing about 800 mL of *anhydrous acetic acid R*, dissolve 20.42 g of *potassium hydrogen phthalate RV*. Heat on a water-bath until completely dissolved, protected from humidity. Cool to 20 °C and dilute to 1000.0 mL with *anhydrous acetic acid R*.

0.5M Potassium Hydroxide in Ethanol (60%) VS 0.5M Potassium hydroxide in alcohol (60 per cent V/V)

Dissolve 3 g of *potassium hydroxide R* in *aldehyde-free alcohol R* (60 per cent *V/V*) and dilute to 100.0 mL with the same solvent.

Standardisation. Dissolve 0.500 g of *benzoic acid RV* in 10 mL of *water R* and 40 mL of *ethanol (96 per cent) R*. Titrate with the potassium hydroxide solution, determining the end-point potentiometrically (*2.2.20*) or using 0.1 mL of *phenolphthalein solution R* as indicator.

1 mL of *0.5 M potassium hydroxide in alcohol (60 per cent V/V)* is equivalent to 61.06 mg of $C_7H_6O_2$.

Potassium Hydroxide in Ethanol (90%) VS

For a 1M solution Dissolve 60 g of *potassium hydroxide* in sufficient *aldehyde-free ethanol (90%)* to produce 1000 mL, allow the solution to stand for 24 hours, decant the clear solution and ascertain its exact concentration by the method described under *0.5M ethanolic potassium hydroxide VS*.

1M Potassium Hydroxide VS

Dissolve 60 g of *potassium hydroxide* in sufficient *carbon dioxide-free water* to produce 1000 mL. Ascertain its exact concentration in the following manner. Titrate 20 mL of the solution with 1M *hydrochloric acid VS* using 0.5 mL of *phenolphthalein solution* as indicator. Each mL of 1M *hydrochloric acid VS* is equivalent to 56.11 mg of KOH.

0.1M Potassium Hydroxide VS

Dissolve 6 g of *potassium hydroxide R* in *carbon dioxide-free water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. Dissolve 0.150 g of *potassium hydrogen phthalate RV* in 50 mL of *water R*. Titrate with the potassium hydroxide solution, determining the end-point potentiometrically (*2.2.20*) or using 0.1 mL of *phenolphthalein solution R* as indicator.

1 mL of *0.1 M potassium hydroxide* is equivalent to 20.42 mg of $C_8H_5KO_4$.

0.5M Potassium Hydroxide, Ethanolic VS 0.5M Potassium hydroxide, alcoholic

Dissolve 3 g of *potassium hydroxide R* in 5 mL of *water R* and dilute to 100.0 mL with *aldehyde-free alcohol R*.

Standardisation. Dissolve 0.500 g of *benzoic acid RV* in 10 mL of *water R* and 40 mL of *ethanol (96 per cent) R*. Titrate with the potassium hydroxide solution, determining the end-point potentiometrically (*2.2.20*) or using 0.1 mL of *phenolphthalein solution R* as indicator.

1 mL of *0.5 M alcoholic potassium hydroxide* is equivalent to 61.06 mg of $C_7H_6O_2$.

Dilution. Use *aldehyde-free alcohol R*.

0.1M Potassium Hydroxide, Ethanolic VS 0.1M Potassium hydroxide, alcoholic

Dissolve 6 g of *potassium hydroxide* in 50 mL of *water* and dilute to 1000 mL with *aldehyde-free ethanol (96%)*.

0.01M Potassium Hydroxide, Ethanolic VS 0.01M Potassium hydroxide, alcoholic

Dilute 2.0 mL of 0.5M *ethanolic potassium hydroxide* to 100.0 mL with *aldehyde-free ethanol (96%)*).

0.05M Potassium Iodate VS

Dissolve 10.70 g of *potassium iodate R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. To 3.0 mL of the potassium iodate solution add 40.0 mL of *water R*, 1 g of *potassium iodide R* and 5 mL of *dilute sulfuric acid R*. Titrate with *0.1 M sodium thiosulfate*, determining the end-point potentiometrically (*2.2.20*) or using 1 mL of *starch solution R*, added towards the end of the titration, as indicator.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 3.567 mg of KIO_3.

0.001M Potassium Iodide VS

Dilute 10.0 mL of *potassium iodide solution R* to 100.0 mL with *water R*. Dilute 5.0 mL of this solution to 500.0 mL with *water R*.

0.02M Potassium Permanganate VS

Dissolve 3.2 g of *potassium permanganate R* in *water R* and dilute to 1000.0 mL with the same solvent. Heat the solution for 1 h on a water-bath, allow to cool and filter through a sintered-glass filter (*2.1.2*).

Standardisation. Dissolve 0.300 g of *ferrous ethylenediammonium sulfate RV* in 50 mL of a diluted solution of *sulfuric acid R* (49 g/L H_2SO_4). Titrate with the potassium permanganate solution, determining the end-point potentiometrically (*2.2.20*) or by the colour of the solution changing to pink. Standardise immediately before use.

1 mL of *0.02 M potassium permanganate* is equivalent to 38.21 mg of $Fe(C_2H_{10}N_2)(SO_4)_2,4H_2O$.

Storage: protected from light.

0.1M Silver Nitrate VS

Dissolve 17.0 g of *silver nitrate R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. Dissolve 50 mg of *sodium chloride RV* in *water R*, add 5 mL of *dilute nitric acid R* and dilute to 50 mL with *water R*. Titrate with the silver nitrate solution, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M silver nitrate* is equivalent to 5.844 mg of NaCl.

Storage: protected from light.

0.001M Silver Nitrate VS

Dilute 5 mL of *0.1M silver nitrate VS* to 500 mL with water.

0.1M Sodium Arsenite VS

Dissolve *arsenious trioxide RV* equivalent to 4.946 g of As_2O_3 in a mixture of 20 mL of *strong sodium hydroxide solution R* and 20 mL of *water R*, dilute to 400 mL with *water R* and add *dilute hydrochloric acid R* until the solution is neutral to *blue litmus paper R*. Dissolve 2 g of *sodium hydrogen carbonate R* in the solution and dilute to 500.0 mL with *water R*.

Sodium Dodecyl Sulfate VS Sodium Dodecyl Sulphate VS; $C_{12}H_{25}NaO_4S$ = 288.4

For a 0.001M solution Dissolve 0.2884 g of *sodium dodecyl sulfate*, calculated with reference to the substance dried at 105° for 2 hours, in sufficient *water* to produce 1000 mL.

Ascertain its exact concentration in the following manner. To 50 mL add 15 mL of *chloroform*, 10 mL of 1M *sulfuric acid* and 1 mL of a solution containing 0.003% w/v of each of *dimethyl yellow* and *oracet blue 2R* in *chloroform* and titrate with 0.004M *benzethonium chloride VS*, shaking vigorously and allowing the layers to separate after each addition, until the chloroform layer acquires a permanent clear green colour. Each mL of 0.004M *benzethonium chloride VS* is equivalent to 1.154 mg of $C_{12}H_{25}NaO_4S$.

1M Sodium Hydroxide VS

Dissolve 42 g of *sodium hydroxide R* in *carbon dioxide-free water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. Dissolve 1.50 g of *potassium hydrogen phthalate RV* in 50 mL of *water R*. Titrate with the sodium hydroxide solution, determining the end-point potentiometrically (*2.2.20*) or using 0.1 mL of *phenolphthalein solution R* as indicator.

1 mL of *1 M sodium hydroxide* is equivalent to 204.2 mg of $C_8H_5KO_4$.

If sodium hydroxide free from carbonate is prescribed, prepare it as follows. Dissolve *sodium hydroxide R* in *water R* to give a concentration of 400-600 g/L and allow to stand. Decant the clear supernatant, taking precautions to avoid the introduction of carbon dioxide, and dilute with *carbon dioxide-free water R* to the required molarity. The solution complies with the following test. Titrate 20.0 mL of hydrochloric acid of the same molarity with the solution of sodium hydroxide, using 0.1 mL of *phenolphthalein solution R* as indicator. At the end-point add just sufficient of the acid to discharge the pink colour and concentrate the solution to 20 mL by boiling. During boiling add just sufficient acid to discharge the pink colour, which should not reappear after prolonged boiling. The volume of acid used does not exceed 0.1 mL.

0.1M Sodium Hydroxide VS

Dilute 100.0 mL of *1 M sodium hydroxide* to 1000.0 mL with *carbon dioxide-free water R*.

Standardisation. Carry out the titration described for *1 M sodium hydroxide* using 0.150 g of *potassium hydrogen phthalate RV* in 50 mL of *water R.*

1 mL of *0.1 M sodium hydroxide* is equivalent to 20.42 mg of $C_8H_5KO_4$.

Standardisation (for use in the assay of halide salts of organic bases). Dissolve 0.100 g of *benzoic acid RV* in a mixture of 5 mL of *0.01 M hydrochloric acid* and 50 mL of *ethanol (96 per cent) R.* Carry out the titration (*2.2.20*), using the sodium hydroxide solution. Note the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 12.21 mg of $C_7H_6O_2$.

0.1M Sodium Hydroxide, Ethanolic VS

To 250 mL of *anhydrous ethanol R* add 3.3 g of *strong sodium hydroxide solution R.*

Standardisation. Dissolve 0.100 g of *benzoic acid RV* in 10 mL of *water R* and 40 mL of *ethanol (96 per cent) R.* Titrate with the ethanolic sodium hydroxide solution, determining the end-point potentiometrically (*2.2.20*) or using 0.2 mL of *thymolphthalein solution R* as indicator. Standardise immediately before use.

1 mL of *0.1 M ethanolic sodium hydroxide* is equivalent to 12.21 mg of $C_7H_6O_2$.

0.1M Sodium Methoxide VS

Cool 175 mL of *anhydrous methanol R* in iced *water R* and add, in small portions, about 2.5 g of freshly cut *sodium R.* When the metal has dissolved, dilute to 1000.0 mL with *toluene R.*

Standardisation. To 10 mL of *dimethylformamide R* add 0.05 mL of a 3 g/L solution of *thymol blue R* in *methanol R,* and titrate with the sodium methoxide solution until a pure blue colour is obtained. Immediately add 0.100 g of *benzoic acid RV.* Stir until dissolution and titrate with the sodium methoxide solution until the pure blue colour is again obtained. Protect the solution from atmospheric carbon dioxide throughout the titration. From the volume of titrant used in the second titration ascertain the exact strength of the sodium methoxide solution. Standardise immediately before use.

1 mL of *0.1 M sodium methoxide* is equivalent to 12.21 mg of $C_7H_6O_2$.

0.1M Sodium Nitrite VS

Dissolve 7.5 g of *sodium nitrite R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. Dissolve 0.150 g of *sulfanilic acid RV* in 50 mL of *dilute hydrochloric acid R* and carry out the determination of primary aromatic amino-nitrogen (*2.5.8*), using the sodium nitrite solution and determining the end-point electrometrically. Standardise immediately before use.

1 mL of *0.1 M sodium nitrite* is equivalent to 17.32 mg of $C_6H_7NO_3S$.

0.1M Sodium Periodate VS

Dissolve 21.4 g of *sodium periodate R* in about 500 mL of *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. In a stoppered flask, introduce 5.0 mL of the sodium periodate solution and add 100 mL of *water R.* Add 10 mL of *potassium iodide solution R* and 5 mL of *hydrochloric acid R1,* close, shake and allow to stand for 2 min. Titrate with *0.1 M sodium thiosulfate* until the yellow colour almost disappears. Determine the end-point potentiometrically (*2.2.20*) or add 2 mL of *starch solution R* and titrate slowly until the colour is completely discharged.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 2.674 mg of $NaIO_4$ or 0.125 mL of *0.1 M sodium periodate.*

Sodium Tetraphenylborate VS $B(C_6H_5)_4Na = 342.2$

For a 0.01M solution Dissolve 3.5 g of *sodium tetraphenylborate* in 50 mL of *water,* shake for 20 minutes with 0.5 g of *aluminium hydroxide gel,* add 250 mL of *water* and 16.6 g of *sodium chloride* and allow to stand for 30 minutes. Filter, add 600 mL of *water,* adjust the pH to 8.0 to 9.0 with 0.1M *sodium hydroxide* and dilute to 1000 mL with *water.*

Ascertain its exact concentration in the following manner. Dissolve 7 mg of *potassium chloride,* previously dried at 150° for 1 hour, in 5 mL of *acetate buffer pH 3.7* and 5 mL of *water,* add 15 mL of the sodium tetraphenylborate solution, allow to stand for 5 minutes and filter through a dry, sintered-glass filter. To 20 mL of the filtrate add 0.5 mL of *bromophenol blue solution* and titrate the excess of sodium tetraphenylborate with 0.005M *cetylpyridinium chloride VS* to the blue colour of the indicator. Repeat the procedure without the potassium chloride. The molarity of the solution is given by the expression:

$$aw/[15(a - b)0.07455]$$

where a is the volume of 0.005M *cetylpyridinium chloride VS* required when the potassium chloride is omitted, b is the volume of 0.005M *cetylpyridinium chloride VS* required when the potassium chloride is present and w is the weight, in g, of potassium chloride taken.

0.1M Sodium Thiosulfate VS

Dissolve 25 g of *sodium thiosulfate R* and 0.2 g of *sodium carbonate R* in *carbon dioxide-free water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. To 10.0 mL of *0.033 M potassium bromate,* add 40 mL of *water R,* 10 mL of *potassium iodide solution R* and 5 mL of *hydrochloric acid R1.* Titrate with the sodium thiosulfate solution, using 1 mL of *starch solution R,* added towards the end of the titration, as indicator.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 2.783 mg of $KBrO_3$ or 0.5 mL of *0.033 M potassium bromate.*

0.5M Sulfuric Acid VS 0.5M Sulphuric Acid VS

Dissolve 28 mL of *sulfuric acid R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. Dissolve 0.950 g of *trometamol RV* in 50 mL of *water R.* Titrate with the sulfuric acid solution, determining the end-point potentiometrically (*2.2.20*) or using 0.1 mL of *methyl orange solution R* as indicator until the solution turns reddish-yellow.

1 mL of *0.5 M sulfuric acid* is equivalent to 121.1 mg of $C_4H_{11}NO_3$.

0.05M Sulfuric Acid VS 0.05M Sulphuric Acid VS

Dilute 100 mL of *0.5M Sulfuric Acid VS* to 1000 mL with water.

Use the exact concentration as ascertained for *0.5M Sulfuric Acid VS.*

0.1M Tetrabutylammonium Hydroxide VS

Dissolve 40 g of *tetrabutylammonium iodide R* in 90 mL of *anhydrous methanol R,* add 20 g of finely powdered *silver oxide R* and shake vigorously for 1 h. Centrifuge a few millilitres of the mixture and test the supernatant for iodides. If a positive reaction is obtained, add an additional 2 g of *silver oxide R* and shake for a further 30 min. Repeat this procedure until the liquid is free from iodides, filter the mixture through a fine sintered-glass filter (*2.1.2*) and rinse

the reaction vessel and filter with three quantities, each of 50 mL, of *toluene R*. Add the washings to the filtrate and dilute to 1000.0 mL with *toluene R*. Pass dry carbon dioxide-free nitrogen through the solution for 5 min.

Standardisation. To 10 mL of *dimethylformamide R* add 0.05 mL of a 3 g/L solution of *thymol blue R* in *methanol R* and titrate with the tetrabutylammonium hydroxide solution until a pure blue colour is obtained. Immediately add 0.100 g of *benzoic acid RV*. Stir to effect solution, and titrate with the tetrabutylammonium hydroxide solution until the pure blue colour is again obtained. Protect the solution from atmospheric carbon dioxide throughout the titration. From the volume of titrant used in the second titration ascertain the exact strength of the tetrabutylammonium hydroxide solution. Standardise immediately before use.

1 mL of *0.1 M tetrabutylammonium hydroxide* is equivalent to 12.21 mg of $C_7H_6O_2$.

0.1M Tetrabutylammonium Hydroxide in 2-propanol VS

Prepare as described for *0.1 M tetrabutylammonium hydroxide* using *2-propanol R* instead of *toluene R* and standardise as described.

Tetrabutylammonium Iodide VS $C_{16}H_{36}IN = 369.4$

For a 0.01M solution Dissolve 4 g of *tetrabutylammonium iodide* in sufficient *water* to produce 1000 mL.

Ascertain its exact concentration in the following manner. To 25 mL add 50 mL of 0.01M *silver nitrate VS* and 0.5 mL of 2M *nitric acid* and titrate the excess of silver nitrate with *0.01M ammonium thiocyanate VS* using *ammonium iron(III) sulfate solution R1* as indicator. Each mL of 0.01M *silver nitrate VS* is equivalent to 3.694 mg of $C_{16}H_{36}IN$.

Titanium(III) Chloride VS $TiCl_3 = 154.3$

For a 0.1M solution Dilute 100 mL of *titanium(III) chloride solution* with 200 mL of *hydrochloric acid* and add sufficient freshly boiled and cooled *water* to produce 1000 mL.

Ascertain its exact concentration immediately before use by titrating with it, in an atmosphere of carbon dioxide, 25 mL of 0.1M *ammonium iron(III) sulfate VS* acidified with *sulfuric acid*, using *ammonium thiocyanate solution*, added just before the end point, as indicator. Each mL of 0.1M *ammonium iron(III) sulfate VS* is equivalent to 15.43 mg of $TiCl_3$.

0.05M Zinc Chloride VS

Dissolve 6.82 g of *zinc chloride R*, weighed with appropriate precautions, in *water R*. If necessary, add dropwise *dilute hydrochloric acid R* until the opalescence disappears. Dilute to 1000.0 mL with *water R*.

Standardisation. To 20.0 mL of the zinc chloride solution add 5 mL of *dilute acetic acid R* and carry out the determination of zinc by complexometry (*2.5.11*).

0.1M Zinc Sulfate VS 0.1M Zinc Sulphate VS

Dissolve 29 g of *zinc sulfate R* in *water R* and dilute to 1000.0 mL with the same solvent.

Standardisation. To 20.0 mL of the zinc sulfate solution add 5 mL of *dilute acetic acid R* and carry out the determination of zinc by complexometry (*2.5.11*).

C. Standard Solutions

The following solutions are used as reference standards in limit tests and should, unless experience has shown it to be unnecessary, be prepared immediately before use.

In monographs of the European Pharmacopoeia, the symbol '%' may be replaced by the words 'per cent'. In such cases the reagent described below is to be used.

Acetaldehyde Standard Solution (100 ppm C_2H_4O)

Dissolve 1.0 g of *acetaldehyde R* in *2-propanol R* and dilute to 100.0 mL with the same solvent. Dilute 5.0 mL of the solution to 500.0 mL with *2-propanol R*. Prepare immediately before use.

Acetaldehyde Standard Solution (100 ppm C_2H_4O) R1

Dissolve 1.0 g of *acetaldehyde R* in *water R* and dilute to 100.0 mL with the same solvent. Dilute 5.0 mL of the solution to 500.0 mL with *water R*. Prepare immediately before use.

Aluminium Standard Solution (200 ppm Al)

Dissolve in *water R* a quantity of *aluminium potassium sulfate R* equivalent to 0.352 g of $AlK(SO_4)_2,12H_2O$. Add 10 mL of *dilute sulfuric acid R* and dilute to 100.0 mL with *water R*.

Aluminium Standard Solution (100 ppm Al)

Immediately before use, dilute with *water R* to 10 times its volume a solution containing 8.947 g of *aluminium chloride R* in 1000.0 mL of *water R*.

Aluminium Standard Solution (25 ppm Al)

Immediately before use, dilute with *water* to 40 times its volume a solution containing 8.947 g of *aluminium chloride* in 1000.0 mL of *water*.

Aluminium Standard Solution (10 ppm Al)

Immediately before use, dilute with *water R* to 100 times its volume in a solution containing *aluminium nitrate R* equivalent to 1.39 g of $Al(NO_3)_3,9H_2O$ in 100.0 mL.

Aluminium Standard Solution (5 ppm Al)

Immediately before use, dilute with *water R* to 100 times its volume in a solution containing *aluminium nitrate R* equivalent to 0.695 g of $Al(NO_3)_3,9H_2O$ in 100.0 mL. Alternatively, use a commercially available standard solution containing a known amount of aluminium (5 ppm Al).

Aluminium Standard Solution (2 ppm Al)

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *aluminium potassium sulfate R* equivalent to 0.352 g of $AlK(SO_4)_2,12H_2O$ and 10 mL of *dilute sulfuric acid R* in 100.0 mL.

Ammonium Standard Solution (100 ppm NH4)

Immediately before use, dilute to 25 mL with *water R* 10 mL of a solution containing *ammonium chloride R* equivalent to 0.741 g of NH_4Cl in 1000 mL.

Ammonium Standard Solution (3 ppm NH4)

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *ammonium chloride R* equivalent to 0.889 g of NH_4Cl in 1000.0 mL.

Ammonium Standard Solution (2.5 ppm NH4)

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *ammonium chloride R* equivalent to 0.741 g of NH_4Cl in 1000.0 mL.

Ammonium Standard Solution (1 ppm NH4)

Immediately before use, dilute *ammonium standard solution (2.5 ppm NH_4) R* to 2.5 times its volume with *water R*.

Antimony Standard Solution (100 ppm Sb)

Dissolve *antimony potassium tartrate R* equivalent to 0.274 g of $C_8H_4K_2O_{12}Sb_2,3H_2O$ in 500 mL of *1 M hydrochloric acid* and dilute the clear solution to 1000 mL with *water R*.

Antimony Standard Solution (1 ppm Sb)

Dissolve *antimony potassium tartrate R* equivalent to 0.274 g of $C_8H_4K_2O_{12}Sb_2,3H_2O$ in 20 mL of *hydrochloric acid R1* and dilute the clear solution to 100.0 mL with *water R*. To 10.0 mL of this solution add 200 mL of *hydrochloric acid R1* and dilute to 1000.0 mL with *water R*. To 100.0 mL of this solution add 300 mL of *hydrochloric acid R1* and dilute to 1000.0 mL with *water R*. Prepare the dilute solutions immediately before use.

Arsenic Standard Solution (10 ppm As)

Immediately before use, dilute with *water R* to 100 times its volume a solution prepared by dissolving *arsenious trioxide R* equivalent to 0.330 g of As_2O_3 in 5 mL of *dilute sodium hydroxide solution R* and diluting to 250.0 mL with *water R*.

Arsenic Standard Solution (1 ppm As)

Immediately before use, dilute *arsenic standard solution (10 ppm As) R* to 10 times its volume with *water R*.

Arsenic Standard Solution (0.1 ppm As)

Immediately before use, dilute *arsenic standard solution (1 ppm As) R* to 10 times its volume with *water R*.

Barium Standard Solution (0.1% Ba)

Dissolve *barium chloride R* equivalent to 0.178 g of $BaCl_2,2H_2O$ in *distilled water R* and dilute to 100.0 mL with the same solvent.

Barium Standard Solution (50 ppm Ba)

Immediately before use, dilute with *distilled water R* to 20 times its volume a solution in *distilled water R* containing *barium chloride R* equivalent to 0.178 g of $BaCl_2,2H_2O$ in 100.0 mL.

Barium Standard Solution (2 ppm Ba)

Immediately before use, dilute *barium standard solution (50 ppm Ba) R* to 25 times its volume with *distilled water R*.

Bismuth Standard Solution (100 ppm Bi)

Dissolve *bismuth subnitrate R* equivalent to 0.500 g of Bi in 50 mL of *nitric acid R* and dilute to 500.0 mL with *water R*. Dilute the solution to 10 times its volume with *dilute nitric acid R* immediately before use.

Cadmium Standard Solution (0.1% Cd)

Dissolve *cadmium R* equivalent to 0.100 g of Cd in the smallest necessary amount of a mixture of equal volumes of *hydrochloric acid R* and *water R* and dilute to 100.0 mL with a 1 per cent *V/V* solution of *hydrochloric acid R*.

Cadmium Standard Solution (10 ppm Cd)

Immediately before use, dilute *cadmium standard solution (0.1 per cent Cd) R* to 100 times its volume with a 1 per cent *V/V* solution of *hydrochloric acid R*.

Calcium Standard Solution (1000 ppm Ca)

Dissolve 2.5 g of *calcium carbonate* in 23 mL of 1M *hydrochloric acid* and add sufficient *distilled water* to produce 100 mL. Dilute 1 volume of this solution to 10 volumes with *distilled water* immediately before use.

Calcium Standard Solution (400 ppm Ca)

Immediately before use, dilute with *distilled water R* to 10 times its volume a solution in *distilled water R* containing *calcium carbonate R* equivalent to 1.000 g of $CaCO_3$ and 23 mL of *1 M hydrochloric acid* in 100.0 mL.

Calcium Standard Solution (100 ppm Ca)

Immediately before use, dilute with *distilled water R* to 10 times its volume a solution in *distilled water R* containing *calcium carbonate R* equivalent to 0.624 g of $CaCO_3$ and 3 mL of *acetic acid R* in 250.0 mL.

Calcium Standard Solution (100 ppm Ca), Alcoholic

Immediately before use, dilute with *ethanol (96 per cent) R* to 10 times its volume a solution in *distilled water R* containing *calcium carbonate R* equivalent to 2.50 g of $CaCO_3$ and 12 mL of *acetic acid R* in 1000.0 mL.

Calcium Standard Solution (100 ppm Ca) R1

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *anhydrous calcium chloride R* equivalent to 2.769 g of $CaCl_2$ in 1000.0 mL of *dilute hydrochloric acid R*.

Calcium Standard Solution (10 ppm Ca)

Immediately before use, dilute with *distilled water R* to 100 times its volume a solution in *distilled water R* containing *calcium carbonate R* equivalent to 0.624 g of $CaCO_3$ and 3 mL of *acetic acid R* in 250.0 mL.

Chloride Standard Solution (50 ppm Cl)

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *sodium chloride R* equivalent to 0.824 g of NaCl in 1000.0 mL.

Chloride Standard Solution (8 ppm Cl)

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *sodium chloride R* equivalent to 1.32 g of NaCl in 1000.0 mL.

Chloride Standard Solution (5 ppm Cl)

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *sodium chloride R* equivalent to 0.824 g of NaCl in 1000.0 mL.

Chromium Liposoluble Standard Solution (1000 ppm Cr)

A chromium (metal) organic compound in an oil.

Chromium Standard Solution (0.1% Cr)

Dissolve *potassium dichromate R* equivalent to 2.83 g of $K_2Cr_2O_7$ in *water R* and dilute to 1000.0 mL with the same solvent.

Chromium Standard Solution (100 ppm Cr)

Dissolve *potassium dichromate R* equivalent to 0.283 g of $K_2Cr_2O_7$ in *water R* and dilute to 1000.0 mL with the same solvent.

Chromium Standard Solution (0.1 ppm Cr)

Immediately before use, dilute *chromium standard solution (100 ppm Cr) R* to 1000 times its volume with *water R*.

Cobalt Standard Solution (100 ppm Co)

Dissolve *cobalt nitrate R* equivalent to 0.494 g of $Co(NO_3)_2,6H_2O$ in 500 mL of *1 M nitric acid* and dilute the clear solution to 1000 mL with *water R*.

Copper Liposoluble Standard Solution (1000 ppm Cu)

A copper (metal) organic compound in an oil.

Copper Standard Solution (0.1% Cu)

Dissolve *copper sulfate pentahydrate R* equivalent to 0.393 g of $CuSO_4,5H_2O$ in *water R* and dilute to 100.0 mL with the same solvent.

Copper Standard Solution (10 ppm Cu)

Immediately before use, dilute *copper standard solution (0.1 per cent Cu) R* to 100 times its volume with *water R*.

Copper Standard Solution (0.1 ppm Cu)

Immediately before use, dilute *copper standard solution (10 ppm Cu) R* to 100 times its volume with *water R*.

Copper Standard Solution (0.1 per cent Cu) for ICP

A copper standard solution (1000 mg/L) suitable for inductively coupled plasma (ICP) applications and traceable to national or international standards.

Elementary Standard Solutions for Atomic Spectrometry, 1.000 g/L

This solution is prepared, generally in acid conditions, from the element or a salt of the element whose minimum content is not less than 99.0 per cent. The quantity per litre of solution is greater than 0.995 g throughout the guaranteed period, as long as the vial has not been opened. The starting material (element or salt) and the characteristics of the final solvent (nature and acidity, etc.) are mentioned on the label.

Ferricyanide Standard Solution (50 ppm $Fe(CN)_6$)

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *potassium ferricyanide R* equivalent to 0.78 g of $K_3Fe(CN)_6$ in 100.0 mL.

Ferrocyanide Standard Solution (100 ppm $Fe(CN)_6$)

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *potassium ferrocyanide R* equivalent to 0.20 g of $K_4Fe(CN)_6,3H_2O$ in 100.0 mL.

Fluoride Standard Solution (10 ppm F)

Dissolve in *water R sodium fluoride R* previously dried at 300 °C for 12 h, equivalent to 0.442 g of NaF, and dilute to 1000.0 mL with the same solvent (1 mL = 0.2 mg F). Store in a polyethylene container. Immediately before use, dilute the solution to 20 times its volume with *water R*.

Fluoride Standard Solution (1 ppm F)

Immediately before use, dilute *fluoride standard solution (10 ppm F) R* to 10 times its volume with *water R*.

Formaldehyde Standard Solution (5 ppm CH_2O)

Immediately before use, dilute with *water R* to 200 times its volume a solution containing 1.0 g of CH_2O per litre prepared from *formaldehyde solution R*.

Germanium Standard Solution (100 ppm Ge)

Dissolve *ammonium hexafluorogermanate(IV) R* equivalent to 0.307 g of $(NH_4)_2GeF_6$ in a 0.01 per cent *V/V* solution of *hydrofluoric acid R*. Dilute the clear solution to 1000 mL with *water R*.

Glucose Standard Solution

Dissolve 0.10 g of *glucose* in a saturated solution of *benzoic acid* in *water*, dilute to 100 mL with the saturated benzoic acid solution and dilute 2 mL of this solution to 100 mL with *water*.

Glucose Standard Solution contains 20 µg of glucose per mL.

Glyoxal Standard Solution (20 ppm $C_2H_2O_2$)

In a 100 mL graduated flask weigh a quantity of *glyoxal solution R* corresponding to 0.200 g of $C_2H_2O_2$ and make up to volume with *anhydrous ethanol R*. Immediately before use dilute the solution to 100 times its volume with the same solvent.

Glyoxal Standard Solution (2 ppm $C_2H_2O_2$)

Immediately before use, dilute *glyoxal standard solution (20 ppm $C_2H_2O_2$) R* to 10 times its volume with *anhydrous ethanol R*.

Hydrogen Peroxide Standard Solution (2 ppm H_2O_2)

Dilute 10.0 mL of *dilute hydrogen peroxide solution R* to 300.0 mL with *water R*. Dilute 2.0 mL of this solution to 1000.0 mL with *water R*. Prepare immediately before use.

Iodide Standard Solution (20 ppm I)

Dilute 10.0 mL of a 0.026% w/v solution of *potassium iodide* to 100.0 mL with *water*.

Iodide Standard Solution (10 ppm I)

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *potassium iodide R* equivalent to 0.131 g of KI in 100.0 mL.

Iron Standard Solution (0.1% Fe)

Dissolve 0.100 g of Fe in the smallest amount necessary of a mixture of equal volumes of *hydrochloric acid R* and *water R* and dilute to 100.0 mL with *water R*.

Iron Standard Solution (250 ppm Fe)

Immediately before use, dilute with *water R* to 40 times its volume a solution containing 4.840 g of *ferric chloride R* in a 150 g/L solution of *hydrochloric acid R* diluted to 100.0 mL.

Iron Standard Solution (20 ppm Fe)

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *ferric ammonium sulfate R* equivalent to 0.863 g of $FeNH_4(SO_4)_2,12H_2O$ and 25 mL of *dilute sulfuric acid R* in 500.0 mL.

Iron Standard Solution (10 ppm Fe)

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *ferrous ammonium sulfate R* equivalent to 7.022 g of $Fe(NH_4)_2(SO_4)_2,6H_2O$ and 25 mL of *dilute sulfuric acid R* in 1000.0 mL.

Iron Standard Solution (8 ppm Fe)

Immediately before use, dilute with *water R* to 10 times its volume a solution containing 80 mg of *iron R* and 50 mL of *hydrochloric acid R* (220 g/L HCl) in 1000.0 mL.

Iron Standard Solution (2 ppm Fe)

Immediately before use, dilute *iron standard solution (20 ppm Fe) R* to 10 times its volume with *water R*.

Iron Standard Solution (1 ppm Fe)

Immediately before use, dilute *iron standard solution (20 ppm Fe) R* to 20 times its volume with *water R*.

Lead Liposoluble Standard Solution (1000 ppm Pb)

A lead (metal) organic compound in an oil.

Lead Standard Solution (0.1% Pb)

Dissolve *lead nitrate R* equivalent to 0.400 g of $Pb(NO_3)_2$ in *water R* and dilute to 250.0 mL with the same solvent.

Lead Standard Solution (100 ppm Pb)

Immediately before use, dilute *lead standard solution (0.1 per cent Pb) R* to 10 times its volume with *water R*.

Lead Standard Solution (20 ppm Pb)

Dissolve 0.80 g of *lead(II) nitrate* in *water* containing 2 mL of *nitric acid* and add sufficient *water* to produce 250 mL. Dilute 1 volume to 100 volumes with *water* immediately before use.

Lead Standard Solution (10 ppm Pb)

Immediately before use, dilute *lead standard solution (100 ppm Pb) R* to 10 times its volume with *water R*.

Lead Standard Solution (10 ppm Pb) R1

Immediately before use, dilute with *water R* to 10 times its volume a solution containing 0.160 g of *lead nitrate R* in 100 mL of *water R*, to which is added 1 mL of *lead-free nitric acid R* and dilute to 1000.0 mL.

Lead Standard Solution (2 ppm Pb)

Immediately before use, dilute *lead standard solution (10 ppm Pb) R* to 5 times its volume with *water R*.

Lead Standard Solution (1 ppm Pb)

Immediately before use, dilute *lead standard solution (10 ppm Pb) R* to 10 times its volume with *water R*.

Lead Standard Solution (0.25 ppm Pb)

Immediately before use, dilute *lead standard solution (1 ppm Pb) R* to 4 times its volume with *water R*.

Lead Standard Solution (0.1 ppm Pb)

Immediately before use, dilute *lead standard solution (1 ppm Pb) R* to 10 times its volume with *water R*.

Lithium Standard Solution (100 ppm Li)

Dissolve 0.6109 g of *lithium chloride* in sufficient *water* to produce 1000 mL.

Lutetium Standard Solution (20 ppm Lu)

Immediately before use, dissolve 0.445 g of *lutetium chloride hexahydrate R* in a mixture of equal volumes of *heavy metal-free nitric acid R* and *water R*, and dilute to 100.0 mL with the same mixture of solvents.

Dilute 1.0 mL of this solution to 100.0 mL with *water R*.

Magnesium Standard Solution (0.1% Mg)

Dissolve *magnesium sulfate R* equivalent to 1.010 g of $MgSO_4,7H_2O$ in *distilled water R* and dilute to 100.0 mL with the same solvent.

Magnesium Standard Solution (1000 ppm Mg)

Dissolve 5.275 g of *magnesium nitrate R* in 16 mL of *dilute nitric acid R* and dilute to 500.0 mL with *water R*.

Standardisation: carry out the determination of magnesium by complexometry (*2.5.11*).

Magnesium Standard Solution (100 ppm Mg)

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *magnesium sulfate R* equivalent to 1.010 g of $MgSO_4,7H_2O$ in 100.0 mL.

Magnesium Standard Solution (10 ppm Mg)

Immediately before use, dilute *magnesium standard solution (100 ppm Mg) R* to 10 times its volume with *water R*.

Magnesium Standard Solution (10 ppm Mg) R1

Immediately before use, dilute with *water R* to 100 times its volume a solution containing 8.365 g of *magnesium chloride R* in 1000.0 mL of *dilute hydrochloric acid R*.

Manganese Standard Solution (1000 ppm Mn)

Dissolve *manganese sulfate R* equivalent to 3.08 g of $MnSO_4$, H_2O in 500 mL of *1 M nitric acid* and dilute the solution to 1000 mL with *water R*.

Manganese Standard Solution (100 ppm Mn)

Dissolve *manganese sulfate R* equivalent to 0.308 g of $MnSO_4,H_2O$ in 500 mL of *1 M nitric acid* and dilute the clear solution to 1000 mL with *water R*.

Mercury Standard Solution (1000 ppm Hg)

Dissolve *mercuric chloride R* equivalent to 1.354 g of $HgCl_2$ in 50 mL of *dilute nitric acid R* and dilute to 1000.0 mL with *water R*.

Mercury Standard Solution (100 ppm Hg)

Dissolve 1.080 g of *yellow mercury(II) oxide* in the minimum volume of 2M *hydrochloric acid* and add sufficient *water* to produce 1000 mL.

Mercury Standard Solution (10 ppm Hg)

Immediately before use, dilute with water to 100 times its volume a solution containing *mercuric chloride R* equivalent to 0.338 g of $HgCl_2$ in 250.0 mL.

Mercury Standard Solution (5 ppm Hg)

Dilute 1.0 mL of a 0.0675% w/v solution of *mercury(II) chloride* to 100.0 mL with *water*.

Nickel Liposoluble Standard Solution (1000 ppm Ni)

A nickel (metal) organic compound in an oil.

Nickel Standard Solution (10 ppm Ni)

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *nickel sulfate R* equivalent to 4.78 g of $NiSO_4,7H_2O$ in 1000.0 mL.

Nickel Standard Solution (5 ppm Ni)

Immediately before use dilute *nickel standard solution (10 ppm Ni) R* to twice its volume with *water for chromatography R*.

Nickel Standard Solution (0.2 ppm Ni)

Immediately before use, dilute *nickel standard solution (10 ppm Ni) R* to 50 times its volume with *water R*.

Nickel Standard Solution (0.1 ppm Ni)

Immediately before use, dilute *nickel standard solution (10 ppm Ni) R* to 100 times its volume with *water R*.

Nitrate Standard Solution (100 ppm NO_3)

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *potassium nitrate R* equivalent to 0.815 g of KNO_3 in 500.0 mL.

Nitrate Standard Solution (10 ppm NO_3)

Immediately before use, dilute *nitrate standard solution (100 ppm NO_3) R* to 10 times its volume with *water R*.

Nitrate Standard Solution (2 ppm NO_3)

Immediately before use, dilute *nitrate standard solution (10 ppm NO_3) R* to 5 times its volume with *water R*.

Nitrite Standard Solution (20 ppm NO_2)

Dissolve 0.6 g of *sodium nitrite* in sufficient *water* to produce 100 mL and dilute 1 mL of this solution to 200 mL with *water*.

Palladium Standard Solution (500 ppm Pd)

Dissolve 50.0 mg of *palladium R* in 9 mL of *hydrochloric acid R* and dilute to 100.0 mL with *water R*.

Palladium Standard Solution (20 ppm Pd)

Dissolve 0.333 g of *palladium chloride R* in 2 mL of warm *hydrochloric acid R*. Dilute the solution to 1000.0 mL with a mixture of equal volumes of *dilute hydrochloric acid R* and *water R*. Immediately before use dilute to 10 times its volume with *water R*.

Palladium Standard Solution (0.5 ppm Pd)

Dilute 1 mL of *palladium standard solution (500 ppm Pd) R* to 1000 mL with a mixture of 0.3 volumes of *nitric acid R* and 99.7 volumes of *water R*.

Phosphate Standard Solution (200 ppm PO_4)

Dissolve *potassium dihydrogen phosphate R* equivalent to 0.286 g of KH_2PO_4 in *water R* and dilute to 1000.0 mL with the same solvent.

Phosphate Standard Solution (100 ppm PO_4)

Dilute 10.0 mL of a 0.143% w/v solution of *potassium dihydrogen orthophosphate* to 100.0 mL with *water* immediately before use.

Phosphate Standard Solution (5 ppm PO_4)

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *potassium dihydrogen phosphate R* equivalent to 0.716 g of KH_2PO_4 in 1000.0 mL.

Platinum Standard Solution (30 ppm Pt)

Immediately before use, dilute with *1 M hydrochloric acid* to 10 times its volume a solution containing 80 mg of *chloroplatinic acid R* in 100.0 mL of *1 M hydrochloric acid.*

Potassium Standard Solution (0.2 % K)

Dissolve *dipotassium sulfate R* equivalent to 0.446 g of K_2SO_4 in *distilled water R* and dilute to 100.0 mL with the same solvent.

Potassium Standard Solution (600 ppm K)

Immediately before use, dilute with *water R* to 20 times its volume a solution containing *dipotassium sulfate R* equivalent to 2.676 g of K_2SO_4 in 100.0 mL.

Potassium Standard Solution (100 ppm K)

Immediately before use, dilute with *water R* to 20 times its volume a solution containing *dipotassium sulfate R* equivalent to 0.446 g of K_2SO_4 in 100.0 mL.

Potassium Standard Solution (20 ppm K)

Immediately before use, dilute *potassium standard solution (100 ppm K) R* to 5 times its volume with *water R.*

Scandium Standard Solution (0.1 per cent Sc) for ICP

A scandium standard solution (1000 mg/L) suitable for inductively coupled plasma (ICP) applications and traceable to national or international standards.

Selenium Standard Solution (100 ppm Se)

Dissolve 0.100 g of *selenium R* in 2 mL of *nitric acid R.* Evaporate to dryness. Take up the residue in 2 mL of *water R* and evaporate to dryness; carry out three times. Dissolve the residue in 50 mL of *dilute hydrochloric acid R* and dilute to 1000.0 mL with the same acid.

Selenium Standard Solution (1 ppm Se)

Immediately before use, dilute with *water R* to 40 times its volume a solution containing *selenious acid R* equivalent to 6.54 mg of H_2SeO_3 in 100.0 mL.

Silver Standard Solution (5 ppm Ag)

Immediately before use, dilute with *water R* to 100 times its volume a solution containing *silver nitrate R* equivalent to 0.790 g of $AgNO_3$ in 1000.0 mL.

Sodium Standard Solution (1000 ppm Na)

Dissolve a quantity of *anhydrous sodium carbonate R* equivalent to 2.305 g of Na_2CO_3 in a mixture of 25 mL of *water R* and 25 mL of *nitric acid R* and dilute to 1000.0 mL with *water R.*

Sodium Standard Solution (200 ppm Na)

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *sodium chloride R* equivalent to 0.509 g of NaCl in 100.0 mL.

Sodium Standard Solution (50 ppm Na)

Dilute the *sodium standard solution (200 ppm Na) R* to four times its volume with *water R.*

Strontium Standard Solution (1.0 per cent Sr)

Cover with *water R, strontium carbonate R* equivalent to 1.6849 g of $SrCO_3$. Cautiously add *hydrochloric acid R* until all the solid has dissolved and there is no sign of further effervescence. Dilute to 100.0 mL with *water R.*

Sulfate Standard Solution (100 ppm SO_4)

Immediately before use, dilute with *distilled water R* to 10 times its volume a solution in *distilled water R* containing *dipotassium sulfate R* equivalent to 0.181 g of K_2SO_4 in 100.0 mL.

Sulfate Standard Solution (10 ppm SO_4)

Immediately before use, dilute with *distilled water R* to 100 times its volume a solution in *distilled water R* containing *dipotassium sulfate R* equivalent to 0.181 g of K_2SO_4 in 100.0 mL.

Sulfate Standard Solution (10 ppm SO_4) R1

Immediately before use, dilute with *ethanol (30 per cent V/V) R* to 100 times its volume a solution containing *dipotassium sulfate R* equivalent to 0.181 g of K_2SO_4 in 100.0 mL of *ethanol (30 per cent V/V) R.*

Sulfite Standard Solution (80 ppm SO_2)

Dissolve 3.150 g of *anhydrous sodium sulfite R* in freshly prepared *distilled water R* and dilute to 100.0 mL with the same solvent. Dilute 0.5 mL to 100.0 mL with freshly prepared *distilled water R.*

Sulfite Standard Solution (1.5 ppm SO_2)

Dissolve *sodium metabisulfite R* equivalent to 0.152 g of $Na_2S_2O_5$ in *water R* and dilute to 100.0 mL with the same solvent. Dilute 5.0 mL of this solution to 100.0 mL with *water R.* To 3.0 mL of the resulting solution, add 4.0 mL of *0.1 M sodium hydroxide* and dilute to 100.0 mL with *water R.*

Thallium Standard Solution (10 ppm Tl)

Dissolve *thallous sulfate R* equivalent to 0.1235 g of Tl_2SO_4 in a 9 g/L solution of *sodium chloride R* and dilute to 1000.0 mL with the same solution. Dilute 10.0 mL of the solution to 100.0 mL with the 9 g/L solution of *sodium chloride R.*

Tin Liposoluble Standard Solution (1000 ppm Sn)

A tin (metal) organic compound in an oil.

Tin Standard Solution (5 ppm Sn)

Dissolve *tin R* equivalent to 0.500 g of Sn in a mixture of 5 mL of *water R* and 25 mL of *hydrochloric acid R* and dilute to 1000.0 mL with *water R.* Dilute the solution to 100 times its volume with a 2.5 per cent *V/V* solution of *hydrochloric acid R* immediately before use.

Tin Standard Solution (0.1 ppm Sn)

Immediately before use, dilute *tin standard solution (5 ppm Sn) R* to 50 times its volume with *water R.*

Titanium Standard Solution (100 ppm Ti)

Dissolve 100.0 mg of *titanium R* in 100 mL of *hydrochloric acid R* diluted to 150 mL with *water R,* heating if necessary. Allow to cool and dilute to 1000 mL with *water R.*

Vanadium Standard Solution (1 g/L V)

Dissolve in *water R ammonium vanadate R* equivalent to 0.230 g of NH_4VO_3 and dilute to 100.0 mL with the same solvent.

Zinc Standard Solution (5 mg/mL Zn)

Dissolve 3.15 g of *zinc oxide R* in 15 mL of *hydrochloric acid R* and dilute to 500.0 mL with *water R.*

Zinc Standard Solution (100 ppm Zn)

Immediately before use, dilute with *water R* to 10 times its volume a solution containing *zinc sulfate R* equivalent to 0.440 g of $ZnSO_4,7H_2O$ and 1 mL of *acetic acid R* in 100.0 mL.

Zinc Standard Solution (25 ppm Zn)

Dilute 25.0 mL of *zinc standard solution (100 ppm Zn)* to 100.0 mL with *water* immediately before use.

Zinc Standard Solution (10 ppm Zn)

Immediately before use, dilute *zinc standard solution (100 ppm Zn) R* to 10 times its volume with *water R*.

Zinc Standard Solution (5 ppm Zn)

Immediately before use, dilute *zinc standard solution (100 ppm Zn) R* to 20 times its volume with *water R*.

Zirconium Standard Solution (1 g/L Zr)

Dissolve *zirconyl nitrate R* equivalent to 0.293 g of $ZrO(NO_3)_2,2H_2O$ in a mixture of 2 volumes of *hydrochloric acid R* and 8 volumes of *water R* and dilute to 100.0 mL with the same mixture of solvents.

D. Buffer Solutions

Buffer solutions should be prepared using *carbon dioxide-free water*.

Acetate Buffer pH 2.45

Mix 200 mL of 1M *hydrochloric acid* with 200 mL of 1M *sodium acetate* and dilute to 1000 mL with *water*. Immediately before use adjust the pH to 2.45 by the addition of 1M *hydrochloric acid* or 1M *sodium acetate*, as required.

Acetate Buffer pH 2.8

Dissolve 4 g of *anhydrous sodium acetate* in about 840 mL of *water*, add sufficient *glacial acetic acid* to adjust the pH to 2.8 (about 155 mL) and dilute to 1000 mL with *water*.

Acetate Buffer pH 3.4

Mix 5 volumes of 0.1M *sodium acetate* with 95 volumes of 0.1M *acetic acid*.

Acetate Buffer pH 3.5

Buffer solution pH 3.5

Dissolve 25 g of *ammonium acetate* in 25 mL of *water* and add 38 mL of 7M *hydrochloric acid*. Adjust the pH to 3.5 with either 2M *hydrochloric acid* or 6M *ammonia* and dilute to 100 mL with *water*.

Acetate Buffer pH 3.7

Dissolve 10 g of *anhydrous sodium acetate* in 300 mL of *water*, adjust to pH 3.7 with *glacial acetic acid* and dilute to 1000 mL with *water*. If necessary, readjust to pH 3.7 with *glacial acetic acid* or *anhydrous sodium acetate* as required, before use.

Acetate Buffer pH 4.4 Acetate buffer solution pH 4.4

Dissolve 136 g of *sodium acetate R* and 77 g of *ammonium acetate R* in *water R* and dilute to 1000.0 mL with the same solvent; add 250.0 mL of *glacial acetic acid R* and mix.

Acetate Buffer pH 4.6 Acetate buffer solution pH 4.6

Dissolve 5.4 g of *sodium acetate R* in 50 mL of *water R*, add 2.4 g of *glacial acetic acid R* and dilute to 100.0 mL with *water R*. Adjust the pH if necessary.

Acetate Buffer pH 5.0

Dissolve 13.6 g of *sodium acetate* and 6 mL of *glacial acetic acid* in sufficient *water* to produce 1000 mL.

Acetate Buffer pH 6.0 Acetate buffer solution pH 6.0

Dissolve 100 g of *ammonium acetate R* in 300 mL of *water R*, add 4.1 mL of *glacial acetic acid R*, adjust the pH if necessary using *ammonia R* or *acetic acid R* and dilute to 500.0 mL with *water R*.

Acetate Buffer Solution pH 4.5

Dissolve 77.1 g of *ammonium acetate R* in *water R*. Add 70 mL of *glacial acetic acid R* and dilute to 1000.0 mL with *water R*.

Acetate Buffer Solution pH 4.7

Dissolve 136.1 g of *sodium acetate R* in 500 mL of *water R*. Mix 250 mL of this solution with 250 mL of *dilute acetic acid R*. Shake twice with a freshly prepared, filtered, 0.1 g/L solution of *dithizone R* in *chloroform R*. Shake with *carbon tetrachloride R* until the extract is colourless. Filter the aqueous layer to remove traces of carbon tetrachloride.

Acetate Buffer Solution pH 4.7 R1

Dissolve 136.1 g of *sodium acetate R* in 500 mL of *water R*. Mix 250 mL of this solution with 250 mL of *dilute acetic acid R*.

Acetate–edetate Buffer Solution pH 5.5

Dissolve 250 g of *ammonium acetate R* and 15 g *sodium edetate R* in 400 mL of *water R* and add 125 mL of *glacial acetic acid R*.

Acetone Solution, Buffered

Dissolve 8.15 g of *sodium acetate R* and 42 g of *sodium chloride R* in *water R*, add 68 mL of *0.1 M hydrochloric acid* and 150 mL of *acetone R* and dilute to 500 mL with *water R*.

Ammonia Buffer pH 10.0 Ammonium chloride buffer solution pH 10.0

Dissolve 5.4 g of *ammonium chloride R* in 20 mL of *water R*, add 35.0 mL of *ammonia R* and dilute to 100.0 mL with *water R*.

Ammonia Buffer pH 10.9 Buffer solution pH 10.9

Dissolve 6.75 g of *ammonium chloride R* in *ammonia R* and dilute to 100.0 mL with the same solvent.

Ammonia Buffer pH 10.9, Dilute

Dilute 2 mL of *ammonia buffer pH 10.9* to 1000 mL with *water*.

Ammonium Acetate Buffer pH 4.5, 0.5M

Mix 14.3 mL of *glacial acetic acid R* and 470 mL of *water R* and adjust to pH 4.5 with *concentrated ammonia R*. Dilute to 500.0 mL with *water R*.

Ammonium Carbonate Buffer Solution pH 10.3, 0.1M

Dissolve 7.91 g of *ammonium carbonate R* in 800 mL of *water R*. Adjust the pH with *dilute sodium hydroxide solution R*. Dilute to 1000.0 mL with *water R*.

Ammonium Chloride Buffer Solution pH 9.5

Dissolve 33.5 g of *ammonium chloride R* in 150 mL of *water R*, add 42.0 mL of *concentrated ammonia R* and dilute to 250.0 mL with *water R*.

Storage: in a polyethylene container.

Ammonium Chloride Buffer Solution pH 10.4

Dissolve 70 g of *ammonium chloride R* in 200 mL of *water R*, add 330 mL of *concentrated ammonia R* and dilute to 1000.0 mL with *water R*. If necessary, adjust to pH 10.4 with *ammonia R*.

Ammonium Chloride Buffer Solution pH 10.7

Dissolve 67.5 g of *ammonium chloride R* in *water R*, add 570 mL of *concentrated ammonia R* and dilute to 1000.0 mL with *water R*.

Barbitone Buffer pH 7.4 Barbital buffer solution pH 7.4

Mix 50 mL of a solution in *water R* containing 19.44 g/L of *sodium acetate R* and 29.46 g/L of *barbital sodium R* with

50.5 mL of *0.1 M hydrochloric acid*, add 20 mL of an 85 g/L of *sodium chloride R* and dilute to 250 mL with *water R*.

Barbitone Buffer pH 8.4 Barbital buffer solution pH 8.4

Dissolve 8.25 g of *barbital sodium R* in *water R* and dilute to 1000.0 mL with the same solvent.

Barbitone Buffer pH 8.6 R1 Barbital buffer solution pH 8.6 R1

Dissolve in *water R* 1.38 g of *barbital R*, 8.76 g of *barbital sodium R* and 0.38 g of *calcium lactate pentahydrate R* and dilute to 1000.0 mL with the same solvent.

Borate Buffer pH 7.5 Borate buffer solution pH 7.5

Dissolve 2.5 g of *sodium chloride R*, 2.85 g of *disodium tetraborate R* and 10.5 g of *boric acid R* in *water R* and dilute to 1000.0 mL with the same solvent. Adjust the pH if necessary.

Storage: at 2 °C to 8 °C.

Borate Buffer pH 8.0

To 50 mL of a solution containing 0.6189 g of *boric acid* and 0.7456 g of *potassium chloride* add 3.97 mL of 0.2M *sodium hydroxide VS* and dilute to 200 mL with *water*.

At 20°, the solution may be used as a solution of standard pH.

Borate Buffer pH 8.4, 0.2M

Dissolve 2.0 g of *sodium hydroxide* and 12.1 g of *boric acid* in 250 mL of *water*, adjust to pH 8.4, if necessary, by adding a few granules of *boric acid*.

Borate Buffer pH 9.0

Buffer solution pH 9.0

Dissolve 6.18 g of *boric acid R* in 0.1 M *potassium chloride R* and dilute to 1000.0 mL with the same solvent.
Mix 1000.0 mL of this solution and 420.0 mL of 0.1 M *sodium hydroxide*.

Borate Buffer pH 9.6

To 50 mL of a solution containing 0.6189 g of *boric acid* and 0.7456 g of *potassium chloride* add 36.85 mL of 0.2M *sodium hydroxide VS* and dilute with *water* to 200 mL.

At 20°, the solution may be used as a solution of standard pH.

Borate Buffer Solution pH 8.0, 0.0015M

Dissolve 0.572 g of *disodium tetraborate R* and 2.94 g of *calcium chloride R* in 800 mL of *water R*. Adjust the pH with *1 M hydrochloric acid*. Dilute to 1000.0 mL with *water R*.

Borate Buffer Solution pH 10.0

Introduce 12.4 g of *boric acid R* into a 500.0 mL volumetric flask. Add 300 mL of *water R* to suspend the boric acid. Add 100 mL of a 56 g/L solution of *potassium hydroxide R* and mix to dissolve the boric acid. Adjust to pH 10.0 by slowly adding a 56 g/L solution of *potassium hydroxide R* (about 60 mL is usually needed). Mix. Dilute almost to volume with *water R*. If necessary, adjust the pH with *boric acid R* or with a 56 g/L solution of *potassium hydroxide R*. Dilute to 500.0 mL with *water R*.

Borate Buffer Solution pH 10.4

Dissolve 24.64 g of *boric acid R* in 900 mL of *distilled water R*. Adjust the pH using a 400 g/L solution of *sodium hydroxide R*. Dilute to 1000 mL with *distilled water R*.

Boric Buffer pH 9.0 Buffer solution pH 9.0 R1

Dissolve 6.20 g of *boric acid R* in 500 mL of *water R* and adjust the pH with *1 M sodium hydroxide* (about 41.5 mL). Dilute to 1000.0 mL with *water R*.

Buffer (Acetate) Solution pH 5.0

To 120 mL of a 6 g/L solution of *glacial acetic acid R* add 100 mL of *0.1 M potassium hydroxide* and about 250 mL of *water R*. Mix. Adjust the pH to 5.0 with a 6 g/L solution of *acetic acid R* or with *0.1 M potassium hydroxide* and dilute to 1000.0 mL with *water R*.

Buffer (HEPES) Solution pH 7.5

Dissolve 2.38 g of *HEPES R* in about 90 mL of *water R*. Adjust the pH to 7.5 with *sodium hydroxide solution R*. Dilute to 100 mL with *water R*.

Buffer Solution pH 2.2

Mix 6.7 mL of *phosphoric acid R* with 55.0 mL of a 40 g/L solution of *sodium hydroxide R* and dilute to 1000.0 mL with *water R*.

Buffer Solution pH 2.5

Dissolve 100 g of *potassium dihydrogen phosphate R* in 800 mL of *water R*; adjust to pH 2.5 with *hydrochloric acid R* and dilute to 1000.0 mL with *water R*.

Buffer Solution pH 2.5 R1

To 4.9 g of *dilute phosphoric acid R* add 250 mL of *water R*. Adjust the pH with *dilute sodium hydroxide solution R* and dilute to 500.0 mL with *water R*.

Buffer Solution pH 3.0

Dissolve 21.0 g of *citric acid monohydrate R* in 200 mL of *1 M sodium hydroxide* and dilute to 1000 mL with *water R*. Dilute 40.3 mL of this solution to 100.0 mL with *0.1 M hydrochloric acid*.

Buffer Solution pH 3.5

Dissolve 25.0 g of *ammonium acetate R* in 25 mL of *water R* and add 38.0 mL of *hydrochloric acid R1*. Adjust the pH if necessary with *dilute hydrochloric acid R* or *dilute ammonia R1*. Dilute to 100.0 mL with *water R*.

Buffer Solution pH 3.7

To 15.0 mL of *acetic acid R* add 60 mL of *ethanol (96 per cent) R* and 20 mL of *water R*. Adjust to pH 3.7 by the addition of *ammonia R*. Dilute to 100.0 mL with *water R*.

Buffer Solution pH 5.2

Dissolve 1.02 g of *potassium hydrogen phthalate R* in 30.0 mL of *0.1 M sodium hydroxide*. Dilute to 100.0 mL with *water R*.

Buffer Solution pH 5.5

Dissolve 54.4 g of *sodium acetate R* in 50 mL of *water R*, heating to 35 °C if necessary. After cooling, slowly add 10 mL of *anhydrous acetic acid R*. Shake and dilute to 100.0 mL with *water R*.

Buffer Solution pH 6.5

Dissolve 60.5 g of *disodium hydrogen phosphate dodecahydrate R* and 46 g of *potassium dihydrogen phosphate R* in *water R*. Add 100 mL of *0.02 M sodium edetate* and 20 mg of *mercuric chloride R* and dilute to 1000.0 mL with *water R*.

Buffer Solution pH 6.6

To 250.0 mL of *0.2 M potassium dihydrogen phosphate R* add 89.0 mL of *0.2 M sodium hydroxide*. Dilute to 1000.0 mL with *water R*.

Buffer Solution pH 7.0

To 1000 mL of a solution containing 18 g/L of *disodium hydrogen phosphate dodecahydrate R* and 23 g/L of *sodium chloride R* add sufficient (about 280 mL) of a solution containing 7.8 g/L of *sodium dihydrogen phosphate R* and 23 g/L of *sodium chloride R* to adjust the pH. Dissolve in the solution sufficient *sodium azide R* to give a 0.2 g/L solution.

Buffer Solution pH 7.2

To 250.0 mL of *0.2 M potassium dihydrogen phosphate R* add 175.0 mL of *0.2 M sodium hydroxide*. Dilute to 1000.0 mL with *water R*. Adjust the pH if necessary.

Buffer Solution pH 7.4

Dissolve 0.6 g of *potassium dihydrogen phosphate R*, 6.4 g of *disodium hydrogen phosphate dodecahydrate R* and 5.85 g of *sodium chloride R* in *water R*, and dilute to 1000.0 mL with the same solvent. Adjust the pH if necessary.

Buffer Solution pH 8.0

To 50.0 mL of *0.2 M potassium dihydrogen phosphate R* add 46.8 mL of *0.2 M sodium hydroxide*. Dilute to 200.0 mL with *water R*.

Buffer Solution pH 8.0 R1

Dissolve 20 g of *dipotassium hydrogen phosphate R* in 900 mL of *water R*. Adjust the pH with *phosphoric acid R*. Dilute to 1000 mL with *water R*.

Buffer Solution pH 9.0

Dissolve 6.18 g of *boric acid R* in *0.1 M potassium chloride R* and dilute to 1000.0 mL with the same solvent.
Mix 1000.0 mL of this solution and 420.0 mL of *0.1 M sodium hydroxide*.

Buffer Solution pH 11

Dissolve 6.21 g of *boric acid R*, 4.00 g of *sodium hydroxide R* and 3.70 g of *potassium chloride R* in 500 mL of *water R* and dilute to 1000 mL with the same solvent.

Buffered Salt Solution pH 7.2

Dissolve in *water R* 8.0 g of *sodium chloride R*, 0.2 g of *potassium chloride R*, 0.1 g of *anhydrous calcium chloride R*, 0.1 g of *magnesium chloride R*, 3.18 g of *disodium hydrogen phosphate dodecahydrate R* and 0.2 g of *potassium dihydrogen phosphate R* and dilute to 1000.0 mL with *water R*.

Carbonate Buffer pH 9.7

Dissolve 8.4 g of *sodium hydrogen carbonate* and 10.6 g of *sodium carbonate* in sufficient *water* to produce 500 mL.

Chloride Buffer pH 2.0, 0.1M Buffer solution pH 2.0

Dissolve 6.57 g of *potassium chloride R* in *water R* and add 119.0 mL of *0.1 M hydrochloric acid*. Dilute to 1000.0 mL with *water R*.

Citrate Buffer Solution pH 5.0

Prepare a solution containing 20.1 g/L of *citric acid monohydrate R* and 8.0 g/L of *sodium hydroxide R*. Adjust the pH with *dilute hydrochloric acid R*.

Citrate Buffer Solution pH 3.0, 0.25M

Dissolve 5.3 g of *citric acid monohydrate R* in 80 mL of *water R*. Adjust the pH with *1 M sodium hydroxide* and dilute to 100.0 mL with *water R*.

Citro-phosphate Buffer pH 4.5

To 30 volumes of 0.2M *disodium hydrogen orthophosphate* add sufficient 0.1M *citric acid* to give a pH of 4.5 (about 36 volumes).

Citro-phosphate Buffer pH 5.0

Mix 48.5 mL of 0.1M *citric acid* with sufficient 0.2M *disodium hydrogen orthophosphate* to produce 100 mL.

Citro-phosphate Buffer pH 6.0 Phosphate buffer solution pH 6.0

Mix 63.2 mL of a 71.5 g/L solution of *disodium hydrogen phosphate dodecahydrate R* and 36.8 mL of a 21 g/L solution of *citric acid monohydrate R*.

Citro-phosphate Buffer pH 6.5

Mix 29.0 mL of 0.1M *citric acid* with sufficient 0.2M *disodium hydrogen orthophosphate* to produce 100 mL.

Citro-phosphate Buffer pH 6.8 Phosphate buffer solution pH 6.8

Mix 77.3 mL of a 71.5 g/L solution of *disodium hydrogen phosphate dodecahydrate R* with 22.7 mL of a 21 g/L solution of *citric acid monohydrate R*.

Citro-phosphate Buffer pH 7.0 Phosphate buffer solution pH 7.0

Mix 82.4 mL of a 71.5 g/L solution of *disodium hydrogen phosphate dodecahydrate R* with 17.6 mL of a 21 g/L solution of *citric acid monohydrate R*.

Citro-phosphate Buffer pH 7.2 Phosphate buffer solution pH 7.2

Mix 87.0 mL of a 71.5 g/L solution of *disodium hydrogen phosphate dodecahydrate R* with 13.0 mL of a 21 g/L solution of *citric acid monohydrate R*.

Citro-phosphate Buffer pH 7.6

Dissolve 67.1 g of *disodium hydrogen orthophosphate* and 1.33 g of *citric acid* in sufficient *water* to produce 1000 mL.

Copper Sulfate Solution pH 2.0

Copper Sulphate Solution pH 2.0.

Mix together 53 mL of 0.2M *hydrochloric acid*, 250 mL of 0.2M *potassium chloride* and 40 mL of a 0.393% w/v solution of *copper(II) sulfate* and dilute with *water* to 1000 mL.

Copper Sulfate Solution pH 4.0, Buffered

Dissolve 0.25 g of *copper sulfate pentahydrate R* and 4.5 g of *ammonium acetate R* in *dilute acetic acid R* and dilute to 100.0 mL with the same solvent.

Copper Sulfate Solution pH 5.2, Buffered

Copper Sulphate Solution pH 5.2, Buffered

Dissolve 15.22 g of *anhydrous disodium hydrogen orthophosphate* in sufficient *water* to produce 536 mL and add a 2.1% w/v solution of *citric acid* until the pH of the solution is between 5.15 and 5.25 (about 464 mL). Mix 985 mL of the resulting solution with 15 mL of a 0.393% w/v solution of *copper(II) sulfate*.

Deuterated Sodium Phosphate Buffer Solution pH 5.0, 0.2M

Dissolve 2.76 g of *sodium dihydrogen phosphate monohydrate R* in 90 mL of *deuterium oxide R*, adjust the pH with a deuterated solution of *phosphoric acid R* or a deuterated 1 M solution of *sodium hydroxide R*, dilute to 100 mL with *deuterium oxide R* and mix.

Diethanolamine Buffer Solution pH 10.0

Dissolve 96.4 g of *diethanolamine R* in *water R* and dilute to 400 mL with the same solvent. Add 0.5 mL of an 186 g/L solution of *magnesium chloride R* and adjust the pH with *1 M hydrochloric acid*. Dilute to 500.0 mL with *water R*.

Diethylammonium Phosphate Buffer Solution pH 6.0

Dilute 68 mL of *phosphoric acid R* to 500 mL with *water R*. To 25 mL of this solution add 450 mL of *water R* and 6 mL of *diethylamine R*, adjust to pH 6 ± 0.05, if necessary, using *diethylamine R* or *phosphoric acid R* and dilute to 500.0 mL with *water R*.

Glycine Buffer pH 2.9

Dissolve 6.0 g of *glycine* and 4.68 g of *sodium chloride* in 10 litres of *water*. Adjust the pH with 1M *hydrochloric acid* (about 30 mL).

Glycine Buffer pH 11.3

Mix a solution containing 0.75% w/v of *glycine* and 0.58% w/v of *sodium chloride* with an equal volume of 0.1M *sodium hydroxide* and adjust the pH if necessary.

Glycine Buffer Solution

Mix 42 g of *sodium hydrogen carbonate* and 50 g of *potassium hydrogen carbonate* with 180 mL of *water* and add a solution containing 37.5 g of *glycine* and 15 mL of 13.5M *ammonia* in 180 mL of *water*. Dilute to 500 mL with *water* and stir until solution is complete.

Guanidine-tris(hydroxymethyl)aminomethane Buffer Solution pH 8.3

Dissolve 1.21 g of *tris(hydroxymethyl)aminomethane R* in 87.5 mL of a 764 g/L solution of *guanidine hydrochloride R*. Adjust to pH 8.3 with *hydrochloric acid R* and dilute to 100 mL with *water R*.

Guanidine-tris(hydroxymethyl)aminomethane-EDTA Buffer Solution pH 8.5

Dissolve 1.0 g of *sodium edetate R*, 12.1 g of *tris(hydroxymethyl)aminomethane R* and 57.0 g of *guanidine hydrochloride R* in 35 mL of *water R*. Adjust to pH 8.5 with *hydrochloric acid R* and dilute to 100 mL with *water R*.

Guanidine-tris(hydroxymethyl)aminomethane-EDTA Buffer Solution pH 8.6

Dissolve 0.018 g of *sodium edetate R*, 2.2 g of *tris(hydroxymethyl)aminomethane R* and 28.7 g of *guanidine hydrochloride R* in 20 mL of *water R*. Adjust to pH 8.6 with *acetic acid R* and dilute to 50 mL with *water R*.

Imidazole Buffer Solution pH 6.5

Dissolve 6.81 g of *imidazole R*, 1.23 g of *magnesium sulfate R* and 0.73 g of *calcium sulfate R* in 752 mL of *0.1 M hydrochloric acid*. Adjust the pH if necessary and dilute to 1000.0 mL with *water R*.

Imidazole Buffer Solution pH 7.3

Dissolve 3.4 g of *imidazole R* and 5.8 g of *sodium chloride R* in *water R*, add 18.6 mL of *1 M hydrochloric acid* and dilute to 1000.0 mL with *water R*. Adjust the pH if necessary.

1M Morpholinoethanesulfonate Buffer Solution pH 6.0

Dissolve 48.8 g of *2-[N-morpholino]ethanesulfonic acid R* in 160 mL of *water R* and add 25 mL of *2 M sodium hydroxide R*. Adjust to pH 6.0 with *2 M sodium hydroxide R*. Dilute to almost 250 mL with *water R*. Adjust the pH, if necessary, with *2 M sodium hydroxide R* and dilute to 250.0 mL with *water R*.

Octylamine Phosphate Buffer pH 3.0

Dilute 3.32 mL of *octylamine* to 1000 mL, adjust the pH to 3.0 using *orthophosphoric acid* and filter through a membrane filter with a nominal pore size not greater than 0.5 µm.

Phosphate Buffers

Solutions from pH 5.8 to pH 8.0 may be prepared by mixing 50 mL of 0.2M *potassium dihydrogen orthophosphate* with the quantities of 0.2M *sodium hydroxide VS* specified in the following table and diluting to 200 mL with *water*.

At 20° the solutions may be used as solutions of standard pH.

pH	5.8	6.0	6.2	6.4	6.6	6.8
ml of 0.2M *sodium hydroxide VS*	3.72	5.70	8.60	12.60	17.80	23.65
pH	7.0	7.2	7.4	7.6	7.8	8.0
ml of 0.2M *sodium hydroxide VS*	29.63	35.00	39.50	42.80	45.20	46.80

Phosphate Buffer pH 3.0

Dissolve 34 g of *potassium dihydrogen orthophosphate* in 250 mL of *water* and adjust the pH of the solution to 3.0 with *orthophosphoric acid*.

Phosphate Buffer pH 3.5 Phosphate buffer solution pH 3.5

Dissolve 68.0 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 mL with the same solvent. Adjust the pH with *phosphoric acid R*.

Phosphate Buffer pH 4.0

Dissolve 6.8 g of *potassium dihydrogen orthophosphate* in 700 mL of *water*, adjust the pH, if necessary, with a 10% v/v solution of *orthophosphoric acid* and add sufficient *water* to produce 1000 mL.

Phosphate Buffer pH 4.0, Mixed

Dissolve 5.04 g of *disodium hydrogen orthophosphate* and 3.01 g of *potassium dihydrogen orthophosphate* in sufficient *water* to produce 1000 mL and adjust the pH with *glacial acetic acid*.

Phosphate Buffer pH 4.75

Dilute 100 mL of 0.5M *potassium dihydrogen orthophosphate* to 800 mL with *water*, adjust to pH 4.75 with 0.1M *sodium hydroxide* and dilute to 1000 mL with *water*.

Phosphate Buffer pH 4.9

Dissolve 40 g of *sodium dihydrogen orthophosphate* and 1.2 g of *sodium hydroxide* in sufficient *water* to produce 100 mL. If necessary, adjust the pH with 1M *sulfuric acid* or 1M *sodium hydroxide* as required.

Phosphate Buffer pH 5.4, Mixed

Dissolve 1.76 g of *disodium hydrogen orthophosphate* and 13.61 g of *potassium dihydrogen orthophosphate* in sufficient *water* to produce 1000 mL. Adjust the pH with 0.05M *orthophosphoric acid*, if necessary.

Phosphate Buffer pH 6.8, Mixed

Dissolve 28.80 g of *disodium hydrogen orthophosphate* and 11.45 g of *potassium dihydrogen orthophosphate* in sufficient *water* to produce 1000 mL.

Phosphate Buffer pH 6.8, 0.2M Mixed Phosphate buffer solution pH 6.8 R1

To 51.0 mL of a 27.2 g/L solution of *potassium dihydrogen phosphate R* add 49.0 mL of a 71.6 g/L solution of *disodium hydrogen phosphate dodecahydrate R*. Adjust the pH if necessary.

Storage: at 2 °C to 8 °C.

Phosphate Buffer pH 7.0, Mixed

Dissolve 0.50 g of *anhydrous disodium hydrogen orthophosphate* and 0.301 g of *potassium dihydrogen orthophosphate* in sufficient *water* to produce 1000 mL.

Phosphate Buffer pH 7.0, 0.067M Mixed 0.067M Phosphate buffer solution pH 7.0

Dissolve 0.908 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 100.0 mL with the same solvent (solution A). Dissolve 2.38 g of *disodium hydrogen phosphate dodecahydrate R* in *water R* and dilute to 100.0 mL with the same solvent (solution B). Mix 38.9 mL of solution A and 61.1 mL of solution B. Adjust the pH if necessary.

Phosphate Buffer pH 7.0, 0.1M Mixed 0.1M Phosphate buffer solution pH 7.0

Dissolve 1.361 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 100.0 mL with the same solvent. Adjust the pH using a 35 g/L solution of *disodium hydrogen phosphate dodecahydrate R*.

Phosphate Buffer pH 7.5, 0.2M

Dissolve 27.22 g of *potassium dihydrogen phosphate R* in 930 mL of *water R*, adjust to pH 7.5 with a 300 g/L solution of *potassium hydroxide R* and dilute to 1000.0 mL with *water R*.

Phosphate Buffer pH 10, Mixed

To 100 mL of 0.2M *disodium hydrogen orthophosphate* add 6.0 mL of 0.25M *trisodium orthophosphate*.

Phosphate Buffer, 0.025M Standard

Dissolve 3.40 g of *potassium dihydrogen orthophosphate* and 3.55 g of *anhydrous disodium hydrogen orthophosphate*, both previously dried at 110° to 130° for 2 hours, in sufficient *water* to produce 1000 mL.

Phosphate Buffer Solution pH 2.0

Dissolve 8.95 g of *disodium hydrogen phosphate dodecahydrate R* and 3.40 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 mL with the same solvent. If necessary adjust the pH with *phosphoric acid R*.

0.125M Phosphate Buffer Solution pH 2.0

Dissolve 17.0 g of *potassium dihydrogen phosphate R* and 17.8 g of *anhydrous disodium hydrogen phosphate R* in *water R* and dilute to 1.0 L with the same solvent. If necessary adjust the pH with *phosphoric acid R*.

Phosphate Buffer Solution pH 2.5, 0.2M

Dissolve 27.2 g of *potassium dihydrogen phosphate R* in about 900 mL of *water R*, adjust to pH 2.5 with *phosphoric acid R* and dilute to 1.0 L with *water R*.

Phosphate Buffer Solution pH 2.8

Dissolve 7.8 g of *sodium dihydrogen phosphate R* in 900 mL of *water R*, adjust to pH 2.8 with *phosphoric acid R* and dilute to 1000 mL with the same solvent.

Phosphate Buffer Solution pH 3.0

Mix 0.7 mL of *phosphoric acid R* with 100 mL of *water R*. Dilute to 900 mL with the same solvent. Adjust to pH 3.0 with *strong sodium hydroxide solution R* and dilute to 1000 mL with *water R*.

Phosphate Buffer Solution pH 3.0, 0.1M

Dissolve 12.0 g of *anhydrous sodium dihydrogen phosphate R* in *water R*, adjust the pH with *dilute phosphoric acid R1* and dilute to 1000 mL with *water R*.

Phosphate Buffer Solution pH 3.0 R1

Dissolve 3.40 g of *potassium dihydrogen phosphate R* in 900 mL of *water R*. Adjust to pH 3.0 with *phosphoric acid R* and dilute to 1000.0 mL with *water R*.

Phosphate Buffer Solution pH 3.2

To 900 mL of a 4 g/L solution of *sodium dihydrogen phosphate R*, add 100 mL of a 2.5 g/L solution of *phosphoric acid R*. Adjust the pH if necessary.

Phosphate Buffer Solution pH 3.2 R1

Adjust a 35.8 g/L solution of *disodium hydrogen phosphate dodecahydrate R* to pH 3.2 with *dilute phosphoric acid R*. Dilute 100.0 mL of the solution to 2000.0 mL with *water R*.

Phosphate Buffer Solution pH 3.25

Dissolve about 1.36 g of *potassium dihydrogen phosphate R* in 1000 mL of *water R* and adjust to pH 3.25 ± 0.05 with *dilute phosphoric acid R*. Filter through a membrane filter (nominal pore size 0.45 µm or finer).

Phosphate Buffer Solution pH 3.4

Dissolve 68.0 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 mL with the same solvent. Adjust the pH with *phosphoric acid R*.

Phosphate Buffer Solution pH 4.5, 0.05M

Dissolve 6.80 g of *potassium dihydrogen phosphate R* in 1000.0 mL of *water R*. The pH of the solution is 4.5.

Phosphate Buffer Solution pH 5.0

Dissolve 2.72 g of *potassium dihydrogen phosphate R* in 800 mL of *water R*. Adjust the pH with a 1 M potassium hydroxide solution prepared from *potassium hydroxide R* and dilute to 1000 mL with *water R*.

Phosphate Buffer Solution pH 5.4, 0.067M

Mix appropriate volumes of a 23.99 g/L solution of *disodium hydrogen phosphate dodecahydrate R* with a 9.12 g/L solution of *sodium dihydrogen phosphate monohydrate R* to obtain pH 5.4.

Phosphate Buffer Solution pH 5.5

Dissolve 13.61 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 mL with the same solvent (solution A). Dissolve 35.81 g of *disodium hydrogen phosphate dodecahydrate R* in *water R* and dilute to 1000.0 mL with the same solvent (solution B). Mix 96.4 mL of solution A and 3.6 mL of solution B.

Phosphate Buffer Solution pH 5.6

Dissolve 0.908 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 100.0 mL with the same solvent (solution A). Dissolve 1.161 g of *dipotassium hydrogen phosphate R* in *water R* and dilute to 100.0 mL with the same solvent (solution B). Mix 94.4 mL of solution A and 5.6 mL of solution B. If necessary, adjust to pH 5.6 using solution A or solution B.

Phosphate Buffer Solution pH 5.8

Dissolve 1.19 g of *disodium hydrogen phosphate dihydrate R* and 8.25 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 mL with the same solvent.

Phosphate Buffer Solution pH 6.0 R1

Dissolve 6.8 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1000.0 mL with *water R*. Adjust the pH with *strong sodium hydroxide solution R*.

Phosphate Buffer Solution pH 6.0 R2

To 250.0 mL of *0.2 M potassium dihydrogen phosphate R* add 28.5 mL of *0.2 M sodium hydroxide* and dilute to 1000.0 mL with *water R*.

Phosphate Buffer Solution pH 6.3, 0.1M

Dissolve 15.6 g of *sodium dihydrogen orthophosphate* in 900 mL of water, adjust the pH to 6.3 with 0.1M *sodium hydroxide* and add sufficient *water* to produce 1000 mL.

Phosphate Buffer Solution pH 6.4

Dissolve 2.5 g of *disodium hydrogen phosphate dodecahydrate R*, 2.5 g of *sodium dihydrogen phosphate R* and 8.2 g of *sodium chloride R* in 950 mL of *water R*. Adjust the pH of the solution to 6.4 with *1 M sodium hydroxide* or *1 M hydrochloric acid*, if necessary. Dilute to 1000.0 mL with *water R*.

Phosphate Buffer Solution pH 6.5

Dissolve 2.75 g of *sodium dihydrogen phosphate R* and 4.5 g of *sodium chloride R* in 500 mL of *water R*. Adjust the pH with *phosphate buffer solution pH 8.5 R*.

Phosphate Buffer Solution pH 6.5, 0.1M

Dissolve 13.80 g of *sodium dihydrogen phosphate monohydrate R* in 900 mL of *distilled water R*. Adjust the pH using a 400 g/L solution of *sodium hydroxide R*. Dilute to 1000 mL with *distilled water R*.

Phosphate Buffer Solution pH 6.7, 0.1M

Dissolve 15.6 g of *sodium dihydrogen phosphate R* in *water R* and dilute to 1.0 L with the same solvent. Dissolve 17.8 g of *disodium hydrogen phosphate dihydrate R* in *water R* and dilute to 1.0 L with the same solvent. Mix the solutions, check the pH and if necessary adjust to pH 6.7.

Phosphate Buffer Solution pH 7.0 R1

Mix 250.0 mL of *0.2 M potassium dihydrogen phosphate R* and 148.2 mL of a 8 g/L solution of *sodium hydroxide R*, adjust the pH if necessary. Dilute to 1000.0 mL with *water R*.

Phosphate Buffer Solution pH 7.0 R2

Mix 50.0 mL of a 136 g/L solution of *potassium dihydrogen phosphate R* with 29.5 mL of *1 M sodium hydroxide* and dilute to 100.0 mL with *water R*. Adjust the pH to 7.0 ± 0.1.

Phosphate Buffer Solution pH 7.0 R3

Dissolve 5 g of *potassium dihydrogen phosphate R* and 11 g of *dipotassium hydrogen phosphate R* in 900 mL of *water R*. Adjust to pH 7.0 with *dilute phosphoric acid R* or *dilute sodium hydroxide solution R*. Dilute to 1000 mL with *water R* and mix.

Phosphate Buffer Solution pH 7.0 R4

Dissolve 28.4 g of *anhydrous disodium hydrogen phosphate R* and 18.2 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 500 mL with the same solvent.

Phosphate Buffer Solution pH 7.0 R5

Dissolve 28.4 g of *anhydrous disodium hydrogen phosphate R* in 800 mL of *water R*. Adjust the pH using a 30 per cent *m/m* solution of *phosphoric acid R* and dilute to 1000 mL with *water R*.

Phosphate Buffer Solution pH 7.0 R6

Dissolve 3.56 g of *disodium hydrogen phosphate dihydrate R* in 950 mL of *water for chromatography R*. Adjust the pH with *phosphoric acid R* and dilute to 1.0 L with *water for chromatography R*.

Phosphate Buffer Solution pH 7.0 R7

Dissolve 35 g of *dipotassium hydrogen phosphate R* in 900 mL of *water R*, adjust to pH 7.0 with *dilute phosphoric acid R* and dilute to 1.0 L with *water R*.

Phosphate Buffer Solution pH 7.0, 0.025M

Mix 1 volume of *0.063 M phosphate buffer solution pH 7.0 R* with 1.5 volumes of *water R*.

Phosphate Buffer Solution pH 7.0, 0.03M

Dissolve 5.2 g of *dipotassium hydrogen phosphate R* in 900 mL of *water for chromatography R*. Adjust the solution to pH 7.0 ± 0.1 using *phosphoric acid R* and dilute to 1000 mL with *water for chromatography R*.

Phosphate Buffer Solution pH 7.0, 0.05M

Mix 34 mL of *water R* and 100 mL of *0.067 M phosphate buffer solution pH 7.0 R*.

Phosphate Buffer Solution pH 7.0, 0.063M

Dissolve 5.18 g of *anhydrous disodium hydrogen phosphate R* and 3.65 g of *sodium dihydrogen phosphate monohydrate R* in 950 mL of *water R* and adjust the pH with *phosphoric acid R*; dilute to 1000.0 mL with *water R*.

Phosphate Buffer Solution pH 7.4

Add 250.0 mL of *0.2 M potassium dihydrogen phosphate R* to 393.4 mL of *0.1 M sodium hydroxide*.

Phosphate Buffer Solution pH 7.5, 0.05M

Dissolve 0.89 g of *disodium hydrogen phosphate dihydrate R* in about 80 mL of *water R*. Adjust to pH 7.5 with an 8.5 per cent *V/V* solution of *phosphoric acid R* and dilute to 100.0 mL with *water R*.

Phosphate Buffer Solution pH 7.5, 0.33M

Dissolve 119.31 g of *disodium hydrogen phosphate dodecahydrate R* in *water R* and dilute to 1000.0 mL with the same solvent (solution A). Dissolve 45.36 g of *potassium dihydrogen phosphate R* in *water R* and dilute to 1000.0 mL with the same solvent (solution B). Mix 85 mL of solution A and 15 mL of solution B. Adjust the pH if necessary.

Phosphate Buffer Solution pH 8.0, 0.02M

To 50.0 mL of *0.2 M potassium dihydrogen phosphate R* add 46.8 mL of *0.2 M sodium hydroxide*. Dilute to 500.0 mL with *water R*.

Phosphate Buffer Solution pH 8.0, 0.1M

Dissolve 0.523 g of *potassium dihydrogen phosphate R* and 16.73 g of *dipotassium hydrogen phosphate R* in *water R* and dilute to 1000.0 mL with the same solvent.

Phosphate Buffer Solution pH 8.0, 0.05M

Dissolve 0.31 g of *sodium dihydrogen phosphate R* in 70 mL of *water R* and adjust to pH 8.0 with *1 M sodium hydroxide*, then dilute to 100 mL with *water R*.

Phosphate Buffer Solution pH 8.0, 1M

Dissolve 136.1 g of *potassium dihydrogen phosphate R* in *water R*, adjust the pH with *1 M sodium hydroxide*. Dilute to 1000.0 mL with *water R*.

Phosphate Buffer Solution pH 8.5

Dissolve 3.5 g of *dipotassium hydrogen phosphate R* and 4.5 g of *sodium chloride R* in 500 mL of *water R*. Adjust the pH with a mixture of equal volumes of *dilute phosphoric acid R* and *water R*.

Phosphate Buffer Solution pH 9.0

Dissolve 1.74 g of *potassium dihydrogen phosphate R* in 80 mL of *water R*, adjust the pH with a 1 M potassium hydroxide solution prepared from *potassium hydroxide R* and dilute to 100.0 mL with *water R*.

Phosphate Buffer Solution pH 11.3, 0.1M

Dissolve 17.4 g of *dipotassium hydrogen phosphate R* in about 950 mL of *water R*, adjust to pH 11.3 using a 100 g/L solution of *potassium hydroxide R* and dilute to 1.0 L with *water R*. Filter through a membrane filter (nominal pore size 0.45 µm).

Phosphate–Citrate Buffer Solution pH 5.5

Mix 56.85 mL of a 28.4 g/L solution of *anhydrous disodium hydrogen phosphate R* and 43.15 mL of a 21 g/L solution of *citric acid monohydrate R*.

Phthalate Buffer pH 3.6 Buffer solution pH 3.6

To 250.0 mL of *0.2 M potassium hydrogen phthalate R* add 11.94 mL of *0.2 M hydrochloric acid.* Dilute to 1000.0 mL with *water R.*

Phthalate Buffer Solution pH 4.4

Dissolve 2.042 g of *potassium hydrogen phthalate R* in 50 mL of *water R,* add 7.5 mL of *0.2 M sodium hydroxide* and dilute to 200.0 mL with *water R.*

Phthalate Buffer Solution pH 6.4, 0.5M

Dissolve 100 g of *potassium hydrogen phthalate R* in *water R* and dilute to 1000.0 mL with the same solvent. Adjust the pH if necessary, using *strong sodium hydroxide solution R.*

Potassium Phosphate Buffer Solution pH 7.0

Dissolve 10 mg of *bovine albumin R* and 68 mg of *potassium dihydrogen phosphate R* in 30 mL of *water R.* If necessary, adjust to pH 7.0 with *potassium hydroxide R.* Dilute to 50 mL with *water R* and filter.

Saline pH 6.4, Phosphate-buffered

Dissolve 1.79 g of *disodium hydrogen orthophosphate,* 1.36 g of *potassium dihydrogen orthophosphate* and 7.02 g of *sodium chloride* in sufficient *water* to produce 1000 mL.

Saline pH 6.8, Phosphate-buffered

Dissolve 1.0 g of *potassium dihydrogen phosphate R,* 2.0 g of *dipotassium hydrogen phosphate R* and 8.5 g of *sodium chloride R* in 900 mL of *water R,* adjust the pH if necessary and dilute to 1000.0 mL with the same solvent.

Saline pH 7.2, Phosphate-albumin Buffered

Dissolve 10.75 g of *disodium hydrogen phosphate dodecahydrate R,* 7.6 g of *sodium chloride R* and 10 g of *bovine albumin R* in *water R* and dilute to 1000.0 mL with the same solvent. Immediately before use adjust the pH using *dilute sodium hydroxide solution R* or *dilute phosphoric acid R.*

Saline pH 7.2 R1, Phosphate-albumin Buffered

Dissolve 10.75 g of *disodium hydrogen phosphate dodecahydrate R,* 7.6 g of *sodium chloride R* and 1 g of *bovine albumin R* in *water R* and dilute to 1000.0 mL with the same solvent. Immediately before use adjust the pH using *dilute sodium hydroxide solution R* or *dilute phosphoric acid R.*

Saline pH 7.4, Phosphate-buffered

Dissolve 2.38 g of *disodium hydrogen phosphate dodecahydrate R,* 0.19 g of *potassium dihydrogen phosphate R* and 8.0 g of *sodium chloride R* in water. Dilute to 1000.0 mL with the same solvent. Adjust the pH if necessary.

Sodium Acetate Buffer pH 7.0.

Dissolve 1.64 g of *anhydrous sodium acetate* in 1 L of *water,* adjust to pH 7.0 using dilute acetic acid

Sodium Acetate Buffer Solution pH 4.0, 0.1M

Dissolve 822 mg of *sodium acetate R* in 100 mL of *water R* (solution A). Dilute 1.44 mL of *glacial acetic acid R* in 250 mL of *water R* (solution B). Titrate 100 mL of solution B using about 20 mL of solution A.

Sodium Acetate Buffer Solution pH 4.5

Dissolve 63 g of *anhydrous sodium acetate R* in *water R,* add 90 mL *acetic acid R* and adjust to pH 4.5, and dilute to 1000 mL with *water R.*

Sodium Acetate Buffer Solution pH 5.0

Dissolve 50.0 g of *sodium acetate R* in 10.0 mL of *glacial acetic acid R* and add *water R.* Adjust to pH 5.0 with a 4.2 g/L solution of *sodium hydroxide R* or with *glacial acetic acid R* and dilute to 1000.0 mL with *water R.*

Sodium Acetate Solution pH 6.0, Buffered

Dissolve 4.1 g of *anhydrous sodium acetate* in 1000 mL of *water* and adjust the pH to 6.0 with *glacial acetic acid.*

Sodium/calcium Acetate Buffer Solution pH 7.0

Dissolve 10 mg of *bovine albumin R* and 32 mg of *calcium acetate R* in 60 mL of *water R.* Add 580 µL of *glacial acetic acid R* and adjust to pH 7.0 with *2 M sodium hydroxide R.* Dilute to 100 mL with *water R* and filter.

Sodium Citrate Buffer Solution pH 7.8 (0.034M Sodium Citrate, 0.101M Sodium Chloride)

Dissolve 10.0 g of *sodium citrate R* and 5.90 g of *sodium chloride R* in 900 mL of *water R.* Adjust the pH by addition of *hydrochloric acid R* and dilute to 1000 mL with *water R.*

Sodium Phosphate Buffer Solution pH 7.5, 0.25M

Dissolve 3.90 g of *sodium dihydrogen phosphate R* in 70 mL of *water R,* adjust to pH 7.5 with a 300 g/L solution of *sodium hydroxide R* and dilute to 100 mL with *water R.*

Sodium Phosphate Buffer Solution pH 8.0, 0.02M

Dissolve 0.31 g of *sodium dihydrogen phosphate R* in 70 mL of *water R* and adjust to pH 8.0 with *1 M sodium hydroxide,* then dilute to 100 mL with *water R.*

Succinate Buffer Solution pH 4.6

Disssolve 11.8 g of *succinic acid R* in a mixture of 600 mL of *water R* and 82 mL of *1 M sodium hydroxide* and dilute to 1000.0 mL with *water R.*

Sulfate Buffer Solution pH 2.00

Dissolve 132.1 g of *ammonium sulfate R* in *water R* and dilute to 500.0 mL with the same solvent (Solution A). Carefully and with constant cooling stir 14 mL of *sulfuric acid R* into about 400 mL of *water R;* allow to cool and dilute to 500.0 mL with *water R* (Solution B). Mix equal volumes of solutions A and B. Adjust the pH if necessary.

Tetrabutylammonium Buffer Solution pH 7.0

Dissolve 6.16 g of *ammonium acetate R* in a mixture of 15 mL of *tetrabutylammonium hydroxide solution (400 g/L) R* and 185 mL of *water R.* Adjust the pH with *nitric acid R.*

Thiobarbituric Acid–citrate Buffer

Dissolve 5.0 g of *thiobarbituric acid* in 5 mL of 4M *sodium hydroxide* and dilute to 500 mL with *water.* Dissolve separately 37 g of *sodium citrate* in 32 mL of *hydrochloric acid* and dilute to 250 mL with *water.* Mix the two solutions and adjust the pH of the resulting solution to 2.0.

Total Ionic Strength Adjustment Buffer

Dissolve 58.5 g of *sodium chloride R,* 57.0 mL of *glacial acetic acid R,* 61.5 g of *sodium acetate R* and 5.0 g of *cyclohexylenedinitrilotetra-acetic acid R* in *water R* and dilute to 500.0 mL with the same solvent. Adjust to pH 5.0 to 5.5 with a 335 g/L solution of *sodium hydroxide R* and dilute to 1000.0 mL with *distilled water R.*

Total Ionic Strength Adjustment Buffer R1

Dissolve 210 g of *citric acid monohydrate R* in 400 mL of *distilled water R.* Adjust to pH 7.0 with *concentrated ammonia R.* Dilute to 1000.0 mL with *distilled water R* (solution A). Dissolve 132 g of *ammonium phosphate R* in *distilled water R* and dilute to 1000.0 mL with the same solvent (solution B). To a suspension of 292 g of (ethylenedinitrilo)tetra-*acetic acid R* in about 500 mL of *distilled water R,* add about 200 mL of *concentrated ammonia R* to dissolve. Adjust the pH to 6 to 7 with *concentrated ammonia R.* Dilute to 1000.0 mL with *distilled water R* (solution C). Mix equal volumes of solution A, B, and C and adjust to pH 7.5 with *concentrated ammonia R.*

Tris-acetate Buffer Solution pH 8.5

Dissolve 0.294 g of *calcium chloride R* and 12.11 g of *tris(hydroxymethyl)aminomethane R* in *water R*. Adjust the pH with *acetic acid R*. Dilute to 1000.0 mL with *water R*.

Tris-borate-EDTA Buffer Solution pH 8.4 MB

Dissolve 10.80 g of *tris(hydroxymethyl)aminomethane MB*, 5.50 g *boric acid R* and 0.584 g of *ethylenediaminetetra-acetic acid R* in 250 mL of *distilled water R*. Adjust the pH *(2.2.3)* to 8.4 using *hydrochloric acid R*. Dilute to 1000.0 mL with *distilled water R*.

Tris-chloride Buffer pH 7.4 Tris(hydroxymethyl) aminomethane sodium chloride buffer solution pH 7.4

Dissolve 6.08 g of *tris(hydroxymethyl)aminomethane R* and 8.77 g of *sodium chloride R* in 500 mL of *distilled water R*. Add 10.0 g of *bovine albumin R* or 1.0-5.0 g of *macrogol 6000 R*. Adjust the pH using *hydrochloric acid R*. Dilute to 1000.0 mL with *distilled water R*.

Tris-chloride Buffer pH 7.5 Tris(hydroxymethyl) aminomethane buffer solution pH 7.5

Dissolve 7.27 g of *tris(hydroxymethyl)aminomethane R* and 5.27 g of *sodium chloride R* in *water R*, and adjust the pH if necessary. Dilute to 1000.0 mL with *water R*.

Tris-chloride Buffer pH 7.5 R1 0.05M Tris-hydrochloride buffer solution pH 7.5

Dissolve 6.057 g of *tris(hydroxymethyl)aminomethane R* in *water R* and adjust the pH with *hydrochloric acid R*. Dilute to 1000.0 mL with *water R*.

Tris-chloride Buffer pH 8.1 Tris(hydroxymethyl) aminomethane buffer solution pH 8.1

Dissolve 0.294 g of *calcium chloride R* in 40 mL of *tris(hydroxymethyl)aminomethane solution R* and adjust the pH with *1 M hydrochloric acid*. Dilute to 100.0 mL with *water R*.

Tris-chloride Buffer pH 8.6

Dissolve 2.0 g of *tris(hydroxymethyl)methylamine* and 2.4 g of *sodium chloride* in about 100 mL of *water*, adjust the pH to 8.6 with 1M *sodium hydroxide* or 1M *hydrochloric acid* and dilute with *water* to 200 mL.

Tris-chloride Buffer Solution

Dissolve 0.606 g of *tris(hydroxymethyl)methylamine* and 2.34 g of *sodium chloride* in sufficient *water* to produce 1000 mL. Store at 2° to 8° and use within 3 days of preparation.

Tris-EDTA Buffer Solution pH 8.0 MB

Dissolve 60.57 g of *tris(hydroxymethyl)aminomethane MB* in 500 mL of *distilled water R* and adjust the pH *(2.2.3)* to 8.4 using *hydrochloric acid R* (1M Tris buffer).

Dissolve 18.60 g of *ethylenediaminetetra-acetic acid R* in100 mL of *distilled water R* and adjust the pH *(2.2.3)* to 8.0 using *sodium hydroxide R* (0.5M EDTA solution). (Use vigorous stirring and moderate heat if desired).

Mix appropriate volumes of the two solutions to achieve the required concentration. (e.g. Mix 5 mL of 1M Tris buffer with 1 mL of 0.5M EDTA solution and dilute with 496 mL of *distilled water R)*.

Tris-EDTA Buffer pH 8.4 Tris(hydroxymethyl) aminomethane-EDTA Buffer Solution pH 8.4

Dissolve 5.12 g of *sodium chloride R*, 3.03 g of *tris(hydroxymethyl)aminomethane R* and 1.40 g of *sodium edetate R* in 250 mL of *distilled water R*. Adjust the pH to 8.4 using *hydrochloric acid R*. Dilute to 500.0 mL with *distilled water R*.

Tris-EDTA BSA Buffer Solution pH 8.4

Dissolve 6.1 g of *tris(hydroxymethyl)aminomethane R*, 2.8 g of *sodium edetate R*, 10.2 g of *sodium chloride R* and 10 g of *bovine albumin R* in *water R*, adjust to pH 8.4 using *1 M hydrochloric acid* and dilute to 1000.0 mL with *water R*.

Tris-glycine Buffer Solution pH 8.3

Dissolve 6.0 g of *tris(hydroxymethyl)aminomethane R* and 28.8 g of *glycine R* in *water R* and dilute to 1000.0 mL with the same solvent. Dilute 1 volume to 10 volumes with *water R* immediately before use.

Tris-hydrochloride Buffer Solution pH 6.8, 1M

Dissolve 60.6 g of *tris(hydroxymethyl)aminomethane R* in 400 mL of *water R*. Adjust the pH with *hydrochloric acid R* and dilute to 500.0 mL with *water R*.

Tris-hydrochloride Buffer Solution pH 7.5, 0.1M

Dissolve 3.03 g of *tris(hydroxymethyl)aminomethane R* in 200 mL of *water R*, adjust to pH 7.5 with *hydrochloric acid R* and dilute to 250 mL with *water R*.

Tris-hydrochloride Buffer Solution pH 7.5, 1M

Dissolve 12.11 g of *tris(hydroxymethyl)aminomethane R* in 90 mL of *water R*, adjust to pH 7.5 with *hydrochloric acid R* and dilute to 100.0 mL with *water R*.

Tris-hydrochloride Buffer Solution pH 8.0

Dissolve 1.21 g of *tris(hydroxymethyl)aminomethane R* and 29.4 mg of *calcium chloride R* in *water R*. Adjust the pH with *1 M hydrochloric acid* and dilute to 100.0 mL with *water R*.

Tris-hydrochloride Buffer Solution pH 8.0, 1M

Dissolve 121.1 g of *tris(hydroxymethyl)aminomethane R* and 1.47 g of *calcium chloride R* in 900 mL of *water R*. Adjust the pH with *hydrochloric acid R* and dilute to 1000.0 mL with *water R*.

Tris-hydrochloride Buffer Solution pH 8.3

Dissolve 9.0 g of *tris(hydroxymethyl)aminomethane R* in 2.9 L of *water R*. Adjust the pH with *1 M hydrochloric acid*. Adjust the volume to 3 L with *water R*.

Tris-hydrochloride Buffer Solution pH 8.8, 1.5M

Dissolve 90.8 g of *tris(hydroxymethyl)aminomethane R* in 400 mL of *water R*. Adjust the pH with *hydrochloric acid R* and dilute to 500.0 mL with *water R*.

Tris-hydrochloride Buffer Solution pH 8.8, 3M

Dissolve 363.3 g of *tris(hydroxymethyl)aminomethane R* in 500 mL of *water R*. Adjust the pH with *hydrochloric acid R* and dilute to 1 L with *water R*.

Tris-hydrochloride Buffer Solution pH 9.0, 0.05M

Dissolve 0.605 g of *tris(hydroxymethyl)aminomethane R* in *water R*. Adjust the pH with *1 M hydrochloric acid* and dilute to 100.0 mL with *water R*.

Tris(hydroxymethyl)aminomethane Buffer Solution pH 7.4

Dissolve 30.3 g of *tris(hydroxymethyl)aminomethane R* in approximately 200 mL of *water R*. Add 183 mL of *1 M hydrochloric acid*. Dilute to 500.0 mL with *water R*. *Note: the pH is 7.7-7.8 at room temperature and 7.4 at 37 °C. This solution is stable for several months at 4 °C.*

Tris(hydroxymethyl)aminomethane Buffer Solution pH 7.5 R1

Dissolve 1.21 g of *tris(hydroxymethyl)aminomethane R* in 900 mL of *water R* and add 10 mL of *0.01 M calcium chloride solution R*. Adjust the pH if necessary with *sodium hydroxide solution R* or *hydrochloric acid R*, and dilute to 1000.0 mL with *water R*.

Tris(hydroxymethyl)aminomethane Buffer Solution pH 9.0

Dissolve 1.21 g of *tris(hydroxymethyl)aminomethane R* in 950 mL of *water for chromatography R*. Adjust to pH 9.0 with *acetic acid R* and dilute to 1000.0 mL with *water for chromatography R*.

Tris(hydroxymethyl)aminomethane Buffer Solution pH 9.0 R1

Dissolve 12.1 g of *tris(hydroxymethyl)aminomethane R* in 950 mL of *water R*. Adjust to pH 9.0 with *acetic acid R* and dilute to 1000.0 mL with *water R*.

Tris(hydroxymethyl)aminomethane-EDTA Buffer Solution pH 8.4 R1

Dissolve 10.20 g of *sodium chloride R*, 6.10 g of *tris(hydroxymethyl)aminomethane R*, 2.80 g of *sodium edetate R* and 1.00 g of *macrogol 6000 R* or 2.00 g of *bovine albumin R* or of *human albumin R* in 800 mL of *water R*. Adjust to pH 8.4 with *hydrochloric acid R* and dilute to 1.0 L with *water R*.

Tris(hydroxymethyl)aminomethane Sodium Chloride Buffer Solution pH 7.4 R1

Dissolve 0.1 g of *bovine albumin R* in a mixture containing 2 mL of *tris(hydroxymethyl)aminomethane buffer solution pH 7.4 R* and 50 mL of a 5.84 mg/mL solution of *sodium chloride R*. Dilute to 100.0 mL with *water R*.

Tris-sodium Acetate Buffer Solution pH 7.4

Dissolve 6.3 g of *tris(hydroxymethyl)aminomethane R* and 4.9 g of *anhydrous sodium acetate R* in 900 mL of *water R*. Adjust to pH 7.4 with *sulfuric acid R* and dilute to 1000 mL with *water R*.

Tris-sodium Acetate Buffer Solution pH 8.0

Dissolve 6.3 g of *tris(hydroxymethyl)aminomethane R* and 4.9 g of *anhydrous sodium acetate R* in 900 mL of *water R*. Adjust to pH 8.0 with *sulfuric acid R* and dilute to 1000 mL with *water R*.

Tris-sodium Acetate-sodium Chloride Buffer Solution pH 7.4

Dissolve 30.0 g of *tris(hydroxymethyl)aminomethane R*, 14.5 g of *anhydrous sodium acetate R* and 14.6 g of *sodium chloride R* in 900 mL of *water R*. Add 0.50 g of *bovine albumin R*. Adjust to pH 7.4 with *sulfuric acid R* and dilute to 1000 mL with *water R*.

Tris-sodium Acetate-Sodium Chloride Buffer Solution pH 8.0

Dissolve 30.0 g of *tris(hydroxymethyl)aminomethane R*, 14.5 g of *anhydrous sodium acetate R* and 14.6 g of *sodium chloride R* in 900 mL of *water R*. Add 0.50 g of *bovine albumin R*. Adjust to pH 8.0 with *sulfuric acid R* and dilute to 1000 mL with *water R*.

E. Reference Materials

Where the letters *BPCRS* appear after the name of a substance in a test or assay, the British Pharmacopoeia Chemical Reference Substance is to be used.
A comprehensive and up-to-date list of British Pharmacopoeia Chemical Reference Substances, together with terms of trade and supply, is available on our website at www.pharmacopoeia.com. The substances are obtainable from the BPCRS Sales Office, MHRA, 10th Floor, 10 South Colonnade, Canary Wharf, London E14 4PU, United Kingdom (telephone +44 (0)20 3080 6561, e-mail: bpcom@mhra.gov.uk, website www.pharmacopoeia.com).

In addition to *BPCRS*, monographs of the British Pharmacopoeia may also refer to reference substances available from other suppliers. These are denoted by the letters *CRS*.

Where the letters *CRS* or *EPCRS* appear, the chemical reference substance issued by the European Pharmacopoeia Commission is to be used; where the letters *BRP* or *EPBRP* appear, the Biological Reference Preparation issued by the European Pharmacopoeia Commission is to be used; where the letters *HRS* or *EPHRS* appear, the herbal reference substance issued by the European Pharmacopoeia Commission is to be used. The substances, as well as European Pharmacopoeia infrared reference spectra, are obtainable from the Council of Europe, European Directorate for the Quality of Medicines & HealthCare, CRS Sales Team, 7 allée Kastner, CS 30026, F-67081, Strasbourg Cedex, France (facsimile +33 (0)3 88 41 27 71, e-mail: crs@pheur.org, website www.edqm.eu).

Other sources of specific reference substances are shown below.

Astragaloside I CRS, Astragaloside II CRS, Astragaloside IV CRS, azadirachtin A CRS, bacopaside I CRS, bacopaside II CRS, bacoside A CRS, Paeonol CRS, Rosmarinic acid CRS, salannin CRS, Salvianolic Acid B CRS, Tanshinone IIA CRS, Withaferin A CRS, Withanolide A CRS, Withanolide B CRS, Z-Ligustilide CRS may be obtained from Chromadex Inc. through LGC Standards, Queen's Road, Teddington, TW11 0LY, United Kingdom (telephone +44 (0)20 8943 8480, facsimile +44 (0)20 8943 7554, e-mail: uksales@lgcstandards.com).

Opacity, Standard Preparation of The Standard Preparation is the 5th International Reference Preparation, established in 1975, and consists of a rod of plastic simulating the optical properties of a bacterial suspension (10 Units of opacity). It may be obtained from the National Institute for Biological Standards and Control (NIBSC), Blanche Lane, South Mimms, Potters Bar, Hertfordshire, EN6 3QG, United Kingdom (telephone +44 (0) 1707 641000, e-mail: enquiries@nibsc.org).

Piperonyl Butoxide CRS may be obtained from LGC Standards, Queen's Road, Teddington, TW11 0LY, United Kingdom (telephone +44 (0)20 8943 8480, facsimile +44 (0)20 8943 7554, e-mail: uksales@lgcstandards.com).

F. Polymorphism

(Ph. Eur. method 5.9)

Polymorphism (or crystal polymorphism) is a phenomenon related to the solid state; it is the ability of a compound in the solid state to exist in different crystalline forms having the same chemical composition. Substances that exist in a non-crystalline solid state are said to be amorphous.

When this phenomenon is observed for a chemical element (for example, sulfur), the term allotropy is used instead of polymorphism.

The term pseudopolymorphism is used to describe solvates (including hydrates), where a solvent is present in the crystal matrix in stoichiometric proportions; the term may also be extended to include compounds where the solvent is trapped in the matrix in variable proportions. However the term

pseudopolymorphism is ambiguous because of its use in different circumstances. It is therefore preferable to use only the terms "solvates" and "hydrates".

Where a monograph indicates that a substance shows polymorphism, this may be true crystal polymorphism, occurrence of solvates, allotropy or occurrence of the amorphous form.

The identity of chemical composition implies that all crystalline and amorphous forms of a given species have the same chemical behaviour in solution or as a melt; in contrast, their physico-chemical and physical characteristics (solubility, hardness, compressibility, density, melting point, etc.), and therefore their reactivity and bioavailability may be different at the solid state.

When a compound shows polymorphism, the form for which the free enthalpy is lowest at a given temperature and pressure is the most thermodynamically stable. The other forms are said to be in a metastable state. At normal temperature and pressure, a metastable form may remain unchanged or may change to a thermodynamically more stable form.

If there are several crystalline forms, one form is thermodynamically more stable at a given temperature and pressure. A given crystalline form may constitute a phase that can reach equilibrium with other solid phases and with the liquid and gas phases.

If each crystalline form is the more stable within a given temperature range, the change from one form to another is reversible and is said to be enantiotropic. The change from one phase to another is a univariate equilibrium, so that at a given pressure this state is characterised by a transition temperature. However, if only one of the forms is stable over the entire temperature range, the change is irreversible or monotropic.

Different crystalline forms or solvates may be produced by varying the crystallisation conditions (temperature, pressure, solvent, concentration, rate of crystallisation, seeding of the crystallisation medium, presence and concentration of impurities, etc.).

The following techniques may be used to study polymorphism:

- X-ray diffraction of powders (*2.9.33*),
- X-ray diffraction of single crystals,
- thermal analysis (*2.2.34*) (differential scanning calorimetry, thermogravimetry, thermomicroscopy),
- microcalorimetry,
- moisture absorption analysis,
- optical and electronic microscopy,
- solid-state nuclear magnetic resonance,
- infrared absorption spectrophotometry (*2.2.24*),
- Raman spectroscopy (*2.2.48*),
- measurement of solubility and intrinsic dissolution rate,
- density measurement.

These techniques are often complementary and it is indispensable to use several of them.

Pressure/temperature and energy/temperature diagrams based on analytical data are valuable tools for fully understanding the energetic relationship (enantiotropism, monotropism) and the thermodynamic stability of the individual modifications of a polymorphic compound.

For solvates, differential scanning calorimetry and thermogravimetry are preferable, combined with measurements of solubility, intrinsic dissolution rate and X-ray diffraction.

For hydrates, water sorption/desorption isotherms are determined to demonstrate the zones of relative stability.

In general, hydrates are less soluble in water than anhydrous forms, and likewise solvates are less soluble in their solvent than unsolvated forms.

Appendix II

A. Infrared Spectrophotometry

(Absorption Spectrophotometry, Infrared, Ph. Eur. method 2.2.24)

PRINCIPLE

Infrared absorption spectrophotometry (also known as infrared (IR) spectroscopy) is based on the interaction of infrared radiation with matter. As a result of interaction between a molecule and IR radiation, absorption of frequencies specific to that molecule can occur, and some intermolecular and intramolecular vibrations can be excited to higher vibrational levels. This results in an infrared absorption spectrum with characteristic bands that correspond to the functional groups of the molecule.

The infrared wavelength region can be further divided into 3 subregions, namely near-infrared, mid-infrared and far-infrared. These subregions have wavelength ranges that are generally accepted by convention to be 0.8-2.5 µm, 2.5-25 µm and 25-1000 µm respectively. However, in IR spectroscopy, wavenumber is more commonly used than wavelength, and can be calculated using the following equation:

$$\tilde{\nu} = \frac{1}{\lambda} \cdot 10^4$$

where ν is the wavenumber in reciprocal centimetres (cm^{-1}) and λ is the wavelength in micrometres. Thus 12 500-4000 cm^{-1} is near-infrared, 4000-400 cm^{-1} is mid-infrared and 400-10 cm^{-1} is far-infrared.

This chapter concerns only spectroscopy in the mid-infrared region, i.e. 4000-400 cm^{-1} (2.5-25 µm), which hereafter is referred to as infrared for simplicity. This region is where the fundamental molecular vibrations of functional groups appear in the spectrum as absorption bands. The region below 1500 cm^{-1} is known as the 'fingerprint region', a very complex and informative part of the spectrum which characterises the molecule being investigated.

The mid-infrared region is flanked by the near-infrared region, where overtones and combinations of fundamental vibrations, mainly C-H, N-H and O-H functional groups, are detected (*2.2.40*) and the far-infrared region, where absorption bands associated with crystal lattice modes, hydrogen bonds, angle deformation vibrations of heavy atoms and molecular rotations are observed.

APPLICATIONS

As the absorption bands in IR spectra are characteristic of the constituent functional groups of a compound, IR spectroscopy is widely used to identify substances and provide information on their structure. It can also be used for quantitative applications, which requires establishing a mathematical relationship between the intensity of the radiation absorbed by the sample and the concentration of the investigated component in the sample.

IR spectroscopy is widely used in the pharmaceutical field for chemical and physical analysis in the laboratory, and has a wide variety of applications during the manufacturing process as outlined below. IR spectroscopy thereby enables the application of Process Analytical Technology (PAT) as part of an advanced control strategy.

Chemical analysis:

- identification of active substances, excipients, dosage forms, manufacturing intermediates, chemicals and packaging materials;
- quality assessment of active substances, excipients, dosage forms, manufacturing intermediates and packaging materials, including batch-to-batch spectral comparison and supplier change assessment;
- quantification of active substances in a sample matrix, determination of water and solvent content;
- quantification of impurities, e.g. in gases, inorganic materials;
- reaction monitoring, e.g. chemical synthesis.

Physical analysis:

- determination of solid-state properties such as polymorphism.

LIMITATIONS

Notable limitations to the use of IR spectroscopy include the following:

- it may be necessary to use additional techniques to unambiguously identify a substance;
- pure enantiomers of a substance cannot be discriminated;
- it may not be a suitable method for trace analysis;
- sample preparation conditions (e.g. pressure, solvent) may change the crystalline form of a substance that exhibits polymorphism;
- for heterogeneous samples, the limited sampling volume may be problematic.

MEASUREMENT MODES

IR measurements are based on passing radiation through or into a sample and measuring the attenuation of the emerging beam at various wavelengths. This corresponds to 2 main measurement modes, i.e. transmission and attenuated total reflection (ATR). However, other modes also exist for specific applications (e.g. diffuse and specular reflection).

TRANSMISSION MODE

This mode is based on determination of the transmittance (T), namely the ability of the sample to transmit IR radiation at a given wavelength (wavenumber). It is defined by the following ratio:

$$T = \frac{I}{I_0}$$

I_0 = intensity of incident radiation;
I = intensity of transmitted radiation.

The resulting spectrum is presented in terms of transmittance (T) on the y-axis versus wavelength or wavenumber on the x-axis. It can also be presented in terms of absorbance (A) on the y-axis, which is related to transmittance (T) by the following equation:

$$A = \log_{10}\left(\frac{1}{T}\right) = \log_{10}\left(\frac{I_0}{I}\right) = a \cdot b \cdot c$$

a = molar absorption coefficient of the sample, in square centimetres per mole ($cm^2 \cdot mol^{-1}$);
b = sample thickness, in centimetres;
c = sample concentration, in moles per cubic centimetre ($mol \cdot cm^{-3}$).

ATTENUATED TOTAL REFLECTION MODE

ATR mode is based on the phenomenon of total internal reflection. The sample, with a refractive index n_2, is brought into close contact with a crystal (diamond, germanium, zinc selenide or any other suitable material), having a refractive index n_1 which is greater than n_2. A beam of IR light is then

passed through the crystal. When the angle α between the incident beam and the sample-crystal interface exceeds a critical value α_c, theoretically all of the radiation is reflected (total internal reflection). However, an evanescent wave is produced which slightly penetrates the sample and part of the energy is absorbed. The total reflection is attenuated, which makes it possible to generate an absorption spectrum.
In practice, multiple internal reflections are often used to amplify the absorption intensity, although some accessories allow absorption measurements with a single reflection.

The penetration depth d_p is usually of the order of a few micrometres and is given for a wavelength λ by the following equation:

$$d_p = \frac{\lambda/n_1}{2\pi\sqrt{sin^2\ \alpha - (n_2/n_1)2}}$$

where d_p is the penetration depth, λ is the wavelength, α is the angle of incidence and n_1, n_2 are the refractive indices of the reflection element and the sample, respectively.

Due to the relationship between these parameters, the absorption intensity in ATR is greater at higher wavelengths (i.e. smaller wavenumbers) and slight band shifts occur compared to the corresponding transmission spectrum. It is therefore not advisable to compare ATR spectra with transmission spectra when identifying compounds.

EQUIPMENT

The most commonly used IR spectrometers are Fourier-transform (FT-IR) spectrometers which typically consist of:
- a suitable polychromatic light source, e.g. a conducting ceramic rod;
- an interferometer;
- a sample presentation accessory, e.g. a sample holder;
- a detector;
- appropriate software for controlling the spectrometer, and for spectral evaluation and data processing.

Other spectrometers based on alternative principles may also be used if the requirements described under Control of equipment performance are fulfilled.

IR spectrometers can also be used in association with a microscope for the study of a small part of the sample or for chemical imaging.

IR spectroscopy can be coupled to other analytical techniques such as thermal analysis or chromatography.

CONTROL OF EQUIPMENT PERFORMANCE

Accuracy of wavenumber scale and spectral resolution are critical parameters and must be verified. The tests described below can be used for the control of instrument performance and for qualification. They can also be used as system suitability tests.

These parameters are checked using suitable reference materials which are selected and presented depending on the measurement mode (e.g. transmission or ATR).

For quantitative analysis, appropriate assessment criteria for the control of absorption intensity must also be defined.

WAVENUMBER SCALE

The wavenumber scale is typically verified using a polystyrene film that exhibits IR absorption bands at the wavenumbers shown in Table 2.2.24.-1.

Table 2.2.24.-1 - *Band positions and associated acceptable tolerances of the polystyrene film used to verify wavenumber accuracy*

Band position (cm^{-1})		Tolerance (cm^{-1})
Transmission	ATR	
906.6	906.1	± 1.0
1028.3	1027.7	± 1.0
1601.2	1601.0	± 1.0
3060.0	3059.7	± 1.0

For measurement modes other than transmission or ATR, reference materials must be defined by the user.

SPECTRAL RESOLUTION

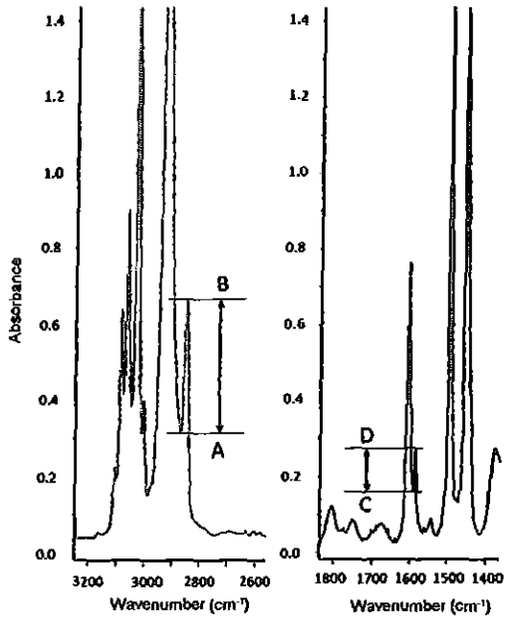


Figure 2.2.24.-1. – *Typical IR absorbance spectrum of polystyrene used to verify spectral resolution*

Spectra recorded in transmission mode

The spectral resolution is typically verified using a polystyrene film approximately 35 µm thick.

Acceptance criteria (see Figure 2.2.24.-1) The difference between the absorbance values at the absorption minimum at 2870 cm^{-1} (*A*) and the absorption maximum at 2849.5 cm^{-1} (*B*) is greater than 0.33; the difference between the absorbance values at the absorption minimum at 1589 cm^{-1} (*C*) and the absorption maximum at 1583 cm^{-1} (*D*) is greater than 0.08.

Spectra recorded in ATR mode

Appropriate assessment criteria for the control of spectral resolution according to the specifications of each instrument need to be defined.

For measurement modes other than transmission or ATR, reference materials have to be defined by the user.

PROCEDURE

SAMPLE PREPARATION AND PRESENTATION

Sample preparation and presentation vary according to the physical state of the sample and the measurement mode.

Transmission mode is applied to transparent samples, such as neat liquids, solutions, gases or suitably prepared mulls and alkali halide discs. For liquids and gases, cells with fixed or variable pathlength and IR transparent windows can be used. For alkali-halide disks, specific sample holders are used. Reflection mode, e.g. ATR, is appropriate for the measurement of a wide range of samples in the solid and liquid state.

Some preparation modes (e.g. for discs and mulls in transmission mode or for solids in ATR mode) involve grinding and/or the application of pressure, which may induce unexpected crystal modifications.

Transmission mode

Prepare the substance by one of the following methods depending on the sample state (solid, liquid or gas). Sample bands in a spectrum have a minimum transmittance not lower than 5 per cent, unless otherwise justified.

Liquids Examine liquids either in the form of a film between 2 plates transparent to infrared radiation or in a cell of suitable pathlength with windows that are transparent to infrared radiation.

Liquids or solids in solution Prepare a solution of the substance to be examined in a suitable solvent. Choose a concentration and a pathlength that give a satisfactory spectrum. Generally, good results are obtained with concentrations of 10-100 g/L for a pathlength of 0.5-0.1 mm. The absorption due to the solvent is usually compensated by successively recording the spectra of the solvent and the sample solution and subtracting the solvent absorption bands from the spectrum of the sample solution.

Solids dispersed in a solid (disc) Grind the substance to be examined taking into consideration any possible changes (e.g. crystalline form) and mix with a suitable amount of finely powdered and dried *potassium bromide R* or *potassium chloride R*, unless otherwise specified. A mixture of a few milligrams (e.g. 1-2 mg) of the substance to be examined in a few hundred milligrams (e.g. 300-400 mg) of halide is normally sufficient to give a disc of 10-15 mm diameter and a spectrum of suitable intensity. If the substance is a hydrochloride salt, it is recommended to use *potassium chloride R*. Carefully grind the mixture, spread it uniformly in a suitable die and apply a suitable pressure. A compacting force of about 800 MPa is generally sufficient to prepare a disc. For substances that are unstable under normal atmospheric conditions or are hygroscopic, the disc may be pressed under vacuum. Several factors may cause the formation of faulty discs, such as insufficient or excessive grinding, humidity or impurities in the dispersion medium. For example, any water in either the sample or the potassium bromide will cause clouding of the disc and produce a low transmission spectrum. A disc is rejected if visual examination shows a lack of uniform transparency or when, in the absence of a specific absorption band, the transmittance is less than 60 per cent or the absorbance is more than 0.22 at about 2000 cm^{-1} (5 µm) and without compensation, unless otherwise prescribed.

Solids dispersed in a liquid (mull) Triturate a small quantity of the substance to be examined with the minimum quantity of *liquid paraffin R* or other suitable liquid. A mixture of a few milligrams (e.g. 5-10 mg) of the substance to be examined in 1 drop of *liquid paraffin R* is generally sufficient to make an adequate mull. Compress the mull between 2 plates transparent to infrared radiation. A mull is rejected if a visual examination shows lack of uniform transparency or where the spectrum shows features such as:

- low transmission at 4000 cm^{-1};
- a strongly sloping baseline between 4000 and about 2500 cm^{-1};
- a ratio of relative intensities of some absorption bands that is less than expected.

Molten solids If prescribed in the monograph, make a film of a molten mass and fix it on a suitable mount.

Evaporated solution If prescribed in the monograph, dissolve the substance to be examined in a suitable solvent. Prepare a film by evaporating the solvent on a suitable carrier and fix it on a suitable mount.

Gases Use a suitable cell transparent to infrared radiation. Evacuate the air from the cell and fill to the desired pressure through a stopcock or needle valve using a suitable gas transfer line between the cell and the container of the gas to be examined. If necessary, adjust the pressure in the cell to atmospheric pressure using a gas transparent to infrared radiation (e.g. *nitrogen R* or *argon R*), or purge with carbon dioxide-free air. An appropriate measurement protocol must be followed to compensate for water, carbon dioxide or other atmospheric gases.

ATR mode

ATR is suitable for liquid and solid samples, and requires no preparation apart from simple treatments such as the grinding of large crystals and coarse material. Proceed as follows depending on the sample state (liquid or solid).

Liquids Place the sample in contact with the crystal.

Solids Ensure close and uniform contact between the substance to be examined and the whole crystal surface, either by applying pressure or by dissolving the substance in an appropriate solvent, then covering the crystal with the resulting solution and evaporating to dryness.

METHODS

Infrared spectroscopy is mostly used to identify substances, but it may also be carried out for quantitative applications. Quantitative analysis (based on the Beer-Lambert law, which relates the absorbance of a sample to its concentration) will not be described in this chapter.

The measurement is performed on an appropriately prepared sample. The data is then processed and evaluated, either to identify substances or quantify them (e.g. based on integration of IR-absorption bands).

Spectral quality may be enhanced by mathematical pretreatments. In practice, these are limited to spectral normalisation and subtraction of bands caused by carbon-dioxide and water vapour. The same pretreatments are performed on both the sample and the reference spectra.

Identification

Prepare the substance to be examined appropriately and record the spectra between 4000 and 650 cm^{-1}, unless otherwise prescribed.

Identification testing is performed by comparing the spectrum of the substance to be examined with the spectrum obtained from a Ph. Eur. chemical reference substance (CRS) or with a Ph. Eur. reference spectrum.

The spectrum of the current batch of the Ph. Eur. CRS may be recorded for immediate use or stored, for example, in a spectral library for future consultation. A stored spectrum may be used, provided traceability to the current batch of CRS is ensured.

In the case of substances that are not covered by individual monographs, a suitable reference standard may be used.

In all cases, spectra must be recorded using the same operating conditions and procedure, and especially the same measurement mode.

When comparison of the spectra recorded in the solid state show differences (see below), treat the substance to be examined and the reference substance in the same manner so that they recrystallise or are produced in the same crystalline form, or proceed as prescribed in the monograph, then record the spectra again. However, this procedure must only be done for substances where the monograph does not cover a particular form of a substance that exhibits polymorphism.

Several comparison procedures may be used, and the analyst must document and justify the method used and the specific acceptance criteria that allow a conclusion for identification. The spectra can be compared either by overlaying the spectra (in the whole spectral range or in the region of interest specified in the monograph) or by using mathematical calculations from the software. It is possible for example to perform:

- visual comparison based on band positions and relative intensities unless otherwise specified - the transmission minima (or absorption maxima) in the spectrum obtained with the substance to be examined correspond in position and relative size to those of the reference;
- calculation of the correlation coefficient between the 2 spectra - this value is calculated by the software and the identification threshold is defined by the user;
- evaluation by chemometric methods (e.g. Euclidean distance, Mahalanobis distance, classification methods); these methods involve the set-up, assessment and validation of the chemometric model by the analyst (see *5.21. Chemometric methods applied to analytical data*).

Impurities in gases

For the analysis of impurities, use a cell transparent to infrared radiation and of suitable optical pathlength (e.g. 1-20 m). Fill the cell as prescribed under Gases. For detection and quantification of the impurities, proceed as prescribed in the monograph.

Near-infrared Spectrophotometry

(Ph. Eur. method 2.2.40)

Near-infrared (NIR) spectroscopy is a technique with wide and varied applications in pharmaceutical analysis. The NIR spectral range extends from 780 nm to 2500 nm (from 12 800 cm^{-1} to 4000 cm^{-1}). NIR spectra are dominated by C-H, N-H, O-H and S-H overtones and combinations of fundamental mid-infrared (MIR) vibrations. They contain composite chemical and physical information and in most cases this information can be extracted by suitable mathematical data treatment. NIR bands are much weaker than the fundamental MIR vibrations from which they originate. Because absorptivities in the NIR range are low, radiation can penetrate up to several millimetres into materials, including solids. Furthermore, many materials such as glass are relatively transparent in this region.

Measurements can be made directly *in situ*, in addition to standard sampling and testing procedures.

NIR measurements can be performed off-line, and also at-line or in-line, and on-line for process analytical technology (PAT). Suitable chemometric methods may be required for identification. However, when the specificity criteria for a qualitative method are met, chemical identification or solid-state characterisation is possible by direct comparison of the untreated or pre-treated spectra obtained with the chemical substance being examined with a spectrum of a reference substance.

NIR spectroscopy has a wide variety of applications for chemical, physical and process analysis, for example:

Chemical analysis:

- identification of active substances, excipients, dosage forms, manufacturing intermediates, chemical materials and packaging materials;
- qualification of active substances, excipients, dosage forms, manufacturing intermediates and packaging materials, including batch-to-batch spectral comparison and supplier change assessment;
- quantification of active substances in a sample matrix, determination of chemical values such as hydroxyl value, determination of absolute water content, determination of degree of hydroxylation and control of solvent content.

Physical analysis:

- crystalline form and crystallinity, polymorphism, solvates, particle size;
- disintegration, hardness;
- film properties.

Process analysis:

- monitoring of unit operations such as synthesis, crystallisation, blending, drying, granulation and coating, for the purpose of process control;
- control and endpoint detection.

Measurements in the NIR region are influenced by many chemical and physical factors as described below; the reproducibility and relevance of results depend on control of these factors and measurements are usually valid only for a defined calibration model.

APPARATUS

All NIR measurements are based on passing light through or into a sample and measuring the attenuation of the emerging (transmitted or reflected) beam. Spectrometers for measurement in the NIR region consist of a suitable light source (such as a highly-stable quartz-tungsten lamp), a monochromator or interferometer, and a detector. Common monochromators are acousto-optic tunable filters (AOTF), gratings or prisms. Traditionally, many NIR instruments have a single-beam design, though some process instruments use internal referencing and can therefore be dual-beam (for example in diode array instruments). Silicon, lead sulfide, and indium gallium arsenide are examples of detector materials. Conventional cuvette sample holders, fibre-optic probes, transmission dip cells, neutral borosilicate vials and spinning or traversing sample holders are a few examples of sampling devices. The selection is based on the intended application, paying particular attention to the suitability of the sampling system for the type of sample to be analysed. Suitable data processing and evaluation units (e.g. software and computer) are usually part of the system.

It is common to express the wavelength (λ) in nanometres and the wavenumber (υ) in reciprocal centimetres (cm^{-1}), depending on the measurement technique and apparatus. Conversion between nm and cm^{-1} is performed according to the following expression:

$$\nu_{cm^{-1}} = 10^7 \times \frac{1}{\lambda_{nm}}$$

MEASUREMENT METHODS

Transmission mode

Transmittance (T) is a measure of the decrease in radiation intensity at given wavelengths when radiation is passed through the sample. The sample is placed in the optical beam between the source and the detector. The arrangement is analogous to that in many conventional spectrometers.

The resulting spectrum can be presented directly in terms of transmittance (T) and/or absorbance (A) (y-axis) versus the wavelength or wavenumber (x-axis).

$$T = \frac{I}{I_0}$$

I_0 = intensity of incident radiation;
I = intensity of transmitted radiation;

$$A = -\log_{10} T = \log_{10}\left(\frac{1}{T}\right) = \log_{10}\left(\frac{I_0}{I}\right)$$

Diffuse reflection mode

The diffuse reflection mode gives a measure of reflectance (R), the ratio of the intensity of light reflected from the sample (I) to that reflected from a background or reference reflective surface (I_r). Depending on the chemical composition and physical characteristics of the sample, NIR radiation can penetrate a more or less substantial distance into the sample, where it can be absorbed by the overtones and combinations of the fundamental vibrations of the analyte species present in the sample. Non-absorbed radiation is partially reflected back from the sample to the detector. NIR reflectance spectra are typically obtained by calculating and plotting $\log_{10}(1/R)$ (y-axis) versus the wavelength or wavenumber (x-axis).

$$R = \frac{I}{I_r}$$

I = intensity of light diffusively reflected from the sample;
I_r = intensity of light reflected from the background or reference reflective surface;

$$A_R = \log_{10}\left(\frac{1}{R}\right) = \log_{10}\left(\frac{I_r}{I}\right)$$

Transflection mode

This mode is a combination of transmittance and reflectance. In the measurement of transflectance (T^*), a mirror or a diffuse reflectance surface is used to reflect the transmitted radiation back through the sample, thus doubling the pathlength. Non-absorbed radiation is reflected back from the sample to the detector. The resulting spectrum can be presented directly in terms of transflectance (T^*) and/or absorbance (A^*) (y-axis) versus the wavelength or wavenumber (x-axis).

$$T^* = \frac{I}{I_T}$$

I = intensity of transflected radiation measured from the sample;
I_T = intensity of transflected radiation of the reference material as background;

$$A^* = \log_{10}\left(\frac{1}{T^*}\right) = \log_{10}\left(\frac{I_T}{I}\right)$$

SAMPLE PREPARATION/PRESENTATION

Sample preparation and presentation may vary according to the measurement mode. The following requirements are necessary for all sampling techniques:

- optimise the measuring time and number of scans to optimise the signal-to-noise ratio;
- find the best suitable measurement mode for the intended application (transmission, diffuse reflection or transflection);
- find the best orientation of the sample (e.g. to minimise the impact of debossing on tablets);
- find the best suitable accessory (e.g. transmission cell or immersion probe);
- optimise pathlength in transmission and transflection modes;
- find a suitable spectroscopic background reference material;
- show that the background reference material is reliable over time and that the measurement of the background is reproducible and stable over time;
- when measuring moving materials or samples (for process-related measurements) it is important to obtain a representative spectrum (e.g. by adjusting the measuring time, the number of scans, co-adding individual spectra, or increasing the beam size);
- ensure there is no fouling of the sensor, for example with build-up of material or contamination;
- the measuring conditions (measuring time, beam size) in relation to the minimal sample size should be justified.

In some process analysis situations it may be impossible to remove a probe for reference background data collection; various options are therefore to be considered, including internal referencing, measurement of a background reference using a 2nd detector, etc. Only spectra measured against a background possessing the same optical properties can be directly compared with one another.

Transmission mode

The measurement of transmittance (T) is dependent on a background transmittance spectrum for its calculation. Examples of background references include air, a polymeric disc, an empty cell, a solvent blank or in special cases a reference sample. The method generally applies to liquids (diluted or undiluted), dispersions, solutions and solids (including tablets and capsules). For transmittance measurements of solids, a suitable sample accessory is used. Liquid samples are examined in a cell of suitable pathlength (typically 0.5-4 mm), transparent to NIR radiation, or alternatively by immersion of a fibre-optic probe of a suitable configuration.

Diffuse reflection mode

This mode generally applies to solids. The sample is examined directly, or in a suitable device (for example a sample holder), or in direct contact with a fibre-optic probe. For process monitoring, material can be analysed through a polished window interface (e.g. sapphire), or using an in-line fibre-optic probe. Care must be taken to ensure that the measuring conditions are as reproducible as possible from one sample to another. The reflected radiation of a background reference is scanned to obtain the baseline, and then the reflectance of one or more analytical samples is measured. Common reflectance references include ceramic, thermoplastic resins and gold. Other suitable materials may be used.

Transflection mode

This mode generally applies to liquids, suspensions and clear plastic materials. A reflector is placed behind the sample so as to double the pathlength. This configuration can be adopted to share the same instrument geometry with reflectance and fibre-optic probe systems where the source and the detector are on the same side of the sample.
The sample is examined through a cell with a mirror or a suitable diffusive reflector, made either of metal or of an inert substance (for example, dried titanium dioxide) not

absorbing in the NIR region. Liquids can also be measured using in-line transflectance probes.

FACTORS AFFECTING SPECTRAL RESPONSE

Environment

The environment temperature and humidity must be taken into consideration before carrying out measurements.

Sample presentation area

The sample presentation area or probe end must be clean of residue prior to measurement. Similarly, the in-line or on-line interface to the sample should not have significant product or contamination build-up, which would interfere with the desired measurement.

Sample temperature

This parameter is important for aqueous solutions and many liquids, where a difference of a few degrees can result in measurable spectral changes which may have a significant effect on the analysis. Temperature is also an important parameter for solids and powders containing water.

Moisture and solvent residues

Moisture and solvent residues present in the samples will contribute significant absorption bands in the NIR region.

Sample thickness

Sample thickness is a known source of spectral variability and must be assessed and/or controlled, particularly for tablet and capsule analysis in transmittance mode. For the measurement of compressed powders, an infinite thickness is typically reached after 5 mm of sample depth (e.g. in a vial).

Sample optical properties

In solids, both surface and bulk scattering properties of samples must be taken into account. Spectra of physically, chemically or optically heterogeneous samples may require increasing the beam size, or examining multiple samples or spinning the sample to obtain a representative spectrum of the sample. Certain factors such as differing degree of compaction or particle size in powdered materials and surface finish can cause significant spectral differences.

Solid-state forms

Variations in solid-state forms (polymorphs, hydrates, solvates and amorphous forms) influence vibrational spectra. Hence, different crystalline forms as well as the amorphous form of a solid may be distinguished from one another on the basis of their NIR spectra. Where multiple crystalline forms are present, care must be taken to ensure that the calibration samples have a distribution of forms relevant to the intended application.

Age of samples

Samples may exhibit changes in their chemical, physical or optical properties over time. Depending on the storage conditions, solid samples may either absorb or desorb water, and portions of amorphous material may crystallise. Materials used for NIR calibration should be representative of future samples and their matrix variables.

PRE-TREATMENT OF NIR SPECTRAL DATA

In many cases, and particularly for reflection mode spectra, some form of mathematical pre-treatment of the spectrum may be useful prior to the development of a classification or calibration model. The aim can be, for example, to reduce baseline variations, to reduce the impact of known variations that are interfering in the subsequent mathematical models, or to simplify data before use. In some cases spectra may also be normalised or corrected for scatter, for example using standard normal variate (SNV) transformation. Spectral pre-treatment techniques may include, for example, windowing and noise reduction and the numerical calculation of the first- or second-order derivative of the spectrum. Higher-order derivatives are not recommended because of increased spectral noise.

CONTROL OF INSTRUMENT PERFORMANCE

Use the apparatus according to the manufacturer's instructions and carry out the prescribed verification at regular intervals, according to the use of the apparatus and the application. For in-line and on-line applications, the use of alternative means of control of instrument performance must be scientifically justified. For example, utilise the standards built into the instrument or separate channels/probes to demonstrate instrument performance (pending practicality).

System suitability tests may be required prior to sample scanning, and the instrument attributes with potential impact on suitability of the final measurement (typically photometric noise and wavelength accuracy) must be tested.

The frequency at which each performance test is carried out must be risk-assessed depending on the instrument type and its environment. For example, instruments placed in harsh environments with variations in temperature and humidity may need frequent performance testing. Cases where the measurement system cannot be removed such as an in-line probe or flow cell are also to be considered.

Some accessories are custom designed and therefore require adequate performance testing.

Verification and calibration of the wavelength or wavenumber scale (except for filter apparatus) Verify the wavelength scale employed, generally in the region between 780 nm and 2500 nm (12 800 cm^{-1} to 4000 cm^{-1}) or in the intended spectral range using one or more suitable wavelength standards which have characteristic maxima or minima within the wavelength range to be used.

For example, *methylene chloride R*, *talc R*, wavelength reference lamps or a mixture of rare-earth oxides are suitable reference materials. Other suitable standards may also be used. Obtain a spectrum and measure the position of at least 3 peaks distributed over the range used. For rare-earth oxides, the National Institute of Standards and Technology (NIST) provides suitable reference materials. Fourier transform (FT) instruments have a linear frequency range, therefore wavelength certification at a single frequency is sufficient.

Verification and calibration of photometric linearity

The photometric linearity is demonstrated with a set of transmittance or reflectance standards with known percentage values of transmittance or reflectance. For reflectance measurements, carbon-doped polymer standards are available. Ensure that the absorbance of the materials used is relevant to the intended linear working range of the method. Subsequent verifications of photometric linearity can use the initial observed absorbance values as the reference values. Non-linear calibration models and hence non-linear responses are acceptable with understanding demonstrated by the user.

Spectra obtained from reflectance and transmittance standards are subject to variability due to the differences between the experimental conditions under which they were factory-calibrated and those under which they are subsequently put to use. Hence, the percentage reflectance values supplied with a set of calibration standards may not be useful in the attempt to establish an 'absolute' calibration for a given instrument. As long as the standards do not change chemically or physically and the same reference background

is used as was used to obtain the certified values, subsequent measurements of the same standards under identical conditions, including precise sample positioning, give information on long-term stability of the photometric response. A tolerance of ± 2 per cent of the absorbance value is acceptable for long-term stability; this verification is only necessary if the spectra are used without pre-treatment.

Recommendations for the conditions used to control instrument performance for the various measurement modes are summarised in Table 2.2.40.-1.

QUALITATIVE ANALYSIS (IDENTIFICATION AND CHARACTERISATION)

Establishment of a spectral reference library

Record the spectra of a suitable number of representative samples of the substance which have known, traceable identities, and that exhibit the variation typical for the substance to be analysed (for example, solid-state form, particle size, etc.). Libraries are built using representative samples under appropriate environmental conditions. The set of spectra obtained represents the information which can be used for identification of the sample to be analysed.

The collection of spectra in the library may be represented in different ways defined by the mathematical technique used for identification. These may be:

— all individual spectra representing the substance;
— a mean spectrum of the measured batches for each chemical substance;
— if necessary, a description of the variability within the substance spectra.

The number of substances in the library depends on the specific application. All spectra in the library used have the same:

— spectral range and number of data points;
— technique of measurement;
— data pre-treatment.

If sub-groups (sub-libraries) are created, the above criteria are applied independently for each group. Sub-libraries are individually validated. Original spectral data for the preparation of the spectral library must be archived. Caution must be exercised when performing any mathematical transformation, as artefacts can be introduced or essential information (important with qualification methods) can be lost. The suitability of the algorithm used should be demonstrated by successful method validation and in all cases the rationale for the use of transform must be documented.

Direct comparison of substance and reference spectra

Direct comparison of representative spectra of the substance to be examined and of a reference substance for qualitative chemical or physical identification purposes may not require use of a reference spectral library where specificity permits.

Data evaluation

Direct comparison of the representative spectrum of the substance to be examined is made with the individual or mean reference spectra of all substances in the database on the basis of their mathematical correlation or other suitable algorithms. A set of known reference mean spectra and the variability around this mean can be used with an algorithm for classification; alternatively, this can be achieved visually by overlaying spectral data if specificity is inherent. There are different techniques available, such as principal component analysis (PCA), cluster analysis, and soft independent modelling by class analogy (SIMCA). The reliability of the technique chosen for a particular application has to be validated according to the following:

Validation of the model

Identification methods using direct spectral comparison must be validated in accordance with identification method validation procedures.

The validation parameters for qualitative methods are robustness and specificity.

LIMIT ANALYSIS

Relative comparison of spectra

A calibration is not required when comparing a set of spectra for limit analysis purposes, such as the maximum or minimum absorbance at which an analyte absorbs. Also, dryer end point control may use a qualitative approach around a specific absorbing wavelength. Appropriate spectral ranges and pre-treatments (if used) must be shown to be fit for purpose.

Specificity

The relative discriminatory power for a limit test must be demonstrated. The extent of specificity testing is dependent on the application and the risks being controlled. Variations in matrix concentrations within the operating range of the method must not affect the measurement.

TREND ANALYSIS

Relative comparison of spectra

A calibration is not necessarily required when comparing a set of spectra for trend analysis purposes, such as the moving block approach to estimate statistical parameters such as mean, median and standard deviation. For example, blend uniformity monitoring using NIR spectroscopy has adopted such data analysis approaches. Appropriate spectral ranges and algorithms must be used for trend analyses.

Specificity

The relative discriminatory power for trend analysis must be demonstrated. The extent of specificity testing is dependent on the application and the risks being controlled. Variations in matrix concentrations within the operating range of the method must not affect the trend analysis.

QUANTITATIVE ANALYSIS

Establishment of a spectral reference library for a calibration model

Calibration is the process of constructing a mathematical model to relate the response from a sample scanned using an analytical instrument to the properties of the samples.
Any calibration model that can be clearly defined in a mathematical expression and gives suitable results can be used. Record the spectra of a suitable number of representative samples with known or future-established values of the attribute of interest throughout the range to be measured (for example, content of water). The number of samples for calibration will depend on the complexity of the sample matrix and interferences (e.g. temperature, particle size, etc.). All samples must give quantitative results within a calibration interval as defined by the intended purpose of the method. Multiple linear regression (MLR), principal component regression (PCR) and partial least squares regression (PLS) are commonly used algorithms. For PLS or PCR calibrations, the regression coefficients and/or the loadings should be plotted and the regions of large coefficients or loadings compared with the spectrum of the analyte. Predicted residual error sum of squares (PRESS) plots (or similar) are useful to facilitate the optimising of the number of PCR or PLS factors.

Pre-treatment of data

Wavelength selection or excluding certain wavelength ranges may enhance the accuracy and robustness of calibration

Table 2.2.40.-1 – *Control of instrument performance*

Measurement mode	Reflection	Transflection	Transmission
Verification of wavelength scale (except for filter apparatus)	Typical tolerances for agreement with standard values are: ± 1.0 nm at 780 nm (± 16 cm^{-1} at 12 800 cm^{-1}); ± 1.0 nm at 1200 nm (± 8 cm^{-1} at 8300 cm^{-1}); ± 1.0 nm at 1600 nm (± 6 cm^{-1} at 6250 cm^{-1}); ± 1.5 nm at 2000 nm (± 4 cm^{-1} at 5000 cm^{-1}); ± 1.5 nm at 2500 nm (± 2 cm^{-1} at 4000 cm^{-1}). For the reference material used, apply the tolerance for the nearest wavelength or wavenumber for each peak used. For diode array instruments, most often the pixel resolution (wavelength between pixels) can be as large as 10 nm. The pixel resolution must be adapted to match the spectral resolution. The peak-finding algorithms are critical to wavelength accuracy. Practically, ± 2 nm is appropriate for peak wavelength accuracy using such instrumentation. Alternatively, refer to manufacturer's specifications for acceptance.		
Bench/mobile instrument	Measure *talc R* via a suitable medium or by fibre-optic probe. *Talc R* has characteristic peaks at 948 nm, 1391 nm and 2312 nm suitable for calibration. Alternatively, other suitable standards may also be used that ensure wavelength accuracy in the region of working methodology. For example, measure an internal polystyrene standard if built-in, or measure a NIST standard or other traceable material, and assess 3 peaks across the wavelength range for calibration.	A suspension of 1.2 g of dry *titanium dioxide R* in about 4 mL of *methylene chloride R* is used directly with a cell or a probe. Titanium dioxide has no absorption in the NIR range. Spectra are recorded with a maximum nominal instrument bandwidth of 10 nm at 2500 nm (16 cm^{-1} at 4000 cm^{-1}). Methylene chloride has characteristic sharp bands at 1155 nm, 1366 nm, 1417 nm, 1690 nm, 1838 nm, 1894 nm, 2068 nm and 2245 nm. Choose 3 peaks across the wavelength range for calibration. Other suitable standards may also be used, such as a liquid transflection standard mixed with titanium dioxide or some other reflective medium.	*Methylene chloride R* may be used and has characteristic sharp bands at 1155 nm, 1366 nm, 1417 nm, 1690 nm, 1838 nm, 1894 nm, 2068 nm and 2245 nm. Choose 3 peaks across the wavelength range for calibration. Other suitable standards may also be used.
Process instrument	If it is not practically possible to measure a traceable reference material at the point of sample measurement, use internal material such as polystyrene, fibreglass or solvent and/or water vapour. Alternatively, adopt a second external channel/probe. For FT instruments, the calibration of the wavenumber scale may be performed using a narrow, isolated water-vapour line, for example, the line at 7306.74 cm^{-1}, or 7299.45 cm^{-1}, or 7299.81 cm^{-1} or a narrow line from a certified reference material.		

Verification of wavelength repeatability (except for filter apparatus)	The standard deviation of the wavelength is consistent with the specifications of the instrument manufacturer, or otherwise scientifically justified.
Bench/mobile instrument	Verify the wavelength repeatability using a suitable external or internal standard.
Process instrument	Verify the wavelength repeatability using a suitable external or internal standard.

Verification of photometric linearity and response stability[1]	Measure 4 photometric standards across the working method absorbance range.		
Bench/mobile instrument	Analyse 4 reflectance standards, for example in the range of 10-99 per cent, including 10 per cent, 20 per cent, 40 per cent and 80 per cent. In some circumstances 2 per cent may be appropriate. Evaluate the observed absorbance values against the reference absorbance values, for example perform a linear regression. Acceptable tolerances are 1.00 ± 0.05 for the slope and 0.00 ± 0.05 for the intercept for the 1st verification of photometric linearity of an instrument. Subsequent verifications of photometric linearity can use the initial observed absorbance values as the reference values.	Transflection measurements can use appropriate reflectance or transmittance standards and criteria.	Analyse 4 transmittance standards to cover the absorbance values over the working absorbance range of the modelled data. Evaluate the observed absorbance values against the reference absorbance values, for example perform a linear regression. Acceptable tolerances are 1.00 ± 0.05 for the slope and 0.00 ± 0.05 for the intercept for the 1st verification of photometric linearity of an instrument. Subsequent verifications of photometric linearity can use the initial observed absorbance values as the reference values.
Process instrument	If photometric reflectance and transmittance standards cannot be measured at the point of sample measurement, use the photometric standards built into the instrument. Process instruments can use internal photometric standards for photometric linearity. Follow the manufacturer's verified tolerances in such cases.		

[1] *Verification of photometric linearity* and *Verification of photometric noise* are not required for instruments using methods to perform simple identifications which do not use the photometric absorbances as part of model strategy (for example, simple correlation with absorbing wavelengths).

Measurement mode	Reflection	Transflection	Transmission
Verification of photometric noise[1]	Determine the photometric noise at a relevant photometric region of the spectrum using a suitable reflectance standard, for example, white reflective ceramic tiles or carbon-doped polymer standards. Follow the manufacturer's methodology and specifications.		
Bench/mobile instrument	Scan the reflectance low flux standard (e.g. 5 or 10 per cent, carbon-doped polymer standard) over a suitable wavelength range in accordance with the manufacturer's recommendation and calculate the photometric noise as peak-to-peak noise.		Scan the transmittance high flux standard (e.g. 90 or 99 per cent, carbon-doped polymer standard) over a suitable wavelength/wavenumber range in accordance with the manufacturer's recommendation and calculate the photometric noise as peak-to-peak noise.
Process instrument	As above, or if not practically possible, use the standard built into the instrument for noise testing and manufacturer specifications.		As above, or if not practically possible, use the standard built into the instrument for noise testing and manufacturer specifications.

[1] *Verification of photometric linearity* and *Verification of photometric noise* are not required for instruments using methods to perform simple identifications which do not use the photometric absorbances as part of model strategy (for example, simple correlation with absorbing wavelengths).

models. Wavelength compression (wavelength averaging) techniques may be applied to the data.

Model validation parameters

Analytical performance characteristics to be considered for demonstrating the validation of NIR methods are similar to those required for any analytical procedure. Specific acceptance criteria for each validation parameter must be consistent with the intended use of the method. Validation parameters for quantitative methods are accuracy, linearity, precision (repeatability and intermediate precision), robustness and specificity.

ONGOING MODEL EVALUATION

NIR models validated for use are subjected to ongoing performance evaluation and monitoring of validation parameters.

TRANSFER OF DATABASES

When databases are transferred to another instrument, spectral range, number of data points, spectral resolution and other parameters have to be taken into consideration. Further procedures and criteria must be applied to demonstrate that the model remains valid with the new database or new instrument.

B. Ultraviolet and Visible Absorption Spectrophotometry

(Ph. Eur. method 2.2.25)

PRINCIPLE

Ultraviolet and visible (UV-Vis) spectroscopy (or spectrophotometry) is based on the ability of atoms, molecules and ions to absorb light at specific wavelengths in the ultraviolet (approximately 180-400 nm) and visible (approximately 400-800 nm) range. This absorption is associated with changes in electronic energy in the form of temporary transitions of electrons to an excited state at a higher energy orbital. As each energy level of a molecule or molecular ion also has associated vibrational and rotational sub-levels, this results in many permitted transitions, which are generally impossible to separate, thereby producing absorption bands rather than sharp lines. These bands are characteristic of the functional groups and bonds in a molecule.

UV-Vis spectroscopy measurements involve exposing a sample to light and measuring the attenuation and/or scattering of the emerging (transmitted or reflected) light either at a single wavelength or over a specified wavelength range.

APPLICATIONS

UV-Vis spectroscopy is traditionally used for the quantitative and qualitative analysis of liquid samples, but is also suitable for solid and gaseous analytes and has other applications such as the determination of physical or chemical properties.

UV-Vis spectroscopy as described in this chapter can be applied in various ways:

- when a monograph or general chapter refers to this chapter, the requirements described in the relevant paragraphs of this chapter are mandatory;
- when used as the detection method in chromatographic systems as described in general chapter *2.2.46*, the requirements listed in the relevant paragraphs of this chapter are mandatory;
- when used as a process analytical technology (PAT) tool for PAT applications similar to the applications described in this chapter, the provisions herein apply; for other PAT applications, the principles are the same, however the criteria are established bearing in mind the intended purpose of the analysis, using a risk-based approach.

EQUIPMENT

Spectrophotometers used for carrying out measurements in the UV-Vis region typically consist of:

- a suitable light source (such as a deuterium lamp for the UV region, a tungsten-halogen lamp for the visible region or a xenon lamp to cover the entire UV-Vis range); UV-Vis spectrophotometers often have 2 sources;
- a monochromator such as a grating system;
- other optical components, such as lenses or mirrors, that relay light through the instrument and that may also be used to generate more than one beam of light, i.e. in double-beam spectrophotometers, as opposed to single-beam spectrophotometers;
- a sample container, holder or sampling device; examples include conventional cuvettes, fibre-optic probes and immersed transmission cells (e.g. high-purity quartz or sapphire transparent to UV-Vis radiation); the choice depends on the intended application, paying particular attention to its suitability for the type of sample to be analysed;
- a single-channel (e.g. photomultiplier, photodiode) or multi-channel detector (e.g. photodiode array (PDA) or charge-coupled device (CCD));
- suitable computerised data processing and evaluation systems.

Control of cuvettes

For benchtop instruments, cuvettes or cells with a defined path length are used. These can be made of different materials such as quartz or glass. The tolerance for the path length of quartz and glass cuvettes is ± 0.5 per cent (e.g. ± 0.005 cm for a 1 cm cuvette). Plastic cuvettes may also be used but the tolerance interval is wider; therefore, their use must be thoroughly justified and based on a risk assessment.

The following method may be applied to check the cleanliness of optical cuvette windows and any significant differences in their thickness or parallelism: fill the cuvette with *water R* and measure its apparent absorbance against air at 240 nm for quartz cuvettes and 650 nm for glass cuvettes; rotate the cuvette 180° in its holder and measure the apparent absorbance again at the same wavelength.

When using scanning instruments, it is recommended to scan over the optical region of interest.

When using double-beam spectrophotometers, measures should be taken (e.g. matching the cuvettes) to ensure that any difference between the absorbance of the cuvettes will not have a significant impact on the analysis to be performed.

Acceptance criteria:

- the apparent absorbance is not greater than 0.093 for 1 cm quartz cuvettes (UV region) and 0.035 for 1 cm glass cuvettes (visible region);
- the absorbance measured after rotation (180°) does not differ by more than 0.005 from the value previously obtained.

MEASUREMENT

Transmission mode

Transmission mode provides a measure of the transmittance (T), at a given UV-Vis wavelength, of a sample placed between the light source and the detector. Transmittance is the ratio of the intensity of the transmitted light to the intensity of the incident light and is given by the following equation:

$$T = \frac{I}{I_0}$$

I = intensity of transmitted radiation;
I_0 = intensity of incident radiation.

A spectrum may be obtained by plotting the variation in transmittance (T) or absorbance (A) as a function of wavelength.

The absorbance is defined as the logarithm to base 10 of the reciprocal of the transmittance for monochromatic radiation. It is a dimensionless quantity expressed in absorbance units (AU), given by the following equation:

$$A = \log_{10}\left(\frac{1}{T}\right) = \log_{10}\left(\frac{I_0}{I}\right)$$

According to the Beer-Lambert law, which applies to clear diluted solutions, in the absence of interfering physico-chemical factors, the absorbance (A) is proportional to the path length (l) of the radiation through the sample, and to the concentration (c) of the substance in solution in accordance with the following equation:

$$A = \varepsilon c l$$

ε = molar absorption coefficient, in litres per mole per centimetre;
c = molar concentration of the substance in solution, in moles per litre;
l = absorption path length, in centimetres.

The specific absorbance ($A_{1\ \text{cm}}^{1\ \text{per cent}}$) of the substance is generally used in monographs and is related to absorbance (A) as follows:

$$A = A_{1\ \text{cm}}^{1\ \text{per cent}} \times c_m \times l$$

c_m = mass concentration of the substance in solution, in grams per 100 millilitres.

$A_{1\ \text{cm}}^{1\ \text{per cent}}$ represents the specific absorbance of a dissolved substance and refers to the absorbance of a 1 g/100 mL (or 1 per cent *m/V*) solution in a 1 cm cuvette or cell and is measured at a defined wavelength. The relationship between $A_{1\ \text{cm}}^{1\ \text{per cent}}$ and ε is:

$$A_{1\ \text{cm}}^{1\ \text{per cent}} = \frac{10\varepsilon}{M_r}$$

M_r = relative molecular mass.

Transmittance or absorbance measurements are generally used for liquids (dispersions and solutions), but can also be used for solids (including tablets and capsules).
For measurements of solids, a suitable sample accessory is used. Liquid samples are examined using a cell or cuvette with a suitable path length (typically 0.01-1 cm) and made of a material that is transparent to UV-Vis radiation, or by using a fibre-optic probe of a suitable configuration immersed in the liquid.

Diffuse reflection mode

Diffuse reflection mode provides a measure of reflectance (R), which is given by the following equation:

$$R = \frac{I}{I_0}$$

I = intensity of light reflected and/or scattered from the sample;
I_0 = intensity of light reflected and/or scattered from a blank or reference reflective surface.

Depending on the chemical composition and physical characteristics of the sample, the UV-Vis radiation may be absorbed as it passes through the sample. In diffuse reflection mode, it is the non-absorbed radiation which is partially reflected and/or scattered back from the sample that is measured by the detector. UV-Vis reflectance spectra are typically obtained by calculating and plotting $\log_{10}(1/R)$ as a function of the wavelength.

This measurement mode is generally selected for solids. The sample is examined either in a suitable device (e.g. a sample holder) or in direct contact with a probe. For process monitoring, the material can be analysed through a polished window interface (e.g. quartz or sapphire), or in-line using a probe. Care must be taken to ensure that the measurement conditions are as reproducible as possible from one sample to another.

Operation of the equipment

The factors below affect the spectral response and must always be taken into account.

Choose a measurement mode that is appropriate for the intended application and the sample type.

Define the measuring conditions taking into account the sample size and sample probe in such a way as to obtain a satisfactory signal-to-noise ratio (e.g. beam size, measurement time and number of measurements). For scanning spectrophotometers, also select the scan range, scan rate and slit-width that provide the necessary optical resolution for the

Table 2.2.25.-1. – *Minimum tests to be carried out for the control of equipment performance*

Purpose	Method	Wavelength accuracy	Absorbance accuracy	Photometric linearity	Stray light	Resolution/spectral bandwidth
Quantitative or limit test	Based on measurement of the absorbance at one or more identified wavelengths (e.g. assay or impurities test)	X	X	X	X	If required in the monograph
Identification test	Based on wavelength of absorption maxima and minima	X	-	-	X	-
	Based on absorption measurement and wavelength of absorption maxima	X	X	-	X	-
	Based on comparison of spectrum with that of reference substance	X	X	-	-	-

intended application without losing the required signal-to-noise ratio or the linearity of the analytical method. When using spectrophotometers with array sensors, there is no need to adjust the beam size, scan range, scan rate or slit-width since the optical resolution is typically fixed and the full spectrum is always recorded.

Before an absorbance measurement is carried out, the zero position of the absorption (baseline correction) should be set or determined for the wavelengths of interest or over the appropriate range of wavelengths.

For PAT applications, when measuring moving materials or samples, ensure that there is no fouling of the sensor (e.g. no contamination or build-up of material).

Unless otherwise prescribed in the monograph, measure the absorbance using a path length of 1 cm at the prescribed wavelength. If a single value for the position of an absorption maximum or minimum is given in a monograph, the user must determine the wavelength position. The value obtained may differ by not more than ± 2 nm, unless otherwise prescribed.

Quantitative measurements relying on absorption values above 2.0 should be avoided.

Background correction

Select a suitable spectroscopic blank (e.g. air, blank solvent, solid material). Unless otherwise prescribed, all measurements are carried out with reference to the same solvent or the same mixture of solvents (blank).

Measure the blank and the sample within a short time-frame either in parallel in double-beam spectrophotometers or sequentially in single-beam spectrophotometers.

The absorbance values of both blank and sample must be in the working range of the equipment as specified by the manufacturer.

For benchtop instruments, the absorbance of the solvent measured against air and at the prescribed wavelength must not exceed 0.4 and is preferably less than 0.2.

For chromatographic systems, the transmittance of the mobile phase may be used as the blank.

In some PAT applications, it may be impossible to remove the probe for background data collection. Various options are therefore to be considered, including the use of internal references, measurement of a blank using a second detector, etc. Only spectra measured against a blank possessing the same optical properties can be directly compared with one another.

For reflectance measurements, common reflectance blank samples include ceramics, fluoropolymers such as polytetrafluoroethylene (PTFE) and powders such as barium sulfate ($BaSO_4$) and magnesium oxide (MgO), but other suitable materials may also be used.

MATHEMATICAL TREATMENT OF SPECTRAL DATA

In the case of single wavelength analysis used to determine the concentration of an unknown sample (e.g. as prescribed in monographs), mathematical treatment consists in determining the regression of the photometric reading (absorbance) on the concentration of the standard samples.

In the case of full range spectra, data for both diffuse reflection and transmission modes may have to be treated before a classification or calibration model can be developed. The aim can be, for example, to reduce baseline drift or to correct for scatter caused by particle size changes in solid samples. For example, first-, second- or higher-order derivative spectra can typically be used to improve resolution or sensitivity. This pretreatment may be a useful means of simplifying the data and thereby reducing the variations that may cause interference in subsequently applied mathematical models.

A wide range of treatment methods, such as scaling, smoothing, normalisation and derivatisation, can be applied either singly or in combination. More information is available in general chapter *5.21. Chemometric methods applied to analytical data.*

CONTROL OF EQUIPMENT PERFORMANCE

Spectrophotometer performance is controlled (automatically or manually) at regular intervals as defined in the quality management system and dictated by the use of the equipment and the application. For example, equipment exposed to variations in temperature and humidity may need more frequent performance testing.

Requirements for control of equipment performance for the various measurement modes are summarised in Table 2.2.25.-1. Further such tests may be performed if appropriate.

Wavelength accuracy, absorbance accuracy and linearity are controlled using either certified reference materials such as

solid filters or liquid filters in appropriate sealed cells, or solutions prepared in the laboratory as described below.

Control of wavelength accuracy

Control the wavelength accuracy of an appropriate number of bands in the intended spectral range using one or more reference materials; for example, use solid or liquid filters (e.g. *holmium perchlorate solution R*) to verify the position of absorption bands, or measure the emission from a light source to check emission-line position. Table 2.2.25.-2 shows examples of wavelengths used to check wavelength accuracy. When certified reference materials are used, the reference wavelength is that stated on the corresponding certificate.

Some instruments may have an automatic or inbuilt wavelength accuracy control feature.

Table 2.2.25.-2. – *Examples of wavelengths used for the control of wavelength accuracy* *Note: the wavelength varies with the resolution of the instrument

Material		Wavelengths (nm)*
Solutions	Cerium in sulfuric acid	201.1; 211.4; 222.6; 240.4; 253.7
	Didymium in perchloric acid	511.8; 731.6; 794.2
	Holmium in perchloric acid	241.1; 287.2; 361.3; 451.4; 485.2; 536.6; 640.5
Solid filters	Didymium glass	513.5
	Holmium glass	279.3; 360.9; 453.4; 637.5
Lamps	Deuterium	486.0; 656.1
	Mercury (low pressure)	184.9; 253.7; 312.5; 365.0; 404.7; 435.8; 546.1; 577.0; 579.1
	Neon	717.4
	Xenon	541.9; 688.2; 764.2

For chromatographic systems, it is also possible to control wavelength accuracy by measuring the absorbance of a 0.05 mg/mL solution of *caffeine R* in *methanol R*; the absorption maximum is obtained at 272 nm and the minimum at 244 nm.

Acceptance criteria

It is recommended to test at least 2 wavelengths that bracket the intended spectral range.

For benchtop instruments, the tolerance for wavelength accuracy of UV-Vis spectroscopy in cuvettes is ± 1 nm at wavelengths below 400 nm and ± 3 nm at wavelengths of 400 nm and above.

For chromatographic systems, the tolerance for wavelength accuracy is ± 2 nm for the whole UV-Vis range.

For PAT applications, a tolerance of ± 2 nm for the UV-Vis range is recommended. However, wider tolerance intervals may be needed for some PAT applications, in which case the requisite wavelength accuracy must be defined by the user depending on the intended purpose, and using a risk-based approach.

The instrument parameters (especially the entrance optics such as slit-width or optical fibre diameter) influence the resolution and must be the same as those intended for the actual measurements.

Control of absorbance accuracy

Control the absorbance accuracy at an appropriate number of wavelengths in the intended spectral range, using suitable solid or liquid filters to check that the absorbance measured at the test wavelength matches the certified absorbance of the filter or the absorbance value that is calculated from a certified specific absorbance. *Nicotinic acid for equipment qualification CRS* may be used.

It is recommended to test absorbance accuracy at selected wavelengths using one or more solid or liquid filters with different absorbance levels; as a minimum, values at approximately the 2 limits of the expected absorbance range should be verified.

For chromatographic systems and PAT applications, the testing of absolute absorbance accuracy may not be necessary, providing that a standard curve is measured as required.

For measurements using *nicotinic acid for equipment qualification CRS*, the certified specific absorbance is given in the corresponding leaflet.

The solution of nicotinic acid can be prepared as follows: dissolve 57.0-63.0 mg of *nicotinic acid for equipment qualification CRS* in a 0.1 M hydrochloric acid solution prepared from *hydrochloric acid R* and dilute to 200.0 mL with the same acid solution; dilute 2.0 mL of the solution to 50.0 mL with the same acid solution to obtain a final concentration of 12 mg/L. These volumes can be adjusted to obtain nicotinic acid solutions with other concentrations (up to about 40 mg/L), for the purposes of testing different absorbance levels. The absorbance is measured at 213 nm and 261 nm.

Acceptance criteria

The difference between the measured absorbance and the absorbance of the certified material is ± 0.010 or ± 1 per cent, whichever is greater, for each combination of wavelength and absorbance assessed (applies to absorbance values not greater than 2). Tolerances for higher absorbance values should be defined on the basis of a risk assessment.

Control of photometric linearity

Control the photometric linearity in the intended spectral range. In the ultraviolet range, the filters used to control absorbance accuracy may be used, as can solutions of nicotinic acid or caffeine. In the visible range, neutral glass filters may be used. Prior to performing the test, ensure that the absorbance of the standards is compatible with the intended linear range.

Solutions with increasing concentrations (e.g. 5-40 mg/L) of *nicotinic acid for equipment qualification CRS* in a 0.1 M hydrochloric acid solution prepared from *hydrochloric acid R* may be used. The absorbance is measured at 213 nm and 261 nm.

For chromatographic systems, it is also possible to check photometric linearity using 0.5-50 mg/L solutions of *caffeine R* in *water for chromatography R*. The absorbance is measured at 273 nm.

Acceptance criterion

The coefficient of determination (R) is not less than 0.999.

Limit of stray light

Stray light is determined at an appropriate wavelength using suitable solid or liquid filters or solutions prepared in-house. The instrument parameters used for the test, such as slit-width and type of light source (e.g. deuterium or tungsten lamp), must be the same as those intended for the actual measurements.

Acceptance criterion

The acceptance criterion depends on the filters or solutions used, for example:

— the absorbance is not less than 3.0 when using a 10 g/L solution of *sodium iodide R* at 220 nm, a 10 g/L solution of *potassium iodide R* at 250 nm or a 50 g/L solution of *sodium nitrite R* at 340 nm and 370 nm;

— the absorbance is not less than 2.0 when using a 12 g/L solution of *potassium chloride R* at 198 nm.

These values apply when using a 1 cm cell and *water R* as the compensation liquid.

Control of resolution

Where prescribed in a monograph, measure the resolution of the equipment either using suitable certified reference materials, or by recording the spectrum of a 0.02 per cent *V/V* solution of *toluene R* in *hexane R* or *heptane R*, with respectively *hexane R* or *heptane R* as the compensation liquid.

Acceptance criterion

For measurements taken with a solution prepared as described above, the minimum ratio of the absorbance at the maximum (269 nm) to that at the minimum (266 nm) is stated in the monograph.

SYSTEM SUITABILITY

System suitability tests may be required prior to sample measurement to verify critical parameters that may have an impact on the result.

These tests may cover wavelength accuracy, absorbance accuracy, stray light and photometric linearity. System functionality tests, for example those performed as part of equipment autotesting, may be considered part of the system suitability tests.

In the case of UV-Vis detection for chromatographic systems, additional system suitability tests are applicable if prescribed in the monograph and/or in general chapter *2.2.46. Chromatographic separation techniques.*

C. Nuclear Magnetic Resonance Spectrometry

(Ph. Eur. method 2.2.33)

INTRODUCTION

Nuclear magnetic resonance (NMR) spectrometry is an analytical method in particular suitable for the elucidation of the chemical structure of organic molecules by means of interpretation of their NMR spectra, arising from, for example, ^{1}H or the X-nuclei ^{13}C, ^{19}F, ^{15}N, ^{31}P. The spectra can be used for qualitative and quantitative purposes.

Under suitable experimental conditions, the integrated NMR intensities of the signals are directly proportional to the number of nuclear spins of the molecular group responsible for the signal. These integrals can be used for quantitative analysis.

GENERAL PRINCIPLES

Placing an ensemble of nuclei with angular momentum and a magnetic moment in a static magnetic field (B_0) causes the nuclei to arrange themselves in different, quantum-mechanically controlled orientations in relation to the axis of the magnetic field. These orientations are different in energy. An oscillating high-frequency magnetic field (B_1), perpendicular to B_0, will cause transitions between these orientations with net energy absorption. According to the resonance condition $\omega_0 = \gamma B_0$ (γ = gyromagnetic ratio, ω_0 = Larmor frequency), either the B_0 magnetic field or the frequency (ω_1) of the B_1 field may be varied to achieve a spectrum (continuous wave (CW) method). Nowadays the B_1 irradiation is achieved by the use of a radiofrequency (RF) pulse (Fourier transform (FT) method). The coherent radiation emitted during the return to the initial state is observed in the form of a decay curve, called the free induction decay (FID). Subsequent Fourier transformation gives the spectrum in the frequency domain, providing information about the molecular structure. Additional radiofrequency fields may be applied during acquisition of the FID signal to suppress scalar (through-bond) interactions between nuclei (called 'decoupling'). One- and multi-dimensional techniques can be applied for qualitative and quantitative purposes, on samples in either the liquid or the solid state.

Important structural information is derived from the following spectroscopic features:

resonance frequency	kind of nuclei observed
number of resonance signals (singlets, multiplets)	number of chemically distinct groups of nuclei
chemical shift δ (ppm)	chemical nature and environment of the structural group observed
intensity of resonance signals	relative number of resonant nuclei per chemically distinct group
multiplicity of coupling pattern	number of nuclei that are scalar coupled to the observed nucleus
coupling constant ^{n}J (Hz)	number of bonds in the coupling pathway, and its geometry

Correlations of different spectral parameters (e.g. chemical shift and coupling constant, or chemical shifts of different nuclei within one molecular system) can be performed by homo- and hetero-nuclear two- and higher-dimensional methods. Information about the relaxation times T_1 and T_2, nuclear Overhauser effects (NOEs) and the kinetics of time-dependent processes are also accessible from appropriate experiments.

APPARATUS

A high-resolution NMR spectrometer consists of at least the following parts:

— a magnet to deliver the constant magnetic field B_0;

— a temperature-controlled probe to contain the sample, to deliver the radiofrequency pulse and to detect radiation emitted by the sample;

— an electronic console to generate high-power radiofrequency pulses and to collect and digitise the FID signal; this unit also maintains the stability of the instrument electronics;

— a data acquisition and processing unit (computer);

and may also include:

— a continuous flow cell for coupled liquid chromatographic-NMR or flow injection analysis;

— a system for pulsed field gradient NMR.

The high magnetic field is generated by a superconducting coil in a Dewar flask filled with liquid helium. The probe typically contains the sample in a 5 mm-outer-diameter sample tube or in a flow cell, and is connected to the electronics cabinet by RF cables carrying lock, ^{1}H-, and X-nucleus frequencies. Additional devices for tuning and

matching the electronic circuits are essential, and sample temperature control is often used.

The NMR spectrometer should be demonstrated to be operating correctly. Appropriate tests to demonstrate this are, typically, measurement of linewidths at half height for defined peaks under defined acquisition conditions, signal-to-noise ratios (*S/N*) for standard mixtures, pulse power (measured as a 90° pulse width), and pulse reproducibility. All instrument manufacturers publish specifications and measurement protocols for these parameters for specific instrument/probe combinations, and compliance with these specifications should be demonstrated.

FOURIER TRANSFORM NMR (FT-NMR)

Contemporary spectrometers generally operate according to the Fourier transform (FT) principle: after exciting the sample with a radiofrequency pulse of appropriate frequency (ν), amplitude (B_1) and duration (τ_p) and a succeeding short dead time (t_d) (to enable the electronics to recover), the amplified analogue FID signal is sampled during the acquisition time (t_{ac}) and digitised with an analogue-to-digital converter (ADC), and the results are stored in the spectrometer memory. The receiver output is amplified prior to digitisation to maximise sensitivity without saturating the ADC. In case of observation of X-nuclei, the standard experiment includes, if necessary, broadband ^{1}H decoupling, i.e. irradiation of all the protons during the experiment. To increase the *S/N*, multiple FID signals may be accumulated coherently and summed. Fourier transformation of this time-domain data gives the frequency-domain spectrum.

PARAMETERS

The following acquisition parameters influence the result of an FT experiment, and should be adjusted and controlled.

Pulse width (τ_p)

The excitation pulse is directed along the x-axis of the so-called rotating frame, its duration (or 'width', τ_p) determines the flip angle (θ) and thus the intensity (*I*) of the resonance signal:

$$\theta = \gamma' \times B_1 \times \tau_p \quad (1)$$

$$M_y = M_o \times \sin\theta \quad (2)$$

The observed magnetisation M_y is maximum at θ = 90°. The pulse duration should be short to guarantee that all signals in the spectral width (*SW*) are excited to a similar degree. The magnetisation decays due to relaxation processes.

Dead time (t_d)

The dead time is the time between the end of the pulse and start of the acquisition, it is necessary for technical reasons and care should be taken as it may influence signal intensities and peak phase. Rapidly decaying signals (giving rise to broad spectral lines) are reduced in intensity by more than slowly decaying signals (which give rise to narrow spectral lines).

Acquisition time (t_{ac})

The acquisition time (t_{ac}) is related to the spectral width (i.e. the whole observed region) and the number of digital data points (*DP*) collected during signal acquisition.

$$t_{ac} = \frac{DP}{2SW} \quad (3)$$

Maximal signal intensity and signal-to-noise ratio will be achieved if $t_{ac} \approx 1.2/(\pi\nu_{1/2})$, where $\nu_{1/2}$ is the full width at half-height (*fwhh*), but it should be set to greater than $5/(\pi\nu_{1/2})$ to minimise signal distortion.

Repetition time (t_r)

The spin-lattice relaxation (T_1) governs the time required for the spin system to return to equilibrium after a pulse. Relaxation can be reduced by the use of special reagents. For quantitative purposes, the repetition time used should be set relative to T_1 and θ to avoid saturation effects.

Receiver gain

The analogue signal detected by the probe is amplified prior to digitisation and storage. The amplification, or receiver gain, should be set, either automatically or manually, so that the signal does not overload the ADC, which causes signal distortion, but allows random noise generated in the probe to be digitised (i.e. is non-zero).

OPTIMISATION OF ACQUISITION AND PROCESSING PARAMETERS FOR QUANTITATIVE PURPOSES

Besides the acquisition parameters, signal intensity is also influenced by several processing parameters. After collecting a sufficient number of scans, the resulting FID is Fourier transformed. For reliable quantitative purposes the following parameters have to be optimised.

Digital resolution

The digital resolution is the frequency separation between data points. The processed signal should have at least 5 digital points above half-height of the signals to be integrated. To improve the digital resolution additional points of zero intensity may be added to the end of the experimental FID before transformation ('zero filling').

Signal-to-noise ratio (*S/N*)

This is the ratio between the intensities (as peak height) of a specified signal in the NMR spectrum and the random fluctuations in that signal, which is usually measured in a region of the spectrum that contains no signals from the analyte. A poor signal-to-noise ratio (*S/N*) limits the accuracy of peak integrations and quantitative analyses. An *S/N* equal to or greater than 150:1 allows peak integrations with a standard deviation of less than 1 per cent. Contemporary spectrometers have software algorithms to report the *S/N* of appropriate peaks. A sufficiently high *S/N* can be difficult to obtain when analysing dilute solutions, and especially when detecting nuclei other than ^{1}H. Methods to enhance the *S/N* include:

- — increasing the number of accumulated scans (*n*), as *S/N* increases with $\sqrt{n}$;
- — use of exponentional multiplication on the FID signal before Fourier transformation; the exponentional multiplication factor should be in the order of the peak full width at half-height (*fwhh*);
- — use of spectrometers with a higher magnetic field B_0, since *S/N* is proportional to $B_0^{3/2}$;
- — use of digital filtering to reduce noise;
- — use of probes that maximise the filling factor;
- — use of cryoprobes that reduce thermal noise.

Integration region

The intensity of the NMR signals is obtained by a quasi-analogue signal integration either by a stepped-line plot or, more accurately, by separate line integration and digital data presentation. In liquid state, NMR signals have Lorentzian line shape. Unless otherwise specified in the monograph or when peak overlap occurs, the same integration range,

expressed as a multiple of the peak *fwhh*, should be used for the monitored peak and the reference peak.

Dynamic range

The dynamic range of the analogue-to-digital converter (ADC) determines the minimum intensity line that can be observed or quantified when integrating 2 signals with the same linewidth in a spectrum. A 16-bit ADC allows identification of a signal of 0.003 per cent intensity relative to a strong signal completely filling the dynamic range of the ADC.

NMR OF SAMPLES IN SOLUTION

Most NMR experiments are performed on dilute solutions (about 1 per cent) of the analyte in an appropriate solvent, which can be spiked with a suitable standard for chemical shift calibration.

Solvents

The solvent should be able to dissolve the analyte without further interaction if not otherwise intended. To minimise the intense solvent signals, fully deuterated solvents (*deuterium oxide R*, *deuterated chloroform R*, *deuterated dimethyl sulfoxide R*, *deuterated acetone R*, *deuterated methanol R*, etc.) should be used. The solvent atoms give signals that are easily identified by their chemical shift and can be used to calibrate the chemical shift axis (secondary reference).

Referencing

The spectral feature most dependent on the chemical environment of the atom in the molecule is the chemical shift, designated as δ and reported in parts per million. The chemical shift between the resonance for an NMR active nucleus X ($\delta_{X,sample}$) is measured in parts per million as the difference between the resonance frequency of that nucleus ($\nu_{X,sample}$) and that of an internal shift reference standard ($\nu_{X,reference}$), both in hertz, divided by the basic spectrometer operating frequency ($\nu_{X,reference}$), in megahertz, at a given B_0:

$$\delta_{X,sample} = \frac{(\nu_{X,sample} - \nu_{X,reference})}{\nu_{X,reference}} \quad (4)$$

By convention, the standard for exact chemical shift referencing is the ^{1}H resonance of *tetramethylsilane R* (TMS), setting $\delta_{TMS} = 0$ ppm. Formally, once the ^{1}H shift scale has been referenced relative to TMS, the exact frequency of any other X resonance can be calculated and its chemical shift scale calibrated. The frequency of a (secondary) reference standard at $\delta_X = 0$ ppm ($\nu_{X,reference}$) is calculated from the ^{1}H frequency of TMS ($\nu_{H,TMS}$) and a tabulated value of the ratio ($\Xi_{X,reference}$) of the isotope-specific frequency in relation to that of ^{1}H in TMS:

$$\nu_{X,reference} = \nu_{H,TMS} \times \Xi_{X,reference} \quad (5)$$

Reference standards at $\delta_X = 0$ ppm and corresponding $\Xi_{X,reference}$ values are shown below:

Nucleus	Water[a]	$\Xi_{X,reference}$	Other solvents	$\Xi_{X,reference}$
^{1}H	DSS[b]	1.00000000	TMS	1.00000000
^{13}C	DSS[b]	0.25144953	TMS	0.25145020
^{15}N	NH_3	0.10132912	CH_3NO_2	0.10136767
^{19}F	CF_3COOH	not reported	CCl_3F	0.94094011
^{31}P	H_3PO_4 (85 per cent)	0.40480742	$(CH_3O)_3PO$	0.40480864
[a]chemical shift depends on pH				
[b]DSS = sodium 2,2-dimethyl-2-silapentane-5-sulfonate				

In practice, X chemical shifts are referenced directly using an appropriate standard. In ^{1}H and ^{13}C NMR, internal referencing is mainly used, where the reference is added directly to the system under study. In ^{15}N, ^{19}F and ^{31}P NMR, external referencing is often suitable, involving sample and reference contained separately in coaxial cylindrical sample tubes.

Lock

In order to prevent drifting of the spectrum over time, a stabilising procedure, called field-frequency locking, is performed. The ^{2}H (deuterium) signal arising from deuterated solvents is used to achieve this, unless otherwise specified in the monograph.

QUALITATIVE ANALYSIS

The principal use for qualitative NMR spectra is as an identity test, in which the ^{1}H or ^{13}C spectrum of a test sample is compared to the spectrum of a reference sample or, less commonly, with a published reference spectrum. Spectra of reference and test samples should be acquired using the same procedure and operational conditions. The peaks in the 2 spectra, or characteristic regions of the spectra, should correspond in position, intensity and multiplicity.

In appropriate cases, mathematical comparison, such as calculation of a correlation coefficient, may be appropriate.

In the absence of a reference standard, an in-house reference may be used, whose identity has been demonstrated by alternative methods, or the demonstration that the NMR spectrum is fully consistent with the reported structure for that material.

QUANTITATIVE ANALYSIS

Signal intensity in the basic NMR experiment is the integrated area under the signal curve measured. Only when 2 signals have equal *fwhh* and the same multiplicity may signal height serve as a measure of intensity. Under conditions of essentially complete relaxation between scans, the signal intensity (I_A) is a true measure of the number (N_A) of nuclei responsible for the respective signal:

$$I_A = K_S \times N_A \quad (6)$$

The constant K_S includes fundamental constants, properties of the sample and receiver parameters, and can be omitted in cases where signal intensities are compared, giving the direct relation between the numbers of nuclei in the 2 compared structure groups A and B:

$$\frac{I_A}{I_B} = \frac{N_A}{N_B} \quad (7)$$

The numbers (N_i) of nuclei belonging to different structure groups of 1 molecule are small integers. The values measured are rounded to the closest integer numbers. However, the proper operation of acquisition and processing of the spectrometer is easily checked by comparing exact intensities within a spectrum of any suitable organic compound of known structure.

In addition to the fact that the intensities of signals arising from each component in a mixture are related to each other by small integer numbers, the relative molar amounts of these components can be measured by comparison of the normalised intensities of resonances from different components. The molar ratio of 2 components of a mixture is calculated according to the following equation:

$$\frac{n_A}{n_B} = \frac{I_A}{I_B} \times \frac{N_B}{N_A} \qquad (8)$$

The determination is only valid in cases where the structure of the molecules for which I_A and I_B are determined are known (or at least the values of N for the monitored groups). Determinations are made using either an internal standard method or a peak-normalisation procedure.

Internal standard method

The mass (m_A) of an analyte (A) can be determined if a known mass (m_B) of a substance (B) with a known percentage content (P_B) is added to the solution as an intensity standard. Equation (8) can be converted to equation (9):

$$m_A = \frac{I_A}{I_B} \times \frac{N_B}{N_A} \times \frac{M_A}{M_B} \times m_B \times \frac{P_B}{100} \qquad (9)$$

Here, M_i are the molecular masses.

The intensity standard has to be carefully chosen; it should be completely soluble in the solvent used for the analyte, should produce only a small number of signals, and the 'monitor group' should have a signal in an empty spectral region. A compound of high purity and with a relatively high molecular mass is recommended for this purpose.

Normalisation procedure

The relative proportions of components in a mixture, the degree of substitution in a structurally modified polymer, or the amount of a contaminant can be determined by comparison of the relative intensities of resonances present.

The experimental method should be validated to ensure that there is no overlap of the relevant signals. When the contaminant is of poorly defined structure or molecular mass (e.g. an emulsifier), addition of known amounts of that material to the NMR tube will allow a calibration curve to be constructed.

METHOD

Sample handling

Dissolve the sample in the solvent to which the appropriate reference material may have been added to calibrate chemical shift, as prescribed in the monograph. For quantitative analysis, the solutions must be free from solid particles. Some quantitative analyses may require an internal standard to be included, so that integrations of resonances from the test sample and the reference material can be compared. Appropriate references and concentrations are indicated in the specific monographs. In other quantitative analyses, the result is obtained by comparing the relative intensities of 2 or all of the resonances that arise from the test sample. After loading the sample into a tube and capping, the sample is introduced into the NMR magnet, the experimental parameters are loaded and the experiment is executed. Key experimental parameters are indicated in the monograph.

The measurement procedure

Equilibrate the sample in the probe, and optimise the instrument to achieve best resonance conditions and to maximise the *S/N* by tuning and matching the probe, and make adjustments to maximise magnetic field homogeneity over the sample volume (called 'shimming'). Record, or save to computer, the parameter settings. An experiment may be composed of multiple pulse-acquisition-delay sequences, and the individual FIDs are summed in the computer memory, with random noise being averaged out. When an appropriate *S/N* has been achieved, the FID is stored and the frequency-domain spectrum is generated by Fourier transformation of the summed FIDs.

NMR IN THE SOLID STATE

Samples in the solid state can be analysed using NMR spectrometers specially equipped for that purpose. Certain technical procedures make observable individual lines for individual atomic sites with a valuable extension of the applicability of NMR to inorganic materials as well.

One technique is the rapid rotation (4-30 kHz) of the powdered sample in a rotor (about 4 mm outer diameter) inclined at an angle of 54.7° (the 'magic angle') to the direction of the B_0 magnetic field axis. This technique is named magic angle spinning (MAS). Another effective tool is high-power decoupling and a 3rd method is the transfer of polarisation from easily excitable nuclei towards less-polarisable nuclei, i.e. cross polarisation (CP).

The combination of these techniques makes available high-resolution spectra containing much information about chemical and structural details in solid glassy, amorphous, and crystalline materials of ceramic, polymeric or mineralogical origin.

If NMR is applied to a solid, full details of the procedure are provided in the monograph.

D. Atomic Spectrophotometry: Emission and Absorption

Atomic Emission Spectrometry

(Ph. Eur. method 2.2.22)

GENERAL PRINCIPLE

Atomic emission is a process that occurs when electromagnetic radiation is emitted by excited atoms or ions. In atomic emission spectrometry the sample is subjected to temperatures high enough to cause not only dissociation into atoms, but also to cause significant amounts of collisional excitation and ionisation of the sample atoms to take place. Once the atoms and ions are in the excited states, they can decay to lower states through thermal or radiative (emission) energy transitions and electromagnetic radiation is emitted. An emission spectrum of an element contains several more lines than the corresponding absorption spectrum.

Atomic emission spectrometry is a technique for determining the concentration of an element in a sample by measuring the intensity of one of the emission lines of the atomic vapour of the element generated from the sample. The determination is carried out at the wavelength corresponding to this emission line.

In this chapter only atomisation in flame is dealt with. The method of inductively coupled plasma-atomic emission spectrometry (ICP-AES) is described in a different general chapter.

APPARATUS

This consists essentially of:
— a sample introduction and nebulisation system;
— a flame to generate the atoms to be determined;
— a monochromator;
— a detector;
— a data-acquisition unit.

Oxygen, air and a combustible gas such as hydrogen, acetylene, propane or butane may be used in flames. The atomisation source is critical, since it must provide sufficient energy to excite and atomise the atoms. The atomic spectra emitted from flames have the advantage of being simpler than those emitted from other sources, the main limitation being that the flames are not powerful enough to cause emission for many elements allowing their determination. Acidified water is the solvent of choice for preparing test and reference solutions, although organic solvents may also be used if precautions are taken to ensure that the solvent does not interfere with the stability of the flame.

INTERFERENCES

Spectral interference is reduced or eliminated by choosing an appropriate emission line for measurement or by adjusting the slit for spectral band-width. Physical interference is corrected by diluting the sample solution, by matching the matrix or by using the method of standard additions. Chemical interference is reduced by using chemical modifiers or ionisation buffers.

MEMORY EFFECT

The memory effect caused by deposit of analyte in the apparatus may be limited by thoroughly rinsing between runs, diluting the solutions to be measured if possible and thus reducing their salt content, and by aspirating the solutions through as swiftly as possible.

METHOD

Use of plastic labware is recommended wherever possible.

Operate an atomic emission spectrometer in accordance with the manufacturer's instructions at the prescribed wavelength. Optimise the experimental conditions (flame temperature, burner adjustment, use of an ionic buffer, concentration of solutions) for the specific element to be analysed and in respect of the sample matrix. Introduce a blank solution into the atomic generator and adjust the instrument reading to zero or to its blank value. Introduce the most concentrated reference solution and adjust the sensitivity to obtain a suitable reading.

It is preferable to use concentrations which fall within the linear part of the calibration curve. If this is not possible, the calibration plots may also be curved and are then to be applied with appropriate calibration software.

Determinations are made by comparison with reference solutions with known concentrations of the element to be determined either by the method of direct calibration (Method I) or the method of standard additions (Method II).

METHOD I - DIRECT CALIBRATION

For routine measurements 3 reference solutions of the element to be determined and a blank are prepared and examined.

Prepare the solution of the substance to be examined (test solution) as prescribed in the monograph. Prepare not fewer than 3 reference solutions of the element to be determined, the concentrations of which span the expected value in the test solution. For assay purposes, optimal calibration levels are between 0.7 and 1.3 times the expected content of the element to be determined or the limit prescribed in the monograph. For purity determination, calibration levels are between the limit of detection and 1.2 times the limit specified for the element to be determined. Any reagents used in the preparation of the test solution are added to the reference solutions and to the blank solution at the same concentration.

Introduce each of the solutions into the instrument using the same number of replicates for each solution, to obtain a steady reading.

Calculation

Prepare a calibration curve from the mean of the readings obtained with the reference solutions by plotting the means as a function of concentration. Determine the concentration of the element in the test solution from the curve obtained.

METHOD II - STANDARD ADDITIONS

Add to at least 3 similar volumetric flasks equal volumes of the solution of the substance to be examined (test solution) prepared as prescribed. Add to all but 1 of the flasks progressively larger volumes of a reference solution containing a known concentration of the element to be determined to produce a series of solutions containing steadily increasing concentrations of that element known to give responses in the linear part of the curve, if at all possible. Dilute the contents of each flask to volume with solvent.

Introduce each of the solutions into the instrument using the same number of replicates for each solution, to obtain a steady reading.

Calculation

Calculate the linear equation of the graph using a least-squares fit, and derive from it the concentration of the element to be determined in the test solution.

VALIDATION OF THE METHOD

Satisfactory performance of methods prescribed in monographs is verified at suitable time intervals.

LINEARITY

Prepare and analyse not fewer than 4 reference solutions over the calibration range and a blank solution. Perform not fewer than 5 replicates.

The calibration curve is calculated by least-square regression from all measured data. The regression curve, the means, the measured data and the confidence interval of the calibration curve are plotted. The operating method is valid when:
— the correlation coefficient is at least 0.99,
— the residuals of each calibration level are randomly distributed around the calibration curve.

Calculate the mean and relative standard deviation for the lowest and highest calibration level.

When the ratio of the estimated standard deviation of the lowest and the highest calibration level is less than 0.5 or greater than 2.0, a more precise estimation of the calibration curve may be obtained using weighted linear regression. Both linear and quadratic weighting functions are applied to the data to find the most appropriate weighting function to be employed. If the means compared to the calibration curve show a deviation from linearity, two-dimensional linear regression is used.

ACCURACY

Verify the accuracy preferably by using a certified reference material (CRM). Where this is not possible, perform a test for recovery.

Recovery

For assay determinations a recovery of 90 per cent to 110 per cent is to be obtained. For other determinations, for example for trace element determination, the test is not valid if recovery is outside of the range 80 per cent to 120 per cent at the theoretical value. Recovery may be determined on a suitable reference solution (matrix solution) which is spiked with a known quantity of analyte (middle concentration of the calibration range).

REPEATABILITY

The repeatability is not greater than 3 per cent for an assay and not greater than 5 per cent for an impurity test.

LIMIT OF QUANTIFICATION

Verify that the limit of quantification (for example, determined using the 10 σ approach) is below the value to be measured.

Inductively Coupled Plasma-atomic Emission Spectrometry

(Ph. Eur. method 2.2.57)

GENERAL PRINCIPLE

Inductively coupled plasma-atomic emission spectrometry (ICP-AES) is an atomic emission spectrometry method that uses an inductively coupled plasma (ICP) as the excitation source.

An ICP is a highly ionised inert gas (usually argon) with equal numbers of electrons and ions sustained by a radio-frequency (RF) field. The high temperature reached in the plasma successively desolvates, vaporises, excites - atomic emission spectrometry (AES) detection - and ionises - mass spectrometry (MS) detection - atoms from the sample. Detection limits are, generally, in the lower nanogram (ICP-MS) to microgram (ICP-AES) per litre range.

The plasma is formed by a tangential stream of support gas through a 'torch', i.e. a system consisting of 3 concentric quartz tubes. A metal coil (the load coil) surrounds the top end of the torch and is connected to a radio-frequency (RF) generator. Power (usually 700-1500 W) is applied through the coil and an oscillating magnetic field corresponding to the frequency of the generator (in most cases 27 MHz, 40 MHz) is formed. The plasma forms when the support gas is made conductive by exposing it to an electric discharge, which produces seed electrons and ions. Inside the induced magnetic field, the charged particles (electrons and ions) are forced to flow in a closed annular path. As they meet resistance to their flow, heating takes place producing additional ionisation. The process occurs almost instantaneously, and the plasma expands to its full strength and dimensions. The radio-frequency oscillation of the power applied through the coil causes radio-frequency electric and magnetic fields to be set up in the area at the top of the torch. When a spark (produced by a Tesla tube or some other seeding device) is applied to the support gas flowing through the torch, some electrons are stripped from the support gas atoms. These electrons are then caught up in the magnetic field and accelerated. Adding energy to the electrons by the use of a coil is known as inductive coupling. These high-energy electrons in turn collide with other support-gas atoms, stripping off still more electrons. The collisional ionisation of the support gas continues in a chain reaction, breaking down the gas into a physical plasma consisting of support-gas atoms, electrons and support-gas ions. The plasma is then sustained within the torch and load coil as radio-frequency energy is continually transferred to it through the inductive coupling process.

The ICP appears as an intense, very bright, plume-shaped plasma. At the base the plasma is toroidal, and this is referred to as the induction region (IR), i.e. the region in which the inductive energy transfer from the load coil to the plasma takes place. The sample is introduced through the induction region into the centre of the plasma.

APPARATUS

The apparatus consists essentially of the following elements:

- sample-introduction system consisting of a peristaltic pump delivering the solution at constant flow rate into a nebuliser;
- radio-frequency (RF) generator;
- plasma torch;
- transfer optics focussing the image of the plasma at the entrance slit of the spectrometer; radial viewing is better for difficult matrices (alkalis, organics), whereas axial viewing gives more intensity and better detection limits in simple matrices;
- wavelength dispersive devices consisting of diffraction gratings, prisms, filters or interferometers;
- detectors converting radiant energy into electrical energy;
- data-acquisition unit.

INTERFERENCE

Interference is anything that causes the signal from an analyte in a sample to be different from the signal for the same concentration of that analyte in a calibration solution. The well-known chemical interference that is encountered in flame atomic absorption spectrometry is usually weak in ICP-AES. In rare cases where interference occurs, it may be necessary to increase the RF power or to reduce the inner support-gas flow to eliminate it. The interference in ICP-AES can be of spectral origin or even the result of high concentrations of certain elements or matrix compounds. Physical interference (due to differences in viscosity and surface tension of the sample and calibration standards) can be minimised by dilution of the sample, matrix matching, use of internal standards or through application of the method of standard additions.

Another type of interference occasionally encountered in ICP-AES is the so-called 'easily ionised elements (EIEs) effect'. The EIEs are those elements that are ionised much more easily, for example alkaline metals and alkaline earths. In samples that contain high concentrations of EIEs (more than 0.1 per cent), suppression or enhancement of emission signals is likely to occur.

Spectral interference

This may be due to other lines or shifts in background intensity. These lines may correspond to argon (observed above 300 nm), OH bands due to the decomposition of water (at about 300 nm), NO bands due to the interaction of the plasma with the ambient air (between 200 nm and 300 nm), and other elements in the sample, especially those present at high concentrations. The interference falls into 4 different categories: simple background shift, sloping background shift, direct spectral overlap, and complex background shift.

Absorption interference

This arises when part of the emission from an analyte is absorbed before it reaches the detector. This effect is observed particularly when the concentration of a strongly

emitting element is so high that the atoms or ions of that element that are in the lower energy state of transition absorb significant amounts of the radiation emitted by the relevant excited species. This effect, known as self-absorption, determines the upper end of the linear working range for a given emission line.

Multicomponent spectral fitting

Multiple emission-line determinations are commonly used to overcome problems with spectral interferences. A better, more accurate method for performing spectral interference corrections is to use the information obtained with advanced detector systems through multicomponent spectral fitting. This quantifies not only the interference, but also the background contribution from the matrix, thereby creating a correction formula. Multicomponent spectral fitting utilises a multiple linear-squares model based on the analysis of pure analyte, the matrix and the blank, creating an interference-corrected mathematical model. This permits the determination of the analyte emission in a complex matrix with improved detection limits and accuracy.

PROCEDURE

SAMPLE PREPARATION AND SAMPLE INTRODUCTION

The basic goal for the sample preparation is to ensure that the analyte concentration falls within the working range of the instrument through dilution or preconcentration, and that the sample-containing solution can be nebulised in a reproducible manner.

Several sample-introduction systems tolerate high acid concentrations, but the use of sulfuric and phosphoric acids can contribute to background emission observed in the ICP spectra. Therefore, nitric and hydrochloric acids are preferable. The availability of hydrofluoric acid-resistant (for example perfluoroalkoxy polymer) sample-introduction systems and torches also allows the use of hydrofluoric acid. In selecting a sample-introduction method, the requirements for sensitivity, stability, speed, sample size, corrosion resistance and resistance to clogging have to be considered. The use of a cross-flow nebuliser combined with a spray chamber and torch is suitable for most requirements. The peristaltic pumps used for ICP-AES usually deliver the standard and sample solutions at a rate of 1 mL/min or less.

In the case of organic solvents being used, the introduction of oxygen must be considered to avoid organic layers.

CHOICE OF OPERATING CONDITIONS

The standard operating conditions prescribed by the manufacturer are to be followed. Usually, different sets of operating conditions are used for aqueous solutions and for organic solvents. Suitable operating parameters are to be properly chosen:

- wavelength selection;
- support-gas flow rates (outer, intermediate and inner tubes of the torch);
- RF power;
- viewing position (radial or axial);
- pump speed;
- conditions for the detector (gain/voltage for photomultiplier tube detectors, others for array detectors);
- integration time (time set to measure the emission intensity at each wavelength).

CONTROL OF INSTRUMENT PERFORMANCE

System suitability

The following tests may be carried out with a multi-element control solution to ensure the adequate performance of the ICP-AES system:

- energy transfer (generator, torch, plasma); measurement of the ratio Mg II (280.270 nm)/Mg I (285.213 nm) may be used;
- sample transfer, by checking nebuliser efficiency and stability;
- resolution (optical system), by measuring peak widths at half height, for example As (189.042 nm), Mn (257.610 nm), Cu (324.754 nm) or Ba (455.403 nm);
- analytical performance, by calculating detection limits of selected elements over the wavelength range.

VALIDATION OF THE METHOD

Satisfactory performance of methods prescribed in monographs is verified at suitable time intervals.

LINEARITY

Prepare and analyse not fewer than 4 reference solutions over the calibration range plus a blank. Perform not fewer than 5 replicates.

The calibration curve is calculated by least-square regression from all measured data of the calibration test. The regression curve, the means, the measured data and the confidence interval of the calibration curve are plotted. The operating method is valid when:

- the correlation coefficient is at least 0.99;
- the residuals of each calibration level are randomly distributed around the calibration curve.

Calculate the mean and relative standard deviation for the lowest and for the highest calibration level.

When the ratio of the estimated standard deviations of the lowest and the highest calibration level is less than 0.5 or greater than 2.0, a more precise estimation of the calibration curve may be obtained using weighted linear regression. Both linear and quadratic weighting functions are applied to the data to find the most appropriate weighting function to be employed.

If the means compared to the calibration curve show a deviation from linearity, two-dimensional linear regression is used.

ACCURACY

Verify the accuracy preferably by using a certified reference material (CRM). Where this is not possible, perform a test for recovery.

Recovery

For assay determinations a recovery of 90 per cent to 110 per cent is to be obtained. The test is not valid if recovery, for example for trace-element determination, is outside of the range 80 per cent to 120 per cent of the theoretical value. Recovery may be determined on a suitable reference solution (matrix solution) spiked with a known quantity of analyte (concentration range that is relevant to the samples to be determined).

REPEATABILITY

The repeatability is not greater than 3 per cent for an assay and not greater than 5 per cent for an impurity test.

LIMIT OF QUANTIFICATION

Verify that the limit of quantification (for example, determined using the 10 σ approach) is below the value to be measured.

Atomic Absorption Spectrometry

(Ph. Eur. method 2.2.23)

GENERAL PRINCIPLE

Atomic absorption is a process that occurs when a ground state-atom absorbs electromagnetic radiation of a specific wavelength and is elevated to an excited state. The atoms in the ground state absorb energy at their resonant frequency and the electromagnetic radiation is attenuated due to resonance absorption. The energy absorption is virtually a direct function of the number of atoms present.

This chapter provides general information and defines the procedures used in element determinations by atomic absorption spectrometry, either atomisation by flame, by electrothermal vaporisation in a graphite furnace, by hydride generation or by cold vapour technique for mercury.

Atomic absorption spectrometry is a technique for determining the concentration of an element in a sample by measuring the absorption of electromagnetic radiation by the atomic vapour of the element generated from the sample. The determination is carried out at the wavelength of one of the absorption (resonance) lines of the element concerned. The amount of radiation absorbed is, according to the Lambert-Beer law, proportional to the element concentration.

APPARATUS

This consists essentially of:
— a source of radiation;
— a sample introduction device;
— a sample atomiser;
— a monochromator or polychromator;
— a detector;
— a data-acquisition unit.

The apparatus is usually equipped with a background correction system. Hollow-cathode lamps and electrodeless discharge lamps (EDL) are used as radiation source. The emission of such lamps consists of a spectrum showing very narrow lines with half-width of about 0.002 nm of the element being determined.

There are 3 types of sample atomisers:
— Flame technique

A flame atomiser is composed of a nebulisation system with a pneumatic aerosol production accessory, a gas-flow regulation and a burner. Fuel-oxidant mixtures are commonly used to produce a range of temperatures from about 2000 K to 3000 K. Fuel gases include propane, hydrogen and acetylene; air and nitrous oxide are used as oxidants. The configuration of the burner is adapted to the gases used and the gas flow is adjustable. Samples are nebulised, acidified water being the solvent of choice for preparing test and reference solutions. Organic solvents may also be used if precautions are taken to ensure that the solvent does not interfere with the stability of the flame.

— Electrothermal atomisation technique

An electrothermal atomiser is generally composed of a graphite tube furnace and an electric power source. Electrothermal atomisation in a graphite tube furnace atomises the entire sample and retains the atomic vapour in the light path for an extended period. This improves the detection limit. Samples, liquid as well as solid, are introduced directly into the graphite tube furnace, which is heated in a programmed series of steps to dry the sample and remove major matrix components by pyrolysis and to then atomise all of the analyte. The furnace is cleaned using a final temperature higher than the atomisation temperature. The flow of an inert gas during the pyrolysis step in the graphite tube furnace allows a better performance of the subsequent atomisation process.

— Cold vapour and hydride technique

The atomic vapour may also be generated outside the spectrometer. This is notably the case for the cold-vapour method for mercury or for certain hydride-forming elements such as arsenic, antimony, bismuth, selenium and tin. For mercury, atoms are generated by chemical reduction with stannous chloride or sodium borohydride and the atomic vapour is swept by a stream of an inert gas into a cold quartz cell mounted in the optical path of the instrument. Hydrides thus generated are swept by an inert gas into a heated cell in which they are dissociated into atoms.

INTERFERENCES

Chemical, physical, ionisation and spectral interferences are encountered in atomic absorption measurements. Chemical interference is compensated by addition of matrix modifiers, of releasing agents or by using high temperature produced by a nitrous oxide-acetylene flame; the use of specific ionisation buffers (for example, lanthanum and caesium) compensates for ionisation interference; by dilution of the sample, through the method of standard additions or by matrix matching, physical interference due to high salt content or viscosity is eliminated. Spectral interference results from the overlapping of resonance lines and can be avoided by using a different resonance line. The use of Zeeman background correction also compensates for spectral interference and interferences from molecular absorption, especially when using the electrothermal atomisation technique. The use of multi-element hollow-cathode lamps may also cause spectral interference. Specific or non-specific absorption is measured in a spectral range defined by the band-width selected by the monochromator (0.2-2 nm).

BACKGROUND CORRECTION

Scatter and background in the flame or the electrothermal atomisation technique increase the measured absorbance values. Background absorption covers a large range of wavelengths, whereas atomic absorption takes place in a very narrow wavelength range of about 0.005-0.02 nm. Background absorption can in principle be corrected by using a blank solution of exactly the same composition as the sample, but without the specific element to be determined, although this method is frequently impracticable. With the electrothermal atomisation technique the pyrolysis temperature is to be optimised to eliminate the matrix decomposition products causing background absorption. Background correction can also be made by using 2 different light sources, the hollow-cathode lamp that measures the total absorption (element + background) and a deuterium lamp with a continuum emission from which the background absorption is measured. Background is corrected by subtracting the deuterium lamp signal from the hollow-cathode lamp signal. This method is limited in the spectral range on account of the spectra emitted by a deuterium lamp from 190-400 nm. Background can also be measured by taking readings at a non-absorbing line near the resonance line and then subtracting the results from the measurement at the resonance line. Another method for the correction of background absorption is the Zeeman effect (based on the Zeeman splitting of the absorption line in a magnetic field). This is particularly useful when the background absorption shows fine structure. It permits an efficient background correction in the range of 185-900 nm.

CHOICE OF THE OPERATING CONDITIONS

After selecting the suitable wavelength and slit width for the specific element, the need for the following has to be ascertained:

- — correction for non-specific background absorption,
- — chemical modifiers or ionisation buffers to be added to the sample as well as to blank and reference solutions,
- — dilution of the sample to minimise, for example, physical interferences,
- — details of the temperature programme, preheating, drying, pyrolysis, atomisation, post-atomisation with ramp and hold times,
- — inert gas flow,
- — matrix modifiers for electrothermal atomisation (furnace),
- — chemical reducing reagents for measurements of mercury or other hydride-forming elements along with cold vapour cell or heating cell temperature,
- — specification of furnace design (tank, L'vov platform, etc).

METHOD

Use of plastic labware is recommended wherever possible. The preparation of the sample may require a dissolution, a digestion (mostly microwave-assisted), an ignition step or a combination thereof in order to clear up the sample matrix and/or to remove carbon-containing material. If operating in an open system, the ignition temperature should not exceed 600 °C, due to the volatility of some metals, unless otherwise stated in the monograph.

Operate an atomic absorption spectrometer in accordance with the manufacturer's instructions at the prescribed wavelength. Introduce a blank solution into the atomic generator and adjust the instrument reading so that it indicates maximum transmission. The blank value may be determined by using solvent to zero the apparatus. Introduce the most concentrated reference solution and adjust the sensitivity to obtain a maximum absorbance reading. Rinse in order to avoid contamination and memory effects. After completing the analysis, rinse with *water R* or acidified water.

If a solid sampling technique is applied, full details of the procedure are provided in the monograph.

Ensure that the concentrations to be determined fall preferably within the linear part of the calibration curve. If this is not possible, the calibration plots may also be curved and are then to be applied with appropriate calibration software.

Determinations are made by comparison with reference solutions with known concentrations of the element to be determined either by the method of direct calibration (Method I) or the method of standard additions (Method II).

METHOD I - DIRECT CALIBRATION

For routine measurements 3 reference solutions and a blank solution are prepared and examined.

Prepare the solution of the substance to be examined (test solution) as prescribed in the monograph. Prepare not fewer than 3 reference solutions of the element to be determined, the concentrations of which span the expected value in the test solution. For assay purposes, optimal calibration levels are between 0.7 and 1.3 times the expected content of the element to be determined or the limit prescribed in the monograph. For purity determination, calibration levels are the limit of detection and 1.2 times the limit specified for the element to be determined. Any reagents used in the preparation of the test solution are added to the reference and blank solutions at the same concentration.

Introduce each of the solutions into the instrument using the same number of replicates for each of the solutions to obtain a steady reading.

Calculation

Prepare a calibration curve from the mean of the readings obtained with the reference solutions by plotting the means as a function of concentration. Determine the concentration of the element in the test solution from the curve obtained.

METHOD II - STANDARD ADDITIONS

Add to at least 3 similar volumetric flasks equal volumes of the solution of the substance to be examined (test solution) prepared as prescribed. Add to all but 1 of the flasks progressively larger volumes of a reference solution containing a known concentration of the element to be determined to produce a series of solutions containing steadily increasing concentrations of that element known to give responses in the linear part of the curve, if possible. Dilute the contents of each flask to volume with solvent.

Introduce each of the solutions into the instrument, using the same number of replicates for each of the solutions, to obtain a steady reading.

Calculation

Calculate the linear equation of the graph using a least-squares fit and derive from it the concentration of the element to be determined in the test solution.

VALIDATION OF THE METHOD

Satisfactory performance of methods prescribed in monographs is verified at suitable time intervals.

LINEARITY

Prepare and analyse not fewer than 4 reference solutions over the calibration range and a blank solution. Perform not fewer than 5 replicates.

The calibration curve is calculated by least-square regression from all measured data. The regression curve, the means, the measured data and the confidence interval of the calibration curve are plotted. The operating method is valid when:

- — the correlation coefficient is at least 0.99,
- — the residuals of each calibration level are randomly distributed around the calibration curve.

Calculate the mean and relative standard deviation for the lowest and highest calibration level.

When the ratio of the estimated standard deviation of the lowest and the highest calibration level is less than 0.5 or greater than 2.0, a more precise estimation of the calibration curve may be obtained using weighted linear regression. Both linear and quadratic weighting functions are applied to the data to find the most appropriate weighting function to be employed. If the means compared to the calibration curve show a deviation from linearity, two-dimensional linear regression is used.

ACCURACY

Verify the accuracy preferably by using a certified reference material (CRM). Where this is not possible, perform a test for recovery.

Recovery

For assay determinations a recovery of 90 per cent to 110 per cent is to be obtained. For other determinations, for example, for trace element determination the test is not valid if recovery is outside of the range 80 per cent to 120 per cent at the theoretical value. Recovery may be determined on a suitable reference solution (matrix solution) which is spiked with a known quantity of analyte (middle concentration of the calibration range).

REPEATABILITY
The repeatability is not greater than 3 per cent for an assay and not greater than 5 per cent for an impurity test.

LIMIT OF QUANTIFICATION
Verify that the limit of quantification (for example, determined using the 10 σ approach) is below the value to be measured.

E. Fluorescence Spectrophotometry [Fluorimetry]

(Ph. Eur. method 2.2.21)

Fluorimetry is a procedure which uses the measurement of the intensity of the fluorescent light emitted by the substance to be examined in relation to that emitted by a given standard.

Method Dissolve the substance to be examined in the solvent or mixture of solvents prescribed in the monograph, transfer the solution to the cell or the tube of the fluorimeter and illuminate it with an excitant light beam of the wavelength prescribed in the monograph and as near as possible monochromatic.

Measure the intensity of the emitted light at an angle of 90° to the excitant beam, after passing it through a filter which transmits predominantly light of the wavelength of the fluorescence. Other types of apparatus may be used provided that the results obtained are identical.

For quantitative determinations, first introduce into the apparatus the solvent or mixture of solvents used to dissolve the substance to be examined and set the instrument to zero. Introduce the standard solution and adjust the sensitivity of the instrument so that the reading is greater than 50. If the second adjustment is made by altering the width of the slits, a new zero setting must be made and the intensity of the standard must be measured again. Finally introduce the solution of unknown concentration and read the result on the instrument. Calculate the concentration c_x of the substance in the solution to be examined, using the formula:

$$c_x = \frac{I_x c_s}{I_s}$$

c_x = concentration of the solution to be examined,
c_s = concentration of the standard solution,
I_x = intensity of the light emitted by the solution to be examined,
I_s = intensity of the light emitted by the standard solution.

If the intensity of the fluorescence is not strictly proportional to the concentration, the measurement may be effected using a calibration curve.

In some cases, measurement can be made with reference to a fixed standard (for example a fluorescent glass or a solution of another fluorescent substance). In such cases, the concentration of the substance to be examined must be determined using a previously drawn calibration curve under the same conditions.

F. X-Ray Fluorescence Spectrometry

(Ph. Eur. method Spectrometry, X.ray fluorescence (2.2.37))

PRINCIPLE OF THE TECHNIQUE

X-ray fluorescence (XRF) analysis is based on measurements of the X-rays emitted by the constituent atoms of a sample when it is excited by an external source of radiation.
If sufficiently energetic radiation impinges on an atom of the sample material, it may eject 1 of the inner-shell electrons of that atom. The vacancy created is filled by 1 of the electrons from an outer, higher-energy shell. The energy difference between the 2 electron shells involved in the process is released in the form of fluorescent X-rays. These X-rays are characteristic since their energy is specific to each element (atom). By measuring their energy and intensity, qualitative and quantitative data about the elemental composition of the test material is obtained.

XRF spectrometry is suitable for liquid, solid and powdered materials and is widely used as a means of screening pharmaceutical ingredients and products for toxic elements or elemental impurities, for quality control and in-process testing. It is also used to identify inorganic foreign elements within falsified medicinal products. As XRF can be non-invasive, it lends itself to process analytical technology (PAT) applications, such as the analysis of an unwanted trace catalyst in an active pharmaceutical ingredient.

EQUIPMENT

An XRF spectrometer (or analyser) consists of 3 essential components:
— a source of exciting radiation (e.g. an X-ray tube, an electron beam if a scanning electron microscope is used or, more rarely, a radioisotope);
— a means for reproducible sample presentation;
— a detector.

Depending on the X-ray detection method employed, either a wavelength-dispersive (WD) or an energy-dispersive (ED) XRF spectrometer is used.

In a WD-XRF spectrometer the X-rays from the sample are directed at a crystal, which diffracts them at precise angles depending on their energy. The intensity of the diffracted X-rays is measured sequentially by a detector counter.

In an ED-XRF spectrometer the X-rays from the sample are directed at a solid-state detector, which generates an electric pulse of an amplitude proportional to the energy of each X-ray photon detected. During measurement, the spectrometer acquires an X-ray spectrum of the sample that contains complete information about its composition.
An ED-XRF spectrometer can also be combined with a scanning electron microscope (SEM). Substantial advances in miniaturisation and automation have led to the development of hand-held ED-XRF spectrometers for field measurements.

Some instruments are supplied with an initial factory-set calibration that allows semi-quantitative analyses to be carried out.

MATRIX EFFECTS AND INTERFERENCE

The intensity of the characteristic X-rays of the analysed elements is not necessarily linear with concentration, owing to matrix effects. The intensity of the fluorescence measured for a given element depends not only on the concentration of that element in the sample but also on the absorption of the incident and fluorescent radiations by the matrix.
The presence and concentration of other elements (analytes) in the sample, the composition of the sample matrix, and the particle size of the sample material are known to contribute

to matrix effects. The presence of matrix effects must be taken into account in any calibration method utilised for quantitative determination.

At low concentrations the linearity is usually well preserved, which greatly facilitates calibration of the spectrometer. The intensity of the fluorescent radiation emitted by an element in a given matrix and at a given wavelength is then proportional to the concentration of that element and inversely proportional to the mass absorption coefficient of the matrix at that wavelength.

SAMPLE PREPARATION

It is essential that the sample is sufficiently thick that the intensities of characteristic X-rays measured are not affected by variations in sample thickness.

Liquid samples Samples are analysed 'as is', provided that the solution consists of a clear, single phase and has sufficiently low volatility. A special liquid-sample holder and a commercially available support window composed of a suitable polymer film (transparent to X-rays and solvent resistant) are required. Alternatively, liquid samples can be transferred onto the surface of a disc and dried before analysis.

Powdered samples Samples may be analysed 'as is' in special X-ray sample cups with bottoms made of a thin polymer film, transparent to X-rays. After transferring the powder to a sample cup, the cup is tapped gently until no further settling of the powder is observed. If necessary, more powder can be added to the cup after tapping. Another alternative for preparation of a powdered sample, which is better suited to WD-XRF analysis, is to press the sample powder into a pellet, with a binder (for example cellulose powder, wax or ethylcellulose) or without a binder. The mass of reference material and sample material must be about the same and the resulting pellets must be approximatively 5 mm thick or more.

Solid samples Samples are analysed by placing them directly on the spectrometer measuring window, making sure they cover it completely. Solid samples for WD-XRF may need to be cut into a uniform shape with a flat surface for reproducible analysis, whereas samples can be measured 'as is' when using ED-XRF, provided there is adequate sample depth.

Fusion The fusion bead method can be used to prepare solid and powdered samples (e.g. minerals or oxides) if the element of interest is not volatile. The sample is homogeneously mixed with a flux reagent (e.g. dilithium tetraborate) and transferred to a platinum vessel; a releasing agent and/or oxidising agent may be added if necessary, for example to prevent damage of the vessel. The mixture is heated at an appropriate temperature while swirling the vessel until a homogeneous melt is obtained. If necessary, the melt is then transferred to a flat-bottomed mould, kept in a horizontal position and cooled under conditions maintaining its property as a glass.

PROCEDURE

Measuring conditions

The instrument is set up and used in accordance with the manufacturer's instructions. The measurements may be carried out under vacuum, nitrogen or helium to improve the sensitivity of the method for the quantitation of light elements.

Reference standards

Standards required for the calibration, system suitability or control of equipment performance are prepared from certified reference materials (CRMs). Standards with a high carbon load may be more representative for pharmaceutical applications.

Calibration

The calibration model selected must be fit for purpose. Various calibration methods are available, including the 'fundamental parameters' approach, empirical calibration, Compton/Rayleigh normalisation and multiple linear regression (MLR).

System suitability test

This test must be carried out before the analysis to ensure that the performance of the measurement system is satisfactory. It may also be performed to verify the calibration of the system.

Acceptance criteria The measurement system is suitable if the concentration obtained for a check material containing the element(s) of interest within the used concentration range does not differ from the actual concentration by more than 5 per cent for an assay, and 20 per cent for impurity tests; when using concentrations determined from reference methods such as atomic absorption spectrometry, the accuracy of the XRF calibration should be aligned to that of the reference method; in this case an acceptance criterion of 10 per cent for the assay can be more realistic.

Analysis

The samples are measured with the same parameters as used during calibration of the instrument.

CONTROL OF EQUIPMENT PERFORMANCE

These parameters are also applicable for equipment qualification.

Specific procedures, acceptance criteria and time intervals for characterising XRF performance depend on the instrument and its intended application. Demonstrating stable instrument performance over extended periods of time provides some assurance that reliable measurements can be obtained.

The following tests may be carried out at appropriate intervals defined according to the user's quality system procedures to ensure the adequate performance of the XRF instrument.

x- and *y*-axes

It is recommended that the *x*-axis (energy or peak angle) and *y*-axis (intensity) are verified at least on installation and thereafter at appropriate intervals that are defined according to the user's quality system procedures. Consideration is to be given to peak position in ED-XRF and to peak angle in WD-XRF when verifying the *x*-axis, and to the count rate when verifying the *y*-axis.

Detector resolution

Calculate the resolution (total width at half-height) at the energy used during calibration of the instrument.

Acceptance criteria The resolution value does not deviate by more than 20 per cent for an assay, and 25 per cent for identity and elemental impurities tests, from the value determined during calibration of the instrument.

VALIDATION REQUIREMENTS

The objective of an XRF method validation is to demonstrate that the measurement procedure is fit for purpose (assay, content uniformity, limit tests and identification tests). Where sample preparation is necessary, it is essential that test materials are spiked before any preparatory steps. For example, if a test material is to be digested, the material must be spiked at the beginning of the digestion procedure.

For the determination of impurities, the validation requirements are given in general chapter *2.4.20.* For other purposes, validation is performed according to the relevant ICH guidelines.

G. Mass Spectrometry

(Ph. Eur. method 2.2.43)

Mass spectrometry is based on the direct measurement of the ratio of the mass to the number of positive or negative elementary charges of ions (*m/z*) in the gas phase obtained from the substance to be analysed. This ratio is expressed in atomic mass units (1 a.m.u. = one twelfth the mass of ^{12}C) or in daltons (1 Da = the mass of the hydrogen atom).

The ions, produced in the ion *source* of the apparatus, are accelerated and then separated by the *analyser* before reaching the *detector.* All of these operations take place in a chamber where a pumping system maintains a vacuum of 10^{-3} to 10^{-6} Pa.

The resulting spectrum shows the relative abundance of the various ionic species present as a function of *m/z.* The signal corresponding to an ion will be represented by several peaks corresponding to the statistical distribution of the various isotopes of that ion. This pattern is called the *isotopic profile* and (at least for small molecules) the peak representing the most abundant isotopes for each atom is called the *monoisotopic peak.*

Information obtained in mass spectrometry is essentially qualitative (determination of the molecular mass, information on the structure from the fragments observed) or quantitative (using internal or external standards) with limits of detection ranging from the picomole to the femtomole.

INTRODUCTION OF THE SAMPLE

The very first step of an analysis is the introduction of the sample into the apparatus without overly disturbing the vacuum. In a common method, called *direct liquid introduction,* the sample is placed on the end of a cylindrical rod (in a quartz crucible, on a filament or on a metal surface). This rod is introduced into the spectrometer after passing through a vacuum lock where a primary intermediate vacuum is maintained between atmospheric pressure and the secondary vacuum of the apparatus.

Other introduction systems allow the components of a mixture to be analysed as they are separated by an appropriate apparatus connected to the mass spectrometer.

Gas chromatography/mass spectrometry
The use of suitable columns (capillary or semi-capillary) allows the end of the column to be introduced directly into the source of the apparatus without using a separator.

Liquid chromatography/mass spectrometry
This combination is particularly useful for the analysis of polar compounds, which are insufficiently volatile or too heat-labile to be analysed by gas chromatography coupled with mass spectrometry. This method is complicated by the difficulty of obtaining ions in the gas phase from a liquid phase, which requires very special interfaces such as:

— *direct liquid introduction*: the mobile phase is nebulised, and the solvent is evaporated in front of the ion source of the apparatus,
— *particle-beam interface*: the mobile phase, which may flow at a rate of up to 0.6 mL/min, is nebulised in a desolvation chamber such that only the analytes, in neutral form, reach the ion source of the apparatus; this technique is used for compounds of relatively low polarity with molecular masses of less than 1000 Da,
— *moving-belt interface*: the mobile phase, which may flow at a rate of up to 1 mL/min, is applied to the surface of a moving belt; after the solvent evaporates, the components to be analysed are successively carried to the ion source of the apparatus where they are ionised; this technique is rather poorly suited to very polar or heat-labile compounds.

Other types of coupling (electrospray, thermospray, atmospheric-pressure chemical ionisation) are considered to be ionisation techniques in their own right and are described in the section on modes of ionisation.

Supercritical fluid chromatography/mass spectrometry
The mobile phase, usually consisting of supercritical carbon dioxide enters the gas state after passing a heated restrictor between the column and the ion source.

Capillary electrophoresis/mass spectrometry
The eluent is introduced into the ion source, in some cases after adding another solvent so that flow rates of the order of a few microlitres per minute can be attained. This technique is limited by the small quantities of sample introduced and the need to use volatile buffers.

MODES OF IONISATION

Electron impact
The sample, in the gas state, is ionised by a beam of electrons whose energy (usually 70 eV) is greater than the ionisation energy of the sample. In addition to the molecular ion M^+, fragments characteristic of the molecular structure are observed. This technique is limited mainly by the need to vaporise the sample. This makes it unsuited to polar, heat-labile or high molecular mass compounds. Electron impact is compatible with the coupling of gas chromatography to mass spectrometry and sometimes with the use of liquid chromatography.

Chemical ionisation
This type of ionisation involves a reagent gas such as methane, ammonia, nitrogen oxide, nitrogen dioxide or oxygen. The spectrum is characterised by ions of the $(M + H)^+$ or $(M - H)^-$ types, or adduct ions formed from the analyte and the gas used. Fewer fragments are produced than with electron impact. A variant of this technique is used when the substance is heat-labile: the sample, applied to a filament, is very rapidly vaporised by the Joule-Thomson effect (desorption chemical ionisation).

Fast-atom bombardment (FAB) or fast-ion bombardment ionisation (liquid secondary-ion mass spectrometry LSIMS)
The sample, dissolved in a viscous matrix such as glycerol, is applied to a metal surface and ionised by a beam of neutral atoms such as argon or xenon or high-kinetic-energy caesium ions. Ions of the $(M + H)^+$ or $(M - H)^-$ types or adduct ions formed from the matrix or the sample are produced. This type of ionisation, well suited to polar and heat-labile compounds, allows molecular masses of up to 10 000 Da to be obtained. The technique can be combined with liquid chromatography by adding 1 per cent to 2 per cent of glycerol to the mobile phase; however, the flow rates must be very low (a few microlitres per minute). These ionisation techniques also allow thin-layer chromatography plates to be analysed by applying a thin layer of matrix to the surface of these plates.

Field desorption and field ionisation
The sample is vaporised near a tungsten filament covered with microneedles (*field ionisation*) or applied to this filament (*field desorption*). A voltage of about 10 kV, applied between this filament and a counter-electrode, ionises the sample. These two techniques mainly produce molecular ions M^+, and $(M + H)^+$ ions and are used for low polarity and/or heat-labile compounds.

Matrix-assisted laser desorption ionisation (MALDI)
The sample, in a suitable matrix and deposited on a metal support, is ionised by a pulsed laser beam whose wavelength may range from UV to IR (impulses lasting from a picosecond to a few nanoseconds). This mode of ionisation plays an essential role in the analysis of very high molecular mass compounds (more than 100 000 Da) but is limited to time-of flight analysers (see below).

Electrospray
This mode of ionisation is carried out at atmospheric pressure. The samples, in solution, are introduced into the source through a capillary tube, the end of which has a potential of the order of 5 kV. A gas can be used to facilitate nebulisation. Desolvation of the resulting microdroplets produces singly or multiply charged ions in the gas phase. The flow rates vary from a few microlitres per minute to 1 mL/min. This technique is suited to polar compounds and to the investigation of biomolecules with molecular masses of up to 100 000 Da. It can be coupled to liquid chromatography or capillary electrophoresis.

Atmospheric-pressure chemical ionisation (APCI)
Ionisation is carried out at atmospheric pressure by the action of an electrode maintained at a potential of several kilovolts and placed in the path of the mobile phase, which is nebulised both by thermal effects and by the use of a stream of nitrogen. The resulting ions carry a single charge and are of the $(M + H)^+$ type in the positive mode and of the $(M - H)^-$ type in the negative mode. The high flow rates that can be used with this mode of ionisation (up to 2 mL/min) make this an ideal technique for coupling to liquid chromatography.

Thermospray
The sample, in the mobile phase consisting of water and organic modifiers and containing a volatile electrolyte (generally ammonium acetate) is introduced in nebulised form after having passed through a metal capillary tube at controlled temperature. Acceptable flow rates are of the order of 1 mL/min to 2 mL/min. The ions of the electrolyte ionise the compounds to be analysed. This ionisation process may be replaced or enhanced by an electrical discharge of about 800 volts, notably when the solvents are entirely organic. This technique is compatible with the use of liquid chromatography coupled with mass spectrometry.

ANALYSERS

Differences in the performance of analysers depend mainly on two parameters:

- the range over which *m/z* ratios can be measured, ie, the *mass range*,
- their *resolving power* characterised by the ability to separate two ions of equal intensity with *m/z* ratios differing by ΔM, and whose overlap is expressed as a given percentage of valley definition; for example, a resolving power ($M/\Delta M$) of 1000 with 10 per cent valley definition allows the separation of *m/z* ratios of 1000 and 1001 with the intensity returning to 10 per cent above baseline. However, the resolving power may in some cases (time-of-flight analysers, quadrupoles, ion-trap analysers) be defined as the ratio between the molecular mass and peak width at half height (50 per cent valley definition).

Magnetic and electrostatic analysers
The ions produced in the ion source are accelerated by a voltage V, and focused towards a magnetic analyser (magnetic field B) or an electrostatic analyser (electrostatic field E), depending on the configuration of the instrument. They follow a trajectory of radius r according to Laplace's law:

$$\frac{m}{z} = \frac{B^2 r^2}{2V}$$

Two types of scans can be used to collect and measure the various ions produced by the ion source: a scan of B holding V fixed or a scan of V with constant B. The magnetic analyser is usually followed by an electric sector that acts as a kinetic energy filter and allows the resolving power of the instrument to be increased appreciably. The maximum resolving power of such an instrument (double sector) ranges from 10 000 to 150 000 and in most cases allows the value of *m/z* ratios to be calculated accurately enough to determine the elemental composition of the corresponding ions.
For monocharged ions, the mass range is from 2000 Da to 15 000 Da. Some ions may decompose spontaneously (metastable transitions) or by colliding with a gas (collision-activated dissociation (CAD)) in field-free regions between the ion source and the detector. Examination of these decompositions is very useful for the determination of the structure as well as the characterisation of a specific compound in a mixture and involves tandem mass spectrometry. There are many such techniques depending on the region where these decompositions occur:

- *daughter-ion mode* (determination of the decomposition ions of a given parent ion): B/E = constant, *MIKES (Mass-analysed Ion Kinetic Energy Spectroscopy)*,
- *parent-ion mode* (determination of all ions which by decomposition give an ion with a specific *m/z* ratio): B^2/E = constant,
- *neutral-loss mode* (detection of all the ions that lose the same fragment):

$B/E(1 - E/E_0)^{1/2}$ = constant, where E_0 is the basic voltage of the electric sector.

Quadrupoles
The analyser consists of four parallel metal rods, which are cylindrical or hyperbolic in cross-section. They are arranged symmetrically with respect to the trajectory of the ions; the pairs diagonally opposed about the axis of symmetry of rods are connected electrically. The potentials to the two pairs of rods are opposed. They are the resultant of a constant component and an alternating component. The ions produced at the ion source are transmitted and separated by varying the voltages applied to the rods so that the ratio of continuous voltage to alternating voltage remains constant. The quadrupoles usually have a mass range of 1 a.m.u. to 2000 a.m.u., but some may range up to 4000 a.m.u. Although they have a lower resolving power than magnetic sector analysers, they nevertheless allow the monoisotopic profile of single charged ions to be obtained for the entire mass range. It is possible to obtain spectra using three quadrupoles arranged in series, Q_1, Q_2, Q_3 (Q_2 serves as a collision cell and is not really an analyser; the most commonly used collision gas is argon).
The most common types of scans are the following:

- *daughter-ion mode*: Q_1 selects an *m/z* ion whose fragments obtained by collision in Q_2 are analysed by Q_3,

— *parent-ion mode*: Q_3 filters only a specific *m/z* ratio, while Q_1 scans a given mass range. Only the ions decomposing to give the ion selected by Q_3 are detected,
— *neutral loss mode*: Q_1 and Q_3 scan a certain mass range but at an offset corresponding to the loss of a fragment characteristic of a product or family of compounds.

It is also possible to obtain spectra by combining quadrupole analysers with magnetic or electrostatic sector instruments; such instruments are called *hybrid mass spectrometers*.

Ion-trap analyser

The principle is the same as for a quadrupole, this time with the electric fields in three dimensions. This type of analyser allows product-ion spectra over several generations (MS^n) to be obtained.

Ion-cyclotron resonance analysers

Ions produced in a cell and subjected to a uniform, intense magnetic field move in circular orbits at frequencies which can be directly correlated to their *m/z* ratio by applying a Fourier transform algorithm. This phenomenon is called ion-cyclotron resonance. Analysers of this type consist of superconducting magnets and are capable of very high resolving power (up to 1000 000 and more) as well as MS^n spectra. However, very low pressures are required (of the order of 10^{-7} Pa).

Time-of-flight analysers

The ions produced at the ion source are accelerated at a voltage V of 10 kV to 20 kV. They pass through the analyser, consisting of a field-free tube, 25 cm to 1.5 m long, generally called a *flight tube*. The time (t) for an ion to travel to the detector is proportional to the square root of the *m/z* ratio. Theoretically the mass range of such an analyser is infinite. In practice, it is limited by the ionisation or desorption method. Time-of-flight analysers are mainly used for high molecular mass compounds (up to several hundred thousand daltons). This technique is very sensitive (a few picomoles of product are sufficient). The accuracy of the measurements and the resolving power of such instruments may be improved considerably by using an electrostatic mirror (reflectron).

SIGNAL ACQUISITION

There are essentially three possible modes.

Complete spectrum mode

The entire signal obtained over a chosen mass range is recorded. The spectrum represents the relative intensity of the different ionic species present as a function of *m/z*. The results are essentially qualitative. The use of spectral reference libraries for more rapid identification is possible.

Fragmentometric mode (Selected-ion monitoring)

The acquired signal is limited to one (single-ion monitoring (SIM)) or several (multiple-ion monitoring (MIM)) ions characteristic of the substance to be analysed. The limit of detection can be considerably reduced in this mode. Quantitative or semiquantitative tests can be carried out using external or internal standards (for example, deuterated standards). Such tests cannot be carried out with time-of-flight analysers.

Fragmentometric double mass spectrometry mode (multiple reaction monitoring (MRM))

The unimolecular or bimolecular decomposition of a chosen precursor ion characteristic of the substance to be analysed is followed specifically. The selectivity and the highly specific nature of this mode of acquisition provide excellent sensitivity levels and make it the most appropriate for quantitative studies using suitable internal standards (for example, deuterated standards). This type of analysis can be performed only on apparatus fitted with three quadrupoles in series, ion-trap analysers or cyclotron-resonance analysers.

CALIBRATION

Calibration allows the corresponding *m/z* value to be attributed to the detected signal. As a general rule, this is done using a reference substance. This calibration may be external (acquisition file separate from the analysis) or internal (the reference substance(s) are mixed with the substance to be examined and appear on the same acquisition file). The number of ions or points required for reliable calibration depends on the type of analyser and on the desired accuracy of the measurement, for example, in the case of a magnetic analyser where the *m/z* ratio varies exponentially with the value of the magnetic field, there should be as many points as possible.

SIGNAL DETECTION AND DATA PROCESSING

Ions separated by an analyser are converted into electric signals by a detection system such as a photomultiplier or an electron multiplier. These signals are amplified before being re-converted into digital signals for data processing, allowing various functions such as calibration, reconstruction of spectra, automatic quantification, archiving, creation or use of libraries of mass spectra. The various physical parameters required for the functioning of the apparatus as a whole are controlled by computer.

G1. Inductively Coupled Plasma-Mass Spectrometry

(Ph. Eur. method 2.2.58)

Inductively coupled plasma-mass spectrometry (ICP-MS) is a mass spectrometry method that uses an inductively coupled plasma (ICP) as the ionisation source. The basic principles of ICP formation are described in chapter *2.2.57* on inductively coupled plasma-atomic emission spectrometry (ICP-AES).

ICP-MS utilises the ability of the ICP to generate charged ions from the element species within a sample. These ions are then directed into a mass spectrometer, which separates them according to their mass-to-charge ratio (*m/z*). Most mass spectrometers have a quadrupole system or a magnetic sector. Ions are transported from the plasma through 2 cones (sampler and skimmer cones, forming the interface region) to the ion optics. The ion optics consist of an electrostatic lens, which takes ions from an area at atmospheric pressure to the mass filter at a vacuum of 10^{-8} Pa or less, maintained with a turbomolecular pump. After their filtration, ions of the selected mass/charge ratio are directed to a detector (channel electromultiplier, Faraday cup, dynodes), where ion currents are converted into electrical signals. The element is quantified according to the number of ions arriving and generating electrical pulses per unit time.

The sample-introduction system and data-handling techniques of an ICP-AES system are also used in ICP-MS.

APPARATUS

The apparatus consists essentially of the following elements:
— sample-introduction system, consisting of a peristaltic pump delivering the solution at constant flow rate into a nebuliser;
— radio-frequency (RF) generator;
— plasma torch;

— interface region including cones to transport ions to the ion optics;
— mass spectrometer;
— detector;
— data-acquisition unit.

INTERFERENCE

Mass interference is the major problem, for example by isobaric species that significantly overlap the mass signal of the ions of interest, especially in the central part of the mass range (for example 40-80 a.m.u.). The combination of atomic ions leads to polyatomic or molecular interferences (i.e. $^{40}Ar^{16}O$ with ^{56}Fe or $^{40}Ar^{40}Ar$ with ^{80}Se). Matrix interference may also occur with some analytes. Some samples have an impact on droplet formation or on the ionisation temperature in the plasma. These phenomena may lead to the suppression of analyte signals. Physical interference is to be circumvented by using the method of internal standardisation or by standard addition. The element used as internal standard depends on the element to be measured: ^{59}Co and ^{115}In, for example, can be used as internal standards.

The prime characteristic of an ICP-MS instrument is its resolution, i.e. the efficiency of separation of 2 close masses. Quadrupole instruments are, from this point of view, inferior to magnetic-sector spectrometers.

PROCEDURE

SAMPLE PREPARATIONS AND SAMPLE INTRODUCTION

The sample preparation usually involves a step of digestion of the matrix by a suitable method, for example in a microwave oven. Furthermore, it is important to ensure that the analyte concentration falls within the working range of the instrument through dilution or preconcentration, and that the sample-containing solution can be nebulised in a reproducible manner.

Several sample-introduction systems tolerate high acid concentrations, but the use of sulfuric and phosphoric acids can contribute to background emission. Therefore, nitric and hydrochloric acids are preferable. The availability of hydrofluoric acid-resistant (for example perfluoroalkoxy polymer) sample-introduction systems and torches also allows the use of hydrofluoric acid. In selecting a sample-introduction method, the requirements for sensitivity, stability, speed, sample size, corrosion resistance and resistance to clogging have to be considered. The use of a cross-flow nebuliser combined with a spray chamber and torch is suitable for most requirements. The peristaltic pumps usually deliver the standard and sample solutions at a rate of 20-1000 µL/min.

In the case of organic solvents being used, the introduction of oxygen must be considered to avoid organic layers.

CHOICE OF OPERATING CONDITIONS

The standard operating conditions prescribed by the manufacturer are to be followed. Usually, different sets of operating conditions are used for aqueous solutions and for organic solvents. Suitable operating parameters are to be properly chosen:
— selection of cones (material of sampler and skimmer);
— support-gas flow rates (outer, intermediate and inner tubes of the torch);
— RF power;
— pump speed;
— selection of one or more isotopes of the element to be measured (mass).

ISOTOPE SELECTION

Isotope selection is made using several criteria. The most abundant isotope for a given element is selected to obtain maximum sensitivity. Furthermore, an isotope with the least interference from other species in the sample matrix and from the support gas should be selected. Information about isobaric interferences and interferences from polyatomic ions of various types, for example hydrides, oxides, chlorides, etc., is usually available in the software of ICP-MS instrument manufacturers.

CONTROL OF INSTRUMENT PERFORMANCE

System suitability

— Tuning of the instrument allows to monitor and adjust the measurement before running samples. ICP-MS mass accuracy is checked with a tuning solution containing several isotopes covering the whole range of masses, for example ^{9}Be, ^{59}Co, ^{89}Y, ^{115}In, ^{140}Ce and ^{209}Bi.
— Sensitivity and short- and long-term stability are recorded. The instrument parameters (plasma condition, ion lenses and quadrupole parameter) are to be optimised to obtain the highest possible number of counts.
— Tuning for resolution and mass axis is to be done with a solution of Li, Y and Tl to ensure an acceptable response over a wide range of masses.
— Evaluation of the efficiency of the plasma to decompose oxides has to be performed in order to minimise these interferences. The ratio Ce/CeO and/or Ba/BaO is a good indicator, and a level less than about 3 per cent is required.
— Reduction of the formation of double-charged ions is made with Ba and Ce. The ratio of the signal for double-charged ions to the assigned element should be less than 2 per cent.
— Long-term stability is checked by running a standard first and at the end of the sample sequence, controlling whether salt deposits on the cones have reduced the signal throughout the run.

VALIDATION OF THE METHOD

Satisfactory performance of methods prescribed in monographs is verified at suitable time intervals.

LINEARITY

Prepare and analyse not fewer than 4 reference solutions over the calibration range plus a blank. Perform not fewer than 5 replicates.

The calibration curve is calculated by least-square regression from all measured data of the calibration test. The regression curve, the means, the measured data and the confidence interval of the calibration curve are plotted. The operating method is valid when:
— the correlation coefficient is at least 0.99;
— the residuals of each calibration level are randomly distributed around the calibration curve.

Calculate the mean and relative standard deviation for the lowest and for the highest calibration level.

When the ratio of the estimated standard deviations of the lowest and the highest calibration level is less than 0.5 or greater than 2.0, a more precise estimation of the calibration curve may be obtained using weighted linear regression. Both linear and quadratic weighting functions are applied to the data to find the most appropriate weighting function to be employed.

If the means compared to the calibration curve show a deviation from linearity, two-dimensional linear regression is used.

ACCURACY

Verify the accuracy preferably by using a certified reference material (CRM). Where this is not possible, perform a test for recovery.

Recovery

For assay determinations a recovery of 90 per cent to 110 per cent is to be obtained. The test is not valid if recovery, for example for trace-element determination, is outside the range 80 per cent to 120 per cent of the theoretical value. Recovery may be determined on a suitable reference solution (matrix solution) spiked with a known quantity of analyte (concentration range that is relevant to the samples to be determined).

REPEATABILITY

The repeatability is not greater than 3 per cent for an assay and not greater than 5 per cent for an impurity test.

LIMIT OF QUANTIFICATION

Verify that the limit of quantification (for example, determined using the 10 σ approach) is below the value to be measured.

H. Raman Spectroscopy

(Ph. Eur. method 2.2.48)

In Raman spectroscopy a sample is irradiated with an intense monochromatic light source (usually a laser). Most of the radiation is scattered from the sample at the same wavelength as that of the incident light; this process is known as Rayleigh scattering or elastic light scattering. Only 10^{-6} to 10^{-8} of the incident photons are scattered from the sample at wavelengths shifted from the original source wavelength; this scattered light is known as Raman scatter or inelastic light scatter. The differences between the incident light source wavelength and the Raman scattered wavelengths are known as the Raman shifts and are related to the molecular vibrations within the sample. The scattered light with lower energy is called Stokes scatter and with higher energy is called anti-Stokes scatter. Typically, Stokes scatter is analysed.

A Raman spectrum can be obtained from liquid, solid and even gaseous samples. Raman spectroscopy is a suitable non-invasive method for determination of solid-state properties and for chemical identification, for example, detecting changes in polymorphic form. Raman spectroscopy encompasses many methodologies, including backscattering, transmittance, resonance Raman (RR) spectroscopy, surface-enhanced Raman spectroscopy (SERS), tip-enhanced Raman spectroscopy (TERS), spatially offset Raman spectroscopy (SORS), Raman optical activity (ROA), coherent anti-Stokes Raman spectroscopy (CARS), stimulated Raman spectroscopy (SRS) and confocal Raman (CF) spectroscopy. It also lends itself to imaging techniques.

Raman spectroscopy is complementary to infrared spectroscopy. Both techniques probe the fundamental molecular vibrations in a material. However, Raman and infrared spectroscopy have different sensitivities for different functional groups within a material. Raman spectroscopy is particularly useful in examining non-polar bonds, functional groups and vibrations that are highly symmetrical (e.g. C-C single or multiple bonds); but is less sensitive to polar bonds (e.g. C=O) and vibrations that are asymmetrical.
For example, water, which strongly influences infrared spectra, exhibits weak Raman scattering and therefore has minimal interference on the resulting spectrum. Raman can therefore be used for aqueous solutions.

A major difficulty of Raman spectroscopy is that the material examined or impurities in the material may exhibit fluorescence, which can overcome the Raman signal. Fluorescence may be avoided by choosing a longer excitation wavelength, for example in the near-infrared region.

Raman spectroscopy is a rapid and non-invasive analytical method and can be performed off-line and also at-line, on-line or in-line for process analytical technology (PAT). Raman spectrometers can be situated at a great distance from the point of measurement when using long-distance optical fibres for sample interfacing. Raman spectroscopy has a wide variety of applications for chemical, physical and process analysis and can also be used for counterfeit detection and quality control, for example:

- *chemical analysis*: identification and quantification of active substances, excipients;
- *physical analysis*: identification and quantification of solid forms (e.g. polymorphs and solvates) and crystallinity;
- *process analysis*: monitoring of biological and chemical reactions, synthesis, crystallisation, granulation, mixing, drying, lyophilisation, extrusion, encapsulation and coating.

APPARATUS

There are different types of spectrometers for recording Raman spectra, the most common are benchtop dispersive instruments, including microscope-coupled Raman spectrometers, Fourier transform (FT) and hand-held Raman spectrometers.

Raman spectrometers typically consist of the following components:

- a monochromatic light source, typically a laser, with a wavelength in the ultraviolet, visible or near-infrared region; selection of laser frequency and intensity should be considered depending on the intended application and material to be examined;
- suitable optics (lens, mirrors or optical-fibre assembly) that direct the monochromatic light to and collect the Raman scattered light from the material to be examined;
- an optical device (monochromator or filter) that transmits the frequency-shifted Raman scattering and prevents the intense incident frequency of Rayleigh scattering from reaching the detector; and
- a dispersing device (grating and/or prism polychromator) combined with wavelength-selecting slits and a single or multi-channel detector (e.g. a charge-coupled device) or
- an interferometer with a detector that records the intensity of the scattered light over time, and a data-handling device (e.g. computer and appropriate software) that converts this data to the frequency or wavenumber domain by a Fourier-transform calculation.

PREPARATION OF THE SAMPLE

Raman spectra can be obtained from solids, liquids and gases either directly or in suitable containers such as glass vials, generally without prior sample preparation or dilution.

When using Raman spectroscopy, the measured sample area and volume may be small (in particular for microscope-coupled devices) and care must be taken to ensure the measurement is representative. This can be achieved by, for example, rotation of the sample, performing multiple measurements on different preparations of the sample, increasing the area of illumination by reducing the magnification (focus), by demagnification (defocusing) of the

Table 2.2.48.-1. – *Wavenumber shifts (and acceptable tolerances) of polystyrene, paracetamol and cyclohexane*

laser beam or by changing the focal length between measurements to scan at different depths.

It is not always possible to consider Raman as a non-destructive technique. The energy transmitted by the laser depends on the duration of exposure and the wavelength. It may change the physical state and may destroy the sample.

CONTROL OF INSTRUMENT PERFORMANCE

Carry out the prescribed calibrations and/or system performance tests according to the manufacturer's instructions at regular intervals, depending on the use of the apparatus. Wavenumber calibration of Fourier transform systems is maintained with an internal laser (He-Ne). For dispersive systems, emission spectra of a low pressure lamp exhibiting characteristic maxima at wavenumbers over the whole spectral range of the instrument can usually be used for calibration (e. g. neon lamps or less frequently mercury, argon, krypton or xenon lamps).

Verification of the wavenumber scale Verify the wavenumber scale of the Raman shift using a suitable standard that has characteristic maxima at the wavenumbers under investigation, for example an organic substance such as polystyrene, paracetamol or cyclohexane (see Table 2.2.48.-1).

A minimum of 3 wavenumber shifts covering the working range of the instrument intended for measurements should be chosen. For dispersive Raman spectrometers that use multiple gratings for different spectral resolutions, the wavenumber scale should be verified at the same optical resolution that will occur for sample collection. All gratings used for Raman measurements should be verified for accuracy of Raman-shift.

Verification of the response-intensity scale The absolute and relative intensities of the Raman bands are affected by variations in several factors including:

— polarisation of the irradiating light;
— polarisation of the Raman scattered light;
— intensity of the irradiating light;
— instrument response;
— focus and geometry at sample;
— packing density for solid samples;
— refractive index n or change of n (Δn) between analyte and the environment;
— the particle size and particle-size distribution;
— the scattering cross-section;
— the absorption cross-section.

Appropriate acceptance criteria will vary with the application but a day-to-day variation of ± 10 per cent or less in relative band intensities is achievable in most cases. Response calibration may involve the use of white-light standards or luminescent glass (e.g. NIST SRM 2241), usually applied by the manufacturer of Raman spectrometers.

QUALITATIVE METHODS

Since the frequency shift position is employed for identification, identical laser intensity for both the reference standard and the material to be examined may not be necessary. The material to be examined is measured in the same physical state (e.g. liquid, solid) as the reference or library material. Raman techniques offer the advantage of non-invasive measurements of the material to be examined without removal from the packaging. However, some packaging materials may alter the measurement. This is especially the case when the packaging absorbs at the laser's excitation wavelength.

Identification using a reference standard Prepare the material to be examined and the reference standard by the same procedure and record the spectra under the same instrumental conditions. The maxima in the spectrum obtained with the material to be examined correspond in position and if applicable in relative intensity to those in the spectrum obtained with the reference standard. When the spectra recorded in the solid state show differences in the positions of the maxima, treat the material to be examined and the reference standard in the same manner so that they crystallise or are produced in the same solid form, or proceed as described in the monograph, then record the spectra.

Identification using a spectral reference library
Record the spectra of a suitable number of materials which exhibit typical variation (manufacturer, batch, particle size, impurity profile, etc.) and comply with the requirements of the monograph or established specifications. The number and selection of samples in the database depends on the specific application. A suitable mathematical transformation of the Raman spectrum may facilitate qualitative comparison of spectra (e.g. baseline correction, min-max normalisation, vector normalisation, derivatives). The selectivity of the database that makes it possible to identify a given material and distinguish it adequately from other materials in the database is to be confirmed during the validation procedure.

QUANTITATIVE METHODS
Quantitative determination requires that the reference standard and the material to be examined are measured at the same laser intensity and frequency. Ensure the material to be examined is measured in the same physical state (e.g. liquid, solid) and concentration range as the reference standard used for calibration. While Beer-Lambert's law is not valid for Raman spectroscopy, Raman intensity is directly proportional to the concentration of the Raman scattering analytes, however for solid samples and suspensions the Raman intensity could be affected by the matrix (e.g. fluorescence and self-absorption). The Raman signal is influenced by the refractive index of the material, the particle size and the particle-size distribution (where the small particles give a relatively more intense Raman scattering than large particles), the packing density, the scattering cross-section, the absorption cross-section, etc. (see also under Verification of the response-intensity scale).

J. Flow Cytometry

(Ph. Eur. method 2.7.24)

Flow cytometry consists of a multiparametric analysis of optical properties of individual particles in a fluidic system.

Cells or particles in suspension are individually distributed into a linear array (stream), which flows through a detection device. Solid tissues have to be reduced to a single-cell suspension to be analysed.

The spectrum of parameters measurable by flow cytometry includes volume and morphological complexity of cells or cell-like structures, cell pigments, DNA content, RNA content, proteins, cell surface markers, intracellular markers, enzymatic activity, pH, membrane and fluidity.

It is possible to collect 2 morphological parameters plus 1 or more fluorescence signals per single cell. The multiparametric analysis allows the definition of cell populations by their phenotype.

APPARATUS
Focusing, magnifying, and choice of light source are optimised to allow the automatic detection and measurement of morphological differences and staining patterns. Flow cytofluorimetric analysis meets the following criteria:
— choice of light source depending on the parameters to be analysed;
— adjustment of instrument settings depending on the cell type to be analysed (for example, cell cultures, leucocytes, platelets, bacteria, spermatozoa, yeast) and the analysis to be performed (for example, phenotyping, cell cycle, apoptosis, cytokines, membrane fluidity, fluorescent protein).

Flow cytometry is characterised by the automated quantification of set parameters for a high number of single cells during each analysis session. For example, 100 000 particles or more (practically unlimited) are analysed one after the other, typically in about 1 min. The detection limit is as low as 100 fluorescent molecules per cell.

A flow cytometer apparatus has 5 main components:
— a fluidic system and a flow cell;
— a light source;
— a detection and Analogue to Digital Conversion (ADC) system;
— an amplification system;
— a computer provided with software for analysis of the signals.

FLUIDIC SYSTEM AND FLOW CELL
The single cell is exposed to the light source and detected in the flow cell. The fluidic system carries the suspended cells individually from the sample tube to the laser intercept point. To achieve this, the sample stream is drawn out to a very thin fluid thread by a sheath fluid in the flow cell (hydrodynamic focusing). The light beam is focused in an elliptical shape, by 2 confocal lenses, into the flow cell channel through which the cells pass. The flow rate must be constant during routine cell surface marker analysis and must ensure a suitable distance between the cells to allow counting.

LIGHT SOURCES
Commonly used light sources are:
— lamps (mercury, xenon);
— high power water-cooled lasers (argon, krypton, dye laser);
— low power air-cooled lasers (argon (488 nm), red helium-neon (633 nm), green helium-neon, helium-cadmium (UV));
— diode lasers (blue, green, red, violet).

SIGNAL DETECTION
When a particle passes across the light beam, it scatters some of the light in all directions. Fluorescent dyes, when added to the particle, give off their own light (fluorescence), which is also radiated in all directions. 2 types of signals may thereby be generated:
— scatter of light;
— fluorescence emission.

The instrument's light detectors collect some of this scattered and fluorescent light and produce electronic signals proportional to the amount of light collected.

Scatter
2 parameters of light scattering are measured:
— the amount scattered mainly forward (forward scatter (FS))
— the amount scattered at 90° from the direction of the light beam (side scatter (SS)).

Forward scatter correlates with the cell volume while side scatter is influenced by parameters such as the shape of the nucleus, the amount and type of cytoplasmic granules or the membrane roughness, and correlates with the morphological complexity of the cell, so that the higher the SS intensity, the higher the cell complexity. As a function of the morphological characteristics of cells, scatter signals will always be generated during a flow analysis; they are defined as intrinsic parameters.

Fluorescence
Depending on the type and number of light sources, when a cell passes through the sensing area, it will emit fluorescent

light. Fluorescence signals are generated from fluorescent dyes naturally present in the cells (for example, co-enzymes, chlorophyll, seaweed pigments) and/or from fluorescent probes taken up by the cells when stained for the analysis of specific characteristics (for example, fluorescent antibodies, nucleic acid dyes, pH probes, calcium probes, fluorescent proteins). Nowadays, there is a large number and a wide range of different types of fluorescent probes available. The optical filters must be adapted to the fluorochromes used and changed if necessary. Each fluorescent probe is characterised by its excitation spectrum and its emission spectrum. They are chosen depending on the nature of the excitation source and the detection system, and according to the specific purpose of the analysis.

SIGNAL MANAGEMENT AND ANALOGUE TO DIGITAL CONVERSION

Scatter and fluorescence signals emitted by cells when passing across the laser beam are sorted and addressed to their detectors using optical filters. The detectors are transducers (photomultiplier tubes (PMTs)) that convert light signals radiated from the cells into voltage pulses.

The process of counting each pulse in the appropriate channel is known as Analogue to Digital Conversion (ADC). The process is finally shown as a frequency histogram.

Amplification

Voltage pulses need to be amplified for optimal visualisation. The amplification process accentuates the differences between cell signals, and consequently increases the resolution among cell populations of different characteristics (for example, the differentiation of viable from non-viable cells, or non-specific fluorescence from antigen-specific fluorescence after staining with a fluorescent monoclonal antibody).

There are 2 methods of amplification: linear or logarithmic; the choice between the 2 types is made for every single signal according to the morphological characteristics of the cells and the staining reagents used (for example, fluorescent monoclonal antibodies, nucleic acid dyes).

Linear amplification, which enhances the differences among strong pulses, is used with those parameters that generate high intensity signals, for example:

— cell scatters;

— fluorescence from nucleic acid dyes for cell cycle studies.

Logarithmic amplification, in contrast, is for weak pulses and parameters or analysis conditions that may generate both weak and strong pulses, for example:

— cell antigens;

— scatter from platelets, bacteria, yeast;

— fluorescence from nucleic acid dyes for apoptosis studies.

Compensation of fluorescence signals

Each fluorescent dye has an absorption wavelength spectrum and a higher emission wavelength spectrum. When using 2 or more fluorescent probes simultaneously for staining cells (for example, 4-antigen immunophenotyping), the fluorochromes emission spectra may overlap. As a consequence, each fluorescence detector will sense its own specific fluorescent light and a variable quantity of light emitted by the other fluorescent probes. This results in signal over-evaluation and poor separation of the cell populations.

The solution is in the use of an electronic matrix that allows the selective subtraction of the interfering signals from each fluorescence signal after detector sensing (fluorescence compensation).

Fluorescence compensation requires the use of fluorescence calibrators, preferably positive cell samples stained with the fluorochromes of interest, combined in a manner equivalent to that for the antibody used for the analysis.

SIGNAL PLOTTING AND DISPLAY

After amplification and compensation, the signals are plotted in 2 or 3 dimensions. Histograms show the signal intensities versus the cell counts for a given parameter. Cytograms, in which each dot represents a cell, result from the combination of 2 signal intensities (dual-parameter dot plots). The type and number of plots and signal combinations are chosen on the basis of the specimens and dyes used. When analysing acquired data, the flow cytometry software can also generate other kinds of graphs (such as overlays, surface plots, tomograms, contour plots, density plots, overlay plots). Statistical data such as mean fluorescent intensities (and their shifts in time or their dependence on cell function) can also be used.

DATA ANALYSIS

Different kinds of cell populations may be present inside the cell suspensions to be analysed, some of which are unwanted (such as dead cells, debris or macro-aggregates), or simply not relevant for the analysis (for example, granulocytes when studying lymphocytes). This depends on the cell sample type (whole blood, bone marrow, cell cultures, biological fluids, cell suspensions from solid tissues) and on the handling procedures (for example, staining methods, lysis, fixation, cryopreservation, thawing, paraffin-embedded tissue preparation).

As a consequence, not all the signals generated during a flow cytometry analysis belong to the cells to be studied. 2 strategies are adopted to exclude unwanted and irrelevant cell signals.

The 1st is used during data acquisition. It is a noise threshold, applied to 1 (or more) significant parameter(s), set to acquire only the cells with signal intensities higher than the pre-defined discrimination value for that parameter. Due to its characteristics of a strong signal with a low grade of interference, forward scatter is the parameter most often used as discriminator.

The 2nd, applied during data analysis, consists of the use of gating regions to restrict the analysis only to signals from those populations that satisfy given morphological and expression profile characteristics. 2 types of logical gating are commonly used. The 1st is the morphological gate. The cell populations are identified using their morphological signals (FS and SS). A region gate is drawn around the population of interest (for example, lymphocytes, viable cells) then the fluorescence plots are gated into the selected region. The 2nd is the fluorescence-based gate. The cell population of interest is identified on the basis of the expression intensity of an antigen or a dye, then a gate region is drawn around it. Afterwards the fluorescence plots are gated into the selected region.

The analysis software allows the creation of multiple gate regions, using a sequential logic order. This feature is especially useful when studying rare cell populations or for sorting purposes.

CONTROLS

Internal control

The system's optical alignment must be validated before analysis using adapted fluorospheres and the optimum fluidic stability is checked. The data obtained are reported and allow the periodical review of control values against the mean

performance value. A positive control is highly desirable to prove that the test antibody is functional and to allow the proper setting of the flow cytometer. The positive control must include samples known to be positive for the marker of interest.

External control
To ensure reliability in the data obtained or to check inter-laboratory reproducibility, participation in a proficiency testing study is recommended.

K. Peptide Identification by Nuclear Magnetic Resonance Spectrometry

(Ph. Eur. method 2.2.64)

This general chapter is to be used in conjunction with general chapter *2.2.33. Nuclear magnetic resonance spectrometry* in the context of peptide identification. The approach to be followed is qualitative and consists of comparing the nuclear magnetic resonance (NMR) spectrum of a test sample with that of a reference sample acquired under identical conditions.

This general chapter mainly applies to the use of proton NMR (^{1}H NMR) spectrometry, to confirm the identity of small peptide products (up to approximately 15 amino acids). It is also applicable when using ^{13}C NMR spectrometry with some modifications. The scope is restricted to the use of one-dimensional NMR spectrometry.

GENERAL PRINCIPLES

Equipment
Unless otherwise specified, an apparatus with a field strength giving an operating frequency for proton NMR of at least 300 MHz.

Spectral acquisition conditions and their optimisation
After introduction into the magnet, the sample is allowed to come to thermal equilibrium, especially if analysis is carried out at a temperature significantly different from room temperature: monitoring the lock signal is often a valuable visual guide to the progress of this process.

The spectral width must encompass the complete spectrum of the peptide, with an empty spectral region at each side. Typically, a spectral width of 12 ppm or 16 ppm is appropriate.

The following parameters may be optimised to improve resolution of characteristic peaks: temperature and/or pH primarily, buffer and peptide concentrations. Control of sample temperature is recommended but is not mandatory; if not used, the effect of small temperature changes on the appearance of the spectrum is validated.

The number of data points collected is such as to define peaks adequately.

Solvent suppression is not recommended but, if used, the intensities of peaks close to the solvent resonance may be affected and this has to be validated when comparing spectra.

Chemical shift referencing
For samples in aqueous solution, sodium 2,2-dimethyl-2-silapentane-5-sulfonate (DSS), sodium 3-(trimethylsilyl) propionate (TSP) or a deuterated analogue (TSP-d_4) are appropriate, and the chemical shift of the methyl signals is often set to 0 ppm. Either the reference material is added at low amounts (10-100 ppm has been found to be appropriate) to the deuterated water used to dissolve the final sample, or an easily recognised internal resonance that is consistently present (such as acetate anion) can be used as a secondary reference. In this case, a validation spectrum obtained under the same spectral conditions is used to define the chemical shift of the secondary standard.

Sample size
Usually a few milligrams are used. If sample sizes are variable, the effects of this variation on the appearance of the spectrum are validated.

Sample preparation
The test and reference samples must be comparable in terms of concentration, pH and buffer composition. Typically, samples in solution are lyophilised, and the dried samples dissolved in deuterated water or a buffer in deuterated water. It may be worthwhile to lyophilise a solution in deuterated water one or more times ('deuterium exchange') as this reduces the intensity of strong solvent signals; volatile process impurities such as ethanol will also be lost. Use of buffer for the final sample preparation can reduce aggregation and improve spectral reproducibility by reducing batch-to-batch pH variation. Some probes are intolerant to high salt concentrations, but ionic strengths up to 200 mM sodium chloride are normally tolerated. High salt concentrations tend to increase 90° pulse length.

VERIFICATION OF IDENTITY

Determination of key spectral factors
Use of a qualitative approach does not entail stringent requirements on spectral parameters (for example, fast pulse repetition rates can be used, as full relaxation is not required). The use of short pulse widths (for example, a 30° pulse) and fast repetition rates will have no significantly deleterious effect on spectra, and will allow faster acquisition of acceptable signal-to-noise ratios. Variation in the pulse width and acquisition time within wide limits will not affect the ability to compare spectra. The number of scans collected must give appropriate signal-to-noise ratios for low intensity resonances and therefore a minimum signal-to-noise ratio of 50:1 is recommended.

Identification of characteristic resonances
It is possible to compare either the complete spectrum or a portion of it. Comparison of spectra of relevant samples will highlight regions of the spectrum that are distinctive, and comparison can be constrained to these regions. It is important to define resonances from impurities, such as residual solvents, which may be essentially irrelevant to product quality and which may vary in intensity between batches.

Spectral comparison
See the provisions of general chapter *2.2.33*.

L. Chemical Imaging

(Ph. Eur. general text 5.24)

1 SCOPE

Chemical imaging (CI) combines spatially resolved sensing technologies with data analysis techniques to characterise a sample in chemical and physical terms, using information primarily obtained from its surface. Chemical imaging is particularly suited to the analysis of solid, semi-solid and liquid samples with regard to material properties, including component identity (active pharmaceutical ingredients and excipients), domain size and distribution, polymorphism, and particle morphology. Thus, imaging can be applied to assess

identity, quality and quantity of active ingredients, intermediates, and excipients in bulk or solid dosage forms, biological samples, packaging and devices. Imaging is used to explore sample homogeneity, detect physical sample defects (e.g. cracks in cores or coatings), and identify foreign particles or contaminants. It also facilitates process understanding and root cause determination. Lastly, it is a tool to evaluate falsified or counterfeit medicinal products.

This general chapter's primary focus is on chemical imaging systems (CIS) based on surface analysis performed with vibrational spectroscopy, e.g. mid-infrared spectroscopy, near-infrared spectroscopy and Raman spectroscopy. However, it also applies to other techniques that supply images.

It offers specific recommendations to assess the performance of chemical imaging systems for the qualitative and quantitative exploitation of images. Where chemical imaging systems are primarily intended for investigative purposes, the performance requirements for infrared absorption spectrophotometry (*2.2.24*), near-infrared spectroscopy (*2.2.40*) and Raman spectroscopy (*2.2.48*) need not be applied. Instead, individual criteria have to be established using a risk-based approach.

2 ASPECTS OF CHEMICAL IMAGING

2-1 DEFINITION

Chemical imaging of pharmaceutical samples is a method that consists of a collection of responses to the illumination at multiple wavelengths of positions spatially distributed across the sample surface. For a given surface location (pixel), a set of responses will be associated with the impinging wavelengths. When x and y positions are varied successively over the range of wavelengths and responses are collected at each location, an image of a wide surface of the sample is constructed.

Imaging systems resolve spatial information primarily at the sample surface. Chemical and morphological sample characteristics or features are collated into an image made up of contributions from multiple domains distributed on the surface of the sample. As a result each mapped sample point (pixel) contains a wealth of information, and the recorded signal reflects chemical and physical properties such as ingredient identity, concentration, crystallinity, orientation, domain size and particle size.

2-2 IMAGING MODES

Chemical images may be acquired in broadband, multispectral or hyperspectral modes. An example of the broadband mode is the camera, where filters are used to weight the relative importance of different wavelengths for the 3 colour variables red, green, and blue (RGB). Multispectral imaging involves sampling spectral bands that may be spread unevenly, not unlike a combination of different detectors in different frequency ranges.

Hyperspectral imaging (HS imaging, HSI) is a two-dimensional (2D) visualisation technique that records a full range spectrum for each pixel. In practice, HSI expands spectroscopic single point analysis of samples into 2D projections of a slice of finite depth for each measured area of the sample. Hyperspectral sensors take advantage of numerous contiguous channels to uncover features that usually cannot be resolved using the average spectra obtained from a single measurement in classical spectroscopy. Images may be produced with a spectral quality similar to that of conventionally obtained spectra. However, this comes at the cost of longer measurement times, larger amounts of data, and complex computation. The spectral quality is sometimes lowered to increase the image throughput. Sample domains may include complex spectral patterns embedded in the individual pixel data that cannot be identified solely by visual inspection, and appropriate image analysis is required to extract analytical information from such a multitude of measurements. Computational and numerical methods are essential for processing, extracting and analysing content in hyperspectral images.

2-3 DATACUBE

In hyperspectral imaging each pixel is associated with one spectrum. Measurements are spread over both dimensions of the sample surface. At each measurement, a column vector of dimensions equal to the number of recorded spectral data points is associated. As a result, data is packaged into a three-dimensional array called a datacube or hypercube. The datacube is a signal intensity data set made up of the pixel x-y coordinates and the corresponding series of responses (e.g. absorbance or transmittance) to the scanned spectrum (see Figure 5.24.-1).

Not unlike classical spectroscopy, which gathers chemical and physical information about the single area under examination, imaging captures spectral and spatial characteristics of surface areas. Spectral and spatial analysis of image pixels can be iterative, or combined in no particular order.

2-4 HIGHER DIMENSIONAL CHEMICAL IMAGING

Spatially resolved three-dimensional imaging can be seen as extending spatial resolution along a third direction (z) that complements x-y imaging. It is the process of stacking a collection of images covering a depth into the sample which is larger compared to the analysis depth. This can be obtained indirectly (invasive, destructive process), by sequentially collecting images of appropriately prepared solid samples, e.g. by slicing the surface stepwise with a microtome. Meanwhile there are techniques which enable direct (non-invasive, non-destructive process) 3D imaging of solids using x-y-z spatially resolved spectroscopy. These include tomography methods such as optical coherence tomography (OCT), far-infrared (FIR)/terahertz (THz) and time-domain THz spectroscopy, confocal Raman, and others, for example, X-ray tomography or nuclear magnetic resonance imaging (MRI). Ultimately 4D and higher dimensional imaging would mean simultaneous spatial (x, y, and z) and spectroscopically resolved mapping. Although higher dimensional imaging is not within the remit of the current general chapter, similar recommendations may initially apply.

2-5 APPLICATIONS

Visual display of the distribution of sample surface features complements classical analytical methods by facilitating rapid and non-destructive comparison between samples. CI can be used to analyse small to large surface areas of a sample. Imaging comes into its own as soon as constituents and morphological characteristics differ from one position to the next. Thus, the technique is particularly suited to exploring samples that are heterogeneous with regard to chemical content and physical morphology. Imaging captures the distribution of selected components and features, i.e. attributes of various parts of a sample. For example, images can display the location of features that directly impact product performance. They can show whether a component is evenly distributed on a relevant scale. Therefore, it is important to choose CI methods depending on the needs with regard to spatial resolution.

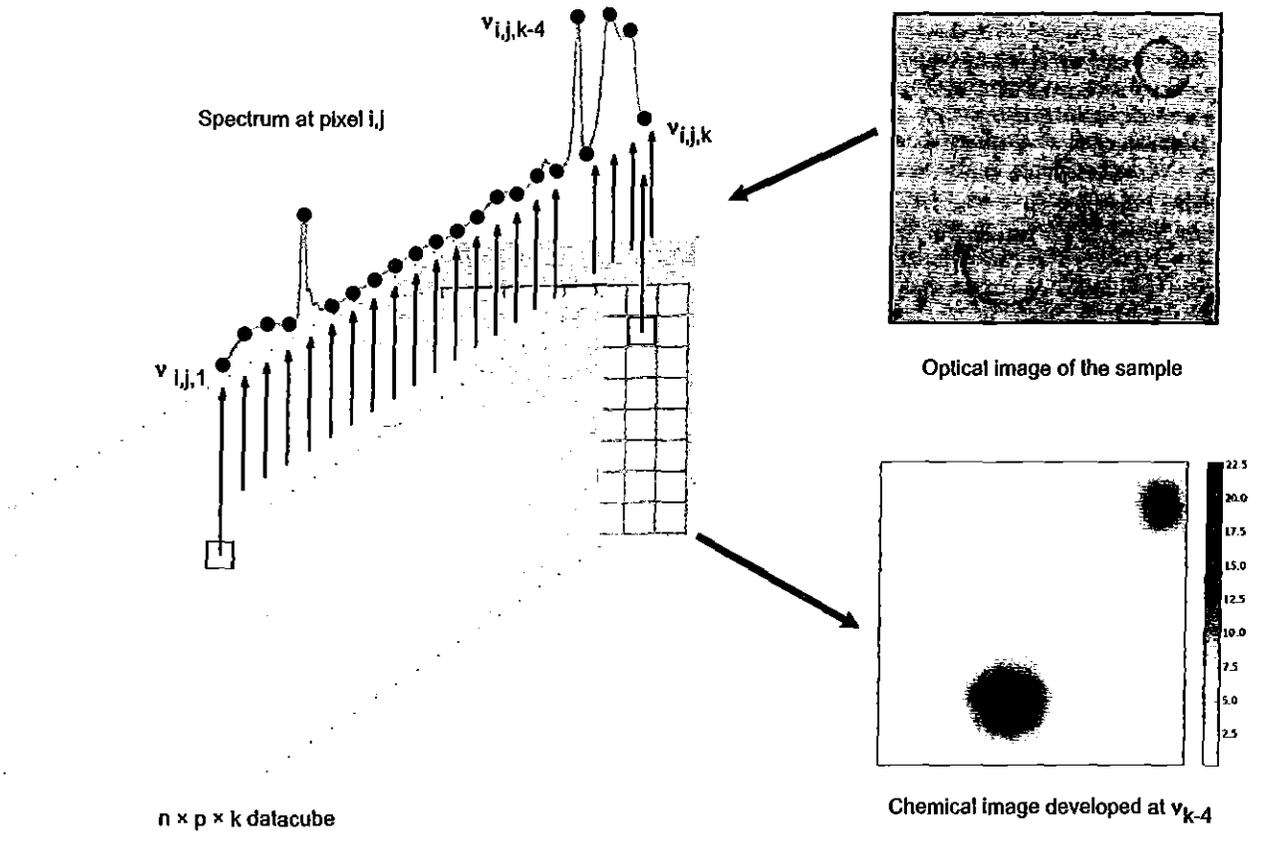

Figure 5.24.-1. – *Example of a n × p × k datacube obtained by recording spectra of k wavenumbers at n × p pixels of the sample; a grey-scale image was developed at wavenumber* v_{k-4}

The main applications of chemical imaging focus on solid-state property analysis, determination of chemical or physical features, contaminant identification, anti-counterfeit, and chemical identification. For example, the measurement of thickness and uniformity of coating on tablets, and the characterisation of surface properties, such as component mapping, determination of adhesion force and deformation depth, can be considered. Moreover, particle characterisation can be performed based on measurements of size, agglomeration and morphology, determination of roughness of the surface, and detection of broken particles and foreign particles. Analysis of particles can also be performed in liquids.

Spatial distribution of different polymorphic forms can be analysed with CI techniques and the investigation of polymorphic transitions and multiphasic materials (e.g. solid dispersions) can also be considered. The characterisation of nano- and micro-crystalline materials can be performed to monitor structural changes under stress conditions and over time, and to evaluate defects in crystals, for example, resulting from milling and micronisation of the material. The chemical characterisation of samples based on chemical images is mainly performed to identify and characterise the distribution and abundance of individual components in a mixture based on characteristic spectral features (see Figure 5.24.-2). This analysis can be performed to determine molecular but also atomic elemental species present on the surface. The kinetics and mechanism of active substance dissolution and release can be modelled, and, as another example, the drug concentration gradient between the solid/solution interface and the bulk solution can be determined.

2-6 CHEMICAL IMAGING SYSTEMS

The selection of a specific imaging instrument or technique depends on the particular analytical application intended. A chemical imaging system is characterised by setup, spatial and spectral resolutions, magnification, type and size of sample, sample preparation and presentation, moving or resting sample, acquisition time, number of measurements, data analysis algorithms, software, etc.

Numerous techniques enable the production of hyperspectral images. A brief description of techniques relying on vibrational spectroscopy is given below, along with their potential uses and limitations.

Mid-infrared (MIR)

MIR spectroscopy is based on the interaction of light with the sample, for the study of intra-molecular vibrations of a material. The electromagnetic spectrum range usually spans the region of 4000-400 cm^{-1} (2.5-25 µm). MIR imaging may be used for the characterisation of chemical species in a mixture of ingredients. Measurements are often carried out using attenuated total reflectance (ATR) microscopy where the sample is in contact with an IR-transparent crystal of higher refractive index than the sample. The measurement may be difficult for samples with excessive moisture due to interference with water bands.

Near-infrared (NIR)

NIR spectroscopy detects molecular vibrations originating from C-H, N-H, O-H and S-H overtones, and combinations of fundamental mid-infrared vibrations. The electromagnetic spectral range usually extends from 12500-4000 cm^{-1} (0.8-2.5 µm). The measurement is contactless, usually in diffuse reflectance mode, and delivers physical and chemical information.

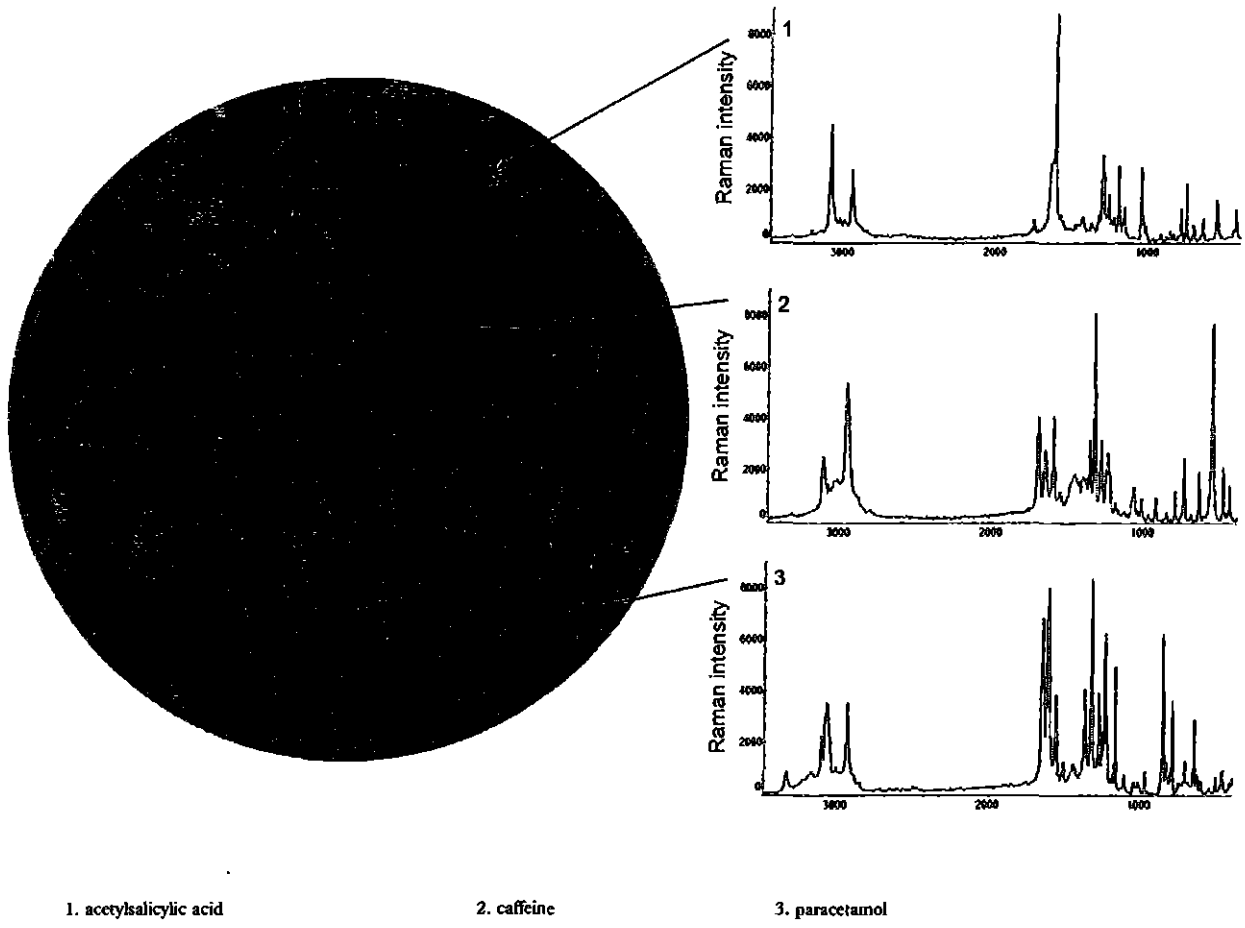

Figure 5.24.-2. – *Example of characterisation of ingredients with Raman imaging*

Far-infrared (FIR) and terahertz (THz)

In the FIR range, electromagnetic radiation typically spans from 400 to approximately 10 cm^{-1} (25-1000 µm). This allows spectra to cover inter-molecular and lattice vibration modes. The selectivity of the technique to the hydrogen bonding networks makes possible the identification and characterisation of solid state forms, e.g. polymorphic forms and degree of crystallinity.

The radiation can pass through a wide variety of non-conducting materials, but cannot pass through conducting materials such as metal and water, and penetrates deep into the sample.

Raman

Raman spectroscopy detects frequency shifts originating from the inelastic part of the light scattered by a sample previously irradiated with an intense monochromatic light source (usually a laser). Raman spectra contain numerous narrow bands which makes possible the identification of chemical substances. As a result, Raman imaging gives information on chemical species in a sample (including polymorphs).

Water, air and glass are weak Raman scatterers and therefore the analysis of aqueous samples may be performed in atmospheric conditions or in sealed vials. However, the measured signal may be disturbed by fluorescence.

2-7 ACQUISITION MODES

Either spatial sequencing or wavelength sequencing techniques are required to produce an image. The 3 modes used to record datacubes are point mapping, line mapping and global imaging. Point mapping (point scanning) is the simplest and typically follows a rectangular grid pattern. A spectrum is recorded at each point on the grid with the sample stage being moved to the next neighbouring location. Scanning is computer-controlled along both spatial axes. In line mapping (linear scanning), the sample is illuminated along a line and the image signal is dispersed along one spatial axis onto the detector. The sample is moved along the other spatial axis to capture the next neighbouring line until full mapping is eventually achieved. Here the speed and flexibility of the experimental setup enable on-line application of continuous CI. Global imaging (focal plane scanning) is performed when all image points of a sample are imaged simultaneously onto the detector array. This can be done on a per wavelength basis with filters or tuneable filters.

2-8 RESOLUTION

Pixels contain a wealth of contributions from chemical and physical features occurring at the surface and near sub-surface of the sample. The performance of an imaging system is directly related to the spatial and spectral resolutions that can be achieved. Linear line mapping systems are more sensitive to spatial interference, whereas spectral resolution is more critical with focal plane acquisition.

Depending on the imaging technique, spectral resolution may be affected for example by laser wavelength, grating, detector and spectrometer focal length. Spectral resolution has an impact on chemical feature extraction because it influences the performance of qualitative and quantitative image analysis, e.g. identity of ingredients.

Spatial resolution is the smallest distance between two consecutive points which can be distinguished. It has an impact on image processing as information may appear as unresolved. For example, the domain size of components of interest should be consistent with the spatial resolution achieved by the system. The spatial resolution obtainable is limited by the instrument characteristics, for example spot size of the laser, diffraction limits, detector size, magnification, numerical aperture, etc. The spatial resolution obtained by a specific CI system is also affected by the diffusion of radiation across the sample surface. Scattering occurring below the surface is likely to distort the image obtained and limit the spatial resolution.

2-9 REPRESENTATIVENESS OF SAMPLE SURFACE

Depending on the instrument setup, the topology of the sample surface may impact imaging performance.

The sample surface investigated has to be representative for the intended purpose of analysis. Depending on the latter, the impact of sample homogeneity has to be evaluated. For example, with a design based on reflectance, due to the limitation of penetration depth and spatial resolution, a true measure of morphology or distribution of particle shapes in the sample is only estimated. Thus, results obtained from surface image analysis may not be representative of the whole sample because it may not be homogeneous.

One approach to overcome this limitation would be to measure a number of cross-sections of the sample to improve estimations for the whole sample. Another approach would be to use an alternative optical design where penetration depth can be increased, e.g. confocal or spatially resolved offset measurements to capture information near the surface, tomography or transmission measurements to collect whole matrix information.

3 ELEMENTS OF A CHEMICAL IMAGING PROCESS

Proceeding with imaging encompasses numerous steps such as:

— sample preparation;
— control of instrument components and system performance;
— calibration of instrument and system suitability test;
— measurement, image processing, display and storage;
— image analysis and computation of numerical results.

3-1 SAMPLE

3-1-1 Sample preparation

Sample preparation has to be in accordance with the imaging technique used. *In situ* measurements with probes can be performed without sample preparation. On the other hand, setups for Raman scattering for example proceed by non-contact focusing, meaning that the sample surface may need to be prepared to obtain a reasonably flat surface. If the instrumentation is unable to compensate for topographical variation, sample surfaces may be mechanically modified, for example by flattening a concave tablet surface. Focusing adjustments by automatic refocusing during mapping compensates for slightly uneven surfaces. Sample surface preparation has also to be considered with ATR-IR imaging for which contact between optics and sample is required.

3-1-2 Sample presentation

Appropriate sample presentation is dictated by instrument setup. A particular setup will be more or less adapted to a specific sample type and analytical task. The sample is positioned so that it is optimally imaged. The setup is optimised to reduce specular reflection as much as possible. Angles and distances between probe (or beam), sample and detector match the setup requirements.

3-2 CONTROL OF INSTRUMENT PERFORMANCE

Evaluating both instrument performance and image analysis methods is essential to avoid misinterpretation or artefacts. Parameters include spectral as well as spatial components. The instrument is to be used according to the manufacturer's instructions.

Instrument performance verification consists of periodic performance qualification as well as system suitability tests. The intervals depend on the use of the instrument and its application. The system suitability tests are carried out before measurements to check if the CI system is operating properly for the intended application.

The parameters to be assessed and the acceptance criteria applied during performance qualification and system suitability tests have to be justified and depend on the CI technique and the purpose of the analysis. Parameters which might be verified are described below.

3-2-1 CIS component adjustment

In a schematic setup, a typical CIS would be made up of components including source of radiation, optical devices, sample holder, detector, and software.

The system and its individual components comply with all expected requirements.

3-2-1-1 Sources, optics and detectors

Source intensity is monitored as part of the setup verification. In particular, the source intensity should be verified before starting calibration routines or a new series of sample measurements. Optical path, confocality, wavelength accuracy and energy throughput at any *x-y* position (pixel) match the specifications.

Alignment of optics, sample and detectors comply with measurement requirements in terms of distances, angles and polarisation. This alignment may shift with the temperature. In particular, illumination of the sample or regions of interest has to be as homogeneous as possible and reproducible.

Parasitic or adverse effects, for example scattering, background, noise, bad pixels, cosmic rays and fluorescent lights in the laboratory, and side effects such as sample fluorescence have to be controlled. Stray light, ghost lines, and ghost images can be caused by reflections from imperfect surface elements. They constitute parasitic light that has to be dealt with.

3-2-1-2 Multi-wavelength and multispectral systems

Multi-wavelength systems should be tested at wavelengths spread over the wavelength scale using the peaks of the selected reference standard with good signal-to-noise properties.

Multispectral systems are verified for all signal sources involved.

3-2-1-3 Mapping

When images from more than one instrument are going to be aligned, it is important to have verified *x-y* scales.

3-2-1-4 Magnification

In the case where the CIS permits different magnifications, the optical or electronic magnification level needs to be optimised. If magnification is inadequate for resolving relevant features, the value of imaging may be diminished; whereas if magnification is set higher than required, the field of view is reduced.

3-2-2 Calibration

The purpose of calibration is to transform the recorded signal into data suitable for analysis, interpretation, or comparison with reference data.

Basic instrument calibration of imaging systems consists of *x*- and *y*-axis calibration in both wavelengths and intensity.

3-2-2-1 Spectral axis

Optimal wavenumber accuracy is critical and should be achieved at the same level as for a standard spectrometer. Spectral axis calibration assigns wavelength and intensity values to every mapped pixel of the sample surface. To determine these relationships, well-characterised light sources or reference materials can be used. Calibration should be carried out using referenced and certified/normalised internal or external standards provided either by the supplier or a third party. Technology and environmental conditions are other critical points.

3-2-2-2 Spatial axes

Spatial axis calibration has an impact on the actual field of view of the CIS and the sampled surface area, i.e. the pixel location. Calibration corrects deformations on the spatial axis such as those caused by the optics. For example, the pixel position may be accompanied by variation of the spectral resolution from the centre towards the detector boundaries. In addition, mixing of signals from adjacent pixels can occur. Both errors change the appearance of the pixel spectra and may reduce the accuracy of subsequent data analysis. If it is not possible to deduce the position of the imaged pixels on the detector surface from the pattern on the target surface, a special test target can be used or developed for the application.

Spatial resolution in both *x* and *y* directions is also limited, for example, by image size and step size of the moving table or the conveyor belt.

3-2-2-3 Method

Appropriate data processing and modelling are needed to deliver information about the property that correlates with the observed features in images. Calibration related to the analytical objective requires, for example, identifying and estimating a characteristic identity or morphological features of the sample.

3-3 IMAGE PROCESSING

Processing means that the image is treated for display and subsequent feature estimations. Imaging requires steps to improve the image for analysis, e.g. to control brightness and contrast, reduce noise, sharpen edges and borders, remove unwanted features, etc. This improvement allows features to be recognised i.e. separated and discriminated from the background.

Chemical images are generally processed by chemometric modelling for qualitative or quantitative purposes (see general chapter *5.21. Chemometric methods applied to analytical data*).

3-3-1 Spectral selection

Image contrast is built upon specific signatures of the components at the sample surface and derived from spectroscopic data such as peak intensity, peak position, baseline variations (scattering differences), or values calculated with multivariate analysis.

3-3-2 Image pre-processing

Data analysis methods for imaging data sets usually begin with the same steps as for single point spectroscopy. Pre-processing is utilised to separate chemical and physical effects, unless an analysis is based on the physical effects (e.g. scattering differences seen as baseline variations).

The collected data is typically affected by noise or instrumental distortions and pre-processing is often applied to improve image quality. There may also be a need to remove irrelevant sources of variation such as cosmic ray spikes or stripes due to detector configuration. Common pre-processing operations for spectra are: baseline correction, derivatives, smoothing, wavelet-based filtering, standard normal variate (SNV), multiplicative scatter correction (MSC), normalisation, truncation and Fourier-transform. It has to be verified that pre-processing does not cause artefacts.

3-4 IMAGE ANALYSIS

Pixel arrangements in an image of the sample represent a map of the distribution of chemical or physical properties or features. Depending on the objective of the analysis, data can be explored for spectral features, spatial features, and a combination of both. Examination of the datacube can be performed in a direct way, as for conventional spectroscopy (e.g. by analysing height of peaks or area ratios), or by techniques including image processing, multivariate data analysis, etc.

3-4-1 Visual exploration

A review by the user of an image displayed on screen may deliver a first impression before beginning enhancement, exploration and evaluation. Images can be analysed for features at the surface of the sample, such as location, distribution, size and shape of domains, constituent identification, etc. Standard image processing tools, such as morphological filtering and particle statistics, may be applied directly for samples that are significantly heterogeneous.

For a chemical image, both spectral and spatial analyses can be equally important and there are different steps of chemical image analysis. Spectral and spatial analyses are often iterative by nature. In practice, the methods used depend upon whether it is the spectral information or the spatial information that is of more interest. The goal is to reduce data dimensionality and extract as many features as possible. Unsupervised multivariate analysis such as principal component analysis (PCA) may be applied prior to feature extraction to describe the information contained in the image. A preliminary segmentation of PCA images may be used to facilitate identification of regions of interest in the image for further processing. If the ingredients of a mixture are known and available for reference measurements, the corresponding data is used to reduce the number of spectral layers in the hypercube down to a few chemically or physically meaningful layers by using supervised regression methods, e.g. multivariate curve resolution-alternating least squares (MCR-ALS), independent component analysis (ICA), and partial least squares regression (PLS).

3-4-2 Feature extraction

The extraction of chemical or morphological features of samples involves supervised techniques to perform dimensional reduction. It concentrates further image processing on characteristics that are meaningful for the analysis. For example, a selected feature could be the quantity of a given substance or a solid-state form of interest. If the sample is comprised of components whose spectral features are well separated, it is possible to proceed directly with a univariate method based on a single wavelength per feature, thus utilising only a small fraction of available data. However, in many cases spectral overlap is significant and the univariate approach is insufficient. The extraction of features can then be improved by including a greater proportion of the spectral information and applying a

multivariate approach, such as clustering, classification, PLS discriminant analysis (PLS-DA), linear discriminant analysis (LDA), etc.

3-4-3 Quantification of ingredients

There are several ways to measure ingredient variation using regression methods. A quantitative model can be computed by using average spectra or binning of regions of interest at the surface of the sample. The known bulk concentration may be used when the ingredient present varies in responses for the analytical method used. This can be performed by peak integration at a single wavelength or alternative chemometric methods.

When individual pixel spectra become increasingly mixed, chemometric tools, typically multivariate data analysis, can be deployed with similar data analytical strategies as those for single-point spectroscopy.

For example, it is possible to estimate relative component abundance by using pure component spectra as the starting point. The reference spectra used to create the library are collected from separate pure component samples. These spectra can be measured with a non-imaging spectrometer, or as separate images of pure components. The inherent variation in pure component spectra when acquired across a large number of pixels provides additional statistical robustness. The reference spectra and the unknown sample can also be measured simultaneously in the same field of view to create one single data set. If pure component reference spectra can be derived directly from an isolated area of the imaged sample, there is no need to acquire additional reference spectra for calibration. A multivariate model can be developed either based on external reference spectra or based on spectra from isolated areas of the respective image.

Both with simultaneously and separately acquired pure component spectra, it is important to verify that they are representative for the present analysis by for example regression residuals.

3-4-4 Spatial analysis of image features

Spatial analysis of the images can be performed with regard to distributions of shapes, sizes and locations of domains, etc. Analysis of shape and distribution relies on a variety of numerical methods and algorithms.

Images display the samples by setting a threshold value and converting data into a set of colours or shades according to a monochrome or pseudo-colour intensity scale to underline the presence or proportion of the analytes of interest at each pixel. Alternatively, the distribution of several analytes can be combined into colour images. Further analysis can be performed, such as counting pixels, estimating the size distributions of particles of the same chemical origin, and segmentation which is a process to divide the image between regions that correspond to surface areas of interest.

3-4-5 Measuring dimensions

Images can be used for example to determine area, dimensions, perimeter, aspect ratio and roundness.

3-4-6 Statistics

Pixel statistics can be performed to facilitate further image analysis. Application of methods such as variance analysis and box-plot for domain size, shape, distribution, and distances between domains, enables estimation of the variability within an image. These methods deliver a condensed description of relations between domains in the images with simplification of the image analysis. Property estimations can also be derived from these values.

M. Direct Amperometric and Pulsed Electrochemical Detection

(Ph. Eur. method 2.2.63)

Direct amperometric detection and pulsed electrochemical detection (PED) are used to detect electroactive compounds by oxidation (or reduction) when coupled to a separation technique such as liquid chromatography (*2.2.29*). Electrochemical detection uses the redox potential of analytes and is therefore only valid for electroactive substances.

PRINCIPLE

When a constant potential is applied between 2 electrodes, the oxidation (or reduction) of an electroactive substance generates a current proportional to the amount of analyte passing the electrode surface. This analytical technique requires a supporting electrolyte, which can be added post-column if not already present in the mobile phase. Detection usually involves oxidation of the compounds of interest.

The potential applied to the measuring electrode can serve as a selectivity parameter for the compounds of interest.

The upper limit of the electroactivity range is defined by the oxidation curve of the mobile phase, the supporting electrolyte or the measuring electrode.

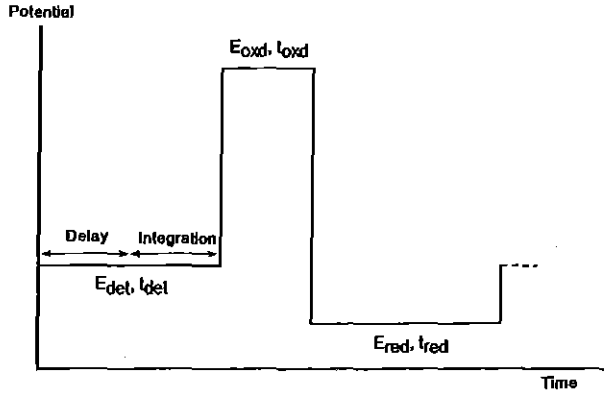
With direct amperometric detection, only a constant potential is applied. However, this method may result in the surface of the measuring electrode becoming fouled with adsorbed carbon compounds, resulting in signal variability and a decreased response. This passivation phenomenon is particularly common with sugars, thiols and phenols.

The problem of electrode fouling can be resolved by the application of a series of pulses, a process known by the generic term of pulsed electrochemical detection (PED).

The most widely used PED mode is pulsed amperometric detection (PAD), which involves a 3-step series of pulses or waveform (Figure 2.2.63.-1). After applying the detection potential (E_{det}), a high positive potential (E_{oxd}) (anodic polarisation) is applied to clean the surface of the measuring electrode, followed by a negative potential (E_{red}) (cathodic polarisation) to restore the surface of the measuring electrode. A new cycle of the waveform can then start.

Following the potential step from E_{red} to E_{det}, background signals will originate. Although these decay quickly, a brief delay must be introduced before the analyte signal can be properly measured.

Other waveforms comprising more than 3 voltage steps have been developed.



E_{det}: detection potential applied during a period t_{det}
E_{oxd}: oxidation potential applied during a period t_{oxd}
E_{red}: reduction potential applied during a period t_{red}

Figure 2.2.63.-1. – *3-Step potential-time waveform (pulse sequence)*

EQUIPMENT

An electrochemical detection system comprises 3 electrodes: a measuring electrode (gold, platinum or glassy carbon); a reference electrode (usually silver-silver chloride); and an auxiliary electrode (e.g. titanium cell body) (Figure 2.2.63.-2).

The choice of measuring electrode depends on the substance to be examined. The electrodes are coupled to a potentiostat, which controls the potentials applied to the measuring electrode without subjecting the reference electrode to a current, the auxiliary electrode functioning as a cathode whenever the measuring electrode is operating as an anode and vice versa.

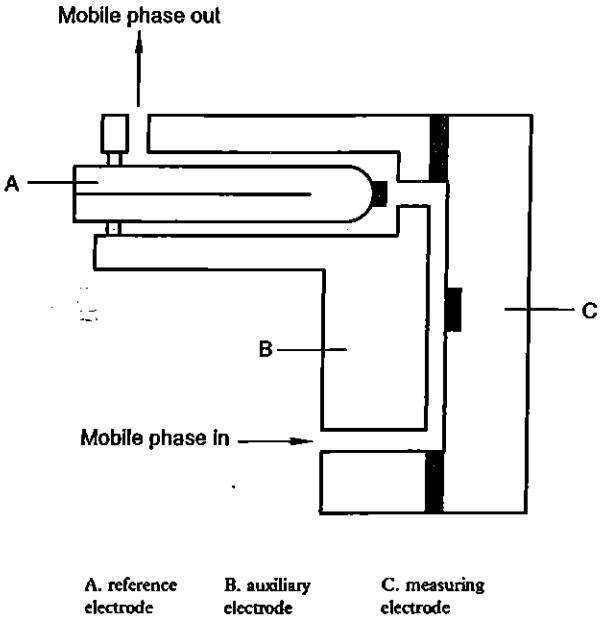


Figure 2.2.63.-2. – *Electrochemical detection system*

EQUIPMENT PERFORMANCE

The potentials to be applied depend on the analyte and the type of electrodes used, and the settings must therefore be adapted accordingly.

All electrodes should be in good condition and periodic replacement is recommended. When the detector is used for quantitative analysis, it is advisable to check the linear range, sensitivity and repeatability of the detector.

The quality of the reagents used is of utmost importance. It is advisable to employ reagents of the highest purity.

ADDITIONAL INFORMATION

Maintenance of the electrochemical cell

Although the application of an increased potential in PED cleans the surface of the measuring electrode effectively, it can be necessary to polish the measuring electrode mechanically from time to time when the background current increases and the sensitivity decreases. The cleaning of the measuring electrode must be carried out very carefully to avoid creating pits or scratches. It is also advisable to wipe the auxiliary electrode at the same time to remove deposited substances. The cell requires some time to stabilise after polishing.

Sodium hydroxide solution

Detection can be enhanced in alkaline media (at least pH 12), as is the case with aminoglycoside antibiotics. When the mobile phase is not sufficiently alkaline, this can be achieved by post-column addition of a sodium hydroxide solution to increase the pH of the column effluent. The solutions are mixed in a coil that is linked to the electrochemical cell. It is essential that the length of the mixing coil is such as to produce a homogeneous solution but with minimal peak broadening. It is important to avoid carbonates in the sodium hydroxide solution. To avoid baseline disturbances, the sodium hydroxide solution should be degassed before use, it must be added pulse-free and its flow should be constant between runs. The parts of the chromatographic system coming into contact with the sodium hydroxide-containing solutions must be alkaline resistant.

Process Analytical Technology

(Ph. Eur. method 5.25)

This general chapter focuses on the interfacing of analytical techniques with the manufacturing process as a means of enhancing process control and improving process understanding. It should be noted that it is not within the scope of the chapter to give specific instructions for all possible process analytical technology sensors; instead, it offers a general approach to the integration of analytical techniques in the process environment together with aspects to be taken into consideration for the application of process analytical technology.

1 INTRODUCTION

Process analytical technology (PAT) can be defined as a system for designing, analysing and controlling manufacturing processes through timely measurements (i.e. during processing) of critical quality attributes (CQA) of raw and in-process materials and critical performance characteristics of processes in order to ensure the quality of the final product. It is important to note that the term 'analytical' in PAT is used in a broad sense to include chemical, physical and microbiological measurements conducted in an integrated manner and combined with data analysis. The goal of PAT is control of the manufacturing process and enhanced process understanding, guided by risk management. Interfacing manufacturing processes with analytical techniques is therefore essential in PAT, as it facilitates process development in accordance with quality by design (QbD) principles, enables real-time release testing (RTRT) and supports continuous manufacturing processes.

Time delays between obtaining a sample for testing, analysis of that sample and any consequent outcomes must be taken into consideration when applying PAT. When the analytical results are used on a continuous basis to monitor and control a process, it is important to minimise such delays. This can be achieved most effectively with sensor-based continuous measurement systems directly interfacing with the process stream during a specific unit operation. The sensors interfaced with the process continuously measure the process conditions and material characteristics within the process environment (*in situ*) and send the measured data (e.g. a spectrum) to an operating system where it is recorded and analysed, and where any necessary adjustments to processing conditions can be determined on a continuous basis. These *in situ* measurements can generate very large volumes of data representative of the process.

2 INTERFACING MODES

The interfacing of analytical techniques with the manufacturing process is central to the application of PAT. Results generated by analytical equipment interfaced with a process can be used for monitoring purposes and to ensure that the process is stable, for example via automated feedback or feedforward control loops.

The terms 'off-line', 'at-line', 'on-line' and 'in-line' describe interfacing modes (see Figure 5.25.-1). Measurements using on-line and in-line systems generally support rapid and automated process adjustments since they move the analytical techniques into the process stream. In contrast, off-line and at-line measurements involve transferring the samples away from the process stream to the analytical equipment.

Off-line measurements

These correspond to conventional analytical testing in which the sample is removed from the manufacturing process environment and tested in a laboratory, typically located away from the production environment. This transfer of samples away from the process stream can result in a significant time lag and generally does not permit immediate process adjustments. However, off-line measurements can nonetheless be useful for PAT purposes if relevant analytical data can be obtained within a time frame that is compatible with process dynamics.

At-line measurements

With at-line measurements, the sample is also removed (manually or automatically) from the process stream for testing, but the testing equipment is usually located within the production environment, i.e. in close physical proximity to the process stream, and testing can therefore take place with minimal delay. This results in a shorter time frame for obtaining analytical data, and also differentiates at-line measurements from off-line measurements. It is therefore possible to make process adjustments based on the results of at-line measurements.

On-line measurements

On-line measurements typically involve sensor-based measurements made under real-time conditions by diverting a portion of the material from the process stream directly into a measuring device and the results are available after a minimal time delay.

Depending on the nature of the test, e.g. whether or not it is detrimental to the product, the diverted portion may be returned to the process stream, otherwise it is discarded.

In-line measurements

In-line measurements are taken within the process stream by placing measuring devices, typically sensors, directly in contact with or into the process stream. No portions of the material are therefore removed from the process stream.

In-line measurements must also be non-detrimental to the product.

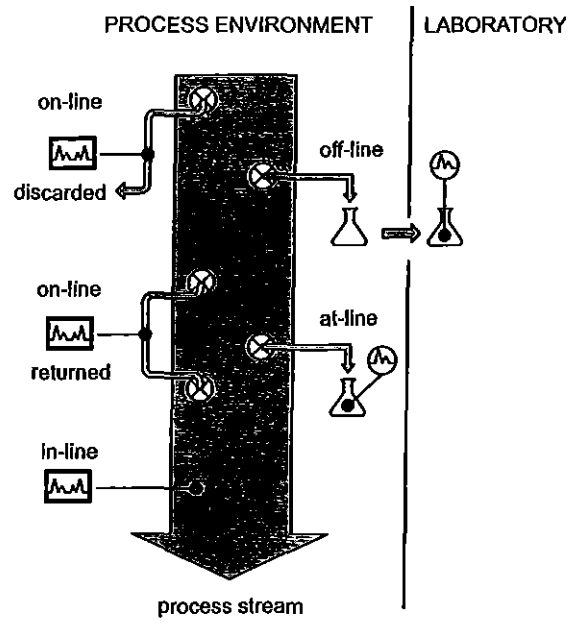

Figure 5.25.-1. – *Interfacing modes*

3 COMPARISON OF INTERFACING MODES

Both off-line and at-line measurements are based on analysis of discrete samples removed from a process stream or bulk material. These samples are considered representative of the material in the process stream at the time they are removed. Frequent at-line measurements also provide data supporting the application of PAT, as they are carried out within a short time frame and in the immediate vicinity of the process stream.

Neither in-line nor on-line measurements involve sampling in the conventional sense. The tested portion might not be separated from the process stream, and is usually smaller than a conventional sample.

Scale of scrutiny must be considered and will determine the frequency and duration of measurements. Furthermore, measurements can be influenced by physical attributes interfering with the acquisition properties of the measuring system. When measuring solids or suspensions, for example using spectroscopic methods, consideration must be given to the surface and bulk scattering properties of samples, and movement of the material. Influencing factors such as particle size, surface roughness and solid density can cause significant spectral differences, which must be taken into account when a method is designed and used in order to ensure that the process and material are described adequately.

In-line and on-line modes offer the advantage of fast data acquisition, allowing high measurement frequency, and thus enabling rapid continuous monitoring as well as immediate action and control of the process.

In some cases, PAT measurements can be used qualitatively to build models such as process trajectories or process signatures which can be used to characterise process variability and highlight unusual process behaviours. These models are not necessarily directly linked to a critical in-process quality attribute or performance characteristic. It is therefore recommended to demonstrate the causal relationship between the PAT measurements, the model and the relevant quality attributes or performance characteristics when using such models for process control purposes.

General validation principles also apply to in-line or on-line measurements although some validation procedures may be different to those for conventional quality control methods.

Analytical validation procedures for at-line and off-line measurements assume homogenous and authentic samples, which are crucial for the assessment of precision. However, this requirement is rarely fulfilled for on-line or in-line methods which are often used to measure processes in which the material rapidly changes and/or moves during the measurement, for example a fast-drying process or reaction monitoring. Comparison of results from on-line/in-line measurements with results from a reference test procedure would normally be needed.

4 STATISTICAL PROCESS CONTROL

Statistical process control (SPC) comprises a set of data analysis methods applied in order to monitor and control a process based on analysis of process variability (e.g. of CQAs). For PAT purposes, the process can be monitored using, for example, real-time data collected by process analysers.

Based on this data, SPC can be used to make process adjustments, when necessary, to maintain or attain a desired state and to ensure that the process remains under control. This includes, for example, trend analysis of quality attributes or performance characteristics. SPC can also be used to measure process variability and process capability (i.e. the ability of a process to produce a product that complies with requirements), with a view to enhancing process understanding, thereby improving lifecycle management.

Rather than using univariate SPC methods to monitor several individual variables, it is often preferable to use multivariate statistical process control (MSPC) to analyse several variables simultaneously, taking into account potential correlations (see general chapter *5.28. Multivariate statistical process control)*.

5 EUROPEAN PHARMACOPOEIA TEXTS SUPPORTING THE APPLICATION OF PAT

Typically, the analytical techniques described in the Ph. Eur. include qualification criteria designed for off-line analytical systems. These criteria are not always relevant or practical in a PAT setting, for instance when the equipment is specifically designed for on-line or in-line measurements. For this reason, certain general chapters (including *2.2.40. Near-infrared spectroscopy*, *2.2.48. Raman spectroscopy* and *2.9.47. Demonstration of uniformity of dosage units using large sample sizes*) have been revised or specifically elaborated to support and promote the use of the techniques in conjunction with PAT.

General Notices

Section 1.1, under Demonstration of compliance with the Pharmacopoeia, states that a substance can be demonstrated to be of pharmacopoeial quality on the basis of product design, together with the control strategy applied and data derived, for example, from validation studies of the manufacturing process.

The section also states that an enhanced approach to quality control could utilise PAT and/or real-time release testing strategies (including parametric release) as alternatives to end-product testing alone.

Absorption spectrophotometry, infrared

General chapter *2.2.24* has a wide variety of applications in the manufacturing process that enable PAT, such as reaction monitoring in chemical synthesis. Wavenumber shifts and acceptable tolerances for the reference material polystyrene are described for both transmission and ATR measurement modes.

Absorption spectrophotometry, ultraviolet and visible

General chapter *2.2.25* covers the use of PAT in the UV-Vis range using modern detectors such as photodiode arrays (PDA) or charge-coupled devices (CCD). Both transmission and diffuse reflection measurement modes are possible with off-line, at-line, on-line and in-line measurements. The table with reference wavelengths for the control of wavelength accuracy includes wavelengths in the UV range down to 180 nm.

X-ray fluorescence spectrometry

General chapter *2.2.37* includes references to modern equipment and the current applications of the XRF technique.

Substantial advances in miniaturisation and automation have led to the development of hand-held energy dispersive XRF (ED-XRF) spectrometers for rapid field measurements. XRF is potentially non-destructive, although it may cause sample instability. Hence, XRF lends itself to applications of PAT such as the analysis of unwanted trace catalysts in active pharmaceutical ingredients (API).

Near-infrared spectroscopy

General chapter *2.2.40* takes into account the increasing use of NIR spectroscopy for process monitoring and control, and the development of modern NIR spectrometers.
NIR measurements can be performed off-line, but the technique also lends itself to at-line, on-line and in-line testing.

The 'Sample preparation/presentation' section includes moving materials or samples, and the use of fibre-optic probe systems in different measurement modes (i.e. transmission, diffuse reflection and transflection). The use of internal referencing for process analysis purposes is permitted when it is impossible to remove a probe for reference background data collection. A detailed table for the control of instrument performance depending on measurement mode and instrument used (benchtop, mobile or process instrument) is also provided. The chapter includes a section on qualitative analysis for identification and characterisation of a substance in addition to sections on limit analysis (e.g. for dryer end-point control) and trend analysis (for monitoring blend uniformity).

Raman spectroscopy

General chapter *2.2.48* includes Raman technologies that have potential uses for the application of PAT, including hand-held instruments.

Wavenumber shifts and acceptable tolerances for the reference materials cyclohexane, paracetamol and polystyrene (values derived from an inter-laboratory study) are described for both benchtop and hand-held Raman systems.

Demonstration of uniformity of dosage units using large sample sizes

General chapter *2.9.47* allows the determination of dosage unit uniformity in a PAT environment where the sample size is markedly greater than 30 units.

Compliance with the acceptance criteria of general chapter *2.9.47* is considered as evidence that the batch would also comply with general chapter *2.9.40. Uniformity of dosage units* if tested using a small sample size (e.g. 30-unit). Therefore, general chapter *2.9.47* does not constitute stand-alone acceptance criteria.

Alternative methods for control of microbiological quality
General chapter *5.1.6* describes alternative methods that might be used for the application of PAT in order to contribute to real-time or near-real-time microbiological quality control (e.g. test for microbiological examination of non-sterile products or for sterility based on laser-induced fluorescence) of in-process samples, active substances, medicinal products or excipients (particularly water). The chapter also provides guidance on how to validate these alternative methods.

Chemometric methods applied to analytical data
Chemometrics (general chapter *5.21*) has proven to be well suited for PAT. The investigation of large data tables and treatment of intricate signals, i.e. data collections with a hidden structure, of the type accumulated during measurements in PAT setups, requires alternative analytical tools to those used in a one-variable-at-a-time approach.

Chemical imaging
Chemical imaging (CI) (general chapter *5.24*) can be used to support PAT applications. CI measures spatial distribution and contributes to the understanding of the properties of materials such as finished products, pharmaceutical intermediates, excipients, APIs and starting materials.

The uses of CI include, for example, detection of defects at the sample surface such as cracks in tablet coatings and identification of foreign particles. It is a versatile tool used in process development and improvement, root cause analysis (e.g. for out-of-specification results), and may also be used to enhance process understanding.

Multivariate statistical process control
General chapter *5.28* gives insight into how MSPC can be used to control and improve manufacturing processes, based on the collection and processing of large amounts of data on multiple variables. It describes the principle of MSPC and the development and use of multivariate control charts, and provides an overview of the theoretical background of multivariate statistical procedures.

Appendix III

Chromatographic Separation Techniques

(Ph. Eur. method 2.2.46)

Chromatographic separation techniques are multi-stage separation methods in which the components of a sample are distributed between 2 phases, one of which is stationary, while the other is mobile. The stationary phase may be a solid or a liquid supported on a solid or a gel. The stationary phase may be packed in a column, spread as a layer, or distributed as a film, etc. The mobile phase may be gaseous or liquid or supercritical fluid. The separation may be based on adsorption, mass distribution (partition), ion-exchange, etc., or may be based on differences in the physico-chemical properties of the molecules such as size, mass, volume, etc.

This chapter contains definitions and calculations of common parameters and generally applicable requirements for system suitability. Principles of separation, apparatus and methods are given in the following general methods:
— paper chromatography (*2.2.26*);
— thin-layer chromatography (*2.2.27*);
— gas chromatography (*2.2.28*);
— liquid chromatography (*2.2.29*);
— size-exclusion chromatography (*2.2.30*);
— supercritical fluid chromatography (*2.2.45*).

DEFINITIONS

The system suitability and acceptance criteria in monographs have been set using parameters as defined below. With some equipment, certain parameters, such as the signal-to-noise ratio and resolution, can be calculated using software provided by the manufacturer. It is the responsibility of the user to ensure that the calculation methods used in the software are equivalent to the requirements of the European Pharmacopoeia and to make any necessary corrections if this is not the case.

Chromatogram
A graphical or other representation of detector response, effluent concentration or other quantity used as a measure of effluent concentration, versus time or volume. Idealised

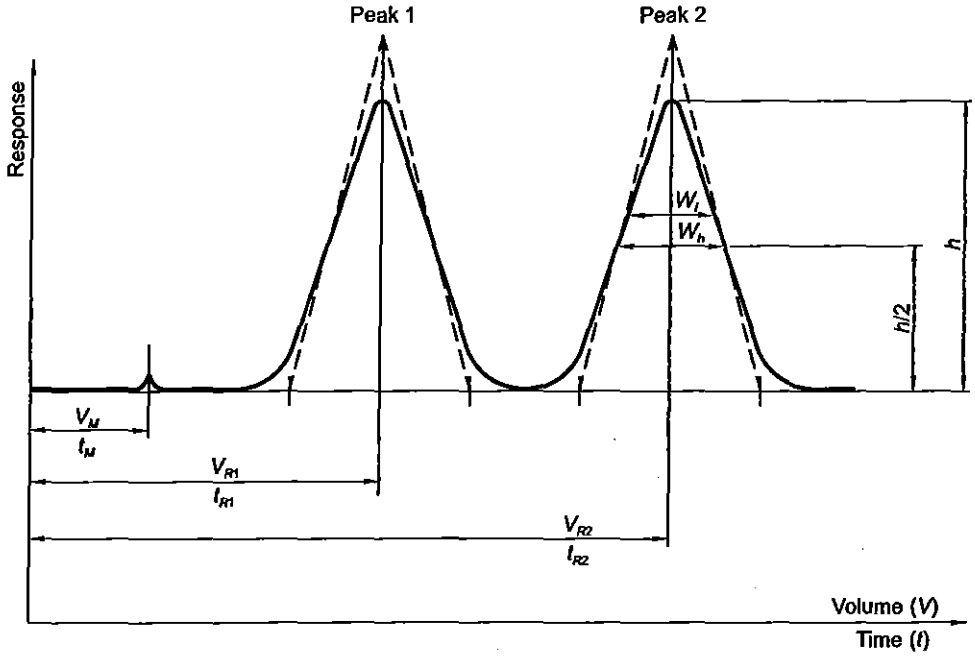

Figure 2.2.46.-1.

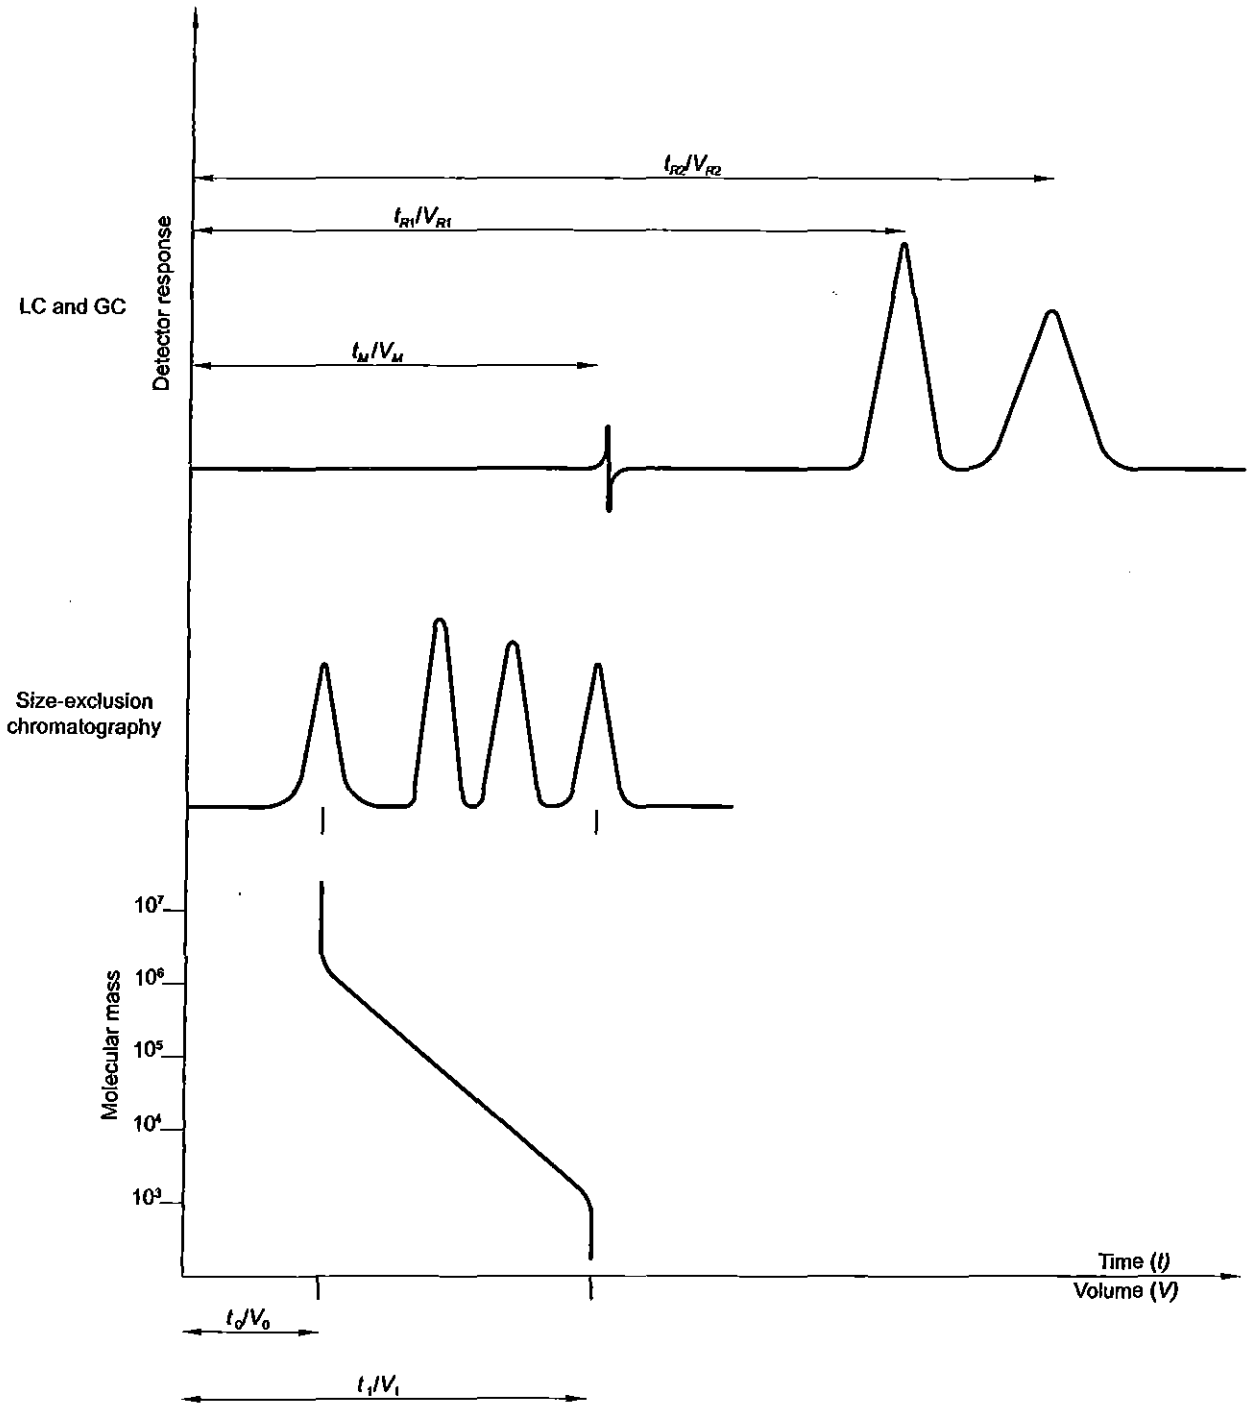

Figure 2.2.46.-2.

chromatograms are represented as a sequence of Gaussian peaks on a baseline (Figure 2.2.46.-1).

Peak

The portion of a chromatogram recording the detector response when a single component (or 2 or more unresolved components) is eluted from the column.

The peak may be defined by the peak area, or the peak height (h) and the peak width at half-height (w_h), or the peak height (h) and the peak width between the points of inflection (w_i). In Gaussian peaks (Figure 2.2.46.-1) there is the following relationship:

$$w_h = 1.18 w_i$$

Retention time (t_R)

Time required for elution of a component (Figure 2.2.46.-1, baseline scale being in minutes).

Retention volume (V_R)

Volume of the mobile phase required for elution of a component. It may be calculated from the retention time and the flow rate (F) in millilitres per minute using the following equation:

$$V_R = t_R \times F$$

Hold-up time (t_M)
Time required for elution of an unretained component (Figure 2.2.46.-1, baseline scale being in minutes). In size-exclusion chromatography, the symbol t_0 (see below) is used.

Hold-up volume (V_M)
Volume of the mobile phase required for elution of an unretained component. It may be calculated from the hold-up time and the flow rate (F) in millilitres per minute using the following equation:

$$V_M = t_M \times F$$

In size-exclusion chromatography, the symbol V_0 (see below) is used.

Retention factor (k)
The retention factor (also known as mass distribution ratio (D_m) or capacity factor (k')) is defined as:

$$k = \frac{\text{amount of component in stationary phase}}{\text{amount of component in mobile phase}} = K_C \frac{V_S}{V_M}$$

K_C = distribution constant (also known as equilibrium distribution coefficient);
V_S = volume of the stationary phase;
V_M = volume of the mobile phase.

The retention factor of a component may be determined from the chromatogram using the following equation:

$$k = \frac{t_R - t_M}{t_M}$$

Total mobile phase time (t_t)
In size-exclusion chromatography, retention time of a component whose molecules are smaller than the smallest gel pores (Figure 2.2.46.-2).

Total mobile phase volume (V_t)
In size-exclusion chromatography, retention volume of a component whose molecules are smaller than the smallest gel pores. It may be calculated from the total mobile phase time and the flow rate (F) in millilitres per minute using the following equation:

$$V_t = t_t \times F$$

Retention time of an unretained compound (t_0)
In size-exclusion chromatography, retention time of a component whose molecules are larger than the largest gel pores (Figure 2.2.46.-2).

Retention volume of an unretained compound (V_0)
In size-exclusion chromatography, retention volume of a component whose molecules are larger than the largest gel pores. It may be calculated from the retention time of an unretained compound and the flow rate (F) in millilitres per minute using the following equation:

$$V_0 = t_0 \times F$$

Distribution constant (K_0)
In size-exclusion chromatography, the elution characteristics of a component in a particular column may be given by the distribution constant (also referred to as distribution coefficient), which is calculated using the following equation:

$$K_0 = \frac{t_R - t_0}{t_t - t_0}$$

Retardation factor (R_F)
The retardation factor (also known as retention factor (R_f)), used in planar chromatography, is the ratio of the distance from the point of application to the centre of the spot and the distance travelled by the solvent front from the point of application (Figure 2.2.46.-3).

$$R_F = \frac{b}{a}$$

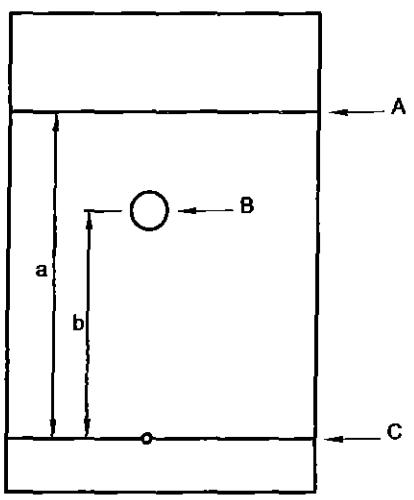
b = migration distance of the component;
a = migration distance of the solvent front.

Plate number (N)
The column performance (apparent efficiency) may be calculated from data obtained under either isothermal, isocratic or isodense conditions, depending on the technique, as the plate number (also referred to as number of theoretical plates), using the following equation, the values of t_R and w_h being expressed in the same units:

$$N = 5.54\left(\frac{t_R}{w_h}\right)^2$$

t_R = retention time of the peak corresponding to the component;
w_h = width of the peak at half-height.

The plate number varies with the component as well as with the column, the column temperature, the mobile phase and the retention time.



A. mobile phase front B. spot C. line of application

Figure 2.2.46.-3.

Dwell volume (D)
The dwell volume (also known as gradient delay volume) is the volume between the point at which the eluents meet and the top of the column. It can be determined using the following procedure.

Column Replace the chromatographic column by an appropriate capillary tubing (e.g. 1 m × 0.12 mm).

Mobile phase:
— *mobile phase A*: *water R*;
— *mobile phase B*: 0.1 per cent *V/V* solution of *acetone R*;

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 20	100 → 0	0 → 100
20 - 30	0	100

Flow rate Set to obtain sufficient back-pressure (e.g. 2 mL/min).

Detection Spectrophotometer at 265 nm.

Determine the time ($t_{0.5}$) in minutes when the absorbance has increased by 50 per cent (Figure 2.2.46.-4).

$$D = t_D \times F$$

t_D = $t_{0.5} - 0.5t_G$ (in minutes);
t_G = pre-defined gradient time (= 20 min);
F = flow rate (in millilitres per minute).

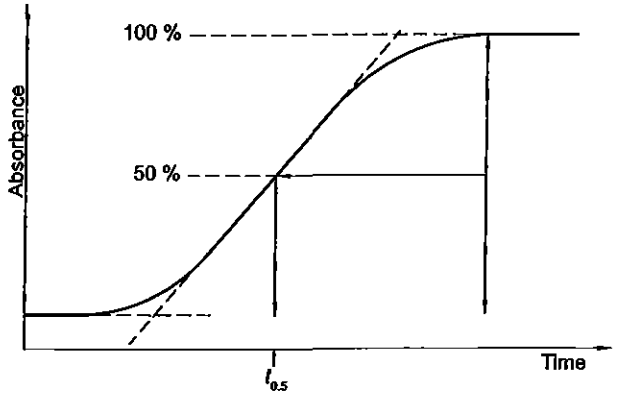


Figure 2.2.46.-4

Symmetry factor (A_s)

The symmetry factor of a peak (Figure 2.2.46.-5) is calculated using the following equation:

$$A_s = \frac{w_{0.05}}{2d}$$

$w_{0.05}$ = width of the peak at one-twentieth of the peak height;
d = distance between the perpendicular dropped from the peak maximum and the leading edge of the peak at one-twentieth of the peak height.

An A_s value of 1.0 signifies symmetry. When $A_s > 1.0$, the peak is tailing. When $A_s < 1.0$, the peak is fronting.

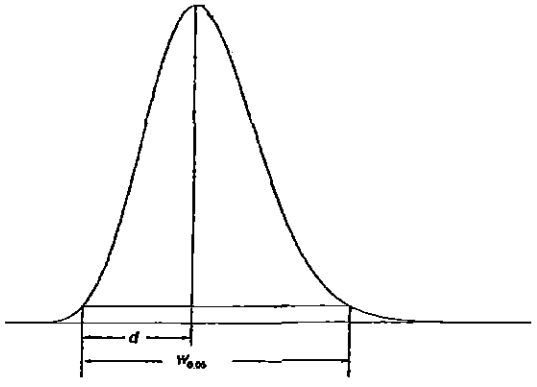

Figure 2.2.46.-5

Resolution (R_s)

The resolution between peaks of 2 components (Figure 2.2.46.-1) may be calculated using the following equation:

$$R_s = \frac{1.18(t_{R2} - t_{R1})}{w_{h1} + w_{h2}}$$

$t_{R2} > t_{R1}$

t_{R1}, t_{R2} = retention times of the peaks;
w_{h1}, w_{h2} = peak widths at half-height.

In quantitative planar chromatography, using densitometry, the migration distances are used instead of retention times and the resolution between peaks of 2 components may be calculated using the following equation:

$$R_s = \frac{1.18a(R_{F2} - R_{F1})}{w_{h1} + w_{h2}}$$

R_{F1}, R_{F2} = retardation factors of the peaks;
w_{h1}, w_{h2} = peak widths at half-height;
a = migration distance of the solvent front.

Peak-to-valley ratio (p/v)

The peak-to-valley ratio may be employed as a system suitability criterion in a test for related substances when baseline separation between 2 peaks is not achieved (Figure 2.2.46.-6).

$$p/v = \frac{H_p}{H_v}$$

H_p = height above the extrapolated baseline of the minor peak;
H_v = height above the extrapolated baseline at the lowest point of the curve separating the minor and major peaks.

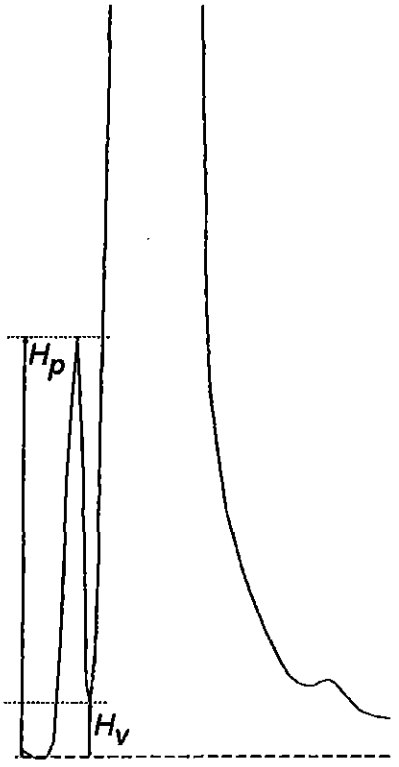

Figure 2.2.46.-6

Relative retention (r)

Relative retention is calculated as an estimate using the following equation:

$$r = \frac{t_{Ri} - t_M}{t_{Rs} - t_M}$$

t_{Ri} = retention time of the peak of interest;
t_{Rs} = retention time of the reference peak (usually the peak corresponding to the substance to be examined);
t_M = hold-up time.

The unadjusted relative retention (r_G) is calculated using the following equation:

$$r_G = \frac{t_{Ri}}{t_{Rst}}$$

Unless otherwise indicated, values for relative retention stated in monographs correspond to unadjusted relative retention.

In planar chromatography, the retardation factors R_{Fst} and R_{Fi} are used instead of t_{Rst} and t_{Ri}.

Signal-to-noise ratio (*S/N*)

The short-term noise influences the precision of quantification. The signal-to-noise ratio is calculated using the following equation:

$$S/N = \frac{2H}{h}$$

H = height of the peak (Figure 2.2.46.-7) corresponding to the component concerned, in the chromatogram obtained with the prescribed reference solution, measured from the maximum of the peak to the extrapolated baseline of the signal observed over a distance equal to at least 5 times the width at half-height;

h = range of the noise in a chromatogram obtained after injection or application of a blank, observed over a distance equal to at least 5 times the width at half-height of the peak in the chromatogram obtained with the prescribed reference solution and, if possible, situated equally around the place where this peak would be found.

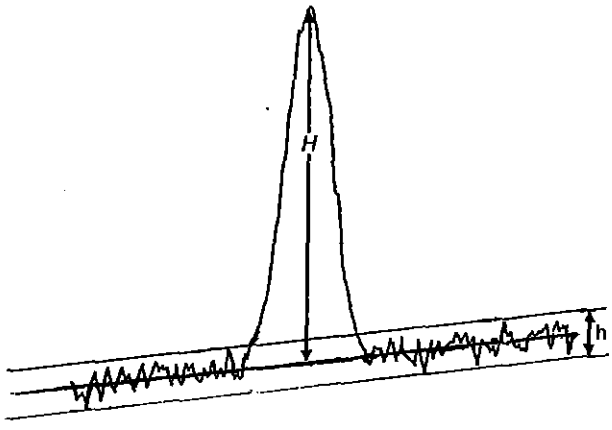

Figure 2.2.46.-7.

System repeatability

The repeatability of response is expressed as an estimated percentage relative standard deviation (s_r(%)) of a consecutive series of measurements for not fewer than 3 injections or applications of a reference solution, and is calculated using the following equation:

$$s_r(\%) = \frac{100}{\bar{y}}\sqrt{\frac{\sum(y_i - \bar{y})^2}{n-1}}$$

y_i = individual values expressed as peak area, peak height, or ratio of areas by the internal standardisation method;

$\bar{y}$ = mean of individual values;

n = number of individual values.

SYSTEM SUITABILITY

The various components of the equipment employed must be qualified and be capable of achieving the performance required to conduct the test or assay.

The system suitability tests represent an integral part of the method and are used to ensure adequate performance of the chromatographic system. Apparent efficiency, retention factor (mass distribution ratio), resolution and symmetry factor are the parameters that are usually employed in assessing the performance of the column. Factors that may affect the chromatographic behaviour include:

- the composition, ionic strength, temperature and apparent pH of the mobile phase;
- flow rate, column dimensions, column temperature and pressure;
- stationary phase characteristics including type of chromatographic support (particle-based or monolithic), particle or macropore size, porosity, specific surface area;
- reversed-phase and other surface-modification of the stationary phases, the extent of chemical modification (as expressed by end-capping, carbon loading etc.).

The following requirements and any supplementary requirements given in the individual monograph are to be fulfilled unless otherwise prescribed:

- in a related substances test or assay, for a peak in the chromatogram obtained with a reference solution used for quantification, the symmetry factor is 0.8 to 1.5, unless otherwise prescribed;
- in an assay of an active substance where the value is 100 per cent for a pure substance, the maximum permitted relative standard deviation ($s_r(\%)_{max}$) for the defined limits is calculated for a series of injections of the reference solution using the following equation:

$$s_r(\%)_{max} = \frac{KB\sqrt{n}}{t_{90\%,n-1}}$$

K = constant (0.349), obtained from the expression $K = \frac{0.6}{\sqrt{2}} \times \frac{t_{90\%,5}}{\sqrt{6}}$ in which $\frac{0.6}{\sqrt{2}}$ represents the required percentage relative standard deviation after 6 injections for $B = 1.0$;

B = upper limit given in the definition of the individual monograph minus 100 per cent;

n = number of replicate injections of the reference solution ($3 \leq n \leq 6$);

$t_{90\%,n-1}$ = Student's t at the 90 per cent probability level (double sided) with $n-1$ degrees of freedom.

Unless otherwise prescribed, the maximum permitted relative standard deviation does not exceed the appropriate value given in Table 2.2.46.-1. This requirement does not apply to tests for related substances.

Table 2.2.46.-1. – *Repeatability requirements*

	Number of individual injections			
	3	4	5	6
B (per cent)	Maximum permitted relative standard deviation			
2.0	0.41	0.59	0.73	0.85
2.5	0.52	0.74	0.92	1.06
3.0	0.62	0.89	1.10	1.27

- in a related substances test, the limit of quantification (corresponding to a signal-to-noise ratio of 10) is equal to or less than the disregard limit.

Compliance with the system suitability criteria is required throughout the chromatographic procedure. Depending on various factors, such as the frequency of use of the procedure and experience with the chromatographic system, the analyst chooses an appropriate verification scheme to monitor this.

ADJUSTMENT OF CHROMATOGRAPHIC CONDITIONS

The extent to which the various parameters of a chromatographic test may be adjusted to satisfy the system suitability criteria without fundamentally modifying the methods are listed below. Adjustment of conditions with gradient elutions is more critical than with isocratic elutions, since it may lead to shifts in peaks to a different step of the gradient, thus leading to the incorrect assignment of peaks, and to the masking of peaks or a shift such that elution occurs beyond the prescribed elution time. Changes other than those indicated require revalidation of the method. The chromatographic conditions described have been validated during the elaboration of the monograph.

The system suitability tests are included to verify that the separation required for satisfactory performance of the test or assay is achieved. Nonetheless, since the stationary phases are described in a general way and there is such a variety available commercially, with differences in chromatographic behaviour, some adjustments of the chromatographic conditions may be necessary to achieve the prescribed system suitability requirements. With reversed-phase liquid chromatographic methods in particular, adjustment of the various parameters will not always result in satisfactory chromatography. In that case, it may be necessary to replace the column with another of the same type (e.g. octadecylsilyl silica gel), which exhibits the desired chromatographic behaviour. The Knowledge database on the EDQM website usually contains information on the column(s) used during monograph elaboration.

For critical parameters the adjustments are defined clearly in the monograph to ensure the system suitability.

Thin-layer chromatography and paper chromatography

Composition of the mobile phase The amount of the minor solvent component may be adjusted by ± 30 per cent relative or ± 2 per cent absolute, whichever is the larger; for a minor component at 10 per cent of the mobile phase, a 30 per cent relative adjustment allows a range of 7-13 per cent whereas a 2 per cent absolute adjustment allows a range of 8-12 per cent, the relative value therefore being the larger; for a minor component at 5 per cent of the mobile phase, a 30 per cent relative adjustment allows a range of 3.5-6.5 per cent whereas a 2 per cent absolute adjustment allows a range of 3-7 per cent, the absolute value being the larger in this case; no other component is altered by more than 10 per cent absolute.

pH of the aqueous component of the mobile phase ± 0.2 pH, unless otherwise prescribed, or ± 1.0 pH when non-ionisable substances are to be examined.

Concentration of salts in the buffer component of a mobile phase ± 10 per cent.

Application volume 10-20 per cent of the prescribed volume if using fine particle size plates (2-10 µm).

Liquid chromatography: isocratic elution

Composition of the mobile phase The amount of the minor solvent component may be adjusted by ± 30 per cent relative or ± 2 per cent absolute, whichever is the larger (see example above); no other component is altered by more than 10 per cent absolute.

pH of the aqueous component of the mobile phase ± 0.2 pH, unless otherwise prescribed, or ± 1.0 pH when non-ionisable substances are to be examined.

Concentration of salts in the buffer component of a mobile phase ± 10 per cent.

Flow rate ± 50 per cent; a larger adjustment is acceptable when changing the column dimensions (see the formula below).

Column parameters

Stationary phase:

— no change of the identity of the substituent of the stationary phase permitted (e.g. no replacement of C18 by C8);

— *particle size*: maximum reduction of 50 per cent; no increase permitted.

Column dimensions:

— *length*: ± 70 per cent;

— *internal diameter*: ± 25 per cent.

When column dimensions are changed, the flow rate may be adjusted as necessary using the following equation:

$$F_2 = F_1 \frac{l_2 d_2^2}{l_1 d_1^2}$$

F_1 = flow rate indicated in the monograph, in millilitres per minute;
F_2 = adjusted flow rate, in millilitres per minute;
l_1 = length of the column indicated in the monograph, in millimetres;
l_2 = length of the column used, in millimetres;
d_1 = internal diameter of the column indicated in the monograph, in millimetres;
d_2 = internal diameter of the column used, in millimetres.

Temperature ± 10 °C, where the operating temperature is specified, unless otherwise prescribed.

Detector wavelength No adjustment permitted.

Injection volume May be decreased, provided detection and repeatability of the peak(s) to be determined are satisfactory; no increase permitted.

Liquid chromatography: gradient elution

Adjustment of chromatographic conditions for gradient systems requires greater caution than for isocratic systems.

Composition of the mobile phase/gradient elution Minor adjustments of the composition of the mobile phase and the gradient are acceptable provided that:

— the system suitability requirements are fulfilled;

— the principal peak(s) elute(s) within ± 15 per cent of the indicated retention time(s);

— the final composition of the mobile phase is not weaker in elution power than the prescribed composition.

Where compliance with the system suitability requirements cannot be achieved, it is often preferable to consider the dwell volume or to change the column.

Dwell volume The configuration of the equipment employed may significantly alter the resolution, retention time and relative retentions described. Should this occur, it may be due to excessive dwell volume. Monographs preferably include an isocratic step before the start of the gradient programme so that an adaptation can be made to the gradient time points to take account of differences in dwell volume between the system used for method development and that actually used. It is the user's responsibility to adapt the length of the isocratic step to the analytical equipment used. If the dwell volume used during the elaboration of the monograph is given in the monograph, the time points (t min) stated in the gradient table may be replaced by adapted time points (t_c min), calculated using the following equation:

$$t_c = t - \frac{(D - D_0)}{F}$$

D = dwell volume, in millilitres;
D_0 = dwell volume used for development of the method, in millilitres;
F = flow rate, in millilitres per minute.

The isocratic step introduced for this purpose may be omitted if validation data for application of the method without this step is available.

pH of the aqueous component of the mobile phase No adjustment permitted.

Concentration of salts in the buffer component of a mobile phase No adjustment permitted.

Flow rate Adjustment is acceptable when changing the column dimensions (see the formula below).

Column parameters

Stationary phase:
- — no change of the identity of the substituent of the stationary phase permitted (e.g. no replacement of C18 by C8);
- — *particle size*: no adjustment permitted.

Column dimensions:
- — *length*: ± 70 per cent;
- — *internal diameter*: ± 25 per cent.

When column dimensions are changed, the flow rate may be adjusted as necessary using the following equation:

$$F_2 = F_1 \frac{l_2 d_2^2}{l_1 d_1^2}$$

F_1 = flow rate indicated in the monograph, in millilitres per minute;
F_2 = adjusted flow rate, in millilitres per minute;
l_1 = length of the column indicated in the monograph, in millimetres;
l_2 = length of the column used, in millimetres;
d_1 = internal diameter of the column indicated in the monograph, in millimetres;
d_2 = internal diameter of the column used, in millimetres.

Temperature ± 5 °C, where the operating temperature is specified, unless otherwise prescribed.

Detector wavelength No adjustment permitted.

Injection volume May be decreased, provided detection and repeatability of the peak(s) to be determined are satisfactory; no increase permitted.

Gas chromatography

Column parameters

Stationary phase:
- — *particle size*: maximum reduction of 50 per cent; no increase permitted (packed columns);
- — *film thickness*: −50 per cent to + 100 per cent (capillary columns).

Column dimensions:
- — *length*: ± 70 per cent;
- — *internal diameter*: ± 50 per cent.

Flow rate ± 50 per cent.

Temperature ± 10 per cent.

Injection volume and split volume May be adjusted, provided detection and repeatability are satisfactory.

Supercritical fluid chromatography

Composition of the mobile phase For packed columns, the amount of the minor solvent component may be adjusted by ± 30 per cent relative or ± 2 per cent absolute, whichever is the larger; no adjustment is permitted for a capillary column system.

Detector wavelength No adjustment permitted.

Column parameters

Stationary phase:
- — *particle size*: maximum reduction of 50 per cent; no increase permitted (packed columns).

Column dimensions:
- — *length*: ± 70 per cent;
- — *internal diameter*:
  ± 25 per cent (packed columns);
  ± 50 per cent (capillary columns).

Flow rate ± 50 per cent.

Temperature ± 5 °C, where the operating temperature is specified.

Injection volume May be decreased, provided detection and repeatability are satisfactory; no increase permitted.

QUANTIFICATION

Peaks due to solvents and reagents or arising from the mobile phase or the sample matrix are disregarded during quantification.

- — *Detector sensitivity*. The detector sensitivity is the signal output per unit concentration or unit mass of a substance in the mobile phase entering the detector. The relative detector response factor, commonly referred to as *response factor*, expresses the sensitivity of a detector for a given substance relative to a standard substance. The *correction factor* is the reciprocal of the response factor.
- — *External standard method*. The concentration of the component(s) to be analysed is determined by comparing the response(s) (peak(s)) obtained with the test solution to the response(s) (peak(s)) obtained with a reference solution.
- — *Internal standard method*. Equal amounts of a component that will be resolved from the substance to be examined (the internal standard) are introduced into the test solution and a reference solution. The internal standard is chosen such that it does not react with the substance to be examined, is stable and does not contain impurities with the same retention time as that of the substance to be examined. The concentration of the substance to be examined is determined by comparing the ratio of the peak areas or peak heights due to the substance to be examined and the internal standard in the test solution with the ratio of the peak areas or peak heights due to the substance to be examined and the internal standard in the reference solution.
- — *Normalisation procedure*. The percentage content of a component of the substance to be examined is calculated by determining the area of the corresponding peak as a percentage of the total area of all the peaks, excluding those due to solvents or reagents or arising from the mobile phase or the sample matrix, and those at or below the disregard limit.
- — *Calibration procedure*. The relationship between the measured or evaluated signal (y) and the quantity (concentration, mass, etc.) of substance (x) is determined and the calibration function is calculated. The analytical results are calculated from the measured signal or evaluated signal of the analyte by means of the inverse function.

In tests for related substances for both the external standard method, when a dilution of the test solution is used for comparison, and the normalisation procedure, any correction factors indicated in the monograph are applied (i.e. when the response factor is outside the range 0.8-1.2).

When the related substances test prescribes the total of impurities or there is a quantitative determination of an impurity, it is important to choose an appropriate threshold setting and appropriate conditions for the integration of the peak areas. In such tests the *disregard limit*, i.e. the limit at or below which a peak is disregarded, is generally 0.05 per cent. Integration of the peak area of any impurity that is not completely separated from the principal peak is preferably performed by valley-to-valley extrapolation (tangential skim).

Additional points for monographs of the British Pharmacopoeia

System suitability

Unless otherwise stated in the monograph, the maximum permitted relative standard deviation for six replicate injections of the prescribed reference solution does not exceed 2.0%. This requirement is applicable only to assays for formulated preparations.

A. Thin-layer Chromatography

(Ph. Eur. method 2.2.27)

Thin-layer chromatography is a separation technique in which a stationary phase consisting of an appropriate material is spread in a uniform thin layer on a support (plate) of glass, metal or plastic. Solutions of analytes are deposited on the plate prior to development. The separation is based on adsorption, partition, ion-exchange or on combinations of these mechanisms and is carried out by migration (development) of solutes (solutions of analytes) in a solvent or a suitable mixture of solvents (mobile phase) through the thin-layer (stationary phase).

APPARATUS

Plates

The chromatography is carried out using pre-coated plates as described under *Reagents (4.1.1)*. The particle size of the silica gel is indicated after the name of the reagent in the tests where it is used.

Pre-treatment of the plates It may be necessary to wash the plates prior to separation. This can be done by migration of an appropriate solvent. The plates may also be impregnated by procedures such as development, immersion or spraying. At the time of use, the plates may be activated, if necessary, by heating in an oven at 120 °C for 20 min.

Chromatographic tank

With a flat bottom or twin trough, of inert, transparent material, of a size suitable for the plates used and provided with a tightly fitting lid. For horizontal development the tank is provided with a trough for the mobile phase and it additionally contains a device for directing the mobile phase to the stationary phase.

Micropipettes, microsyringes, calibrated disposable capillaries

Or other application devices suitable for the proper application of the solutions.

Fluorescence detection device

To measure direct fluorescence or the inhibition of fluorescence.

Visualisation devices and reagents

Suitable devices are used for derivatisation to transfer to the plate reagents by spraying, immersion or exposure to vapour and, where applicable, to facilitate heating for visualisation of separated components.

Documentation

A device may be used to provide documentation of the visualised chromatogram, for example a photograph or a computer file.

METHOD

Sample application

Apply the prescribed volume of the solutions at a suitable distance from the lower edge and from the sides of the plate and on a line parallel to the lower edge; allow an interval of at least 10 mm (5 mm on high-performance plates) between the centres of circular spots and 5 mm (2 mm on high-performance plates) between the edges of bands. Apply the solutions in sufficiently small portions to obtain circular spots 2-5 mm in diameter (1-2 mm on high-performance plates) or bands 10-20 mm (5-10 mm on high-performance plates) by 1-2 mm.

In a monograph, where both normal and high-performance plates may be used, the working conditions for high-performance plates are given in the brackets [ ] after those for normal plates.

Vertical development

Line the walls of the chromatographic tank with filter paper. Pour into the chromatographic tank a sufficient quantity of the mobile phase for the size of the tank to give after impregnation of the filter paper a layer of appropriate depth related to the dimension of the plate to be used.

For saturation of the chromatographic tank, replace the lid and allow to stand at 20-25 °C for 1 h. Unless otherwise indicated in the monograph, the chromatographic separation is performed in a saturated tank. Apply the prescribed volume of solutions as described above. When the solvent has evaporated from the applied solutions, place the plate in the chromatographic tank, ensuring that the plate is as vertical as possible and that the spots or bands are above the surface of the mobile phase. Close the chromatographic tank, maintain it at 20-25 °C and protect from sunlight. Remove the plate when the mobile phase has moved over the prescribed distance, measured between the points of application and the solvent front. Dry the plate and visualise the chromatograms as prescribed.

For two-dimensional chromatography, dry the plates after the first development and carry out a second development in a direction perpendicular to that of the first development.

Horizontal development

Apply the prescribed volume of the solutions as described above. When the solvent has evaporated from the applied solutions, introduce a sufficient quantity of the mobile phase into the trough of the chamber using a syringe or pipette, place the plate in the chamber after verifying that the latter is horizontal and connect the mobile phase direction device according to the manufacturer's instructions. If prescribed, develop the plate starting simultaneously at both ends. Close the chamber and maintain it at 20-25 °C. Remove the plate when the mobile phase has moved over the distance prescribed in the monograph. Dry the plate and visualise the chromatograms as prescribed.

For two-dimensional chromatography, dry the plates after the first development and carry out a second development in a direction perpendicular to that of the first development.

VISUAL EVALUATION

Identification

The principal spot in the chromatogram obtained with the test solution is visually compared to the corresponding spot in the chromatogram obtained with the reference solution by

comparing the colour, the size and the retardation factor (R_F) of both spots.

The retardation factor (R_F) is defined as the ratio of the distance from the point of application to the centre of the spot and the distance travelled by the solvent front from the point of application.

Verification of the separating power for identification Normally the performance given by the suitability test described in *Reagents (4.1.1)* is sufficient. Only in special cases an additional performance criterion is prescribed in the monograph.

Related substances test

The secondary spot(s) in the chromatogram obtained with the test solution is (are) visually compared to either the corresponding spot(s) in the chromatogram obtained with the reference solution containing the impurity(ies) or the spot in the chromatogram obtained with the reference solution prepared from a dilution of the test solution.

Verification of the separating power The requirements for the verification of the separating power are prescribed in the monographs concerned.

Verification of the detecting power The detecting power is satisfactory if a spot or band is clearly visible in the chromatogram obtained with the most dilute reference solution.

QUANTITATIVE MEASUREMENT

The requirements for resolution and separation are prescribed in the monographs concerned.

Substances separated by thin-layer chromatography and responding to UV-Vis irradiation can be determined directly on the plate, using appropriate instrumentation. While moving the plate or the measuring device, examine the plate by measuring the reflectance of the incident light. Similarly, fluorescence may be measured using an appropriate optical system. Substances containing radionuclides can be quantified in 3 ways: either directly by moving the plate alongside a suitable counter or vice versa (see *Radiopharmaceutical preparations (0125)*), by cutting the plates into strips and measuring the radioactivity on each individual strip using a suitable counter or by scraping off the stationary phase, dissolving it in a suitable scintillation cocktail and measuring the radioactivity using a liquid scintillation counter.

Apparatus

The apparatus for direct measurement on the plate consists of:

- a device for exact positioning and reproducible dispensing of the amount of substances onto the plate;
- a mechanical device to move the plate or the measuring device along the *x*-axis or the *y*-axis;
- a recorder and a suitable integrator or a computer;
- *for substances responding to UV-Vis irradiation*: a photometer with a source of light, an optical device able to generate monochromatic light and a photo cell of adequate sensitivity are used for the measurement of reflectance or transmittance; if fluorescence is measured, a suitable filter is required to prevent light used for excitation from reaching the detector while permitting emitted light or a specific portion thereof to pass;
- *for substances containing radionuclides*: a suitable counter for radioactivity. The linearity range of the counting device is to be verified.

Method

Prepare the solution of the substance to be examined (test solution) as prescribed in the monograph and, if necessary, prepare the reference solutions of the substance to be determined using the same solvent as in the test solution. Apply the same volume of each solution to the plate and develop.

Substances responding to UV-Vis irradiation Prepare and apply not fewer than 3 reference solutions of the substance to be examined, the concentrations of which span the expected value in the test solution (about 80 per cent, 100 per cent and 120 per cent). Treat with the prescribed reagent, if necessary, and record the reflectance, the transmittance or fluorescence in the chromatograms obtained with the test and reference solutions. Use the measured results for the calculation of the amount of substance in the test solution.

Substances containing radionuclides Prepare and apply a test solution containing about 100 per cent of the expected value. Determine the radioactivity as a function of the path length and report the radioactivity in each resulting peak as a percentage of the total amount of radioactivity.

Criteria for assessing the suitability of the system are described in the chapter on *Chromatographic separation techniques (2.2.46)*. The extent to which adjustments of parameters of the chromatographic system can be made to satisfy the criteria of system suitability are also given in this chapter.

Additional points for monographs of the British Pharmacopoeia

When the method prescribed in a monograph carries the instructions 'protected from light' or 'in subdued light' it is intended that the entire procedure is carried out under these conditions.

Unless otherwise indicated in the monograph, the mobile phase should be allowed to ascend 15 cm above the line of application.

The phrase *ultraviolet light (254 nm)* indicates that the plate should be examined under an ultraviolet lamp having a maximum output at 254 nm (see below); other wavelength maxima may be specified.

The term *secondary spot* means any spot other than the principal spot. Similarly, a *secondary band* is any band other than the principal band.

Where a spraying technique is prescribed it is essential that the reagent is evenly applied as a fine spray. The following method of visualisation is used when directed in the monograph.

METHOD I

Spray the dried plate with *ethanolic sulfuric acid (20%)*, heat at 105° for 30 minutes and immediately expose to nitrous fumes in a closed glass tank for 15 minutes (the nitrous fumes may be generated by adding 7M *sulfuric acid* dropwise to a solution containing 10% w/v of *sodium nitrite* and 3% w/v of *potassium iodide*). Place the plate in a current of warm air for 15 minutes and spray with a 0.5% w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride* in *ethanol (96%)*. If necessary, allow to dry and repeat the spraying.

MATERIALS

The coating substances and precoated plates are described in Appendix I A: General Reagents. Prepare suspensions of the coating substances as recommended by the manufacturer unless otherwise prescribed. Commercial pre-coated plates

may be used for pharmacopoeial tests where a coating substances is prescribed provided that they comply with the test for chromatographic separation described for the corresponding coating substance and with any additional test for verification of separating power required in the monograph test.

Ultraviolet Ray Lamps for Analytical Purposes
(Ph. Eur. method 2.1.3)

Mercury vapour in quartz lamps is used as the source of ultraviolet light. A suitable filter may be fitted to eliminate the visible part of the spectrum emitted by the lamp. When the Pharmacopoeia prescribes in a test the use of ultraviolet light of wavelength 254 nm or 365 nm, an instrument consisting of a mercury vapour lamp and a filter which gives an emission band with maximum intensity at about 254 nm or 365 nm is used. The lamp used should be capable of revealing without doubt a standard spot of sodium salicylate with a diameter of about 5 mm on a support of *silica gel G R*, the spot being examined while in a position normal to the radiation.

For this purpose apply 5 µL of a 0.4 g/L solution of *sodium salicylate R* in *alcohol R*[1] for lamps of maximum output at 254 nm and 5 µL of a 2 g/L solution in *alcohol R*[3] for lamps of maximum output at 365 nm. The distance between the lamp and the chromatographic plate under examination used in a pharmacopoeial test should never exceed the distance used to carry out the above test.

Identification of Phenothiazines by Thin-Layer Chromatography
(Ph. Eur. method 2.3.3)

Examine by thin-layer chromatography (*2.2.27*) using *kieselguhr G R* as the coating substance. Impregnate the plate by placing it in a closed tank containing the necessary quantity of the impregnation mixture composed of a solution containing 10 per cent *V/V* of *phenoxyethanol R* and 50 g/L of *macrogol 300 R* in *acetone R* so that the plate dips about 5 mm beneath the surface of the liquid. When the impregnation mixture has risen at least 17 cm from the lower edge of the plate, remove the plate and use immediately for chromatography. Carry out the chromatography in the same direction as the impregnation.

Test solution Dissolve 20 mg of the substance to be examined in *chloroform R* and dilute to 10 mL with the same solvent.

Reference solution Dissolve 20 mg of the corresponding chemical reference substance (CRS) in *chloroform R* and dilute to 10 mL with the same solvent.

Apply separately to the plate 2 µL of each solution and develop in the dark over a path of 15 cm using a mixture of 50 mL of *light petroleum R* and 1 mL of *diethylamine R* saturated with *phenoxyethanol R* (i.e. add about 3 mL to 4 mL of *phenoxyethanol R* to the above mixture of solvents to give a persistent cloudiness on shaking, decant, and use the supernatant, even if it is cloudy). After development place the plate under ultraviolet light at 365 nm and examine after a few minutes. The spot in the chromatogram obtained with the test solution is similar in position, fluorescence and size to the spot in the chromatogram obtained with the reference solution. Spray with a 10 per cent *V/V* solution of *sulfuric acid R* in *alcohol R*. The spot in the chromatogram obtained with the test solution is of the same colour as that in the chromatogram obtained with the reference solution and has similar stability over a period of at least 20 min.

Related Substances in Phenothiazines
(No Ph. Eur. method)

Carry out the method for *thin-layer chromatography* protected from light using *silica gel* GF_{254} as the coating substance and the mobile phase prescribed in the monograph, but allowing the solvent front to ascend 12 cm above the line of application. Unless otherwise specified, apply separately to the plate 10 µL of each of two solutions of the substance being examined prepared immediately before use in a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* containing (1) 2.0% w/v and (2) 0.010% w/v. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Disregard any spot remaining on the line of application. Unless otherwise specified any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

Mobile phases

A. A mixture of 10 volumes of *acetone*, 10 volumes of *diethylamine* and 80 volumes of *cyclohexane*.

B. A mixture of 5 volumes of *diethylamine*, 10 volumes of *acetone* and 85 volumes of *hexane*.

C. A mixture of 18 volumes of 1M *ammonia* and 90 volumes of *butan-1-ol*.

Identification of Steroids
(No Ph. Eur. method)

Carry out the method for *thin-layer chromatography* using *kieselguhr G* as the coating substance. Impregnate the dry plate by placing it in a tank containing a shallow layer of the specified impregnating solvent, allowing the solvent to ascend to the top, removing the plate from the tank and allowing the solvent to evaporate; use within 2 hours, with the flow of the mobile phase in the direction in which impregnation was carried out. Unless otherwise specified, apply separately to the plate 2 µL of each of the following three solutions in a mixture of 9 volumes of *chloroform* and 1 volume of *methanol*. Solution (1) contains 0.25% w/v of the substance being examined. Solution (2) contains 0.25% w/v of the corresponding British Pharmacopoeia Chemical Reference Substance or European Pharmacopoeia Chemical Reference Substance. Solution (3) is a mixture of equal volumes of solutions (1) and (2). Use the specified mobile phase. After removal of the plate, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulfuric acid (20%)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour in daylight, fluorescence in ultraviolet light (365 nm) and size to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single, compact spot.

Impregnating solvents

I. A mixture of 1 volume of *formamide* and 9 volumes of *acetone*.

II. A mixture of 1 volume of *propane-1,2-diol* and 9 volumes of *acetone*.

III. A mixture of 1 volume of liquid paraffin and 9 volumes of petroleum spirit (boiling range, 40° to 60° or 50° to 70°).

[1] *The alcohol R used must be free from fluorescence.*

Mobile phases

A. *Chloroform.*

B. A mixture of 25 volumes of *chloroform* and 75 volumes of *toluene.*

C. Toluene.

D. A mixture of 20 volumes of *toluene* and 80 volumes of *cyclohexane.*

E. A mixture of equal volumes of cyclohexane and petroleum spirit (boiling range, 40° to 60° or 50° to 70°).

F. A mixture of 40 volumes of *glacial acetic acid* and 60 volumes of *water.*

G. A mixture of 20 volumes of *1,4-dioxan* and 80 volumes of *hexane.*

H. A mixture of 29 volumes of *toluene,* 56 volumes of *chloroform* and 115 volumes of *cyclohexane.*

B. Gas Chromatography

(Ph. Eur. method 2.2.28)

PRINCIPLE

Gas chromatography (GC) is a chromatographic separation technique based on the difference in the distribution of species between 2 non-miscible phases in which the mobile phase is a carrier gas moving through or passing the stationary phase contained in a column. It is applicable to substances or their derivatives which are volatilised under the temperatures employed.

GC is mainly based on mechanisms of adsorption or mass distribution.

EQUIPMENT

The equipment typically consists of:
- an injector;
- a chromatographic column contained in an oven;
- one or more detector(s);
- a data acquisition system.

The carrier gas flows through the column and then through the detector at a controlled rate or pressure.

The chromatography is carried out either at a constant temperature or according to a given temperature programme.

INJECTORS

Injection may be carried out either into a vaporisation chamber which may be equipped with a stream splitter, or directly at the head of the column using a syringe or an injection valve.

Injections of vapour phase May be effected by static or dynamic head-space injection systems.

Dynamic head-space (purge and trap) injection systems include a sparging device by which volatile substances in solution are swept into an absorbent column maintained at a low temperature. Retained substances are then desorbed into the mobile phase by rapid heating of the absorbent column.

Static head-space Injection systems include a thermostatically controlled sample heating chamber in which closed vials containing solid or liquid samples are placed for a fixed period of time to allow equilibration of the volatile components of the sample between the non-gaseous phase and the vapour phase. After equilibration, a predetermined amount of the head-space of the vial is flushed into the gas chromatograph.

STATIONARY PHASES

Stationary phases are contained in columns which may be:
- a capillary column whose stationary phase may be a solid coating the inner surface of the column (e.g. macrogol 20 000), or a liquid deposited on the inner surface (e.g. dimethylpolysiloxane); in the latter case it may be chemically bonded to the inner surface;
- a column packed with the stationary phase which may be a solid phase (e.g. alumina, silica) or an inert solid support (usually a porous polymer) impregnated or coated with a liquid.

Capillary columns, made of fused silica, are 0.1 mm to 0.53 mm in internal diameter (Ø) and at least 5 m in length. The stationary phase is a film 0.1 µm to 5.0 µm thick.

Packed columns, made of glass or metal, are usually 1 m to 3 m in length with an internal diameter (Ø) of 2 mm to 4 mm.

MOBILE PHASES

Retention time and peak efficiency depend on the carrier gas flow rate; retention time is directly proportional to column length and resolution is proportional to the square root of the column length.

The carrier gas flow rate is usually expressed in millilitres per minute at atmospheric pressure and at the stated temperature. Flow rate is measured at the detector outlet, either with a calibrated mechanical device or with a bubble tube, while the column is at operating temperature.

The linear velocity of the carrier gas through a column is inversely proportional to the square of the internal diameter of the column for a given flow volume.

Helium, nitrogen and hydrogen are commonly used carrier gases.

DETECTORS

Flame-ionisation detectors are usually employed but other detectors such as electron-capture, nitrogen-phosphorus, mass spectrometric, thermal conductivity or infrared spectrophotometric detectors may also be used.

PROCEDURE

Equilibrate the column, the injector and the detector at the temperatures and the gas flow rates/pressures specified in the monograph until a stable baseline is achieved. Prepare the test solution(s) and the reference solution(s) as prescribed. The solutions injected must be free from solid particles.

Criteria for assessing the suitability of the system are described in general chapter *2.2.46 Chromatographic separation techniques.* The extent to which adjustments of parameters of the chromatographic system can be made to satisfy the criteria of system suitability are also given in this general chapter.

STATIC HEAD-SPACE GAS CHROMATOGRAPHY

Static head-space gas chromatography is a technique particularly suitable for separating and determining volatile compounds present in solid or liquid samples. The method is based on the analysis of the vapour phase in equilibrium with the solid or liquid phase.

EQUIPMENT

The equipment consists of a gas chromatograph provided with a sample-introduction device that may be connected to a module that automatically controls the pressure and the temperature. If necessary, a device for eliminating solvents can be added.

The sample to be analysed is introduced into a container fitted with a suitable stopper and a valve-system which

permits the passage of the carrier gas. The container is placed in a thermostatically controlled chamber at a temperature set according to the substance to be examined.

The sample is held at this temperature long enough to allow equilibration between the solid or liquid phase and the vapour phase.

The carrier gas is introduced into the container and, after the prescribed time, a suitable valve is opened so that the gas expands towards the chromatographic column taking the volatilised compounds with it.

Instead of using a chromatograph specifically equipped for the introduction of samples, it is also possible to use airtight syringes and a conventional chromatograph. Equilibration is then carried out in a separate chamber and the vapour phase is carried onto the column, while necessary precautions are taken to avoid any changes in the equilibrium.

PROCEDURE

Using the reference preparations, determine suitable instrument settings to produce an adequate response.

DIRECT CALIBRATION

Introduce into separate, identical containers the preparation to be examined and each of the reference preparations, as prescribed in the monograph, avoiding contact between the sampling device and the samples.

Close the containers hermetically and place in the thermostatically controlled chamber set to the temperature and pressure prescribed in the monograph; after equilibration, carry out the chromatography under the prescribed conditions.

STANDARD ADDITIONS

Add to a set of identical suitable containers equal volumes of the preparation to be examined. Add to all but one of the containers, suitable quantities of a reference preparation containing a known concentration of the substance to be determined so as to produce a series of preparations containing steadily increasing concentrations of the substance.

Close the containers hermetically and place in the thermostatically controlled chamber set to the temperature and pressure prescribed in the monograph; after equilibration, carry out the chromatography under the prescribed conditions.

Calculate the linear equation of the graph using a least-squares fit, and derive from it the concentration of the substance to be determined in the preparation to be examined.

Alternatively, plot on a graph the mean of readings against the added quantity of the substance to be determined. Extrapolate the line joining the points on the graph until it meets the concentration axis. The distance between this point and the intersection of the axes represents the concentration of the substance to be determined in the preparation to be examined.

Additional points for monographs of the British Pharmacopoeia

APPARATUS

The design of a particular chromatograph may require modification of the conditions detailed in the monograph. In such a case, the analyst should be satisfied that the modified conditions produce comparable results. If necessary, adjust the flow rate of the carrier gas to improve the quality of the chromatogram or to modify the retention times of the peaks of interest.

METHOD

Unless otherwise stated in the monograph, use nitrogen as the carrier gas and a flame ionisation detector. Occasionally reference is made to on-column injection, in which case the sample is injected directly on to the packing material without the use of an inlet heater. When non-volatile material is to be injected on to the column, a suitable interchangeable pre-column may be used.

REAGENTS

Solvents and reagents used in the preparation of solutions for examination should be of a quality suitable for use in gas chromatography. A wide range of chemical substances is used as stationary phases, including polyethylene glycols, high-molecular weight esters and amides, hydrocarbons, silicone gums and fluids (polysiloxanes often substituted with methyl, phenyl, nitrilo, vinyl or fluoroalkyl groups or mixtures of these) and microporous cross-linked polyaromatic beads. A suitable stationary phase, its concentration and the nature and grade of a suitable solid support are stated in the monograph. The column should be conditioned in accordance with the manufacturer's instructions. In most cases reference is made to a particular commercial brand that has been found to be suitable for the purpose, but such statements do not imply that a different but equivalent commercial brand may not be used.

INTERNAL STANDARDS

Reagents used as internal standards should not contain any impurity that would produce a peak likely to interfere in the determination described in the monograph.

INJECTION VOLUME

Where no injection volume is specified in the monograph, the analyst should select an appropriate volume for their specific application. The volume chosen is dependent on the response of the analyte, the detector used, the efficiency of the column and the overall performance of the chromatographic system. Where a volume is not indicated, 1 µL is usually appropriate; however this should be checked for suitability under the local operating conditions.

SECONDARY PEAKS

Reference may be made to a secondary peak. A *secondary peak* is a peak in the chromatogram other than the principal peak and any peaks due to internal standard, solvent and derivatising agents. Peaks identified as being due to the counter-ion and/or other excipients including preservatives in the material being examined may also be excluded.

C. Size-exclusion Chromatography

(Ph. Eur. method 2.2.30)

PRINCIPLE

Size-exclusion chromatography is a liquid chromatography (*2.2.29*) technique which separates molecules in solution according to their size. With organic mobile phases, the technique is known as gel-permeation chromatography and with aqueous mobile phases it is known as gel-filtration chromatography. The sample is introduced into a column, which is filled with a gel or a porous particle packing material, and is carried by the mobile phase through the column. The size separation takes place by repeated exchange of the solute molecules between the solvent of the mobile phase and the same solvent in the stagnant liquid phase (stationary phase) within the pores of the packing

material. The pore-size range of the packing material determines the molecular-size range within which separation can occur.

Molecules small enough to penetrate all the pore spaces elute at the total mobile phase volume V_t (also known as total permeation volume). Molecules apparently larger than the maximum pore size of the packing material migrate along the column only through the spaces between the particles of the packing material without being retained and elute at the retention volume of an unretained compound V_0 (also known as exclusion volume or void volume). Separation according to molecular size occurs between the retention volume of an unretained compound and the total mobile phase volume, with useful separation usually occurring in the first two thirds of this range.

EQUIPMENT

The equipment consists essentially of a chromatographic column of varying length and internal diameter (Ø), if necessary temperature-controlled, packed with a separation material that is capable of fractionation in the appropriate range of molecular sizes. The packing material may be a soft support such as a swollen gel or a rigid support composed of a material such as glass, silica or a solvent-compatible, cross-linked organic polymer. Rigid supports usually require pressurised systems giving faster separations.

One end of the column is usually fitted with a suitable device for applying the sample such as a flow adapter, a syringe through a septum or an injection valve and may also be connected to a suitable pump for controlling the flow of the eluent. Alternatively, the sample may be applied directly to the drained bed surface or, where the sample is denser than the eluent, it may be layered beneath the eluent.

The mobile phase is chosen according to sample type, separation medium and method of detection. The eluent is passed through the column at a constant rate.

The outlet of the column is usually connected to a suitable detector fitted with an automatic recorder which enables the monitoring of the relative concentrations of separated components of the sample. Ultraviolet/visible spectrophotometers (*2.2.25*), differential refractometers (RI), luminescent detectors, multi-angle light scattering (MALS) detectors and other detectors may be used. An automatic fraction collector may be attached, if necessary.

PROCEDURE

Before carrying out the separation, the packing material is treated, and the column is packed, as described in the monograph, or according to the manufacturer's instructions.

Criteria for assessing the suitability of the system are described in general chapter *2.2.46. Chromatographic separation techniques.* The extent to which adjustments of parameters of the chromatographic system can be made to satisfy the criteria of system suitability are also given in this general chapter.

DETERMINATION OF RELATIVE COMPONENT COMPOSITION OF MIXTURES

Carry out the separation as stated in the monograph.
If possible, monitor the elution of the components continuously and measure the corresponding peak areas.
If the sample is monitored by a physico-chemical property to which all the components of interest exhibit equivalent responses (for example if they have the same specific absorbance), calculate the relative amount of each component by dividing the respective peak area by the sum of the peak areas of all the components of interest. If the responses to the property used for detection of the components of interest are not equivalent, calculate the content by means of calibration curves obtained with the calibration standards prescribed in the monograph.

DETERMINATION OF MOLECULAR MASSES

Size-exclusion chromatography may be used to determine molecular masses by comparison with appropriate calibration standards specified in the monograph. The retention volumes of the calibration standards may be plotted against the logarithm of their molecular masses. The plot usually approximates a straight line within the exclusion and total permeation limits for the separation medium used. From the calibration curve, molecular masses may be estimated.
The molecular-mass calibration is valid only for the particular macromolecular solute/solvent system used under the specified experimental conditions.

DETERMINATION OF MOLECULAR SIZE DISTRIBUTION OF POLYMERS

Size-exclusion chromatography may be used to determine the distribution of the molecular size of polymers. However, sample comparison may be valid only for results obtained under the same experimental conditions. The reference standards used for the calibration and the methods for determination of the distribution of molecular sizes of polymers are specified in the monograph.

Molecular Mass Distribution in Dextrans

(Ph. Eur. method 2.2.39)

Examine by size-exclusion chromatography (*2.2.30*).

Test solution Dissolve 0.200 g of the substance to be examined in the mobile phase and dilute to 10 mL with the mobile phase.

Marker solution Dissolve 5 mg of *glucose R* and 2 mg of *dextran V_0 CRS* in 1 mL of the mobile phase.

Calibration solutions Dissolve separately in 1 mL of the mobile phase 15 mg of *dextran 4 for calibration CRS*, 15 mg of *dextran 10 for calibration CRS*, 20 mg of *dextran 40 for calibration CRS*, 20 mg of *dextran 70 for calibration CRS* and 20 mg of *dextran 250 for calibration CRS*.

System suitability solution Dissolve either 20 mg of *dextran 40 for performance test CRS* (for dextran 40) or 20 mg of *dextran 60/70 for performance test CRS* (for dextran 60 and dextran 70) in 1 mL of the mobile phase.

The chromatographic procedure may be carried out using:
- a column 0.3 m long and 10 mm in internal diameter, packed with *cross-linked agarose for chromatography R* or a series of columns, 0.3 m long and 7.5 mm in internal diameter, packed with *polyether hydroxylated gel for chromatography R*,
- as the mobile phase, at a flow rate of 0.5-1 mL/min, kept constant to ± 1 per cent per hour, a solution containing 7 g of *anhydrous sodium sulfate R* and 1 g of *chlorobutanol R* in 1000 mL of *water for chromatography R*,
- as detector a differential refractometer,
- a 100 µL to 200 µL loop injector,

maintaining the system at a constant temperature (± 0.1 °C).

CALIBRATION OF THE CHROMATOGRAPHIC SYSTEM

Carry out replicate injections of the chosen volume of the marker solution. The chromatogram shows 2 peaks, the first of which corresponds to *dextran V_0 CRS* and the second of which corresponds to *glucose R*. From the elution volume of the peak corresponding to dextran V_0, calculate the void

volume V_0 and from the peak corresponding to dextrose, calculate the total volume V_t.

Inject the chosen volume of each of the calibration solutions. Draw carefully the baseline of each of the chromatograms. Divide each chromatogram into p (at least 60) equal vertical sections (corresponding to equal elution volumes). In each section i, corresponding to an elution volume V_i measure the height (y_i) of the chromatogram line above the baseline and calculate the coefficient of distribution K_i using the expression:

$$\frac{(V_i - V_0)}{(V_t - V_0)} \qquad (1)$$

V_0 = void volume of the column, determined using the peak corresponding to *dextran V_0 CRS* in the chromatogram obtained with the marker solution,

V_t = total volume of the column, determined using the peak corresponding to glucose in the chromatogram obtained with the marker solution,

V_i = elution volume of section i in the chromatogram obtained with each of the calibration solutions.

Carry out the calibration using either of the following methods.

Calibration by plotting of the curve

For each of the dextrans for calibration calculate the coefficient of distribution K_{max} corresponding to the maximum height of the chromatographic line, using expression (1). Plot on semilogarithmic paper the values of K_{max} (on the x-axis) against the declared molecular mass at the maximum height of the chromatographic line (M_{max}) of each of the dextrans for calibration and glucose. Draw a first calibration curve through the points obtained, extrapolating it from the point K_{max} obtained with *dextran 250 for calibration CRS* to the lowest K value obtained for this CRS (Figure 2.2.39.-1). Using this first calibration curve, transform, for each chromatogram, all K_i values into the corresponding molecular mass M_i, thus obtaining the molecular mass distribution. Calculate for each dextran for calibration the average molecular mass M_w using equation (3) below. If the calculated values for M_w do not differ by more than 5 per cent from those declared for each of the dextrans for calibration and the mean difference is within ± 3 per cent, the calibration curve is approved. If not, move the calibration curve along the y-axis and repeat the procedure above until the calculated and the declared values for M_w do not differ by more than 5 per cent.

Calibration by calculation of the curve

Calculate from equations (2) and (3) below, using a suitable method[1], values for b_1, b_2, b_3, b_4 and b_5 that give values of M_w within 5 per cent of the declared values of each of the dextrans for calibration and 180 ± 2 for glucose:

$$M_i = b_5 + e^{\left(b_4 + b_1 K_i + b_2 K_i^2 + b_3 K_i^3\right)} \qquad (2)$$

$$\overline{M}_w = \frac{\sum_{i=1}^{p}(y_i M_i)}{\sum_{i=1}^{p} y_i} \qquad (3)$$

p = number of sections dividing the chromatograms,

y_i = height of the chromatographic line above the baseline in section i,

M_i = molecular mass in section i.

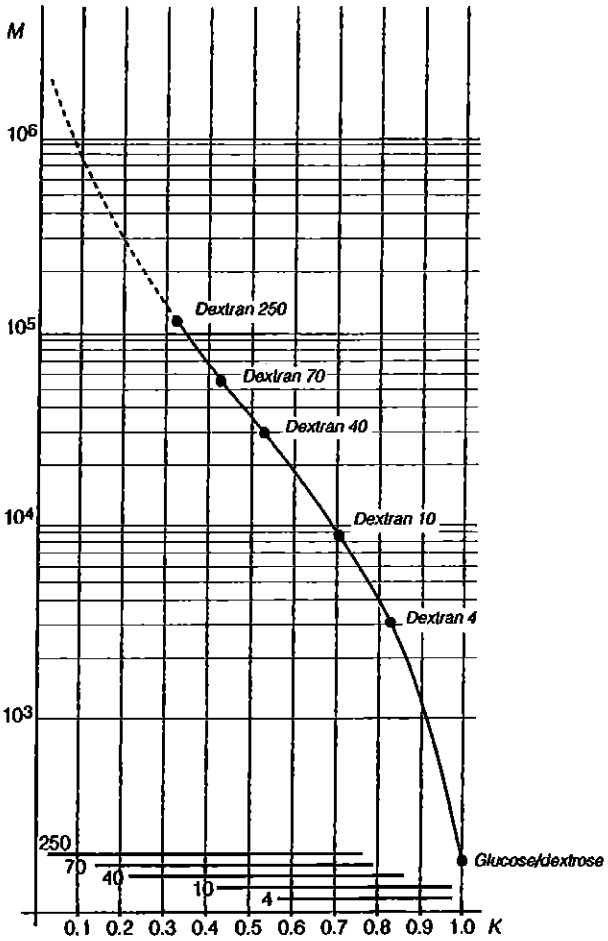

Figure 2.2.39.-1. – *Example of a calibration curve.*

The dotted line corresponds to the part of the curve that is extrapolated. Horizontal lines at the bottom of the figure represent the width and the position of the chromatographic line obtained with each of the dextrans for calibration.

SYSTEM SUITABILITY

Inject the chosen volume of the appropriate system suitability solution.

Average molecular mass of dextran for performance test CRS

Calculate the average molecular mass M_w as indicated under Calibration of the chromatographic system, using either the plotted calibration curve or the values obtained above for b_1, b_2, b_3, b_4 and b_5. The test is not valid unless M_w is:

— 41 000 to 47 000 (*dextran 40 for performance test CRS*),

— 67 000 to 75 000 (*dextran 60/70 for performance test CRS*).

Average molecular mass of the 10 per cent high-fraction dextran

Calculate M_w for the 10 per cent high-fraction dextran eluted through section n using the equation:

$$M_w = \frac{\sum_{i=1}^{n}(y_i M_i)}{\sum_{i=1}^{n} y_i} \qquad (4)$$

[1] *An iterative method such as the Gauss-Newton method modified by Hartley is suitable (see O. Hartley, Tecnometrics, 3 (1961) and G. Nilsson and K. Nilsson, J. Chromat. 101, 137 (1974)). A curve-fitting programme for microcomputers, capable of non-linear regression, may be used.*

in which n is defined by the expressions:

$$\sum_{i=1}^{n} y_i \leq 0.1\left(\sum_{i=1}^{p} y_i\right) \quad (5)$$

$$\sum_{i=1}^{n+1} y_i > 0.1\left(\sum_{i=1}^{p} y_i\right) \quad (6)$$

p = number of sections dividing the chromatograms,
y_i = height of the chromatographic line above the baseline in section i,
M_i = molecular mass in section i.

The test is not valid unless M_w of the 10 per cent high fraction dextran is:
— 110 000 to 130 000 (*dextran 40 for performance test CRS*),
— 190 000 to 230 000 (*dextran 60/70 for performance test CRS*).

Average molecular mass of the 10 per cent low-fraction dextran

Calculate M_w for the 10 per cent low-fraction dextran eluted in and after section m using the expression:

$$M_w = \frac{\sum_{i=m}^{p}(y_i M_i)}{\sum_{i=m}^{p} y_i} \quad (7)$$

in which m is defined by the expressions:

$$\sum_{i=m}^{p} y_i \leq 0.1\left(\sum_{i=1}^{p} y_i\right) \quad (8)$$

$$\sum_{i=m-1}^{p} y_i > 0.1\left(\sum_{i=1}^{p} y_i\right) \quad (9)$$

p = number of sections dividing the chromatograms,
y_i = height of the chromatographic line above the baseline in section i,
M_i = molecular mass in section i.

The test is not valid unless M_w of the 10 per cent low-fraction dextran is:
— 6000 to 8500 (*dextran 40 for performance test CRS*),
— 7000 to 11 000 (*dextran 60/70 for performance test CRS*).

MOLECULAR MASS DISTRIBUTION OF THE DEXTRAN TO BE ANALYSED

Inject the chosen volume of the test solution and calculate M_w of the total molecular mass distribution, M_w of the 10 per cent high-fraction dextran and M_w of the 10 per cent low-fraction dextran as indicated under System suitability.

D. Liquid Chromatography

(Ph. Eur. method 2.2.29)

PRINCIPLE

Liquid chromatography (LC) is a method of chromatographic separation based on the difference in the distribution of species between 2 non-miscible phases, in which the mobile phase is a liquid which percolates through a stationary phase contained in a column.

LC is mainly based on mechanisms of adsorption, mass distribution, ion exchange, size exclusion or stereochemical interaction.

Unless otherwise specified, all the information below is valid for both standard LC and LC using reduced particle-size columns (e.g. sub-2.0 µm).

The latter requires instrumentation that is able to withstand higher pressures (typically up to 100 MPa, i.e. about 15 000 psi), generates lower extra-column band broadening, provides improved gradient mixing and allows a higher sampling rate in the detection system.

EQUIPMENT

The equipment typically consists of:
— a pumping system;
— an injector;
— a chromatographic column (a column temperature controller may be used);
— 1 or more detectors;
— a data acquisition system.

The mobile phase is supplied from 1 or more reservoirs and is pumped to the injector, then through the column, usually at a constant rate, and then through the detector(s).

PUMPING SYSTEMS

LC pumping systems deliver the mobile phase at a controlled flow rate. Pressure fluctuations are to be minimised, for example by passing the pressurised solvent through a pulse-dampening device. Tubing and connections are capable of withstanding the pressures developed by the pumping system. LC pumps may be fitted with a facility for 'bleeding' the system of entrapped air bubbles.

Microprocessor-controlled pumping systems are capable of accurately delivering a mobile phase of either constant (isocratic elution) or varying composition (gradient elution), according to a defined programme. In the case of gradient elution, pumping systems which deliver solvent(s) from several reservoirs are available and solvent mixing can be achieved on either the low or high-pressure side of the pump(s).

INJECTORS

The sample solution is introduced into the flowing mobile phase at or near the head of the column using an injection system which can operate at high pressure. Fixed-loop and variable volume devices operated manually or by an autosampler are used. Partial filling of loops during manual injection may adversely affect injection volume precision.

STATIONARY PHASES

There are many types of stationary phases employed in LC, including:
— silica or alumina, commonly used in normal-phase LC (polar stationary phase and non-polar mobile phase), where the separation is based on differences in adsorption on the stationary phase and/or mass distribution between the mobile phase and the stationary phase (partition chromatography);
— a variety of chemically modified supports prepared from polymers, silica or porous graphite, used in normal-phase and reversed-phase LC (non-polar stationary phase and polar mobile phase), where the separation is based principally on partition of the molecules;
— resins or polymers with acidic or basic groups, used in ion-exchange chromatography, where separation is based

on competition between the ions to be separated and those in the mobile phase;
- porous silica or polymers, used in size-exclusion chromatography (*2.2.30*), where separation is based on differences between the volumes of the molecules, corresponding to steric exclusion;
- specially modified stationary phases, e.g. cellulose or amylose derivatives, proteins or peptides, cyclodextrins etc., for the separation of enantiomers (chiral chromatography).

Most separations are based on reversed-phase LC utilising chemically modified silica as the stationary phase.
The surface of the support, i.e. the silanol groups of silica, is reacted with various silane reagents to produce covalently bound silyl derivatives covering a varying number of active sites on the surface of the support. The nature of the bonded phase is an important parameter for determining the separation properties of the chromatographic system.

Unless otherwise stated by the manufacturer, silica-based reversed-phase columns are considered to be stable in mobile phases having an apparent pH in the range 2.0 to 8.0. Columns containing porous graphite or particles of polymeric materials such as styrene-divinylbenzene copolymer are stable over a wider pH range.

Analysis using normal-phase LC with unmodified silica or polar chemically modified silica (e.g. cyanopropyl or diol) as the stationary phase, with a non-polar mobile phase is applicable in certain cases.

For analytical separations, the particle size of the most commonly used stationary phases varies between 2 and 10 µm. The particles may be spherical or irregular, and of varying porosity and specific surface area. These properties contribute to the chromatographic behaviour of a particular stationary phase. In the case of reversed phases, the nature of the stationary phase, the extent of bonding, e.g. expressed as the carbon loading, and whether the stationary phase is end-capped (i.e. part of the residual silanol groups are silylated) are additional determining factors. Tailing of peaks, particularly of basic substances, can occur when residual silanol groups are present.

In addition to porous particles, superficially porous or monolithic materials may be used.

Unless otherwise prescribed in the monograph, columns made of stainless steel of varying length and internal diameter (Ø) are used for analytical chromatography. Columns with internal diameters of less than 2 mm are often referred to as microbore columns.

The temperature of the mobile phase and the column must be kept constant during the analysis. A column temperature may be specified in the monograph for optimal performance but most separations are performed at 20-25 °C.

MOBILE PHASES

For normal-phase LC, low-polarity organic solvents are generally employed. The residual water content of the solvents used in the mobile phase is to be strictly controlled to obtain reproducible results.

In reversed-phase LC, aqueous mobile phases, usually with organic solvents and/or modifiers, are employed.

The components of the mobile phase are usually filtered to remove particles greater than 0.45 µm in size (or greater than 0.2 µm when the stationary phase is made of sub-2.0 µm particles, and when special detectors, e.g. light scattering detectors, are used). Multicomponent mobile phases are prepared by measuring the required volumes (unless masses are specified) of the individual components, followed by mixing. Alternatively, the solvents may be delivered by individual pumps controlled by proportioning valves, by which mixing is performed according to the desired proportion. Solvents are normally degassed before pumping by sparging with helium, sonication and/or using in-line membrane/vacuum modules to avoid the creation of gas bubbles in the detector cell.

Solvents for the preparation of the mobile phase are normally free of stabilisers and, if an ultraviolet detector is employed, are transparent at the wavelength of detection. Solvents and other components employed are to be of appropriate quality. In particular, *water for chromatography R* is used for the preparation of mobile phases when water, or an aqueous solution, is 1 of the components. Any necessary adjustments of the pH are made to the aqueous component of the mobile phase and not the mixture. If buffer solutions or saline solutions are used, adequate rinsing of the system is carried out with a mixture of water and a small proportion of the organic part of the mobile phase (5 per cent *V/V*) to prevent crystallisation of salts after completion of the analysis.

Mobile phases may contain other components, for example a counter-ion for ion-pair chromatography or a chiral selector for chiral chromatography using an achiral stationary phase.

DETECTORS

Ultraviolet/visible (UV/Vis) spectrophotometers (including diode array detectors) (*2.2.25*), are the most commonly employed detectors. Fluorescence spectrophotometers, differential refractometers (RI), electrochemical detectors (ECD), light scattering detectors, charged aerosol detectors (CAD), mass spectrometers (MS) (*2.2.43*), radioactivity detectors, multi-angle light scattering (MALS) detectors or other detectors may be used.

PROCEDURE

Equilibrate the column with the prescribed mobile phase and flow rate, at 20-25 °C or at the temperature specified in the monograph, until a stable baseline is achieved. Prepare the solution(s) of the substance to be examined and the reference solution(s) required. The solutions must be free from solid particles.

Criteria for assessing the suitability of the system are described in general chapter *2.2.46. Chromatographic separation techniques*. The extent to which adjustments of parameters of the chromatographic system can be made to satisfy the criteria of system suitability are also given in this chapter.

Additional points for monographs of the British Pharmacopoeia

The composition and flow rate of the mobile phase are stated in the monograph. It is advisable to use as the mobile phase solvent mixtures that have been de-aerated using a vacuum pump or other suitable means of de-aeration that has no effect on the composition of the mixture.

In quantitative work, particularly where the use of an internal standard is not specified in the monograph, the use of a fixed-volume loop injector is recommended. In certain exceptional cases the use of peak heights alone is prescribed in the monograph; where this is the case peak heights should be used irrespective of the symmetry factor.

The column is usually made of stainless steel and its dimensions are stated in the monograph. The dimensions are stated as (length × internal diameter). When the monograph prescribes the use of a stationary phase designated by a letter, the relevant stationary phase defined below is intended.

The nominal diameter of the particles of the stationary phase is stated in parentheses immediately following the designating letter. In most cases reference is made to a particular commercial brand that has been found to be suitable for the purpose, but such statements do not imply that a different but equivalent commercial brand may not be used.
The separation should be carried out at a constant ambient temperature unless otherwise specified in the monograph.
When using mobile phases of high pH with a silica-based column, it is advisable to use a pre-column before the analytical column.

Unless otherwise specified in the monograph the detector consists of a photometric detector fitted with a low-volume flow cell (about 10 µL is suitable); the wavelength setting is specified in the monograph.

The design of a particular chromatograph may require modification of the conditions detailed in the monograph. In such a case the analyst should be satisfied that the modified conditions produce comparable results.

INJECTION VOLUME

Where no injection volume is specified in the monograph, the analyst should select an appropriate volume for their specific application. The volume chosen is dependent on the response of the analyte, the detector used, the efficiency of the column and the overall performance of the chromatographic system. Where a volume is not indicated, 20 µL is usually appropriate; however this should be checked for suitability under the local operating conditions.

RESOLUTION FACTOR

Unless otherwise stated in the monograph, for monographs with a stated *resolution factor* read Resolution (*Rs*) as referred to in Appendix III Chromatographic Separation Techniques.

RUN TIME

Where no run time is specified in the monograph, the analyst should select an appropriate run time for their specific application. The run time chosen is dependent on the type of test. For example, where a run time is not indicated in a Related substances test the analyst should ensure that the run time is greater than all known or likely *secondary peaks;* similarly in an Assay the run time should be chosen to allow the baseline to stabilise following the elution of the peak of interest.

SECONDARY PEAKS

Reference may be made to secondary peaks. A *secondary peak* is a peak in the chromatogram other than the principal peak and any peak due to internal standard, solvent or derivatising agents. Peaks identified as being due to the counter-ion and/or other excipients including preservatives in the material being examined may also be excluded.

MATERIALS

Solvents and reagents used in the preparation of solutions for examination should be of a quality suitable for use in liquid chromatography.

E. Paper Chromatography

(Ph. Eur. method 2.2.26)

ASCENDING PAPER CHROMATOGRAPHY

Apparatus The apparatus consists of a glass tank of suitable size for the chromatographic paper used, ground at the top to take a closely fitting lid. In the top of the tank is a device which suspends the chromatographic paper and is capable of being lowered without opening the chamber.
In the bottom of the tank is a dish to contain the mobile phase into which the paper may be lowered.
The chromatographic paper consists of suitable filter paper, cut into strips of sufficient length and not less than 2.5 cm wide; the paper is cut so that the mobile phase runs in the direction of the grain of the paper.

Method Place in the dish a layer 2.5 cm deep of the mobile phase prescribed in the monograph. If prescribed in the monograph, pour the stationary phase between the walls of the tank and the dish. Close the tank and allow to stand for 24 h at 20 °C to 25 °C. Maintain the tank at this temperature throughout the subsequent procedure. Draw a fine pencil line horizontally across the paper 3 cm from one end. Using a micro pipette, apply to a spot on the pencil line the volume of the solution prescribed in the monograph.
If the total volume to be applied would produce a spot more than 10 mm in diameter, apply the solution in portions allowing each to dry before the next application. When more than one chromatogram is to be run on the same strip of paper, space the solutions along the pencil line at points not less than 3 cm apart. Insert the paper into the tank, close the lid and allow to stand for 1 h 30 min. Lower the paper into the mobile phase and allow elution to proceed for the prescribed distance or time. Remove the paper from the tank and allow to dry in air. Protect the paper from bright light during the elution process.

DESCENDING PAPER CHROMATOGRAPHY

Apparatus The apparatus consists of a glass tank of suitable size for the chromatographic paper used, ground at the top to take a closely fitting glass lid. The lid has a central hole about 1.5 cm in diameter closed by a heavy glass plate or a stopper. In the upper part of the tank is suspended a solvent trough with a device for holding the chromatographic paper. On each side of the trough, parallel to and slightly above its upper edges, are two glass guide rods to support the paper in such a manner that no part of it is in contact with the walls of the tank. The chromatographic paper consists of suitable filter paper, cut into strips of sufficient length, and of any convenient width between 2.5 cm and the length of the trough; the paper is cut so that the mobile phase runs in the direction of the grain of the paper.

Method Place in the bottom of the tank a layer 2.5 cm deep of the solvent prescribed in the monograph, close the tank and allow to stand for 24 h at 20 °C to 25 °C. Maintain the tank at this temperature throughout the subsequent procedure. Draw a fine pencil line horizontally across the paper at such a distance from one end that when this end is secured in the solvent trough and the remainder of the paper is hanging freely over the guide rod, the line is a few centimetres below the guide rod and parallel with it. Using a micro-pipette, apply on the pencil line the volume of the solution prescribed in the monograph. If the total volume to be applied would produce a spot more than 10 mm in diameter, apply the solution in portions, allowing each to dry before the next application. When more than one chromatogram is to be run on the same strip of paper, space the solutions along the pencil line at points not less than 3 cm apart. Insert the paper in the tank, close the lid, and allow to stand for 1 h 30 min. Introduce into the solvent trough, through the hole in the lid, a sufficient quantity of the mobile phase, close the tank and allow elution to proceed for the prescribed distance or time. Remove the paper from the tank and allow to dry in air. The paper should be protected from bright light during the elution process.

F. Electrophoresis[1]

(Ph. Eur. method 2.2.31)

♦1 GENERAL PRINCIPLE

Under the influence of an electrical field, charged particles dissolved or dispersed in an electrolyte solution migrate in the direction of the electrode bearing the opposite polarity. In gel electrophoresis, the movements of the particles are retarded by interactions with the surrounding gel matrix, which acts as a molecular sieve. The opposing interactions of the electrical force and molecular sieving result in differential migration rates according to sizes, shapes and charges of particles. Because of their different physico-chemical properties, different macromolecules of a mixture will migrate at different speeds during electrophoresis and will thus be separated into discrete fractions. Electrophoretic separations can be conducted in systems without support phases (e.g. free solution separation in capillary electrophoresis) and in stabilising media such as thin-layer plates, films or gels.

2 FREE OR MOVING BOUNDARY ELECTROPHORESIS

This method is mainly used for the determination of mobility, the experimental characteristics being directly measurable and reproducible. It is chiefly employed with substances of high relative molecular mass and low diffusibility. The boundaries are initially located by a physical process such as refractometry or conductimetry. After applying a given electric field for an accurately measured time, the new boundaries and their respective positions are observed. The operating conditions must be such as to make it possible to determine as many boundaries as there are components.

3 ZONE ELECTROPHORESIS USING A SUPPORTING MEDIUM

This method requires the use of small samples only.

The nature of the support, such as paper, agar gel, cellulose acetate, starch, agarose, methacrylamide, mixed gel, introduces a number of additional factors modifying the mobility:

a) owing to channelling in the supporting medium, the apparent distance covered is less than the real distance,

b) some supporting media are not electrically neutral. As the medium is a stationary phase it may sometimes give rise to a considerable electro-endosmotic flow,

c) any heating due to the joule effect may cause some evaporation of the liquid from the supporting medium which, by capillarity, causes the solution to move from the ends towards the centre. The ionic strength therefore tends to increase gradually.

The rate of migration then depends on four main factors: the mobility of the charged particle, the electro-endosmotic flow, the evaporation flow, and the field strength. Hence it is necessary to operate under clearly defined experimental conditions and to use, wherever possible, reference substances.

An *apparatus* for electrophoresis consists of:

— a *generator supplying direct current* whose voltage can be controlled and, preferably, stabilised,

— an *electrophoresis chamber*. This is usually rectangular and made of glass or rigid plastic, with 2 separate compartments, the anodic and the cathodic, containing the electrolyte solution. In each compartment is immersed an electrode, for example of platinum or graphite. These are connected by means of an appropriately isolated circuit to the corresponding terminal of the power supply to form the anode and the cathode. The level of the liquid in the 2 compartments is kept equal to prevent siphoning.

The electrophoresis chamber is fitted with an airtight lid which maintains a moisture-saturated atmosphere during operation and reduces evaporation of the solvent. A safety device may be used to cut off the power when the lid is removed. If the electrical power measured across the strip exceeds 10 W, it is preferable to cool the support.

— a *support-carrying device*:

Strip electrophoresis The supporting strip, previously wetted with the same conducting solution and dipped at each end into an electrode compartment is appropriately tightened and fixed on to a suitable carrier designed to prevent diffusion of the conducting electrolyte, such as a horizontal frame, inverted-V stand or a uniform surface with contact points at suitable intervals.

Gel electrophoresis The device consists essentially of a glass plate (for example, a microscope slide) over the whole surface of which is deposited a firmly adhering layer of gel of uniform thickness. The connection between the gel and the conducting solution is effected in various ways according to the type of apparatus used. Precautions must be taken to avoid condensation of moisture or drying of the solid layer.

— measuring *device or means of detection*.

Method Introduce the electrolyte solution into the electrode compartments. Place the support suitably impregnated with electrolyte solution in the chamber under the conditions prescribed for the type of apparatus used. Locate the starting line and apply the sample. Apply the electric current for the prescribed time. After the current has been switched off, remove the support from the chamber, dry and visualise.

4 POLYACRYLAMIDE ROD GEL ELECTROPHORESIS

In polyacrylamide rod gel electrophoresis, the stationary phase is a gel which is prepared from a mixture of acrylamide and *N,N'*-methylenebisacrylamide. Rod gels are prepared in tubes 7.5 cm long and 0.5 cm in internal diameter, one solution being applied to each rod.

Apparatus This consists of 2 buffer solution reservoirs made of suitable material such as poly(methyl methacrylate) and mounted vertically one above the other. Each reservoir is fitted with a platinum electrode. The electrodes are connected to a power supply allowing operation either at constant current or at constant voltage. The apparatus has in the base of the upper reservoir a number of holders equidistant from the electrode.

Method The solutions should usually be degassed before polymerisation and the gels used immediately after preparation. Prepare the gel mixture as prescribed and pour into suitable glass tubes, stoppered at the bottom, to an equal height in each tube and to about 1 cm from the top, taking care to ensure that no air bubbles are trapped in the tubes. Cover the gel mixture with a layer of *water R* to exclude air and allow to set. Gel formation usually takes about 30 min and is complete when a sharp interface appears between the gel and the water layer. Remove the water layer. Fill the lower reservoir with the prescribed buffer solution and remove the stoppers from the tubes. Fit the tubes into the holders of the upper reservoir and adjust so that the bottom

[1] *This chapter has undergone pharmacopoeial harmonisation. See chapter 5.8 Pharmacopoeial harmonisation.*

of the tubes are immersed in the buffer solution in the lower reservoir. Carefully fill the tubes with the prescribed buffer solution. Prepare the test and reference solutions containing the prescribed marker dye and make them dense by dissolving in them *sucrose R*, for example. Apply the solutions to the surface of a gel using a different tube for each solution. Add the same buffer to the upper reservoir. Connect the electrodes to the power supply and allow electrophoresis to proceed at the prescribed temperature and using the prescribed constant voltage or current. Switch off the power supply when the marker dye has migrated almost into the lower reservoir. Immediately remove each tube from the apparatus and extrude the gel. Locate the position of the bands in the electropherogram as prescribed.♦

5 SODIUM DODECYL SULFATE POLYACRYLAMIDE GEL ELECTROPHORESIS (SDS-PAGE)

5-1 SDS-PAGE - UNIFORM PERCENTAGE GELS

Scope

Polyacrylamide gel electrophoresis is used for the qualitative characterisation of proteins in biological preparations, for control of purity and for quantitative determinations.

Purpose

Analytical gel electrophoresis is an appropriate method with which to identify and to assess the homogeneity of proteins in pharmaceutical preparations. The method is routinely used for the estimation of protein subunit molecular masses and for determination of the subunit compositions of purified proteins.

Ready-to-use gels and reagents are commercially available and can be used instead of those described in this text, provided that they give equivalent results and that they meet the validity requirements given below under Validation of the test.

5-1-1 Characteristics of polyacrylamide gels

The sieving properties of polyacrylamide gels are established by the three-dimensional network of fibres and pores which is formed as the bifunctional bisacrylamide cross-links adjacent polyacrylamide chains. Polymerisation is usually catalysed by a free radical-generating system composed of ammonium persulfate and *N,N,N′,N′*-tetramethylethylenediamine (TEMED).

As the acrylamide concentration of a gel increases, its effective pore size decreases. The effective pore size of a gel is operationally defined by its sieving properties, i.e. by the resistance it imparts to the migration of macromolecules. There are limits on the acrylamide concentrations that can be used. At high acrylamide concentrations, gels break much more easily and are difficult to handle. As the pore size of a gel decreases, the migration rate of a protein through the gel decreases. By adjusting the pore size of a gel, through manipulating the acrylamide concentration, the resolution of the method can be optimised for a given protein product. Thus, a given gel is physically characterised by its respective composition of acrylamide and bisacrylamide.

In addition to the composition of the gel, the state of the protein is an important component to the electrophoretic mobility. In the case of proteins, the electrophoretic mobility is dependent on the pK value of the charged groups and the size of the molecule. It is influenced by the type, the concentration and the pH of the buffer, by the temperature and the field strength, and by the nature of the support material.

5-1-2 Denaturing polyacrylamide gel electrophoresis

The method cited as an example is limited to the analysis of monomeric polypeptides with a mass range of 14 000 to 100 000 daltons. It is possible to extend this mass range using various techniques (e.g. gradient gels, particular buffer system). For instance, tricine-SDS gels, with tricine as the trailing ion in the electrophoresis running-buffer (instead of glycine as in the method described here), can separate very small proteins and peptides under 10 000 to 15 000 daltons.

Denaturing polyacrylamide gel electrophoresis using glycine-SDS is the most common mode of electrophoresis used in assessing the pharmaceutical quality of protein products and will be the focus of the example method. Typically, analytical electrophoresis of proteins is carried out in polyacrylamide gels under conditions that ensure dissociation of the proteins into their individual polypeptide subunits and that minimise aggregation. Most commonly, the strongly anionic detergent SDS is used in combination with heat to dissociate the proteins before they are loaded on the gel. The denatured polypeptides bind to SDS, become negatively charged and exhibit a consistent charge-to-mass ratio regardless of protein type. Because the amount of SDS bound is almost always proportional to the molecular mass of the polypeptide and is independent of its sequence, SDS-polypeptide complexes migrate through polyacrylamide gels with mobilities dependent on the size of the polypeptide.

The electrophoretic mobilities of the resultant detergent-polypeptide complexes all assume the same functional relationship to their molecular masses. SDS complexes will migrate toward the anode in a predictable manner, with low-molecular-mass complexes migrating faster than larger ones. The molecular mass of a protein can therefore be estimated from its relative mobility in calibrated SDS-PAGE, and the intensity of a single band relative to other undesired bands in such a gel can be a measure of purity.

Modifications to the polypeptide backbone, such as *N*- or *O*-linked glycosylation, can change the apparent molecular mass of a protein since SDS does not bind to a carbohydrate moiety in a manner similar to a polypeptide; therefore, a consistent charge-to-mass ratio is not maintained.

Depending on the extent of glycosylation and other post-translational modifications, the apparent molecular mass of proteins may not be a true reflection of the mass of the polypeptide chain.

Reducing conditions

Polypeptide subunits and three-dimensional structure are often maintained in proteins by the presence of disulfide bonds. A goal of SDS-PAGE analysis under reducing conditions is to disrupt this structure by reducing disulfide bonds. Complete denaturation and dissociation of proteins by treatment with 2-mercaptoethanol (2-ME) or dithiothreitol (DTT) will result in unfolding of the polypeptide backbone and subsequent complexation with SDS. Using these conditions, the molecular mass of the polypeptide subunits can reasonably be calculated by linear regression (or, more accurately, by non-linear regression) with the aid of suitable molecular-mass standards.

Non-reducing conditions

For some analyses, complete dissociation of the protein into subunit peptides is not desirable. In the absence of treatment with reducing agents such as 2-ME or DTT, disulfide covalent bonds remain intact, preserving the oligomeric form of the protein. Oligomeric SDS-protein complexes migrate more slowly than their SDS-polypeptide subunits.
In addition, non-reduced proteins may not be completely

saturated with SDS and, hence, may not bind the detergent in a constant mass ratio. Moreover, intra-chain disulfide bonds constrain the molecular shape, usually in such a way as to reduce the Stokes radius of the molecule, thereby reducing the apparent molecular mass M_r. This makes molecular-mass determinations of these molecules by SDS-PAGE less straightforward than analyses of fully denatured polypeptides, since it is necessary that both standards and unknown proteins be in similar configurations for valid comparisons.

5-1-3 Characteristics of discontinuous buffer system gel electrophoresis

The most popular electrophoretic method for the characterisation of complex mixtures of proteins uses a discontinuous buffer system involving 2 contiguous, but distinct gels: a resolving or separating (lower) gel and a stacking (upper) gel. The 2 gels are cast with different porosities, pH, and ionic strengths. In addition, different mobile ions are used in the gel and electrode buffers.

The buffer discontinuity acts to concentrate large volume samples in the stacking gel, resulting in improved resolution. When power is applied, a voltage drop develops across the sample solution which drives the proteins into the stacking gel. Glycinate ions from the electrode buffer follow the proteins into the stacking gel. A moving boundary region is rapidly formed with the highly mobile chloride ions in the front and the relatively slow glycinate ions in the rear.

A localised high-voltage gradient forms between the leading and trailing ion fronts, causing the SDS-protein complexes to form into a thin zone (stack) and migrate between the chloride and glycinate phases. Within broad limits, regardless of the height of the applied sample, all SDS-proteins condense into a very narrow region and enter the resolving gel as a well-defined, thin zone of high protein density.

The large-pore stacking gel does not retard the migration of most proteins and serves mainly as an anti-convective medium. At the interface of the stacking and resolving gels, the proteins undergo a sharp increase in retardation due to the restrictive pore size of the resolving gel and the buffer discontinuity, which also contributes to the focusing of the proteins. Once in the resolving gel, proteins continue to be slowed by the sieving of the matrix. The glycinate ions overtake the proteins, which then move in a space of uniform pH formed by the tris(hydroxymethyl)aminomethane and glycine. Molecular sieving causes the SDS-polypeptide complexes to separate on the basis of their molecular masses.

5-1-4 Preparing vertical discontinuous buffer SDS polyacrylamide gels

This section describes the preparation of gels using particular instrumentation. This does not apply to pre-cast gels.

For pre-cast gels or any other commercially available equipment, the manufacturer's instructions must be used for guidance.

The use of commercial reagents that have been purified in solution is recommended. When this is not the case and where the purity of the reagents used is not sufficient, a pre-treatment is applied. For instance, any solution sufficiently impure to require filtration must also be deionised with a mixed-bed (anion/cation exchange) resin to remove acrylic acid and other charged degradation products. When stored according to recommendations, acrylamide/bisacrylamide solutions and solid persulfate are stable for long periods.

Assembling the gel moulding cassette

Clean the 2 glass plates (e.g. 10 cm by 8 cm in size), the polytetrafluoroethylene comb, the 2 spacers and the silicone rubber tubing (e.g. 0.6 mm in diameter by 35 cm) with mild detergent and rinse extensively with water, followed by anhydrous ethanol, and allow the plates to dry at room temperature. Lubricate the spacers and the tubing with non-silicone grease. Apply the spacers along each of the 2 short sides of the glass plate 2 mm away from the edges and 2 mm away from the long side corresponding to the bottom of the gel. Begin to lay the tubing on the glass plate by using one spacer as a guide. Carefully twist the tubing at the bottom of the spacer and follow the long side of the glass plate. While holding the tubing with 1 finger along the long side, twist again the tubing and lay it on the second short side of the glass plate, using the spacer as a guide. Place the second glass plate in perfect alignment and hold the mould together by hand pressure. Apply 2 clamps on each of the 2 short sides of the mould. Carefully apply four clamps on the longer side of the gel mould thus forming the bottom of the gel mould. Verify that the tubing runs along the edge of the glass plates and has not been extruded while placing the clamps. The gel mould is now ready for pouring the gel.

Preparation of the gel

In a discontinuous buffer SDS polyacrylamide gel, it is recommended to pour the resolving gel, let the gel set, and then pour the stacking gel since the composition of the 2 gels in acrylamide-bisacrylamide, buffer and pH are different.

Preparation of the resolving gel In a conical flask, prepare the appropriate volume of solution containing the desired concentration of acrylamide for the resolving gel, using the values given in Table 2.2.31.-1. Mix the components in the order shown. Where appropriate, before adding the ammonium persulfate solution and the TEMED, filter the solution if necessary under vacuum through a cellulose acetate membrane (pore diameter 0.45 µm). Keep the solution under vacuum, while swirling the filtration unit, until no more bubbles are formed in the solution.

Add appropriate amounts of ammonium persulfate solution and TEMED as indicated in Table 2.2.31.-1, swirl and pour immediately into the gap between the 2 glass plates of the mould. Leave sufficient space for the stacking gel (the length of the teeth of the comb plus 1 cm). Using a tapered glass pipette, carefully overlay the solution with water-saturated isobutanol. Leave the gel in a vertical position at room temperature to allow polymerisation.

Preparation of the stacking gel After polymerisation is complete (about 30 min), pour off the isobutanol and wash the top of the gel several times with water to remove the isobutanol overlay and any unpolymerised acrylamide. Drain as much fluid as possible from the top of the gel, and then remove any remaining water with the edge of a paper towel.

In a conical flask, prepare the appropriate volume of solution containing the desired concentration of acrylamide, using the values given in Table 2.2.31.-2. Mix the components in the order shown. Where appropriate, before adding the ammonium persulfate solution and the TEMED, filter the solution if necessary under vacuum through a cellulose acetate membrane (pore diameter 0.45 µm). Keep the solution under vacuum, while swirling the filtration unit, until no more bubbles are formed in the solution.

Add appropriate amounts of ammonium persulfate solution and TEMED as indicated in Table 2.2.31.-2. Swirl and pour immediately into the gap between the 2 glass plates of the mould directly onto the surface of the polymerised resolving gel. Immediately insert a clean polytetrafluoroethylene comb into the stacking gel solution, being careful to avoid trapping air bubbles. Add more stacking gel solution to fill the spaces

(1) Acrylamide solution: *30 per cent acrylamide/bisacrylamide (29:1) solution R.*
(2) 1.0 M Tris (pH 6.8): *1 M tris-hydrochloride buffer solution pH 6.8 R.*
(3) 100 g/L SDS: a 100 g/L solution of *sodium dodecyl sulfate R.*
(4) 100 g/L APS: a 100 g/L solution of *ammonium persulfate R.* Ammonium persulfate provides the free radicals that drive polymerisation of acrylamide and bisacrylamide. Since ammonium persulfate solution decomposes rapidly, fresh solutions must be prepared daily.
(5) TEMED: *tetramethylethylenediamine R.*

of the comb completely. Leave the gel in a vertical position and allow to polymerise at room temperature.

Preparation of the samples

Unless otherwise stated in the specific monograph, the samples can be prepared as follows:

Preparation of the samples (non-reducing conditions) Mix equal volumes of a mixture comprising *water R* plus the preparation to be examined or the reference preparation, and *concentrated SDS-PAGE sample buffer R.*

Preparation of the samples (reducing conditions) Mix equal volumes of a mixture comprising *water R* plus the preparation to be examined or the reference preparation, and *concentrated SDS-PAGE sample buffer for reducing conditions R* containing 2-ME (or DTT) as the reducing agent.

The concentration prescribed in the monograph can vary depending on the protein and staining method.

Sample treatment: keep for 5 min in a water-bath or in a block heater set at 100 °C, then cool. The temperature and time in the monograph may vary as protein cleavage may occur during the heat treatment.

Mounting the gel in the electrophoresis apparatus and electrophoretic separation

After polymerisation is complete (about 30 min), remove the polytetrafluoroethylene comb carefully. Rinse the wells immediately with water or with the *SDS-PAGE running buffer R* to remove any unpolymerised acrylamide.

If necessary, straighten the teeth of the stacking gel with a blunt hypodermic needle attached to a syringe. Remove the clamps on one short side, carefully pull out the tubing and replace the clamps. Proceed similarly on the other short side. Remove the tubing from the bottom part of the gel. Mount the gel in the electrophoresis apparatus. Add the electrophoresis buffers to the top and bottom reservoirs. Remove any bubbles that become trapped at the bottom of the gel between the glass plates. This is best done with a bent hypodermic needle attached to a syringe. Never pre-run the gel before loading the samples, since this will destroy the discontinuity of the buffer systems. Before loading the sample carefully rinse each well with *SDS-PAGE running buffer R.* Prepare the test and reference solutions in the recommended sample buffer and treat as specified in the individual monograph. Apply the appropriate volume of each solution to the stacking gel wells.

Start the electrophoresis using the conditions recommended by the manufacturer of the equipment. Manufacturers of SDS-PAGE equipment may provide gels of different surface area and thickness and electrophoresis running time and current/voltage may vary in order to achieve optimal separation. Check that the dye front is moving into the resolving gel. When the dye is near the bottom of the gel, stop the electrophoresis. Remove the gel assembly from the apparatus and carefully separate the glass plates. Remove the spacers, cut off and discard the stacking gel and immediately proceed with staining.

5-2 SDS-PAGE - GRADIENT CONCENTRATION GELS

Gradient gels (resolving gels) are prepared with an increasing concentration of acrylamide from the top to the bottom. Preparation of gradient gels requires a gradient-forming apparatus. Ready-to-use gradient gels are commercially available with specific recommended protocols.

Gradient gels offer some advantages, as some proteins which co-migrate on fixed-concentration gels can be resolved within gradient gels. During electrophoresis, the proteins migrate until the pore size prevents further progress and a stacking effect therefore occurs, resulting in sharper bands. As shown in Table 2.2.31.-3, gradient gels also allow separation of proteins with a wider range of molecular masses compared to a single fixed concentration gel.

The table gives suggested compositions of the linear gradient, relating the range of acrylamide concentrations to the appropriate protein molecular mass ranges. Note that other gradient shapes (e.g. concave) can be prepared for specific applications.

Table 2.2.31.-3

Acrylamide (per cent)	Protein range (kDa)
5 - 15	20 - 250
5 - 20	10 - 200
10 - 20	10 - 150
8 - 20	8 - 150

Gradient gels are also used for the determination of molecular mass and protein purity.

5-3 DETECTION OF PROTEINS IN GELS

Coomassie and silver staining are the most common protein staining methods and are described in more detail below. Several other commercial stains, detection methods and commercial kits are available. For example, fluorescent stains

are visualised using a fluorescent imager and often provide a linear response over a wide range of protein concentrations, often several orders of magnitude depending on the protein.

Coomassie staining has a protein detection level of approximately 1 µg to 10 µg of protein per band. Silver staining is the most sensitive method for staining proteins in gels and a band containing 10 ng to 100 ng can be detected. These figures are considered robust in the context of these gels. Improved sensitivity of 1 or 2 orders of magnitude has sometimes been reported in the literature.

Coomassie staining responds in a more linear manner than silver staining; however, the response and range depend on the protein and development time. Both Coomassie and silver staining can be less reproducible if staining is stopped in a subjective manner, i.e. the point at which the staining is deemed satisfactory. The use of dynamic ranges of reference proteins is very important as they help assess the intra-experimental sensitivity and linearity. All gel staining steps are carried out while wearing gloves, at room temperature, with gentle shaking (e.g. on an orbital shaker platform) and using any convenient container.

Coomassie staining

Immerse the gel in a large excess of *Coomassie staining solution R* and allow to stand for at least 1 h. Remove the staining solution.

Destain the gel with a large excess of *destaining solution R*. Change the destaining solution several times, until the stained protein bands are clearly distinguishable on a clear background. The more thoroughly the gel is destained, the smaller is the amount of protein that can be detected by the method. Destaining can be speeded up by including a few grams of anion-exchange resin or a small sponge in the *destaining solution R*.

NOTE: the acid-alcohol solutions used in this procedure do not completely fix proteins in the gel. This can lead to losses of some low-molecular-mass proteins during the staining and destaining of thin gels. Permanent fixation is obtainable by allowing the gel to stand in a mixture of 1 volume of trichloroacetic acid R, 4 volumes of methanol R and 5 volumes of water R for 1 h before it is immersed in the Coomassie staining solution R.

Silver staining

Immerse the gel in a large excess of *fixing solution R* and allow to stand for 1 h. Remove the fixing solution, add fresh fixing solution and incubate either for at least 1 h or overnight, if convenient. Discard the fixing solution and wash the gel in a large excess of *water R* for 1 h. Soak the gel for 15 min in a 1 per cent *V/V* solution of *glutaraldehyde R*. Wash the gel twice for 15 min in a large excess of *water R*. Soak the gel in fresh *silver nitrate reagent R* for 15 min, in darkness. Wash the gel three times for 5 min in a large excess of *water R*. Immerse the gel for about 1 min in *developer solution R* until satisfactory staining has been obtained. Stop the development by incubation in the *blocking solution R* for 15 min. Rinse the gel with *water R*.

5-4 RECORDING OF THE RESULTS

Gels are photographed or scanned while they are still wet or after an appropriate drying procedure. Currently, gel scanning systems with data analysis software are commercially available to immediately photograph and analyse the wet gel.

Depending on the staining method used, gels are treated in a slightly different way. For Coomassie staining, after the destaining step, allow the gel to stand in a 100 g/L solution of *glycerol R* for at least 2 h (overnight incubation is possible).

For silver staining, add to the final rinsing a step of 5 min in a 20 g/L solution of *glycerol R*.

Drying of stained SDS polyacrylamide gels is one of the methods used to obtain permanent documentation. This method frequently results in the cracking of gel during drying between cellulose films.

Immerse 2 sheets of porous cellulose film in *water R* and incubate for 5 min to 10 min. Place one of the sheets on a drying frame. Carefully lift the gel and place it on the cellulose film. Remove any trapped air bubbles and pour a few millilitres of *water R* around the edges of the gel. Place the second sheet on top and remove any trapped air bubbles. Complete the assembly of the drying frame. Place in an oven or leave at room temperature until dry.

5-5 MOLECULAR-MASS DETERMINATION

Molecular masses of proteins are determined by comparison of their mobilities with those of several marker proteins of known molecular weight. Mixtures of pre-stained and unstained proteins with precisely known molecular masses blended for uniform staining are available for calibrating gels. They are available in various molecular mass ranges. Concentrated stock solutions of proteins of known molecular mass are diluted in the appropriate sample buffer and loaded on the same gel as the protein sample to be examined.

Immediately after the gel has been run, the position of the bromophenol blue tracking dye is marked to identify the leading edge of the electrophoretic ion front. This can be done by cutting notches in the edges of the gel or by inserting a needle soaked in India ink into the gel at the dye front. After staining, measure the migration distances of each protein band (markers and unknowns) from the top of the resolving gel. Divide the migration distance of each protein by the distance travelled by the tracking dye. The normalised migration distances are referred to as the relative mobilities of the proteins (relative to the dye front), or R_F. Construct a plot of the logarithm of the relative molecular masses (M_r) of the protein standards as a function of the R_F values. Unknown molecular masses can be estimated by linear regression analysis (or more accurately by non-linear regression analysis) or interpolation from the curves of log M_r against R_F if the values obtained for the unknown samples are positioned along the approximately linear part of the graph.

5-6 VALIDATION OF THE TEST

The test is not valid unless the target resolution range of the gel has been demonstrated by the distribution of appropriate molecular mass markers, e.g. across 80 per cent of the length of the gel. The separation obtained for the expected proteins must show a linear relationship between the logarithm of the molecular mass and the R_F. If the plot has a sigmoidal shape, then only data from the linear region of the curve can be used in the calculations. Additional validation requirements with respect to the test sample may be specified in individual monographs.

Sensitivity must also be validated. A reference protein control corresponding to the desired concentration limit that is run in parallel with the test samples can serve to establish system suitability.

5-7 QUANTIFICATION OF IMPURITIES

SDS-PAGE is often used as a limit test for impurities. When impurities are quantified by normalisation to the main band using an integrating densitometer or image analysis, the responses must be validated for linearity. Note that depending on the detection method and protein as described in the introduction of section 5-3, the linear range can vary

but can be assessed within each run by using one or more control samples containing an appropriate range of protein concentration.

Where the impurity limit is specified in the individual monograph, a reference solution corresponding to that level of impurity should be prepared by diluting the test solution. For example, where the limit is 5 per cent, a reference solution would be a 1:20 dilution of the test solution.

No impurity (any band other than the main band) in the electropherogram obtained with the test solution may be more intense than the main band obtained with the reference solution.

Under validated conditions, impurities may be quantified by normalisation to the main band using an integrating densitometer or by image analysis.

G. Capillary Electrophoresis[1]

(Ph. Eur. method 2.2.47)

GENERAL PRINCIPLES

Capillary electrophoresis is a physical method of analysis based on the migration, inside a capillary, of charged analytes dissolved in an electrolyte solution, under the influence of a direct-current electric field.

The migration velocity of an analyte under an electric field of intensity E, is determined by the electrophoretic mobility of the analyte and the electro-osmotic mobility of the buffer inside the capillary. The electrophoretic mobility of a solute (μ_{ep}) depends on the characteristics of the solute (electric charge, molecular size and shape) and those of the buffer in which the migration takes place (type and ionic strength of the electrolyte, pH, viscosity and additives).

The electrophoretic velocity (v_{ep}) of a solute, assuming a spherical shape, is given by the equation:

$$v_{ep} = \mu_{ep} \times E = \left(\frac{q}{6\pi\eta r}\right) \times \left(\frac{V}{L}\right)$$

q = effective charge of the solute,
η = viscosity of the electrolyte solution,
r = Stoke's radius of the solute,
V = applied voltage,
L = total length of the capillary.

When an electric field is applied through the capillary filled with buffer, a flow of solvent is generated inside the capillary, called electro-osmotic flow. The velocity of the electro-osmotic flow depends on the electro-osmotic mobility (μ_{eo}) which in turn depends on the charge density on the capillary internal wall and the buffer characteristics. The electro-osmotic velocity (v_{eo}) is given by the equation:

$$v_{eo} = \mu_{eo} \times E = \left(\frac{\varepsilon\zeta}{\eta}\right) \times \left(\frac{V}{L}\right)$$

ε = dielectric constant of the buffer,
ζ = zeta potential of the capillary surface.

The velocity of the solute (v) is given by:

$$v = v_{ep} + v_{eo}$$

The electrophoretic mobility of the analyte and the electro-osmotic mobility may act in the same direction or in opposite directions, depending on the charge of the solute. In normal capillary electrophoresis, anions will migrate in the opposite direction to the electro-osmotic flow and their velocities will be smaller than the electro-osmotic velocity. Cations will migrate in the same direction as the electro-osmotic flow and their velocities will be greater than the electro-osmotic velocity. Under conditions in which there is a fast electro-osmotic velocity with respect to the electrophoretic velocity of the solutes, both cations and anions can be separated in the same run.

The time (t) taken by the solute to migrate the distance (l) from the injection end of the capillary to the detection point (capillary effective length) is given by the expression:

$$t = \frac{l}{v_{ep} + v_{eo}} = \frac{l \times L}{(\mu_{ep} + \mu_{eo}) \times V}$$

In general, uncoated fused-silica capillaries above pH 3 have negative charge due to ionised silanol groups in the inner wall. Consequently, the electro-osmotic flow is from anode to cathode. The electro-osmotic flow must remain constant from run to run if good reproducibility is to be obtained in the migration velocity of the solutes. For some applications, it may be necessary to reduce or suppress the electro-osmotic flow by modifying the inner wall of the capillary or by changing the concentration, composition and/or pH of the buffer solution.

After the introduction of the sample into the capillary, each analyte ion of the sample migrates within the background electrolyte as an independent zone, according to its electrophoretic mobility. Zone dispersion, that is the spreading of each solute band, results from different phenomena. Under ideal conditions the sole contribution to the solute-zone broadening is molecular diffusion of the solute along the capillary (longitudinal diffusion). In this ideal case the efficiency of the zone, expressed as the number of theoretical plates (N), is given by:

$$N = \frac{(\mu_{ep} + \mu_{eo}) \times V \times l}{2 \times D \times L}$$

D = molecular diffusion coefficient of the solute in the buffer.

In practice, other phenomena such as heat dissipation, sample adsorption onto the capillary wall, mismatched conductivity between sample and buffer, length of the injection plug, detector cell size and unlevelled buffer reservoirs can also significantly contribute to band dispersion.

Separation between 2 bands (expressed as the resolution, R_s) can be obtained by modifying the electrophoretic mobility of the analytes, the electro-osmotic mobility induced in the capillary and by increasing the efficiency for the band of each analyte, according to the equation:

$$R_s = \frac{\sqrt{N}(\mu_{epb} - \mu_{epa})}{4(\overline{\mu}_{ep} + \mu_{eo})}$$

μ_{epa} and μ_{epb} = electrophoretic mobilities of the 2 analytes separated,

μ_{ep} = mean electrophoretic mobility of the 2 analytes $\overline{\mu}_{ep} = {}^1/_2 (\mu_{epb} + \mu_{epa})$.

APPARATUS

An apparatus for capillary electrophoresis is composed of:
— a high-voltage, controllable direct-current power supply;

[1] *This chapter has undergone pharmacopoeial harmonisation. See chapter 5.8 Pharmacopoeial harmonisation.*

- 2 buffer reservoirs, held at the same level, containing the prescribed anodic and cathodic solutions;
- 2 electrode assemblies (the cathode and the anode), immersed in the buffer reservoirs and connected to the power supply;
- a separation capillary (usually made of fused-silica) which, when used with some specific types of detectors, has an optical viewing window aligned with the detector. The ends of the capillary are placed in the buffer reservoirs. The capillary is filled with the solution prescribed in the monograph;
- a suitable injection system;
- a detector able to monitor the amount of substances of interest passing through a segment of the separation capillary at a given time; it is usually based on absorption spectrophotometry (UV and visible) or fluorimetry, but conductimetric, amperometric or mass spectrometric detection can be useful for specific applications; indirect detection is an alternative method used to detect non-UV-absorbing and non-fluorescent compounds;
- a thermostatic system able to maintain a constant temperature inside the capillary is recommended to obtain a good separation reproducibility;
- a recorder and a suitable integrator or a computer.

The definition of the injection process and its automation are critical for precise quantitative analysis. Modes of injection include gravity, pressure or vacuum injection and electrokinetic injection. The amount of each sample component introduced electrokinetically depends on its electrophoretic mobility, leading to possible discrimination using this injection mode.

Use the capillary, the buffer solutions, the preconditioning method, the sample solution and the migration conditions prescribed in the monograph of the considered substance. The employed electrolytic solution is filtered to remove particles and degassed to avoid bubble formation that could interfere with the detection system or interrupt the electrical contact in the capillary during the separation run. A rigorous rinsing procedure should be developed for each analytical method to achieve reproducible migration times of the solutes.

CAPILLARY ZONE ELECTROPHORESIS

PRINCIPLE

In capillary zone electrophoresis, analytes are separated in a capillary containing only buffer without any anticonvective medium. With this technique, separation takes place because the different components of the sample migrate as discrete bands with different velocities. The velocity of each band depends on the electrophoretic mobility of the solute and the electro-osmotic flow in the capillary (see General Principles). Coated capillaries can be used to increase the separation capacity of those substances adsorbing on fused-silica surfaces.

Using this mode of capillary electrophoresis, the analysis of both small (M_r < 2000) and large molecules (2000 < M_r < 100 000) can be accomplished. Due to the high efficiency achieved in capillary zone electrophoresis, separation of molecules having only minute differences in their charge-to-mass ratio can be effected. This separation mode also allows the separation of chiral compounds by addition of chiral selectors to the separation buffer.

OPTIMISATION

Optimisation of the separation is a complex process where several separation parameters can play a major role. The main factors to be considered in the development of separations are instrumental and electrolytic solution parameters.

Instrumental parameters

Voltage A Joule heating plot is useful in optimising the applied voltage and capillary temperature. Separation time is inversely proportional to applied voltage. However, an increase in the voltage used can cause excessive heat production, giving rise to temperature and, as a result thereof, viscosity gradients in the buffer inside the capillary. This effect causes band broadening and decreases resolution.

Polarity Electrode polarity can be normal (anode at the inlet and cathode at the outlet) and the electro-osmotic flow will move toward the cathode. If the electrode polarity is reversed, the electro-osmotic flow is away from the outlet and only charged analytes with electrophoretic mobilities greater than the electro-osmotic flow will pass to the outlet.

Temperature The main effect of temperature is observed on buffer viscosity and electrical conductivity, and therefore on migration velocity. In some cases, an increase in capillary temperature can cause a conformational change in proteins, modifying their migration time and the efficiency of the separation.

Capillary The dimensions of the capillary (length and internal diameter) contribute to analysis time, efficiency of separations and load capacity. Increasing both effective length and total length can decrease the electric fields (working at constant voltage) which increases migration time. For a given buffer and electric field, heat dissipation, and hence sample band-broadening, depend on the internal diameter of the capillary. The latter also affects the detection limit, depending on the sample volume injected and the detection system employed.

Since the adsorption of the sample components on the capillary wall limits efficiency, methods to avoid these interactions should be considered in the development of a separation method. In the specific case of proteins, several strategies have been devised to avoid adsorption on the capillary wall. Some of these strategies (use of extreme pH and adsorption of positively charged buffer additives) only require modification of the buffer composition to prevent protein adsorption. In other strategies, the internal wall of the capillary is coated with a polymer, covalently bonded to the silica, that prevents interaction between the proteins and the negatively charged silica surface. For this purpose, ready-to-use capillaries with coatings consisting of neutral-hydrophilic, cationic and anionic polymers are available.

Electrolytic solution parameters

Buffer type and concentration Suitable buffers for capillary electrophoresis have an appropriate buffer capacity in the pH range of choice and low mobility to minimise current generation.

Matching buffer-ion mobility to solute mobility, whenever possible, is important for minimising band distortion. The type of sample solvent used is also important to achieve on-column sample focusing, which increases separation efficiency and improves detection.

An increase in buffer concentration (for a given pH) decreases electro-osmotic flow and solute velocity.

Buffer pH The pH of the buffer can affect separation by modifying the charge of the analyte or additives, and by changing the electro-osmotic flow. In protein and peptide separation, changing the pH of the buffer from above to below the isoelectric point (pI) changes the net charge of the

solute from negative to positive. An increase in the buffer pH generally increases the electro-osmotic flow.

Organic solvents Organic modifiers (methanol, acetonitrile, etc.) may be added to the aqueous buffer to increase the solubility of the solute or other additives and/or to affect the degree of ionisation of the sample components. The addition of these organic modifiers to the buffer generally causes a decrease in the electro-osmotic flow.

Additives for chiral separations For the separation of enantiomers, a chiral selector is added to the separation buffer. The most commonly used chiral selectors are cyclodextrins, but crown ethers, polysaccharides and proteins may also be used. Since chiral recognition is governed by the different interactions between the chiral selector and each of the enantiomers, the resolution achieved for the chiral compounds depends largely on the type of chiral selector used. In this regard, for the development of a given separation it may be useful to test cyclodextrins having a different cavity size (α-, β-, or γ-cyclodextrin) or modified cyclodextrins with neutral (methyl, ethyl, hydroxyalkyl, etc.) or ionisable (aminomethyl, carboxymethyl, sulfobutyl ether, etc.) groups. When using modified cyclodextrins, batch-to-batch variations in the degree of substitution of the cyclodextrins must be taken into account since it will influence the selectivity. Other factors controlling the resolution in chiral separations are concentration of chiral selector, composition and pH of the buffer and temperature. The use of organic additives, such as methanol or urea can also modify the resolution achieved.

CAPILLARY GEL ELECTROPHORESIS

PRINCIPLE

In capillary gel electrophoresis, separation takes place inside a capillary filled with a gel that acts as a molecular sieve. Molecules with similar charge-to-mass ratios are separated according to molecular size since smaller molecules move more freely through the network of the gel and therefore migrate faster than larger molecules. Different biological macromolecules (for example, proteins and DNA fragments), which often have similar charge-to-mass ratios, can thus be separated according to their molecular mass by capillary gel electrophoresis.

CHARACTERISTICS OF GELS

2 types of gels are used in capillary electrophoresis: permanently coated gels and dynamically coated gels.

Permanently coated gels, such as cross-linked polyacrylamide, are prepared inside the capillary by polymerisation of the monomers. They are usually bonded to the fused-silica wall and cannot be removed without destroying the capillary.

If the gels are used for protein analysis under reducing conditions, the separation buffer usually contains sodium dodecyl sulfate and the samples are denatured by heating in a mixture of sodium dodecyl sulfate and 2-mercaptoethanol or dithiothreitol before injection. When non-reducing conditions are used (for example, analysis of an intact antibody), 2-mercaptoethanol and dithiothreitol are not used.

Separation in cross-linked gels can be optimised by modifying the separation buffer (as indicated in the capillary zone electrophoresis section) and controlling the gel porosity during the gel preparation. For cross-linked polyacrylamide gels, the porosity can be modified by changing the concentration of acrylamide and/or the proportion of cross-linker. As a rule, a decrease in the porosity of the gel leads to a decrease in the mobility of the solutes. Due to the rigidity of these gels, only electrokinetic injection can be used.

Dynamically coated gels are hydrophilic polymers, such as linear polyacrylamide, cellulose derivatives, dextran, etc., which can be dissolved in aqueous separation buffers giving rise to a separation medium that also acts as a molecular sieve. These separation media are easier to prepare than cross-linked polymers. They can be prepared in a vial and filled by pressure in a wall-coated capillary (with no electro-osmotic flow). Replacing the gel before every injection generally improves the separation reproducibility.

The porosity of the gels can be increased by using polymers of higher molecular mass (at a given polymer concentration) or by decreasing the polymer concentration (for a given polymer molecular mass). A reduction in the gel porosity leads to a decrease in the mobility of the solute for the same buffer. Since the dissolution of these polymers in the buffer gives low viscosity solutions, both hydrodynamic and electrokinetic injection techniques can be used.

CAPILLARY ISOELECTRIC FOCUSING

PRINCIPLE

In isoelectric focusing, the molecules migrate under the influence of the electric field, so long as they are charged, in a pH gradient generated by ampholytes having pI values in a wide range (poly-aminocarboxylic acids), dissolved in the separation buffer.

The three basic steps of isoelectric focusing are loading, focusing and mobilisation.

Loading step

Two methods may be employed:

— loading in one step: the sample is mixed with ampholytes and introduced into the capillary either by pressure or vacuum;

— sequential loading: a leading buffer, then the ampholytes, then the sample mixed with ampholytes, again ampholytes alone and finally the terminating buffer are introduced into the capillary. The volume of the sample must be small enough not to modify the pH gradient.

Focusing step

When the voltage is applied, ampholytes migrate toward the cathode or the anode, according to their net charge, thus creating a pH gradient from anode (lower pH) to cathode (higher pH). During this step the components to be separated migrate until they reach a pH corresponding to their isoelectric point (pI) and the current drops to very low values.

Mobilisation step

If mobilisation is required for detection, use one of the following methods.

— in the first method, mobilisation is accomplished during the focusing step under the effect of the electro-osmotic flow; the electro-osmotic flow must be small enough to allow the focusing of the components;

— in the second method, mobilisation is accomplished by applying positive pressure after the focusing step;

— in the third method, mobilisation is achieved after the focusing step by adding salts to the cathode reservoir or the anode reservoir (depending on the direction chosen for mobilisation) in order to alter the pH in the capillary when the voltage is applied. As the pH is changed, the proteins and ampholytes are mobilised in the direction of the reservoir which contains the added salts and pass the detector.

The separation achieved, expressed as ΔpI, depends on the pH gradient (dpH/dx), the number of ampholytes having different pI values, the molecular diffusion coefficient (D), the intensity of the electric field (E) and the variation of the

electrophoretic mobility of the analyte with the pH ($-d\mu/dpH$):

$$\Delta pI = 3 \times \sqrt{\frac{D(dpH/dx)}{E(-d\mu/dpH)}}$$

OPTIMISATION

The main parameters to be considered in the development of separations are:

Voltage

Capillary isoelectric focusing utilises very high electric fields, 300 V/cm to 1000 V/cm in the focusing step.

Capillary

The electro-osmotic flow must be reduced or suppressed depending on the mobilisation strategy (see above). Coated capillaries tend to reduce the electro-osmotic flow.

Solutions

The anode buffer reservoir is filled with a solution with a pH lower than the pI of the most acidic ampholyte and the cathode reservoir is filled with a solution with a pH higher than the pI of the most basic ampholyte. Phosphoric acid for the anode and sodium hydroxide for the cathode are frequently used.

Addition of a polymer, such as methylcellulose, in the ampholyte solution tends to suppress convective forces (if any) and electro-osmotic flow by increasing the viscosity. Commercial ampholytes are available covering many pH ranges and may be mixed if necessary to obtain an expanded pH range. Broad pH ranges are used to estimate the isoelectric point whereas narrower ranges are employed to improve accuracy. Calibration can be done by correlating migration time with isoelectric point for a series of protein markers.

During the focusing step precipitation of proteins at their isoelectric point can be prevented, if necessary, using buffer additives such as glycerol, surfactants, urea or zwitterionic buffers. However, depending on the concentration, urea denatures proteins.

MICELLAR ELECTROKINETIC CHROMATOGRAPHY (MEKC)

PRINCIPLE

In micellar electrokinetic chromatography, separation takes place in an electrolyte solution which contains a surfactant at a concentration above the critical micellar concentration (*cmc*). The solute molecules are distributed between the aqueous buffer and the pseudo-stationary phase composed of micelles, according to the partition coefficient of the solute. The technique can therefore be considered as a hybrid of electrophoresis and chromatography. It is a technique that can be used for the separation of both neutral and charged solutes, maintaining the efficiency, speed and instrumental suitability of capillary electrophoresis. One of the most widely used surfactants in MEKC is the anionic surfactant sodium dodecyl sulfate, although other surfactants, for example cationic surfactants such as cetyltrimethylammonium salts, are also used.

The separation mechanism is as follows. At neutral and alkaline pH, a strong electro-osmotic flow is generated and moves the separation buffer ions in the direction of the cathode. If sodium dodecyl sulfate is employed as the surfactant, the electrophoretic migration of the anionic micelle is in the opposite direction, towards the anode. As a result, the overall micelle migration velocity is slowed down compared to the bulk flow of the electrolytic solution. In the case of neutral solutes, since the analyte can partition between the micelle and the aqueous buffer, and has no electrophoretic mobility, the analyte migration velocity will depend only on the partition coefficient between the micelle and the aqueous buffer. In the electropherogram, the peaks corresponding to each uncharged solute are always between that of the electro-osmotic flow marker and that of the micelle (the time elapsed between these two peaks is called the separation window). For electrically charged solutes, the migration velocity depends on both the partition coefficient of the solute between the micelle and the aqueous buffer, and on the electrophoretic mobility of the solute in the absence of micelle.

Since the mechanism in MEKC of neutral and weakly ionised solutes is essentially chromatographic, migration of the solute and resolution can be rationalised in terms of the retention factor of the solute (k'), also referred to as mass distribution ratio (D_m), which is the ratio of the number of moles of solute in the micelle to those in the mobile phase. For a neutral compound, k' is given by:

$$k' = \frac{t_R - t_0}{t_0 \times \left(1 - \frac{t_R}{t_{mc}}\right)} = K \times \frac{V_S}{V_M}$$

t_R = migration time of the solute,
t_0 = analysis time of an unretained solute (determined by injecting an electro-osmotic flow marker which does not enter the micelle, for instance methanol),
t_{mc} = micelle migration time (measured by injecting a micelle marker, such as Sudan III, which migrates while continuously associated in the micelle),
K = partition coefficient of the solute,
V_S = volume of the micellar phase,
V_M = volume of the mobile phase.

Likewise, the resolution between 2 closely-migrating solutes (R_s) is given by:

$$R_s = \frac{\sqrt{N}}{4} \times \frac{\alpha - 1}{\alpha} \times \frac{k'_b}{k'_b + 1} \times \frac{1 - \left(\frac{t_0}{t_{mc}}\right)}{1 + k'_a \times \left(\frac{t_0}{t_{mc}}\right)}$$

N = number of theoretical plates for one of the solutes,
α = selectivity,
k'_a and k'_b = retention factors for both solutes, respectively ($k'_b > k'_a$).

Similar, but not identical, equations give k' and R_s values for electrically charged solutes.

OPTIMISATION

The main parameters to be considered in the development of separations by MEKC are instrumental and electrolytic solution parameters.

Instrumental parameters

Voltage Separation time is inversely proportional to applied voltage. However, an increase in voltage can cause excessive heat production that gives rise to temperature gradients and viscosity gradients of the buffer in the cross-section of the capillary. This effect can be significant with high conductivity buffers such as those containing micelles. Poor heat dissipation causes band broadening and decreases resolution.

Temperature Variations in capillary temperature affect the partition coefficient of the solute between the buffer and the micelles, the critical micellar concentration and the viscosity of the buffer. These parameters contribute to the migration time of the solutes. The use of a good cooling system

improves the reproducibility of the migration time for the solutes.

Capillary As in capillary zone electrophoresis, the dimensions of the capillary (length and internal diameter) contribute to analysis time and efficiency of separations. Increasing both effective length and total length can decrease the electric fields (working at constant voltage), increase migration time and improve the separation efficiency. The internal diameter controls heat dissipation (for a given buffer and electric field) and consequently the sample band broadening.

Electrolytic solution parameters

Surfactant type and concentration The type of surfactant, in the same way as the stationary phase in chromatography, affects the resolution since it modifies separation selectivity. Also, the log k' of a neutral compound increases linearly with the concentration of surfactant in the mobile phase. Since resolution in MEKC reaches a maximum when k' approaches the value of $\sqrt{t_{mc}/t_0}$, modifying the concentration of surfactant in the mobile phase changes the resolution obtained.

Buffer pH Although pH does not modify the partition coefficient of non-ionised solutes, it can modify the electro-osmotic flow in uncoated capillaries. A decrease in the buffer pH decreases the electro-osmotic flow and therefore increases the resolution of the neutral solutes in MEKC, resulting in a longer analysis time.

Organic solvents To improve MEKC separation of hydrophobic compounds, organic modifiers (methanol, propanol, acetonitrile, etc.) can be added to the electrolytic solution. The addition of these modifiers usually decreases migration time and the selectivity of the separation. Since the addition of organic modifiers affects the critical micellar concentration, a given surfactant concentration can be used only within a certain percentage of organic modifier before the micellisation is inhibited or adversely affected, resulting in the absence of micelles and, therefore, in the absence of partition. The dissociation of micelles in the presence of a high content of organic solvent does not always mean that the separation will no longer be possible; in some cases the hydrophobic interaction between the ionic surfactant monomer and the neutral solutes forms solvophobic complexes that can be separated electrophoretically.

Additives for chiral separations For the separation of enantiomers using MEKC, a chiral selector is included in the micellar system, either covalently bound to the surfactant or added to the micellar separation electrolyte. Micelles that have a moiety with chiral discrimination properties include salts of *N*-dodecanoyl-L-amino acids, bile salts, etc. Chiral resolution can also be achieved using chiral discriminators, such as cyclodextrins, added to the electrolytic solutions which contain micellised achiral surfactants.

Other additives Several strategies can be carried out to modify selectivity, by adding chemicals to the buffer. The addition of several types of cyclodextrins to the buffer can also be used to reduce the interaction of hydrophobic solutes with the micelle, thus increasing the selectivity for this type of compound.

The addition of substances able to modify solute-micelle interactions by adsorption on the latter, is used to improve the selectivity of the separations in MEKC. These additives may be a second surfactant (ionic or non-ionic) which gives rise to mixed micelles or metallic cations which dissolve in the micelle and form co-ordination complexes with the solutes.

QUANTIFICATION

Peak areas must be divided by the corresponding migration time to give the corrected area in order to:

— compensate for the shift in migration time from run to run, thus reducing the variation of the response,

— compensate for the different responses of sample constituents with different migration times.

Where an internal standard is used, verify that no peak of the substance to be examined is masked by that of the internal standard.

CALCULATIONS

From the values obtained, calculate the content of the component or components being examined. When prescribed, the percentage content of one or more components of the sample to be examined is calculated by determining the corrected area(s) of the peak(s) as a percentage of the total of the corrected areas of all peaks, excluding those due to solvents or any added reagents (normalisation procedure). The use of an automatic integration system (integrator or data acquisition and processing system) is recommended.

SYSTEM SUITABILITY

In order to check the behaviour of the capillary electrophoresis system, system suitability parameters are used. The choice of these parameters depends on the mode of capillary electrophoresis used. They are: retention factor (k') (only for micellar electrokinetic chromatography), apparent number of theoretical plates (N), symmetry factor (A_s) and resolution (R_s). In previous sections, the theoretical expressions for N and R_s have been described, but more practical equations that allow these parameters to be calculated from the electropherograms are given below.

APPARENT NUMBER OF THEORETICAL PLATES

The apparent number of theoretical plates (N) may be calculated using the expression:

$$N = 5.54 \times \left(\frac{t_R}{w_h}\right)^2$$

t_R = migration time or distance along the baseline from the point of injection to the perpendicular dropped from the maximum of the peak corresponding to the component,

w_h = width of the peak at half-height.

RESOLUTION

The resolution (R_s) between peaks of similar height of 2 components may be calculated using the expression:

$$R_s = \frac{1.18 \times (t_{R2} - t_{R1})}{w_{h1} + w_{h2}}$$

$$t_{R2} > t_{R1}$$

t_{R1} and t_{R2} = migration times or distances along the baseline from the point of injection to the perpendiculars dropped from the maxima of two adjacent peaks,

w_{h1} and w_{h2} = peak widths at half-height.

When appropriate, the resolution may be calculated by measuring the height of the valley (H_v) between 2 partly resolved peaks in a standard preparation and the height of the smaller peak (H_p) and calculating the peak-to-valley ratio:

$$\frac{p}{v} = \frac{H_p}{H_v}$$

SYMMETRY FACTOR

The symmetry factor (A_s) of a peak may be calculated using the expression:

$$A_s = \frac{w_{0.05}}{2d}$$

$w_{0.05}$ = width of the peak at one-twentieth of the peak height,
d = distance between the perpendicular dropped from the peak maximum and the leading edge of the peak at one-twentieth of the peak height.

Tests for area repeatability (standard deviation of areas or of the area/migration-time ratio) and for migration time repeatability (standard deviation of migration time) are introduced as suitability parameters. Migration time repeatability provides a test for the suitability of the capillary washing procedures. An alternative practice to avoid the lack of repeatability of the migration time is to use migration time relative to an internal standard.

A test for the verification of the signal-to-noise ratio for a standard preparation (or the determination of the limit of quantification) may also be useful for the determination of related substances.

SIGNAL-TO-NOISE RATIO

The detection limit and quantification limit correspond to signal-to-noise ratios of 3 and 10 respectively. The signal-to-noise ratio (S/N) is calculated using the expression:

$$\frac{S}{N} = \frac{2H}{h}$$

H = height of the peak corresponding to the component concerned, in the electropherogram obtained with the prescribed reference solution, measured from the maximum of the peak to the extrapolated baseline of the signal observed over a distance equal to twenty times the width at half-height,
h = range of the background in an electropherogram obtained after injection of a blank, observed over a distance equal to twenty times the width at the half-height of the peak in the electropherogram obtained with the prescribed reference solution and, if possible, situated equally around the place where this peak would be found.

H. Supercritical Fluid Chromatography

(Ph. Eur. method 2.2.45)

Supercritical fluid chromatography (SFC) is a method of chromatographic separation in which the mobile phase is a fluid in a supercritical or a subcritical state. The stationary phase, contained in a column, consists of either finely divided solid particles, such as a silica or porous graphite, a chemically modified stationary phase, as used in liquid chromatography, or, for capillary columns, a cross-linked liquid film evenly coated on the walls of the column.

SFC is based on mechanisms of adsorption or mass distribution.

APPARATUS

The apparatus usually consists of a cooled pumping system, an injector, a chromatographic column, contained in an oven, a detector, a pressure regulator and a data acquisition device (or an integrator or a chart recorder).

Pumping system

Pumping systems are required to deliver the mobile phase at a constant flow rate. Pressure fluctuations are to be minimised, e.g. by passing the pressurised solvent through a pulse-damping device. Tubing and connections are capable of withstanding the pressures developed by the pumping system.

Microprocessor controlled systems are capable of accurately delivering a mobile phase in either constant or varying conditions, according to a defined programme. In the case of gradient elution, pumping systems which deliver solvent(s) from several reservoirs are available and solvent mixing can be achieved on either the low or high-pressure side of the pump(s).

Injectors

Injection may be carried out directly at the head of the column using a valve.

Stationary phases

Stationary phases are contained in columns which have been described in the chapters on *Liquid chromatography* (*2.2.29*) (packed columns) and *Gas chromatography* (*2.2.28*) (capillary columns). A capillary column has a maximum internal diameter (Ø) of 100 µm.

Mobile phases

Usually the mobile phase is carbon-dioxide which may contain a polar modifier such as methanol, 2-propanol or acetonitrile. The composition, pressure (density), temperature and flow rate of the prescribed mobile phase may either be constant throughout the whole chromatographic procedure (isocratic, isodense, isothermic elution) or may vary according to a defined programme (gradient elution of the modifier, pressure (density), temperature or flow rate).

Detectors

Ultraviolet/visible (UV/Vis) spectrophotometers and flame ionisation detectors are the most commonly employed detectors. Light scattering detectors, infrared absorption spectrophotometers, thermal conductivity detectors or other special detectors may be used.

METHOD

Prepare the test solution(s) and the reference solution(s) as prescribed. The solutions must be free from solid particles.

Criteria for assessing the suitability of the system are described in the chapter on *Chromatographic separation techniques* (*2.2.46*). The extent to which adjustments of parameters of the chromatographic system can be made to satisfy the criteria of system suitability are also given in this chapter.

J. Isoelectric Focusing[1]

(Ph. Eur. method 2.2.54)

GENERAL PRINCIPLES

Isoelectric focusing (IEF) is a method of electrophoresis that separates proteins according to their isoelectric point. Separation is carried out in a slab of polyacrylamide or agarose gel that contains a mixture of amphoteric electrolytes (ampholytes). When subjected to an electric field, the ampholytes migrate in the gel to create a pH gradient. In some cases gels containing an immobilised pH gradient, prepared by incorporating weak acids and bases to specific regions of the gel network during the preparation of the gel, are used. When the applied proteins reach the gel fraction that has a pH that is the same as their isoelectric point (pI),

[1] *This chapter has undergone pharmacopoeial harmonisation. See chapter 5.8 Pharmacopoeial harmonisation.*

their charge is neutralised and migration ceases. Gradients can be made over various ranges of pH, according to the mixture of ampholytes chosen.

THEORETICAL ASPECTS

When a protein is at the position of its isoelectric point, it has no net charge and cannot be moved in a gel matrix by the electric field. It may, however, move from that position by diffusion. The pH gradient forces a protein to remain in its isoelectric point position, thus concentrating it; this concentrating effect is called "focusing". Increasing the applied voltage or reducing the sample load result in improved separation of bands. The applied voltage is limited by the heat generated, which must be dissipated. The use of thin gels and an efficient cooling plate controlled by a thermostatic circulator prevents the burning of the gel whilst allowing sharp focusing. The separation is estimated by determining the minimum pI difference (ΔpI), which is necessary to separate 2 neighbouring bands:

$$\Delta pI = 3 \times \sqrt{\frac{D(dpH/dx)}{E(-d\mu/dpH)}}$$

D = diffusion coefficient of the protein,

$\frac{dpH}{dx}$ = pH gradient,

E = intensity of the electric field, in volts per centimetre,

$-\frac{d\mu}{dpH}$ = variation of the solute mobility with the pH in the region close to the pI.

Since D and $-\frac{d\mu}{dpH}$ for a given protein cannot be altered, the separation can be improved by using a narrower pH range and by increasing the intensity of the electric field.

Resolution between protein bands on an IEF gel prepared with carrier ampholytes can be quite good. Improvements in resolution may be achieved by using immobilised pH gradients where the buffering species, which are analogous to carrier ampholytes, are copolymerised within the gel matrix. Proteins exhibiting pIs differing by as little as 0.02 pH units may be resolved using a gel prepared with carrier ampholytes while immobilised pH gradients can resolve proteins differing by approximately 0.001 pH units.

PRACTICAL ASPECTS

Special attention must be paid to sample characteristics and/or preparation. Having salt in the sample can be problematic and it is best to prepare the sample, if possible, in deionised water or 2 per cent ampholytes, using dialysis or gel filtration if necessary.

The time required for completion of focusing in thin-layer polyacrylamide gels is determined by placing a coloured protein (e.g. haemoglobin) at different positions on the gel surface and by applying the electric field: the steady state is reached when all applications give an identical band pattern. In some protocols the completion of the focusing is indicated by the time elapsed after the sample application.

The IEF gel can be used as an identity test when the migration pattern on the gel is compared to a suitable standard preparation and IEF calibration proteins, the IEF gel can be used as a limit test when the density of a band on IEF is compared subjectively with the density of bands appearing in a standard preparation, or it can be used as a quantitative test when the density is measured using a densitometer or similar instrumentation to determine the relative concentration of protein in the bands subject to validation.

APPARATUS

An apparatus for IEF consists of:

- a controllable generator for constant potential, current and power; potentials of 2500 V have been used and are considered optimal under a given set of operating conditions; a supply of up to 30 W of constant power is recommended;
- a rigid plastic IEF chamber that contains a cooled plate, of suitable material, to support the gel;
- a plastic cover with platinum electrodes that are connected to the gel by means of paper wicks of suitable width, length and thickness, impregnated with solutions of anodic and cathodic electrolytes.

ISOELECTRIC FOCUSING IN POLYACRYLAMIDE GELS: DETAILED PROCEDURE

The following method is a detailed description of an IEF procedure in thick polyacrylamide slab gels, which is used unless otherwise stated in the monograph.

PREPARATION OF THE GELS

Mould

The mould (see Figure 2.2.54.-1) is composed of a glass plate (A) on which a polyester film (B) is placed to facilitate handling of the gel, one or more spacers (C), a second glass plate (D) and clamps to hold the structure together.

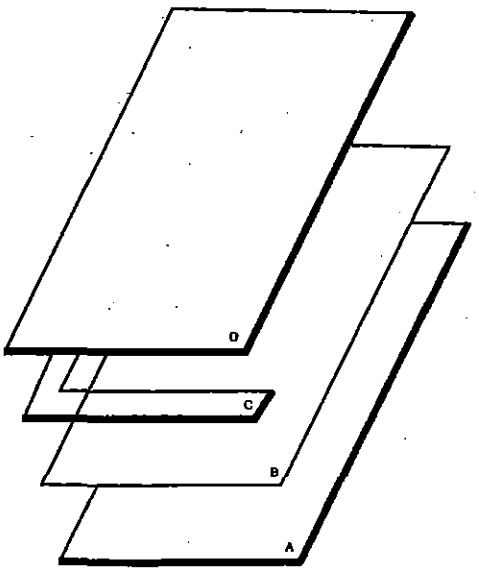

Figure 2.2.54.-1 – *Mould*

7.5 per cent polyacrylamide gel

Dissolve 29.1 g of *acrylamide R* and 0.9 g of *methylenebisacrylamide R* in 100 mL of *water R*.
To 2.5 volumes of this solution, add the mixture of ampholytes specified in the monograph and dilute to 10 volumes with *water R*. Mix carefully and degas the solution.

Preparation of the mould

Place the polyester film on the lower glass plate, apply the spacer, place the second glass plate and fit the clamps. Before use, place the solution on a magnetic stirrer and add 0.25 volumes of a 100 g/L solution of *ammonium persulfate R* and 0.25 volumes of *tetramethylethylenediamine R*. Immediately fill the space between the glass plates of the mould with the solution.

METHOD

Dismantle the mould and, making use of the polyester film, transfer the gel onto the cooled support, wetted with a few millilitres of a suitable liquid, taking care to avoid forming air bubbles. Prepare the test solutions and reference solutions as specified in the monograph. Place strips of paper for sample application, about 10 mm × 5 mm in size, on the gel and impregnate each with the prescribed amount of the test and reference solutions. Also apply the prescribed quantity of a solution of proteins with known isoelectric points as pH markers to calibrate the gel. In some protocols the gel has pre-cast slots where a solution of the sample is applied instead of using impregnated paper strips. Cut 2 strips of paper to the length of the gel and impregnate them with the electrolyte solutions: acid for the anode and alkaline for the cathode. The compositions of the anode and cathode solutions are given in the monograph. Apply these paper wicks to each side of the gel several millimetres from the edge. Fit the cover so that the electrodes are in contact with the wicks (respecting the anodic and cathodic poles). Proceed with the isoelectric focusing by applying the electrical parameters described in the monograph. Switch off the current when the migration of the mixture of standard proteins has stabilised. Using forceps, remove the sample application strips and the 2 electrode wicks. Immerse the gel in *fixing solution for isoelectric focusing in polyacrylamide gel R*. Incubate with gentle shaking at room temperature for 30 min. Drain off the solution and add 200 mL of *destaining solution R*. Incubate with shaking for 1 h. Drain the gel, add *coomassie staining solution R*. Incubate for 30 min. Destain the gel by passive diffusion with *destaining solution R* until the bands are well visualised against a clear background. Locate the position and intensity of the bands in the electropherogram as prescribed in the monograph.

VARIATIONS TO THE DETAILED PROCEDURE (SUBJECT TO VALIDATION)

Where reference to the general method on isoelectric focusing is made, variations in methodology or procedure may be made subject to validation. These include:

- the use of commercially available pre-cast gels and of commercial staining and destaining kits,
- the use of immobilised pH gradients,
- the use of rod gels,
- the use of gel cassettes of different dimensions, including ultra-thin (0.2 mm) gels,
- variations in the sample application procedure, including different sample volumes or the use of sample application masks or wicks other than paper,
- the use of alternate running conditions, including variations in the electric field depending on gel dimensions and equipment, and the use of fixed migration times rather than subjective interpretation of band stability,
- the inclusion of a pre-focusing step,
- the use of automated instrumentation,
- the use of agarose gels.

VALIDATION OF ISO-ELECTRIC FOCUSING PROCEDURES

Where alternative methods to the detailed procedure are employed they must be validated. The following criteria may be used to validate the separation:

- formation of a stable pH gradient of desired characteristics, assessed for example using coloured pH markers of known isoelectric points,
- comparison with the electropherogram provided with the chemical reference substance for the preparation to be examined,
- any other validation criteria as prescribed in the monograph.

SPECIFIED VARIATIONS TO THE GENERAL METHOD

Variations to the general method required for the analysis of specific substances may be specified in detail in monographs. These include:

- the addition of urea in the gel (3 M concentration is often satisfactory to keep protein in solution but up to 8 M can be used): some proteins precipitate at their isoelectric point; in this case, urea is included in the gel formulation to keep the protein in solution; if urea is used, only fresh solutions should be used to prevent carbamylation of the protein;
- the use of alternative staining methods;
- the use of gel additives such as non-ionic detergents (e.g. octylglucoside) or zwitterionic detergents (e.g., CHAPS or CHAPSO), and the addition of ampholyte to the sample, to prevent proteins from aggregating or precipitating.

POINTS TO CONSIDER

Samples can be applied to any area on the gel, but to protect the proteins from extreme pH environments samples should not be applied close to either electrode. During method development the analyst can try applying the protein in 3 positions on the gel (i.e. middle and both ends); the pattern of a protein applied at opposite ends of the gel may not be identical.

A phenomenon known as cathodic drift, where the pH gradient decays over time, may occur if a gel is focused too long. Although not well understood, electroendoosmosis and absorption of carbon dioxide may be factors that lead to cathodic drift. Cathodic drift is observed as focused protein migrating off the cathode end of the gel. Immobilised pH gradients may be used to address this problem.

Efficient cooling (approximately 4 °C) of the bed that the gel lies on during focusing is important. High field strengths used during isoelectric focusing can lead to overheating and affect the quality of the focused gel.

K. Peptide Mapping[1]

(Ph. Eur. method 2.2.55)

Peptide mapping is an identity test for proteins, especially those obtained by rDNA technology. It involves the chemical or enzymatic treatment of a protein resulting in the formation of peptide fragments followed by separation and identification of these fragments in a reproducible manner. It is a powerful test that is capable of identifying almost any single amino acid changes resulting from events such as errors in the reading of complementary DNA (cDNA) sequences or point mutations. Peptide mapping is a comparative procedure because the information obtained, compared to a reference substance similarly treated, confirms the primary structure of the protein, is capable of detecting whether alterations in structure have occurred, and demonstrates process consistency and genetic stability. Each

[1] *This chapter has undergone pharmacopoeial harmonisation. See chapter 5.8 Pharmacopoeial harmonisation.*

Table 2.2.55.-1. – *Examples of cleavage agents*

Type	Agent	Specificity
Enzymatic	Trypsin (EC 3.4.21.4)	*C*-terminal side of Arg and Lys
	Chymotrypsin (EC 3.4.21.1)	*C*-terminal side of hydrophobic residues (e.g. Leu, Met, Ala, aromatics)
	Pepsin (EC 3.4.23.1 and 2)	Non-specific digest
	Lysyl endopeptidase (Lys-C endopeptidase) (EC 3.4.21.50)	*C*-terminal side of Lys
	Glutamyl endopeptidase (from *S. aureus* strain V8) (EC 3.4.21.19)	*C*-terminal side of Glu and Asp
	Peptidyl-Asp metallo-endopeptidase (endoproteinase Asp-N)	*N*-terminal side of Asp
	Clostripain (EC 3.4.22.8)	*C*-terminal side of Arg
Chemical	Cyanogen bromide	*C*-terminal side of Met
	2-Nitro-5-thio-cyanobenzoic acid	*N*-terminal side of Cys
	O-Iodosobenzoic acid	*C*-terminal side of Trp and Tyr
	Dilute acid	Asp and Pro
	BNPS-skatole	Trp

protein presents unique characteristics which must be well understood so that the scientific and analytical approaches permit validated development of a peptide map that provides sufficient specificity.

This chapter provides detailed assistance in the application of peptide mapping and its validation to characterise the desired protein, to evaluate the stability of the expression construct of cells used for recombinant DNA products and to evaluate the consistency of the overall process, to assess product stability as well as to ensure the identity of the protein, or to detect the presence of protein variant.

Peptide mapping is not a general method, but involves developing specific maps for each unique protein. Although the technology is evolving rapidly, there are certain methods that are generally accepted. Variations of these methods will be indicated, when appropriate, in specific monographs.

A peptide map may be viewed as a fingerprint of a protein and is the end product of several chemical processes that provide a comprehensive understanding of the protein being analysed. 4 principal steps are necessary for the development of the procedure: isolation and purification of the protein, if the protein is part of a formulation; selective cleavage of the peptide bonds; chromatographic separation of the peptides; and analysis and identification of the peptides. A test sample is digested and assayed in parallel with a reference substance. Complete cleavage of peptide bonds is more likely to occur when enzymes such as endoproteases (e.g., trypsin) are used, instead of chemical cleavage reagents. A map must contain enough peptides to be meaningful. On the other hand, if there are too many fragments, the map might lose its specificity because many proteins will then have the same profiles.

ISOLATION AND PURIFICATION

Isolation and purification are necessary for analysis of bulk drugs or dosage forms containing interfering excipients and carrier proteins and, when required, will be specified in the monograph. Quantitative recovery of protein from the dosage form must be validated.

SELECTIVE CLEAVAGE OF PEPTIDE BONDS

The selection of the approach used for the cleavage of peptide bonds will depend on the protein under test. This selection process involves determination of the type of cleavage to be employed, enzymatic or chemical, and the type of cleavage agent within the chosen category. Several cleavage agents and their specificity are shown in Table 2.2.55.-1. This list is not all-inclusive and will be expanded as other cleavage agents are identified.

Pretreatment of sample

Depending on the size or the configuration of the protein, different approaches in the pretreatment of samples can be used. If trypsin is used as a cleavage agent for proteins with a molecular mass greater than 100 000 Da, lysine residues must be protected by citraconylation or maleylation; otherwise, too many peptides will be generated.

Pretreatment of the cleavage agent

Pretreatment of cleavage agents, especially enzymatic agents, might be necessary for purification purposes to ensure reproducibility of the map. For example, trypsin used as a cleavage agent will have to be treated with tosyl-L-phenylalanine chloromethyl ketone to inactivate chymotrypsin. Other methods, such as purification of trypsin by high performance liquid chromatography (HPLC) or immobilisation of enzyme on a gel support, have been successfully used when only a small amount of protein is available.

Pretreatment of the protein

Under certain conditions, it might be necessary to concentrate the sample or to separate the protein from excipients and stabilisers used in formulation of the product, if these interfere with the mapping procedure. Physical procedures used for pretreatment can include ultrafiltration, column chromatography and lyophilization. Other pretreatments, such as the addition of chaotropic agents (e.g. urea) can be used to unfold the protein prior to mapping. To allow the enzyme to have full access to cleavage sites and permit some unfolding of the protein, it is often necessary to reduce and alkylate the disulfide bonds prior to digestion.

Digestion with trypsin can introduce ambiguities in the peptide map due to side reactions occurring during the digestion reaction, such as non-specific cleavage, deamidation, disulfide isomerisation, oxidation of methionine

residues, or formation of pyroglutamic groups created from the deamidation of glutamine at the *N*-terminal side of a peptide. Furthermore, peaks may be produced by autohydrolysis of trypsin. Their intensities depend on the ratio of trypsin to protein. To avoid autohydrolysis, solutions of proteases may be prepared at a pH that is not optimal (e.g. at pH 5 for trypsin), which would mean that the enzyme would not become active until diluted with the digest buffer.

Establishment of optimal digestion conditions
Factors that affect the completeness and effectiveness of digestion of proteins are those that could affect any chemical or enzymatic reactions.

pH of the reaction milieu The pH of the digestion mixture is empirically determined to ensure the optimisation of the performance of the given cleavage agent. For example, when using cyanogen bromide as a cleavage agent, a highly acidic environment (e.g. pH 2, formic acid) is necessary; however, when using trypsin as a cleavage agent, a slightly alkaline environment (pH 8) is optimal. As a general rule, the pH of the reaction milieu must not alter the chemical integrity of the protein during the digestion and must not change during the course of the fragmentation reaction.

Temperature A temperature between 25 °C and 37 °C is adequate for most digestions. The temperature used is intended to minimise chemical side reactions. The type of protein under test will dictate the temperature of the reaction milieu, because some proteins are more susceptible to denaturation as the temperature of the reaction increases. For example, digestion of recombinant bovine somatropin is conducted at 4 °C, because at higher temperatures it will precipitate during digestion.

Time If sufficient sample is available, a time course study is considered in order to determine the optimum time to obtain a reproducible map and avoid incomplete digestion. Time of digestion varies from 2 h to 30 h. The reaction is stopped by the addition of an acid which does not interfere in the map or by freezing.

Amount of cleavage agent used Although excessive amounts of cleavage agent are used to accomplish a reasonably rapid digestion time (i.e. 6-20 hours), the amount of cleavage agent is minimised to avoid its contribution to the chromatographic map pattern. A protein to protease ratio between 20:1 and 200:1 is generally used. It is recommended that the cleavage agent is added in 2 or more stages to optimise cleavage. Nonetheless, the final reaction volume remains small enough to facilitate the next step in peptide mapping, the separation step. To sort out digestion artifacts that might interfere with the subsequent analysis, a blank determination is performed, using a digestion control with all the reagents, except the test protein.

CHROMATOGRAPHIC SEPARATION

Many techniques are used to separate peptides for mapping. The selection of a technique depends on the protein being mapped. Techniques that have been successfully used for separation of peptides are shown in Table 2.2.55-2. In this section, a most widely used reversed-phase HPLC method is described as one of the procedures of chromatographic separation.

The purity of solvents and mobile phases is a critical factor in HPLC separation. HPLC-grade solvents and water that are commercially available, are recommended for reversed-phase HPLC. Dissolved gases present a problem in gradient systems where the solubility of the gas in a solvent may be less in a mixture than in a single solvent. Vacuum degassing and agitation by sonication are often used as useful degassing procedures. When solid particles in the solvents are drawn into the HPLC system, they can damage the sealing of pump valves or clog the top of the chromatographic column. Both pre- and post-pump filtration is also recommended.

Table 2.2.55-2. – *Techniques used for the separation of peptides*

Reversed-phase high performance liquid chromatography (HPLC)
Ion-exchange chromatography (IEC)
Hydrophobic interaction chromatography (HIC)
Polyacrylamide gel electrophoresis (PAGE), non-denaturating
Sodium dodecyl sulfate polyacrylamide gel electrophoresis (SDS-PAGE)
Capillary electrophoresis (CE)
Paper chromatography-high voltage (PCHV)
High voltage-paper electrophoresis (HVPE)

Chromatographic column
The selection of a chromatographic column is empirically determined for each protein. Columns with 10 nm or 30 nm pore size with silica support can give optimal separation. For smaller peptides, *octylsilyl silica gel for chromatography R* (3-10 µm) and *octadecylsilyl silica gel for chromatography R* (3-10 µm) column packings are more efficient than *butylsilyl silica gel for chromatography R* (5-10 µm).

Solvent
The most commonly used solvent is water with acetonitrile as the organic modifier to which not more than 0.1 per cent trifluoroacetic acid is added. If necessary, add propyl alcohol or isopropyl alcohol to solubilise the digest components, provided that the addition does not unduly increase the viscosity of the components.

Mobile phase
Buffered mobile phases containing phosphate are used to provide some flexibility in the selection of pH conditions, since shifts of pH in the 3.0-5.0 range enhance the separation of peptides containing acidic residues (e.g. glutamic and aspartic acids). Sodium or potassium phosphates, ammonium acetate, phosphoric acid at a pH between 2 and 7 (or higher for polymer-based supports) have also been used with acetonitrile gradients. Acetonitrile containing trifluoroacetic acid is used quite often.

Gradient
Gradients can be linear, nonlinear, or include step functions. A shallow gradient is recommended in order to separate complex mixtures. Gradients are optimised to provide clear resolution of 1 or 2 peaks that will become "marker" peaks for the test.

Isocratic elution
Isocratic HPLC systems using a single mobile phase are used on the basis of their convenience of use and improved detector responses. Optimal composition of a mobile phase to obtain clear resolution of each peak is sometimes difficult to establish. Mobile phases for which slight changes in component ratios or in pH significantly affect retention times of peaks in peptide maps must not be used in isocratic HPLC systems.

Other parameters
Temperature control of the column is usually necessary to achieve good reproducibility. The flow rates for the mobile phases range from 0.1-2.0 mL/min, and the detection of peptides is performed with a UV detector at 200-230 nm. Other methods of detection have been used (e.g. post-column derivatisation), but they are not as robust or versatile as UV detection.

Validation

This section provides an experimental means for measuring the overall performance of the test method. The acceptance criteria for system suitability depend on the identification of critical test parameters that affect data interpretation and acceptance. These critical parameters are also criteria that monitor peptide digestion and peptide analysis. An indicator that the desired digestion endpoint has been achieved is shown by comparison with a reference standard, which is treated in the same manner as the test protein. The use of a reference substance in parallel with the test protein is critical in the development and establishment of system suitability limits. In addition, a chromatogram is included with the reference substance for additional comparison purposes. Other indicators may include visual inspection of protein or peptide solubility, the absence of intact protein, or measurement of responses of a digestion-dependent peptide. The critical system suitability parameters for peptide analysis will depend on the particular mode of peptide separation and detection and on the data analysis requirements.

When peptide mapping is used as an identification test, the system suitability requirements for the identified peptides cover selectivity and precision. In this case, as well as when identification of variant protein is done, the identification of the primary structure of the peptide fragments in the peptide map provides both a verification of the known primary structure and the identification of protein variants by comparison with the peptide map of the reference substance for the specified protein. The use of a digested reference substance for a given protein in the determination of peptide resolution is the method of choice. For an analysis of a variant protein, a characterised mixture of a variant and a reference substance can be used, especially if the variant peptide is located in a less-resolved region of the map. The index of pattern consistency can be simply the number of major peptides detected. Peptide pattern consistency can be best defined by the resolution of peptide peaks. Chromatographic parameters, such as peak-to-peak resolution, maximum peak width, peak area, peak tailing factors, and column efficiency, may be used to define peptide resolution. Depending on the protein under test and the method of separation used, single peptide or multiple peptide resolution requirements may be necessary.

The replicate analysis of the digest of the reference substance for the protein under test yields measures of precision and quantitative recovery. Recovery of the identified peptides is generally ascertained by the use of internal or external peptide standards. The precision is expressed as the relative standard deviation (RSD). Differences in the recovery and precision of the identified peptides are to be expected; therefore, the system suitability limits will have to be established for both the recovery and the precision of the identified peptides. These limits are unique for a given protein and will be specified in the individual monograph.

Visual comparison of the relative retentions, the peak responses (the peak area or the peak height), the number of peaks, and the overall elution pattern is completed initially. It is then complemented and supported by mathematical analysis of the peak response ratios and by the chromatographic profile of a 1:1 (*V/V*) mixture of sample and reference substance digest. If all peaks in the sample digest and in the reference substance digest have the same relative retentions and peak response ratios, then the identity of the sample under test is confirmed.

If peaks that initially eluted with significantly different relative retentions are then observed as single peaks in the 1:1 mixture, the initial difference would be an indication of system variability. However, if separate peaks are observed in the 1:1 mixture, this would be evidence of the nonequivalence of the peptides in each peak. If a peak in the 1:1 mixture is significantly broader than the corresponding peak in the sample and reference substance digest, it may indicate the presence of different peptides. The use of computer-aided pattern recognition software for the analysis of peptide mapping data has been proposed and applied, but issues related to the validation of the computer software preclude its use in a compendial test in the near future. Other automated approaches have been used that employ mathematical formulas, models, and pattern recognition. Such approaches are, for example, the automated identification of compounds by IR spectroscopy and the application of diode-array UV spectral analysis for identification of peptides. These methods have limitations due to inadequate resolutions, co-elution of fragments, or absolute peak response differences between reference substance and sample digest fragments.

The numerical comparison of the peak retention times and peak areas or peak heights can be done for a selected group of relevant peaks that have been correctly identified in the peptide maps. Peak areas can be calculated using 1 peak showing relatively small variation as an internal reference, keeping in mind that peak area integration is sensitive to baseline variation and likely to introduce error in the analysis. Alternatively, the percentage of each peptide peak height relative to the sum of all peak heights can be calculated for the sample under test. The percentage is then compared to that of the corresponding peak of the reference substance. The possibility of auto-hydrolysis of trypsin is monitored by producing a blank peptide map, that is, the peptide map obtained when a blank solution is treated with trypsin.

The minimum requirement for the qualification of peptide mapping is an approved test procedure that includes system suitability as a test control. In general, early in the regulatory process, qualification of peptide mapping for a protein is sufficient. As the regulatory approval process for the protein progresses, additional qualifications of the test can include a partial validation of the analytical procedure to provide assurance that the method will perform as intended in the development of a peptide map for the specified protein.

ANALYSIS AND IDENTIFICATION OF PEPTIDES

This section gives guidance on the use of peptide mapping during development in support of regulatory applications.

The use of a peptide map as a qualitative tool does not require the complete characterisation of the individual peptide peaks. However, validation of peptide mapping in support of regulatory applications requires rigorous characterisation of each of the individual peaks in the peptide map. Methods to characterise peaks range from *N*-terminal sequencing of each peak followed by amino acid analysis to the use of mass spectroscopy (MS).

For characterisation purposes, when *N*-terminal sequencing and amino acids analysis are used, the analytical separation is scaled up. Since scale-up might affect the resolution of peptide peaks, it is necessary, using empirical data, to assure that there is no loss of resolution due to scale-up. Eluates corresponding to specific peptide peaks are collected, vacuum-concentrated, and chromatographed again, if necessary. Amino acid analysis of fragments may be limited by the peptide size. If the *N*-terminus is blocked, it may need to be cleared before sequencing. *C*-terminal sequencing of proteins in combination with carboxypeptidase and matrix-

assisted laser desorption ionisation coupled to time-of-flight analyser (MALDI-TOF) can also be used for characterisation purposes.

The use of MS for characterisation of peptide fragments is by direct infusion of isolated peptides or by the use of on-line LC-MS for structure analysis. In general, it includes electrospray and MALDI-TOF-MS, as well as fast-atom bombardment (FAB). Tandem MS has also been used to sequence a modified protein and to determine the type of amino acid modification that has occurred. The comparison of mass spectra of the digests before and after reduction provides a method to assign the disulfide bonds to the various sulfydryl-containing peptides.

If regions of the primary structure are not clearly demonstrated by the peptide map, it might be necessary to develop a secondary peptide map. The goal of a validated method of characterisation of a protein through peptide mapping is to reconcile and account for at least 95 per cent of the theoretical composition of the protein structure.

L. Amino Acid Analysis[1]

(Ph. Eur. method 2.2.56)

Amino acid analysis refers to the methodology used to determine the amino acid composition or content of proteins, peptides, and other pharmaceutical preparations. Proteins and peptides are macromolecules consisting of covalently bonded amino acid residues organised as a linear polymer. The sequence of the amino acids in a protein or peptide determines the properties of the molecule. Proteins are considered large molecules that commonly exist as folded structures with a specific conformation, while peptides are smaller and may consist of only a few amino acids. Amino acid analysis can be used to quantify proteins and peptides, to determine the identity of proteins or peptides based on their amino acid composition, to support protein and peptide structure analysis, to evaluate fragmentation strategies for peptide mapping, and to detect atypical amino acids that might be present in a protein or peptide. It is necessary to hydrolyse a protein/peptide to its individual amino acid constituents before amino acid analysis. Following protein/peptide hydrolysis, the amino acid analysis procedure can be the same as that practiced for free amino acids in other pharmaceutical preparations. The amino acid constituents of the test sample are typically derivatised for analysis.

APPARATUS

Methods used for amino acid analysis are usually based on a chromatographic separation of the amino acids present in the test sample. Current techniques take advantage of the automated chromatographic instrumentation designed for analytical methodologies. An amino acid analysis instrument will typically be a low-pressure or high-pressure liquid chromatograph capable of generating mobile phase gradients that separate the amino acid analytes on a chromatographic column. The instrument must have post-column derivatisation capability, unless the sample is analysed using precolumn derivatisation. The detector is usually an ultraviolet/visible or fluorescence detector depending on the derivatisation method used. A recording device (e.g., integrator) is used for transforming the analogue signal from the detector and for quantitation. It is preferred that instrumentation be dedicated particularly for amino acid analysis.

GENERAL PRECAUTIONS

Background contamination is always a concern for the analyst in performing amino acid analysis. High purity reagents are necessary (e.g., low purity hydrochloric acid can contribute to glycine contamination). Analytical reagents are changed routinely every few weeks using only high-pressure liquid chromatography (HPLC) grade solvents. Potential microbial contamination and foreign material that might be present in the solvents are reduced by filtering solvents before use, keeping solvent reservoirs covered, and not placing amino acid analysis instrumentation in direct sunlight.

Laboratory practices can determine the quality of the amino acid analysis. Place the instrumentation in a low traffic area of the laboratory. Keep the laboratory clean. Clean and calibrate pipets according to a maintenance schedule. Keep pipet tips in a covered box; the analysts may not handle pipet tips with their hands. The analysts may wear powder-free latex or equivalent gloves. Limit the number of times a test sample vial is opened and closed because dust can contribute to elevated levels of glycine, serine, and alanine.

A well-maintained instrument is necessary for acceptable amino acid analysis results. If the instrument is used on a routine basis, it is to be checked daily for leaks, detector and lamp stability, and the ability of the column to maintain resolution of the individual amino acids. Clean or replace all instrument filters and other maintenance items on a routine schedule.

REFERENCE MATERIAL

Acceptable amino acid standards are commercially available for amino acid analysis and typically consist of an aqueous mixture of amino acids. When determining amino acid composition, protein or peptide standards are analysed with the test material as a control to demonstrate the integrity of the entire procedure. Highly purified bovine serum albumin has been used as a protein standard for this purpose.

CALIBRATION OF INSTRUMENTATION

Calibration of amino acid analysis instrumentation typically involves analysing the amino acid standard, which consists of a mixture of amino acids at a number of concentrations, to determine the response factor and range of analysis for each amino acid. The concentration of each amino acid in the standard is known. In the calibration procedure, the analyst dilutes the amino acid standard to several different analyte levels within the expected linear range of the amino acid analysis technique. Then, replicates at each of the different analyte levels can be analysed. Peak areas obtained for each amino acid are plotted versus the known concentration for each of the amino acids in the standard dilution. These results will allow the analyst to determine the range of amino acid concentrations where the peak area of a given amino acid is an approximately linear function of the amino acid concentration. It is important that the analyst prepare the samples for amino acid analysis so that they are within the analytical limits (e.g., linear working range) of the technique employed in order to obtain accurate and repeatable results.

4 to 6 amino acid standard levels are analysed to determine a response factor for each amino acid. The response factor is calculated as the average peak area or peak height per nanomole of amino acid present in the standard.

A calibration file consisting of the response factor for each amino acid is prepared and used to calculate the

[1] *This chapter has undergone pharmacopoeial harmonisation. See chapter 5.8 Pharmacopoeial harmonisation.*

concentration of each amino acid present in the test sample. This calculation involves dividing the peak area corresponding to a given amino acid by the response factor for that amino acid to give the nanomoles of the amino acid. For routine analysis, a single-point calibration may be sufficient; however, the calibration file is updated frequently and tested by the analysis of analytical controls to ensure its integrity.

REPEATABILITY

Consistent high quality amino acid analysis results from an analytical laboratory require attention to the repeatability of the assay. During analysis of the chromatographic separation of the amino acids or their derivatives, numerous peaks can be observed on the chromatogram that correspond to the amino acids. The large number of peaks makes it necessary to have an amino acid analysis system that can repeatedly identify the peaks based on retention time and integrate the peak areas for quantitation. A typical repeatability evaluation involves preparing a standard amino acid solution and analysing many replicates (e.g., 6 analyses or more) of the same standard solution. The relative standard deviation (RSD) is determined for the retention time and integrated peak area of each amino acid. An evaluation of the repeatability is expanded to include multiple assays conducted over several days by different analysts. Multiple assays include the preparation of standard dilutions from starting materials to determine the variation due to sample handling. The amino acid composition of a standard protein (e.g., bovine serum albumin) is often analysed as part of the repeatability evaluation. By evaluating the replicate variation (i.e., RSD), the laboratory can establish analytical limits to ensure that the analyses from the laboratory are under control. It is desirable to establish the lowest practical variation limits to ensure the best results. Areas to focus on to lower the variability of the amino acid analysis include sample preparation, high background spectral interference due to quality of reagents and/or laboratory practices, instrument performance and maintenance, data analysis and interpretation, and analyst performance and habits.
All parameters involved are fully investigated in the scope of the validation work.

SAMPLE PREPARATION

Accurate results from amino acid analysis require purified protein and peptide samples. Buffer components (e.g., salts, urea, detergents) can interfere with the amino acid analysis and are removed from the sample before analysis. Methods that utilise post-column derivatisation of the amino acids are generally not affected by buffer components to the extent seen with pre-column derivatisation methods. It is desirable to limit the number of sample manipulations to reduce potential background contamination, to improve analyte recovery, and to reduce labour. Common techniques used to remove buffer components from protein samples include the following methods: (1) injecting the protein sample onto a reversed-phase HPLC system, removing the protein with a volatile solvent containing a sufficient organic component, and drying the sample in a vacuum centrifuge; (2) dialysis against a volatile buffer or water; (3) centrifugal ultrafiltration for buffer replacement with a volatile buffer or water; (4) precipitating the protein from the buffer using an organic solvent (e.g., acetone); (5) gel filtration.

INTERNAL STANDARDS

It is recommended that an internal standard be used to monitor physical and chemical losses and variations during amino acid analysis. An accurately known amount of internal standard can be added to a protein solution prior to hydrolysis. The recovery of the internal standard gives the general recovery of the amino acids of the protein solution. Free amino acids, however, do not behave in the same way as protein-bound amino acids during hydrolysis, whose rates of release or destruction are variable. Therefore, the use of an internal standard to correct for losses during hydrolysis may give unreliable results. It will be necessary to take this point into consideration when interpreting the results. Internal standards can also be added to the mixture of amino acids after hydrolysis to correct for differences in sample application and changes in reagent stability and flow rates. Ideally, an internal standard is an unnaturally occurring primary amino acid that is commercially available and inexpensive. It should also be stable during hydrolysis, its response factor should be linear with concentration, and it needs to elute with a unique retention time without overlapping other amino acids. Commonly used amino acid standards include norleucine, nitrotyrosine, and α-aminobutyric acid.

PROTEIN HYDROLYSIS

Hydrolysis of protein and peptide samples is necessary for amino acid analysis of these molecules. The glassware used for hydrolysis must be very clean to avoid erroneous results. Glove powders and fingerprints on hydrolysis tubes may cause contamination. To clean glass hydrolysis tubes, boil tubes for 1 h in 1 M hydrochloric acid or soak tubes in concentrated nitric acid or in a mixture of equal volumes of concentrated hydrochloric acid and nitric acid. Clean hydrolysis tubes are rinsed with high-purity water followed by a rinse with HPLC grade methanol, dried overnight in an oven, and stored covered until use. Alternatively, pyrolysis of clean glassware at 500 °C for 4 h may also be used to eliminate contamination from hydrolysis tubes. Adequate disposable laboratory material can also be used.

Acid hydrolysis is the most common method for hydrolysing a protein sample before amino acid analysis. The acid hydrolysis technique can contribute to the variation of the analysis due to complete or partial destruction of several amino acids: tryptophan is destroyed; serine and threonine are partially destroyed; methionine might undergo oxidation; and cysteine is typically recovered as cystine (but cystine recovery is usually poor because of partial destruction or reduction to cysteine). Application of adequate vacuum (less than 200 µm of mercury or 26.7 Pa) or introduction of an inert gas (argon) in the headspace of the reaction vessel can reduce the level of oxidative destruction. In peptide bonds involving isoleucine and valine the amido bonds of Ile-Ile, Val-Val, Ile-Val, and Val-Ile are partially cleaved; and asparagine and glutamine are deamidated, resulting in aspartic acid and glutamic acid, respectively. The loss of tryptophan, asparagine, and glutamine during an acid hydrolysis limits quantitation to 17 amino acids. Some of the hydrolysis techniques described are used to address these concerns. Some of the hydrolysis techniques described (i.e., Methods 4-11) may cause modifications to other amino acids. Therefore, the benefits of using a given hydrolysis technique are weighed against the concerns with the technique and are tested adequately before employing a method other than acid hydrolysis.

A time-course study (i.e., amino acid analysis at acid hydrolysis times of 24 h, 48 h and 72 h) is often employed to analyse the starting concentration of amino acids that are partially destroyed or slow to cleave. By plotting the observed concentration of labile amino acids (e.g., serine and threonine) versus hydrolysis time, the line can be

extrapolated to the origin to determine the starting concentration of these amino acids. Time-course hydrolysis studies are also used with amino acids that are slow to cleave (e.g., isoleucine and valine). During the hydrolysis time course, the analyst will observe a plateau in these residues. The level of this plateau is taken as the residue concentration. If the hydrolysis time is too long, the residue concentration of the sample will begin to decrease, indicating destruction by the hydrolysis conditions.

An acceptable alternative to the time-course study is to subject an amino acid calibration standard to the same hydrolysis conditions as the test sample. The amino acid in free form may not completely represent the rate of destruction of labile amino acids within a peptide or protein during the hydrolysis. This is especially true for peptide bonds that are slow to cleave (e.g., Ile-Val bonds). However, this technique will allow the analyst to account for some residue destruction. Microwave acid hydrolysis has been used and is rapid but requires special equipment as well as special precautions. The optimal conditions for microwave hydrolysis must be investigated for each individual protein/peptide sample. The microwave hydrolysis technique typically requires only a few minutes, but even a deviation of one minute may give inadequate results (e.g., incomplete hydrolysis or destruction of labile amino acids). Complete proteolysis, using a mixture of proteases, has been used but can be complicated, requires the proper controls, and is typically more applicable to peptides than proteins.

During initial analyses of an unknown protein, experiments with various hydrolysis time and temperature conditions are conducted to determine the optimal conditions.

METHOD 1

Acid hydrolysis using hydrochloric acid containing phenol is the most common procedure used for protein/peptide hydrolysis preceding amino acid analysis. The addition of phenol to the reaction prevents the halogenation of tyrosine.

Hydrolysis solution

6 M hydrochloric acid containing 0.1 per cent to 1.0 per cent of phenol.

Procedure

Liquid phase hydrolysis Place the protein or peptide sample in a hydrolysis tube, and dry (the sample is dried so that water in the sample will not dilute the acid used for the hydrolysis). Add 200 µL of hydrolysis solution per 500 µg of lyophilised protein. Freeze the sample tube in a dry ice-acetone bath, and flame seal *in vacuo*. Samples are typically hydrolysed at 110 °C for 24 h *in vacuo* or in an inert atmosphere to prevent oxidation. Longer hydrolysis times (e.g., 48 h and 72 h) are investigated if there is a concern that the protein is not completely hydrolysed.

Vapour phase hydrolysis This is one of the most common acid hydrolysis procedures, and it is preferred for microanalysis when only small amounts of the sample are available. Contamination of the sample from the acid reagent is also minimised by using vapour phase hydrolysis. Place vials containing the dried samples in a vessel that contains an appropriate amount of hydrolysis solution. The hydrolysis solution does not come in contact with the test sample. Apply an inert atmosphere or vacuum (less than 200 µm of mercury or 26.7 Pa) to the headspace of the vessel, and heat to about 110 °C for a 24 h hydrolysis time. Acid vapour hydrolyses the dried sample. Any condensation of the acid in the sample vials is to be minimised. After hydrolysis, dry the test sample *in vacuo* to remove any residual acid.

METHOD 2

Tryptophan oxidation during hydrolysis is decreased by using mercaptoethanesulfonic acid as the reducing acid.

Hydrolysis solution

2.5 M mercaptoethanesulfonic acid solution.

Vapour phase hydrolysis

Dry about 1 µg to 100 µg of the protein/peptide under test in a hydrolysis tube. Place the hydrolysis tube in a larger tube with about 200 µL of the hydrolysis solution. Seal the larger tube *in vacuo* (about 50 µm of mercury or 6.7 Pa) to vaporise the hydrolysis solution. Heat the hydrolysis tube to 170-185 °C for about 12.5 min. After hydrolysis, dry the hydrolysis tube *in vacuo* for 15 min to remove the residual acid.

METHOD 3

Tryptophan oxidation during hydrolysis is prevented by using thioglycollic acid (TGA) as the reducing acid.

Hydrolysis solution

7 M hydrochloric acid containing 1 per cent of phenol, 10 per cent of trifluoroacetic acid and 20 per cent of thioglycollic acid.

Vapour phase hydrolysis

Dry about 10 µg to 50 µg of the protein/peptide under test in a sample tube. Place the sample tube in a larger tube with about 200 µL of the hydrolysis solution. Seal the larger tube *in vacuo* (about 50 µm of mercury or 6.7 Pa) to vaporise the TGA. Heat the sample tube to 166 °C for about 15-30 min. After hydrolysis, dry the sample tube *in vacuo* for 5 min to remove the residual acid. Recovery of tryptophan by this method may be dependent on the amount of sample present.

METHOD 4

Cysteine/cystine and methionine oxidation is performed with performic acid before the protein hydrolysis.

Oxidation solution

Use performic acid freshly prepared by mixing 1 volume of hydrogen peroxide solution (30 per cent) and 9 volumes of anhydrous formic acid and incubating at room temperature for 1 h.

Procedure

Dissolve the protein/peptide sample in 20 µL of anhydrous formic acid and heat at 50 °C for 5 min; then add 100 µL of the oxidation solution. Allow the oxidation to proceed for 10-30 min. In this reaction, cysteine is converted to cysteic acid and methionine is converted to methionine-sulfone. Remove the excess reagent from the sample in a vacuum centrifuge. The oxidised protein can then be acid hydrolysed using Method 1 or Method 2. This technique may cause modifications to tyrosine residues in the presence of halides.

METHOD 5

Cysteine/cystine oxidation is accomplished during the liquid phase hydrolysis with sodium azide.

Hydrolysis solution

To 6 M hydrochloric acid containing 0.2 per cent of phenol, add sodium azide to obtain a final concentration of 2 g/L. The added phenol prevents halogenation of tyrosine.

Liquid phase hydrolysis

Conduct the protein/peptide hydrolysis at about 110 °C for 24 h. During the hydrolysis, the cysteine/cystine present in the sample is converted to cysteic acid by the sodium azide present in the hydrolysis solution. This technique allows better tyrosine recovery than Method 4, but it is not quantitative for methionine. Methionine is converted to a

mixture of the parent methionine and its 2 oxidative products, methionine-sulfoxide and methionine-sulfone.

METHOD 6

Cysteine/cystine oxidation is accomplished with dimethyl sulfoxide (DMSO).

Hydrolysis solution

To 6 M hydrochloric acid containing 0.1 per cent to 1.0 per cent of phenol, add dimethyl sulfoxide to obtain a final concentration of 2 per cent *V/V*.

Vapour phase hydrolysis

Conduct the protein/peptide hydrolysis at about 110 °C for 24 h. During the hydrolysis, the cysteine/cystine present in the sample is converted to cysteic acid by the DMSO present in the hydrolysis solution. As an approach to limit variability and compensate for partial destruction, it is recommended to evaluate the cysteic acid recovery from oxidative hydrolysis of standard proteins containing 1-8 mol of cysteine per mole of protein. The response factors from protein/peptide hydrolysates are typically about 30 per cent lower than those for non-hydrolysed cysteic acid standards. Because histidine, methionine, tyrosine, and tryptophan are also modified, a complete compositional analysis is not obtained with this technique.

METHOD 7

Cysteine/cystine reduction and alkylation is accomplished by a vapour phase pyridylethylation reaction.

Reducing solution

Transfer 83.3 µL of pyridine, 16.7 µL of 4-vinylpyridine, 16.7 µL of tributylphosphine, and 83.3 µL of water to a suitable container and mix.

Procedure

Add the protein/peptide (between 1 and 100 µg) to a hydrolysis tube, and place in a larger tube. Transfer the reducing solution to the large tube, seal *in vacuo* (about 50 µm of mercury or 6.7 Pa), and heat at about 100 °C for 5 min. Then remove the inner hydrolysis tube, and dry it in a vacuum desiccator for 15 min to remove residual reagents. The pyridylethylated sample can then be acid hydrolysed using previously described procedures. The pyridylethylation reaction is performed simultaneously with a protein standard sample containing 1-8 mol of cysteine per mole of protein to evaluate the pyridylethyl-cysteine recovery. Longer incubation times for the pyridylethylation reaction can cause modifications to the α-amino terminal group and the ε-amino group of lysine in the protein.

METHOD 8

Cysteine/cystine reduction and alkylation is accomplished by a liquid phase pyridylethylation reaction.

Stock solutions

Prepare and filter 3 solutions: 1 M Tris-hydrochloride pH 8.5 containing 4 mM disodium edetate (stock solution A), 8 M guanidine hydrochloride (stock solution B), and 10 per cent of 2-mercaptoethanol (stock solution C).

Reducing solution

Prepare a mixture of 1 volume of stock solution A and 3 volumes of stock solution B to obtain a buffered solution of 6 M guanidine hydrochloride in 0.25 M tris-hydrochloride.

Procedure

Dissolve about 10 µg of the test sample in 50 µL of the reducing solution, and add about 2.5 µL of stock solution C. Store under nitrogen or argon for 2 h at room temperature in the dark. To achieve the pyridylethylation reaction, add about 2 µL of 4-vinylpyridine to the protein solution, and incubate for an additional 2 h at room temperature in the dark. Desalt the protein/peptide by collecting the protein/peptide fraction from a reversed-phase HPLC separation. The collected sample can be dried in a vacuum centrifuge before acid hydrolysis.

METHOD 9

Cysteine/cystine reduction and alkylation is accomplished by a liquid phase carboxymethylation reaction.

Stock solutions

Prepare as directed for Method 8.

Carboxymethylation solution

Prepare a 100 g/L solution of iodoacetamide in alcohol.

Buffer solution

Use the reducing solution, prepared as described for Method 8.

Procedure

Dissolve the test sample in 50 µL of the buffer solution, and add about 2.5 µL of stock solution C. Store under nitrogen or argon for 2 h at room temperature in the dark. Add the carboxymethylation solution in a ratio 1.5 fold per total theoretical content of thiols, and incubate for an additional 30 min at room temperature in the dark. If the thiol content of the protein is unknown, then add 5 µL of 100 mM iodoacetamide for every 20 nmol of protein present. The reaction is stopped by adding excess of 2-mercaptoethanol. Desalt the protein/peptide by collecting the protein/peptide fraction from a reversed-phase HPLC separation. The collected sample can be dried in a vacuum centrifuge before acid hydrolysis. The *S*-carboxyamidomethyl-cysteine formed will be converted to *S*-carboxymethyl-cysteine during acid hydrolysis.

METHOD 10

Cysteine/cystine is reacted with dithiodiglycolic acid or dithiodipropionic acid to produce a mixed disulfide. The choice of dithiodiglycolic acid or dithiodipropionic acid depends on the required resolution of the amino acid analysis method.

Reducing solution

A 10 g/L solution of dithiodiglycolic acid (or dithiodipropionic acid) in 0.2 M sodium hydroxide.

Procedure

Transfer about 20 µg of the test sample to a hydrolysis tube, and add 5 µL of the reducing solution. Add 10 µL of isopropyl alcohol, and then remove all of the sample liquid by vacuum centrifugation. The sample is then hydrolysed using Method 1. This method has the advantage that other amino acid residues are not derivatised by side reactions, and that the sample does not need to be desalted prior to hydrolysis.

METHOD 11

Asparagine and glutamine are converted to aspartic acid and glutamic acid, respectively, during acid hydrolysis. Asparagine and aspartic acid residues are added and represented by *Asx*, while glutamine and glutamic acid residues are added and represented by *Glx*. Proteins/peptides can be reacted with bis (1,1-trifluoroacetoxy)iodobenzene (BTI) to convert the asparagine and glutamine residues to diaminopropionic acid and diaminobutyric acid residues, respectively, upon acid hydrolysis. These conversions allow the analyst to determine the asparagine and glutamine content of a protein/peptide in the presence of aspartic acid and glutamic acid residues.

Reducing solutions

Prepare and filter 3 solutions: a solution of 10 mM trifluoroacetic acid (Solution A), a solution of 5 M guanidine hydrochloride and 10 mM trifluoroacetic acid (Solution B),

and a freshly prepared solution of dimethylformamide containing 36 mg of BTI per millilitre (Solution C).

Procedure

In a clean hydrolysis tube, transfer about 200 µg of the test sample, and add 2 mL of Solution A or Solution B and 2 mL of Solution C. Seal the hydrolysis tube *in vacuo*. Heat the sample at 60 °C for 4 h in the dark. The sample is then dialysed with water to remove the excess reagents. Extract the dialysed sample 3 times with equal volumes of butyl acetate, and then lyophilise. The protein can then be acid hydrolysed using previously described procedures. The α,β-diaminopropionic and α,γ-diaminobutyric acid residues do not typically resolve from the lysine residues upon ion-exchange chromatography based on amino acid analysis. Therefore, when using ion-exchange as the mode of amino acid separation, the asparagine and glutamine contents are the quantitative difference in the aspartic acid and glutamic acid content assayed with underivatised and BTI-derivatised acid hydrolysis. The threonine, methionine, cysteine, tyrosine, and histidine assayed content can be altered by BTI derivatisation; a hydrolysis without BTI will have to be performed if the analyst is interested in the composition of these other amino acid residues of the protein/peptide.

METHODOLOGIES OF AMINO ACID ANALYSIS: GENERAL PRINCIPLES

Many amino acid analysis techniques exist, and the choice of any one technique often depends on the sensitivity required from the assay. In general, about one-half of the amino acid analysis techniques employed rely on the separation of the free amino acids by ion-exchange chromatography followed by post-column derivatisation (e.g., with ninhydrin or *o*-phthalaldehyde). Post-column derivatisation techniques can be used with samples that contain small amounts of buffer components, (such as salts and urea) and generally require between 5 µg and 10 µg of protein sample per analysis. The remaining amino acid techniques typically involve pre-column derivatisation of the free amino acids (e.g., phenyl isothiocyanate; 6-aminoquinolyl-*N*-hydroxysuccinimidyl carbamate or *o*-phthalaldehyde; (dimethylamino) azobenzenesulfonyl chloride; 9-fluorenylmethyl chloroformate; and 7-fluoro-4-nitrobenzo-2-oxa-1,3-diazole) followed by reversed-phase HPLC. Pre-column derivatisation techniques are very sensitive and usually require between 0.5 µg and 1.0 µg of protein sample per analysis but may be influenced by buffer salts in the samples. Pre-column derivatisation techniques may also result in multiple derivatives of a given amino acid, which complicates the result interpretation. Post-column derivatisation techniques are generally influenced less by performance variation of the assay than pre-column derivatisation techniques.

The following methods may be used for quantitative amino acid analysis. Instruments and reagents for these procedures are available commercially. Furthermore, many modifications of these methodologies exist with different reagent preparations, reaction procedures, chromatographic systems, etc. Specific parameters may vary according to the exact equipment and procedure used. Many laboratories will use more than one amino acid analysis technique to exploit the advantages offered by each. In each of these methods, the analogue signal is visualised by means of a data acquisition system, and the peak areas are integrated for quantification purposes.

METHOD 1 - POST-COLUMN NINHYDRIN DERIVATISATION

Ion-exchange chromatography with post-column ninhydrin derivatisation is one of the most common methods employed for quantitative amino acid analysis. As a rule, a lithium-based cation-exchange system is employed for the analysis of the more complex physiological samples, and the faster sodium-based cation-exchange system is used for the more simplistic amino acid mixtures obtained with protein hydrolysates (typically containing 17 amino acid components). Separation of the amino acids on an ion-exchange column is accomplished through a combination of changes in pH and cation strength. A temperature gradient is often employed to enhance separation.

When the amino acid reacts with ninhydrin, the reactant has a characteristic purple or yellow colour. Amino acids, except imino acid, give a purple colour, and show an absorption maximum at 570 nm. The imino acids such as proline give a yellow colour, and show an absorption maximum at 440 nm. The post-column reaction between ninhydrin and amino acids eluted from the column is monitored at 440 nm and 570 nm, and the chromatogram obtained is used for the determination of amino acid composition.

The detection limit is considered to be 10 pmol for most of the amino acid derivatives, but 50 pmol for the proline derivative. Response linearity is obtained in the range of 20-500 pmol with correlation coefficients exceeding 0.999. To obtain good composition data, samples larger than 1 µg before hydrolysis are best suited for this amino acid analysis of protein/peptide.

METHOD 2 - POST-COLUMN OPA DERIVATISATION

o-Phthalaldehyde (OPA) reacts with primary amines in the presence of thiol compound, to form highly fluorescent isoindole products. This reaction is used for the post-column derivatisation in analysis of amino acids by ion-exchange chromatography. The rule of the separation is the same as Method 1.

Although OPA does not react with secondary amines (imino acids such as proline) to form fluorescent substances, the oxidation with sodium hypochlorite or chloramine T allows secondary amines to react with OPA. The procedure employs a strongly acidic cation-exchange column for separation of free amino acids followed by post-column oxidation with sodium hypochlorite or chloramine T and post-column derivatisation using OPA and a thiol compound such as *N*-acetyl-L-cysteine or 2-mercaptoethanol. The derivatisation of primary amino acids is not noticeably affected by the continuous supply of sodium hypochlorite or chloramine T.

Separation of the amino acids on an ion-exchange column is accomplished through a combination of changes in pH and cation strength. After post-column derivatisation of eluted amino acids with OPA, the reactant passes through the fluorometric detector. Fluorescence intensity of OPA-derivatised amino acids are monitored with an excitation wavelength of 348 nm and an emission wavelength of 450 nm.

The detection limit is considered to be a few tens of picomole level for most of the OPA-derivatised amino acids. Response linearity is obtained in the range of a few picomole level to a few tens of nanomole level. To obtain good compositional data, samples larger than 500 ng of protein/peptide before hydrolysis are recommended.

METHOD 3 - PRE-COLUMN PITC DERIVATISATION

Phenylisothiocyanate (PITC) reacts with amino acids to form phenylthiocarbamyl (PTC) derivatives which can be detected with high sensitivity at 254 nm. Therefore, pre-column derivatisation of amino acids with PITC followed by a reversed-phase HPLC separation with UV detection is used to analyse the amino acid composition.

After the reagent is removed under vacuum, the derivatised amino acids can be stored dry and frozen for several weeks with no significant degradation. If the solution for injection is kept cold, no noticeable loss in chromatographic response occurs after 3 days.

Separation of the PTC-amino acids on a reversed-phase HPLC with an octadecylsilyl (ODS) column is accomplished through a combination of changes in concentrations of acetonitrile and buffer ionic strength. PTC-amino acids eluted from the column are monitored at 254 nm.

The detection limit is considered to be 1 pmol for most of the PTC-amino acids. Response linearity is obtained in the range of 20-500 pmol with correlation coefficients exceeding 0.999. To obtain good compositional data, samples larger than 500 ng of protein/peptide before hydrolysis are recommended.

METHOD 4 - PRE-COLUMN AQC DERIVITISATION

Pre-column derivatisation of amino acids with 6-aminoquinolyl-*N*-hydroxysuccinimidyl carbamate (AQC) followed by reversed-phase HPLC separation with fluorometric detection is used.

AQC reacts with amino acids to form stable, fluorescent unsymmetric urea derivatives (AQC-amino acids) which are readily amenable to analysis by reversed-phase HPLC. Therefore, pre-column derivatisation of amino acids with AQC followed by reversed-phase HPLC separation with fluorimetric detection is used to analyse the amino acid composition.

Separation of the AQC-amino acids on a reversed-phase HPLC with an ODS column is accomplished through a combination of changes in concentrations of acetonitrile and buffer ionic strengh. Selective fluorescence detection of the derivatives with an excitation wavelength at 250 nm and an emission wavelength at 395 nm allows for the direct injection of the reaction mixture with no significant interference from the only major fluorescent reagent by-product, 6-aminoquinoline. Excess reagent is rapidly hydrolysed ($t_{1/2}$<15 s) to yield 6-aminoquinoline, *N*-hydroxysuccinimide and carbon dioxide, and after 1 min no further derivatisation can take place.

Peak areas for AQC-amino acids are essentially unchanged for at least 1 week at room temperature. Therefore AQC-amino acids have more than sufficient stability to allow for overnight automated chromatographic analysis.

The detection limit is considered to range from about 40 fmol to 320 fmol for each amino acid, except for cystein. The detection limit for cystein is approximately 800 fmol. Response linearity is obtained in the range of 2.5-200 µM with correlation coefficients exceeding 0.999. Good compositional data can be obtained from the analysis of derivatised protein hydrolysates derived from as little as 30 ng of protein/peptide.

METHOD 5 - PRE-COLUMN OPA DERIVATISATION

Pre-column derivatisation of amino acids with *o*-phthalaldehyde (OPA) followed by reversed-phase HPLC separation with fluorometric detection is used. This technique does not detect amino acids that exist as secondary amines (e.g., proline).

OPA in conjunction with a thiol reagent reacts with primary amine groups to form highly fluorescent isoindole products. 2-Mercaptoethanol or 3-mercaptopropionic acid can be used as the thiol. OPA itself does not fluoresce and consequently produces no interfering peaks. In addition, its solubility and stability in aqueous solution, along with the rapid kinetics for the reaction, make it amenable to automated derivatisation and analysis using an autosampler to mix the sample with the reagent. However, lack of reactivity with secondary amino acids has been a predominant drawback. This method does not detect amino acids that exist as secondary amines (e.g., proline). To compensate for this drawback, this technique may be combined with another technique described in Method 7 or Method 8.

Pre-column derivatisation of amino acids with OPA is followed by a reversed-phase HPLC separation. Because of the instability of the OPA-amino acid derivative, HPLC separation and analysis are performed immediately following derivatisation. The liquid chromatograph is equipped with a fluorometric detector for the detection of derivatised amino acids. Fluorescence intensity of OPA-derivatised amino acids is monitored with an excitation wavelength of 348 nm and an emission wavelength of 450 nm.

Detection limits as low as 50 fmol via fluorescence have been reported, although the practical limit of analysis remains at 1 pmol.

METHOD 6 - PRE-COLUMN DABS-CL DERIVATISATION

Pre-column derivatisation of amino acids with (dimethylamino)azobenzenesulfonyl chloride (DABS-Cl) followed by reversed-phase HPLC separation with visible light detection is used.

DABS-Cl is a chromophoric reagent employed for the labelling of amino acids. Amino acids labelled with DABS-Cl (DABS-amino acids) are highly stable and show an absorption maximum at 436 nm.

DABS-amino acids, all naturally occurring amino acid derivatives, can be separated on an ODS column of a reversed-phase HPLC by employing gradient systems consisting of acetonitrile and aqueous buffer mixture. Separated DABS-amino acids eluted from the column are detected at 436 nm in the visible region.

This method can analyse the imino acids such as proline together with the amino acids at the same degree of sensitivity, DABS-Cl derivatisation method permits the simultaneous quantification of tryptophan residues by previous hydrolysis of the protein/peptide with sulfonic acids such as mercaptoethanesulfonic acid, *p*-toluenesulfonic acid or methanesulfonic acid described in Method 2 under Protein hydrolysis. The other acid-labile residues, asparagine and glutamine, can also be analysed by previous conversion into diaminopropionic acid and diaminobutyric acid, respectively, by treatment of protein/peptide with BTI described in Method 11 under Protein hydrolysis.

The non-proteinogenic amino acid norleucine cannot be used as an internal standard in this method as this compound is eluted in a chromatographic region crowded with peaks of primary amino acids. Nitrotyrosine can be used as an internal standard because it is eluted in a clean region.

The detection limit of DABS-amino acid is about 1 pmol. As little as 2-5 pmol of an individual DABS-amino acid can be quantitatively analysed with reliability, and only 10-30 ng

of the dabsylated protein hydrolysate is required for each analysis.

METHOD 7 - PRE-COLUMN FMOC-CL DERIVATISATION

Pre-column derivatisation of amino acids with 9-fluorenylmethyl chloroformate (FMOC-Cl) followed by reversed-phase HPLC separation with fluorometric detection is used.

FMOC-Cl reacts with both primary and secondary amino acids to form highly fluorescent products. The reaction proceeds under mild conditions in aqueous solution and is completed in 30 s. The derivatives are stable, only the histidine derivative showing any breakdown. Although FMOC-Cl is fluorescent itself, the reagent excess and fluorescent side-products can be eliminated without loss of FMOC-amino acids.

FMOC-amino acids are separated by a reversed-phase HPLC using an ODS column. The separation is carried out by gradient elution varied linearly from a mixture of 10 volumes of acetonitrile, 40 volumes of methanol and 50 volumes of acetic acid buffer to a mixture of 50 volumes of acetonitrile and 50 volumes of acetic acid buffer and 20 amino acid derivatives are separated in 20 min. Each derivative eluted from the column is monitored by a fluorometric detector set at an excitation wavelength of 260 nm and an emission wavelength of 313 nm.

The detection limit is in the low femtomole range. A linearity range of 0.1-50 µM is obtained for most of the amino acids.

METHOD 8 - PRE-COLUMN NBD-F DERIVATISATION

Pre-column derivatisation of amino acids with 7-fluoro-4-nitrobenzo-2-oxa-1,3-diazole (NBD-F) followed by reversed-phase HPLC separation with fluorometric detection is used.

NBD-F reacts with both primary and secondary amino acids to form highly fluorescent products. Amino acids are derivatised with NBD-F by heating to 60 °C for 5 min.

NBD-amino acid derivatives are separated on an ODS column of a reversed-phase HPLC by employing a gradient elution system consisting of acetonitrile and aqueous buffer mixture, and 17 amino acid derivatives are separated in 35 min. ε-Aminocaproic acid can be used as an internal standard, because it is eluted in a clean chromatographic region. Each derivative eluted from the column is monitored by a fluorometric detector set at an excitation wavelength of 480 nm and an emission wavelength of 530 nm.

The sensitivity of this method is almost the same as for the pre-column OPA derivatisation method (Method 5), excluding proline to which OPA is not reactive, and might be advantageous for NBD-F against OPA. The detection limit for each amino acid is about 10 fmol. Profile analysis can be achieved with about 1.5 mg of protein hydrolysates in the pre-column reaction mixture.

DATA CALCULATION AND ANALYSIS

When determining the amino acid content of a protein/peptide hydrolysate, it should be noted that the acid hydrolysis step destroys tryptophan and cysteine. Serine and threonine are partially destroyed by acid hydrolysis, while isoleucine and valine residues may be only partially cleaved. Methionine can undergo oxidation during acid hydrolysis, and some amino acids (e.g., glycine and serine) are common contaminants. Application of adequate vacuum (less than 200 µm of mercury or 26.7 Pa) or introduction of inert gas (argon) in the headspace of the reaction vessel during vapour phase hydrolysis can reduce the level of oxidative destruction. Therefore, the quantitative results obtained for cysteine, tryptophan, threonine, isoleucine, valine, methionine, glycine, and serine from a protein/peptide hydrolysate may be variable and may warrant further investigation and consideration.

Amino Acid Mole Percent

This is the number of specific amino acid residues per 100 residues in a protein. This result may be useful for evaluating amino acid analysis data when the molecular mass of the protein under investigation is unknown. This information can be used to corroborate the identity of a protein/peptide and has other applications. Carefully identify and integrate the peaks obtained as directed for each procedure. Calculate the mole percent for each amino acid present in the test sample using the formula:

$$\frac{100r_U}{r}$$

in which r_U is the peak response, in nanomoles, of the amino acid under test; and r is the sum of peak responses, in nanomoles, for all amino acids present in the test sample. Comparison of the mole percent of the amino acids under test to data from known proteins can help establish or corroborate the identity of the sample protein.

Unknown Protein Samples

This data analysis technique can be used to estimate the protein concentration of an unknown protein sample using the amino acid analysis data. Calculate the mass, in micrograms, of each recovered amino acid using the formula:

$$\frac{mM_r}{1000}$$

in which m is the recovered quantity, in nanomoles, of the amino acid under test; and M_r is the average molecular mass for that amino acid, corrected for the mass of the water molecule that was eliminated during peptide bond formation. The sum of the masses of the recovered amino acids will give an estimate of the total mass of the protein analysed after appropriate correction for partially and completely destroyed amino acids. If the molecular mass of the unknown protein is available (i.e., by SDS-PAGE analysis or mass spectroscopy), the amino acid composition of the unknown protein can be predicted. Calculate the number of residues of each amino acid using the formula:

$$\frac{m}{\left(\frac{1000M}{M_n}\right)}$$

in which m is the recovered quantity, in nanomoles, of the amino acid under test; M is the total mass, in micrograms, of the protein; and M_n is the molecular mass of the unknown protein.

Known protein samples

This data analysis technique can be used to investigate the amino acid composition and protein concentration of a protein sample of known molecular mass and amino acid composition using the amino acid analysis data. When the composition of the protein being analysed is known, one can exploit the fact that some amino acids are recovered well, while other amino acid recoveries may be compromised because of complete or partial destruction (e.g., tryptophan, cysteine, threonine, serine, methionine), incomplete bond cleavage (i.e., for isoleucine and valine) and free amino acid contamination (i.e., by glycine and serine).

Because those amino acids that are recovered best represent the protein, these amino acids are chosen to quantify the

amount of protein. Well-recovered amino acids are, typically, aspartate-asparagine, glutamate-glutamine, alanine, leucine, phenylalanine, lysine, and arginine. This list can be modified based on experience with one's own analysis system. Divide the quantity, in nanomoles, of each of the well-recovered amino acids by the expected number of residues for that amino acid to obtain the protein content based on each well-recovered amino acid. Average the protein content results calculated. The protein content determined for each of the well-recovered amino acids should be evenly distributed about the mean. Discard protein content values for those amino acids that have an unacceptable deviation from the mean. Typically greater than 5 per cent variation from the mean is considered unacceptable. Recalculate the mean protein content from the remaining values to obtain the protein content of the sample. Divide the content of each amino acid by the calculated mean protein content to determine the amino acid composition of the sample by analysis.

Calculate the relative compositional error, in percentage, using the formula:

$$\frac{100m}{m_S}$$

in which m is the experimentally determined quantity, in nanomoles per amino acid residue, of the amino acid under test; and m_S is the known residue value for that amino acid. The average relative compositional error is the average of the absolute values of the relative compositional errors of the individual amino acids, typically excluding tryptophan and cysteine from this calculation. The average relative compositional error can provide important information on the stability of analysis run over time. The agreement in the amino acid composition between the protein sample and the known composition can be used to corroborate the identity and purity of the protein in the sample.

M. Glycan Analysis of Glycoproteins

(Ph. Eur. method 2.2.59)

1 INTRODUCTION

Glycan analysis is a test to analyse glycan moieties of glycoproteins. It may involve:

— whole glycoprotein analysis;
— separation and detection of protein glycoforms;
— analysis of glycopeptides obtained after enzymatic treatment of the glycoprotein;
— analysis of released glycans obtained after chemical or enzymatic treatment of the glycoprotein.

Monosaccharide analysis may complement information obtained by glycan analysis.

Glycosylation can play a predominant role in determining the function, pharmacokinetics, pharmacodynamics, stability, and immunogenicity of biotherapeutics. Glycosylation, unlike transcription, is a non-template-driven enzymatic modification process that results in glycan heterogeneity. The manufacturing procedure also has an influence on glycan heterogeneity. Glycoprotein glycan analysis may therefore be an important test to identify variations in the glycosylation pattern of the glycoprotein and/or monitor the consistency of the glycosylation pattern during production.

Glycan analysis can be a comparative procedure, because the information obtained, compared to a similarly treated reference substance, confirms product consistency.

This chapter provides approaches used for glycoprotein glycan analysis and requirements for the application of methods and validation of methods.

Glycan analysis is not a single general method, but involves the application of specific procedures and the development of specific glycan maps for each unique glycoprotein. Specific procedures are therefore indicated in relevant specific monographs.

1-1 PROTEIN GLYCOSYLATION

There are 3 main types of enzymatic glycosylation found in proteins:

— *N*-glycosylation, which involves the addition of oligosaccharides to the nitrogen on the terminal amide group of asparagine;
— *O*-glycosylation, which involves the addition of oligosaccharides to the hydroxyl groups of serine, threonine, and/or hydroxyproline;
— *C*-glycosylation, which involves the addition of an α-mannopyranose to the C2-carbon of the indole ring of tryptophan.

Non-enzymatic additions, also known as glycation, can occur when proteins are incubated with reducing sugars.

This chapter describes analytical methods for the *N*- and *O*-linked glycosylations, which are the most commonly found in glycoprotein medicinal products.

1-2 HETEROGENEITY OF THE PROTEIN GLYCOSYLATION

Different levels of glycan heterogeneity can appear during the production of glycoproteins. This heterogeneity may result from variations:

— in the degree of occupancy (full, partial, unoccupied);
— in the type of glycosylation (*N*- or *O*-linked);
— in the oligosaccharide structures (extensions, branching and linkage).

This heterogeneity in glycosylation results in a set of glycoforms for one specific glycoprotein. These variations arise because, unlike transcription and translation, glycosylation is a non-template post-translational modification process. The glycosylation pattern at a given site depends on many factors including the cell-specific and/or growth-dependent availability of glycosyltransferases and exo-glycosidases found in the Golgi apparatus and endoplasmic reticulum. Protein glycosylation is also influenced by the protein structure, the production process, the host-vector expression system and the cell culture conditions.

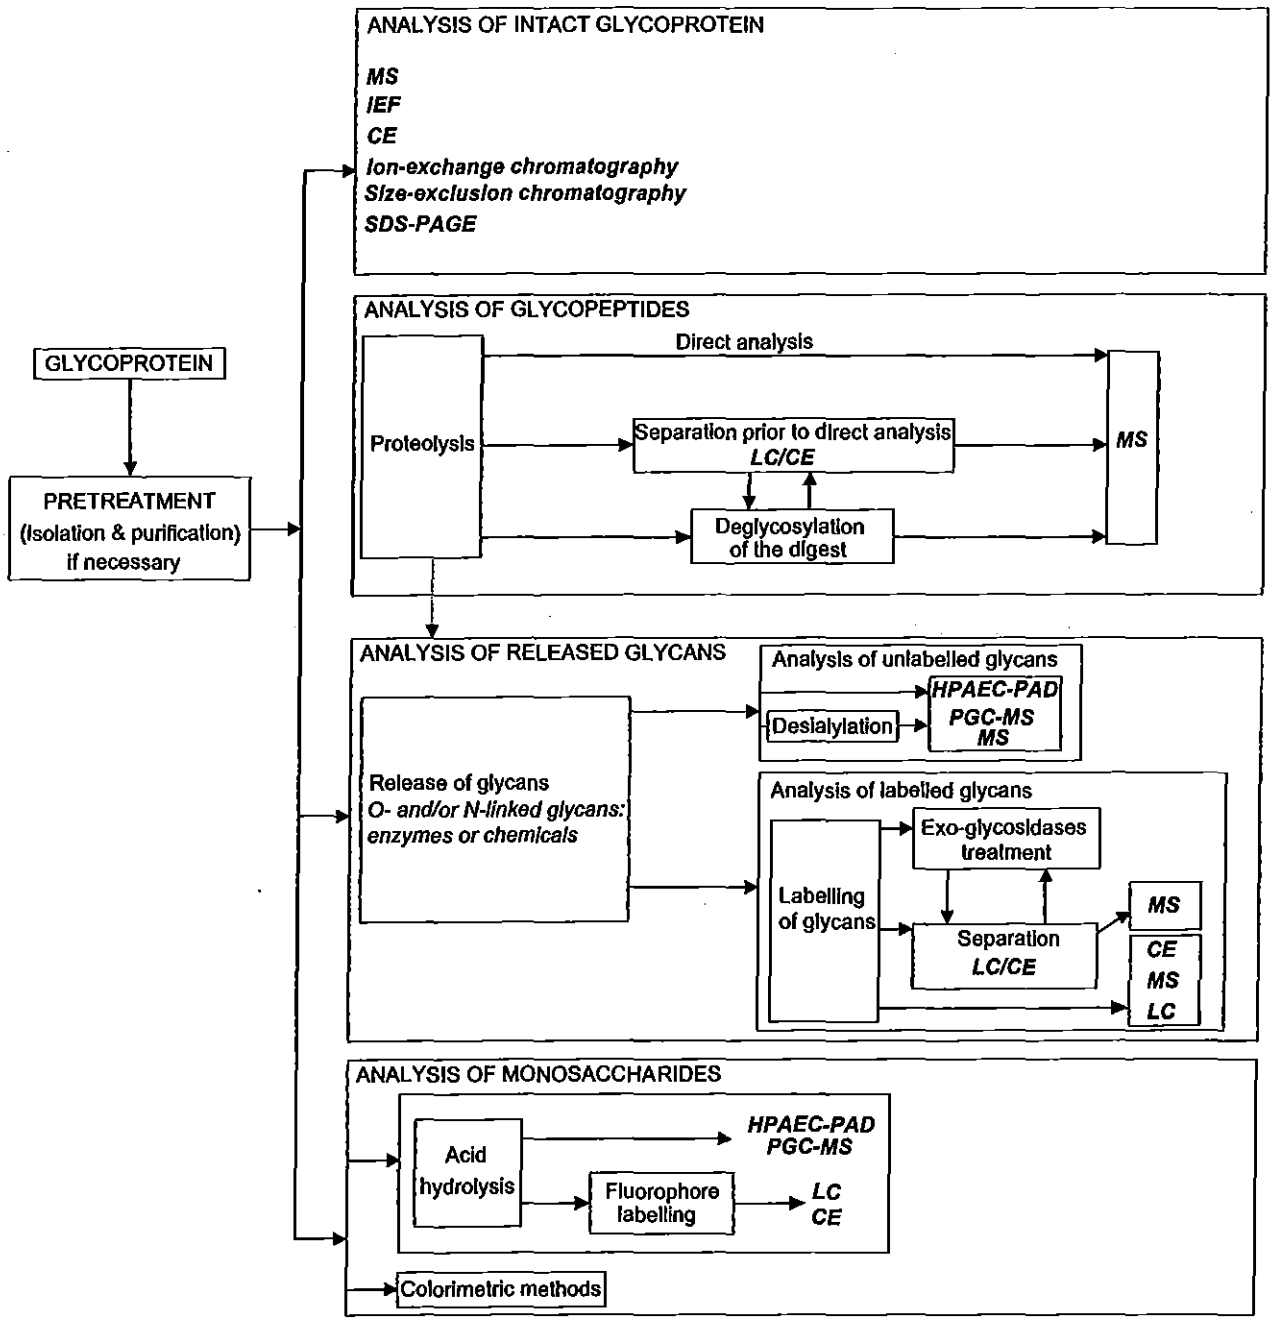
2 GLYCAN ANALYSIS PROCEDURES

Heterogeneity in glycosylation can be assessed by 4 distinct and complementary approaches:

— analysis of the intact glycoprotein;
— analysis of glycopeptides;
— analysis of released glycans;
— monosaccharide analysis.

The present section provides methods and general requirements used for glycan analysis of glycoproteins containing *N*- and *O*-linked glycans.

Glycan analysis is usually a multistep process. There are numerous methodologies for glycan analysis. This variety is a consequence of the diversity and complexity of glycan structures, of the available technologies and detection systems, and of the wide range of approaches depending on the level of information required.



CE: Capillary electrophoresis
HPAEC-PAD: High-pH anion-exchange chromatography with pulsed amperometric detection
IEF: Isoelectric focusing
LC: Liquid chromatography
MS: Mass spectrometry
PGC: Porous graphite chromatography
SDS-PAGE: Sodium dodecyl sulfate polyacrylamide gel electrophoresis

Figure 2.2.59.-1. – *Overview of glycan analysis procedures*

Figure 2.2.59.-1 provides an overview of glycan analysis analytical procedures that can be employed to apply the chosen approach(es). Many variations of the same techniques and conditions are available depending on the glycan structures and origin.

Isolation and purification

Isolation and purification may be necessary for analysis of bulk drug substances or dosage forms containing interfering excipients, and, when required, will be described in the specific monograph.

2-1 ANALYSIS OF INTACT GLYCOPROTEIN

Analysis of the intact glycoprotein provides information on the overall pattern of glycosylation of the glycoprotein.

This approach provides limited information when the molecule is large and contains multiple glycosylation sites.

Methods such as capillary electrophoresis (CE) (*2.2.47*) and mass spectrometry (MS) (*2.2.43*) can be used. Size-based techniques, such as size-exclusion chromatography (*2.2.30*) and sodium dodecyl sulfate polyacrylamide gel electrophoresis (SDS-PAGE) (*2.2.31*), may provide

information on the glycosylation status of a protein. If the degree of sialylation significantly contributes to the biological activity of the glycoprotein, ion-exchange chromatography (*2.2.46*), isoelectric focusing (IEF) (*2.2.54*) or CE (*2.2.47*) may be performed to monitor sialylation. The technique must be chosen according to its suitability to provide a reliable correlation between the degree of sialylation and the bioactivity of the product.

2-2 ANALYSIS OF GLYCOPEPTIDES

Analysis of glycopeptides provides information on site-specific glycosylation properties, on the degree of occupancy, and on the oligosaccharide structures. It involves proteolytic digestion of the glycoprotein. Approaches to site-specific cleavage of the protein backbone are given in general chapter *2.2.55. Peptide mapping.*

After proteolysis of the glycoprotein, the following approaches can be chosen.

Direct analysis by MS (2.2.43) Care should be taken that the glycopeptide signal is not suppressed due to the presence of other peptides, where glycopeptides represent a minor portion of the total peptide mixture and where signal intensities are lower than those of non-glycosylated peptides.

Separation prior to analysis by MS This additional step overcomes the problems raised above. Enrichment or fractionation techniques can be used either in parallel with or sequentially to direct analysis. Separation techniques such as liquid chromatography (LC) (*2.2.29*) and CE (*2.2.47*) are suitable. These techniques may be interfaced with MS to allow online MS measurements.

Deglycosylation of the glycopeptides Identification of the different glycosylation sites of a glycoprotein is made possible by comparing peptide maps obtained by proteolytic digestion of the intact glycoprotein to those obtained when the glycoprotein is deglycosylated previously or following proteolytic digestion. The peptide mass gives information about the glycosylation sites and by calculating the mass difference between the intact glycopeptide and the deglycosylated glycopeptide, it is possible to obtain information about the attached glycans concerning composition and heterogeneity. Approaches to deglycosylation of the protein backbone are given in section 2-3-1. A separation step can be performed after or before deglycosylation.

2-3 ANALYSIS OF RELEASED GLYCANS

Analysis of released glycans provides a convenient way to obtain information on the various populations of glycans present on the protein (bi-, tri-, and tetra-antennary profile). The degree of sialylation can also be addressed at this stage. Depending on the chosen method, prior derivatisation/labelling may be needed to allow the detection of the glycans.

Analysis of released glycans generally involves the release and purification of glycans from the reaction mixture, followed by the labelling/derivatisation of the glycans, where needed; the glycans are then profiled (fractionation or separation).

2-3-1 Release of glycans

The selection of the approach used for the release of glycans will depend on the glycoprotein under test. The cleavage agent to be employed is chosen according to the type of cleavage needed and level of information required. Enzymatic or chemical cleavage may be used. Table 2.2.59.-1 gives a non-exhaustive list of enzymatic cleavage agents and their specificity.

Digestion efficiency is generally dependent on the accessibility of the glycans on the protein and hence the protein can be denatured to maximise glycosylation site exposure, unless it is desirable to distinguish between surface and buried glycans.

Chemical cleavage agents might also be used, using for example hydrazine or alkaline borohydride for β-elimination.

Table 2.2.59.-1. – *Examples of enzymatic cleavage agents*

Agents	Specificity
***N*-linked glycans release**	
Peptide-N^4-(*N*-acetyl-β-glucosaminyl)asparagine amidase (EC 3.5.1.52)	Hydrolysis of an N^4-(acetyl-β-D-glucosaminyl)asparagine residue in which the glucosamine residue may be further glycosylated, to yield a (substituted) *N*-acetyl-β-D-glucosaminylamine and a peptide containing an aspartate residue
- Peptide *N*-glycosidase F (PNGase F)	Release of *N*-glycan chain but no release of *N*-glycan chain containing (α1-3)-linked core fucose
- Peptide *N*-glycosidase A (PNGase A)	Release of *N*-glycan chain containing (α1-3)-linked core fucose
Mannosyl-glycoprotein endo-β-*N*-acetylglucosaminidase (EC 3.2.1.96)	Endohydrolysis of the *N,N'*-diacetylchitobiosyl unit in high-mannose glycopeptides/ glycoproteins containing the -[Man(GlcNAc)$_2$] Asn structure
- Endo-β-*N*-acetylglucosaminidase F (endo F)	Release of high-mannose, hybrid and complex oligosaccharides
- Endo-β-*N*-acetylglucosaminidase H (endo H)	Release of high-mannose, hybrid oligosaccharides
***O*-linked glycans release**	
Glycopeptide α-*N*-acetylgalactosaminidase (EC 3.2.1.97)*	Hydrolysis of terminal D-galactosyl-*N*-acetyl-α-D-galactosaminidic residues
* This enzyme has limited usage because of its high substrate specificity.	

2-3-2 Analysis of glycans

Released glycans can be analysed or profiled by chromatographic, electrophoretic and mass spectrometric techniques, and in general by a combination of these techniques. The choice of the method can be grouped according to the nature of the glycans and level of information required.

Analysis of glycans provides information on the various populations of glycans present on the protein (high-mannose, hybrid, complex). Information on the relative amounts of branched structures might be obtained by analysis of desialylated glycans.

A separation step may be required. It implies the use of LC (*2.2.29*) and CE (*2.2.47*) as intermediate techniques. LC (*2.2.29*) can be used preparatively with individual fractions being collected (usually labelling is required) or can be directly coupled to MS (*2.2.43*).

2-3-2-1 Analysis of unlabelled glycans

Native glycans can be analysed by high-pH anion-exchange chromatography with pulsed amperometric detection (HPAEC-PAD), porous graphite chromatography (PGC) and MS (*2.2.43*).

HPAEC-PAD has high sensitivity and can also separate some linkage isomers. Response factors of the different signals are not equal for the different oligosaccharide structures. Absolute quantification of the glycan is not possible unless an oligosaccharide reference library is available. Quantification can be obtained by comparison with a well-characterised reference standard of the substance being tested, or by relating the peak area of each glycan to the total peak area of all glycans in the map.

PGC can also be used to separate native glycans because of its higher selectivity compared to the conventional non-polar columns. A PGC-electrospray-ionisation-MS approach can be applied for direct glycan analysis.

2-3-2-2 Analysis of labelled glycans

Labelling of glycans

The type of derivatisation carried out will depend on the method used to detect glycans: UV or fluorescent.

Derivatisation with fluorescent labels is the most commonly used technique for labelling glycans at their reducing end by reductive amination. One label can be attached to every single mono- and oligo-saccharide, allowing the determination of molar quantities. Table 2.2.59.-2 gives a non-exhaustive list of commonly used fluorescent labels and suitable analytical techniques.

Table 2.2.59.-2. – *Examples of fluorescent labels and suitable techniques*

Name	Acronym	Analytical techniques
2-Aminobenzoic acid	2-AA	LC (*2.2.29*), MS (*2.2.43*)
2-Aminobenzamide	2-AB	LC (*2.2.29*), MS (*2.2.43*)
2-Aminopyridine	2-AP	LC (*2.2.29*), MS (*2.2.43*)
2-Amino-9(10*H*)-acridinone	AMAC	Gel electrophoresis (*2.2.23*)
Trisodium 8-aminopyrene-1,3,6-trisulfonic acid	APTS	CE (*2.2.47*)

Permethylation of glycans may also be used when MS (*2.2.43*) is used alone for detection. It is based on the methylation of the oligosaccharides.

Analysis of labelled glycans

Labelled glycans can be analysed by analytical techniques such as LC (*2.2.29*), CE (*2.2.47*) and MS (*2.2.43*).

According to the separation properties of the glycans, glycans can be profiled and quantified by several LC (*2.2.29*) systems using an appropriate label: reversed-phase (separation by hydrophobicity), normal-phase (separation by size), and anion-exchange (separation by charge) LC.

2-4 MONOSACCHARIDE ANALYSIS

Monosaccharide analysis provides information on the monosaccharide composition of a glycoprotein. Analysis of monosaccharides can be performed using either colorimetric or separation methods.

2-4-1 Colorimetric methods

The colorimetric methods, which are based on chemical staining, provide information on the quantity of specific classes of sugars such as sialic acids, neutral sugars and hexosamines.

2-4-2 Separation methods

The separation methods generate quantitative information on the overall monosaccharide composition. The methods require acid hydrolysis pre-treatment of the oligosaccharide chains of the intact glycoprotein or released glycans, prior to analysis. To release sialic acids, mild acid hydrolysis or enzymatic treatment is employed. The hydrolysis step is a significant source of variability and may require product-specific validation.

Methods for separation and quantification of monosaccharides include:

— the use of HPAEC-PAD and PGC-MS, which allow the determination of molar quantities of native monosaccharides (sialic acids, neutral sugars and alcohol sugars);

— fluorophore labelling of monosaccharides followed by separation methods such as reversed-phase or ion-exchange chromatography, or CE.

3 EVALUATION AND ANALYSIS OF DATA

Data obtained from analytical methods for the analysis of glycans can be analysed and evaluated for 3 different purposes:

— confirmation of identity of individual structures or families of structures;

— confirmation of compliance of the substance being tested with qualitative requirements;

— confirmation of compliance of the substance being tested with quantitative requirements.

Specific considerations with respect to reference standards and method development of each level of analysis are set out in sections 4 and 5 respectively.

3-1 CONFIRMATION OF IDENTITY OF INDIVIDUAL STRUCTURES OR FAMILIES OF STRUCTURES

The analytical target for a glycan analysis method may be an individual monosaccharide (e.g. sialic acid, fucose), a defined oligosaccharide structure (e.g. tetra-sialylated, tetra-antennary glycan) or a family of structures sharing a common analytical feature (e.g. tetra-sialylated glycans, tri-antennary glycans, glycoprotein isoforms with the same charge). Confirmation of the identity of the analytical target is an essential step in the analysis and evaluation of data, and can be achieved absolutely, by verification of molecular structure, or comparatively, by comparison with an appropriate reference standard.

3-1-1 Absolute confirmation of identity

Absolute confirmation of the identity of glycan structures is typically achieved during product development, and should not necessarily be the target of routine analysis. Identity of the analytical target will be assigned by reference to a known molecular property of the molecule. Such absolute identification of individual structures can require multi-step approaches using enzymatic and chemical reactions, separation techniques and online or offline detection methods, and will most commonly use the charge-to-mass ratio of a molecular ion, determined using a suitable mass spectrometric method as the final basis for structure assignment.

3-1-2 Comparative confirmation of identity

During routine application of the analytical method, the identity of the analytical target may be confirmed by comparison with process or system suitability reference standards. These may be generated from known, well-characterised glycoproteins, which may be of the same general class as the product being tested (e.g. fetuin for complex *N*-linked glycoproteins), or may be derived from a well-characterised batch of the product being tested, which has been established as a reference standard. The following

considerations apply to comparative assignment of structural identity:
- in the case of a validated high reproducibility of the retention times, the absolute retention times can be used for correct assignment;
- alternatively, a glycan marker can be injected at the beginning and at the end of the testing sequence and checked for any drifts in the retention times; based on these reference chromatograms the glycans of the test samples can be assigned;
- in cases where no standard is available to assign all glycan peaks in the test sample, absolute or normalised retention times can be used to monitor and label unidentified glycan peaks.

3-2 CONFIRMATION OF COMPLIANCE OF THE SUBSTANCE BEING TESTED WITH QUALITATIVE REQUIREMENTS

At this level of evaluation, the analytical results obtained with the product being tested are evaluated to demonstrate compliance with specifications. Typically this is achieved by comparison with data obtained in parallel using a reference standard of the substance being tested. In evaluating the data it is necessary:
- to establish that the analytical result obtained using the reference standard is broadly comparable to the expected result, to verify the suitability of the system; for example, in a glycan mapping procedure, this would be achieved by comparison of the map obtained with the reference substance with a provided specimen map obtained during establishment of the reference substance, and by ensuring compliance with all stated system suitability criteria;
- to demonstrate similarity of the maps obtained with the reference substance and the test substance, using any specific compliance criteria given in the specific monograph.

3-3 CONFIRMATION OF COMPLIANCE OF THE SUBSTANCE BEING TESTED WITH QUANTITATIVE REQUIREMENTS

3-3-1 Quantitative measurement of analyte levels and expression of results

In some cases, e.g. measurement of sialic acid or other monosaccharides, data can be expressed in order to obtain a molar ratio of sialic acid to glycoprotein. Data is calculated by reference to a reference standard for sialic acid and to a validated method of protein determination. Either the internal or external standard method may be used (see general chapter *2.2.46. Chromatographic separation techniques*).

3-3-2 Quantitative expressions of separation profile

Profiles or distribution patterns may be expressed numerically in a number of ways, including the normalisation procedure; the percentage content of each analytical target, e.g. glycan entity, is calculated by determining the response of the glycan entity as a percentage of the total response of all the entities, excluding those due to solvents or any added reagents, and those below the disregard limit. In addition, numerical expressions such as the *Z* number, which are method- and product-specific and defined in specific monographs, can be used.

4 REFERENCE STANDARDS

Reference standards for glycan analysis serve 2 functions: the verification of the suitability of the system and the confirmation that the article under test complies with specified requirements.

The reference standards used for system suitability may be:
- a reference substance for the substance being tested;
- glycan moities liberated from a fully characterised reference standard of the substance being tested;
- well-characterised glycan moities liberated from glycoproteins (e.g. fetuin, IgG);
- glycan markers characterised for identity and purity.

The reference standard used for compliance of the glycoprotein under test is a preparation of the substances being tested. It is noted that glycan analysis procedures described in specific monographs prescribe the use of a reference standard for the substance being tested and for which the glycan analysis procedure has been validated.

5 POINTS TO CONSIDER IN METHOD DEVELOPMENT

This section provides means for measuring the overall performance of the method during development. The extent of method development and analytical validation is selected on the basis of their suitability for a specific product. Depending on the chosen approach, several steps are necessary for glycan analysis, for example:
- isolation and purification (or desalting) of the glycoprotein;
- enzymatic (or chemical) treatment of the glycoprotein to selectively release either *N*- or *O*-linked glycans from the protein backbone;
- isolation and purification of the released glycans;
- verification of released sialic acid and monosaccharide residues;
- chromophore labelling of the released glycans;
- separation of the glycans, native or fluorescence labelled;
- glycan identification and quantification (e.g. determination of the *Z* number);
- determination of site occupancy based on relative quantities of glycosylated and non-glycosylated peptides.

Protein isolation and purification

Isolation and purification of the glycoprotein from its matrix may be necessary to remove all interfering substances (e.g. excipients, salts) and, when required, will be specified in the specific monograph. This must be performed in a reproducible manner in order to guarantee a quantitative recovery of the protein.

Release and isolation of oligosaccharides

The approach chosen for the release of glycans will depend on the protein under test and will be based on the types of glycosylation, i.e. *N*- or *O*-linked glycosylation. Non-compendial approaches available for the release of glycans must be optimised in order to ascertain a quantitative profiling of all glycan entities. Factors that impact cleavage efficiency, such as enzyme-to-protein concentration ratio, temperature, reaction time course, and denaturation of protein prior to digestion, must be optimised.

It is noteworthy that the enzymatic/chemical reaction must not alter the glycan composition, e.g. not destroy sialic acid residues. Where there is more than one glycosylation site, the enzymatic treatment should proportionally release all oligosaccharide moieties attached to the protein, independent of their structure and their individual position in the protein. Reproducible recovery of all glycan entities from the reaction mixture must be confirmed.

Derivatisation of released glycans

Derivatisation is usually carried out according to non-compendial protocols. Therefore, the reproducible derivatisation of all glycan entities must be verified. This may be achieved through optimisation of the reaction conditions such as amount of the derivatisation reagent, reaction temperature and time. The derivatisation reaction must not

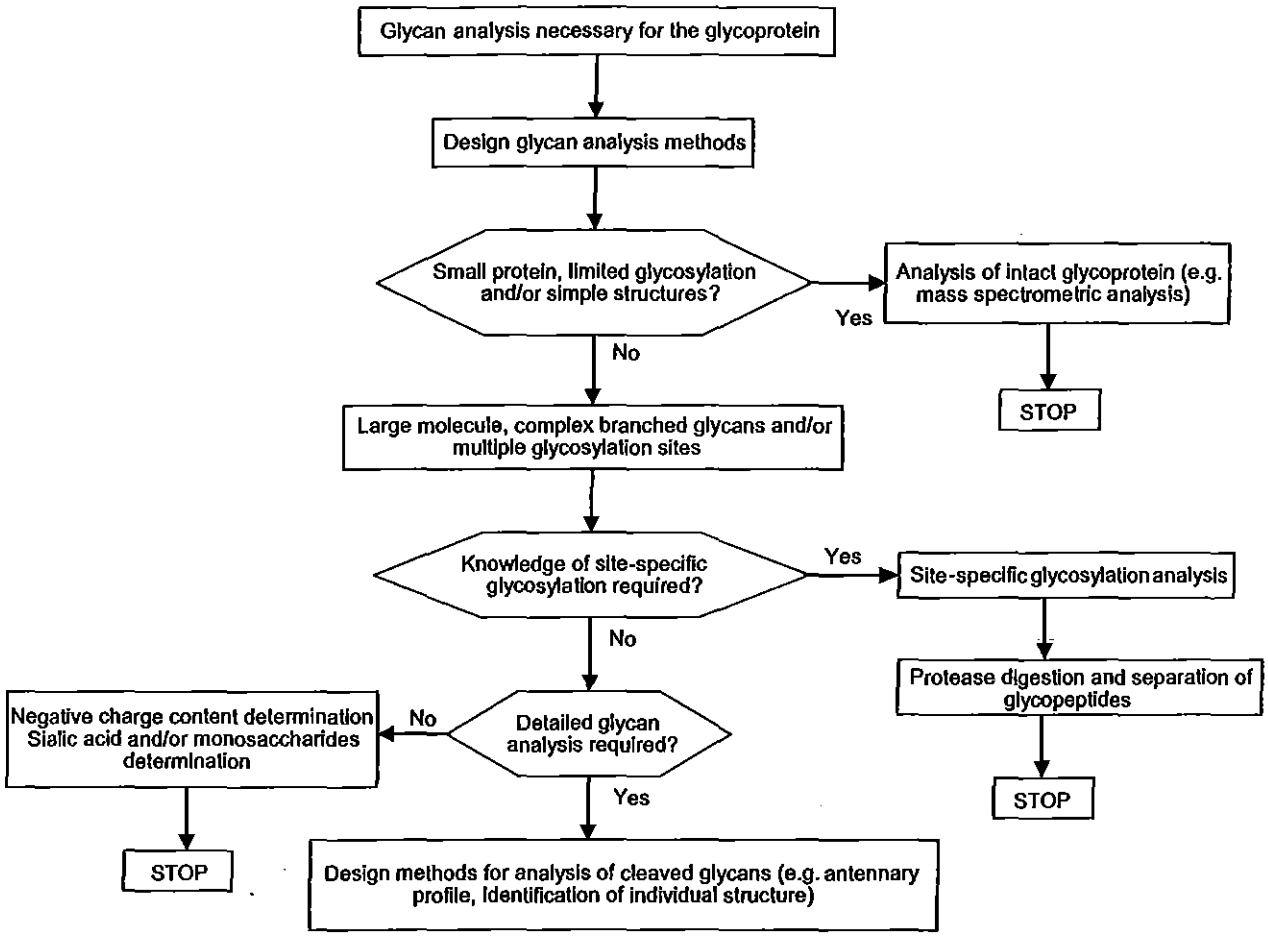


Figure 2.2.59.-2. – *Guidance on methods to be used when glycan analysis is required*

change the glycan composition, e.g. not destroy sialic acid residues.

Separation, identification and system suitability

The methods employed for glycan analysis must be capable of detecting and separating different glycan moieties to ascertain a reliable identification and quantification.

The acceptance criteria for system suitability, which also cover glycan cleavage, recovery and analysis, depend on the critical test parameters that affect the outcome of the result.

A comparison between the glycan map of the substance under test and that of a reference substance, being treated in the same conditions, is an indicator to evaluate the performance of the analytical procedure. In order to further confirm the obtained results, the analyses may be repeated with an orthogonal method. The use of a reference standard (e.g. reference substance of the product being examined, system suitability glycan marker) is essential in the establishment of system suitability parameters and validation of the analytical procedure.

Reproducibility of quantitative expression (e.g. *Z* number estimation) of glycan profiles must be verified.

Determination of site occupancy based on relative quantities of glycosylated and non-glycosylated peptides

Where site occupancy is estimated by comparison of glycosylated and non-glycosylated peptides from an enzymatically digested glycoprotein, reproducible cleavage of both forms of the peptide must be demonstrated.

6 GLYCAN ANALYSIS DECISION-MAKING FRAMEWORK

This decision-making framework is given for information and does not constitute a mandatory part of the European Pharmacopoeia.

The choice of procedures used to analyse glycans is established according to the level of information required to ensure the quality of the glycoprotein and is set up during the development phase of the product.

Figure 2.2.59.-2 provides guidance in the choice of methods to be used when glycan analysis is required.

Appendix IV

A. Clarity of Solution

(Ph. Eur. method 2.2.1)

Opalescence is the effect of light being absorbed or scattered by submicroscopic particles or optical density inhomogeneities. The absence of any particles or inhomogeneities in a solution results in a clear solution.

A liquid is considered *clear* if its clarity is the same as that of *water R* or of the solvent used, or if its opalescence is not more pronounced than that of reference suspension I (see Table 2.2.1.-1), when examined under the conditions described below.

Requirements in monographs are expressed in terms of the visual method by comparing with the defined reference suspensions (see Table 2.2.1.-1). However, instrumental methods may also be used for determining compliance with monograph requirements once the suitability of the instrument has been established as described below and calibration with reference suspensions I-IV and with *water R* or the solvent used has been performed.

VISUAL METHOD

Using identical test-tubes of colourless, transparent, neutral glass with a flat base and an internal diameter of 15-25 mm, compare the liquid to be examined with a reference suspension freshly prepared as described below. Ensure that the depths of the layers in the 2 test-tubes are the same (about 40 mm).

Compare the liquids in diffused daylight 5 min after preparation of the reference suspension, viewing vertically against a black background.

System suitability The diffusion of light must be such that reference suspension I can readily be distinguished from *water R*, and that reference suspension II can readily be distinguished from reference suspension I (see Table 2.2.1.-1).

INSTRUMENTAL METHOD

The instrumental assessment of clarity and opalescence provides a more discriminatory test that does not depend on the visual acuity of the analyst. Numerical results are more useful for process control and quality monitoring, especially in stability studies. For example, previous numerical data on stability can be extrapolated to determine whether a given batch of a preparation will exceed shelf-life limits prior to the expiry date.

TURBIDIMETRY AND NEPHELOMETRY

When a suspension is viewed at right angles to the direction of the incident light, the system appears opalescent due to the scattering of light by the particles of the suspension (Tyndall effect). A certain portion of the light beam entering a turbid liquid is transmitted, another portion is absorbed and the remaining portion is scattered by the suspended particles. The light-scattering effect of suspended particles can be measured either indirectly by observation of the transmitted light (turbidimetry) or directly by measuring the scattered light (nephelometry). Turbidimetry and nephelometry are more reliable in low turbidity ranges, where there is a linear relationship between turbidity values and detector signals. As the degree of turbidity increases, not all the particles are exposed to the incident light and the scattered or the transmitted radiation of other particles is hindered on its way to the detector.

For quantitative measurements, the construction of calibration curves is essential. Linearity must be based on at least 4 levels of concentrations. Reference suspensions must show a sufficiently stable degree of turbidity and must be produced under well-defined conditions.

MEASUREMENTS IN RATIO MODE

The determination of opalescence of coloured liquids is done using instruments with ratio mode, since colour provides a negative interference, attenuating both incident and scattered light and lowering the turbidity value. The effect is so great, even for moderately coloured samples, that conventional nephelometers cannot be used.

In turbidimetry or nephelometry with ratio mode, the ratio of the transmission measurement to the 90° scattered light measurement is determined. This procedure compensates for the light that is diminished by the colour of the sample. Instruments with ratio mode use as light source a tungsten lamp with spectral sensitivity at about 550 nm operating at a filament colour temperature of 2700 K. Other suitable light sources may also be used. Silicon photodiodes and photomultipliers are commonly used as detectors and record changes in light scattered or transmitted by the sample. The light scattered at 90 ± 2.5° is measured by the primary detector. Other detectors measure back and forward scatter (reflected light) as well as transmitted light. The results are obtained by calculating the ratio of the 90° scattered light measured to the sum of the components of forward scattered and transmitted light values.

The instruments used are calibrated against standards of known turbidity and are capable of automatic measurement of turbidity. The test results are obtained directly from the instrument and compared to the specifications in the individual monograph.

Alternatively, the influence of the colour of the sample may also be eliminated by using an infrared light-emitting diode (IR LED) having an emission maximum at 860 nm with a 60 nm spectral bandwidth as the light source of the instrument.

INSTRUMENT REQUIREMENTS

Instruments complying with the following characteristics and verified using reference suspensions as described below may be used instead of visual examination for determination of compliance with monograph requirements.

- *Measuring unit*: NTU (nephelometric turbidity units). NTU is based on the turbidity of a primary standard of formazin. FTU (formazin turbidity units) or FNU (formazin nephelometric units) are also used, and are equivalent to NTU in regions of low turbidity (up to 40 NTU). These units are used in all 3 instrumental methods (nephelometry, turbidimetry and in ratio mode).
- *Measuring range*: 0.01-1100 NTU.
- *Resolution*: 0.01 NTU within the range 0-9.99 NTU; 0.1 NTU within the range 10.0-99.9 NTU; and 1 NTU for the range > 100 NTU.
- *Accuracy*: ± (10 per cent of reading + 0.01 NTU) within the range 0-20 NTU; ± 7.5 per cent within the range 20-1100 NTU.
- *Repeatability*: ± 0.05 NTU within the range 0-20 NTU; ± 2 per cent of the reading within the range 20-1100 NTU.

Instruments with measuring range or resolution, accuracy and repeatability capabilities other than those mentioned above may be used provided they are sufficiently validated and are capable for the intended use.

CONTROL OF INSTRUMENT PERFORMANCE

— *Calibration*: performed with at least 4 reference suspensions of formazin covering the measuring range of interest. Reference suspensions described in this chapter or suitable reference standards calibrated against the primary reference suspensions may be used.

— *Stray light*: < 0.15 NTU within the range 0-10 NTU; < 0.5 NTU within the range 10-1100 NTU. Stray light is defined as that light that reaches the nephelometric detector without being a result of scatter from the sample. Stray light is always a positive interference and is a significant source of error in low-range turbidity measurements. Sources of stray light include: imperfections in and scratches on sample cells, internal reflections of the optical system, contamination of the optics or sample cell chamber with dust, and electronic noise. Instrument design can also affect stray light. The influence of stray light becomes negligible in ratio mode measurements.

The test methodology for the specific substance/product to be analysed must also be verified to demonstrate its analytical capability. The instrument and methodology shall be consistent with the attributes of the substance to be examined.

Measurements of standards and samples should be carried out under the same temperature conditions, preferably between 20 °C and 25 °C.

REFERENCE SUSPENSIONS

Formazin has several desirable characteristics that make it an excellent turbidity standard. It can be reproducibly prepared from assayed raw materials. The physical characteristics make it a desirable light-scatter calibration standard. The formazin polymer consists of chains of different lengths, which fold into random configurations. This results in a wide variety of particle shapes and sizes, which allows the analysis of different particle sizes and shapes that are found in real samples. Stabilised formazin suspensions that can be used to prepare stable, diluted turbidity standards are commercially available and may be used after comparison with the standards prepared as described.

All steps of the preparation of reference suspensions as described below are carried out at 25 ± 3 °C.

Hydrazine sulfate solution

Dissolve 1.0 g of *hydrazine sulfate R* in *water R* and dilute to 100.0 mL with the same solvent. Allow to stand for 4-6 h.

Primary opalescent suspension (formazin suspension)

In a 100 mL ground-glass-stoppered flask, dissolve 2.5 g of *hexamethylenetetramine R* in 25.0 mL of *water R*. Add 25.0 mL of the hydrazine sulfate solution. Mix and allow to stand for 24 h. This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be mixed thoroughly before use.

Standard of opalescence

Dilute 15.0 mL of the primary opalescent suspension to 1000.0 mL with *water R*. This suspension is freshly prepared and may be stored for up to 24 h.

Reference suspensions

Prepare the reference suspensions according to Table 2.2.1.-1. Mix and shake before use.

Table 2.2.1.-1

	I	II	III	IV
Standard of opalescence	5.0 mL	10.0 mL	30.0 mL	50.0 mL
Water R	95.0 mL	90.0 mL	70.0 mL	50.0 mL

Measurements of reference suspensions I-IV in ratio mode show a linear relationship between the concentrations and measured NTU values (see Table 2.2.1.-2).

Table 2.2.1.-2

Formazin suspensions	Opalescent values (NTU)
Reference suspension I	3
Reference suspension II	6
Reference suspension III	18
Reference suspension IV	30
Standard of opalescence	60
Primary opalescent suspension	4000

B. Colour of Solution[1]

(Ph. Eur. method 2.2.2)

◊A solution is *colourless* if it has the appearance of *water R* or the solvent used for the preparation of the solution to be examined, or is not more intensely coloured than reference solution B_9.

Report the results together with the method used (method I, method II or method III).

VISUAL METHODS

The examination of the degree of coloration of liquids in the range brown-yellow-red is carried out using one of the 2 methods below, as prescribed in the monograph.

METHOD I

Using identical tubes of colourless, transparent, neutral glass with an external diameter of 12 mm, compare 2.0 mL of the liquid to be examined with 2.0 mL of *water R*, of the solvent used for the preparation of the solution to be examined, or of the reference solution (see Tables of reference solutions) prescribed in the monograph. Compare the colours in diffuse daylight, viewing horizontally against a white background.

METHOD II

Using identical tubes of colourless, transparent, neutral glass with a flat base and an internal diameter of 15-25 mm, compare the liquid to be examined with *water R*, with the solvent used for the preparation of the solution to be examined, or with the reference solution (see Tables of reference solutions) prescribed in the monograph, the depth of the layer being 40 mm. Compare the colours in diffuse daylight, viewing vertically against a white background.

PREPARATION OF REFERENCE SOLUTIONS

Primary solutions

Yellow solution Dissolve 46 g of *ferric chloride R* in about 900 mL of a mixture of 25 mL of *hydrochloric acid R* and 975 mL of *water R* and dilute to 1000.0 mL with the same mixture. Titrate and adjust the solution to contain 45.0 mg of $FeCl_3,6H_2O$ per millilitre by adding the same acidic mixture. Protect the solution from light.

Titration. In a 250 mL conical flask fitted with a ground-glass stopper, introduce 10.0 mL of the solution, 15 mL of

[1] *This chapter has undergone pharmacopoeial harmonisation. See chapter 5.8. Pharmacopoeial harmonisation.*

water R, 5 mL of *hydrochloric acid R* and 4 g of *potassium iodide R*, close the flask, allow to stand in the dark for 15 min and add 100 mL of *water R*. Titrate the iodine released with *0.1 M sodium thiosulfate*, using 0.5 mL of *starch solution R*, added towards the end of the titration, as indicator.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 27.03 mg of $FeCl_3,6H_2O$.

Red solution Dissolve 60 g of *cobalt chloride R* in about 900 mL of a mixture of 25 mL of *hydrochloric acid R* and 975 mL of *water R* and dilute to 1000.0 mL with the same mixture. Titrate and adjust the solution to contain 59.5 mg of $CoCl_2,6H_2O$ per millilitre by adding the same acidic mixture.

Titration. In a 250 mL conical flask fitted with a ground-glass stopper, introduce 5.0 mL of the solution, 5 mL of *dilute hydrogen peroxide solution R* and 10 mL of a 300 g/L solution of *sodium hydroxide R*. Boil gently for 10 min, allow to cool and add 60 mL of *dilute sulfuric acid R* and 2 g of *potassium iodide R*. Close the flask and dissolve the precipitate by shaking gently. Titrate the iodine released with *0.1 M sodium thiosulfate*, using 0.5 mL of *starch solution R*, added towards the end of the titration, as indicator. The end-point is reached when the solution turns pink.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 23.79 mg of $CoCl_2,6H_2O$.

Blue primary solution Dissolve 63 g of *copper sulfate pentahydrate R* in about 900 mL of a mixture of 25 mL of *hydrochloric acid R* and 975 mL of *water R* and dilute to 1000.0 mL with the same mixture. Titrate and adjust the solution to contain 62.4 mg of $CuSO_4,5H_2O$ per millilitre by adding the same acidic mixture.

Titration. Into a 250 mL conical flask fitted with a ground-glass stopper, introduce 10.0 mL of the solution, 50 mL of *water R*, 12 mL of *dilute acetic acid R* and 3 g of *potassium iodide R*. Titrate the iodine released with *0.1 M sodium thiosulfate*, using 0.5 mL of *starch solution R*, added towards the end of the titration, as indicator. The end-point is reached when the solution shows a slight pale brown colour.

1 mL of *0.1 M sodium thiosulfate* is equivalent to 24.97 mg of $CuSO_4,5H_2O$.

Standard solutions

Using the 3 primary solutions, prepare the 5 standard solutions as follows.

Table 2.2.2.-1.

Standard solution	Volumes in millilitres			
	Yellow solution	Red solution	Blue solution	Hydrochloric acid (10 g/L HCl)
B (brown)	3.0	3.0	2.4	1.6
BY (brownish-yellow)	2.4	1.0	0.4	6.2
Y (yellow)	2.4	0.6	0.0	7.0
GY (greenish-yellow)	9.6	0.2	0.2	0.0
R (red)	1.0	2.0	0.0	7.0

Reference solutions for Methods I and II

Using the 5 standard solutions, prepare the following reference solutions.

Storage

For Method I, the reference solutions may be stored in sealed tubes of colourless, transparent, neutral glass of 12 mm external diameter, protected from light.

For Method II, prepare the reference solutions immediately before use from the standard solutions.◊

INSTRUMENTAL METHOD – METHOD III

PRINCIPLE

The observed colour of an object depends primarily on its light-absorbing characteristics. However, a variety of conditions such as light-source differences, spectral energy of the illuminant, visual sensitivity of the observer, size differences, background differences and directional differences affect the perception of colour. Hue, lightness (or brightness) and saturation are 3 attributes of the colour. Instrumental measurement under defined conditions allows numerical expression of a colour. The base of any instrumental measurement of colour is that the human eye has been shown to detect colour via 3 types of receptors.

Instrumental methods for measurement of colour provide more objective data than the subjective viewing of colours by a small number of individuals. With adequate maintenance and calibration, instrumental methods can provide accurate, precise and consistent measurements of colour that do not drift with time. Through extensive colour-matching experiments with human subjects having normal colour vision, distribution coefficients (weighting factors) have been established for each wavelength in the visible spectrum, giving the relative amount of stimulation of each receptor type caused by the light of that wavelength.

The International Commission on Illumination (CIE) has developed models taking into account the light source and the angle at which the observer is looking at the target (field of view). In a visual test for coloration of solutions, there are requirements that lead to the use of a 2° angle and diffuse daylight (illuminant C). The mean sensitivity of the human eye is represented by the distribution coefficients $\bar{x}_\lambda$, $\bar{y}_\lambda$ and $\bar{z}_\lambda$ (Figure 2.2.2.-1).

For any colour, the amount of stimulation of each receptor type is defined by the set of tristimulus values (*XYZ*).

The relationship between the distribution coefficients and the tristimulus values (*X*, *Y* and *Z*) is given by the following equations, expressed in terms of integrals:

$$X = k\int_0^\infty f_\lambda \bar{x}_\lambda S_\lambda d\lambda$$

$$Y = k\int_0^\infty f_\lambda \bar{y}_\lambda S_\lambda d\lambda$$

$$Z = k\int_0^\infty f_\lambda \bar{z}_\lambda S_\lambda d\lambda$$

$$k = 100 / \int_0^\infty \bar{y}_\lambda S_\lambda d\lambda$$

k = normalising constant characterising the stimulation of one receptor type and the used illumination;

S_λ = relative spectral power distribution of the illuminant;

$\bar{x}_\lambda$, $\bar{y}_\lambda$ and $\bar{z}_\lambda$ = colour matching distribution coefficients for CIE 2° Standard Observer;

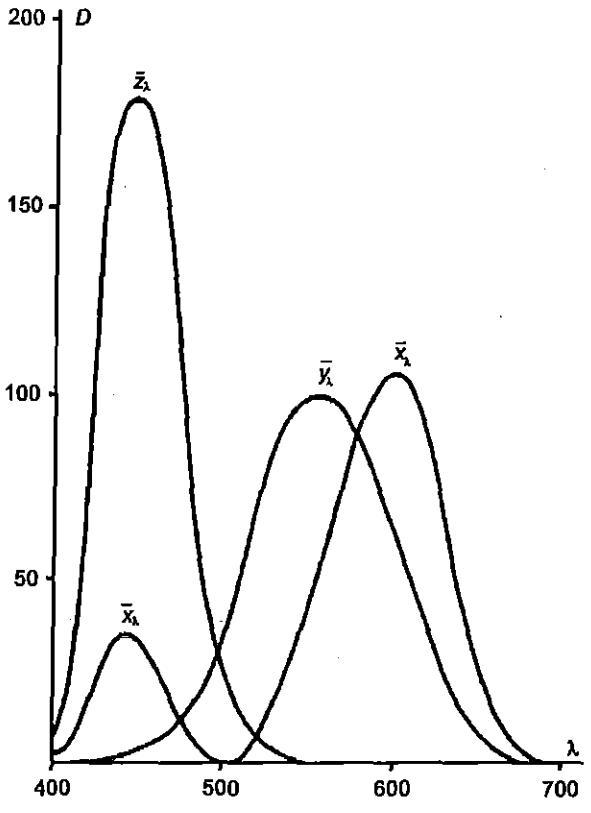

Figure 2.2.2.-1. – *Mean sensitivity of the human eye represented by distribution coefficients, CIE 2° Standard Observer (D = distribution coefficient; λ = wavelength in nanometres)*

f_λ = spectral transmittance T_λ of the material;

λ = wavelength, in nanometres.

In practical calculations of tristimulus values, the integration is approximated by a summation, as follows:

$$X = k\sum_\lambda T_\lambda \bar{x}_\lambda S_\lambda \Delta\lambda$$

$$Y = k\sum_\lambda T_\lambda \bar{y}_\lambda S_\lambda \Delta\lambda$$

$$Z = k\sum_\lambda T_\lambda \bar{z}_\lambda S_\lambda \Delta\lambda$$

$$k = \frac{100}{\sum_\lambda S_\lambda \bar{y}_\lambda \Delta\lambda}$$

The tristimulus values can be used to calculate the CIE *Lab* colour space co-ordinates: *L*(lightness or brightness)*, *a*(red-green)* and *b*(yellow-blue)*; these are defined by:

$$L^* = 116f(Y/Y_n) - 16$$

$$a^* = 500[f(X/X_n) - f(Y/Y_n)]$$

$$b^* = 200[f(Y/Y_n) - f(Z/Z_n)]$$

where X_n, Y_n and Z_n are the tristimulus values of *water R* and

$f(X/X_n) = (X/X_n)^{1/3}$ if $X/X_n > (6/29)^3$

otherwise $f(X/X_n) = 841/108(X/X_n) + 4/29$;

$f(Y/Y_n) = (Y/Y_n)^{1/3}$ if $Y/Y_n > (6/29)^3$

otherwise $f(Y/Y_n) = 841/108(Y/Y_n) + 4/29$;

$f(Z/Z_n) = (Z/Z_n)^{1/3}$ if $Z/Z_n > (6/29)^3$

otherwise $f(Z/Z_n) = 841/108(Z/Z_n) + 4/29$.

In the spectrophotometric method, transmittance values are obtained at discrete wavelengths throughout the visible spectrum. These values are then used to calculate the tristimulus values through the use of weighting factors $\bar{x}_\lambda$, $\bar{y}_\lambda$, and $\bar{z}_\lambda$ for a 2° Standard Observer and CIE standard illuminant C (see the current International Commission on Illumination publication, CIE).

SPECTROPHOTOMETRIC METHOD

Using a suitable spectrophotometer according to the manufacturer's instructions, determine the transmittance (T) at least over the range 400-700 nm, at intervals of not greater than 10 nm. Express the result as a percentage. Calculate the tristimulus values X, Y, and Z and the colour co-ordinates L^*, a^* and b^*.

DETERMINATION OF COLORATION

Calibrate the instrument according to the manufacturer's recommendations. Carry out system performance tests prior to each measurement or at regular intervals, depending on the use of the apparatus. For this purpose, use certified reference materials within the measurement range.

Operate the apparatus according to the manufacturer's instructions and test the sample solution and reference solution(s) under the same conditions (e.g. path length of the cuvette, temperature).

For transmittance measurements, use *water R* as the standard, assigning it a transmittance of 100.0 per cent at all wavelengths in the visible spectrum. Then the weighting factors $\bar{x}_\lambda$, $\bar{y}_\lambda$ and $\bar{z}_\lambda$ for CIE standard illuminant C are used to calculate the tristimulus values corresponding to colour co-ordinates $L^* = 100$, $a^* = 0$ and $b^* = 0$.

Reference measurements can be made using the colour co-ordinates of *water R* or freshly prepared pharmacopoeial reference solutions, or using the respective colour co-ordinates stored in the instrument manufacturer's database, provided the latter have been obtained under the same testing conditions.

If the test solution is turbid or hazy, it is filtered or centrifuged. If the test solution is not filtered or centrifuged, any haziness or turbidity is reported with the results. Air bubbles are to be avoided or, where applicable, removed.

The instrumental method is used to compare 2 solutions in terms of their colour or colour difference, or a deviation from a defined colour. Calculate the colour difference (ΔE^*_{tr}) between the test solution (t) and a reference solution (r) using the following equation:

$$\Delta E^*_{tr} = \sqrt{(\Delta L^*)^2 + (\Delta a^*)^2 + (\Delta b^*)^2}$$

where ΔL^*, Δa^* and Δb^* are the differences in colour co-ordinates.

The CIE *LCh* colour co-ordinates may be used instead of the CIE *Lab* colour co-ordinates.

Assessment of location within the $L^*a^*b^*$ colour space

Instruments may provide information on the actual location of the test solution within the $L^*a^*b^*$ colour space. Using appropriate algorithms, correspondence to pharmacopoeial reference solutions (such as 'test solution equals reference solution XY', 'test solution close to reference solution XY' or 'test solution between reference solutions XY and XZ') can be obtained.

Appendix V

A. Determination of Melting Point

Method I

(Ph. Eur. method 2.2.14)

The melting point determined by the capillary method is the temperature at which the last solid particle of a compact column of a substance in a tube passes into the liquid phase (i.e. clear point). The melting point determined by this method is specific to the methodology (e.g. heating rate) described in this chapter. Similarly, whenever the use of certified reference materials is required, their certified values refer to the described analytical procedure.

When prescribed in the monograph, the same apparatus and method are used for the determination of other factors, such as meniscus formation or melting range, that characterise the melting behaviour of a substance.

Equipment The equipment consists of a metal heating block with 1 or more compartments for capillary tubes, or of a suitable glass vessel containing a liquid bath (e.g. water, liquid paraffin or silicone oil) and fitted with a suitable means of heating and stirring. The equipment is equipped with a temperature sensor or a suitable certified thermometer allowing readings at least to the nearest 0.1 °C.

Samples are introduced into the equipment in glass capillary tubes. The dimensions are chosen according to the manufacturer's requirements, typically with an external diameter of 1.3-1.5 mm and a wall thickness of 0.1-0.3 mm. In some equipment glass slides are used instead of capillary tubes.

The equipment is capable of heating samples at a rate of 1 °C/min or less. The accuracy of the equipment is at most ± 0.5 °C.

Detection can be performed either visually or instrumentally. In the case of instrumental detection, this is generally performed by image recording and subsequent analysis or by a photodetector that measures the transmitted or reflected light from the sample.

Method The substance is previously treated as described in the monograph. Coarse crystals are to be avoided as they might lead to false results. If necessary, samples are crushed into a fine powder. Unless otherwise prescribed, dry the finely powdered substance *in vacuo* over *anhydrous silica gel R* for 24 h. Introduce a sufficient quantity into a capillary tube to give a compact column as described by the instrument manufacturer (e.g. 4-6 mm in height). Raise the temperature of the apparatus to about 5 °C below the presumed melting point. Allow the temperature to stabilise and then introduce the capillary tube into the instrument. Finally, adjust the rate of heating to about 1 °C/min unless otherwise prescribed.

In the case of instrumental detection, follow the instrument manufacturer's requirements for the determination of the melting point. For visual detection, record the temperature at which the last particle of the substance to be examined passes into the liquid phase.

Samples can be measured in parallel if the instrument allows multiple sample processing.

System suitability Carry out a system suitability test before the measurements for example by choosing a suitable reference material with a melting point close to that expected for the substance to be examined.

Qualification / Calibration of the equipment The qualification / calibration is carried out periodically according to the instrument manufacturer's requirements, using at least 2 certified reference materials. These are selected to cover the temperature range that is used on the equipment.
Use capillary tubes with the same dimensions as those used for sample measurement.

Guidance on how to compare results obtained from certified reference materials with values from the certificates can be found on the European Reference Materials (ERM) website (Application note 1).

Method II

(No Ph. Eur. method)

Apparatus

(*a*) A glass heating vessel of suitable construction and capacity containing one of the following, or another suitable liquid, to a height of not less than 14 cm.

(i) A liquid paraffin of sufficiently high boiling point.

(ii) A silicone fluid of sufficiently high boiling point.

(iii) Water.

(*b*) A suitable stirring device capable of rapidly mixing the liquid.

(*c*) An accurately standardised thermometer suitable for the substance being examined complying with the requirements of British Standard 1365:1990 (Specification for short-range short-stem thermometers) for thermometers designated by one of the following Schedule Marks.

Schedule mark at each (max)	Range °C	Graduated	Diameter of stem mm	Overall length mm
SA 55C/80	−10 to 55	0.5°	5.5 to 8	200
SA 105C/80	45 to 105	0.5°	5.5 to 8	200
SA 155C/80	95 to 155	0.5°	5.5 to 8	200
SA 205C/80	145 to 205	0.5°	5.5 to 8	200
SA 225C/80	195 to 255	0.5°	5.5 to 8	200
SA 305C/80	245 to 305	0.5°	5.5 to 8	200
SA 360C/80	295 to 360	0.5°	5.5 to 8	200

(*d*) Thin-walled capillary glass tubes of hard glass, closed at one end, with a wall thickness of 0.10 to 0.15 mm, at least 12 cm in length and of internal diameter 0.9 to 1.1 mm. The tubes should preferably be kept sealed at both ends and cut as required.

Method Dry a small quantity of the finely powdered substance at a temperature considerably below its melting point or at a pressure of 2 kPa over a suitable desiccant, unless otherwise directed. Transfer a portion to a dry capillary tube and pack the powder by tapping on a hard surface so as to form a tightly packed column 4 to 6 mm in height. Heat a suitable liquid in the heating vessel and regulate the rate of rise of temperature, prior to the introduction of the capillary tube, to 3° per minute, unless otherwise directed, stirring constantly. When the temperature reaches 10° below the lowest figure of the range for the substance being tested, adjust the height of the thermometer so that the immersion mark is at the level of the surface of the liquid and insert the capillary tube so that the closed end is near the middle of the bulb of the thermometer. Note the temperature at which the liquefaction of the substance

occurs, which is indicated by the formation of a definite meniscus or, for substances that decompose, the temperature at which frothing begins. Correct the observed temperature for any error in the calibration of the thermometer and for the difference, if any, between the temperature of the emergent stem of the thermometer and the temperature of the emergent stem under the conditions of standardisation of the thermometer. The temperature of the emergent stem is determined by placing the bulb of a second thermometer in contact with the emergent stem at a point approximately midway along the mercury thread in the emergent stem.

The correction to be applied is given by the following equation:

$$t_c = 0.00016n(t_s - t_d)$$

where t_c = correction to be added to the observed temperature of the melting point,

t_s = mean temperature of the emergent column when standardised,

t_d = mean temperature of the emergent column at the observed melting point,

n = number of °C over which the exposed column extends.

The corrected temperature is regarded as the melting point of the substance. When the melting point in the monograph is expressed as a range, the melting point of the substance being tested must fall within that range.

Method III

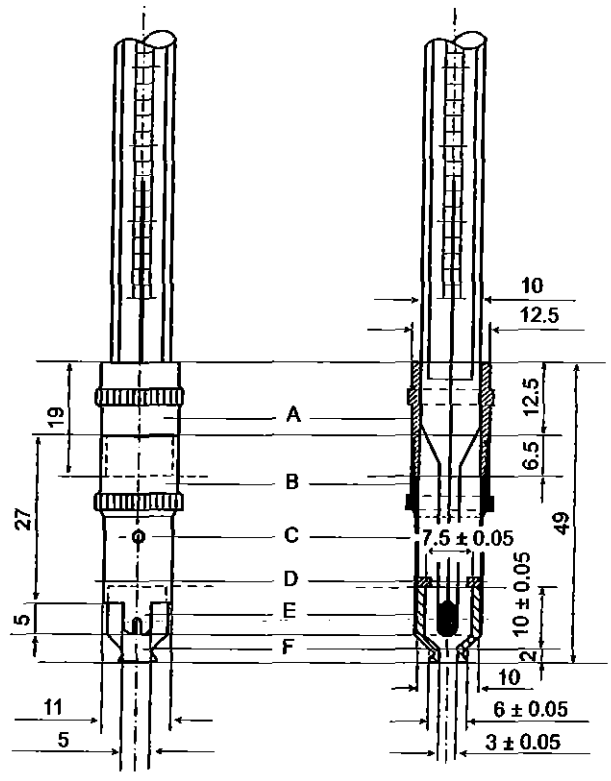
(Ph. Eur. method 2.2.17)

The drop point is the temperature at which the first drop of the melting substance to be examined falls from a cup under defined conditions.

When a monograph does not specify the method to be used, apply method A. Any change from method A to method B is validated.

METHOD A

Equipment The equipment (see Figure 2.2.17.-1) consists of 2 metal sheaths (*A* and *B*) screwed together. Sheath *A* is fixed to a thermometer. A metal cup is loosely fixed to the lower part of sheath *B* by means of 2 tightening bands. Fixed supports 2 mm long determine the exact position of the cup, and in addition are used to centre the thermometer. A hole pierced in the wall of sheath *B* is used to balance the pressure. The draining surface of the cup must be flat and the edges of the outflow orifice must be at right angles to it. The thermometer has the form and size shown in Figure 2.2.17.-1; it covers a range from 0 °C to 110 °C and on its scale a distance of 1 mm represents a difference of 1 °C. The thermometer bulb has a diameter of 3.5 ± 0.2 mm and a height of 6.0 ± 0.3 mm.
The equipment is placed in the axis of a test-tube about 200 mm long and with an external diameter of about 40 mm. It is fixed to the test-tube by means of a laterally grooved stopper through which the thermometer passes. The opening of the cup is placed about 15 mm from the bottom of the test-tube. The whole device is immersed in a beaker with a capacity of about 1 L, filled with water. The bottom of the test-tube is placed about 25 mm from the bottom of the beaker. The water level reaches the upper part of sheath *A*. A stirrer is used to ensure that the temperature of the water remains uniform.



A. upper metal sheath C. pressure-balancing hole E. tightening bands
B. lower metal sheath D. fixed supports F. metal sample cup

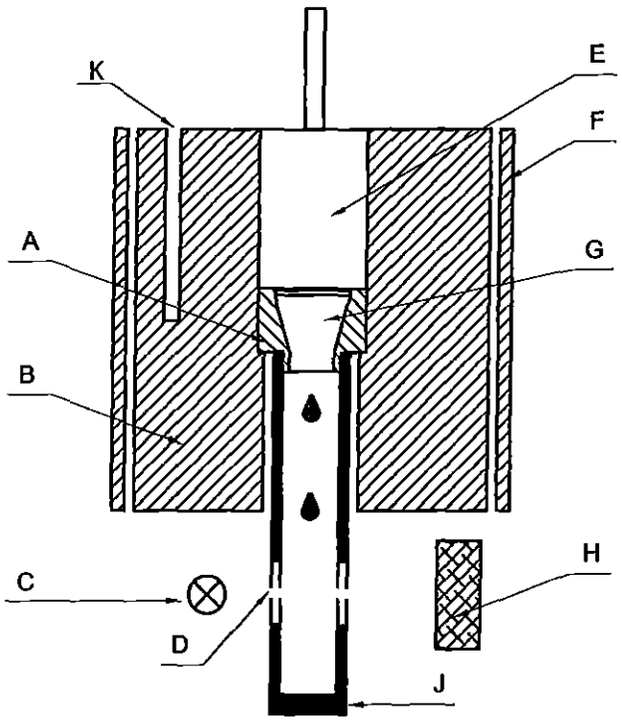
Figure 2.2.17.-1. – *Equipment for the determination of drop point (dimensions in millimetres)*

Method Prepare the substance to be examined as described in the monograph. Fill the cup to the brim with the substance to be examined. Remove the excess substance at both ends of the cup with a spatula. When sheaths *A* and *B* have been assembled, press the cup into its housing in sheath *B* until it touches the supports. Remove with a spatula the substance pushed out by the thermometer. Place the equipment in the water-bath as described above. Heat the water-bath and, when the temperature is at about 10 °C below the presumed drop point, adjust the heating rate to about 1 °C/min. Note the temperature at the fall of the first drop. Carry out at least 3 determinations, each time with a fresh sample of the substance. The difference between the readings must not exceed 3 °C. The mean of 3 readings is the drop point of the substance.

METHOD B - AUTOMATED METHOD

Equipment The equipment (see Figure 2.2.17.-2) consists of a cartridge assembly comprising a cup holder into which the sample cup containing the sample is loosely fixed, and a collector sleeve with a horizontal light slit, which is fixed below the cup. This assembly is placed in a heating block. The block is a metal cylinder with a cylindrical hole along its vertical axis into which the cartridge assembly is placed. There is another, narrower cylindrical vertical hole in which a temperature sensor sits. This is positioned level with the sample cup. The heating block is surrounded by an electrical heating element. Below the heating block a lamp is mounted such that a beam of light shines through the light slit in the collector sleeve, and onto a photo-sensor mounted opposite. The heating element is capable of maintaining the heating

block at a pre-defined temperature, and of heating at a slow and steady, pre-defined rate.



A. cup holder
B. heating block
C. light source
D. light slit
E. cartridge assembly
F. heating element
G. sample cup
H. photo-sensor
J. collector sleeve
K. temperature probe

Figure 2.2.17.-2. – *Example of automated drop point equipment*

Method Prepare the substance to be examined as described in the monograph, then proceed as follows or according to the manufacturer's instructions. Remove the excess substance at both ends of the cup with a spatula. Press the cup into the cup holder, and then press the collector sleeve onto the cup. Place the cartridge assembly in the heating block. Set the instrument to the initial isothermal conditions and the rate for subsequent heating as described in the monograph. Start the temperature programme. When the first drop of molten sample falls through the hole at the bottom of the sample cup, thus interrupting the light beam, a signal from the photo-sensor causes the temperature of the heating block to be recorded automatically.

Calibration Use the equipment according to the manufacturer's instructions and carry out the prescribed calibrations and system performance tests at regular intervals, depending on the use of the equipment and the substances to be examined. Benzoic acid and benzophenone are usually used as certified reference materials. Other materials may be used provided they show no polymorphism. Proceed as follows or according to the manufacturer's instructions. Prepare 3 sample cups for each of 2 certified reference materials. Place the sample cups on a clean surface. Into each sample cup, introduce a small quantity of the sample and press it down with a rod (diameter about 4.5 mm). Check that the opening is completely blocked. Fill the sample cup about half full and compact the sample with a rod (diameter about 9 mm). Fill the sample cup and compact, adding more sample and compacting again if necessary, until the sample cup is completely packed.

Temperature programme for benzoic acid: start temperature = 118.0 °C; heating rate = 0.2 °C/min; end temperature = 126.0 °C. After inserting the cup at 118 °C, a waiting time of 30 s is set before heating starts.

Temperature programme for benzophenone: start temperature = 44.0 °C; heating rate = 0.2 °C/min; end temperature = 56.0 °C. After inserting the cup at 44 °C, a waiting time of 30 s is set before heating starts.

Check the 3 single results: the test is valid if the 3 results are within 0.3 °C of the mean value.

Calculate the corrected mean temperature (T_2) using the following expression:

$$T_1 - F$$

T_1 = mean drop point temperature of 3 samples, in °C;
F = compensation for the difference in temperature between the sample and the point in the heating block where the temperature is measured; this will vary depending upon the design of the automatic drop point instrument and is provided by the manufacturer.

Taking into account the drop point of the certified reference material (T_0), the accuracy of the temperature scale is satisfactory if $|T_2 - T_0|$ is not greater than 0.3 °C.

Method IV

(Ph. Eur. method 2.2.15)

For certain substances, the following method is used to determine the melting point (also referred to as slip point and rising melting point when determined by this method).

Use glass capillary tubes open at both ends, about 80 mm long, having an external diameter of 1.4 mm to 1.5 mm and an internal diameter of 1.0 mm to 1.2 mm.

Introduce into each of 5 capillary tubes a sufficient amount of the substance, previously treated as described, to form in each tube a column about 10 mm high and allow the tubes to stand for the appropriate time and at the prescribed temperature.

Unless otherwise prescribed, substances with a waxy consistency are carefully and completely melted on a water-bath before introduction into the capillary tubes. Allow the tubes to stand at 2-8 °C for 2 h.

Attach one of the tubes to a thermometer graduated in 0.5 °C so that the substance is close to the bulb of the thermometer. Introduce the thermometer with the attached tube into a beaker so that the distance between the bottom of the beaker and the lower part of the bulb of the thermometer is 1 cm. Fill the beaker with water to a depth of 5 cm. Increase the temperature of the water gradually at a rate of 1 °C/min.

The temperature at which the substance begins to rise in the capillary tube is regarded as the melting point.

Repeat the operation with the other 4 capillary tubes and calculate the result as the mean of the 5 readings.

Method V

(Ph. Eur. method 2.2.16)

The instantaneous melting point is calculated using the following expression:

$$\frac{t_1 + t_2}{2}$$

in which t_1 is the first temperature and t_2 the second temperature read under the conditions stated below.

Apparatus The apparatus consists of a metal block resistant to the substance to be examined, of good heat-conducting capacity, such as brass, with a carefully polished plane upper surface. The block is uniformly heated throughout its mass by means of a micro-adjustable gas heater or an electric heating device with fine adjustment. The block has a cylindrical cavity, which is wide enough to accomodate a thermometer that is maintained in the same position during the calibration of the apparatus and the determination of the melting point of the substance to be examined. The cylindrical cavity is parallel to the upper polished surface of the block and about 3 mm from it. The apparatus is calibrated using appropriate substances of known melting point.

Method Heat the block at a suitably rapid rate to a temperature about 10 °C below the presumed melting temperature, then adjust the heating rate to about 1 °C/min. At regular intervals drop a few particles of powdered and, where appropriate, dried substance, prepared as for the capillary tube method, onto the block in the vicinity of the thermometer bulb, cleaning the surface after each test. Record the temperature t_1 at which the substance melts instantaneously for the first time in contact with the metal. Stop the heating. During cooling drop a few particles of the substance at regular intervals on the block, cleaning the surface after each test. Record the temperature t_2 at which the substance ceases to melt instantaneously when it comes in contact with the metal.

Calibration of the apparatus The apparatus may be calibrated using melting point reference substances such as those of the World Health Organization or other appropriate substances.

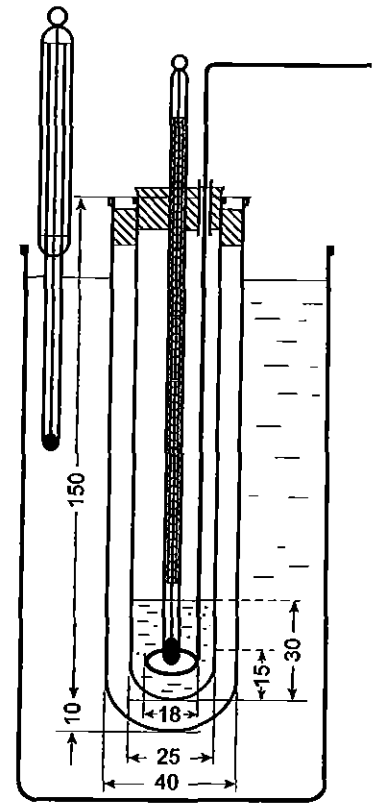


Figure 2.2.18.-1. – *Apparatus for the determination of freezing point*

Dimensions in millimetres

B. Determination of Freezing Point

(Ph. Eur. method 2.2.18)

The freezing point is the maximum temperature occurring during the solidification of a supercooled liquid.

Apparatus The apparatus (see Figure 2.2.18.-1) consists of a test-tube about 25 mm in diameter and 150 mm long placed inside a test-tube about 40 mm in diameter and 160 mm long. The inner tube is closed by a stopper which carries a thermometer about 175 mm long and graduated in 0.2 °C fixed so that the bulb is about 15 mm above the bottom of the tube. The stopper has a hole allowing the passage of the stem of a stirrer made from a glass rod or other suitable material formed at one end into a loop of about 18 mm overall diameter at right angles to the rod. The inner tube with its jacket is supported centrally in a 1 L beaker containing a suitable cooling liquid to within 20 mm of the top. A thermometer is supported in the cooling bath.

Method Place in the inner tube sufficient quantity of the liquid or previously melted substance to be examined, to cover the thermometer bulb and determine the approximate freezing point by cooling rapidly. Place the inner tube in a bath about 5 °C above the approximate freezing point until all but the last traces of crystals are melted. Fill the beaker with water or a saturated solution of sodium chloride, at a temperature about 5 °C lower than the expected freezing point, insert the inner tube into the outer tube, ensuring that some seed crystals are present, and stir thoroughly until solidification takes place. Note the highest temperature observed during solidification.

C. Determination of Distillation Range

(Ph. Eur. method 2.2.11)

The distillation range is the temperature interval, corrected for a pressure of 101.3 kPa, within which a liquid or a specified fraction of a liquid, distils under the following conditions.

Apparatus The apparatus (see Figure 2.2.11.-1) consists of a distillation flask (*A*), a straight tube condenser (*B*) which fits on to the side arm of the flask and a plain-bend adaptor (*C*) attached to the end of the condenser. The lower end of the condenser may, alternatively, be bent to replace the adaptor. A thermometer is inserted in the neck of the flask so that the upper end of the bulb is 5 mm lower than the junction of the lower wall of the lateral tube.
The thermometer can be read to the nearest 0.2 °C and covers a range of at least 50 °C. During the determination, the flask, including its neck, is protected from draughts by a suitable screen.

Method Place in the flask (*A*) 50.0 mL of the liquid to be examined and a few pieces of porous material. Collect the distillate in a 50 mL cylinder graduated in millilitres. Cooling by circulating water is essential for liquids distilling below 150 °C. Heat the flask so that boiling is rapidly achieved and note the temperature at which the first drop of distillate falls into the cylinder. Adjust the heating to give a regular rate of distillation of 2-3 mL/min and note the temperature when the whole or the prescribed fraction of the liquid, measured at 20 °C, has distilled.

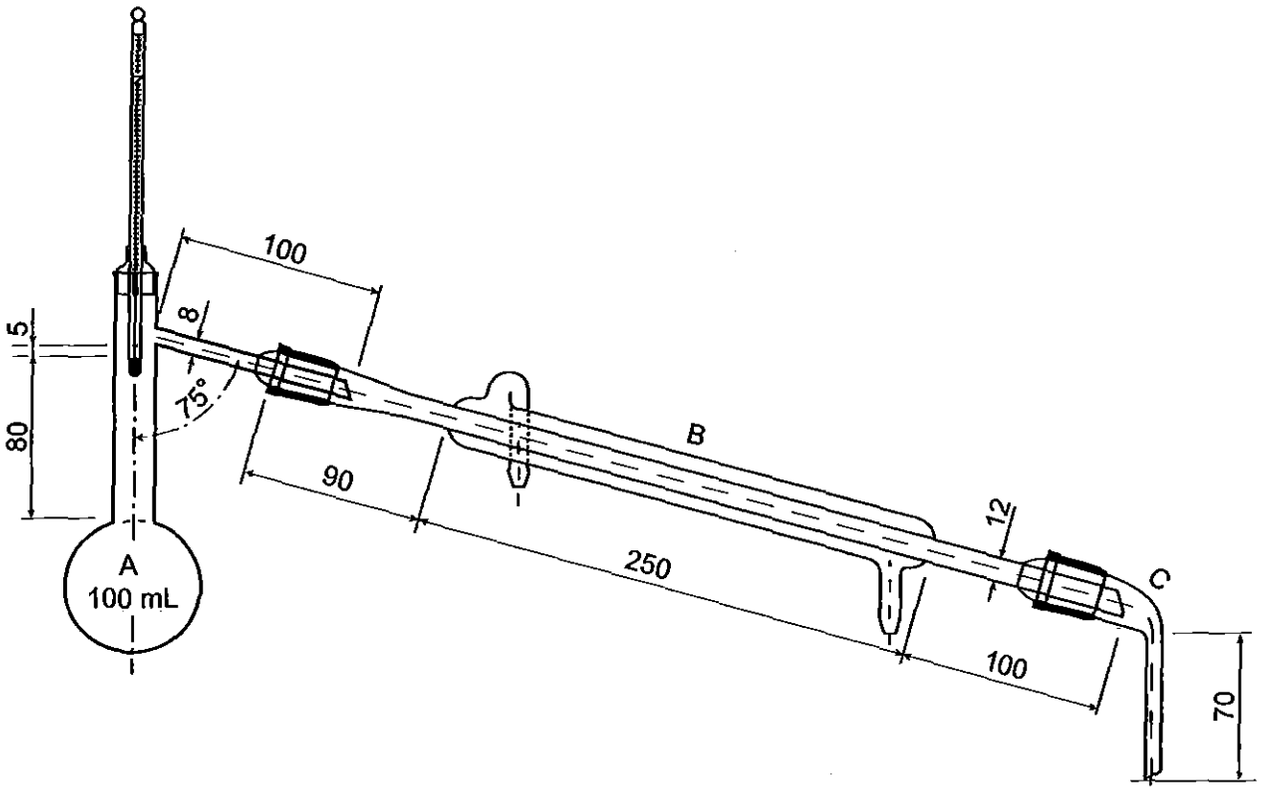

Figure 2.2.11.-1. – *Apparatus for the determination of distillation range*
Dimensions in millimetres

Correct the observed temperatures for barometric pressure by means of the formula:

$$t_1 = t_2 + k(101.3 - b)$$

t_1 = the corrected temperature,
t_2 = the observed temperature, at the barometric pressure b,
k = the correction factor taken from Table 2.2.11.-1 unless the factor is given,
b = the barometric pressure, expressed in kilopascals, during the distillation.

Table 2.2.11.-1. – *Temperature correction in relation to the pressure*

Distillation temperature	Correction factor k
up to 100 °C	0.30
above 100 °C up to 140 °C	0.34
above 140 °C up to 190 °C	0.38
above 190 °C up to 240 °C	0.41
above 240 °C	0.45

D. Determination of Boiling Point

(Ph. Eur. method 2.2.12)

The boiling point is the corrected temperature at which the vapour pressure of a liquid is equal to 101.3 kPa.

Apparatus The apparatus is that used for distillation range (*2.2.11*) with the exception that the thermometer is inserted in the neck of the flask so that the lower end of the bulb is level with the lower end of the neck of the distillation flask and that the flask is placed on a plate of isolating material pierced by a hole 35 mm in diameter.

Method Place in the flask (*A*) 20 mL of the liquid to be examined and a few pieces of porous material. Heat the flask so that boiling is rapidly achieved and record the temperature at which liquid runs from the side-arm into the condenser.

Correct the observed temperature for barometric pressure by means of the formula:

$$t_1 = t_2 + k(101.3 - b)$$

t_1 = the corrected temperature,
t_2 = the observed temperature at barometric pressure b,
k = the correction factor as shown in Table 2.2.11.-1 under Distillation Range,
b = the barometric pressure, in kilopascals, at the time of the determination.

E. Determination of Refractive Index

(Ph. Eur. method 2.2.6)

The refractive index of a medium with reference to air is equal to the ratio of the sine of the angle of incidence of a beam of light in air to the sine of the angle of refraction of the refracted beam in the given medium.

Unless otherwise prescribed, the refractive index is measured at 20 ± 0.5 °C, with reference to the wavelength of the D-line of sodium (λ = 589.3 nm); the symbol is then n_D^{20}.

Refractometers normally determine the critical angle. In such apparatus the essential part is a prism of known refractive index in contact with the liquid to be examined.

Calibrate the apparatus using certified reference materials.

When white light is used, the refractometer is provided with a compensating system. The apparatus gives readings accurate to at least the third decimal place and is provided

with a means of operation at the temperature prescribed. The thermometer is graduated at intervals of 0.5 °C or less.

F. Determination of Optical Rotation and Specific Optical Rotation

(Ph. Eur. method 2.2.7)

PRINCIPLE

Optical rotation (also known as optical activity) is the property displayed by chiral substances of rotating the plane of polarisation of linearly polarised light.

Optical rotation is considered to be positive (+) for dextrorotatory substances (i.e. those that rotate the plane of polarisation in a clockwise direction when viewed in the direction facing the oncoming light beam) and negative (−) for laevorotatory substances (i.e. anticlockwise rotation).

The angle of optical rotation α of a liquid is the angle of rotation of the plane of polarisation, expressed in degrees (°), at the wavelength of the D-line of sodium (λ = 589.3 nm) measured at 20 °C through the liquid when using a path length of 1.00 dm.

The specific optical rotation $[\alpha]_D^{20}$ of a substance in solution is calculated from the angle of optical rotation, as defined above, with reference to a path length of 1.00 dm and a concentration of the substance to be examined of 1 g/mL. The specific optical rotation of a substance in solution is always expressed with reference to a given solvent and concentration.

As some equipment may not use sodium lamps, the wavelength of measurement is given as 589 nm instead of 589.3 nm.

In certain cases specified in the monograph, the angle of optical rotation is measured at other temperatures, other wavelengths and/or in cells with a path length other than 1.00 dm.

In the conventional system adopted by the Pharmacopoeia, the specific optical rotation is expressed by its value without units; the actual units, degree millilitres per decimetre gram [(°)·ml·dm^{-1}·g^{-1}] are understood.

EQUIPMENT

The polarimeter typically consists of:

- a light source, for example a sodium discharge lamp, a light-emitting diode (LED) or another light source capable of providing radiation at the desired wavelength (589 nm unless otherwise prescribed in the monograph); if the light source is polychromatic, a means of isolating the required wavelength is necessary, e.g. an optical filter;
- a polariser and an analyser;
- a sample cell with a path length of 1.00 dm, unless otherwise specified in the monograph;
- a detection system to measure the angle of optical rotation, which must be capable of giving readings to at least the nearest 0.01°, unless otherwise specified in the monograph;
- a temperature control system that indicates the temperature with a readability of 0.1 °C; it may be embedded in the polarimeter (e.g. a Peltier system) or be an external unit (e.g. a cycle-cryostat), and must be able to maintain the temperature of the liquid to within ± 0.5 °C of that prescribed.

EQUIPMENT PERFORMANCE

The accuracy of the scale is checked near the value to be measured or over an appropriate range, usually by means of certified quartz plates. Other certified reference materials may also be suitable (e.g. sucrose solutions).

Optical rotation measurements may be used to quantify the amount of an enantiomer or the ratio of enantiomers present in a sample. For that purpose, the linearity must be checked, for example using sucrose solutions.

PROCEDURE

Determine the zero of the polarimeter and the angle of rotation of the liquid at a wavelength of 589 nm and a temperature of 20 ± 0.5 °C, unless otherwise prescribed. The zero of the polarimeter is determined with the sample cell closed.

For neat liquids, the zero is determined with an empty sample cell.

For solutions, the zero is determined with the sample cell filled with the same solvent as that used for the solution to be examined and measured at the same temperature. The sample preparation procedure is prescribed in the monograph.

Calculate the specific optical rotation at temperature t and wavelength λ using the following formulae.

For neat liquids, the density of the liquid is taken into account:

$$[\alpha]_\lambda^t = \frac{\alpha}{l \cdot \rho_t}$$

For solutions:

$$[\alpha]_\lambda^t = \frac{1000\alpha}{l \cdot c}$$

α	=	angle of rotation measured at temperature t and wavelength λ, in degrees;
l	=	path length of the polarimeter sample cell, in decimetres;
ρ_t	=	density determined at the temperature of measurement t, in grams per cubic centimetre; for the purposes of the Pharmacopoeia, density is replaced by relative density (*2.2.5*);
c	=	concentration of the solution, in grams per litre.

When the limits for optical rotation or specific optical rotation are expressed as the dried substance, the anhydrous substance or the solvent-free substance, the result must be corrected for loss on drying (*2.2.32*), water content (*2.5.12* or *2.5.32*) or content of solvent as appropriate.

G. Determination of Weight per Millilitre, Density, Relative Density and Apparent Density

Weight per millilitre

(No Ph. Eur. method)

The *weight per millilitre* of a liquid is the weight in g of 1 mL of a liquid when weighed in air at 20°, unless otherwise specified in the monograph.

The *weight per millilitre* is determined by dividing the weight in air, expressed in g, of the quantity of liquid that fills a pycnometer at the specified temperature by the capacity,

expressed in mL, of the pycnometer at the same temperature. The capacity of the pycnometer is ascertained from the weight in air, expressed in g, of the quantity of *water* required to fill the pycnometer at that temperature. The weight of a litre of *water* at specified temperatures when weighed against brass weights in air of density 0.0012 g per mL is given in the following table. Ordinary deviations in the density of air from the above value, here taken as the mean, do not affect the result of a determination in the significant figures prescribed for Pharmacopoeial substances.

Temperature	Weight of a litre of water
°C	g
20	997.18
25	996.02
30	994.62

Density

(No Ph. Eur. method)

The *density*, ρ_{20}, of a substance is the ratio of its mass to its volume at 20°. It is expressed in kg m^{-3}.

The *density* is determined by dividing the weight in air of the quantity of the liquid being examined that fills a pycnometer at 20° by the weight in air of *water* required to fill the pycnometer after making allowance for the thrust of the air.

The *density* is calculated from the expression

$$\rho_{20} = \frac{998.2(M_1 + A)}{M_2 + A}$$

where M_1 = weight in air (apparent mass) in grams of the substance being examined,
M_2 = weight in air (apparent mass) in grams of *water*,
A = the correction factor for the thrust of the air, $0.0012M_2$
998.2 = the density of water at 20° in kg m^{-3}.

In most cases, the correction for the thrust of the air may be disregarded.

Relative density

(Ph. Eur. method 2.2.5)

The relative density $d^{t_1}_{t_2}$ of a substance is the ratio of the mass of a certain volume of a substance at temperature t_1 to the mass of an equal volume of water at temperature t_2.

Unless otherwise indicated, the relative density d^{20}_{20} is used. Relative density is also commonly expressed as d^{20}_{4}.

Density ρ_{20}, defined as the mass of a unit volume of the substance at 20 °C may also be used, expressed in kilograms per cubic metre or grams per cubic centimetre (1 kg·m^{-3} = 10^{-3} g·cm^{-3}). These quantities are related by the following equations where density is expressed in grams per cubic centimetre:

$$\rho_{20} = 0.998203 \times d^{20}_{20} \quad \text{or} \quad d^{20}_{20} = 1.00180 \times \rho_{20}$$

$$\rho_{20} = 0.999972 \times d^{20}_{4} \quad \text{or} \quad d^{20}_{4} = 1.00003 \times \rho_{20}$$

$$d^{20}_{4} = 0.998230 \times d^{20}_{20}$$

Relative density or density is measured according to the number of decimals prescribed in the monograph using a density bottle (solids or liquids), a hydrostatic balance (solids), a hydrometer (liquids) or a digital density meter with an oscillating transducer (liquids and gases). When the determination is made by weighing, the buoyancy of air is disregarded, which may introduce an error of 1 unit in the 3rd decimal place. When using a density meter, the buoyancy of air has no influence.

Oscillating transducer density meter The apparatus consists of:

- — a U-shaped tube, usually of borosilicate glass, which contains the liquid to be examined;
- — a magneto-electrical or piezo-electrical excitation system that causes the tube to oscillate as a cantilever oscillator at a characteristic frequency depending on the density of the liquid to be examined;
- — a means of measuring the oscillation period (T), which may be converted by the apparatus to give a direct reading of density, or used to calculate density using the constants A and B described below.

The resonant frequency (f) is a function of the spring constant (c) and the mass (m) of the system:

$$f^2 = \frac{1}{T^2} = \frac{c}{m} \times \frac{1}{4\pi^2}$$

Hence:

$$T^2 = \left(\frac{M}{c} + \frac{\rho \times V}{c}\right) \times 4\pi^2$$

M = mass of the tube;
V = inner volume of the tube.

Introduction of 2 constants $A = c/(4\pi^2 \times V)$ and $B = M/V$, leads to the classical equation for the oscillating transducer:

$$\rho = A \times T^2 - B$$

The constants A and B are determined by operating the instrument with the U-tube filled with 2 different samples of known density, for example, degassed *water R* and air. Control measurements are made daily using degassed *water R*. The results displayed for the control measurement using degassed *water R* shall not deviate from the reference value (ρ_{20} = 0.998203 g·cm^{-3}, d^{20}_{20} = 1.000000) by more than its specified error. For example, an instrument specified to ± 0.0001 g·cm^{-3} shall display 0.9982 ± 0.0001 g·cm^{-3} in order to be suitable for further measurement. Otherwise a re-adjustment is necessary. Calibration with certified reference materials is carried out regularly. Measurements are made using the same procedure as for calibration. The liquid to be examined is equilibrated in a thermostat at 20 °C before introduction into the tube, if necessary, to avoid the formation of bubbles and to reduce the time required for measurement.

Factors affecting accuracy include:

- — temperature uniformity throughout the tube;
- — non-linearity over a range of density;
- — parasitic resonant effects;
- — viscosity, whereby solutions with a higher viscosity than the calibrant have a density that is apparently higher than the true value.

The effects of non-linearity and viscosity may be avoided by using calibrants that have density and viscosity close to those of the liquid to be examined (± 5 per cent for density, ± 50 per cent for viscosity). The density meter may have functions for automatic viscosity correction and for

correction of errors arising from temperature changes and non-linearity.

Precision is a function of the repeatability and stability of the oscillator frequency, which is dependent on the stability of the volume, mass and spring constant of the cell.

Density meters are able to achieve measurements with an error of the order of 1×10^{-3} g·cm^{-3} to 1×10^{-5} g·cm^{-3} and a repeatability of 1×10^{-4} g·cm^{-3} to 1×10^{-6} g·cm^{-3}.

Apparent density

(No Ph. Eur. method)

The term 'Apparent density' is used in the monographs for Dilute Ethanols, Industrial Methylated Spirit and Industrial Methylated Spirit (Ketone-free). It is defined as weight in air per unit volume and expressed in kg m^{-3}. It is named 'density' in the *Laboratory Alcohol Table for Laboratory Use* (HM Customs and Excise 1979).

The *apparent density* is calculated from the following expression:

apparent density = $997.2 \times d_{20}^{20}$

where d_{20}^{20} is the *relative density* of the substance being examined and 997.2 is the weight in air in kg of 1 cubic metre of water.

H. Viscosity

(Ph. Eur. method 2.2.8)

The *dynamic* viscosity or *viscosity coefficient* η is the tangential force per unit surface, known as *shearing stress* τ and expressed in pascals, necessary to move, parallel to the sliding plane, a layer of liquid of 1 square metre at a rate (v) of 1 metre per second relative to a parallel layer at a distance (x) of 1 metre.

The ratio dv/dx is a speed gradient giving the *rate of shear D* expressed in reciprocal seconds (s^{-1}), so that $\eta = \tau/D$.

The unit of dynamic viscosity is the pascal second (Pa·s). The most commonly used submultiple is the millipascal second (mPa·s).

The *kinematic viscosity* v, expressed in square metres per second, is obtained by dividing the dynamic viscosity η by the density ρ expressed in kilograms per cubic metre, of the liquid measured at the same temperature, i.e. $v = \eta/\rho$. The kinematic viscosity is usually expressed in square millimetres per second.

A capillary viscometer may be used for determining the viscosity of Newtonian liquids and a rotating viscometer for determining the viscosity of Newtonian and non-Newtonian liquids. Other viscometers may be used provided that the accuracy and precision are at least as satisfactory as those obtained with the viscometers described in the related chapters.

Method I

(No Ph. Eur. method)

Apparatus

The apparatus consists of a glass U-tube viscometer (Fig.5H–1) made of clear borosilicate glass and constructed in accordance with the dimensions shown in the figure and in Table 5H–1. The monograph states the size of viscometer to be used.

Method

Fill the viscometer with the liquid being examined through tube L to slightly above the mark G, using a long pipette to minimise wetting the tube above the mark. Place the tube vertically in a water bath and when it has attained the specified temperature, adjust the volume of the liquid so that the bottom of the meniscus settles at the mark G. Adjust the liquid to a point about 5 mm above the mark E. After releasing pressure or suction, measure the time taken for the bottom of the meniscus to fall from the top edge of mark E to the top edge of mark F.

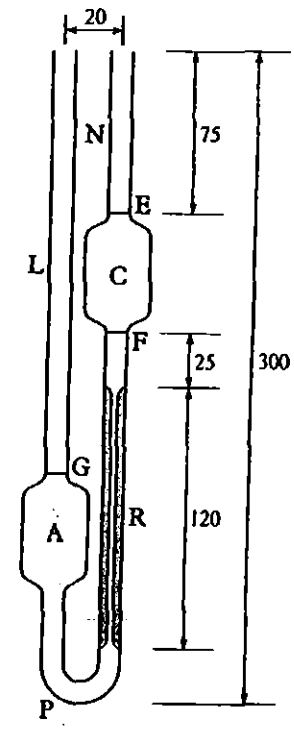

Fig. 5H–1
U-Tube Viscometer

Calculate, as required, either the *kinematic viscosity* (v) in square millimetres per second (mm^2 s^{-1}) from the expression:

$$v = Kt,$$

or the *dynamic viscosity* (η) in millipascal seconds (mPa s) from the expression:

$$\eta = K\rho t,$$

where t = time in seconds for the meniscus to fall from E to F,

ρ = mass/volume (g cm^{-3}) obtained by multiplying the *relative density*, Appendix V G, of the fluid being examined by 0.9982.

The constant (K) of the instrument is determined using the appropriate European Pharmacopoeia reference liquid for viscometers.

Method II (Capillary Viscometer Method)

(Ph. Eur. method 2.2.9)

PRINCIPLE

The determination of viscosity is carried out using a suspended-level (Ubbelohde-type) capillary viscometer of appropriate size at a temperature of 20.0 ± 0.1 °C, unless otherwise prescribed. The time required for the level of the liquid to drop from one mark to the other is measured.

Table 5H–1 U-Tube Viscometer – Dimensions

Size	Nominal viscometer constant	Kinematic viscosity range	Inside diameter of tube R	Outside diameter of tubes[1]		Volume of bulb C	Vertical distance F to G	Outside diameter of bulbs A and C
				L and P	N			
	mm^2s^{-2}	mm^2s^{-1}	mm(±2%)	mm	mm	mm (±5%)	mm	mm
A[2]	0.003	0.9 to 3	0.50	8 to 9	6 to 7	5.0	91±4	21 to 23
B	0.01	2.0 to 10	0.71	8 to 9	6 to 7	5.0	87±4	21 to 23
C	0.03	6 to 30	0.88	8 to 9	6 to 7	5.0	83±4	21 to 23
D	0.1	20 to 100	1.40	9 to 10	7 to 8	10.0	78±4	25 to 27
E	0.3	60 to 300	2.00	9 to 10	7 to 8	10.0	73±4	25 to 27
F	1.0	200 to 1000	2.50	9 to 10	7 to 8	10.0	70±4	25 to 27
G	3.0	600 to 3000	4.00	10 to 11	9 to 10	20.0	60±3	32 to 35
H	10.0	2000 to 10,000	6.10	10 to 11	9 to 10	20.0	50±3	32 to 35

[1]Use 1 to 1.25 mm wall tubing for L, N and P.
[2]300 s minimum flow time; 200 s minimum flow time for all other sizes.

EQUIPMENT

The principal components of an Ubbelohde-type capillary viscometer[1]. are shown in Figure 2.2.9.-1.

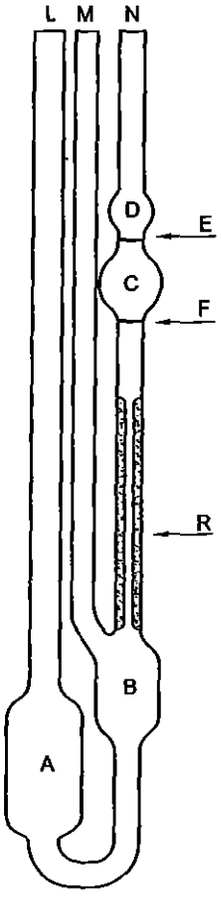

Figure 2.2.9.-1. – *Suspended-level (Ubbelohde-type) capillary viscometer*

PROCEDURE

Select a capillary viscometer of appropriate size to obtain a minimum flow time of 200 s.

[1] *The European Pharmacopoeia describes the system proposed by the International Organization for Standardization (ISO)*

Calibration

Capillary viscometers are calibrated at regular intervals as defined in the quality management system and dictated by the frequency of use of the equipment and the application.

Calibrate the instrument at the temperature used for the measurement by using at least 2 certified reference materials matching the viscosity range of the viscometer.

Calculate the viscometer constant (k) in square millimetres per second squared, using the following expression:

$$k = \frac{\eta}{\rho t}$$

η = dynamic viscosity of the certified reference material, in millipascal seconds;
ρ = density of the certified reference material, in milligrams per cubic millimetre;
t = flow time for the certified reference material to drop from the upper mark to the lower mark, in seconds.

Calculate the mean of the values obtained.

Method

Charge the viscometer (Figure 2.2.9.-1) through tube *L* with a sufficient quantity of the liquid to be examined (previously brought to 20 °C unless otherwise prescribed) to fill bulb *A* while ensuring that the level of liquid in bulb *B* is below the exit to ventilation tube *M*. Immerse the viscometer in the upright position in a water-bath at 20.0 ± 0.1 °C (unless otherwise prescribed) and allow to stand for not less than 30 min to allow the temperature to reach equilibrium. Close tube *M* and draw the level of the liquid in tube *N* up to a level about 8 mm above mark *E*. Keep the liquid at this level by closing tube *N* and opening tube *M*. Open tube *N* and, using a stopwatch, measure the time required, to at least the nearest 1/5 of a second, for the level of the liquid to drop from mark *E* to mark *F*.

The flow time of the liquid to be examined is the mean of 3 consecutive measurements. The result is valid if the relative standard deviation of the 3 measurements is not more than 2.0 per cent.

Calculation

Calculate the kinematic viscosity (ν) (*2.2.8*), in square millimetres per second, using the following expression:

$$\nu = kt$$

k = viscometer constant, in square millimetres per second squared;
t = flow time of the liquid to be examined, in seconds.

Calculate the dynamic viscosity (η) (*2.2.8*), in millipascal seconds, using the following expression:

$$\eta = k\rho t$$

ρ = density of the liquid to be examined at the temperature used for the viscosity measurement, in milligrams per cubic millimetre.

The density may be obtained by multiplying the relative density of the liquid to be examined by 0.99820 (measurement at 20 °C) or 0.99704 (measurement at 25 °C).

Method III (Rotating Viscometer Method)

(Ph. Eur. method 2.2.10)

The principle of the method is to measure the force acting on a rotor (torque) when it rotates at a constant angular velocity (rotational speed) in a liquid. Rotating viscometers are used for measuring the viscosity of Newtonian (shear-independent viscosity) or non-Newtonian liquids (shear dependent viscosity or apparent viscosity). Rotating viscometers can be divided in 2 groups, namely absolute and relative viscometers. In absolute viscometers the flow in the measuring geometry is well defined. The measurements result in absolute viscosity values, which can be compared with any other absolute values. In relative viscometers the flow in the measuring geometry is not defined. The measurements result in relative viscosity values, which cannot be compared with absolute values or other relative values if not determined by the same relative viscometer method.

Different measuring systems are available for given viscosity ranges as well as several rotational speeds.

APPARATUS

The following types of instruments are most common.

CONCENTRIC CYLINDER VISCOMETERS (ABSOLUTE VISCOMETERS)

In the concentric cylinder viscometer (coaxial double cylinder viscometer or simply coaxial cylinder viscometer), the viscosity is determined by placing the liquid in the gap between the inner cylinder and the outer cylinder. Viscosity measurement can be performed by rotating the inner cylinder (Searle type viscometer) or the outer cylinder (Couette type viscometer), as shown in Figures 2.2.10.-1 and 2.2.10.-2, respectively. For laminar flow, the viscosity (or apparent viscosity) η expressed in pascal-seconds is given by the following formula:

$$\eta = \frac{1}{\omega}\left(\frac{M}{4\pi h}\right)\left(\frac{1}{R_i^2} - \frac{1}{R_o^2}\right) = k\frac{M}{\omega}$$

M = torque in newton-metres acting on the cylinder surface,
ω = angular velocity in radians per second,
h = height of immersion in metres of the inner cylinder in the liquid medium,
R_i = radius in metres of the inner cylinder,
R_o = radius in metres of the outer cylinder,
k = constant of the apparatus, expressed in radians per cubic metre.

For non-Newtonian liquids it is indispensable to specify the shear stress (τ) or the shear rate (γ) at which the viscosity is measured. Under narrow gap conditions (conditions satisfied in absolute viscometers), there is a proportional relationship between M and τ and also between ω and γ:

$$\tau = AM \qquad \gamma = B\omega$$

where A and B are constants for the instrument and are calculated from the following expressions:

— *for concentric surface:*

$$A = \frac{1}{4\pi h}\frac{R_i^2 + R_0^2}{R_i^2 R_0^2} \qquad B = \frac{R_i^2 + R_0^2}{R_0^2 - R_i^2}$$

— *for cone-plates:*

$$A = \frac{3}{2\pi R^3} \qquad B = \frac{1}{\alpha}$$

M = torque in Newton-metres acting on the cone or cylinder surface,
ω = angular velocity in radians per second,
R_i = radius in metres of the inner cylinder,
R_0 = radius in metres of the outer cylinder,
R = radius in metres of the cone,
h = height of immersion in metres of the inner cylinder in the liquid medium,
α = angle in radians between the flat disk and the cone,
τ = shear stress in pascals (Pa),
γ = shear rate in reciprocal seconds (s^{-1}).

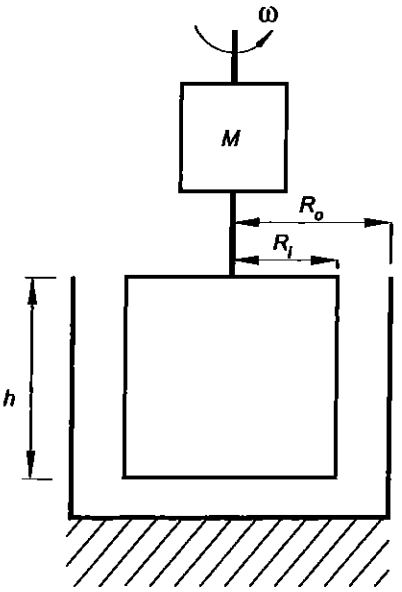

Figure 2.2.10.-1

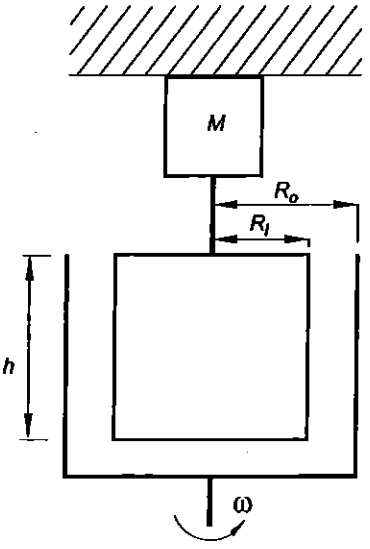

Figure 2.2.10.-2

CONE-PLATE VISCOMETERS (ABSOLUTE VISCOMETERS)

In the cone-plate viscometer, the liquid is introduced into the gap between a flat disc and a cone forming a define angle. Viscosity measurement can be performed by rotating the cone or the flat disc, as shown in Figures 2.2.10.-3 and 2.2.10.-4, respectively. For laminar flow, the viscosity (or apparent viscosity) η expressed in pascal-seconds is given by the following formula:

$$\eta = \left(\frac{M}{\omega}\right)\left(\frac{3\alpha}{2\pi R^3}\right) = k\frac{M}{\omega}$$

M = torque in Newton-metres acting on the flat disc or cone surface,
ω = angular velocity in radians per second,
α = angle in radians between the flat disc and the cone,
R = radius in metres of the cone,
k = constant of the apparatus, expressed in radians per cubic metre.

Constants A, B of the apparatus (see under concentric cylinder viscometers).

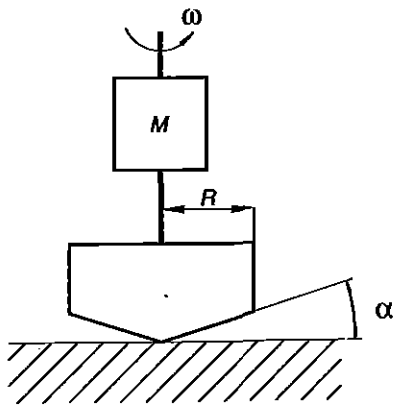

Figure 2.2.10.-3

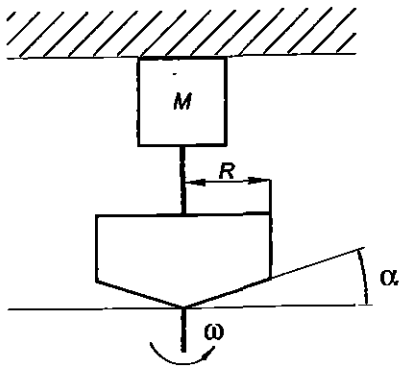

Figure 2.2.10.-4

SPINDLE VISCOMETERS (RELATIVE VISCOMETERS)

In the spindle viscometer, the viscosity is determined by rotating a spindle (for example, cylinder- or disc-shaped, as shown in Figures 2.2.10.-5 and 2.2.10.-6, respectively) immersed in the liquid. Relative values of viscosity (or apparent viscosity) can be directly calculated using conversion factors from the scale reading at a given rotational speed.

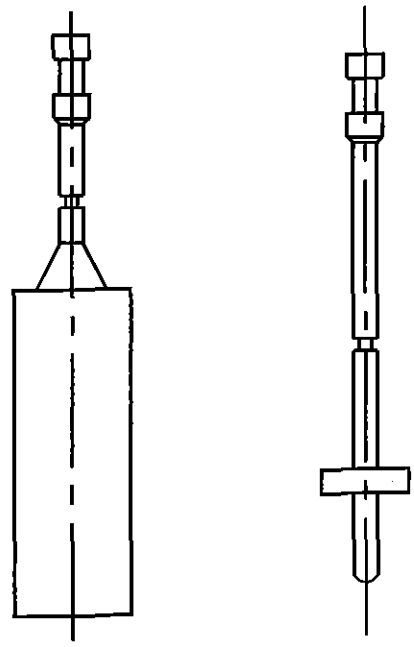

Figure 2.2.10.-5

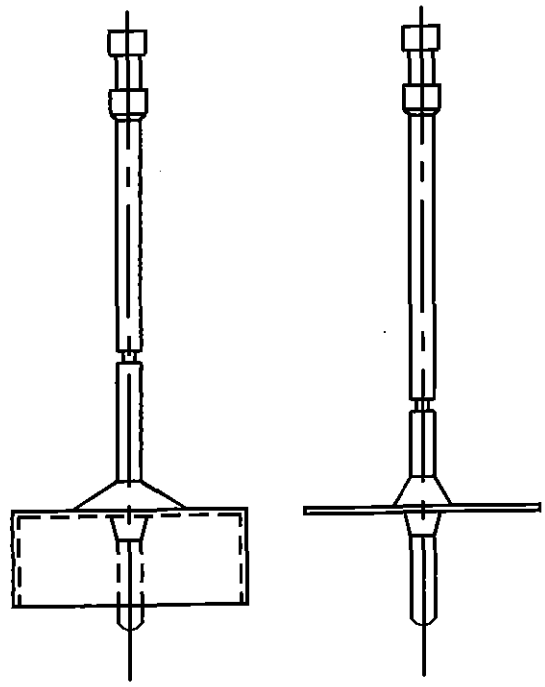

Figure 2.2.10.-6

In a general way, the constant k of the apparatus may be determined at various speeds of rotation using a certified viscometer calibration liquid. The viscosity η then corresponds to the formula:

$$\eta = k\frac{M}{\omega}$$

METHOD

Measure the viscosity (or apparent viscosity) according to the instructions for the operation of the rotating viscometer. The temperature for measuring the viscosity is indicated in the monograph. For non-Newtonian systems, the monograph indicates the type of viscometer to be used and if absolute viscometers are used the angular velocity or the shear rate at

which the measurement is made. If it is impossible to obtain the indicated shear rate exactly, use a shear rate slightly higher and a shear rate slightly lower and interpolate.

With relative viscometers the shear rate is not the same throughout the sample and therefore it cannot be defined. Under these conditions, the viscosity of non-Newtonian liquids determined from the previous formula has a relative character, which depends on the type of spindle and the angular velocity as well as the dimensions of the sample container (Ø = minimum 80 mm) and the depth of immersion of the spindle. The values obtained are comparable only if the method is carried out under experimental conditions that are rigorously the same.

Method IV (Falling Ball and Automatic Rolling Ball Viscometer Methods)

(Ph. Eur. method 2.2.49)

The determination of dynamic viscosity of Newtonian liquids using a falling ball or rolling ball viscometer is performed at 20.0 ± 0.1 °C, unless otherwise prescribed in the monograph. The time required for a test ball to fall or roll in the liquid to be examined from one ring mark or sensor to the other is determined.

METHOD A - FALLING BALL VISCOMETER

Apparatus The falling ball viscometer consists of: a glass tube enclosed in a mantle, which allows precise control of temperature; 6 balls made of glass, nickel-iron or steel with different densities and diameters. The tube is fixed in such a way that the axis is inclined by 10 ± 1° with regard to the vertical. The tube has 2 ring marks that define the distance the ball has to fall. Commercially available apparatuses are supplied with tables giving the constants, the density of the balls and the suitability of the different balls for the expected viscosity range.

Method Fill the clean, dry tube of the viscometer, previously brought to 20.0 ± 0.1 °C, with the liquid to be examined, avoiding bubbles. Choose the ball that is suitable for the viscosity range of the liquid so as to obtain a falling time (run time) not less than 30 s. Place it in the tube, close the tube and maintain the solution at 20.0 ± 0.1 °C for at least 15 min. Let the ball run through the liquid between the 2 ring marks once without measurement. Let it run again and measure with a stop-watch, to at least the nearest 1/5 s, the time required for the ball to fall from the upper to the lower ring mark. Repeat the test run at least 3 times to obtain a minimum of 4 run times. The result is only valid if the relative standard deviation determined on the run times is not greater than 2.0 per cent .

Use the mean of the run times to calculate the dynamic viscosity (η) in millipascal seconds using the formula:

$$\eta = k(\rho_1 - \rho_2) \times t$$

k = constant, in square millimetres per second squared;
ρ_1 = density of the ball used, in grams per cubic centimetre;
ρ_2 = density of the liquid to be examined, in grams per cubic centimetre, obtained by multiplying its relative density (d_{20}^{20}) by 0.9982;
t = mean of the run times of the ball, in seconds.

METHOD B – AUTOMATIC ROLLING BALL VISCOMETER

Apparatus The automatic rolling ball viscometer consists of: several capillaries made of glass or other suitable materials with different diameters enclosed in a thermostatically controlled block, which allows precise control of the temperature; balls made of stainless steel (optionally coated) or other suitable materials; a motor drive that positions the capillary at an inclination angle from 10.0 ± 0.2° to 80.0 ± 0.2° with regard to the vertical. The apparatus has at least 2 sensors to measure the run time of the ball over a predefined distance. Commercially available apparatuses are supplied with tables giving the constants, the density of the balls and the suitability of the different capillaries for the expected viscosity range. Temperature control, control of the inclination angle, run-time determination, repetitions of runs and calculations of the mean and relative standard deviation are performed by the apparatus software.

Method Set the instrument software to perform a measurement with at least 4 run times (2 forward/backward cycles) and a maximum relative standard deviation of 0.5 per cent. Choose the capillary, the ball and the inclination angle that are suitable for the expected viscosity range of the liquid to be examined so as to obtain a rolling time (run time) not less than 20 s over the 100 mm distance or a proportional time over other distances. If no digital density meter is connected to the viscometer, ensure that the density value of the liquid to be examined has been specified in the apparatus software. Fill the clean, dry capillary of the viscometer with the liquid to be examined, avoiding bubbles. Start the measurement immediately after filling the capillary.

The instrument calculates automatically the dynamic viscosity (η) in millipascal seconds and the kinematic viscosity (ν) in square millimetres per second.

Additional points for monographs of the British Pharmacopoeia

The apparatus and methods described in Methods I and II are in agreement in all essentials with International Standards ISO 3104-1994 and 3105-1994 (Methods for the determination of the viscosity of liquids).

J. Circular Dichroism

(Ph. Eur. method 2.2.41)

The difference in absorbance of optically active substances within an absorption band for left and right circularly polarised light is referred to as circular dichroism.

Direct measurement gives a mean algebraic value:

$$\Delta A = A_L - A_R$$

ΔA = circular dichroic absorbance,
A_L = absorbance of left circularly polarised light,
A_R = absorbance of right circularly polarised light.

Circular dichroism is calculated using the equation:

$$\Delta\varepsilon = \varepsilon_L - \varepsilon_R = \frac{\Delta A}{c \times l}$$

$\Delta\varepsilon$ = molar circular dichroism or molar differential dichroic absorptivity expressed in litre·mole^{-1}·cm^{-1},
ε_L = molar absorptivity (*2.2.25*) of left circularly polarised light,
ε_R = molar absorptivity of right circularly polarised light,
c = concentration of the test solution in mole·litre^{-1},
l = optical path of the cell in centimetres.

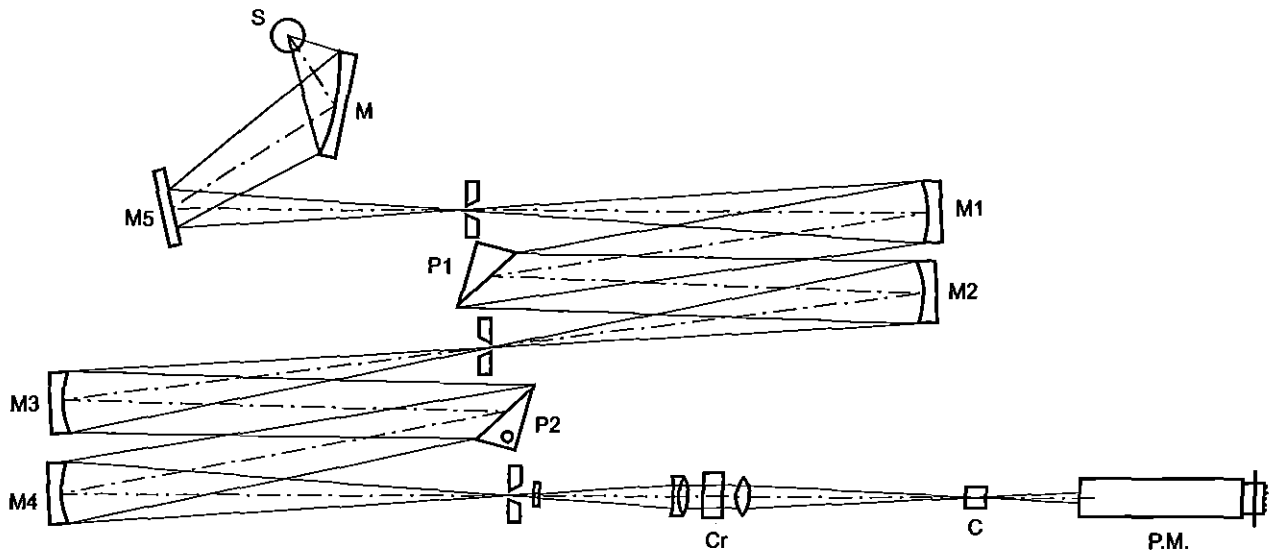

Figure 2.2.41.-1. – *Optical scheme of a dichrograph*

The following units may also be used to characterise circular dichroism:

Dissymmetry factor:

$$g = \frac{\Delta\varepsilon}{\varepsilon}$$

ε = molar absorptivity (*2.2.25*).

Molar ellipticity:

Certain types of instruments display directly the value of ellipticity Θ, expressed in degrees. When such instruments are used, the molar ellipticity [Θ] may be calculated using the following equation:

$$[\Theta] = \frac{\Theta \times M}{c \times l \times 10}$$

[Θ] = molar ellipticity, expressed in degrees·cm^2·decimole^{-1},
Θ = value of ellipticity given by the instrument,
M = relative molecular mass of the substance to be examined,
c = concentration of the solution to be examined in g/mL,
l = optical path of the cell in centimetres.

Molar ellipticity is also related to molar circular dichroism by the following equation:

$$[\Theta] = 2.303\Delta\varepsilon\frac{4500}{\pi} \approx 3300\Delta\varepsilon$$

Molar ellipticity is often used in the analysis of proteins and nucleic acids. In this case, molar concentration is expressed in terms of monomeric residue, calculated using the expression:

$$\frac{\text{molecular mass}}{\text{number of amino acids}}$$

The mean relative molecular mass of the monomeric residue is 100 to 120 (generally 115) for proteins and about 330 for nucleic acids (as the sodium salt).

Apparatus

The light source (S) is a xenon lamp (Figure 2.2.41.-1); the light passes through a double monochromator (M) equipped with quartz prisms (P1, P2).

The linear beam from the first monochromator is split into 2 components polarised at right angles in the second monochromator. The exit slit of the monochromator eliminates the extraordinary beam.

The polarised and monochromatic light passes through a birefringent modulator (Cr): the result is alternating circularly polarised light.

The beam then passes through the sample to be examined (C) and reaches a photomultiplier (PM) followed by an amplifier circuit which produces 2 electrical signals: one is a direct current V_c and the other is an alternating current at the modulation frequency V_{ac} characteristic of the sample to be examined. The phase gives the sign of the circular dichroism. The ratio V_{ac}/V_c is proportional to the differential absorption ΔA which created the signal. The region of wavelengths normally covered by a dichrograph is 170 nm to 800 nm.

Calibration of the apparatus

Accuracy of absorbance scale Dissolve 10.0 mg of *isoandrosterone R* in *dioxan R* and dilute to 10.0 mL with the same solvent. Record the circular dichroism spectrum of the solution between 280 nm and 360 nm. Measured at the maximum at 304 nm, $\Delta\varepsilon$ is + 3.3.

The solution of *(1S)-(+)-10-camphorsulfonic acid R* may also be used.

Linearity of modulation Dissolve 10.0 mg of *(1S)-(+)-10-camphorsulfonic acid R* in *water R* and dilute to 10.0 mL with the same solvent. Determine the exact concentration of camphorsulfonic acid in the solution by ultraviolet spectrophotometry (*2.2.25*), taking the specific absorbance to be 1.49 at 285 nm.

Record the circular dichroism spectrum between 185 nm and 340 nm. Measured at the maximum at 290.5 nm, $\Delta\varepsilon$ is + 2.2 to + 2.5. Measured at the maximum at 192.5 nm, $\Delta\varepsilon$ is −4.3 to −5.

(1S)-(+)- Or antipodal *(1R)-(−)-ammonium 10-camphorsulfonate R* can also be used.

K. Approximate pH of Solutions

(Ph. Eur. method 2.2.4)

Determine the approximate pH using a *pH indicator strip R*. Alternatively, pH indicators such as those described in Table 2.2.4.-1 can be used.

Table 2.2.4.-1

Reaction	pH	Indicator
Alkaline	> 8	*Red litmus paper R*
Slightly alkaline	8 – 10	*Phenolphthalein solution R*
		Thymol blue solution R
Strongly alkaline	> 10	*Phenolphthalein paper R*
		Thymol blue solution R
Neutral	6 – 8	*Methyl red solution R*
		Phenol red solution R
Acid	< 6	*Methyl red solution R*
		Bromothymol blue solution R1
Slightly acid	4 – 6	*Methyl red solution R*
		Bromocresol green solution R
Strongly acid	< 4	*Congo red paper R*

L. Determination of pH Values

(Ph. Eur. method 2.2.3)

The pH of an aqueous solution is defined as the negative logarithm of the activity of its hydrogen ions, expressed conventionally as the hydrogen ion concentration of the solution. For practical purposes, its definition is an experimental one. The pH of a solution to be examined is related to that of a reference solution (pH_s) by the following equation:

$$pH = pH_s - \frac{E - E_s}{k}$$

in which E is the potential, expressed in volts, of the cell containing the solution to be examined and E_s is the potential, expressed in volts, of the cell containing the solution of known pH (pH_s), k is the change in potential per unit change in pH, expressed in volts and calculated from the Nernst equation.

Table 2.2.3.-1. – *Values of k at different temperatures*

Temperature (°C)	k (V)
15	0.0572
20	0.0582
25	0.0592
30	0.0601
35	0.0611

The potentiometric determination of pH is made by measuring the potential difference between 2 appropriate electrodes immersed in the solution to be examined; 1 of these electrodes is sensitive to hydrogen ions (usually a glass electrode) and the other is the reference electrode (e.g. a silver-silver chloride electrode). They are often combined as 1 compact electrode, together with a temperature probe.

Apparatus The measuring apparatus is usually a voltmeter with an input resistance at least 100 times that of the electrodes used. It is normally graduated in pH units and has a sensitivity such that discrimination of at least 0.05 pH unit or at least 0.003 V may be achieved.

Recent pH meters are microprocessor-controlled and are operated using the manufacturer's firmware or software, according to given instructions.

Management of electrodes The electrodes are stored appropriately and according to the manufacturer's recommendations (e.g. in an electrolyte solution or a suitable storage solution). Before measurement, the electrodes are visually checked. Refillable electrodes are checked for the absence of air bubbles in the glass bulb and to ensure that the inner electrolyte solution level is satisfactory. The filling orifice has to remain open during the measurement. It is also recommended that the diaphragm of the reference electrode is checked. Before first use, or if the electrode has been stored out of electrolyte solution, it is usually necessary to condition it, according to the recommendations of the manufacturer. If pH stabilisation is too slow (i.e. a long response time), or a zero point shift, reduced slope or any other difficulties in calibration are observed, the electrode will probably need to be cleaned or replaced. The cleaning is performed depending on the type of sample and as prescribed in the manufacturer's manual. Regular cleaning is recommended.

Calibration and measurement conditions Unless otherwise prescribed in the monograph, all measurements are carried out at the same temperature as that used for calibration (± 2.5 °C), usually between 20 °C and 25 °C. Table 2.2.3.-2 shows the variation of pH with respect to temperature of a number of reference buffer solutions used for calibration. Follow the manufacturer's instructions for temperature correction.

The calibration consists of the determination of the slope (e.g. 95-105 per cent) and the offset of the measuring system. Most commercial pH meters offer a "self test" or "start-up test" where, for example, the slope and asymmetry potential are tested and compared to the manufacturer's specifications. The apparatus is calibrated using at least 2 buffer solutions chosen so that the expected pH value of the solution to be examined lies between the pH values of the buffer solutions. The range must be at least 2 pH units. The pH of another buffer solution of intermediate pH, read from the scale, must not differ by more than 0.05 pH units from the value corresponding to that solution.

Reference buffer solutions are preferably commercially available certified reference materials. Alternatively, buffer solutions can be prepared in-house according to Table 2.2.3.-2. These solutions must be traceable to primary standards. Calibration has to be performed on a regular basis, preferably each day of use or before each series of measurements.

Immerse the electrodes in the solution to be examined and take the reading in the same conditions as those applied for the reference buffer solutions.

If suspensions, emulsions or solutions of non-aqueous or partially non-aqueous character are measured on a system calibrated as described above, the pH reading can only be considered to be an approximation of the true value. Suitable electrodes have to be used for pH measurements of such mixtures.

PREPARATION OF REFERENCE BUFFER SOLUTIONS

Potassium tetraoxalate 0.05 M

Dissolve 12.61 g of $C_4H_3KO_8,2H_2O$ in *carbon dioxide-free water R* and dilute to 1000.0 mL with the same solvent.

Table 2.2.3.-2. – *pH of reference buffer solutions at various temperatures*

Temperature (°C)	Potassium tetraoxalate 0.05 M	Potassium hydrogen tartrate saturated at 25 °C	Potassium dihydrogen citrate 0.05 M	Potassium hydrogen phthalate 0.05 M	Potassium dihydrogen phosphate 0.025 M+ Disodium hydrogen phosphate 0.025 M	Potassium dihydrogen phosphate 0.0087 M+ Disodium hydrogen phosphate 0.0303 M	Disodium tetraborate 0.01 M	Sodium carbonate 0.025 M+ Sodium bicarbonate 0.025 M	Calcium hydroxide, saturated at 25°C

(1) pH variation per degree Celsius.

Potassium hydrogen tartrate, saturated at 25 °C
Shake an excess of $C_4H_5KO_6$ vigorously with *carbon dioxide-free water R* at 25 °C. Filter or decant. Prepare immediately before use.

Potassium dihydrogen citrate 0.05 M
Dissolve 11.41 g of $C_6H_7KO_7$ in *carbon dioxide-free water R* and dilute to 1000.0 mL with the same solvent. Prepare immediately before use.

Potassium hydrogen phthalate 0.05 M
Dissolve 10.13 g of $C_8H_5KO_4$, previously dried for 1 h at 110 ± 2 °C, in *carbon dioxide-free water R* and dilute to 1000.0 mL with the same solvent.

Potassium dihydrogen phosphate 0.025 M + Disodium hydrogen phosphate 0.025 M
Dissolve 3.39 g of KH_2PO_4 and 3.53 g of Na_2HPO_4, both previously dried for 2 h at 120 ± 2 °C, in *carbon dioxide-free water R* and dilute to 1000.0 mL with the same solvent.

Potassium dihydrogen phosphate 0.0087 M + Disodium hydrogen phosphate 0.0303 M
Dissolve 1.18 g of KH_2PO_4 and 4.30 g of Na_2HPO_4, both previously dried for 2 h at 120 ± 2 °C, in *carbon dioxide-free water R* and dilute to 1000.0 mL with the same solvent.

Disodium tetraborate 0.01 M
Dissolve 3.80 g of $Na_2B_4O_7,10H_2O$ in *carbon dioxide-free water R* and dilute to 1000.0 mL with the same solvent. Store protected from atmospheric carbon dioxide.

Sodium carbonate 0.025 M + Sodium hydrogen carbonate 0.025 M
Dissolve 2.64 g of Na_2CO_3 and 2.09 g of $NaHCO_3$ in *carbon dioxide-free water R* and dilute to 1000.0 mL with the same solvent. Store protected from atmospheric carbon dioxide.

Calcium hydroxide, saturated at 25 °C
Shake an excess of *calcium hydroxide R* with *carbon dioxide-free water R* and decant at 25 °C. Store protected from atmospheric carbon dioxide.

STORAGE OF BUFFER SOLUTIONS
Store buffer solutions in suitable chemically-resistant, airtight containers, such as type I glass bottles or plastic containers suitable for aqueous solutions.

Additional points for monographs of the British Pharmacopoeia
[Suitable glass electrodes and pH meters of both the analogue and digital type are described in British Standards 2586:1979 and 3145:1978.]

M. Thermal Analysis[1]

(Ph. Eur. method 2.2.34)

Thermal analysis is a group of techniques in which the variation of a physical property of a substance is measured as a function of temperature. The most commonly used techniques are those which measure changes in the mass or energy of a sample of a substance.

These techniques have different applications:
— determination of phase changes;
— determination of changes in chemical composition;
— determination of purity.

THERMOGRAVIMETRY
Thermogravimetry (TG) or thermogravimetric analysis (TGA) is a technique in which the mass of a sample of a substance is recorded as a function of temperature according to a controlled temperature programme.

Instrument
The essential components of a thermobalance are a device for heating or cooling the substance according to a given temperature programme, a sample holder in a controlled atmosphere, an electrobalance and a means of electronic signal output to a recorder or a computer.

Temperature calibration
The temperature sensor close to or in contact with the sample is calibrated using the Curie temperature of a ferromagnetic substance such as nickel. In the case of an instrument capable of simultaneously conducting TG/TGA and differential thermal analysis (DTA) or differential scanning calorimetry (DSC), the same certified reference materials as those for DTA and DSC may be used, for example, indium, tin and/or zinc.

[1] *This chapter has undergone pharmacopoeial harmonisation. See chapter 5.8 Pharmacopoeial harmonisation.*

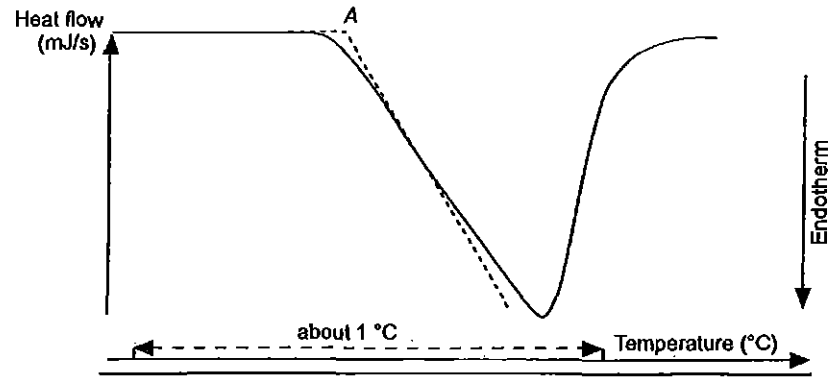

Figure 2.2.34.-1. – *Thermogram*

Calibration of the electrobalance
Place an appropriate quantity of a suitable certified reference material (e.g. *calcium oxalate monohydrate CRS*) in the sample holder and record the mass. Set the heating rate according to the manufacturer's instructions (e.g. 5 °C/min) and start the temperature increase. Record the thermogravimetric curve as a graph with temperature or time on the abscissa, increasing from left to right, and mass on the ordinate, decreasing downwards. Stop the temperature increase at about 250 °C. Measure the difference on the graph between the initial and final mass-temperature or mass-time plateaux, which corresponds to the loss of mass. The declared loss of mass for the certified reference material is stated on the label.

Method
Apply the same procedure to the substance to be examined using the conditions prescribed in the monograph. Calculate the loss of mass of the substance to be examined from the difference measured in the graph obtained. Express the loss of mass as $\Delta m/m$ (per cent).

If the instrument is in frequent use, carry out temperature calibration regularly. Otherwise, calibration is carried out before each measurement.

As the operating conditions are critical, the following parameters are noted for each measurement: pressure or flow rate, gas composition, mass of the sample, heating rate, temperature range and sample pre-treatment including any isothermal period.

DIFFERENTIAL SCANNING CALORIMETRY

Differential scanning calorimetry (DSC) is a technique that can be used to demonstrate the energy phenomena produced during heating (or cooling) of a substance (or a mixture of substances) and to determine the changes in enthalpy and specific heat and the temperatures at which these occur.

The technique is used to determine the difference in heat flow (with reference to the temperature) evolved or absorbed by the test sample compared with the reference cell, as a function of the temperature. Two types of DSC instruments are available, those using power compensation to maintain a null temperature difference between sample and reference and those that apply a constant rate of heating and detect temperature differential as a difference in heat flow between sample and reference.

Instrument
The instrument for power compensation DSC consists of a furnace containing a sample holder with a reference cell and a test cell. The instrument for heat flow DSC consists of a furnace containing a single cell with a sample holder for the reference crucible and the test crucible.

A temperature-programming device, thermal detector(s) and a recording system which can be connected to a computer are attached. The measurements are carried out under a controlled atmosphere.

Calibration of the instrument
Calibrate the instrument for temperature and enthalpy change, using suitable certified materials or reference standards.

Temperature calibration It can be performed using certified reference materials having an intrinsic thermal property, such as the melting point of pure metals or organic substances, or the phase transition point of crystalline inorganic salts or oxides. Melting points of indium, tin and/or zinc are usually employed for calibration.

Heat-quantity calibration For accurate estimation of the quantity of heat change (enthalpic change) of a test sample, caused by a certain physical change accompanying a temperature change, it is necessary to calibrate the instrument using suitable certified reference materials. Similar to temperature calibration, heat-quantity calibration may be performed using suitable certified reference materials showing a known definite enthalpic change caused by physical changes, such as the melting of pure metals and/or organic substances, or the phase transition of crystalline inorganic salts. The heats of fusion of indium, tin and/or zinc are usually employed for calibration.

Operating procedure
Weigh in a suitable crucible an appropriate quantity of the substance to be examined and place it in the sample holder. Place an empty crucible in the reference holder. Set the initial and final temperatures, and the heating rate according to the operating conditions prescribed in the monograph.

Begin the analysis and record the DSC curve with the temperature or time on the abscissa (values increasing from left to right) and the energy change on the ordinate (specify whether the change is endothermic or exothermic).

The temperature at which the phenomenon occurs (the onset temperature) corresponds to the intersection (A) of the extension of the baseline with the tangent at the point of greatest slope (inflexion point) of the curve (see Figure 2.2.34.-1). The end of the thermal phenomenon is indicated by the peak of the curve.

The enthalpy of the phenomenon is proportional to the area under the curve limited by the baseline; the proportionality factor is determined from the measurement of the heat of fusion of a known substance (e.g. indium) under the same operating conditions.

Each thermogram may be accompanied by the following data: conditions employed, record of last calibration, mass of

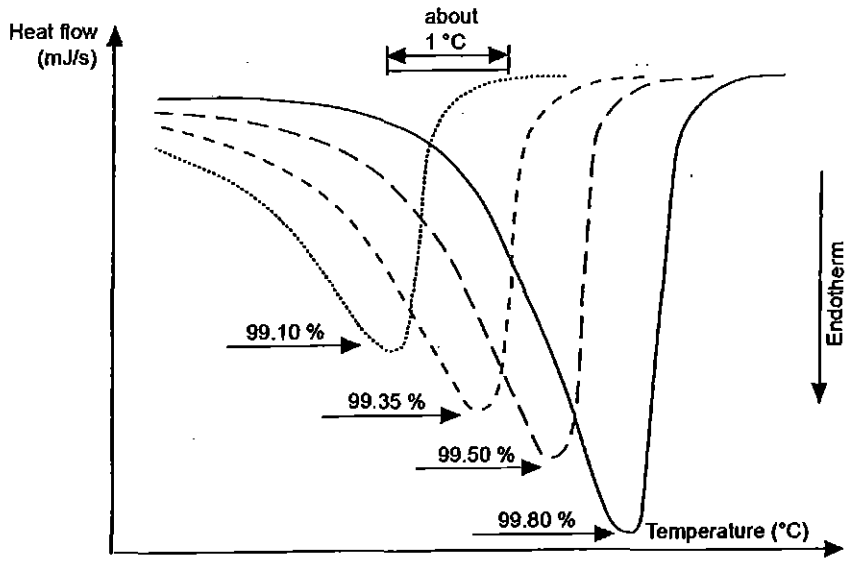

Figure 2.2.34.-2. – *Thermal diagrams according to purity*

the sample and identification (including thermal history), container, atmosphere (identity, flow rate, pressure), direction and rate of temperature change, instrument and recorder sensitivity.

Applications

Phase changes Determination of the temperature, heat capacity change and enthalpy of phase changes undergone by a substance as a function of temperature. The transitions that may be observed include those shown in Table 2.2.34.-1.

Table 2.2.34.-1.

solid - solid transition:	allotropy - polymorphism desolvation amorphous-crystalline
solid - liquid transition:	melting glass-transition
solid - gas transition:	sublimation
liquid - solid transition:	freezing recrystallisation glass-transition
liquid - gas transition:	evaporation

Changes in chemical composition Measurement of heat and temperatures of reaction under given experimental conditions, so that, for example, the kinetics of decomposition or desolvation can be determined.

Application to phase diagrams Establishment of phase diagrams for solid mixtures. The establishment of a phase diagram may be an important step in the preformulation and optimisation of the freeze-drying process.

Determination of purity The measurements of the fraction of substance melted at a given temperature and the heat of fusion by DSC enable the impurity content of a substance to be determined from a single thermal diagram, requiring the use of only a few milligrams of sample with no need for repeated accurate measurements of the true temperature.

In theory, the melting of an entirely crystalline, pure substance at constant pressure is characterised by a heat of fusion ΔH_f in an infinitely narrow range, corresponding to the melting point T_0. A broadening of this range is a sensitive indicator of impurities. Therefore, samples of the same substance, whose impurity contents vary by a few tenths of a per cent, give thermal diagrams that are visually distinct (see Figure 2.2.34.-2).

The determination of molar purity by DSC is based on the use of a mathematical approximation of the integrated form of the van't Hoff equation applied to the concentrations (not the activities) in a binary system [$\ln(1 - x_2) \approx -x_2$ and $T \times T_0 \approx T_0^2$]. For low amounts of impurities ($x_2 \ll 1$) and for temperatures close to the melting point T_0 the equation can be written as follows, in which T and x_2 are variables:

$$T = T_0 - \frac{RT_0^2}{\Delta H_f} \times x_2 \qquad (1)$$

T = temperature of the sample, in kelvins;
T_0 = melting point of the chemically pure substance, in kelvins;
R = gas constant for ideal gases, in joules·kelvin^{-1}·mole^{-1};
ΔH_f = molar heat of fusion of the pure substance, in joules·mole^{-1};
x_2 = mole fraction of the impurity, i.e., the number of molecules of the impurity divided by the total number of molecules in the liquid phase (or molten phase) at temperature T (expressed in kelvins).

Hence, the determination of purity by DSC is limited to the detection of impurities forming a eutectic mixture with the principal compound and present at a mole fraction of typically less than 2 per cent in the substance to be examined.

This method cannot be applied to:
— amorphous substances;
— solvates or polymorphic compounds that are unstable within the experimental temperature range;
— impurities forming solid solutions with the principal substance;
— impurities that are insoluble in the liquid phase or in the melt of the principal substance.

During the heating of the substance to be examined, the impurity melts completely at the eutectic temperature. Above this temperature, the solid phase contains only the pure substance. As the temperature increases progressively from the eutectic temperature to the melting point of the pure substance, the mole fraction of the impurity in the liquid phase decreases, since the quantity of liquefied pure substance increases.

For all temperatures above the eutectic point:

$$x_2 = \frac{1}{F} \times x_2^* \qquad (2)$$

F = molten fraction of the analysed sample;
x_2^* = mole fraction of the impurity in the analysed sample.

When the entire sample has melted, $F = 1$ and $x_2 = x_2^*$.

If equation (2) is combined with equation (1), the following equation is obtained:

$$T = T_0 - \frac{RT_0^2}{\Delta H_f} \times \frac{1}{F} \times x_2^*$$

The value of the heat of fusion of the pure substance is obtained by integrating the melting peak.

The melting point T_0 of the pure substance is extrapolated from the plot of temperature T (expressed in kelvins) versus $1/F$. The slope α of the curve (obtained after linearisation, if necessary) corresponding to $RT_0^2 \frac{x_2^*}{\Delta H_f}$, allows x_2^* to be evaluated.

The fraction x_2^* multiplied by 100 gives the mole fraction in per cent for total eutectic impurities.

N. Osmolality

(Ph. Eur. method 2.2.35)

PRINCIPLE

GENERAL

Osmolality is a measure of the total number of chemical entities per kilogram of solvent, and thus provides an indication of the osmotic pressure of the solution. Osmolality is dependent on the molal concentration of the solute(s) in the solution, on their dissociation and on the deviation of the solution from ideal behaviour (Raoult's law).

The unit of osmolality is the osmole per kilogram (osmol/kg), but the submultiple milliosmole per kilogram (mosmol/kg) is more commonly used.

The osmolality (ξ_m) of a solution containing i solutes is given by the expression:

$$\xi_m = \sum \nu_i m_i \Phi_{m,i}$$

ν_i = number of entities formed by the dissociation of one molecule of the i^{th} solute; if the solute is non-ionic (non-dissociating), ν_i equals 1,
m_i = molality of the i^{th} solute in the solution, in moles per kilogram of solvent,
$\Phi_{m,i}$ = molal osmotic coefficient, a dimensionless factor.

The molal osmotic coefficient is a measure of the deviation of the solution from ideal behaviour. For an ideal solution, osmolality equals molality (Φ=1).

In the case of a real, non-ideal solution, the molal osmotic coefficient is influenced by the interactions occurring amongst the components (i.e. molecules, ions, solvent) of the solution. The more complex the composition of the solution, the harder it becomes to determine Φ.

For this reason, the measurement of a colligative property such as the freezing-point depression is used as a practical means of determining osmolality by obtaining an overall measure of the contribution of the various solutes present in a solution.

PRINCIPLE OF MEASUREMENT

Unless otherwise prescribed, osmolality is determined by measuring the freezing-point depression (ΔT_f) of a solution. The relationship between osmolality and freezing-point depression is given by the expression:

$$\Delta T_f = k_f \xi_m$$

where k_f is the molal cryoscopic constant, which is solvent-dependent. For water, the value of k_f is 1.86 K/osmol (i.e. adding 1 mol of a non-dissociating solute to 1 kg of water results in a decrease in freezing-point of 1.86 K).

EQUIPMENT

An osmometer for freezing-point depression measurement typically consists of:

— an appropriate sample container;
— a means of cooling the sample;
— a temperature-sensitive resistor (thermistor), with an appropriate current or potential difference measurement device that can indicate a temperature depression or give osmolality values directly;
— a means of mixing the sample and/or inducing solidification when supercooling occurs.

PROCEDURE

CALIBRATION

Prepare reference solutions as specified in Table 2.2.35.-1, as necessary, using dried *sodium chloride R*. Commercially available certified solutions for osmometer calibration, with osmolalities equal or similar to those listed in Table 2.2.35.-1, may be used. Calibrate the equipment according to the manufacturer's instructions using *water R* to determine the zero value and at least 2 of the reference solutions listed in Table 2.2.35.-1. Confirm the calibration using at least one additional reference solution with a known osmolality (see Table 2.2.35.-1). Select a reference solution preferably with an osmolality within ± 50 mosmol/kg of the expected value for the solution to be examined or close to the centre of the expected osmolality range of the solutions to be examined. It is recommended that the reading is within ± 4 mosmol/kg of the osmolality of the chosen reference solution.

Table 2.2.35.-1. – *Reference solutions for osmometer calibration*

Mass of *sodium chloride R* in *water R* (g/kg)	Osmolality, ξ_m (mosmol/ kg)	Freezing-point depression, ΔT_f (K)
3.087	100	0.186
6.260	200	0.372
9.463	300	0.558
12.684	400	0.744
15.916	500	0.930
19.147	600	1.116
22.380	700	1.302

METHOD

Rinse the sample container with the solution to be examined before each measurement. Programme the device inducing solidification to start at a defined temperature below the expected freezing-point of the solution to be examined. Introduce an appropriate volume of the solution to be examined into the sample container according to the manufacturer's instructions, and start the cooling system. The equipment indicates when equilibrium has been reached.

Perform the test under the conditions (cooling temperature and volume) used to calibrate the equipment. Depending on the type of equipment, the osmolality can be read directly or

can be calculated from the measured freezing-point depression.

The test is not valid unless the measured osmolality of the solution to be examined lies within the calibrated osmolality range.

O. Conductivity[1]

(Ph. Eur. method 2.2.38)

INTRODUCTION

This general chapter provides information on how to carry out electrical conductivity measurements (hereafter referred to as 'conductivity') of fluids, including pure liquids. It is intended for fluid applications when conductivity is used to measure, monitor or control chemical dispensing (e.g. chemical purity or ionic concentration), and other applications where the ionic character of the fluid needs to be known or controlled.

Applications include, but are not limited to, solutions that may be used in clean-in-place, chromatography detection, ionic solution preparation, end point detection, dosing, fermentation and buffer production. In some cases, conductivity measurements can be extended to pure organic fluids such as alcohols and glycols where a weak conductivity signal exists, and the signal can be significantly increased if the organic fluids become contaminated with water or salts.

Conductivity is the measurement of the ability of a fluid to conduct electricity via its ions. The ability of any ion to electrically conduct is directly related to its ion mobility. Conductivity is directly proportional to the concentrations of ions in the fluid according to the following equation:

$$\kappa = 1000 \sum_{i}^{\text{all ions}} C_i \lambda_i$$

κ	=	conductivity, in siemens per centimetre;
C_i	=	concentration of ion i, in moles per litre;
λ_i	=	specific molar conductance of ion i, in siemens square centimetres per mole ($S \cdot cm^2 \cdot mol^{-1}$).

Although siemens per metre is the appropriate SI unit for conductivity, historically the unit siemens per centimetre has been selected by industry as the accepted unit.

Based on this equation, conductivity is not ion-selective because it responds to all ions. Furthermore, the specific molar conductance of each ion is different. As a result, unless the percentage composition of ions in the solution is limited and known, the precise concentrations of ionic species cannot be determined from conductivity measurements. However, for examples such as a solution of a single salt, acid or base (e.g. a caustic solution used in cleaning) the precise concentration can be directly determined. Despite the lack of ionic specificity, conductivity is a valuable laboratory and process tool for measurement and control of total ionic content because it is proportional to the sum of the concentrations of all ionic species (anions and cations) for diluted solutions, as described in the equation above.

At higher concentrations, conductivity measurements are not perfectly linear with concentration. Conductivity measurements cannot be applied to solids or gases, but they can be applied to the condensate of gases.

[1] *This general chapter has undergone pharmacopoeial harmonisation. See chapter 5.8. Pharmacopoeial harmonisation.*

Another variable that influences conductivity measurements is the fluid temperature. As fluid temperature increases, the ion conductance increases, making this physico-chemical phenomenon the predominant reason for the temperature-compensation requirement when testing conductive fluids.

The conductivity (κ) is proportional to the conductance (G), of a fluid between 2 electrodes:

$$\kappa = G \times \left(\frac{d}{A}\right) = G \times K$$

κ	=	conductivity, in siemens per centimetre;
G	=	conductance, in siemens;
d	=	distance between the electrodes, in centimetres;
A	=	area of the conducting electrodes, in square centimetres;
K	=	cell constant, in reciprocal centimetres, which is also equal to the ratio of d/A.

The resistivity ρ, expressed in ohm centimetres, of the fluid is, by definition, the reciprocal of the conductivity:

$$\rho = \frac{1}{\kappa} = \frac{1}{G \times K} = \frac{R}{K}$$

ρ	=	resistivity, in ohm centimetres;
κ	=	conductivity, in siemens per centimetre;
G	=	conductance, in siemens;
R	=	resistance, in ohms, which is the reciprocal of the conductance (G);
K	=	cell constant, in reciprocal centimetres.

EQUIPMENT

An electrical conductivity measurement consists of the determination of resistance of the fluid between and around the electrodes of the conductivity sensor. To achieve this measurement, the primary instrumentation is the resistance-measuring circuit and the conductivity sensor, and they are usually connected by a cable when the sensor and the user interface are separated.

The resistance measurement is made by applying an AC (alternating current, meaning the flow of electric charge periodically reverses direction) voltage (or current) to the electrodes, measuring the current (or voltage), and calculating the resistance according to Ohm's law.

The alternating source is utilised to prevent polarisation (collection of ions) at the electrodes. Depending on the equipment, the frequency of the measuring system adjusts automatically according to the measuring conditions of the instrument, and there may be multiple resistance-measuring circuits embedded in the measuring system. The resistance-measurement circuit may be embedded in the transmitter or in the sensor.

The conductivity sensor consists of at least 2 electrical conductors of a fixed size and geometry, separated by an electrical insulator. The electrodes, insulator and any other wetted components are constructed of materials that are unreactive to fluids with which they may come into contact. In addition, the sensor construction must be able to withstand the environmental conditions (process or ambient temperature, pressure, cleaning applications) that it would be subjected to.

Most conductivity sensors have temperature devices such as a platinum RTD (resistance temperature device) or NTC (negative temperature coefficient) thermistor embedded inside the sensor, although external temperature measurement is possible. The purpose of the temperature measurement is for temperature compensation of the conductivity measurement.

CELL CONSTANT DETERMINATION

The purpose of the sensor's cell constant is to normalise the conductance (or resistance) measurement for the geometrical construction of the 2 electrodes.

The cell constant is determined by immersing the conductivity sensor in a solution of known conductivity. Solutions of known conductivity can be obtained by preparation of specific recipes according to national authoritative sources, or procurement of commercially available certified and traceable standard solutions. These recipes or certified solutions can range from 5 to 200 000 $\mu S \cdot cm^{-1}$ depending on the level of accuracy desired. Alternatively, the cell constant is determined by comparison to other reference conductivity measuring systems (also available as an accredited calibration service). (*NOTE*: conductivity measurements are not perfectly linear with concentration.)

The measured cell constant of the conductivity sensor must be within 5 per cent of the nominal value indicated by the sensor certificate, unless otherwise prescribed.

Modern conductivity sensors normally do not change their cell constant over their lifetime. If a change in the cell constant is detected during calibration, cleaning of the sensor according to the manufacturer's recommendations is appropriate, followed by a repeat of the calibration procedure. Sometimes 'memory effects' appear, particularly when changing from high to low concentrations if the sensor is not well flushed.

CALIBRATION OF TEMPERATURE

In addition to verifying the sensor's cell constant, the embedded temperature device (or external temperature device) must be appropriately calibrated for the application, in order to apply the temperature compensation algorithm accurately. The temperature accuracy that is required depends on the criticality of the temperature to the application. An accuracy of ± 1 °C typically suffices.

CALIBRATION OF MEASUREMENT ELECTRONICS

The measurement circuit of the system is fundamentally an AC resistance measuring device. Appropriate verification and/or calibration of the measuring circuit is required for measurement systems with signal transfer via analog cable. This is accomplished by disconnecting the measuring circuit from the sensor's electrodes, attaching traceable resistors of known value to the measuring circuit using the same measurement system cable, and verifying that the measured resistance agrees with the resistor value to an acceptable level. A typical acceptance criterion for the resistance accuracy is below 2 per cent of the reading at resistances greater than 100 Ω, and increasing to 5 per cent at lower resistances. However, it is recommended that the application criticality ultimately determines the desired accuracy.

For conductivity systems that cannot have the resistance-measuring circuit disconnected from the electrodes (e.g. measurement circuit and electrodes in 1 mutual housing), it may be difficult to directly adjust or verify the circuit accuracy, depending on the sensor design.
An alternative method of verifying the measurement system integrity is a system calibration according to the procedures for cell constant determination for each measuring circuit that is intended to be used.

If verification/calibration of the sensor's cell constant, temperature device and measuring circuit are done at the same service interval, it is recommended to verify the measuring circuit first, the temperature device next and the cell constant last. Because all of these parameters are typically very stable due to modern electronics and stable sensor construction, frequent calibration (such as daily) is not usually required. Comparison to qualified reference systems is also a suitable means of calibration. Calibration is performed at appropriate intervals as defined in the quality management system.

TEMPERATURE COMPENSATION

As the conductivity of a fluid is temperature dependent, temperature compensation of the conductivity measurement is necessary unless otherwise prescribed (e.g. purified water, water for injection). An appropriate temperature compensation algorithm will ensure that changes in the conductivity measurements can be ascribed to concentration changes and not temperature changes. Conductivity measurements are normally referenced to 25 °C. A common form of linear temperature compensation uses a temperature coefficient according to the following equation:

$$\kappa_{25} = \frac{\kappa_T}{[1 + \alpha(T - 25)]}$$

κ_{25} = conductivity compensated to 25 °C;
κ_T = conductivity at T;
α = temperature coefficient of conductivity;
T = measured temperature.

A temperature coefficient of 2.1 per cent per degree Celsius is commonly used for many salt solutions. Most salt-based solutions have temperature coefficients of conductivity ranging from 1.9 to 2.2 per cent per degree Celsius. Depending on the fluid samples, other forms of temperature compensation may be appropriate. Non-linear temperature compensation data for a variety of solutions is widely available, e.g. as described in ISO 7888 *Water Quality – Determination of electrical conductivity*. In cases of very low conductivity (below 10 $\mu S \cdot cm^{-1}$), for example, purified water used for cleaning/rinsing purposes, two compensations need to be made. One is for the intrinsic conductivity of water, and the other is for the other ionic species in water. These compensations are normally combined and embedded in the microprocessor-controlled conductivity measurement systems. This is not supplied in all conductivity measurement technologies.

CONDUCTIVITY MEASUREMENT OF FLUIDS

For off-line or at-line batch measurements, rinse the cleaned sensor with the fluid to be measured, then perform the measurement. Ensure that the position of the sensor in the container does not impact the conductivity measurement, as the container walls can impact the measurement for some electrode designs. Record the temperature and the temperature-compensated conductivity as required.

For continuous on-line or in-line measurements, install the cleaned sensor into the pipe, tank or other containment vessel, and flush if necessary. Make sure proper installation procedures are applied to prevent bubbles or particles from collecting between the electrodes. Ensure that the position of the sensor in the pipe or tank does not impact the conductivity measurement, as the nearby surfaces can affect the measurement for some electrode designs. Record the temperature and the temperature-compensated conductivity as required.

For all batch or continuous measurements, ensure that the wetted components of the sensor are compatible with the fluid and the temperature to be measured.

P. Total Organic Carbon in Water for Pharmaceutical Use

(Ph. Eur. method 2.2.44)

Total organic carbon (TOC) determination is an indirect measure of organic substances present in water for pharmaceutical use. TOC determination can also be used to monitor the performance of various operations in the preparation of medicines.

A variety of acceptable methods is available for determining TOC. Rather than prescribing a given method to be used, this general chapter describes the procedures used to qualify the chosen method and the interpretation of results in limit tests. A standard solution is analysed at suitable intervals, depending on the frequency of measurements; the solution is prepared with a substance that is expected to be easily oxidisable (for example, sucrose) at a concentration adjusted to give an instrument response corresponding to the TOC limit to be measured. The suitability of the system is determined by analysis of a solution prepared with a substance expected to be oxidisable with difficulty (for example, 1,4-benzoquinone).

The various types of apparatus used to measure TOC in water for pharmaceutical use have in common the objective of completely oxidising the organic molecules in the sample water to produce carbon dioxide followed by measurement of the amount of carbon dioxide produced, the result being used to calculate the carbon concentration in the water.

The apparatus used must discriminate between organic and inorganic carbon, the latter being present as carbonate. The discrimination may be effected either by measuring the inorganic carbon and subtracting it from the total carbon, or by purging inorganic carbon from the sample before oxidisation. Purging may also entrain organic molecules, but such purgeable organic carbon is present in negligible quantities in water for pharmaceutical use.

Apparatus Use a calibrated instrument installed either on-line or off-line. Verify the system suitability at suitable intervals as described below. The apparatus must have a limit of detection specified by the manufacturer of 0.05 mg or less of carbon per litre.

TOC water Use highly purified water complying with the following specifications:
— conductivity: not greater than 1.0 $\mu S \cdot cm^{-1}$ at 25 °C,
— total organic carbon: not greater than 0.1 mg/L.

Depending on the type of apparatus used, the content of heavy metals and copper may be critical. The manufacturer's instructions should be followed.

Glassware preparation Use glassware that has been scrupulously cleaned by a method that will remove organic matter. Use *TOC water* for the final rinse of glassware.

Standard solution Dissolve *sucrose R*, dried at 105 °C for 3 h in *TOC water* to obtain a solution containing 1.19 mg of sucrose per litre (0.50 mg of carbon per litre).

Test solution Using all due care to avoid contamination, collect water to be tested in an airtight container leaving minimal head-space. Examine the water with minimum delay to reduce contamination from the container and its closure.

System suitability solution Dissolve *1,4-benzoquinone R* in *TOC water* to obtain a solution having a concentration of 0.75 mg of 1,4-benzoquinone per litre (0.50 mg of carbon per litre).

TOC water control Use *TOC water* obtained at the same time as that used to prepare the standard solution and the system suitability solution.

Control solutions In addition to the *TOC water control*, prepare suitable blank solutions or other solutions needed for establishing the baseline or for calibration adjustments following the manufacturer's instructions; run the appropriate blanks to zero the instrument.

System suitability Run the following solutions and record the responses: *TOC water* (r_w); *standard solution* (r_s); *system suitability solution* (r_{ss}). Calculate the percentage response efficiency using the expression:

$$\frac{r_{ss} - r_w}{r_s - r_w} \times 100$$

The system is suitable if the response efficiency is not less than 85 per cent and not more than 115 per cent of the theoretical response.

Procedure Run the test solution and record the response (r_u). The test solution complies with the test if r_u is not greater than $r_s - r_w$.

The method can also be applied using on-line instrumentation that has been adequately calibrated and shown to have acceptable system suitability. The location of instrumentation must be chosen to ensure that the responses are representative of the water used.

Q. Density of Solids

(Ph. Eur. method 2.2.42)

The density of solids corresponds to their average mass per unit volume and typically is expressed in grams per cubic centimetre (g/cm^3) although the International Unit is the kilogram per cubic metre (1 g/cm^3 = 1000 kg/m^3).

Unlike gases and liquids whose density depends only on temperature and pressure, the density of a solid also depends on its assembly and therefore varies with the crystal structure and degree of crystallinity.

When a solid is amorphous or partially amorphous, its density may further depend upon the history of preparation, treatment and storage.

Therefore, unlike fluids, the densities of 2 chemically equivalent solids may be different, and this difference reflects a difference in solid-state structure. The density of constituent particles is an important physical characteristic of pharmaceutical powders.

The density of a solid particle can assume different values depending on the method used to measure the volume of the particle. It is useful to distinguish 3 levels of expression of density:
— the *true density*, which only includes the solid fraction of the material; in case of crystalline material, the true density is also called *crystal density*;
— the *particle density*, which also includes the volume due to intraparticulate pores;
— the *bulk density*, which further includes the interparticulate void volume formed in the powder bed.

TRUE DENSITY

The true density of a substance is the ratio of the mass to the volume of the unit cell, exclusive of all voids that are not a fundamental part of the molecular packing arrangement. It is an intrinsic property of the specified crystal structure of

substance, and hence should be independent of the method of determination. The true density is determined by calculation.

It is obtained using crystallographic data (volume and composition of the unit cell) from, for example, X-ray diffraction data, either on a single crystal or by refinement of the crystalline structure from X-ray powder diffraction data.

PARTICLE DENSITY

The particle density takes into account both the true density and the intraparticulate porosity (sealed and/or experimentally non-accessible open pores). Thus, particle density depends on the value of the volume determined, which in turn depends on the method of measurement. The particle density can be determined using one of the 2 following methods.

The gas *pycnometric density* is determined by measuring the volume occupied by a known mass of powder, which is equivalent to the volume of gas displaced by the powder using a gas displacement pycnometer (*2.9.23*). In gas pycnometric density measurements, the volume determined excludes the volume occupied by open pores; however, it includes the volume occupied by sealed pores or pores inaccessible to the gas. Due to the high diffusivity of helium, which is the preferred choice of gas, most open pores are accessible to the gas. Therefore, the gas pycnometric density of a finely milled powder is generally not very different from the true density. Hence, this density is the best estimate of the true density of an amorphous or partially crystalline sample and is therefore widely applicable for processed pharmaceutical powder samples.

The *mercury porosimeter density* is also called *granular density*. With this method the volume determined includes the volume occupied by sealed pores or pores inaccessible to mercury; however, it includes the volume only from open pores smaller than some size limit. This pore-size limit or minimal access diameter depends on the maximal mercury intrusion pressure applied during the measurement, and under normal operating pressures the mercury does not penetrate the finest pores accessible to helium. Various granular densities can be obtained from one sample since, for each applied mercury intrusion pressure, a density can be determined that corresponds to the pore-size limit at that pressure.

BULK AND TAPPED DENSITY

The bulk density of a powder includes the contribution of interparticulate void volume. Hence, the bulk density depends on both the density of powder particles and the spatial arrangement of particles in the powder bed.

The bulk density of a powder is often very difficult to measure with good reproducibility since the slightest disturbance of the bed may result in a new density. Thus, it is essential in reporting bulk density to specify how the determination was made.

The bulk density and the tapped density are determined as mentioned in chapter *2.9.34. Bulk density and tapped density*.

R. Detection and Measurement of Radioactivity

(Ph. Eur. method 2.2.66)

INTRODUCTION

Within the context of the European Pharmacopoeia, the term 'radioactivity' is used both to describe the phenomenon of radioactive decay and to express the physical quantity of this phenomenon. In the monographs on radiopharmaceutical preparations, the detection and measurement of radioactivity are performed for different purposes: verification of the characters, identification, determination of radionuclidic and radiochemical purity, as well as determination of the radioactivity in a substance (assay).

Under these assumptions, the measurement can be qualitative, quantitative or both, depending whether it is directed to the identification of the radionuclide or the determination of its activity (rate of decay) or both of them.

Radioactive sources can produce various types of emissions, such as alpha particles, electrons, positrons, gamma- and X-rays, according to the radionuclidic composition.

Each radionuclide yields characteristic emissions, with specific energies and relative intensities. Such radiations can be detected as a result of their ionising properties in an ionisation chamber but without further characterisation; when they are detected and analysed using a spectrometer, an energy spectrum is obtained. A detailed spectrum analysis is typically used to identify radionuclides present in a sample. Spectrometry can also be used for quantitative determination of the radioactivity in sources made of a single radionuclide or radionuclide mixtures or of the individual radionuclides present.

A measurement of radioactivity is generally performed by counting the number of detected decay events (emissions). Therefore, the geometry of the sample during the measurement of radioactivity and the acquisition time strongly influence the result. In general, the measurement geometry must correspond to a calibrated geometry and the acquisition time must be long enough to reach sufficient counting statistics.

A measurement of radioactivity can be done in a stand-alone mode (e.g. using an ionisation chamber or a spectrometer) or in combination with a separation technique (e.g. radiochromatography) to account for relative contributions from different radioactive chemical species that may be present in a mixture.

MEASUREMENT OF RADIOACTIVITY

A direct determination of the radioactivity of a given sample, in becquerel (Bq), may be carried out if the decay scheme of the radionuclide is known, but in practice many corrections are required to obtain accurate results. For this reason, it is possible to carry out the measurement with the aid of a primary standard source or by using measuring instruments such as an ionisation chamber or a spectrometer calibrated using suitable standards for the particular radionuclides.

A spectrometer is used when measuring the radioactivity of radionuclides in a mixture, each radionuclide being identified by its emissions and their characteristic energies.

All measurements of radioactivity must be corrected for dead-time losses and by subtracting the background signal due to radiation in the environment and to spurious signals generated in the equipment itself.

The radioactivity of a preparation is stated at a given date. If the half-life of the radionuclide is less than 70 days, the time is also indicated. This statement of the radioactive content must be made with reference to a specified time zone. The radioactivity at other times may be calculated from the exponential decay equation or from tables.

In general, a correct measurement of radioactivity requires that consideration is given to some or all of the following:

Dead-time losses

Due to the finite resolving time (dead time) of the detector and its associated electronic equipment, it may be necessary to correct for losses by coincidence. The resolving time of a counter is the minimum time interval required by the counter to resolve 2 single pulses. Incident radiation events at shorter intervals may not be detected or may be detected as a single event with the summed energy. These losses are sometimes referred to as 'dead-time losses'. For a counting system with a fixed dead time τ following each count, the true count rate, per second, is calculated using the following expression:

$$\frac{N_1}{1 - N_1\tau}$$

N_1 = the observed count rate, per second;
τ = the dead time, in seconds.

With some equipment this correction is made automatically. Corrections for losses by coincidence must be made before the correction for background radiation.

Correction for decay during measurement

If the time period of an individual measurement, t_m, is not negligibly short compared with the half-life of the radionuclide, $T_{1/2}$, the decay during this measurement time must be taken into account. For example, there is a 5 per cent cumulative loss of counts due to decay during a counting period that is 15 per cent of the half-life of the radionuclide.

After having corrected the instrument reading (count rate, ionisation current, etc.) for background signals and, if necessary, for losses due to electronic effects, the instrument reading corrected to the beginning of the individual measurement is calculated using the following expression:

$$\frac{R(\lambda t_m)}{1 - (e^{-\lambda t_m})}$$

R = instrument reading before decay correction, but already corrected for background signal, etc.;
λ = radionuclide decay constant ($\ln 2/T_{1/2}$);
e = base of natural logarithm;
t_m = measurement duration.

Statistics of radioactivity measurement

The results of determinations of radioactivity show variations that derive mainly from the random nature of nuclear transformations. Counting for any finite time can yield only an estimate of the true rate of nuclear transformations. A sufficient number of counts must be registered in order to compensate for variations in the number of transformations per time. In the case of measurement of radioactivity, the standard deviation of the recorded counts is the square root of the counts, so at least 10 000 counts are necessary to obtain a relative standard deviation of not more than 1 per cent.

Linearity

The linearity of an instrument is the range of radioactivity for a particular radionuclide over which its efficiency remains constant.

The linear range of a radioactivity measurement assembly can be determined by repeatedly counting a radioactive sample in a fixed geometry as it decays from an activity level that is above the linear range. After correction for the background signal, the natural logarithm of the count rate data is plotted against the elapsed time after the first measurement (Figure 2.2.66.-1).

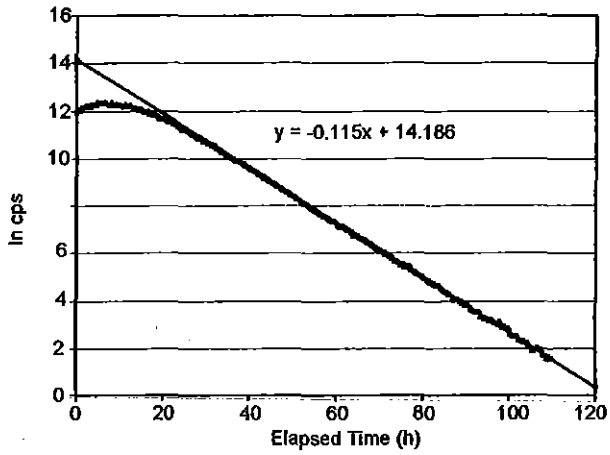

Figure 2.2.66.-1. – *Plot showing the measured and extrapolated count rate (natural logarithm of counts per second (cps)) from a technetium-99m source as a function of time, starting with a level of radioactivity above the linear range of the measuring equipment*

Linear regression analysis of the central, linear portion of the data set yields a slope which is the decay constant λ, which has a characteristic value for each radionuclide:

$$\ln \text{cps} = -\lambda t + c$$

c represents the natural logarithm of the count rate at $t = 0$ of a perfectly linear instrument.

The resulting regression equation is used to calculate the theoretical count rate at each time that the actual data were recorded. Where the deviation of the measured count rate from the theoretical count rate is unacceptably high, the linear range of the measuring equipment has been exceeded.

Alternatively, a series of dilutions can be made of a radioactive solution of known radioactivity concentration. Equal volumes of each of the dilutions are then counted using standardised geometry and counter settings. The ratio of the count rate for each sample (after correction for background signals and decay) to the calculated radioactivity of the respective sample in Bq is the counting efficiency. The range over which this ratio is constant is the useable range of the measuring equipment for the radionuclide concerned.

The limit of detection and the limit of quantification for equipment and procedures used for radioactivity measurement must be established before their routine use.

Limit of detection

The limit of detection (LOD) of an individual procedure is the lowest amount of radioactivity in a sample that can be detected but not necessarily quantified as an exact value. In practical terms this requires an estimate of the background signal and its standard deviation. The LOD is usually considered to be 3 times the standard deviation of the background signal.

Limit of quantification
The limit of quantification (LOQ) of an individual procedure is the lowest amount of radioactivity in a sample that can be quantitatively determined with suitable precision and accuracy. The LOQ is used particularly for the determination of impurities and/or degradation products. In practical terms the LOQ is usually considered to be 10 times the standard deviation of the background signal.

MEASUREMENT OF RADIOACTIVITY USING IONISATION CHAMBERS

Apparatus
Ionisation chambers (including dose calibrators) are the most common equipment for the measurement of radioactivity in the practice of radiopharmacy. It generally can measure activities from a few tens of kBq to hundreds of GBq.
It usually comprises a sealed well-type ionisation chamber and built-in electronics to convert the detector signal to a measure of radioactivity.

The chamber is filled with a gas across which an electrical field is applied. When the gas is ionised by the radiation emitted by the source, the resulting ionisation current is measured and related to the radioactivity present in the ionisation chamber. The ionisation current is influenced by the applied voltage, the energy and the intensity of the radiation and the nature and pressure of the gas.
The instrument settings (calibration factor) may be adjusted to keep a direct relationship between the ionisation produced by the radiation of a specific radionuclide and the radioactivity value obtained for each measurement geometry.

As an ionisation chamber measures only the current resulting from the overall ionisation produced within the chamber, it cannot discriminate between the emissions of different radionuclides.

For an accurate measurement of the radioactivity of a specific radionuclide, the measurement must be corrected for the contributions to the ionisation current caused by radionuclidic impurities present in the preparation.

The activity levels to be measured are limited by saturation considerations, the range of the amplifier and the design of the chamber itself. The linearity range of the ionisation chamber is established as described above under Linearity.

The ionisation chamber must be shielded to minimise background signals to an acceptable level.

Method
The sample is positioned inside the well of the ionisation chamber at a given position, using a holder. After putting the sample in the ionisation chamber, the activity reading is made once the response is stable. Measuring the sample under exactly the same geometrical conditions as the calibration source will yield the most accurate results.
If necessary, dilute the preparation to be measured to the same volume as that of the calibration source.

Calibration The ionisation chamber is calibrated taking into account the shape, dimensions, material of the container, volume and composition of the solution, the position within the chamber and the radionuclide being measured. Limits for uncertainty in calibration can be found in national and international regulations.

Calibrate the ionisation chamber at least once a year, by using sources of radionuclides traceable to national or international standards in the appropriate containers (vial, syringe) with regard to geometry. Establish and implement subsidiary correction factors to take account of the differing configurations of the radionuclides to be measured. Perform a linearity check of the instrument's response over the complete range of energies and activities for which the equipment is used.

For each setting and before each use (minimum once on each day of use) perform a constancy check of the ionisation chamber using standard sources of radionuclides with long half-lives to verify its calibrated state. A check with a reference source, such as caesium-137, must be performed on each day of use to verify that the ionisation chamber is still in its calibrated state.

MEASUREMENT OF RADIOACTIVITY USING SOLID-STATE DETECTORS

Solid-state detectors include scintillating plastic fluors and crystals, and semiconductors. Further to their application in spectrometry (see section Spectrometry), solid-state detectors can be used for the measurement of radioactivity.
In particular, due to their high sensitivity, plastic and crystal scintillation detectors are used in counting low levels of radioactivity. Dead-time losses must be carefully considered with these types of detectors. Semiconductor detectors are used when a higher energy discrimination is required, for example in mixtures of radionuclides or when there are potential radionuclidic impurities with emissions of similar energy.

Apparatus
The equipment consists of a shielded detector comprising a plastic or crystal scintillator coupled to a photomultiplier, or a semiconductor, which are connected to an amplifier and counting electronics. The system may have an adjustable energy window, used for selecting a counting region of the radionuclide energy spectrum that may be adjusted by the operator.

Instruments have different properties of energy resolution and detection efficiency depending on the type of detector and its volume and geometry. Lower efficiency requires a longer counting time.

Samples to be measured may be placed in front of the detector or into the well of a well-type detector. Measuring chambers may be enclosed in the detector shielding and single samples may be introduced using lids or other positioning systems to ensure correct measurement geometry.

A scintillation detector can be used for dynamic radioactivity measurement when, for example, the eluate of a liquid chromatograph is directed over or through a detector, see section on Detection and measurement of radioactivity in combination with a separation technique.

Method
Ensure that the sample radioactivity gives a counting rate in the linearity range of the equipment. The measurement is started after any shielding is in place or the well cover is replaced and the counting time is selected to reach sufficient counts for a statistically significant value.

Calibration The detector has to be calibrated by measuring its efficiency using a source of the radionuclide in question traceable to national or international standards. Calibration in terms of efficiency uses sources such as caesium-137, cobalt-60, barium-133 and others covering the desired energy range.

MEASUREMENT OF RADIOACTIVITY USING LIQUID SCINTILLATION DETECTORS

Liquid scintillation counting is commonly used for beta-particle emitting samples, but is also used for alpha-particle emitting samples. For the principles of the detection of

radioactivity using liquid scintillation detectors see under Beta-particle spectrometry below.

Calibration In order to take into account the loss of counting efficiency due to quenching, the liquid scintillation counter may make use of an external source, typically barium-133 or europium-152, which is brought close to the sample vial to release Compton electrons. The shape of the resulting spectrum is analysed automatically to compute a quench-indicating parameter. This parameter can then be related to the counting efficiency measuring sources of known activity at a determined level of quenching agent. The obtained quench curve allows the determination of the activity of an unknown sample knowing the count rate and the value of the quenching parameter.

DETERMINATION OF HALF-LIFE

The half-life is a characteristic of the radionuclide that may be used for its identification. The half-life is calculated by measuring the variation of radioactivity of a sample to be tested as a function of time. Perform the measurements in the linearity range of a calibrated instrument.

Apparatus

Half-life can be measured by using any type of quantitative radioactivity detector provided it is used within a linearity range throughout the range of activities that are present during the measurement and the geometry is not changed during the measurement.

For preparations containing a radionuclide with a short half-life and when stated in a monograph, determination of the approximate half-life contributes to the identification.

Method

Half-life The preparation to be examined is used as such or diluted or dried in a capsule after appropriate dilution. The radioactive sample is prepared in a manner that will avoid loss of material during handling. If it is a liquid (solution), it is contained in a closed flask or a sealed tube. If it is a residue from drying in a capsule, it is protected by a cover consisting of a sheet of adhesive cellulose acetate or of some other material.

The radioactivity of the sample must be high enough to allow measurements over a period corresponding to 3 estimated half-lives but must be, for each measurement, within the linearity range of the equipment. Correction for dead-time losses is applied if necessary.

The same source is measured in the same geometrical conditions and at intervals usually corresponding to at least half of the estimated half-life. Each value is tabulated against the time interval from the initial measurement. To avoid influence of decay during measurement, the counting time is the same for all measurements.

A graph can be drawn with time as the abscissa and the logarithm of the relative instrument reading (e.g. count rate) as the ordinate. The half-life is calculated from the slope of the best linear fit of the measured values against the time corresponding to each measurement.

Approximate half-life For this purpose, not fewer than 3 measurements are made over a period of not less than 1/4 of the estimated half-life.

The sample to be examined and the instrument to be used comply with the indications given above. The data are processed in the same way as above.

SPECTROMETRY

Radionuclides can be identified by their emission spectrum. Each type of emission (i.e. alpha particles, beta particles and electrons, gamma- and X-rays) requires specific equipment to acquire an emission spectrum. Spectrometers must be calibrated in order to work properly and the following sections describe the different equipment and detail the general procedures for a reliable measurement.

GAMMA-RAY SPECTROMETRY

General principles

In gamma-ray spectrometry using a scintillation detector, absorption of gamma- and X-rays results in production of light, which is converted into an electrical pulse by a photomultiplier. In gamma-ray spectrometry using a semiconductor detector, absorption of gamma- and X-rays results in the immediate production of an electrical pulse.

In both cases the pulse amplitude is proportional to the energy of the absorbed radiation. The most common detectors for gamma- and X-ray spectrometry are thallium-activated sodium iodide (NaI(Tl)) scintillation counters and high-purity germanium (HPGe) semiconductor detectors.

A gamma-ray spectrum can be produced by collecting and analysing a sufficient number of pulses.

Apparatus

A gamma-ray spectrometer usually comprises a shielded measuring chamber where the sample is positioned, a detector, an electronic chain and a multichannel analyser.

The shielding of the chamber must be able to reduce the background signal to a level that allows the registration of a correct gamma-ray spectrum.

The measurement chamber has a movable cover or a drawer to allow the positioning of the sample. A sample holder may be present to ensure reproducible geometry between measurements.

The duration of measurement is related to the radioactivity of the target radionuclide and a long period of acquisition may be required to achieve the necessary counting statistics. Dead-time losses must be carefully considered with this type of detector.

The sensitivity of a NaI(Tl) detector is higher than that of a germanium detector of the same size. In general, peaks in an energy spectrum are identified with an uncertainty depending upon the full width of the peak at its half-maximum height (FWHM). The energy resolution of a solid-state scintillation detector is much poorer than that of a semiconductor detector and hence peaks obtained with a semiconductor detector are much narrower than those obtained with a scintillation detector. Figure 2.2.66.-2 shows a comparison of the spectra obtained from the same source with the 2 types of detector.

The different performances of NaI(Tl) and HPGe detectors may limit their use in some spectrometric analyses.

For the identification of the radionuclide(s) in a preparation and determination of radionuclidic purity, a risk assessment on the process of radionuclide production must assess the potential presence of other radionuclides with photon energies in the same range (± 10 per cent) as that of the radionuclide(s) present in the radiopharmaceutical.

In case radionuclidic impurities can be present that emit gamma- or X-rays with an energy in the same range as that of the photons emitted by the radionuclide in the preparation, a measured peak energy within a maximum interval of ± 2 keV or ± 2 per cent (whichever is the larger) with respect to the nominal peak energy (see *5.7. Table of physical characteristics of radionuclides)* is sufficient for peak identification.

In the case where such impurities are not expected to be present, a maximum interval of ± 10 keV or ± 6 per cent

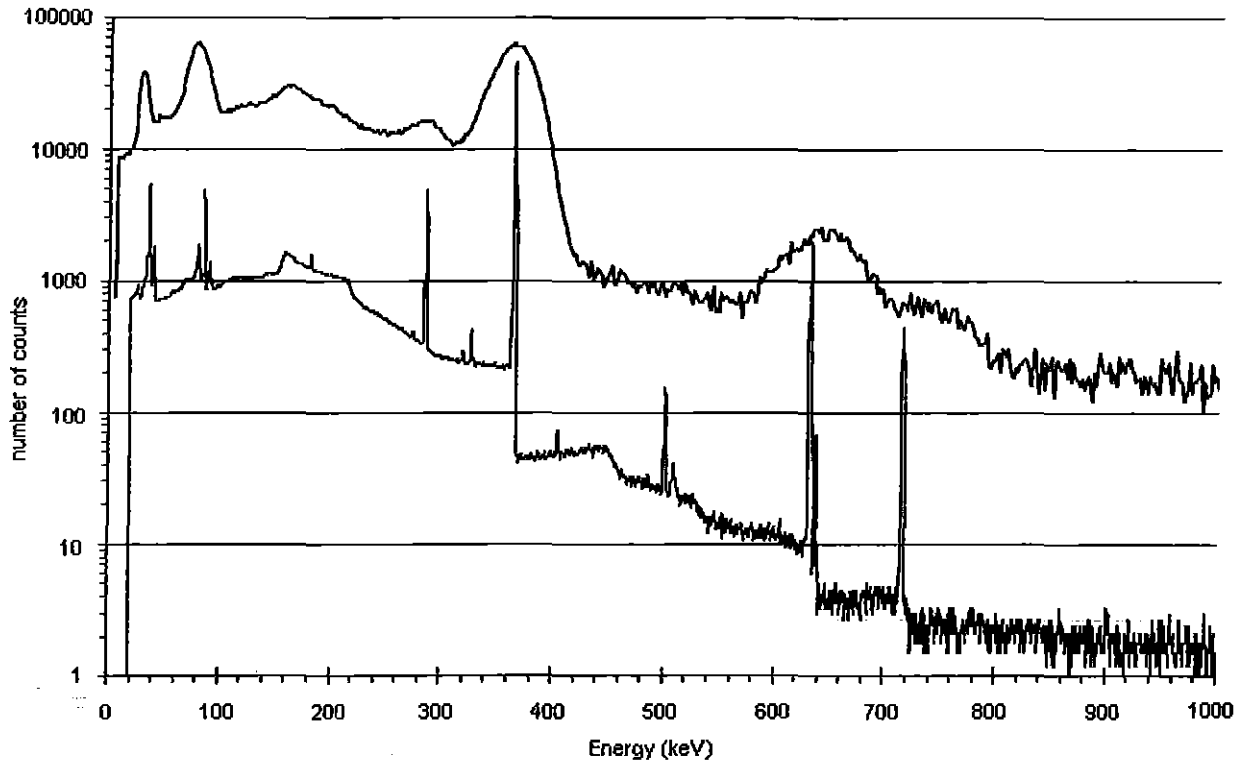

Figure 2.2.66.-2. – *Comparative pulse-height spectra recorded using a thallium-activated sodium iodide scintillator (upper curve) and a high-purity germanium semiconductor detector (lower curve). The source was gamma- and X-ray radiation from the decay of iodine-131.*

(whichever is the larger) with respect to the nominal peak energy is acceptable for peak identification.

Method

Ensure that the counting rate of the sample falls within the linearity range of the equipment. For liquid samples this may be achieved by appropriate dilution; for solid samples, by increasing the source-to-detector distance or by using an attenuating material. Introduce the preparation to be examined in a container into the instrument chamber and record the spectrum after closing the shielding.

Ensure that the container used for quantitative measurements is of the same shape, dimensions, volume and material as that of the calibration standard.

Ensure that the composition of the solution and the position of the container in the measuring chamber is the same for the container for the quantitative measurement as for the calibration standard.

Radionuclide identification Calibrate the spectrometer in relation to energy. Determination of the correspondence of the energy of the peaks detected from the sample to the energies prescribed by a monograph is a valid identification test.

Radionuclidic purity Calibrate the spectrometer in relation to efficiency and energy. Determine the LOQ and resolution of the equipment and ensure that they are in line with the limits of the radionuclides to be determined. Record the spectrum of the preparation.

Identify the radionuclides present in the preparation to be examined and determine their radioactivity with the aid of chapter *5.7. Table of physical characteristics of radionuclides.* Because the level of radionuclidic impurities, expressed as a percentage of the total radioactivity, may increase or decrease with time, the measured activity of each impurity must be recalculated to the activity during the period of validity of the preparation. The activities of all radionuclidic impurities need to be summed (taking into account the limit of quantification) and related to the total radioactivity of the preparation.

The sample is placed close to the detector or within a well-type detector. All the events within a pre-set energy range are collected and displayed on a ratemeter as counts per second or accumulated over a pre-set period of time. If there is sufficient difference in photon energies emitted by the radionuclide(s), a sodium iodide detector can be suitable, given its high sensitivity. However, if there is a need to discriminate emissions of similar energy, a HPGe detector or another semiconductor detector is needed.

Calibration Calibration in relation to energy is done by using the peaks of known sources traceable to national or international standards, such as cobalt-57, caesium-137, cobalt-60 and others covering the desired energy range. A calibration in relation to efficiency can be simultaneously obtained, so that not only the energy spectrum but also the activity of the sample and the radionuclide impurities can be further determined. The calibration of efficiency can be performed with a traceable radionuclide source with energy peaks covering the desired range or with the aid of a mixed, traceable radionuclide standard with gamma-ray energies covering the desired range.

To obtain the efficiency curve, the detector response as a function of the energy has to be measured using each separate sample/detector geometry. For this reason, it is possible to carry out the measurement with the aid of a primary standard source. Primary standards may not be available for radionuclides with a short half-life, e.g. some positron emitters. When measuring, the sample will mostly have to be in a container and set at a defined position in relation to the detector. The sample/detector geometry is

then defined by the position of the sample relative to the detector and the characteristics of the container and sample, e.g. shape, volume and density. Figure 2.2.66.-3 shows a typical HPGe detector efficiency curve obtained for a cylindrical container placed on top of the detector.

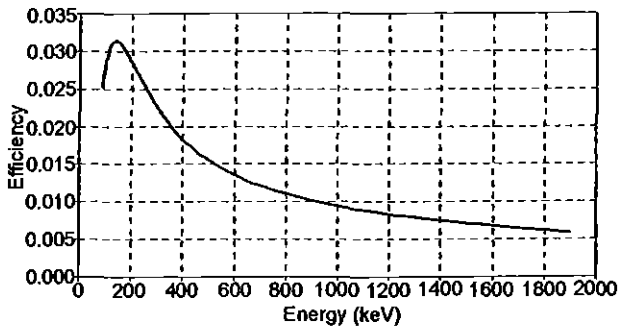

Figure 2.2.66.-3. – *Typical HPGe efficiency curve measured using a dedicated container set on top of the detector*

BETA-PARTICLE SPECTROMETRY

In the case of a beta-particle emitter, a beta-particle spectrometer is necessary to determine the energy distribution of the emitted beta particles. It is analogous to a gamma-ray spectrometer, but frequently uses liquid scintillators to convert the energy of the beta particles into detectable light, which can then be analysed. Beta-particle spectrometry is mostly achieved by dissolving or suspending the sample in a liquid scintillation cocktail in transparent or translucent (glass or plastic) containers and subsequent counting of the electrical pulses generated by a photomultiplier from the emitted light. The pulse amplitude is related to the energy of the absorbed radiation. A beta-particle spectrum can be produced by collecting a sufficient number of pulses. The liquid scintillation cocktail is chosen in such a way that counting errors due to quenching, chemoluminescence, phosphorescence, etc., are minimised. Coincidence counting with 2 or more photomultipliers is also used to minimise counts from background radiation, electronics, etc.

To differentiate between alpha- and beta-particle emissions, pulse-shape discrimination is commonly used.

Radionuclide identification Determination of the correspondence of the mean and/or maximum energies in the energy spectrum from the sample to the energies prescribed by a monograph is a valid identification test.

Calibration A common method of energy calibration is to use an unquenched reference sample to determine the maximum energy of the beta particles emitted by the radionuclide of interest.

ALPHA-PARTICLE SPECTROMETRY

For the identification and assay of alpha-particle emitters, spectrometry using liquid scintillation is mostly used. The principle is explained in the previous section on beta-particle spectrometry.

For the identification and determination of radionuclidic purity of alpha-particle emitters, spectrometry using a silicon-diode semiconductor detector can be used. Using this detector, the absorption of alpha particles results in the immediate production of an electrical pulse. The movement of electron-hole pairs created by the interaction of radiation induces an electrical charge, which is amplified and measured.

The sample preparation is of crucial importance. After a chemical separation of the radionuclide of interest, the sample is electro-deposited on a stainless steel disk in the form of a very thin layer of material to minimise self-absorption. The yield of the whole procedure can be determined experimentally by adding a known amount of a tracer, which will take into account the chemical separation efficiency, the electro-deposition efficiency and the counting efficiency.

For both types of detectors, the pulse amplitude is related to the energy of the absorbed radiation. An alpha-particle spectrum can be produced by collecting a sufficient number of pulses.

Radionuclide identification Determination of the correspondence of the energy of the peaks detected from the sample to the energies prescribed by a monograph is a valid identification test.

Calibration An alpha-particle spectrometer has to be calibrated in relation to energy and efficiency. This is done by using the peaks from known sources covering the desired energy range, such as americium-241 and plutonium-242. Not all alpha particles emitted by the source will produce a count in the system. The probability that an emitted alpha particle will interact with the detector material and produce a count is the efficiency of the detector, which depends on the geometry.

DETECTION AND MEASUREMENT OF RADIOACTIVITY IN COMBINATION WITH A SEPARATION TECHNIQUE

A radioactive preparation may contain the radionuclide in different chemical forms other than the intended one. Therefore it is necessary to separate the different substances containing the radionuclide and determine the percentage of radioactivity due to the radionuclide concerned associated with the stated chemical form and the contribution to the total radioactivity due to the radionuclide concerned coming from other substances. For this purpose, instruments for the detection and measurement of radioactivity are used in combination with a physico-chemical separation technique. In principle, any method of separation may be used.

Monographs for radiopharmaceutical preparations may include the combined use of radioactivity measurement with paper chromatography (*2.2.26*), thin-layer chromatography (*2.2.27*), gas chromatography (*2.2.28*), liquid chromatography (*2.2.29*), size-exclusion chromatography (*2.2.30*) or electrophoresis (*2.2.31*).

In all cases the radioactivity of each analyte is measured after the separation has been achieved using the stated method.

Radioactivity measurement may be performed using detectors mounted in series with other detectors in analytical instruments, such as liquid chromatographs, making in-line detection of analytes, or performed off-line, i.e. after the analytical separation has been completed, by measuring the radioactivity of eluate fractions obtained after liquid chromatographic separation of equal volume or as the distribution of radioactivity on paper chromatography or thin-layer chromatography supports.

IN-LINE DETECTION AND MEASUREMENT OF RADIOACTIVITY IN COMBINATION WITH LIQUID CHROMATOGRAPHY

Apparatus

Liquid chromatography (see *2.2.29*) may be used to separate the principal radioactive substance of a radiopharmaceutical preparation from radiochemical impurities or degradation

products. In-line detection is usually obtained by using a scintillation detector connected to a ratemeter and recording device. The scintillating material of the detector is selected on the basis of the emission to be detected, e.g. plastic scintillator for beta-particle emissions or scintillation crystals for gamma- and X-ray radiations. The addition of a liquid scintillation cocktail before the eluate reaches the in-line radioactivity detector may also be used in the case of beta-particle-emitting radionuclides.

The simultaneous use of a radioactivity detector and other detectors (UV, refractive index, conductimetric, etc.) connected in series may be used to identify the substance, e.g. in relation to the retention time of a known standard, to determine the amount of the substance using a suitable reference standard and to measure the radioactivity associated with such a substance. When different detectors are coupled in series, correct the experimentally obtained retention times for the delay in time between the detectors.

In liquid chromatography some radiochemical impurities, such as colloidal impurities, may be retained on the column. In such cases a separate method is required for the determination of the content of the retained radiochemical impurities and the calculation formula for the expression of the total radiochemical purity takes into account the relative amount of the retained radiochemical impurities.

One possibility to evaluate such retention problems during method validation is to evaluate the radioactivity recovery from the column by measuring the total radioactivity recovered from the chromatographic equipment with and without the column.

Method

The sample is diluted if necessary and then applied to the column in the prescribed volume and conditions. In this respect it is important to demonstrate the LOD and LOQ, and the linearity of the detector throughout the range of activities to be measured.

Flow-through detector A portion of the tubing where the eluate containing the radioactive species is flowing is placed in front of or within the detector. Counting efficiency may be increased using a longer portion of the tube (e.g. making multiple turns in front of or within the detector); however, this will reduce the ability of the system to separate 2 closely eluting peaks of radioactivity.

When the radiochemical purity test prescribes determination of the total radiochemical impurities or there is a quantitative determination of an individual impurity, it is important to choose an appropriate threshold setting and appropriate conditions for integration of the peak areas. In such tests the disregard limit, i.e. the limit at or below which a peak is disregarded, is dependent on the method and is related to the limit of detection and limit of quantification. Thus, the threshold setting of the data collection system corresponds to at least half of the disregard limit.

Record the signal of the detectors as a function of time.

Identification of peaks in the radiometric signal (radiochromatogram) is made on the basis of the retention time of the analytes. The profile from other detectors may be used for this purpose.

Quantification of the different components of chromatogram and radiochromatogram profiles is made on the basis of peak areas. Peak areas are usually obtained by direct integration of the detector signal using commercially available software.

OFF-LINE DETECTION AND MEASUREMENT OF RADIOACTIVITY

Liquid chromatography (*2.2.29*). Provided the retention times of the various radiochemical species are reproducibly consistent, an alternative method of radioactivity quantification is to collect the liquid chromatography effluent in a series of timed samples (fractions) for off-line analysis for radioactivity content. The radioactivity in the fractions corresponding to the peaks can be expressed as a percentage of the total of the radioactivity in all fractions, taking into account the limit of quantification.

Method

The sample is applied on the column in the prescribed volume and conditions. Fractions are collected at the end of the chromatographic line.

The volume between the detector used to identify the retention time of the peaks and the collection point is measured and a delay factor is calculated on the basis of the effluent flow rate and applied to each peak to estimate the time of elution of the peak at the point of collection. The fractions are collected on the basis of a fixed time interval or at the time of appearance estimated from the delay time so that any relevant peak is collected in one or more fractions.

The radioactivity of each fraction is counted using a calibrated instrument such as a dose calibrator or a scintillation detector, taking into account the limit of quantification and the linearity.

An elution profile is obtained tabulating the counts per fraction against the elution time or volume. The activity of fractions belonging to the same peak may be summed and the relative percentage calculated to define radiochemical purity.

Thin-layer chromatography (*2.2.27*) and paper chromatography (*2.2.26*). Provided a thin-layer chromatography or a paper chromatography analytical method has been validated for the separation of components of a radioactive preparation, the number and relative intensities of the separated spots can be detected and measured using a radioactivity detector that can relate the radioactivity to a specific position on the chromatographic support.

The positions of the spots (peaks) may permit chemical identification by comparison with solutions of the same chemical substances (non-radioactive), using a suitable detection method.

Apparatus

Scanning device The apparatus generally comprises a radioactivity detector, such as a position-sensitive proportional counter or a collimated scintillation detector placed at a fixed distance from a scanning platform where the chromatographic support to be scanned is positioned.

The radioactivity of the sample applied to the chromatography support must result in a counting rate in the linearity range of the equipment and the sample may be diluted if necessary. The area to be scanned is positioned at the reference position so that the desired lane is aligned with the detector scanning trip. Adjust the scanning time to allow enough counting time during the run.

The detector or the platform may be moved in-plane, along the *x*-axis or the *y*-axis, so that the entire surface can be scanned during a single run.

The detector is connected to a suitable counting device, so that the radioactivity revealed can be measured quantitatively and the count rate related spatially to the surface scanned.

The radioactivity is automatically reported against the development distance and the profile describes peaks having an area proportional to the number of counts per unit of distance.

Radioactivity counter In the case where a maximum of only 3 radiochemical components needs to be identified and they are fully separated, the support can be cut into equal strips, each having a size not more than half the length of the support corresponding to the difference between the retardation factors of the 2 closest spots. Each single strip is numbered starting from the origin side and counted separately. Alternatively, for well-characterised systems the support may be cut into 2 or more unequal portions, folded if necessary to approximately equal geometry before counting. An ionisation chamber or a scintillation counter can be used for this purpose, provided they are used within the instrument's linearity range and above its LOQ.

Autoradiography This may also be used to acquire an image of the radioactivity distribution on the chromatographic support. In this case, the response of the system used for the acquisition of the image, such as a phosphor imager or a photographic film, must be shown to be linear with respect to the radioactivity in the chromatogram. Otherwise the system must be pre-calibrated or exposed at the same time to a series of reference radioactive sources, obtained by dilution from a calibrated standard solution, covering the expected radioactivity range that may be present on the support.

Method

Deposit the required amount of sample at the origin of the chromatographic support, with drying if necessary to avoid spreading of the spot. Develop the chromatogram according to the prescribed method. A carrier may be added when prescribed in a particular monograph.

In paper and thin-layer chromatography, it is preferable not to dilute the preparation to be examined but it is important to avoid depositing such a quantity of radioactivity that counting losses by coincidence (dead-time losses) occur during measurement of the radioactivity.

After development, the support is dried and the positions of the radioactive areas are detected by measurement of radioactivity over the length of the chromatogram, using a suitable collimated counter, by autoradiography, or by cutting the strips into portions and counting each portion.

Radioactivity may be measured by integration using an automatic-plotting instrument or a digital counter.

The ratios of the areas under the peaks give the ratios of the percentages of radioactivity due to the respective radiochemical substances.

When the strips are cut into portions, the ratios of the quantities of radioactivity measured give the ratio of percentages of radioactivity due to the respective radiochemical species.

Calibration It is important to demonstrate the limits of detection and quantification, and the linearity of the detector throughout the range of activities to be measured and in all positions on the support of the chromatographic system. This may be done by applying samples covering a range of activities from 0.1 per cent to 100 per cent of the expected range. Prepare the samples by dilution and apply equal volumes of each, with drying if necessary. After examining the radioactivity profile using the equipment's standard settings, the peak areas are integrated for comparison with the calculated amount of radioactivity applied to each spot. Verify that the response of the detector over the complete length and width of the detector path is the same, as the response may vary with the detector position.

The peak-resolving power is influenced by the size of the spot, the total radioactivity of the radionuclide and the detector equipment. It can be checked by applying 5 µL spots separated by distances increasing from 4 mm to 20 mm in 2 mm increments. The approximate resolution of the detection system can be determined from the radioactivity profile as the distance between the 2 spots where the baseline is only just clearly separated.

Appendix VI

Qualitative Reactions and Tests

(Ph. Eur. method 2.3.1)

Identification reactions of ions and functional groups

ACETATES

a) Heat the substance to be examined with an equal quantity of *oxalic acid R*. Acid vapours with the characteristic odour of acetic acid are liberated, showing an acid reaction (*2.2.4*).

b) Dissolve about 30 mg of the substance to be examined in 3 mL of *water R* or use 3 mL of the prescribed solution. Add successively 0.25 mL of *lanthanum nitrate solution R*, 0.1 mL of *0.05 M iodine* and 0.05 mL of *dilute ammonia R2*. Heat carefully to boiling. Within a few minutes a blue precipitate is formed or a dark blue colour develops.

ACETYL GROUPS

In a test-tube about 180 mm long and 18 mm in external diameter, place about 15 mg of the substance to be examined, or the prescribed quantity, and 0.15 mL of *phosphoric acid R*. Close the tube with a stopper through which passes a small test-tube about 100 mm long and 10 mm in external diameter containing *water R* to act as a condenser. On the outside of the smaller tube, hang a drop of *lanthanum nitrate solution R*. Except for substances hydrolysable only with difficulty, place the apparatus in a water-bath for 5 min, then take out the smaller tube. Remove the drop and mix it with 0.05 mL of *0.01 M iodine* on a tile. Add at the edge 0.05 mL of *dilute ammonia R2*. After 1 min to 2 min, a blue colour develops at the junction of the two drops; the colour intensifies and persists for a short time.

For *substances hydrolysable only with difficulty* heat the mixture slowly to boiling over an open flame and then proceed as prescribed above.

ALKALOIDS

Dissolve a few milligrams of the substance to be examined, or the prescribed quantity, in 5 mL of *water R*, add *dilute hydrochloric acid R* until an acid reaction occurs (*2.2.4*), then 1 mL of *potassium iodobismuthate solution R*. An orange or orange-red precipitate is formed immediately.

ALUMINIUM SALTS

Dissolve about 15 mg of the substance to be examined in 2 mL of *water R* or use 2 mL of the prescribed solution. Add about 0.5 mL of *dilute hydrochloric acid R* and about 0.5 mL of *thioacetamide reagent R*. No precipitate is formed. Add dropwise *dilute sodium hydroxide solution R*. A gelatinous white precipitate is formed which dissolves on further addition of *dilute sodium hydroxide solution R*. Gradually add *ammonium chloride solution R*. The gelatinous white precipitate is re-formed.

AMINES, PRIMARY AROMATIC

Acidify the prescribed solution with *dilute hydrochloric acid R* and add 0.2 mL of *sodium nitrite solution R*. After 1 min to 2 min, add 1 mL of *β-naphthol solution R*. An intense orange or red colour and usually a precipitate of the same colour are produced.

AMMONIUM SALTS

To the prescribed solution add 0.2 g of *magnesium oxide R*. Pass a current of air through the mixture and direct the gas that escapes just beneath the surface of a mixture of 1 mL of *0.1 M hydrochloric acid* and 0.05 mL of *methyl red solution R*. The colour of the indicator changes to yellow. On addition of 1 mL of a freshly prepared 100 g/L solution of *sodium cobaltinitrite R* a yellow precipitate is formed.

AMMONIUM SALTS AND SALTS OF VOLATILE BASES

Dissolve about 20 mg of the substance to be examined in 2 mL of *water R* or use 2 mL of the prescribed solution. Add 2 mL of *dilute sodium hydroxide solution R*. On heating, the solution gives off vapour that can be identified by its odour and by its alkaline reaction (*2.2.4*).

ANTIMONY COMPOUNDS

Dissolve with gentle heating about 10 mg of the substance to be examined in a solution of 0.5 g of *sodium potassium tartrate R* in 10 mL of *water R* and allow to cool: to 2 mL of this solution, or to 2 mL of the prescribed solution, add *sodium sulfide solution R* dropwise; an orange-red precipitate is formed which dissolves on addition of *dilute sodium hydroxide solution R*.

ARSENIC COMPOUNDS

Heat 5 mL of the prescribed solution on a water-bath with an equal volume of *hypophosphorous reagent R*. A brown precipitate is formed.

BARBITURATES, NON-NITROGEN SUBSTITUTED

Dissolve about 5 mg of the substance to be examined in 3 mL of *methanol R*, add 0.1 mL of a solution containing 100 g/L of *cobalt nitrate R* and 100 g/L of *calcium chloride R*. Mix and add, with shaking, 0.1 mL of *dilute sodium hydroxide solution R*. A violet-blue colour and precipitate are formed.

BENZOATES

a) To 1 mL of the prescribed solution add 0.5 mL of *ferric chloride solution R1*. A dull-yellow precipitate, soluble in *ether R*, is formed.

b) Place 0.2 g of the substance to be examined, treated if necessary as prescribed, in a test-tube. Moisten with 0.2 mL to 0.3 mL of *sulfuric acid R*. Gently warm the bottom of the tube. A white sublimate is deposited on the inner wall of the tube.

c) Dissolve 0.5 g of the substance to be examined in 10 mL of *water R* or use 10 mL of the prescribed solution. Add 0.5 mL of *hydrochloric acid R*. The precipitate obtained, after crystallisation from warm *water R* and drying *in vacuo*, has a melting point (*2.2.14*) of 120 °C to 124 °C.

BICARBONATES

a) Introduce into a test tube 0.1 g of the substance being examined suspended in 2 mL of *water* or use 2 mL of the prescribed solution. Add 3 mL of 2M *acetic acid*, close the tube immediately using a stopper fitted with a glass tube bent at two right angles. The solution or suspension effervesces. Heat gently and collect the gas in 5 mL of a 4.73% w/v solution of *barium hydroxide*. A white precipitate is produced which dissolves on addition of an excess of 7M *hydrochloric acid*.

b) Treat a solution of the substance being examined with a solution of *magnesium sulfate*; no precipitate is produced (distinction from carbonates). Boil; a white precipitate is produced.

c) A solution liberates carbon dioxide when boiled.

BISMUTH AND BISMUTH COMPOUNDS

a) To 0.5 g of the substance to be examined add 10 mL of *dilute hydrochloric acid R* or use 10 mL of the prescribed solution. Heat to boiling for 1 min. Cool and filter if necessary. To 1 mL of the solution obtained add 20 mL of *water R*. A white or slightly yellow precipitate is formed

which on addition of 0.05 mL to 0.1 mL of *sodium sulfide solution R* turns brown.

b) To about 45 mg of the substance to be examined add 10 mL of *dilute nitric acid R* or use 10 mL of the prescribed solution. Boil for 1 min. Allow to cool and filter if necessary. To 5 mL of the solution obtained add 2 mL of a 100 g/L solution of *thiourea R*. A yellowish-orange colour or an orange precipitate is formed. Add 4 mL of a 25 g/L solution of *sodium fluoride R*. The solution is not decolorised within 30 min.

BROMIDES

a) Dissolve in 2 mL of *water R* a quantity of the substance to be examined equivalent to about 3 mg of bromide (Br^-) or use 2 mL of the prescribed solution. Acidify with *dilute nitric acid R* and add 0.4 mL of *silver nitrate solution R1*. Shake and allow to stand. A curdled, pale yellow precipitate is formed. Centrifuge and wash the precipitate with three quantities, each of 1 mL, of *water R*. Carry out this operation rapidly in subdued light disregarding the fact that the supernatant solution may not become perfectly clear. Suspend the precipitate obtained in 2 mL of *water R* and add 1.5 mL of *ammonia R*. The precipitate dissolves with difficulty.

b) Introduce into a small test-tube a quantity of the substance to be examined equivalent to about 5 mg of bromide (Br^-) or the prescribed quantity. Add 0.25 mL of *water R*, about 75 mg of *lead dioxide R*, 0.25 mL of *acetic acid R* and shake gently. Dry the inside of the upper part of the test-tube with a piece of filter paper and allow to stand for 5 min. Prepare a strip of suitable filter paper of appropriate size. Impregnate it by capillarity, by dipping the tip in a drop of *decolorised fuchsin solution R* and introduce the impregnated part immediately into the tube. Starting from the tip, a violet colour appears within 10 s that is clearly distinguishable from the red colour of fuchsin, which may be visible on a small area at the top of the impregnated part of the paper strip.

CALCIUM AND CALCIUM SALTS

For monographs from the European Pharmacopoeia, use tests A and B only.

a) To 0.2 mL of a neutral solution containing a quantity of the substance to be examined equivalent to about 0.2 mg of calcium (Ca^{2+}) per millilitre or to 0.2 mL of the prescribed solution add 0.5 mL of a 2 g/L solution of glyoxalhydroxyanil R in *ethanol (96 per cent) R*, 0.2 mL of *dilute sodium hydroxide solution R* and 0.2 mL of *sodium carbonate solution R*. Shake with 1 mL to 2 mL of *chloroform R* and add 1 mL to 2 mL of *water R*. The chloroform layer is coloured red.

b) Dissolve about 20 mg of the substance to be examined or the prescribed quantity in 5 mL of *acetic acid R*. Add 0.5 mL of *potassium ferrocyanide solution R*. The solution remains clear. Add about 50 mg of *ammonium chloride R*. A white, crystalline precipitate is formed.

c) To 5 mL of 0.4% w/v solution of the substance being examined add 0.2 mL of a 2% w/v solution of *ammonium oxalate*. A white precipitate is produced which is only sparingly soluble in 6M *acetic acid* but is soluble in *hydrochloric acid*.

CARBONATES

a) Introduce into a test tube 0.1 g of the substance being examined suspended in 2 mL of *water* or use 2 mL of the prescribed solution. Add 3 mL of 2M *acetic acid*, close the tube immediately using a stopper fitted with a glass tube bent at two right angles. The solution or suspension effervesces evolving a colourless and odourless gas. Heat gently and collect the gas in 5 mL of 0.1M *barium hydroxide*. A white precipitate is produced which dissolves on addition of an excess of 7M *hydrochloric acid*.

b) Treat a solution of the substance being examined with a solution of *magnesium sulfate*. A white precipitate is produced (distinction from bicarbonates).

CARBONATES AND BICARBONATES

Introduce into a test-tube 0.1 g of the substance to be examined and suspend in 2 mL of *water R* or use 2 mL of the prescribed solution. Add 3 mL of *dilute acetic acid R*. Close the tube immediately using a stopper fitted with a glass tube bent twice at right angles. The solution or the suspension becomes effervescent and gives off a colourless and odourless gas. Heat gently and collect the gas in 5 mL of *barium hydroxide solution R*. A white precipitate is formed that dissolves on addition of an excess of *hydrochloric acid R1*.

CHLORIDES

a) Dissolve in 2 mL of *water R* a quantity of the substance to be examined equivalent to about 2 mg of chloride (Cl^-) or use 2 mL of the prescribed solution. Acidify with *dilute nitric acid R* and add 0.4 mL of *silver nitrate solution R1*. Shake and allow to stand. A curdled, white precipitate is formed. Centrifuge and wash the precipitate with three quantities, each of 1 mL, of *water R*. Carry out this operation rapidly in subdued light, disregarding the fact that the supernatant solution may not become perfectly clear. Suspend the precipitate in 2 mL of *water R* and add 1.5 mL of *ammonia R*. The precipitate dissolves easily with the possible exception of a few large particles which dissolve slowly.

b) Introduce into a test-tube a quantity of the substance to be examined equivalent to about 15 mg of chloride (Cl^-) or the prescribed quantity. Add 0.2 g of *potassium dichromate R* and 1 mL of *sulfuric acid R*. Place a filter-paper strip impregnated with 0.1 mL of *diphenylcarbazide solution R* over the opening of the test-tube. The paper turns violet-red. The impregnated paper must not come into contact with the potassium dichromate.

CITRATES

For monographs from the European Pharmacopoeia, use test A only.

a) Dissolve in 5 mL of *water R* a quantity of the substance to be examined equivalent to about 50 mg of citric acid or use 5 mL of the prescribed solution. Add 0.5 mL of *sulfuric acid R* and 1 mL of *potassium permanganate solution R*. Warm until the colour of the permanganate is discharged. Add 0.5 mL of a 100 g/L solution of *sodium nitroprusside R* in *dilute sulfuric acid R* and 4 g of *sulfamic acid R*. Make alkaline with *concentrated ammonia R*, added dropwise until all the sulfamic acid has dissolved. Addition of an excess of *concentrated ammonia R* produces a violet colour, turning to violet-blue.

b) To a neutral solution of the substance being examined add a solution of *calcium chloride*; no precipitate is produced. Boil the solution; a white precipitate is produced which is soluble in 6M *acetic acid*.

ESTERS

To about 30 mg of the substance to be examined or the prescribed quantity add 0.5 mL of a 70 g/L solution of *hydroxylamine hydrochloride R* in *methanol R* and 0.5 mL of a 100 g/L solution of *potassium hydroxide R* in *ethanol (96 per cent) R*. Heat to boiling, cool, acidify with *dilute hydrochloric acid R* and add 0.2 mL of *ferric chloride*

solution R1 diluted ten times. A bluish-red or red colour is produced.

IODIDES

a) Dissolve a quantity of the substance to be examined equivalent to about 4 mg of iodide (I^-) in 2 mL of *water R* or use 2 mL of the prescribed solution. Acidify with *dilute nitric acid R* and add 0.4 mL of *silver nitrate solution R1*. Shake and allow to stand. A curdled, pale-yellow precipitate is formed. Centrifuge and wash with three quantities, each of 1 mL, of *water R*. Carry out this operation rapidly in subdued light disregarding the fact that the supernatant solution may not become perfectly clear. Suspend the precipitate in 2 mL of *water R* and add 1.5 mL of *ammonia R*. The precipitate does not dissolve.

b) To 0.2 mL of a solution of the substance to be examined containing about 5 mg of iodide (I^-) per millilitre, or to 0.2 mL of the prescribed solution, add 0.5 mL of *dilute sulfuric acid R*, 0.1 mL of *potassium dichromate solution R*, 2 mL of *water R* and 2 mL of *chloroform R*. Shake for a few seconds and allow to stand. The chloroform layer is coloured violet or violet-red.

IRON AND IRON SALTS

a) Dissolve a quantity of the substance to be examined equivalent to about 10 mg of iron (Fe^{2+}) in 1 mL of *water R* or use 1 mL of the prescribed solution. Add 1 mL of *potassium ferricyanide solution R*. A blue precipitate is formed that does not dissolve on addition of 5 mL of *dilute hydrochloric acid R*.

b) Dissolve a quantity of the substance to be examined equivalent to about 1 mg of iron (Fe^{3+}) in 30 mL of *water R*. To 3 mL of this solution or to 3 mL of the prescribed solution, add 1 mL of *dilute hydrochloric acid R* and 1 mL of *potassium thiocyanate solution R*. The solution is coloured red. Take two portions, each of 1 mL, of the mixture. To one portion add 5 mL of *isoamyl alcohol R* or 5 mL of *ether R*. Shake and allow to stand. The organic layer is coloured pink. To the other portion add 2 mL of *mercuric chloride solution R*. The red colour disappears.

c) Dissolve a quantity of the substance to be examined equivalent to not less than 1 mg of iron (Fe^{3+}) in 1 mL of *water R* or use 1 mL of the prescribed solution. Add 1 mL of *potassium ferrocyanide solution R*. A blue precipitate is formed that does not dissolve on addition of 5 mL of *dilute hydrochloric acid R*.

LACTATES

Dissolve a quantity of the substance to be examined equivalent to about 5 mg of lactic acid in 5 mL of *water R* or use 5 mL of the prescribed solution. Add 1 mL of *bromine water R* and 0.5 mL of *dilute sulfuric acid R*. Heat on a water-bath until the colour is discharged, stirring occasionally with a glass rod. Add 4 g of *ammonium sulfate R* and mix. Add dropwise and without mixing 0.2 mL of a 100 g/L solution of *sodium nitroprusside R* in *dilute sulfuric acid R*. Still without mixing add 1 mL of *concentrated ammonia R*. Allow to stand for 30 min. A dark green ring appears at the junction of the two liquids.

LEAD AND LEAD COMPOUNDS

a) Dissolve 0.1 g of the substance to be examined in 1 mL of *acetic acid R* or use 1 mL of the prescribed solution. Add 2 mL of *potassium chromate solution R*. A yellow precipitate is formed that dissolves on addition of 2 mL of *strong sodium hydroxide solution R*.

b) Dissolve 50 mg of the substance to be examined in 1 mL of *acetic acid R* or use 1 mL of the prescribed solution. Add 10 mL of *water R* and 0.2 mL of *potassium iodide solution R*. A yellow precipitate is formed. Heat to boiling for 1 min to 2 min. The precipitate dissolves. Allow to cool. The precipitate is re-formed as glistening, yellow plates.

MAGNESIUM AND MAGNESIUM SALTS

For monographs from the European Pharmacopoeia, use test A only.

a) Dissolve about 15 mg of the substance to be examined in 2 mL of *water R* or use 2 mL of the prescribed solution. Add 1 mL of *dilute ammonia R1*. A white precipitate is formed that dissolves on addition of 1 mL of *ammonium chloride solution R*. Add 1 mL of *disodium hydrogen phosphate solution R*. A white crystalline precipitate is formed.

b) To 0.5 mL of a neutral or slightly acidic solution of the substance being examined add 0.2 mL of a 0.1% w/v solution of titan yellow and 0.5 mL of 0.1M *sodium hydroxide*. A bright red turbidity is produced which gradually settles to give a bright red precipitate.

MERCURY AND MERCURY COMPOUNDS

a) Place about 0.1 mL of a solution of the substance to be examined on well-scraped copper foil. A dark-grey stain that becomes shiny on rubbing is formed. Dry the foil and heat in a test-tube. The spot disappears.

b) To the prescribed solution add *dilute sodium hydroxide solution R* until strongly alkaline (*2.2.4*). A dense yellow precipitate is formed (mercuric salts).

NITRATES

To a mixture of 0.1 mL of *nitrobenzene R* and 0.2 mL of *sulfuric acid R*, add a quantity of the powdered substance equivalent to about 1 mg of nitrate (NO_3^-) or the prescribed quantity. Allow to stand for 5 min. Cool in iced water and add slowly and with mixing 5 mL of *water R*, then 5 mL of *strong sodium hydroxide solution R*. Add 5 mL of *acetone R*. Shake and allow to stand. The upper layer is coloured deep violet.

PHOSPHATES (ORTHOPHOSPHATES)

a) To 5 mL of the prescribed solution, neutralised if necessary, add 5 mL of *silver nitrate solution R1*. A yellow precipitate is formed whose colour is not changed by boiling and which dissolves on addition of *ammonia R*.

b) Mix 1 mL of the prescribed solution with 2 mL of *molybdovanadic reagent R*. A yellow colour develops.

POTASSIUM AND POTASSIUM SALTS

a) Dissolve 0.1 g of the substance to be examined in 2 mL of *water R* or use 2 mL of the prescribed solution. Add 1 mL of *sodium carbonate solution R* and heat. No precipitate is formed. Add to the hot solution 0.05 mL of *sodium sulfide solution R*. No precipitate is formed. Cool in iced water and add 2 mL of a 150 g/L solution of *tartaric acid R*. Allow to stand. A white crystalline precipitate is formed.

b) Dissolve about 40 mg of the substance to be examined in 1 mL of *water R* or use 1 mL of the prescribed solution. Add 1 mL of *dilute acetic acid R* and 1 mL of a freshly prepared 100 g/L solution of *sodium cobaltinitrite R*. A yellow or orange-yellow precipitate is formed immediately.

SALICYLATES

a) To 1 mL of the prescribed solution add 0.5 mL of *ferric chloride solution R1*. A violet colour is produced that persists after the addition of 0.1 mL of *acetic acid R*.

b) Dissolve 0.5 g of the substance to be examined in 10 mL of *water R* or use 10 mL of the prescribed solution. Add 0.5 mL of *hydrochloric acid R*. The precipitate obtained,

after recrystallisation from hot *water R* and drying *in vacuo*, has a melting point (*2.2.14*) of 156 °C to 161 °C.

SILICATES

Mix the prescribed quantity of the substance to be examined in a lead or platinum crucible by means of a copper wire with about 10 mg of *sodium fluoride R* and a few drops of *sulfuric acid R* to give a thin slurry. Cover the crucible with a thin, transparent plate of plastic under which a drop of *water R* is suspended and warm gently. Within a short time a white ring is rapidly formed around the drop of water.

SILVER AND SILVER COMPOUNDS

Dissolve about 10 mg of the substance to be examined in 10 mL of *water R* or use 10 mL of the prescribed solution. Add 0.3 mL of *hydrochloric acid R1*. A curdled, white precipitate is formed that dissolves on addition of 3 mL of *dilute ammonia R1*.

SODIUM AND SODIUM SALTS

a) Dissolve 0.1 g of the substance to be examined in 2 mL of *water R* or use 2 mL of the prescribed solution. Add 2 mL of a 150 g/L solution of *potassium carbonate R* and heat to boiling. No precipitate is formed. Add 4 mL of *potassium pyroantimonate solution R* and heat to boiling. Allow to cool in iced water and if necessary rub the inside of the test-tube with a glass rod. A dense white precipitate is formed.

b) Dissolve a quantity of the substance to be examined equivalent to about 2 mg of sodium (Na^+) in 0.5 mL of *water R* or use 0.5 mL of the prescribed solution. Add 1.5 mL of *methoxyphenylacetic reagent R* and cool in ice-water for 30 min. A voluminous, white, crystalline precipitate is formed. Place in water at 20 °C and stir for 5 min. The precipitate does not disappear. Add 1 mL of *dilute ammonia R1*. The precipitate dissolves completely. Add 1 mL of *ammonium carbonate solution R*. No precipitate is formed.

SULFATES

a) Dissolve about 45 mg of the substance to be examined in 5 mL of *water R* or use 5 mL of the prescribed solution. Add 1 mL of *dilute hydrochloric acid R* and 1 mL of *barium chloride solution R1*. A white precipitate is formed.

b) To the suspension obtained during reaction (a), add 0.1 mL of *0.05 M iodine*. The suspension remains yellow (distinction from sulfites and dithionites), but is decolorised by adding dropwise *stannous chloride solution R* (distinction from iodates). Boil the mixture. No coloured precipitate is formed (distinction from selenates and tungstates).

TARTRATES

a) Dissolve about 15 mg of the substance to be examined in 5 mL of *water R* or use 5 mL of the prescribed solution. Add 0.05 mL of a 10 g/L solution of *ferrous sulfate R* and 0.05 mL of *dilute hydrogen peroxide solution R*. A transient yellow colour is produced. After the colour has disappeared add *dilute sodium hydroxide solution R* dropwise. A violet or purple colour is produced.

b) To 0.1 mL of a solution of the substance to be examined containing the equivalent of about 15 mg of tartaric acid per millilitre or to 0.1 mL of the prescribed solution add 0.1 mL of a 100 g/L solution of *potassium bromide R*, 0.1 mL of a 20 g/L solution of *resorcinol R* and 3 mL of *sulfuric acid R*. Heat on a water-bath for 5 min to 10 min. A dark-blue colour develops. Allow to cool and pour the solution into *water R*. The colour changes to red.

XANTHINES

To a few milligrams of the substance to be examined or the prescribed quantity add 0.1 mL of *strong hydrogen peroxide solution R* and 0.3 mL of *dilute hydrochloric acid R*. Heat to dryness on a water-bath until a yellowish-red residue is obtained. Add 0.1 mL of *dilute ammonia R2*. The colour of the residue changes to violet-red.

ZINC AND ZINC SALTS

Dissolve 0.1 g of the substance to be examined in 5 mL of *water R* or use 5 mL of the prescribed solution. Add 0.2 mL of *strong sodium hydroxide solution R*. A white precipitate is formed. Add a further 2 mL of *strong sodium hydroxide solution R*. The precipitate dissolves. Add 10 mL of *ammonium chloride solution R*. The solution remains clear. Add 0.1 mL of *sodium sulfide solution R*. A flocculent white precipitate is formed.

ODOUR

(Ph. Eur. method 2.3.4)

On a watch-glass 6 cm to 8 cm in diameter, spread in a thin layer 0.5 g to 2.0 g of the substance to be examined. After 15 min, determine the odour or verify the absence of odour.

Appendix VII

Limit Tests

Nessler Cylinders

(No Ph. Eur. method)

Where the use of *Nessler cylinders* is prescribed in a test of the Pharmacopoeia, Nessler cylinders complying with the following requirements should be used.

Nessler cylinders comply with British Standard 612:1966 (Specification for Nessler cylinders). They are of clear glass with a nominal capacity of 50 mL; the overall height is about 15 cm, the external height to the 50-mL mark 11.0 to 12.4 cm, the thickness of the wall 1.0 to 1.5 mm and the thickness of the base 1.0 to 3.0 mm. The external heights to the 50-mL mark of cylinders used for a test must not differ by more than 1 mm.

Tubes for Comparative Tests

(Ph. Eur. method 2.1.5)

Tubes used for comparative tests are matched tubes of colourless glass with a uniform internal diameter. The base is transparent and flat.

A column of the liquid is examined down the vertical axis of the tube against a white background, or if necessary, against a black background. The examination is carried out in diffused light.

It is assumed that tubes with an internal diameter of 16 mm will be used. Tubes with a larger internal diameter may be used instead but the volume of liquid examined must then be increased so that the depth of liquid in the tubes is not less than where the prescribed volume of liquid and tubes 16 mm in internal diameter are used.

Limit Test for Aluminium

(Ph. Eur. method 2.4.17)

Place the prescribed solution in a separating funnel and shake with 2 quantities, each of 20 mL, and then with one 10 mL quantity of a 5 g/L solution of hydroxyquinoline R in *chloroform R*. Dilute the combined chloroform solutions to 50.0 mL with *chloroform R* (test solution).

Prepare a standard in the same manner using the prescribed reference solution.

Prepare a blank in the same manner using the prescribed blank solution.

Measure the intensity of the fluorescence (*2.2.21*) of the test solution (I_1), of the standard (I_2) and of the blank (I_3) using an excitant beam at 392 nm and a secondary filter with a transmission band centred on 518 nm or a monochromator set to transmit at this wavelength.

The fluorescence (I_1–I_3) of the test solution is not greater than that of the standard (I_2–I_3).

Limit Test for Ammonium

(Ph. Eur. method 2.4.1)

Unless otherwise prescribed, use method A.

METHOD A

Introduce the prescribed solution into a test-tube or dissolve the prescribed quantity of the substance to be examined in 14 mL of *water R* in a test-tube. Make the solution alkaline if necessary by the addition of *dilute sodium hydroxide solution R*, dilute to 15 mL with *water R* and add 0.3 mL of *alkaline potassium tetraiodomercurate solution R*. Prepare a standard by mixing 10 mL of *ammonium standard solution (1 ppm NH_4) R*, 5 mL of *water R* and 0.3 mL of *alkaline potassium tetraiodomercurate solution R*. Stopper the test-tubes.

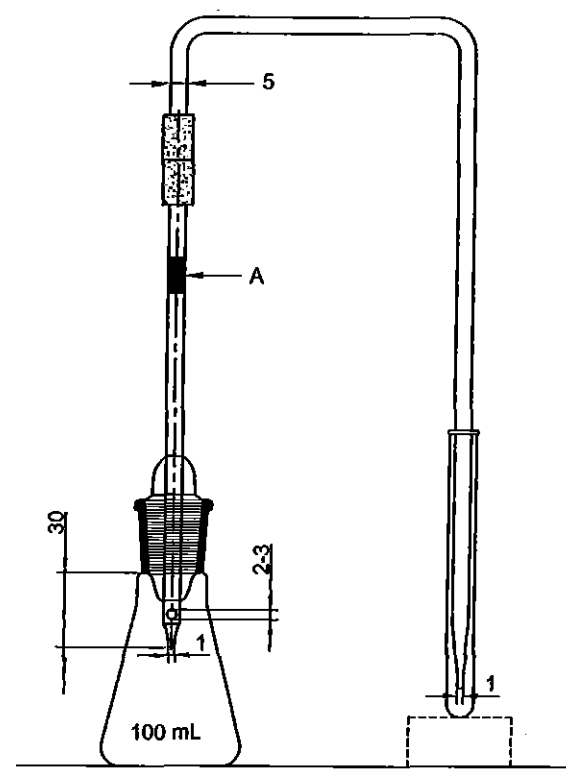
After 5 min, any yellow colour in the test solution is not more intense than that in the standard.

METHOD B

In a 25 mL jar fitted with a cap, place the prescribed quantity of the finely powdered substance to be examined and dissolve or suspend in 1 mL of *water R*. Add 0.30 g of *heavy magnesium oxide R*. Close immediately after placing a piece of *silver manganese paper R* 5 mm square, wetted with a few drops of *water R*, under the polyethylene cap. Swirl, avoiding projections of liquid, and allow to stand at 40 °C for 30 min. If the silver manganese paper shows a grey colour, it is not more intense than that of a standard prepared at the same time and in the same manner using the prescribed volume of *ammonium standard solution (1 ppm NH_4) R*, 1 mL of *water R* and 0.30 g of *heavy magnesium oxide R*.

Limit Test for Arsenic

(Ph. Eur. method 2.4.2)



A. Lead acetate paper/cotton

Figure 2.4.2.-1. – *Apparatus for the limit test for arsenic (method A)*

Dimensions in millimetres

METHOD A

The apparatus (see Figure 2.4.2.-1) consists of a 100 mL conical flask closed with a ground-glass stopper through which passes a glass tube about 200 mm long and about 5 mm in internal diameter. The lower part of the tube tapers to an internal diameter of 1 mm, and about 20 mm from its tip is a lateral orifice 2-3 mm in diameter. When the tube is in position in the stopper, the lateral orifice is at least 3 mm below the lower surface of the stopper. A second glass tube of the same internal diameter is connected to the first tube.

The second tube is bent twice at right angles and the free end of the tube tapers to an internal diameter of 1 mm. This end is immersed in a test-tube containing 3.0 mL of *silver diethyldithiocarbamate solution R*. Other suitable equipment may be used. Into the first tube insert 50-60 mg of *lead acetate cotton R*, loosely packed, or a small plug of cotton and a rolled piece of *lead acetate paper R* weighing 50-60 mg.

In the conical flask, dissolve the prescribed quantity of the substance to be examined in 25 mL of *water R*, or in the case of a solution adjust the prescribed volume to 25 mL with *water R*. Add 15 mL of *hydrochloric acid R*, 0.1 mL of *stannous chloride solution R* and 5 mL of *potassium iodide solution R*, allow to stand for 15 min and introduce 5 g of *activated zinc R*. Assemble the 2 parts of the apparatus immediately and immerse the flask in a water-bath at a temperature such that a uniform evolution of gas is maintained. Prepare a standard in the same manner, using 1 mL of *arsenic standard solution (1 ppm As) R*, diluted to 25 mL with *water R*. If foaming occurs, 1 mL of *2-propanol R* may be added to the flask.

After at least 2 h, the colour obtained in the test-tube with the test solution is not more intense than that obtained with the standard.

Suitability test The colour obtained in the test-tube with the standard is at least as intensely coloured as 3 mL of a mixture of 3.0 mL of yellow primary solution, 0.6 mL of red primary solution and 11.40 mL of a solution of *hydrochloric acid R* (10 g/L HCl) (*2.2.2, Method I*).

METHOD B

Introduce the prescribed quantity of the substance to be examined into a test-tube containing 4 mL of *hydrochloric acid R* and about 5 mg of *potassium iodide R* and add 3 mL of *hypophosphorous reagent R*. Heat the mixture on a water-bath for 15 min, shaking occasionally. Prepare a standard in the same manner, using 0.5 mL of *arsenic standard solution (10 ppm As) R*.

After heating on the water-bath, the colour obtained in the test-tube with the test solution is not more intense than that obtained with the standard.

Limit Test for Calcium

(Ph. Eur. method 2.4.3)

All solutions used for this test are prepared with distilled water R.

To 0.2 mL of *alcoholic calcium standard solution (100 ppm Ca) R* add 1 mL of *ammonium oxalate solution R*. After 1 min add a mixture of 1 mL of *dilute acetic acid R* and 15 mL of the prescribed solution or of a solution containing the prescribed quantity of the substance to be examined, and shake. Prepare a standard in the same manner using a mixture of 10 mL of aqueous *calcium standard solution (10 ppm Ca) R*, 1 mL of *dilute acetic acid R* and 5 mL of *distilled water R*.

After 15 min, any opalescence in the test solution is not more intense than that in the standard.

Limit Test for Chlorides

(Ph. Eur. method 2.4.4)

To 15 mL of the prescribed solution add 1 mL of *dilute nitric acid R* and pour the mixture as a single addition into a test-tube containing 1 mL of *silver nitrate solution R2*. Prepare a standard in the same manner using 10 mL of *chloride standard solution (5 ppm Cl) R* and 5 mL of *water R*. Examine the tubes laterally against a black background.

After standing for 5 min protected from light, any opalescence in the test solution is not more intense than that in the standard.

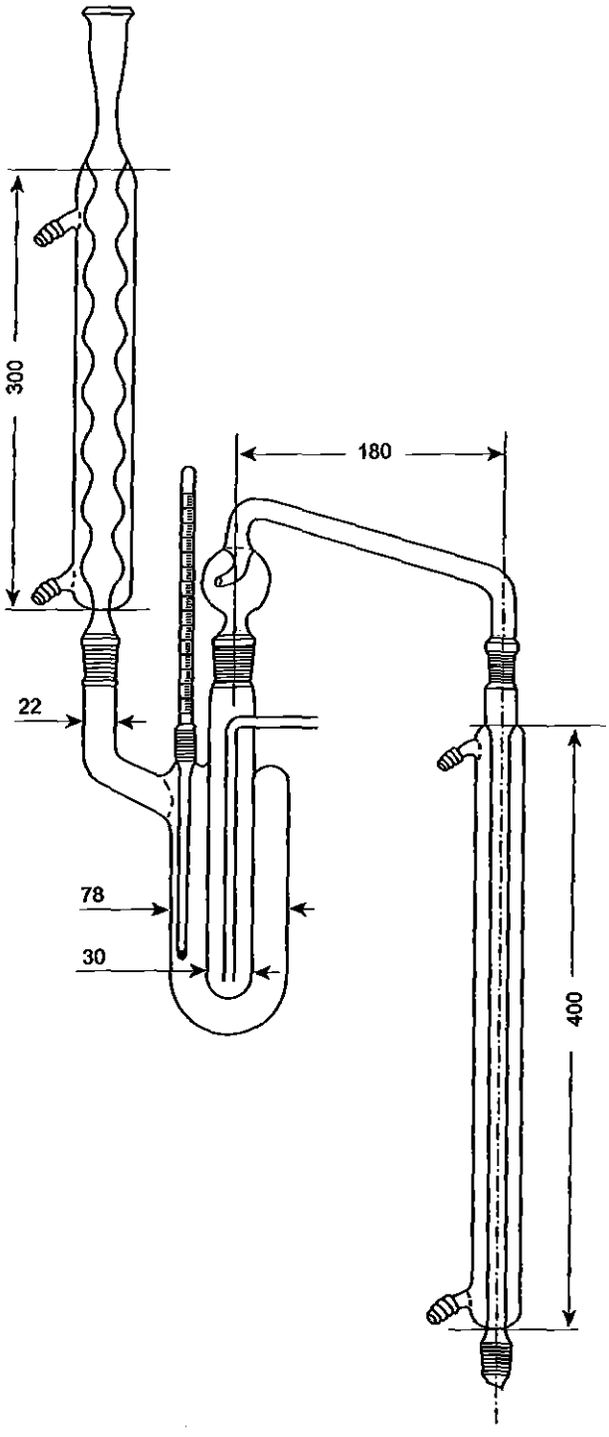


Figure 2.4.5.-1. – *Apparatus for limit test for fluorides*
Dimensions in millimetres

Limit Test for Fluorides

(Ph. Eur. method 2.4.5)

Introduce into the inner tube of the apparatus (see Figure 2.4.5.-1) the prescribed quantity of the substance to be examined, 0.1 g of acid-washed *sand R* and 20 mL of a mixture of equal volumes of *sulfuric acid R* and *water R*. Heat the jacket containing *tetrachloroethane R* maintained at its boiling point (146 °C). Heat the steam generator and distil, collecting the distillate in a 100 mL volumetric flask containing 0.3 mL of *0.1 M sodium hydroxide* and 0.1 mL of *phenolphthalein solution R*. Maintain a constant volume

(20 mL) in the tube during distillation and ensure that the distillate remains alkaline, adding *0.1 M sodium hydroxide* if necessary. Dilute the distillate to 100 mL with *water R* (test solution). Prepare a standard in the same manner by distillation, using 5 mL of *fluoride standard solution (10 ppm F) R* instead of the substance to be examined. Into two glass-stoppered cylinders introduce 20 mL of the test solution and 20 mL of the standard and 5 mL of *aminomethylalizarindiacetic acid reagent R*.

After 20 min, any blue colour in the test solution (originally red) is not more intense than that in the standard.

Limit Test for Heavy Metals

(Ph. Eur. method 2.4.8)

The methods described below require the use of *thioacetamide reagent R*. As an alternative, *sodium sulfide solution R1* (0.1 mL) is usually suitable. Since tests prescribed in monographs have been developed using *thioacetamide reagent R*, if *sodium sulfide solution R1* is used instead, it is necessary to include also for methods A, B and H a monitor solution, prepared from the quantity of the substance to be examined prescribed for the test, to which has been added the volume of lead standard solution prescribed for preparation of the reference solution. The test is invalid if the monitor solution is not at least as intense as the reference solution.

METHOD A

Test solution 12 mL of the prescribed aqueous solution of the substance to be examined.

Reference solution (standard) A mixture of 10 mL of *lead standard solution (1 ppm Pb) R* or *lead standard solution (2 ppm Pb) R*, as prescribed, and 2 mL of the prescribed aqueous solution of the substance to be examined.

Blank solution A mixture of 10 mL of *water R* and 2 mL of the prescribed aqueous solution of the substance to be examined.

To each solution, add 2 mL of *buffer solution pH 3.5 R*. Mix and add to 1.2 mL of *thioacetamide reagent R*. Mix immediately. Examine the solutions after 2 min.

System suitability The reference solution shows a slight brown colour compared to the blank solution.

Result Any brown colour in the test solution is not more intense than that in the reference solution.

If the result is difficult to judge, filter the solutions through a suitable membrane filter (nominal pore size 0.45 µm). Carry out the filtration slowly and uniformly, applying moderate and constant pressure to the piston. Compare the spots on the filters obtained with the different solutions.

METHOD B

Test solution 12 mL of the prescribed solution of the substance to be examined prepared using an organic solvent containing a minimum percentage of water (for example, dioxan containing 15 per cent of water or acetone containing 15 per cent of water).

Reference solution (standard) A mixture of 10 mL of lead standard solution (1 or 2 ppm Pb), as prescribed, and 2 mL of the prescribed solution of the substance to be examined in an organic solvent. Prepare the lead standard solution (1 or 2 ppm Pb) by dilution of *lead standard solution (100 ppm Pb) R* with the solvent used for the substance to be examined.

Blank solution A mixture of 10 mL of the solvent used for the substance to be examined and 2 mL of the prescribed solution of the substance to be examined in an organic solvent.

To each solution, add 2 mL of *buffer solution pH 3.5 R*. Mix and add to 1.2 mL of *thioacetamide reagent R*. Mix immediately. Examine the solutions after 2 min.

System suitability The reference solution shows a slight brown colour compared to the blank solution.

Result Any brown colour in the test solution is not more intense than that in the reference solution.

If the result is difficult to judge, filter the solutions through a suitable membrane filter (nominal pore size 0.45 µm). Carry out the filtration slowly and uniformly, applying moderate and constant pressure to the piston. Compare the spots on the filters obtained with the different solutions.

METHOD C

Test solution Place the prescribed quantity (not more than 2 g) of the substance to be examined in a silica crucible with 4 mL of a 250 g/L solution of *magnesium sulfate R* in *dilute sulfuric acid R*. Mix using a fine glass rod. Heat cautiously. If the mixture is liquid, evaporate gently to dryness on a water-bath. Progressively heat to ignition and continue heating until an almost white or at most greyish residue is obtained. Carry out the ignition at a temperature not exceeding 800 °C. Allow to cool. Moisten the residue with a few drops of *dilute sulfuric acid R*. Evaporate, ignite again and allow to cool. The total period of ignition must not exceed 2 h. Take up the residue in 2 quantities, each of 5 mL, of *dilute hydrochloric acid R*. Add 0.1 mL of *phenolphthalein solution R*, then *concentrated ammonia R* until a pink colour is obtained. Cool, add *glacial acetic acid R* until the solution is decolorised and add 0.5 mL in excess. Filter if necessary and wash the filter. Dilute to 20 mL with *water R*.

Reference solution (standard) Prepare as described for the test solution, using the prescribed volume of *lead standard solution (10 ppm Pb) R* instead of the substance to be examined. To 10 mL of the solution obtained add 2 mL of the test solution.

Monitor solution Prepare as described for the test solution, adding to the substance to be examined the volume of *lead standard solution (10 ppm Pb) R* prescribed for preparation of the reference solution. To 10 mL of the solution obtained add 2 mL of the test solution.

Blank solution A mixture of 10 mL of *water R* and 2 mL of the test solution.

To 12 mL of each solution, add 2 mL of *buffer solution pH 3.5 R*. Mix and add to 1.2 mL of *thioacetamide reagent R*. Mix immediately. Examine the solutions after 2 min.

System suitability:

- the reference solution shows a slight brown colour compared to the blank solution,
- the monitor solution is at least as intense as the reference solution.

Result Any brown colour in the test solution is not more intense than that in the reference solution.

If the result is difficult to judge, filter the solutions through a suitable membrane filter (nominal pore size 0.45 µm). Carry out the filtration slowly and uniformly, applying moderate and constant pressure to the piston. Compare the spots on the filters obtained with the different solutions.

METHOD D

Test solution In a silica crucible, mix thoroughly the prescribed quantity of the substance to be examined with 0.5 g of *magnesium oxide R1*. Ignite to dull redness until a

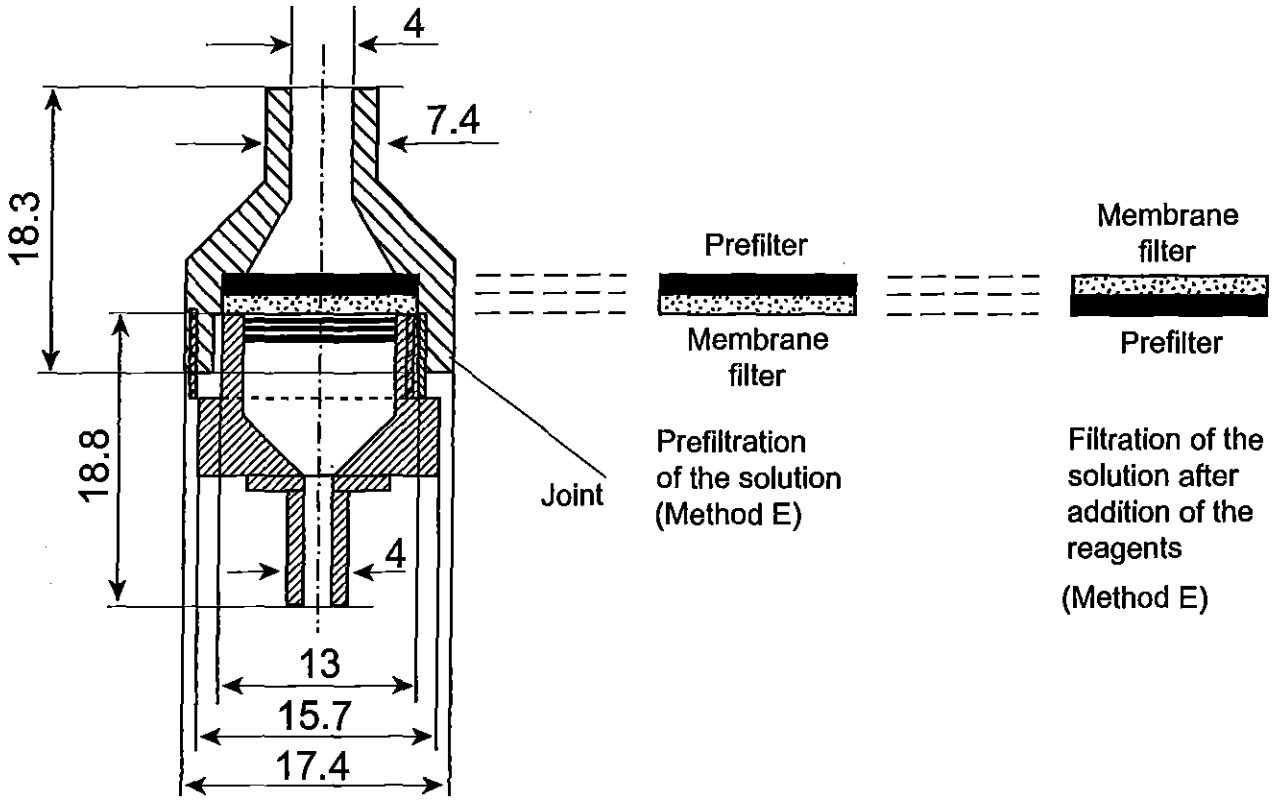

Figure 2.4.8.-1. – *Apparatus for the test for heavy metals*
Dimensions in millimetres

homogeneous white or greyish-white mass is obtained. If after 30 min of ignition the mixture remains coloured, allow to cool, mix using a fine glass rod and repeat the ignition. If necessary repeat the operation. Heat at 800 °C for about 1 h. Take up the residue in 2 quantities, each of 5 mL, of a mixture of equal volumes of *hydrochloric acid RI* and *water R*. Add 0.1 mL of *phenolphthalein solution R* and then *concentrated ammonia R* until a pink colour is obtained. Cool, add *glacial acetic acid R* until the solution is decolorised and add 0.5 mL in excess. Filter if necessary and wash the filter. Dilute to 20 mL with *water R*.

Reference solution (standard) Prepare as described for the test solution using the prescribed volume of *lead standard solution (10 ppm Pb) R* instead of the substance to be examined and drying in an oven at 100-105 °C. To 10 mL of the solution obtained add 2 mL of the test solution.

Monitor solution Prepare as described for the test solution, adding to the substance to be examined the volume of *lead standard solution (10 ppm Pb) R* prescribed for preparation of the reference solution and drying in an oven at 100-105 °C. To 10 mL of the solution obtained add 2 mL of the test solution.

Blank solution A mixture of 10 mL of *water R* and 2 mL of the test solution.

To 12 mL of each solution, add 2 mL of *buffer solution pH 3.5 R*. Mix and add to 1.2 mL of *thioacetamide reagent R*. Mix immediately. Examine the solutions after 2 min.

System suitability:
- the reference solution shows a slight brown colour compared to the blank solution,
- the monitor solution is at least as intense as the reference solution.

Result Any brown colour in the test solution is not more intense than that in the reference solution.

If the result is difficult to judge, filter the solutions through a suitable membrane filter (nominal pore size 0.45 µm). Carry out the filtration slowly and uniformly, applying moderate and constant pressure to the piston. Compare the spots on the filters obtained with the different solutions.

METHOD E

Test solution Dissolve the prescribed quantity of the substance to be examined in 30 mL of *water R* or the prescribed volume.

Reference solution (standard) Unless otherwise prescribed, dilute the prescribed volume of *lead standard solution (1 ppm Pb) R* to the same volume as the test solution.

Prepare the filtration apparatus by adapting the barrel of a 50 mL syringe without its piston to a support containing, on the plate, a membrane filter (nominal pore size 3 µm) and above it a prefilter (Figure 2.4.8.-1).

Transfer the test solution into the syringe barrel, put the piston in place and then apply an even pressure on it until the whole of the liquid has been filtered. In opening the support and removing the prefilter, check that the membrane filter remains uncontaminated with impurities. If this is not the case replace it with another membrane filter and repeat the operation under the same conditions.

To the prefiltrate or to the prescribed volume of the prefiltrate add 2 mL of *buffer solution pH 3.5 R*. Mix and add to 1.2 mL of *thioacetamide reagent R*. Mix immediately and allow to stand for 10 min and again filter as described above, but inverting the order of the filters, the liquid passing first through the membrane filter before passing through the prefilter (Figure 2.4.8.-1). The filtration must be carried out slowly and uniformly by applying moderate and constant

pressure to the piston of the syringe. After complete filtration, open the support, remove the membrane filter, and dry using filter paper.

In parallel, treat the reference solution in the same manner as the test solution.

Result The colour of the spot obtained with the test solution is not more intense than that obtained with the reference solution.

METHOD F

Test solution Place the prescribed quantity or volume of the substance to be examined in a clean, dry, 100 mL long-necked combustion flask (a 300 mL flask may be used if the reaction foams excessively). Clamp the flask at an angle of 45°. If the substance to be examined is a solid, add a sufficient volume of a mixture of 8 mL of *sulfuric acid R* and 10 mL of *nitric acid R* to moisten the substance thoroughly; if the substance to be examined is a liquid, add a few millilitres of a mixture of 8 mL of *sulfuric acid R* and 10 mL of *nitric acid R*. Warm gently until the reaction commences, allow the reaction to subside and add additional portions of the same acid mixture, heating after each addition, until a total of 18 mL of the acid mixture has been added. Increase the amount of heat and boil gently until the solution darkens. Cool, add 2 mL of *nitric acid R* and heat again until the solution darkens. Continue the heating, followed by the addition of *nitric acid R* until no further darkening occurs, then heat strongly until dense, white fumes are produced. Cool, cautiously add 5 mL of *water R*, boil gently until dense, white fumes are produced and continue heating to reduce to 2-3 mL. Cool, cautiously add 5 mL of *water R* and examine the colour of the solution. If the colour is yellow, cautiously add 1 mL of *strong hydrogen peroxide solution R* and again evaporate until dense, white fumes are produced and reduce to a volume of 2-3 mL. If the solution is still yellow in colour, repeat the addition of 5 mL of *water R* and 1 mL of *strong hydrogen peroxide solution R* until the solution is colourless. Cool, dilute cautiously with *water R* and rinse into a 50 mL colour comparison tube, ensuring that the total volume does not exceed 25 mL. Adjust the solution to pH 3.0-4.0, using short range pH indicator paper as external indicator, with *concentrated ammonia R1* (*dilute ammonia R1* may be used, if desired, as the specified range is approached), dilute with *water R* to 40 mL and mix. Add 2 mL of *buffer solution pH 3.5 R*. Mix and add to 1.2 mL of *thioacetamide reagent R*. Mix immediately. Dilute to 50 mL with *water R* and mix.

Reference solution (standard) Prepare at the same time and in the same manner as the test solution, using the prescribed volume of *lead standard solution (10 ppm Pb) R*.

Monitor solution Prepare as described for the test solution, adding to the substance to be examined the volume of *lead standard solution (10 ppm Pb) R* prescribed for the preparation of the reference solution.

Blank solution Prepare as described for the test solution, omitting the substance to be examined.

Examine the solutions vertically against a white background after 2 min.

System suitability:

— the reference solution shows a brown colour compared to the blank solution,

— the monitor solution is at least as intense as the reference solution.

Result Any brown colour in the test solution is not more intense than that in the reference solution.

If the result is difficult to judge, filter the solutions through a suitable membrane filter (nominal pore size 0.45 µm). Carry out the filtration slowly and uniformly, applying moderate and constant pressure to the piston. Compare the spots on the filters obtained with the different solutions.

METHOD G

CAUTION: when using high-pressure digestion vessels the safety precautions and operating instructions given by the manufacturer must be followed. The digestion cycles have to be elaborated depending on the type of microwave oven to be used (for example, energy-controlled microwave ovens, temperature-controlled microwave ovens or high-pressure ovens). The cycle must conform to the manufacturer's instructions. The digestion cycle is suitable if a clear solution is obtained.

Test solution Place the prescribed amount of the substance to be examined (not more than 0.5 g) in a suitable, clean beaker. Add successively 2.7 mL of *sulfuric acid R*, 3.3 mL of *nitric acid R* and 2.0 mL of *strong hydrogen peroxide solution R* using a magnetic stirrer. Allow the substance to react with a reagent before adding the next one. Transfer the mixture to a dry high-pressure-resistant digestion vessel (fluoropolymer or quartz glass).

Reference solution (standard) Prepare as described for the test solution, using the prescribed volume of *lead standard solution (10 ppm Pb) R* instead of the substance to be examined.

Monitor solution Prepare as prescribed for the test solution, adding to the substance to be examined the volume of *lead standard solution (10 ppm Pb) R* prescribed for the preparation of the reference solution.

Blank solution Prepare as described for the test solution, omitting the substance to be examined.

Close the vessels and place in a laboratory microwave oven. Digest using a sequence of 2 separate suitable programmes. Design the programmes in several steps in order to control the reaction, monitoring pressure, temperature or energy depending on the type of microwave oven available. After the first programme allow the digestion vessels to cool before opening. Add to each vessel 2.0 mL of *strong hydrogen peroxide solution R* and digest using the second programme. After the second programme allow the digestion vessels to cool before opening. If necessary to obtain a clear solution, repeat the addition of *strong hydrogen peroxide solution R* and the second digestion programme.

Cool, dilute cautiously with *water R* and rinse into a flask, ensuring that the total volume does not exceed 25 mL.

Using short-range pH indicator paper as external indicator, adjust the solutions to pH 3.0-4.0 with *concentrated ammonia R1* (*dilute ammonia R1* may be used as the specified range is approached). To avoid heating of the solutions use an ice-bath and a magnetic stirrer. Dilute to 40 mL with *water R* and mix. Add 2 mL of *buffer solution pH 3.5 R*. Mix and add to 1.2 mL of *thioacetamide reagent R*. Mix immediately. Dilute to 50 mL with *water R*, mix and allow to stand for 2 min.

Filter the solutions through a suitable membrane filter (nominal pore size 0.45 µm). Carry out the filtration slowly and uniformly, applying moderate and constant pressure to the piston. Compare the spots on the filters obtained with the different solutions.

System suitability:

— the spot obtained with the reference solution shows a brown colour compared to the spot obtained with the blank solution,

— the spot obtained with the monitor solution is at least as intense as the spot obtained with the reference solution.

Result The brown colour of the spot obtained with the test solution is not more intense than that of the spot obtained with the reference solution.

METHOD H

Test solution Dissolve the prescribed quantity of the substance to be examined in 20 mL of the solvent or solvent mixture prescribed.

Reference solution Dilute the prescribed volume of *lead standard solution (10 ppm Pb) R* to 20 mL with the solvent or solvent mixture prescribed.

Blank solution 20 mL of the solvent or solvent mixture prescribed.

To each solution, add 2 mL of *buffer solution pH 3.5 R*. Mix. *(In some cases precipitation occurs, in which case the specific monograph would describe re-dissolution in a defined volume of a given solvent.)* Add to 1.2 mL of *thioacetamide reagent R*. Mix immediately and allow to stand for 2 min. Filter the solutions through a suitable membrane filter (nominal pore size 0.45 µm). Compare the spots on the filters obtained with the different solutions.

System suitability The spot obtained with the reference solution shows a brownish-black colour compared to the spot obtained with the blank solution.

Result The brownish-black colour of the spot obtained with the test solution is not more intense than that of the spot obtained with the reference solution.

Limit Test for Iron

(Ph. Eur. method 2.4.9)

Dissolve the prescribed quantity of the substance to be examined in *water R* and dilute to 10 mL with the same solvent or use 10 mL of the prescribed solution. Add 2 mL of a 200 g/L solution of *citric acid monohydrate R* and 0.1 mL of *thioglycollic acid R*. Mix, make alkaline with *ammonia R* and dilute to 20 mL with *water R*. Prepare a standard in the same manner, using 10 mL of *iron standard solution (1 ppm Fe) R*.

After 5 min, any pink colour in the test solution is not more intense than that in the standard.

Limit Test for Lead in Sugars

(Ph. Eur. method 2.4.10)

Determine the lead by atomic absorption spectrometry (*2.2.23, Method II*).

Test solution Dissolve 20.0 g of the substance to be examined in a mixture of equal volumes of *dilute acetic acid R* and *water R* and dilute to 100.0 mL with the same mixture of solvents. Add 2.0 mL of a clear 10 g/L solution of *ammonium pyrrolidinedithiocarbamate R* and 10.0 mL of *methyl isobutyl ketone R* and then shake for 30 s protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solutions Prepare 3 reference solutions in the same manner as the test solution but adding 0.5 mL, 1.0 mL and 1.5 mL respectively of *lead standard solution (10 ppm Pb) R* in addition to the 20.0 g of the substance to be examined.

Set the zero of the instrument using *methyl isobutyl ketone R* treated as described for the test solution without the substance to be examined. Measure the absorbance at 283.3 nm using a lead hollow-cathode lamp as source of radiation and an air-acetylene flame.

The substance to be examined contains not more than 0.5 ppm of lead, unless otherwise prescribed.

Limit Test for Magnesium

(Ph. Eur. method 2.4.6)

To 10 mL of the prescribed solution add 0.1 g of *disodium tetraborate R*. Adjust the solution, if necessary, to pH 8.8 to pH 9.2 using *dilute hydrochloric acid R* or *dilute sodium hydroxide solution R*. Shake with 2 quantities, each of 5 mL, of a 1 g/L solution of hydroxyquinoline R in *chloroform R*, for 1 min each time. Allow to stand. Separate and discard the organic layer. To the aqueous solution add 0.4 mL of *butylamine R* and 0.1 mL of *triethanolamine R*. Adjust the solution, if necessary, to pH 10.5 to pH 11.5. Add 4 mL of the solution of hydroxyquinoline in chloroform, shake for 1 min, allow to stand and separate. Use the lower layer for comparison. Prepare a standard in the same manner using a mixture of 1 mL of *magnesium standard solution (10 ppm Mg) R* and 9 mL of *water R*.

Any colour in the solution obtained from the substance to be examined is not more intense than that in the standard.

Limit Test for Magnesium and Alkaline-earth Metals

(Ph. Eur. method 2.4.7)

To 200 mL of *water R* add 0.1 g of *hydroxylamine hydrochloride R*, 10 mL of *ammonium chloride buffer solution pH 10.0 R*, 1 mL of *0.1 M zinc sulfate* and about 15 mg of *mordant black 11 triturate R*. Heat to about 40 °C. Titrate with *0.01 M sodium edetate* until the violet colour changes to full blue. To the solution add the prescribed quantity of the substance to be examined dissolved in 100 mL of *water R* or use the prescribed solution. If the colour of the solution changes to violet, titrate with *0.01 M sodium edetate* until the full blue colour is again obtained.

The volume of *0.01 M sodium edetate* used in the second titration does not exceed the prescribed quantity.

Limit Test for Heavy Metals in Herbal Drugs and Herbal Drug Preparations

(Ph. Eur. method 2.4.27)

CAUTION: when using closed high-pressure digestion vessels and microwave laboratory equipment, be familiar with the safety and operating instructions given by the manufacturer.

APPARATUS

The apparatus typically consists of the following:

— as digestion flasks, polytetrafluoroethylene, perfluoroalkoxy polymer, quartz or glass flasks with a volume of 20-150 mL, fitted with an airtight closure, a valve to adjust the pressure inside the container and a polytetrafluoroethylene tube to allow release of gas;

— a system to make flasks airtight, using the same torsional force for each of them;

— a programmable microwave oven (e.g. with a magnetron frequency of 2450 MHz, with a selectable output from 0 to 1500 ± 70 W in 1 per cent increments), a polytetrafluoroethylene-coated microwave cavity with a variable speed exhaust fan, a rotating turntable drive system and exhaust tubing to vent fumes;

— an atomic absorption spectrometer (*2.2.23*), an inductively coupled plasma-atomic emission spectrometer (*2.2.57*), or an inductively coupled plasma-mass spectrometer (*2.2.58*).

METHOD

Examine by atomic absorption spectrometry (AAS) (*2.2.23*), inductively coupled plasma-atomic emission spectrometry

(ICP-AES) (*2.2.57*), or inductively coupled plasma-mass spectrometry (ICP-MS) (*2.2.58*).

Deviations from the experimental parameters of the sample preparation procedure and the method description below are acceptable provided that the validation requirements are met and the system suitability test is fulfilled on the day of the analysis.

Sample preparation

Clean all the glassware and laboratory equipment with a 10 g/L solution of *nitric acid R* before use.

Test solution In a digestion flask, place the prescribed quantity of the substance to be examined (about 0.50 g of powdered herbal drug (1400) (*2.9.12*)). Add 4 mL of *heavy metal-free hydrochloric acid R* and 6 mL of *heavy metal-free nitric acid R*. Make the flask airtight.

Place the digestion flasks in the microwave oven. Carry out the digestion in 3 steps according to the following programme, used for 7 flasks each containing the test solution: 80 per cent power for 15 min, 100 per cent power for 5 min, 80 per cent power for 20 min.

At the end of the cycle, allow the flasks to cool in air or water. After cooling, open each digestion flask and introduce the clear, colourless solution obtained into a 50 mL volumetric flask. Rinse each digestion flask with 2 quantities, each of 15 mL, of *heavy metal-free dilute nitric acid R*, collect the rinsings in the volumetric flask and dilute to 50.0 mL with *water R*. Modifiers (e.g. in the case of AAS with electrothermal atomisation, 1.0 mL of a 10 g/L solution of *magnesium nitrate R* and 1.0 mL of a 100 g/L solution of *ammonium dihydrogen phosphate R*) and stabilising agents may be used, if necessary.

Blank solution Mix 4 mL of *heavy metal-free hydrochloric acid R* and 6 mL of *heavy metal-free nitric acid R* in a digestion flask. Carry out the digestion in the same manner as for the test solution.

DETERMINATION OF ARSENIC, CADMIUM, COPPER, NICKEL AND LEAD USING AAS (2.2.23) WITH ELECTROTHERMAL ATOMISATION

Measure the content of arsenic, cadmium, copper, nickel and lead by direct calibration (*2.2.23, Method I*) or by the standard additions method (*2.2.23, Method II*), using reference solutions of each heavy metal and the instrumental parameters recommended in Table 2.4.27.-1.

The absorbance value of the blank solution is subtracted from the value obtained with the test solution.

Table 2.4.27.-1. – *Instrumental parameters for AAS with electrothermal atomisation*

		As	Cd	Cu	Ni	Pb
Wavelength	nm	193.7	228.8	324.8	232	283.5
Slit width	nm	0.5	0.5	0.5	0.2	0.5
Lamp current	mA	10	6	7	10	5
Ignition temperature	°C	1400	800	800	800	800
Atomisation temperature	°C	2600	1800	2300	2500	2200
Gas flow rate	L/min	3	3	3	3	3

DETERMINATION OF ARSENIC AND MERCURY USING AAS (2.2.23) WITH COLD-VAPOUR OR HYDRIDE ATOMISATION

Measure the content of arsenic and mercury by direct calibration (*2.2.23, Method I*) or by the standard additions method (*2.2.23, Method II*), using reference solutions of arsenic or mercury and an automated continuous-flow hydride vapour generation system.

The absorbance value of the blank solution is subtracted from the value obtained with the test solution.

Arsenic

Sample solution To 19.0 mL of the test solution or of the blank solution as prescribed above, add 1 mL of a 200 g/L solution of *potassium iodide R*. Allow the test solution to stand at room temperature for about 50 min or at 70 °C for about 4 min.

Acid reagent *Heavy metal-free hydrochloric acid R.*

Reducing reagent 6 g/L solution of *sodium tetrahydroborate R* in a 5 g/L solution of *sodium hydroxide R.*

The recommended instrumental parameters in Table 2.4.27.-2 may be used.

Mercury

Sample solution Test solution or blank solution, as prescribed above.

Acid reagent 515 g/L solution of *heavy metal-free hydrochloric acid R.*

Reducing reagent 10 g/L solution of *stannous chloride R* in heavy metal-free dilute hydrochloric acid R.

The recommended instrumental parameters in Table 2.4.27.-2 may be used.

Table 2.4.27.-2. – *Instrumental parameters for AAS with cold-vapour or hydride atomisation*

		As	Hg
Wavelength	nm	193.7	253.7
Slit width	nm	0.2	0.5
Lamp current	mA	10	4
Acid reagent flow rate	mL/min	1.0	1.0
Reducing reagent flow rate	mL/min	1.0	1.0
Sample solution flow rate	mL/min	7.0	7.0
Absorption cell		Quartz (heated)	Quartz (unheated)
Nitrogen flow rate	L/min	0.1	0.1

DETERMINATION OF ARSENIC, CADMIUM, COPPER, MERCURY, NICKEL AND LEAD USING ICP-AES (2.2.57)

Measure the content of arsenic, cadmium, copper, mercury, nickel and lead by direct calibration (*2.2.23, Method I*), using reference solutions of each heavy metal or a mixture of all measured metals, and the instrumental parameters recommended in Table 2.4.27.-3.

The emission value of the blank solution is subtracted from the value obtained with the test solution.

DETERMINATION OF ARSENIC, CADMIUM, COPPER, MERCURY, NICKEL AND LEAD USING ICP-MS (2.2.58)

Measure the content of arsenic, cadmium, copper, mercury, nickel and lead by direct calibration (*2.2.23, Method I*) using reference solutions of each heavy metal and the analytical isotopes and additional masses recommended in Table 2.4.27.-4.

The signal intensity of the blank solution is subtracted from the value obtained with the test solution.

SYSTEM SUITABILITY

A system suitability test must be carried out on the day of the analysis to ensure that the sample preparation and measurement system are appropriate.

Table 2.4.27.-3. – *Instrumental parameters for ICP-AES*

		As	Cd	Cu	Hg	Ni	Pb
Wavelength	nm	193.696/	214.438/	324.754/	184.950/	231.604/	220.351/
		197.197/	226.502/	327.396/	253.652/	231.997/	283.306/
		189.042	228.802	224.700	435.835	352.454	168.215
Ar, Monitorline	nm	430.010	430.010	430.010	430.010	430.010	430.010
Plasma energy	W	1200	1200	1200	1200	1200	1200
Peak algorithm with background correction		yes	yes	yes	yes	yes	yes

Acceptance criterion for preparation of sample solution A clear solution is obtained.

Acceptance criterion for measurement system The measured concentration of a standard solution of the metal at a concentration within the range of the used calibration curve does not differ from the actual concentration by more than 20 per cent.

Table 2.4.27.-4. – *Recommended analytical isotopes and additional masses for ICP-MS*

Isotope	Element of Interest
75	Arsenic
106, 108, 111, 114	Cadmium
63, 65	Copper
202	Mercury
60, 62	Nickel
206, 207, 208	Lead

VALIDATION REQUIREMENTS

The analytical procedures used must be validated in accordance with the relevant general methods AAS (*2.2.23*), ICP-AES (*2.2.57*) and ICP-MS (*2.2.58*). Additionally, the following criteria must be fulfilled.

SPECIFICITY

Specificity is the ability to ensure that the analytical procedures for sample preparation and measurement allow a reliable determination of the metal(s) in the presence of components (e.g. carrier gas, impurities, matrix) that may be expected to be present.

Acceptance criteria The procedure must be able to assess unequivocally each heavy metal to be determined with this procedure in the presence of components that may be expected to be present, including other heavy metals, matrix components and other sources of interference; specificity is demonstrated by complying with the accuracy requirement for the metal(s) to be determined.

RANGE

The calibration range of each metal is within the linear range of the method; test solutions containing residues at a level outside the calibration range may be diluted to concentrations within the calibration range.

Acceptance criterion Range is demonstrated by complying with the recovery requirement.

ACCURACY

Verify the accuracy using a certified reference material (CRM) or by performing a test for recovery.

Recovery. Recovery may be determined on a sample of the substance to be examined, spiked with a known quantity of a reference standard of the metal (3 concentration levels in the range of 50-150 per cent of the intended specification limit, even if the original concentration of the reference standard is at the specified value), in triplicate.

Acceptance criterion Spike recovery is within 70 per cent and 150 per cent for the mean of 3 replicates at each concentration.

REPEATABILITY

Test samples Either 6 independent samples of the substance to be examined spiked with a suitable reference standard at the specified concentration level, or 3 concentration levels prepared in triplicate.

Acceptance criterion The relative standard deviation is in both cases not greater than the value indicated in Table 2.4.27.-5.

INTERMEDIATE PRECISION

The effect of random events (intra-laboratory variations) on the analytical precision of the method must be established. Acceptable experiments for establishing intermediate precision include performing the repeatability analysis on different days, or with different instrumentation, or with different analysts. Only 1 of the 3 experiments is required to demonstrate intermediate precision.

Acceptance criterion The relative standard deviation is not greater than the value indicated in Table 2.4.27.-5.

LIMIT OF QUANTIFICATION

Determine the lowest concentration meeting the acceptance criterion. Use the results from the accuracy study.

Acceptance criterion The limit of quantification is below the specification limit.

Table 2.4.27.-5

Concentration range of the metal (mg/kg)	Repeatability (RSD) (per cent)	Intermediate precision (RSD) (per cent)
0.01 - 1	20	32
> 1	10	16

LIMIT OF DETECTION (ONLY APPLICABLE TO LIMIT TESTS)

Determine the lowest concentration giving a signal clearly distinct from that obtained with a blank solution.

Acceptance criterion The limit of detection is not more than 0.1 times the concentration of the specification limit.

Limit Test for Nickel in Polyols

(Ph. Eur. method 2.4.15)

Determine the nickel by atomic absorption spectrometry (*2.2.23, Method II*).

Test solution Dissolve 20.0 g of the substance to be examined in a mixture of equal volumes of *dilute acetic acid R* and *water R* and dilute to 100.0 mL with the same mixture of solvents. Add 2.0 mL of a saturated solution of *ammonium pyrrolidinedithiocarbamate R* (about 10 g/L) and 10.0 mL of *methyl isobutyl ketone R* and then shake for 30 s protected from bright light. Allow the layers to separate and use the methyl isobutyl ketone layer.

Reference solutions Prepare 3 reference solutions in the same manner as the test solution but adding 0.5 mL, 1.0 mL and 1.5 mL respectively of *nickel standard solution (10 ppm Ni) R* in addition to the 20.0 g of the substance to be examined.

Set the zero of the instrument using *methyl isobutyl ketone R* treated as described for preparation of the test solution omitting the substance to be examined. Measure the absorbance at 232.0 nm using a nickel hollow-cathode lamp as source of radiation and an air-acetylene flame.

The substance to be examined contains not more than 1 ppm of nickel, unless otherwise prescribed.

Limit Test for Phosphates

(Ph. Eur. method 2.4.11)

To 100 mL of the solution prepared and, if necessary, neutralised as prescribed add 4 mL of *sulfomolybdic reagent R3*. Shake and add 0.1 mL of *stannous chloride solution R1*. Prepare a standard in the same manner using 2 mL of *phosphate standard solution (5 ppm PO_4) R* and 98 mL of *water R*. After 10 min, compare the colours using 20 mL of each solution.

Any colour in the test solution is not more intense than that in the standard.

Limit Test for Potassium

(Ph. Eur. method 2.4.12)

To 10 mL of the prescribed solution add 2 mL of a freshly prepared 10 g/L solution of *sodium tetraphenylborate R*. Prepare a standard in the same manner using a mixture of 5 mL of *potassium standard solution (20 ppm K) R* and 5 mL of *water R*.

After 5 min, any opalescence in the test solution is not more intense than that in the standard.

Limit Test for Sulfates

(Ph. Eur. method 2.4.13)

All solutions used for this test must be prepared with distilled water R.

Add 3 mL of a 250 g/L solution of *barium chloride R* to 4.5 mL of *sulfate standard solution (10 ppm SO_4) R1*. Shake and allow to stand for 1 min. To 2.5 mL of this suspension add 15 mL of the prescribed solution and 0.5 mL of *acetic acid R*. Prepare a standard in the same manner using 15 mL of *sulfate standard solution (10 ppm SO_4) R* instead of the prescribed solution.

After 5 min, any opalescence in the test solution is not more intense than that in the standard.

Appendix VIII

A. Non-aqueous Titration

(No Ph. Eur. method)

Method I

Dissolve the prescribed quantity of the substance being examined in a suitable volume of *anhydrous acetic acid* previously neutralised using the indicator specified in the monograph, warming and cooling if necessary, or prepare a solution as directed. When the substance is a salt of hydrochloric or hydrobromic acid, add 15 mL of *mercury(II) acetate solution* before neutralising the solvent, unless otherwise directed in the monograph. Titrate with *0.1M perchloric acid VS* to the colour change of the indicator that corresponds to the maximum absolute value of dE/dV (where E is the electromotive force and V is the volume of titrant) in a *potentiometric titration*, Appendix VIII B, of the substance being examined. The indicator specified in the monograph is also used for the neutralisation of the *mercury(II) acetate solution* and the standardisation of the titrant.

When the temperature (t_2) of the titrant at the time of the assay differs from the temperature (t_1) of the titrant when it was standardised, multiply the volume of the titrant required by $[1+0.0011(t_1 - t_2)]$ and calculate the result of the assay from the corrected volume.

Carry out a blank titration when necessary.

Method II

The titrant, solvent and, where necessary, the indicator to be used are stated in the monograph.

Protect the solution and titrant from atmospheric carbon dioxide and moisture throughout the determination.

Dissolve the substance being examined in a suitable volume of the solvent previously neutralised to the indicator, warming and cooling if necessary, or prepare a solution as directed. Titrate to the colour change of the indicator that corresponds to the maximum absolute value of dE/dV (where E is the electromotive force and V is the volume of titrant) in a *potentiometric titration*, Appendix VIII B, of the substance under examination. The titrant is standardised using the same solvent and indicator as specified for the substance.

Carry out a blank titration when necessary.

B. Amperometric, Potentiometric and Voltametric Titrations

Amperometric Titration

(Ph. Eur. method 2.2.19)

In an amperometric titration, the end-point is determined by following the variation of the current measured between 2 electrodes (either one indicator electrode and one reference electrode or 2 indicator electrodes) immersed in the solution to be examined and maintained at a constant potential difference as a function of the quantity of titrant added.

The potential of the measuring electrode is sufficient to ensure a diffusion current for the electroactive substance.

Apparatus The apparatus comprises an adjustable voltage source and a sensitive microammeter; the detection system generally consists of an indicator electrode (for example, a platinum electrode, a rotating-disc electrode or a carbon

electrode) and a reference electrode (for example, a silver-silver chloride electrode).

A three-electrode apparatus is sometimes used, consisting of an indicator electrode, a reference electrode and a polarised auxiliary electrode.

Method Set the potential of the indicator electrode as prescribed and plot a graph of the initial current and the values obtained during the titration as functions of the quantity of titrant added. Add the titrant in not fewer than 3 successive quantities equal to a total of about 80 per cent of the theoretical volume corresponding to the presumed equivalence point. The 3 values must fall on a straight line. Continue adding the titrant beyond the presumed equivalence point in not fewer than 3 successive quantities. The values obtained must fall on a straight line. The point of intersection of the 2 lines represents the end-point of the titration.

For amperometric titrations with 2 indicator electrodes, the whole titration curve is recorded and used to determine the end-point.

Potentiometric Titration

(Ph. Eur. method 2.2.20)

In a potentiometric titration (volumetric titration with potentiometric end-point determination) the end-point is determined by recording the variation of the potential difference between 2 electrodes (either 1 indicator electrode and 1 reference electrode, or a combined electrode) immersed in the solution to be examined as a function of the volume of titrant added.

Apparatus The apparatus used comprises a millivoltmeter. Commercial autotitrator instruments may be used and are operated in accordance with the manufacturer's instructions, using electrodes recommended for the type of titration described.

The indicator electrode to be used depends on the substance to be determined and may be a glass or metal electrode (e.g. platinum, gold or silver).

For acid-base titrations, a glass-silver-silver chloride electrode combination is generally used.

Method Prepare the sample solution as described. Add the titrant in suitable aliquots paying particular attention to the rate of addition and the volume increments near the end-point. Continue the titration beyond this point to allow a clear detection of the end-point.

The end-point of the titration is reached when the maximum change in potential occurs in a plot of potential versus volume of titrant, and is expressed as the corresponding volume of titrant. Recording the first or second derivative curve can facilitate the determination of the end-point.
In potentiometric titrations of weak acids or bases using non-aqueous solvents, if necessary, either carry out a blank determination or pre-neutralise the solvent mixture. Where it is impracticable to use potentiometric detection for this purpose, the solvent mixture can be pre-neutralised by titration using a suitable indicator. Some examples are given below:

Titrant	Indicator
Perchloric acid	*Crystal violet solution R*
Tetrabutylammonium hydroxide	3 g/L solution of *thymol blue R* in *methanol R*
Ethanolic sodium hydroxide	*Thymolphthalein solution R*

Voltametric Titrations

(Ph. Eur. method 2.2.65)

In voltametric titration the end-point of the titration is determined by following the variation of the voltage measured between 2 electrodes (either 1 indicator electrode and 1 reference electrode or 2 indicator electrodes) immersed in the solution to be examined and maintained at a constant current as a function of the quantity of titrant added.

Apparatus The apparatus comprises an adjustable current source and a voltmeter; the detection system generally consists of an indicator electrode (for example, a platinum electrode, a rotating-disc electrode or a carbon electrode) and a 2nd electrode (for example, a platinum electrode, a rotating-disc electrode or a carbon electrode).

Method Set the current to the indicator electrode as prescribed in the monograph and plot a graph of the initial voltage and the values obtained during the titration as functions of the quantity of titrant added. Add the titrant in not fewer than 3 successive quantities equal to a total of about 80 per cent of the theoretical volume corresponding to the presumed equivalence point. The 3 values must fall on a straight line. Continue adding the titrant beyond the presumed equivalence point in not fewer than 3 successive quantities. The values obtained must fall on another straight line. The point of intersection of the 2 lines represents the end-point of the titration.

Using titration systems for voltametric titration with 2 indicator electrodes, the whole titration curve is recorded and used to determine the end-point.

Determination of Primary Aromatic Amino-nitrogen

(Ph. Eur. method 2.5.8)

Dissolve the prescribed quantity of the substance to be examined in 50 mL of *dilute hydrochloric acid R* or in another prescribed solvent and add 3 g of *potassium bromide R*. Cool in ice-water and titrate by slowly adding *0.1 M sodium nitrite* with constant stirring.

Determine the end-point electrometrically or by the use of the prescribed indicator.

C. Oxygen-flask Combustion

(Ph. Eur. method 2.5.10)

Unless otherwise prescribed the combustion flask is a conical flask of at least 500 mL capacity of borosilicate glass with a ground-glass stopper fitted with a suitable carrier for the sample, for example in platinum or platinum-iridium.

Finely grind the substance to be examined, place the prescribed quantity in the centre of a piece of filter paper measuring about 30 mm by 40 mm provided with a small strip about 10 mm wide and 30 mm long. If paper impregnated with lithium carbonate is prescribed, moisten the centre of the paper with a saturated solution of *lithium carbonate R* and dry in an oven before use. Envelop the substance to be examined in the paper and place it in the sample carrier. Introduce into the flask *water R* or the prescribed solution designed to absorb the combustion products, displace the air with oxygen by means of a tube having its end just above the liquid, moisten the neck of the flask with *water R* and close with its stopper. Ignite the paper strip by suitable means with the usual precautions. Keep the flask firmly closed during the combustion. Shake the flask

vigorously to completely dissolve the combustion products. Cool and after about 5 min, unless otherwise prescribed, carefully unstopper the flask. Wash the ground parts and the walls of the flask, as well as the sample carrier, with *water R*. Combine the combustion products and the washings and proceed as prescribed in the monograph.

For Iodine

(No Ph. Eur. method)

Burn the specified quantity of the substance being examined in the prescribed manner using a mixture of 10 mL of *water* and 2 mL of 1M *sodium hydroxide* as the absorbing liquid. When the process is complete, add to the flask an excess of *acetic bromine solution* (between 5 and 10 mL) and allow to stand for 2 minutes. Remove the excess of bromine by the addition of *formic acid* (about 0.5 to 1 mL), rinse the sides of the flask with *water* and displace any bromine vapour above the liquid with a current of air. Add 1 g of *potassium iodide* and titrate with 0.02M *sodium thiosulfate VS* using *starch mucilage*, added towards the end of the titration, as indicator. Each mL of 0.02M *sodium thiosulfate VS* is equivalent to 0.4230 mg of I.

D. Complexometric Titrations

(Ph. Eur. method 2.5.11)

ALUMINIUM

Introduce 20.0 mL of the prescribed solution into a 500 mL conical flask, add 25.0 mL of *0.1 M sodium edetate* and 10 mL of a mixture of equal volumes of a 155 g/L solution of *ammonium acetate R* and *dilute acetic acid R*. Boil for 2 min, then cool. Add 50 mL of *ethanol R* and 3 mL of a freshly prepared 0.25 g/L solution of *dithizone R* in *ethanol R*. Titrate the excess of sodium edetate with *0.1 M zinc sulfate* until the colour changes from greenish-blue to reddish-violet.

1 mL of *0.1 M sodium edetate* is equivalent to 2.698 mg of Al.

BISMUTH

Introduce the prescribed solution into a 500 mL conical flask. Dilute to 250 mL with *water R* and then, unless otherwise prescribed, add dropwise, with shaking, *concentrated ammonia R* until the mixture becomes cloudy. Add 0.5 mL of *nitric acid R*. Heat to about 70 °C until the cloudiness disappears completely. Add about 50 mg of *xylenol orange triturate R* and titrate with *0.1 M sodium edetate* until the colour changes from pinkish-violet to yellow.

1 mL of *0.1 M sodium edetate* is equivalent to 20.90 mg of Bi.

CALCIUM

Introduce the prescribed solution into a 500 mL conical flask, and dilute to 300 mL with *water R*. Add 6.0 mL of *strong sodium hydroxide solution R* and about 200 mg of *calconecarboxylic acid triturate R*. Titrate with *0.1 M sodium edetate* until the colour changes from violet to full blue.

1 mL of *0.1 M sodium edetate* is equivalent to 4.008 mg of Ca.

MAGNESIUM

Introduce the prescribed solution into a 500 mL conical flask and dilute to 300 mL with *water R*. Add 10 mL of *ammonium chloride buffer solution pH 10.0 R* and about 50 mg of *mordant black 11 triturate R*. Heat to about 40 °C then titrate at this temperature with *0.1 M sodium edetate* until the colour changes from violet to full blue.

1 mL of *0.1 M sodium edetate* is equivalent to 2.431 mg of Mg.

LEAD

Introduce the prescribed solution into a 500 mL conical flask and dilute to 200 mL with *water R*. Add about 50 mg of *xylenol orange triturate R* and *hexamethylenetetramine R* until the solution becomes violet-pink. Titrate with *0.1 M sodium edetate* until the violet-pink colour changes to yellow.

1 mL of *0.1 M sodium edetate* is equivalent to 20.72 mg of Pb.

ZINC

Introduce the prescribed solution into a 500 mL conical flask and dilute to 200 mL with *water R*. Add about 50 mg of *xylenol orange triturate R* and *hexamethylenetetramine R* until the solution becomes violet-pink. Add 2 g of *hexamethylenetetramine R* in excess. Titrate with *0.1 M sodium edetate* until the violet-pink colour changes to yellow.

1 mL of *0.1 M sodium edetate* is equivalent to 6.54 mg of Zn.

E. Potentiometric Determination of Ionic Concentration Using Ion-selective Electrodes

(Ph. Eur. method 2.2.36)

Ideally, the potential E of an ion-selective electrode varies linearly with the logarithm of the activity a_i of a given ion, as expressed by the Nernst equation:

$$E = E_0 + 2.303\frac{RT}{z_i F}\log_{10} a_i$$

E_0 = part of the constant potential due to the apparatus used,
R = gas constant,
T = absolute temperature,
F = Faraday's number,
z_i = charge number of the ion including its sign.

At a constant ionic strength, the following holds:

$$E = E_0 + \frac{k}{z_i}\log_{10} f C_i$$

C_i = molar concentration of the ion,
f = the activity coefficient ($a_i = f C_i$),
k = $\frac{RT}{F}$

If: $E_0 + \frac{k}{z_i}\log_{10} f = E'_0$ and $S = \frac{k}{z_i}$

S = slope of the calibration curve of the electrode,

the following holds: $E = E'_0 + S\log_{10} C_i$

and for $-\log_{10} C_i = pC_i$: $E = E'_0 - SpC_i$.

The potentiometric determination of the ion concentration is carried out by measuring the potential difference between two suitable electrodes immersed in the solution to be examined; the indicator electrode is selective for the ion to be determined and the other is a reference electrode.

Apparatus Use a voltmeter allowing measurements at least to the nearest 0.1 millivolt and whose input impedance is at least one hundred times greater than that of the electrodes used.

Ion-selective electrodes may be primary electrodes with a crystal or non-crystal membrane or with a rigid matrix (for

example, glass electrodes), or electrodes with charged (positive or negative) or uncharged mobile carriers, or sensitised electrodes (enzymatic-substrate electrodes, gas-indicator electrodes). The reference electrode is generally a silver–silver chloride electrode with suitable junction liquids producing no interference.

Procedure Carry out each measurement at a temperature constant to ± 0.5 °C, taking into account the variation of the slope of the electrode with temperature (see Table 2.2.36.-1). Adjust the ionic strength and possibly the pH of the solution to be analysed using the buffer reagent described in the monograph and equilibrate the electrode by immersing it in the solution to be analysed, under slow and uniform stirring, until a constant reading is obtained.

Table 2.2.36.-1. – *Values of k at different temperatures*

Temperature (°C)	*k*
20	0.0582
25	0.0592
30	0.0602

If the electrode system is used frequently, check regularly the repeatability and the stability of responses, and the linearity of the calibration curve or the calculation algorithm in the range of concentrations of the test solution; if not, carry out the test before each set of measurements. The response of the electrode may be regarded as linear if the slope S of the calibration curve is approximately equal to k/z_i per unit of pC_i.

METHOD I (DIRECT CALIBRATION)

Measure at least three times in succession the potential of at least three reference solutions spanning the expected concentration of the test solution. Calculate the calibration curve, or plot on a chart the mean potential E obtained against the concentration of the ion to be determined expressed as $-\log_{10} C_i$ or pC_i.

Prepare the test solution as prescribed in the monograph; measure the potential three times and, from the mean potential, calculate the concentration of the ion to be determined using the calibration curve.

METHOD II (MULTIPLE STANDARD ADDITIONS)

Prepare the test solution as prescribed in the monograph. Measure the potential at equilibrium E_T of a volume V_T of this solution of unknown concentration C_T of the ion to be determined. Make at least three consecutive additions of a volume V_S negligible compared to V_T ($V_S \leq 0.01 V_T$) of a reference solution of a concentration C_S known to be within the linear part of the calibration curve. After each addition, measure the potential and calculate the difference of potential ΔE between the measured potential and E_T. ΔE is related to the concentration of the ion to be determined by the equation:

$$\Delta E = S \log_{10}\left(1 + \frac{C_S V_S}{C_T V_T}\right)$$

or

$$10^{\frac{\Delta E}{S}} = 1 + \frac{C_S V_S}{C_T V_T}$$

V_T = volume of the test solution,
C_T = concentration of the ion to be determined in the test solution,
V_S = added volume of the reference solution,
C_S = concentration of the ion to be determined in the reference solution,
S = slope of the electrode determined experimentally, at constant temperature, by measuring the difference between the potentials obtained with two reference solutions whose concentrations differ by a factor of ten and are situated within the range where the calibration curve is linear.

Plot on a graph $10^{\frac{\Delta E}{S}}$ (*y*-axis) against V_S (*x*-axis) and extrapolate the line obtained until it intersects the *x*-axis. At the intersection, the concentration C_T of the ion to be determined in the test solution is given by the equation:

$$C_T = -\frac{C_S V_S}{V_T}$$

METHOD III (SINGLE STANDARD ADDITION)

To a volume V_T of the test solution prepared as prescribed in the monograph, add a volume V_S of a reference solution containing an amount of the ion to be determined known to give a response situated in the linear part of the calibration curve. Prepare a blank solution in the same conditions. Measure at least three times the potentials of the test solution and the blank solution, before and after adding the reference solution. Calculate the concentration C_T of the ion to be analysed using the following equation and making the necessary corrections for the blank:

$$C_T = \frac{C_S V_S}{10^{\frac{\Delta E}{S}}(V_T + V_S) - V_T}$$

V_T = volume of the test solution or the blank,
C_T = concentration of the ion to be determined in the test solution,
V_S = added volume of the reference solution,
C_S = concentration of the ion to be determined in the reference solution,
ΔE = difference between the average potentials measured before and after adding V_S,
S = slope of the electrode determined experimentally, at constant temperature, by measuring the difference between the potentials obtained from two reference solutions whose concentrations differ by a factor of ten and are situated within the range where the calibration curve is linear.

F. Determination of Ethanol

Use Method I or, where appropriate, Method II unless otherwise prescribed in the monograph.

Method I

(No Ph. Eur. method)

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. Solution (1) contains 5.0% v/v of *absolute ethanol* and 5.0% v/v of *propan-1-ol* (internal standard). For solution (2) dilute a volume of the preparation being examined with *water* to contain between 4.0 and 6.0% v/v of ethanol. Prepare solution (3) in the same manner as solution (2) but adding sufficient of the internal standard to produce a final concentration of 5.0% v/v.

The chromatographic procedure may be carried out using a column (1.5 m × 4 mm) packed with porous polymer beads (100 to 120 mesh) (Porapak Q and Chromosorb 101 are suitable) and maintained at 150° with both the inlet port and the detector at 170°.

Calculate the percentage content of ethanol from the areas of the peaks due to ethanol in the chromatograms obtained with solutions (1) and (3).

Method II

(No Ph. Eur. method)

For preparations in which, in accordance with the authority given in the monographs, Industrial Methylated Spirit has been used, determine the content of ethanol as described in Method I but using as solution (2) a volume of the preparation being examined diluted with *water* to contain between 4.0 and 6.0% v/v of total ethanol and methanol.

Determine the concentration of methanol in the following manner. Carry out the chromatographic procedure described under Method I but using the following solutions. Solution (1) contains 0.25% v/v of *methanol* and 0.25% v/v of *propan-1-ol* (internal standard). For solution (2) dilute a volume of the preparation being examined with *water* to contain between 0.2% and 0.3% v/v of methanol. Prepare solution (3) in the same manner as solution (2) but adding sufficient of the internal standard to produce a final concentration of 0.25% v/v.

The sum of the contents of ethanol and methanol is within the range specified in the monograph and the ratio of the content of methanol to that of ethanol is commensurate with Industrial Methylated Spirit having been used.

Method III

(Ph. Eur. method 2.9.10)

These methods are intended for the examination of liquid pharmaceutical preparations and their ingredients that contain ethanol.

The ethanol content of a liquid is expressed as the number of volumes of ethanol contained in 100 volumes of the liquid, the volumes being measured at 20 ± 0.1 °C. This is known as the 'percentage of ethanol by volume' (per cent V/V). The content may also be expressed in grams of ethanol per 100 g of the liquid. This is known as the 'percentage of ethanol by mass' (per cent m/m).

METHOD A

Where preparations contain dissolved substances, the dissolved substances must be separated from the ethanol that is to be determined by distillation. Where distillation would distil volatile substances other than ethanol and water, the appropriate precautions are stated in the monograph.

The relation between the density at 20 ± 0.1 °C, the relative density (corrected to vacuum) and the ethanol content of a mixture of water and ethanol is given in the tables of the International Organisation for Legal Metrology (1972), International Recommendation No. 22.

Apparatus

The apparatus (see Figure 2.9.10.-1) consists of a round-bottomed flask (*A*) fitted with a distillation head (*B*) with a steam trap and attached to a vertical condenser (*C*). The latter is fitted at its lower part with a tube (*D*), which carries the distillate into the lower part of a 100 mL or 250 mL volumetric flask. The volumetric flask is immersed in a mixture of ice and water (*E*) during the distillation. A disc having a circular aperture 6 cm in diameter is placed under the flask (*A*) to reduce the risk of charring any dissolved substances.

Method

Pycnometer method/oscillating transducer density meter method Transfer 25.0 mL of the preparation to be examined, measured at 20 ± 0.1 °C, to the distillation flask. Dilute with 100-150 mL of *distilled water R* and add a few pieces of pumice. Attach the distillation head and condenser. Distil and collect not less than 90 mL of distillate in a 100 mL volumetric flask. Adjust the temperature to 20 ± 0.1 °C and dilute to 100.0 mL with *distilled water R* at 20 ± 0.1 °C. Determine the relative density at 20 ± 0.1 °C using a pycnometer or an oscillating transducer density meter.

The values indicated in Table 2.9.10.-1, column 3, are multiplied by 4 to obtain the percentage of ethanol by volume (*V/V*) contained in the preparation. After calculation of the ethanol content using the table, round off the result to 1 decimal place.

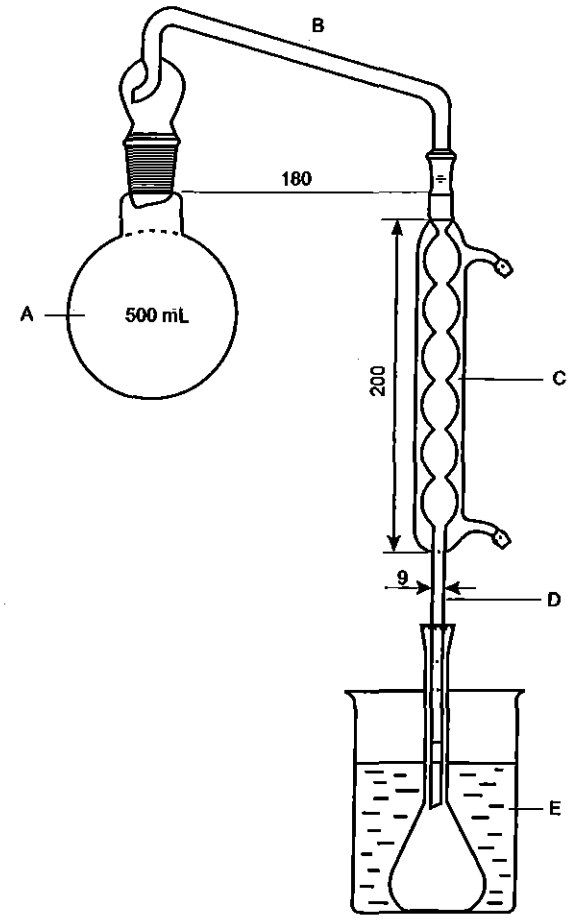

Figure 2.9.10.-1. – *Apparatus for the determination of ethanol content*

Dimensions in millimetres

Hydrometer method Transfer 50.0 mL of the preparation to be examined, measured at 20 ± 0.1 °C, to the distillation flask, add 200-300 mL of *distilled water R* and distil, as described above, into a volumetric flask until at least 180 mL has been collected. Adjust the temperature to 20 ± 0.1 °C and dilute to 250.0 mL with *distilled water R* at 20 ± 0.1 °C.

Transfer the distillate to a cylinder whose diameter is at least 6 mm wider than the bulb of the hydrometer. If the volume is insufficient, double the quantity of the sample and dilute the distillate to 500.0 mL with *distilled water R* at 20 ± 0.1 °C.

Multiply the strength by 5 to allow for the dilution during the determination. After calculation of the ethanol content using Table 2.9.10.-1, round off the result to 1 decimal place.

Table 2.9.10.-1. – *Relationship between density, relative density and ethanol content*

ρ_{20} (kg·m^{-3})	Relative density of the distillate measured in air d_{20}^{20}	Ethanol content in per cent *V/V* at 20 °C

METHOD B

Head-space gas chromatography (*2.2.28*).

Internal standard solution Dilute 1.0 mL of *propanol R1* to 100.0 mL with *water R*. Dilute 1.0 mL of the solution to 20.0 mL with *water R*.

Test solution Dilute a volume of the preparation to be examined corresponding to 0.4 g of ethanol to 50.0 mL with *water R*. Dilute 1.0 mL of the solution to 20.0 mL with *water R*. To 2.0 mL of this solution add 1.0 mL of the internal standard solution and dilute to 20.0 mL with *water R*. Transfer 2.0 mL of this solution into an injection vial.

Reference solution (a) Dilute 5.0 mL of *anhydrous ethanol R* to 100.0 mL with *water R*. Dilute 25.0 mL of the solution to 100.0 mL with *water R*. Dilute 1.0 mL of this solution to 20.0 mL with *water R*.

Reference solution (b) Mix 0.5 mL of reference solution (a) and 1.0 mL of the internal standard solution and dilute to 20.0 mL with *water R*. Transfer 2.0 mL of this solution into an injection vial.

Reference solution (c) Mix 1.0 mL of reference solution (a) and 1.0 mL of the internal standard solution and dilute to 20.0 mL with *water R*. Transfer 2.0 mL of this solution into an injection vial.

Reference solution (d) Mix 1.5 mL of reference solution (a) and 1.0 mL of the internal standard solution and dilute to 20.0 mL with *water R*. Transfer 2.0 mL of this solution into an injection vial.

Reference solution (e) Dilute 1.0 mL of *methanol R2* to 100.0 mL with *water R*. Dilute 1.0 mL of the solution to 20.0 mL with *water R*.

Reference solution (f) Mix 1.0 mL of the internal standard solution, 2.0 mL of reference solution (a) and 2.0 mL of reference solution (e) and dilute to 20.0 mL with *water R*. Transfer 2.0 mL of this solution into an injection vial.

Close the vials immediately with a tight rubber membrane stopper coated with polytetrafluoroethylene and secure with an aluminium crimp cap.

Column:
- *material*: fused silica;
- *size*: *l* = 30 m, Ø = 0.53 mm;
- *stationary phase*: *cyanopropyl(3)phenyl(3)methyl(94) polysiloxane R* (film thickness 3 µm).

Carrier gas *helium for chromatography R*.

Flow rate 3 mL/min.

Split ratio 1:50.

Static head-space conditions that may be used:
- *equilibration temperature*: 85 °C;
- *equilibration time*: 20 min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1.6	40
	1.6 - 9.9	40 → 65
	9.9 - 13.6	65 → 175
	13.6 - 20	175
Injection port		200
Detector		200

Detection Flame ionisation.

Injection 1.0 mL of the gaseous phase of the test solution and reference solutions (b), (c), (d) and (f), at least 3 times.

Elution order Methanol, ethanol, propanol.

Relative retention With reference to ethanol (retention time = about 5.3 min): methanol = about 0.8; propanol = about 1.6.

System suitability Reference solution (f):
— *resolution*: minimum 5 between the peaks due to methanol and ethanol.

Establish a calibration curve with the concentration of ethanol in reference solutions (b), (c), (d) and (f) as the abscissa and the mean ratio of the peak area of ethanol to the peak area of the internal standard in the corresponding chromatograms as the ordinate.

Calculate the percentage content of ethanol in the preparation to be examined.

METHOD C

Gas chromatography (*2.2.28*).

Internal standard solution Dilute 1.0 mL of *propanol R1* to 100.0 mL with *water R*.

Test solution Dilute a volume of the preparation to be examined corresponding to 1 g of ethanol to 50.0 mL with *water R*. To 1.0 mL of this solution add 1.0 mL of the internal standard solution and dilute to 20.0 mL with *water R*.

Reference solution (a) Dilute 1.0 mL of *anhydrous ethanol R* to 50.0 mL with *water R*.

Reference solution (b). Dilute 1.0 mL of *methanol R2* to 100.0 mL with *water R*. Dilute 1.0 mL of the solution to 20.0 mL with *water R*.

Reference solution (c) Mix 1.0 mL of the internal standard solution, 1.0 mL of reference solution (a) and 2.0 mL of reference solution (b) and dilute to 20.0 mL with *water R*.

Column:
— *material*: fused silica;
— *size*: *l* = 30 m, Ø = 0.53 mm;
— *stationary phase*: *cyanopropyl(3)phenyl(3)methyl(94) polysiloxane R* (film thickness 3 µm).

Carrier gas *helium for chromatography R*.

Flow rate 3 mL/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1.6	40
	1.6 - 9.9	40 → 65
	9.9 - 13.6	65 → 175
	13.6 - 20	175
Injection port		200
Detector		200

Detection Flame ionisation.

Injection 1.0 µL of the test solution and reference solution (c), at least 3 times.

Elution order Methanol, ethanol, propanol.

Relative retention With reference to ethanol (retention time = about 5.3 min): methanol = about 0.8; propanol = about 1.6.

System suitability Reference solution (c):
— *resolution*: minimum 5 between the peaks due to methanol and ethanol.

Calculate the ethanol content in per cent *V/V* using the following expression:

$$\frac{A_1 \times I_2 \times 100}{A_2 \times I_1 \times V_1}$$

A_1 = area of the peak due to ethanol in the chromatogram obtained with the test solution;
A_2 = area of the peak due to ethanol in the chromatogram obtained with reference solution (c);
I_1 = area of the peak due to the internal standard in the chromatogram obtained with the test solution;
I_2 = area of the peak due to the internal standard in the chromatogram obtained with reference solution (c);
V_1 = volume of the preparation to be examined in the test solution, in millilitres.

G. Determination of Methanol and Propan-2-ol

(Ph. Eur. method 2.9.11)

METHOD A

Head-space gas chromatography (*2.2.28*).

Internal standard solution Dilute 1.0 mL of *propanol R1* to 100.0 mL with *water R*. Dilute 1.0 mL of the solution to 20.0 mL with *water R*.

Test solution Mix 1.0 mL of the internal standard solution and 4.0 mL of the preparation to be examined and dilute to 20.0 mL with *water R*. Transfer 2.0 mL of this solution into an injection vial.

Reference solution (a) Mix 1.0 mL of *methanol R2* and 1.0 mL of *2-propanol R2* and dilute to 100.0 mL with *water R*. Dilute 1.0 mL of the solution to 20.0 mL with *water R*.

Reference solution (b) Dilute 5.0 mL of *anhydrous ethanol R* to 100.0 mL with *water R*. Dilute 25.0 mL of the solution to 100.0 mL with *water R*. Dilute 1.0 mL of this solution to 20.0 mL with *water R*.

Reference solution (c) Mix 1.0 mL of the internal standard solution, 2.0 mL of reference solution (a) and 2.0 mL of reference solution (b) and dilute to 20.0 mL with *water R*. Transfer 2.0 mL of this solution into an injection vial.

Close the vials immediately with a tight rubber membrane stopper coated with polytetrafluoroethylene and secure with an aluminium crimp cap.

Column:
— *material*: fused silica;
— *size*: *l* = 30 m, Ø = 0.53 mm;
— *stationary phase*: *cyanopropyl(3)phenyl(3)methyl(94) polysiloxane R* (film thickness 3 µm).

Carrier gas *helium for chromatography R*.

Flow rate 3 mL/min.

Split ratio 1:50.

Static head-space conditions that may be used:
— *equilibration temperature*: 85 °C;
— *equilibration time*: 20 min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1.6	40
	1.6 - 9.9	40 → 65
	9.9 - 13.6	65 → 175
	13.6 - 20	175
Injection port		200
Detector		200

Detection Flame ionisation.

Injection 1.0 mL of the gaseous phase of the test solution and reference solution (c), at least 3 times.

Elution order Methanol, ethanol, 2-propanol, 1-propanol.

Relative retention With reference to ethanol (retention time = about 5.3 min): methanol = about 0.8; 2-propanol = about 1.2; 1-propanol = about 1.6.

System suitability Reference solution (c):
— *resolution*: minimum 5 between the peaks due to methanol and ethanol.

Calculate the methanol content in per cent *V/V* using the following expression:

$$\frac{A_1 \times I_2}{A_2 \times I_1 \times 40}$$

A_1 = area of the peak due to methanol in the chromatogram obtained with the test solution;
A_2 = area of the peak due to methanol in the chromatogram obtained with reference solution (c);
I_1 = area of the peak due to the internal standard in the chromatogram obtained with the test solution;
I_2 = area of the peak due to the internal standard in the chromatogram obtained with reference solution (c).

Calculate the 2-propanol content in per cent *V/V* using the following expression:

$$\frac{A_3 \times I_2}{A_4 \times I_1 \times 40}$$

A_3 = area of the peak due to 2-propanol in the chromatogram obtained with the test solution;
A_4 = area of the peak due to 2-propanol in the chromatogram obtained with reference solution (c);
I_1 = area of the peak due to the internal standard in the chromatogram obtained with the test solution;
I_2 = area of the peak due to the internal standard in the chromatogram obtained with reference solution (c).

METHOD B

Gas chromatography (*2.2.28*).

Internal standard solution Dilute 1.0 mL of *propanol R1* to 100.0 mL with *water R*.

Test solution Mix 1.0 mL of the internal standard solution and 4.0 mL of the preparation to be examined and dilute to 20.0 mL with *water R*.

Reference solution (a) Mix 1.0 mL of *methanol R2* and 1.0 mL of *2-propanol R2* and dilute to 100.0 mL with *water R*. Dilute 1.0 mL of the solution to 20.0 mL with *water R*.

Reference solution (b) Dilute 1.0 mL of *anhydrous ethanol R* to 50.0 mL with *water R*.

Reference solution (c) Mix 1.0 mL of the internal standard solution, 1.0 mL of reference solution (b) and 2.0 mL of reference solution (a) and dilute to 20.0 mL with *water R*.

Column:
— *material*: fused silica;
— *size*: *l* = 30 m, Ø = 0.53 mm;
— *stationary phase*: *cyanopropyl(3)phenyl(3)methyl(94) polysiloxane R* (film thickness 3 µm).

Carrier gas *helium for chromatography R*.

Flow rate 3 mL/min.

Split ratio 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1.6	40
	1.6 - 9.9	40 → 65
	9.9 - 13.6	65 → 175
	13.6 - 20	175
Injection port		200
Detector		200

Detection Flame ionisation.

Injection 1.0 µL of the test solution and reference solution (c), at least 3 times.

Elution order Methanol, ethanol, 2-propanol, 1-propanol.

Relative retention With reference to ethanol (retention time = about 5.3 min): methanol = about 0.8; 2-propanol = about 1.2; 1-propanol = about 1.6.

System suitability Reference solution (c):
— *resolution*: minimum 5 between the peaks due to methanol and ethanol.

Calculate the methanol content in per cent *V/V* using the following expression:

$$\frac{A_1 \times I_2}{A_2 \times I_1 \times 40}$$

A_1 = area of the peak due to methanol in the chromatogram obtained with the test solution;
A_2 = area of the peak due to methanol in the chromatogram obtained with reference solution (c);
I_1 = area of the peak due to the internal standard in the chromatogram obtained with the test solution;
I_2 = area of the peak due to the internal standard in the chromatogram obtained with reference solution (c).

Calculate the 2-propanol content in per cent *V/V* using the following expression:

$$\frac{A_3 \times I_2}{A_4 \times I_1 \times 40}$$

A_3 = area of the peak due to 2-propanol in the chromatogram obtained with the test solution;
A_4 = area of the peak due to 2-propanol in the chromatogram obtained with reference solution (c);
I_1 = area of the peak due to the internal standard in the chromatogram obtained with the test solution;
I_2 = area of the peak due to the internal standard in the chromatogram obtained with reference solution (c).

H. Determination of Nitrogen

Method I

(Ph. Eur. method 2.5.9)

SEMI-MICRO METHOD

Place a quantity of the substance to be examined (*m* g) containing about 2 mg of nitrogen in a combustion flask, add 4 g of a powdered mixture of 100 g of *dipotassium sulfate R*, 5 g of *copper sulfate pentahydrate R* and 2.5 g of *selenium R*, and three glass beads. Wash any adhering particles from the neck into the flask with 5 mL of *sulfuric acid R*, allowing it to run down the sides of the flask, and mix the contents by rotation. Close the mouth of the flask loosely, for example by means of a glass bulb with a short stem, to avoid excessive loss of sulfuric acid. Heat gradually at first, then increase the temperature until there is vigorous boiling with condensation of sulfuric acid in the neck of the flask; precautions should be taken to prevent the upper part of the flask from becoming overheated. Continue the heating for 30 min, unless otherwise prescribed. Cool, dissolve the solid material by cautiously adding to the mixture 25 mL of *water R*, cool again and place in a steam-distillation apparatus. Add 30 mL of *strong sodium hydroxide solution R* and distil immediately by passing steam through the mixture. Collect about 40 mL of distillate in 20.0 mL of *0.01 M hydrochloric acid* and enough *water R* to cover the tip of the condenser. Towards the end of the distillation, lower the receiver so that the tip of the condenser is above the surface of the acid. Take precautions to prevent any water on the outer surface of the condenser from reaching the contents of the receiver. Titrate the distillate with *0.01 M sodium hydroxide*, using *methyl red mixed solution R* as indicator (n_1 mL of *0.01 M sodium hydroxide*).

Repeat the test using about 50 mg of *glucose R* in place of the substance to be examined (n_2 mL of *0.01 M sodium hydroxide*).

$$\text{Content of nitrogen} = \frac{0.01401(n_2 - n_1)}{m} \text{ per cent}$$

Method II (Determination of Protein in Blood Products)

(No Ph. Eur. method)

For dried blood products prepare a solution of the preparation as directed in the monograph.

To a volume expected to contain about 0.1 g of protein add sufficient *saline solution* to produce 20 mL. To 2 mL of the resulting solution, in a 75-mL boiling tube, add 2 mL of a solution containing 75% v/v of *nitrogen-free sulfuric acid*, 4.5% w/v of *potassium sulfate* and 0.5% w/v of *copper(II) sulfate*, mix and loosely stopper the tube. Heat gradually to boiling, boil vigorously for 1.5 hours and cool. If the solution is not clear add 0.25 mL of *hydrogen peroxide solution (20 vol)*, continue heating until a clear solution is produced and cool. During heating, take precautions to ensure that the upper part of the tube is not overheated.

Transfer the solution to a distillation apparatus using three 3-mL quantities of *water*, add 10 mL of 10M *sodium hydroxide* and distil rapidly for 4 minutes, collecting the distillate in a mixture of 5 mL of a saturated solution of *boric acid* and 5 mL of *water* and keeping the tip of the condenser below the level of the acid. Lower the collection flask so that the condenser can drain freely and continue the distillation for a further 1 minute. Titrate with 0.02M *hydrochloric acid VS* using *methyl red mixed solution* as indicator (V_1 mL).

To a further volume of the preparation being examined, or of the solution prepared from it, expected to contain about 0.1 g of protein, add 12 mL of *saline solution*, 2 mL of a 7.5% w/v solution of *sodium molybdate* and 2 mL of a mixture of 1 volume of *nitrogen-free sulfuric acid* and 30 volumes of *water*. Shake, allow to stand for 15 minutes, add sufficient *water* to produce 20 mL, shake again and centrifuge. Using 2 mL of the resulting clear supernatant liquid repeat the procedure described above beginning at the words 'in a 75-mL boiling tube...' (V_2 mL). Calculate the protein content in mg per mL of the preparation being examined, using the expression $6.25 \times 0.280(V_1 - V_2)$ and taking into account the initial dilution.

J. Tetrazolium Assay of Steroids

(No Ph. Eur. method)

The coloured reaction products tend to adsorb onto the surface of the glassware. To avoid low results, the glassware should be treated with the coloured reaction products before use. The treated glassware should be reserved for this assay and should be washed only with water between assays.

Carry out the following procedure protected from light. Dissolve a quantity of the substance being examined in sufficient *aldehyde-free absolute ethanol* to produce a solution containing 300 to 350 µg in 10 mL unless otherwise specified in the monograph. Transfer 10 mL to a 25-mL graduated flask, add 2 mL of *triphenyltetrazolium chloride solution*, displace the air in the flask with *oxygen-free nitrogen*, immediately add 2 mL of *dilute tetramethylammonium hydroxide solution* and again displace the air with *oxygen-free nitrogen*. Stopper the flask, mix the contents by gently swirling and allow to stand in a water bath at 30° for 1 hour unless otherwise specified in the monograph. Cool rapidly, add sufficient *aldehyde-free absolute ethanol* to produce 25 mL, mix and immediately determine the *absorbance* of the resulting solution in a stoppered cell at the maximum at 485 nm, Appendix II B, using in the reference cell a solution prepared at the same time and in the same manner using 10 mL of *aldehyde-free absolute ethanol*. Repeat the operation using the specified BPCRS or EPCRS in place of the substance being examined ensuring that the period of time that elapses between the addition of the tetramethylammonium hydroxide solution and the measurement of the absorbance is the same as for the test solution.

K. Ethylene Glycol and Diethylene Glycol in Ethoxylated Substances

(Ph. Eur. method 2.4.30)

Ethoxylated substances may contain varied amounts of ethylene glycol and diethylene glycol, as a result of the manufacturing process. The following method may be used for the quantitative determination of these substances, in particular in the case of the following surfactants: macrogolglycerol ricinoleate, macrogolglycerol hydroxystearate, macrogol 15 hydroxystearate, nonoxinol 9 and macrogol cetostearyl ether.

Gas chromatography (*2.2.28*).

Internal standard solution Dissolve 30.0 mg of *1,2-pentanediol R* in *acetone R* and dilute to 30.0 mL with the same solvent. Dilute 1.0 mL of this solution to 20.0 mL with *acetone R*.

Test solution Dissolve 0.500 g of the substance to be examined in the internal standard solution and dilute to 10.0 mL with the same solution.

Reference solution (a) Mix 30.0 mg of *ethylene glycol R* with *acetone R* and dilute to 100.0 mL with the same solvent. Dilute 1.0 mL to 10.0 mL with the internal standard solution.

Reference solution (b) Prepare a solution of *diethylene glycol R* with a concentration corresponding to the prescribed limit and using the same solvents as for the preparation of reference solution (a).

Column:
— *material*: fused silica,
— *size*: *l* = 30 m, Ø = 0.53 mm,
— *stationary phase*: *macrogol 20 000 R* (film thickness 1 µm).

Carrier gas *helium for chromatography R.*

Flow rate 10 mL/min.

Split ratio 1:3.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 40	80 → 200
	40 - 45	200 → 230
	45 - 65	230
Injection port		250
Detector		250

Detection Flame ionisation.

Injection 2 µL.

Relative retention With reference to 1,2-pentanediol (retention time = about 19 min): ethylene glycol = about 0.7; diethylene glycol = about 1.3.

L. Residual Solvents

(Ph. Eur. method 2.4.24)

The test procedures described in this general method may be used:

i. for the identification of the majority of Class 1 and Class 2 residual solvents in an active substance, excipient or medicinal product when the residual solvents are unknown;

ii. as a limit test for Class 1 and Class 2 solvents when present in an active substance, excipient or medicinal product;

iii. for the quantification of Class 2 solvents when the limits are greater than 1000 ppm (0.1 per cent) or for the quantification of Class 3 solvents when required.

Class 1, Class 2 and Class 3 residual solvents are listed in general chapter *5.4. Residual solvents*.

Three diluents are described for sample preparation and the conditions to be applied for head-space injection of the gaseous sample onto the chromatographic system.

Two chromatographic systems are prescribed but System A is preferred whilst System B is employed normally for confirmation of identity. The choice of sample preparation procedure depends on the solubility of the substance to be examined and in certain cases the residual solvents to be controlled.

The following residual solvents are not readily detected by the head-space injection conditions described: formamide, 2-ethoxyethanol, 2-methoxyethanol, ethylene glycol, *N*-methylpyrrolidone and sulfolane. Other appropriate procedures should be employed for the control of these residual solvents.

When the test procedure is applied quantitatively to control residual solvents in a substance, then it must be validated.

PROCEDURE

Examine by gas chromatography with static head-space injection (*2.2.28*).

Sample preparation 1

This is intended for the control of residual solvents in water-soluble substances.

Sample solution (1) Dissolve 0.200 g of the substance to be examined in *water R* and dilute to 20.0 mL with the same solvent.

Sample preparation 2

This is intended for the control of residual solvents in water-insoluble substances.

Sample solution (2) Dissolve 0.200 g of the substance to be examined in *dimethylformamide R* (DMF) and dilute to 20.0 mL with the same solvent.

Sample preparation 3

This is intended for the control of *N,N*-dimethylacetamide and/or *N,N*-dimethylformamide, when it is known or suspected that one or both of these substances are present in the substance to be examined.

Sample solution (3) Dissolve 0.200 g of the substance to be examined in *1,3-dimethyl-2-imidazolidinone R* (DMI) and dilute to 20.0 mL with the same solvent.

In some cases none of the above sample preparation procedures are appropriate, in which case the diluent to be used for the preparation of the sample solution and the static head-space conditions to be employed must be demonstrated to be suitable.

Solvent solution (a) To 1.0 mL of *Class 1 residual solvent solution CRS*, add 9 mL of *dimethyl sulfoxide R* and dilute to 100.0 mL with *water R*. Dilute 1.0 mL of this solution to 100 mL with *water R*. Dilute 1.0 mL of this solution to 10.0 mL with *water R*.

The reference solutions correspond to the following limits:
— benzene: 2 ppm;
— carbon tetrachloride: 4 ppm;
— 1,2-dichloroethane: 5 ppm;
— 1,1-dichloroethene: 8 ppm;
— 1,1,1-trichloroethane: 10 ppm.

Solvent solution (b) Dissolve appropriate quantities of the Class 2 residual solvents in *dimethyl sulfoxide R* and dilute to 100.0 mL with the same solvent. Dilute in *water R* to give a concentration of 1/20 of the limits stated in Table 2 (see *5.4. Residual solvents*).

Solvent solution (c) Dissolve 1.00 g of the solvent or solvents present in the substance to be examined in *dimethyl sulfoxide R* or *water R*, if appropriate, and dilute to 100.0 mL with *water R*. Dilute to give a concentration of 1/20 of the limit(s) stated in Table 1 or 2 (see *5.4. Residual solvents*).

Blank solution Prepare as described for solvent solution (c) but without the addition of solvent(s) (used to verify the absence of interfering peaks).

Test solution Introduce 5.0 mL of the sample solution and 1.0 mL of the blank solution into an injection vial.

Reference solution (a) (Class 1) Introduce 1.0 mL of solvent solution (a) and 5.0 mL of the appropriate diluent into an injection vial.

Reference solution (a_1) (Class 1) Introduce 5.0 mL of the sample solution and 1.0 mL of solvent solution (a) into an injection vial.

Reference solution (b) (Class 2) Introduce 1.0 mL of solvent solution (b) and 5.0 mL of the appropriate diluent into an injection vial.

Reference solution (c) Introduce 5.0 mL of the sample solution and 1.0 mL of solvent solution (c) into an injection vial.

Reference solution (d) Introduce 1.0 mL of the blank solution and 5.0 mL of the appropriate diluent into an injection vial.

Close the vials with a tight rubber membrane stopper coated with polytetrafluoroethylene and secure with an aluminium crimp cap. Shake to obtain a homogeneous solution.

The following static head-space injection conditions may be used:

	Sample preparation procedure		
Operating parameters	1	2	3
Equilibration temperature (°C)	80	105	80
Equilibration time (min)	60	45	45
Transfer-line temperature (°C)	85	110	105
Carrier gas: *nitrogen for chromatography R* or *helium for chromatography R* at an appropriate pressure			
Pressurisation time (s)	30	30	30
Injection volume (mL)	1	1	1

The chromatographic procedure may be carried out using:

SYSTEM A

- a fused-silica capillary or wide-bore column 30 m long and 0.32 mm or 0.53 mm in internal diameter coated with *cyanopropyl(3)phenyl(3)methyl(94)polysiloxane R* (film thickness 1.8 µm or 3 µm);
- *nitrogen for chromatography R* or *helium for chromatography R* as the carrier gas, split ratio 1:5 with a linear velocity of about 35 cm/s;
- a flame-ionisation detector (a mass spectrometer may also be used or an electron-capture detector for the chlorinated residual solvents of Class 1);

maintaining the temperature of the column at 40 °C for 20 min, then raising the temperature at a rate of 10 °C per min to 240 °C and maintaining it at 240 °C for 20 min and maintaining the temperature of the injection port at 140 °C and that of the detector at 250 °C; or, where there is interference from the matrix, use:

SYSTEM B

- a fused-silica capillary or wide-bore column 30 m long and 0.32 mm or 0.53 mm in internal diameter coated with *macrogol 20 000 R* (film thickness 0.25 µm);
- *nitrogen for chromatography R* or *helium for chromatography R* as the carrier gas, split ratio 1:5 with a linear velocity of about 35 cm/s;
- a flame-ionisation detector (a mass spectrophotometer may also be used or an electron-capture detector for the chlorinated residual solvents of Class 1);

maintaining the temperature of the column at 50 °C for 20 min, then raising the temperature at a rate of 6 °C per min to 165 °C and maintaining it at 165 °C for 20 min and maintaining the temperature of the injection port at 140 °C and that of the detector at 250 °C.

Inject 1 mL of the gaseous phase of reference solution (a) onto the column described in System A and record the chromatogram under such conditions that the signal-to-noise ratio for 1,1,1-trichloroethane can be measured. The signal-to-noise ratio must be at least 5. A typical chromatogram is shown in Figure 2.4.24.-1.

Inject 1 mL of the gaseous phase of reference solution (a_1) onto the column described in System A. The peaks due to the Class 1 residual solvents are still detectable.

Inject 1 mL of the gaseous phase of reference solution (b) onto the column described in System A and record the chromatogram under such conditions that the resolution between acetonitrile and dichloromethane can be determined. The system is suitable if the chromatogram obtained resembles the chromatogram shown in Figure 2.4.24.-2 and the resolution between acetonitrile and dichloromethane is at least 1.0.

Inject 1 mL of the gaseous phase of the test solution onto the column described in System A. If in the chromatogram obtained, there is no peak which corresponds to one of the residual solvent peaks in the chromatograms obtained with reference solution (a) or (b), then the substance to be examined meets the requirements of the test. If any peak in the chromatogram obtained with the test solution corresponds to any of the residual solvent peaks obtained with reference solution (a) or (b) then System B is to be employed.

Inject 1 mL of the gaseous phase of reference solution (a) onto the column described in System B and record the chromatogram under such conditions that the signal-to-noise ratio for benzene can be measured. The signal-to-noise ratio must be at least 5. A typical chromatogram is shown in Figure 2.4.24.-3.

Inject 1 mL of the gaseous phase of reference solution (a_1) onto the column described in System B. The peaks due to the Class 1 residual solvents are still detectable.

Inject 1 mL of the gaseous phase of reference solution (b) onto the column described in System B and record the chromatogram under such conditions that the resolution between acetonitrile and 1,1,2-trichloroethene can be determined. The system is suitable if the chromatogram obtained resembles the chromatogram shown in Figure 2.4.24.-4 and the resolution between acetonitrile and 1,1,2-trichloroethene is at least 1.0.

Inject 1 mL of the gaseous phase of the test solution onto the column described in System B. If in the chromatogram obtained, there is no peak which corresponds to any of the residual solvent peaks in the chromatogram obtained with the reference solution (a) or (b), then the substance to be examined meets the requirements of the test. If any peak in the chromatogram obtained with the test solution corresponds to any of the residual solvent peaks obtained with reference solution (a) or (b) and confirms the correspondence obtained when using System A, then proceed as follows.

Inject 1 mL of the gaseous phase of reference solution (c) onto the column described for System A or System B. If necessary, adjust the sensitivity of the system so that the height of the peak corresponding to the identified residual solvent(s) is at least 50 per cent of the full scale of the recorder.

Inject 1 mL of the gaseous phase of reference solution (d) onto the column. No interfering peaks should be observed.

Inject 1 mL of the gaseous phase of the test solution and 1 mL of the gaseous phase of reference solution (c) on to the column. Repeat these injections twice more.

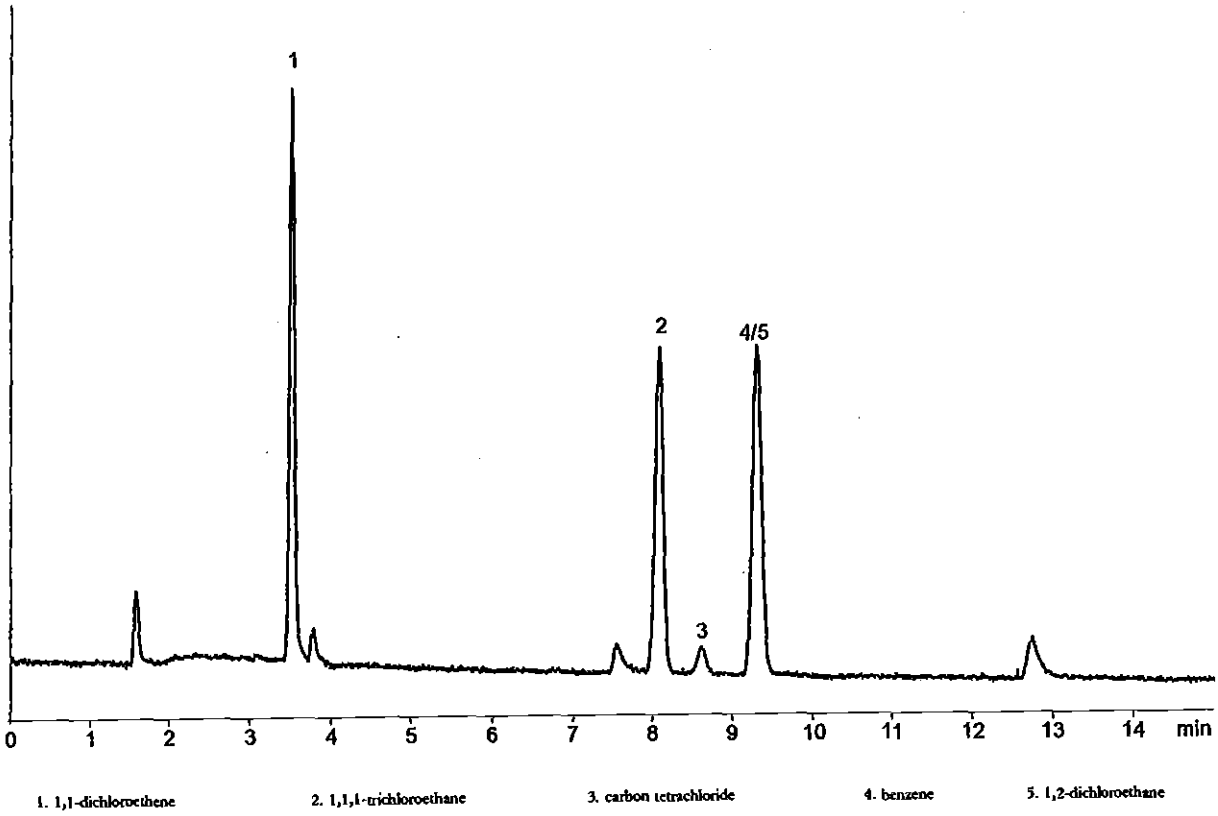

Figure 2.4.24.-1. – *Typical chromatogram of Class 1 solvents using the conditions described for System A and Procedure 1. Flame-ionisation detector*

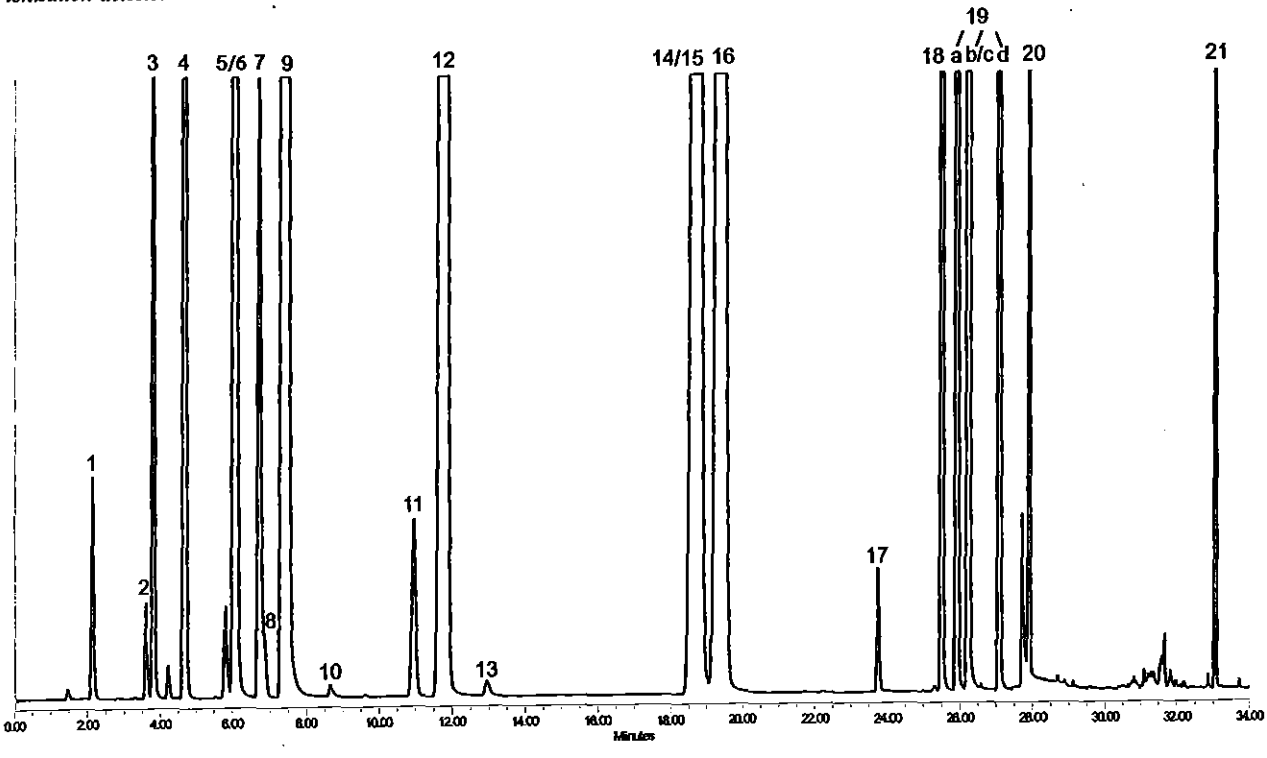

Figure 2.4.24.-2. – *Chromatogram of Class 2 solvents (solvent solution (b)) using the conditions described for System A and Procedure 1. Flame-ionisation detector*

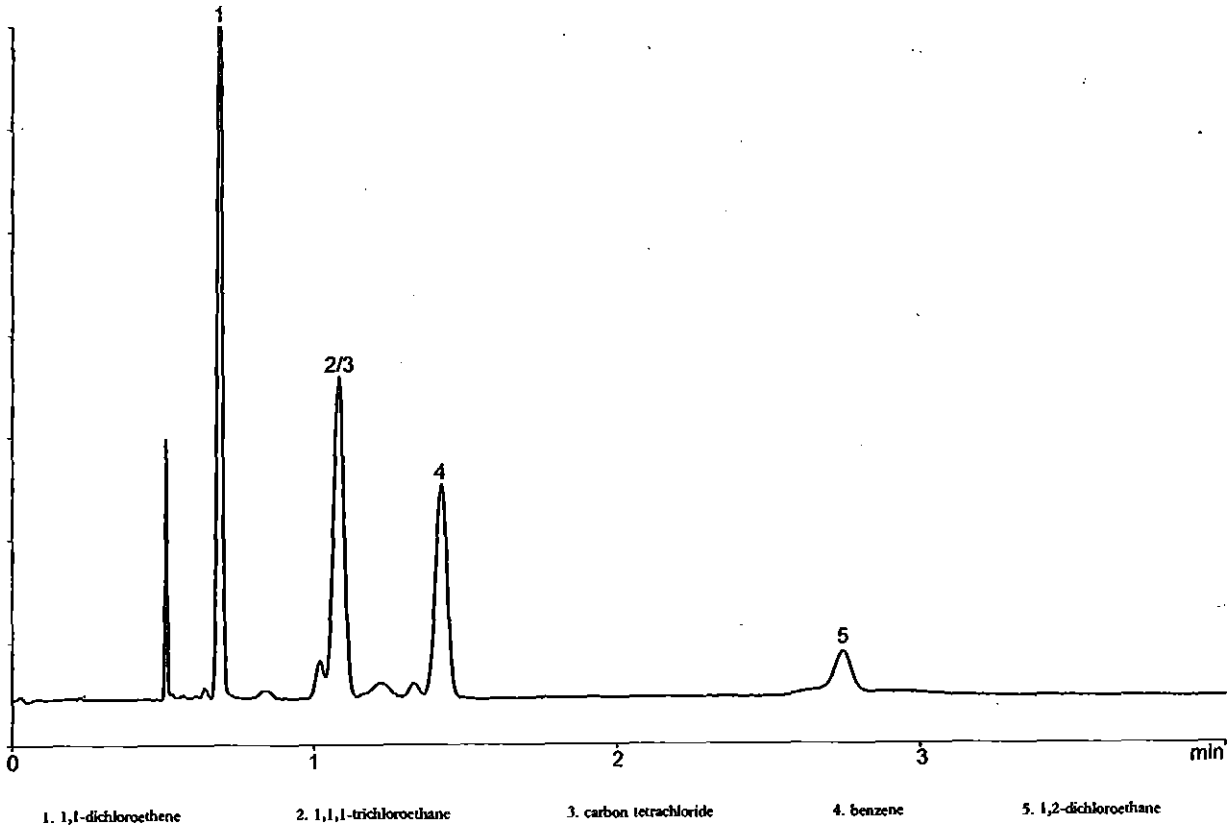

Figure 2.4.24.-3. – *Chromatogram of Class 1 residual solvents using the conditions described for System B and Procedure 1. Flame-ionisation detector*

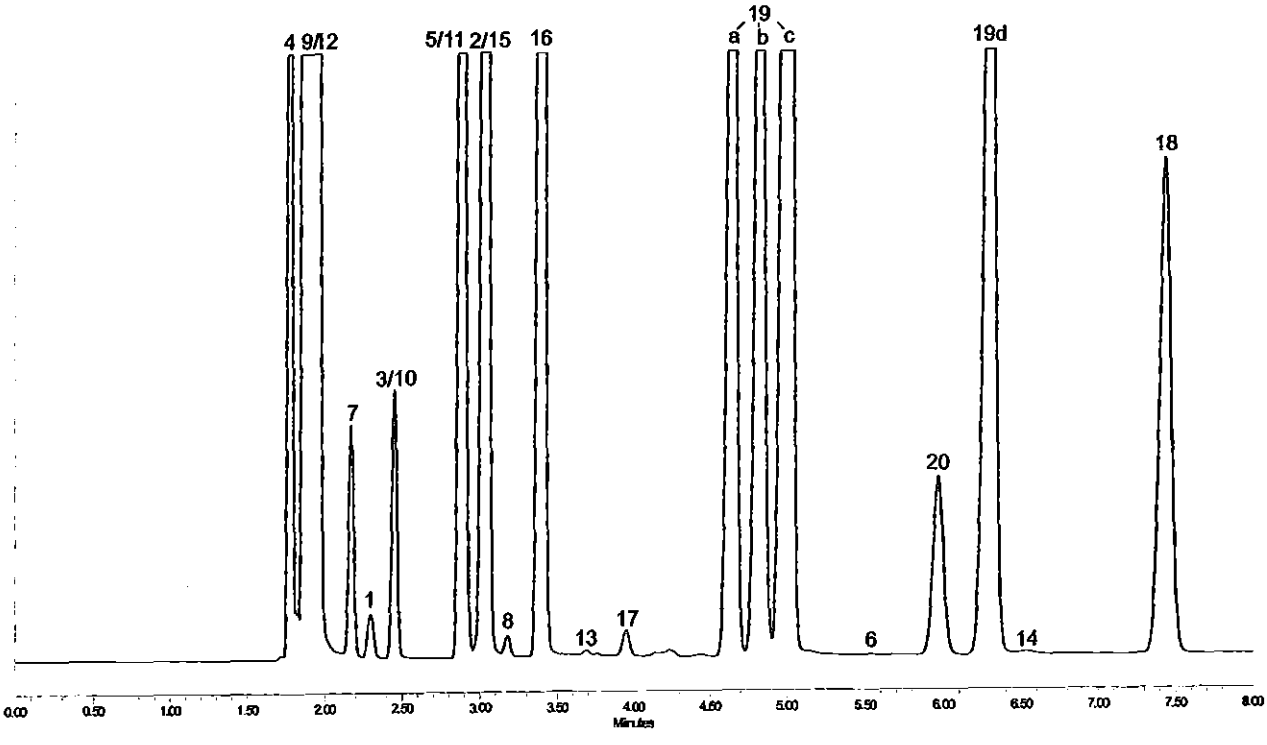

Figure 2.4.24.-4. – *Typical chromatogram of Class 2 residual solvents (solvent solution (b)) using the conditions described for System B and Procedure 1. Flame-ionisation detector*

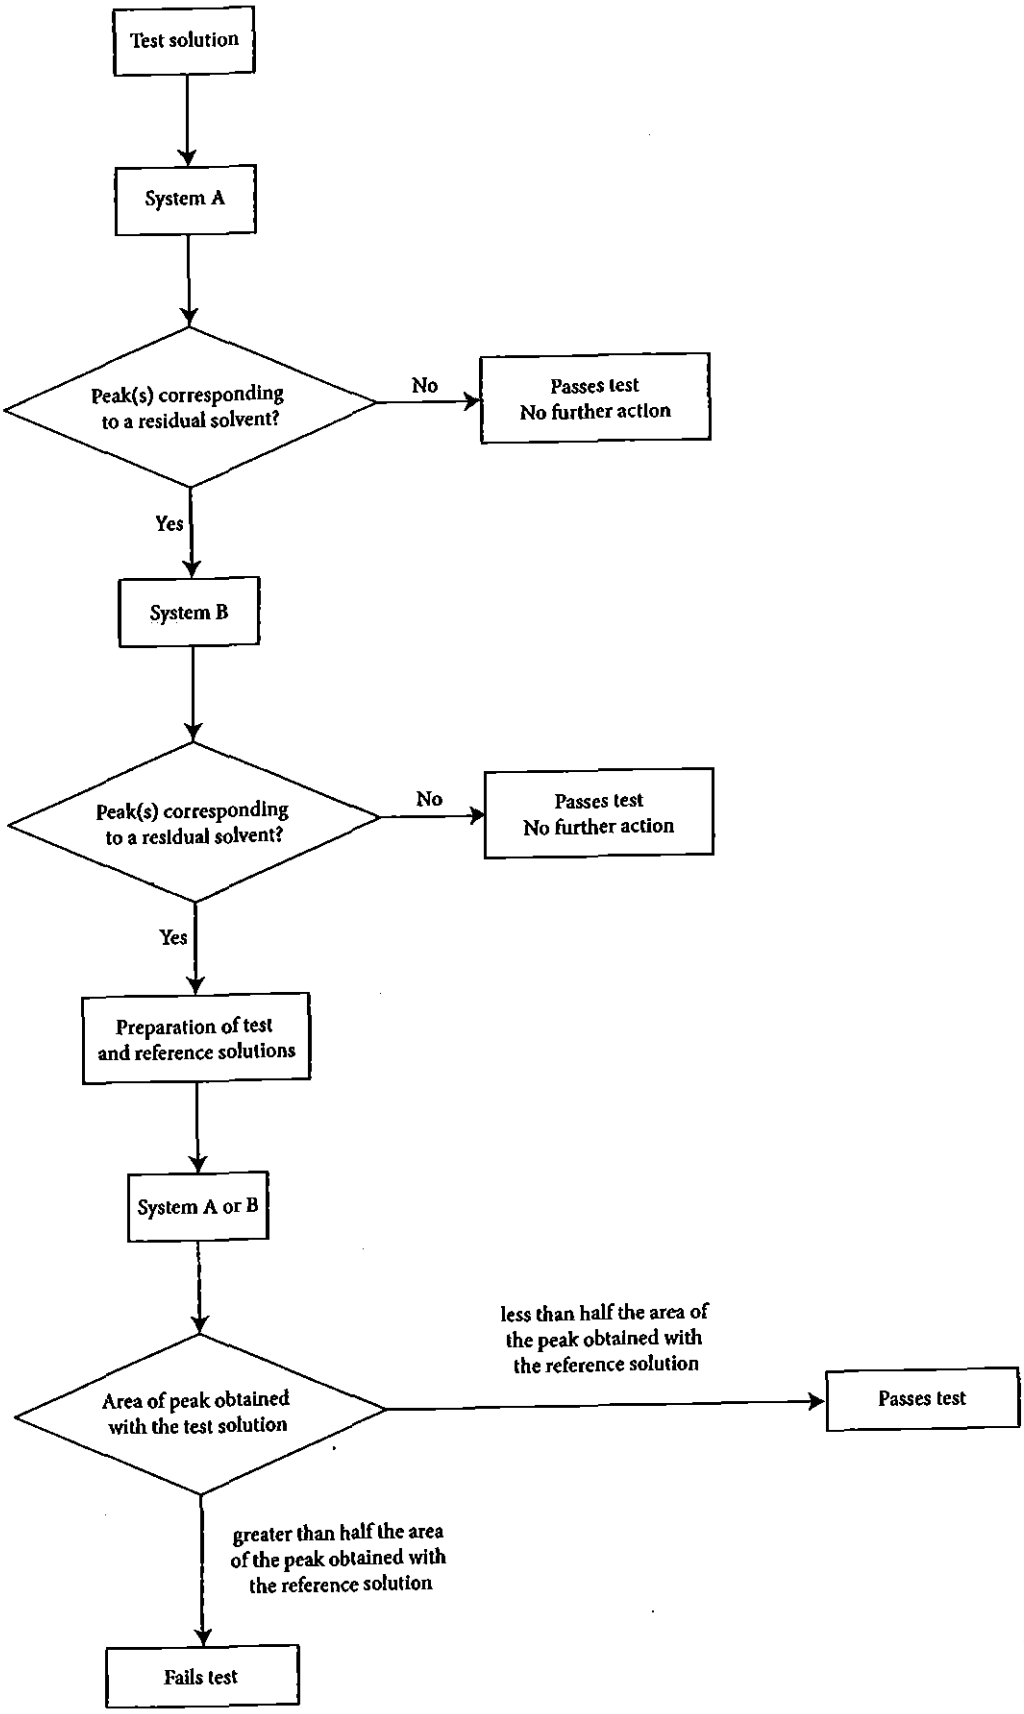

Figure 2.4.24.-5. – *Diagram relating to the identification of residual solvents and the application of limit tests*

The mean area of the peak of the residual solvent(s) in the chromatograms obtained with the test solution is not greater than half the mean area of the peak of the corresponding residual solvent(s) in the chromatograms obtained with reference solution (c). The test is not valid unless the relative standard deviation of the differences in areas between the analyte peaks obtained from 3 replicate paired injections of reference solution (c) and the test solution, is at most 15 per cent.

A flow diagram of the procedure is shown in Figure 2.4.24.-5.

When a residual solvent (Class 2 or Class 3) is present at a level of 0.1 per cent or greater then the content may be quantitatively determined by the method of standard additions.

M. Residual Ethylene Oxide and Dioxan

(Ph. Eur. method 2.4.25)

The test is intended for the determination of residual ethylene oxide and dioxan in samples soluble in water or dimethylacetamide. For substances that are insoluble or insufficiently soluble in these solvents, the preparation of the sample solution and the head-space conditions to be employed are given in the individual monograph.

Head-space gas chromatography (*2.2.28*).

A. For samples soluble in or miscible with water, the following procedure may be used.

Test solution Weigh 1.00 g (M_T) of the substance to be examined in a 10 mL vial (other sizes may be used depending on the operating conditions) and add 1.0 mL of *water R*. Close and mix to obtain a homogeneous solution. Allow to stand at 70 °C for 45 min.

Reference solution (a) Weigh 1.00 g (M_R) of the substance to be examined into an identical 10 mL vial, add 0.50 mL of *dioxan solution R2* and 0.50 mL of *ethylene oxide solution R3*. Close and mix to obtain a homogeneous solution. Allow to stand at 70 °C for 45 min.

Reference solution (b) To 0.50 mL of *ethylene oxide solution R3* in a 10 mL vial add 0.1 mL of a freshly prepared 10 mg/L solution of *acetaldehyde R* and 0.10 mL of *dioxan solution R1*. Close and mix to obtain a homogeneous solution. Allow to stand at 70 °C for 45 min.

B. For samples soluble in or miscible with dimethylacetamide, the following procedure may be used.

Test solution Weigh 1.00 g (M_T) of the substance to be examined in a 10 mL vial (other sizes may be used depending on the operating conditions) and add 0.20 mL of *water R* and 1.0 mL of *dimethylacetamide R*. Close and mix to obtain a homogeneous solution. Allow to stand at 90 °C for 45 min.

Reference solution (a) Weigh 1.00 g (M_R) of the substance to be examined into an identical 10 mL vial, add 0.10 mL of *dioxan solution R1*, 0.10 mL of *ethylene oxide solution R2* and 1.0 mL of *dimethylacetamide R*. Close and mix to obtain a homogeneous solution. Allow to stand at 90 °C for 45 min.

Reference solution (b) To 0.10 mL of *ethylene oxide solution R2* in a 10 mL vial, add 0.1 mL of a freshly prepared 10 mg/L solution of *acetaldehyde R* and 0.10 mL of *dioxan solution R1*. Close and mix to obtain a homogeneous solution. Allow to stand at 70 °C for 45 min.

Column:
- *material*: glass or fused silica;
- *size*: l = 30 m, Ø = 0.32 mm;
- *stationary phase*: *methylpolysiloxane R* (film thickness 1.0 µm).

Carrier gas *helium for chromatography R* or *nitrogen for chromatography R*.

Linear velocity 20 cm/s.

Split ratio 1:20.

Static head-space conditions that may be used:
- *equilibration temperature*: 70 °C (90 °C for solutions in dimethylacetamide);
- *equilibration time*: 45 min;
- *transfer-line temperature*: 75 °C (150 °C for solutions in dimethylacetamide);
- *carrier gas*: *helium for chromatography R*;
- *pressurisation time*: 1 min;
- *injection time*: 12 s.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	50
	5 - 31	50 → 180
	31 - 32.5	180 → 230
	32.5 - 37.5	230
Injection port		150
Detector		250

Detection Flame ionisation.

Injection A suitable volume, for example 1.0 mL, of the gaseous phase of the test solution and of reference solutions (a) and (b). Repeat the procedure twice more.

System suitability Reference solution (b):
- *resolution*: minimum 2.0 between the peaks due to acetaldehyde and ethylene oxide;
- *signal-to-noise ratio*: minimum 5 for the peaks due to ethylene oxide and dioxan.

Verification of precision

For each pair of injections, calculate for ethylene oxide and for dioxan the difference in area between the peaks obtained with the test solution and reference solution (a). The test is not valid unless the relative standard deviation of the 3 values obtained for ethylene oxide is not greater than 15 per cent and the relative standard deviation of the 3 values obtained for dioxan is not greater than 15 per cent. If the weighings used for the test solution and reference solution (a) differ from 1.00 g by more than 0.5 per cent, the appropriate corrections must be made.

Calculate the content of ethylene oxide or dioxan in parts per million from the following expressions:

$$\frac{A_T \times C}{(A_R \times M_T) - (A_T \times M_R)}$$

A_T = area of the peak due to ethylene oxide in the chromatogram obtained with the test solution;

A_R = area of the peak due to ethylene oxide in the chromatogram obtained with reference solution (a);

M_T = mass of the substance to be examined in the test solution, in grams;

M_R = mass of the substance to be examined in reference solution (a), in grams;

C = amount of ethylene oxide added to reference solution (a), in micrograms.

$$\frac{D_T \times C}{(D_R \times M_T) - (D_T \times M_R)}$$

D_T = area of the peak due to dioxan in the chromatogram obtained with the test solution;
D_R = area of the peak due to dioxan in the chromatogram obtained with reference solution (a);
C = amount of dioxan added to reference solution (a) in micrograms.

N. *N,N*-Dimethylaniline

(Ph. Eur. method 2.4.26)

METHOD A

Examine by gas chromatography (*2.2.28*), using *N,N-diethylaniline R* as the internal standard.

Internal standard solution Dissolve 50 mg of *N,N-diethylaniline R* in 4 mL of *0.1 M hydrochloric acid* and dilute to 50 mL with *water R*. Dilute 1 mL of this solution to 100 mL with *water R*.

Test solution Dissolve in a ground-glass-stoppered tube 0.50 g of the substance to be examined in 30.0 mL of *water R*. Add 1.0 mL of the internal standard solution. Adjust the solution to a temperature of 26-28 °C. Add 1.0 mL of *strong sodium hydroxide solution R* and mix until completely dissolved. Add 2.0 mL of *trimethylpentane R*. Shake for 2 min and allow the phases to separate. Use the upper layer.

Reference solution Dissolve 50.0 mg of *N,N-dimethylaniline R* in 4.0 mL of *0.1 M hydrochloric acid* and dilute to 50.0 mL with *water R*. Dilute 1.0 mL of this solution to 100.0 mL with *water R*. Dilute 1.0 mL of this solution to 30.0 mL with *water R*. Add 1.0 mL of the internal standard solution and 1.0 mL of *strong sodium hydroxide solution R*. Add 2.0 mL of *trimethylpentane R*. Shake for 2 min and allow the phases to separate. Use the upper layer.

The chromatographic procedure may be carried out using:
- a fused-silica capillary column 25 m long and 0.32 mm in internal diameter coated with *phenyl(50)methyl(50) polysiloxane R* (film thickness 0.52 µm),
- *helium for chromatography R* as the carrier gas with a split ratio 1:20, a column head pressure of 50 kPa and a split vent of 20 mL/min,
- a flame-ionisation detector,
- a split-liner consisting of a column about 1 cm long packed with *diatomaceous earth for gas chromatography R* impregnated with 10 per cent *m/m* of *methylpolysiloxane R*,

maintaining the temperature of the column at 150 °C for 5 min, then raising the temperature at a rate of 20 °C per min to 275 °C and maintaining it at 275 °C for 3 min and maintaining the temperature of the detector at 300 °C and that of the injection port at 220 °C.

The retention times are: *N,N*-dimethylaniline about 3.6 min, *N,N*-diethylaniline about 5.0 min.

Inject 1 µL of the test solution and 1 µL of the reference solution.

METHOD B

Examined by gas chromatography (*2.2.28*), using *naphthalene R* as the internal standard.

Internal standard solution Dissolve 50 mg of *naphthalene R* in *cyclohexane R* and dilute to 50 mL with the same solvent. Dilute 5 mL of this solution to 100 mL with *cyclohexane R*.

Test solution To 1.00 g of the substance to be examined in a ground-glass-stoppered tube add 5 mL of *1 M sodium hydroxide* and 1.0 mL of the internal standard solution. Stopper the tube and shake vigorously for 1 min. Centrifuge if necessary and use the upper layer.

Reference solution To 50.0 mg of *N,N-dimethylaniline R* add 2 mL of *hydrochloric acid R* and 20 mL of *water R*, shake to dissolve and dilute to 50.0 mL with *water R*. Dilute 5.0 mL of this solution to 250.0 mL with *water R*. To 1.0 mL of the latter solution in a ground-glass-stoppered tube add 5 mL of *1 M sodium hydroxide* and 1.0 mL of the internal standard solution. Stopper the tube and shake vigorously for 1 min. Centrifuge if necessary and use the upper layer.

The chromatographic procedure may be carried out using:
- a glass column 2 m long and 2 mm in internal diameter packed with *silanised diatomaceous earth for gas chromatography R* impregnated with 3 per cent *m/m* of *phenyl(50)methyl(50)polysiloxane R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 mL/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 120 °C and that of the injection port and of the detector at 150 °C.

Inject 1 µL of the test solution and 1 µL of the reference solution.

O. 2-Ethylhexanoic Acid

(Ph. Eur. method 2.4.28)

Examine by gas chromatography (*2.2.28*), using *3-cyclohexylpropionic acid R* as the internal standard.

Internal standard solution Dissolve 100 mg of *3-cyclohexylpropionic acid R* in *cyclohexane R* and dilute to 100 mL with the same solvent.

Test solution To 0.300 g of the substance to be examined, add 4.0 mL of a 33 per cent *V/V* solution of *hydrochloric acid R*. Shake vigorously for 1 min with 1.0 mL of the internal standard solution. Allow the phases to separate (if necessary, centrifuge for a better separation). Use the upper layer.

Reference solution Dissolve 75.0 mg of *2-ethylhexanoic acid R* in the internal standard solution and dilute to 50.0 mL with the same solution. To 1.0 mL of the solution add 4.0 mL of a 33 per cent *V/V* solution of *hydrochloric acid R*. Shake vigorously for 1 min. Allow the phases to separate (if necessary, centrifuge for a better separation). Use the upper layer.

The chromatographic procedure may be carried out using:
- a wide-bore fused-silica column 10 m long and 0.53 mm in internal diameter coated with *macrogol 20 000 2-nitroterephthalate R* (film thickness 1.0 µm),
- *helium for chromatography R* as the carrier gas at a flow rate of 10 mL/min,
- a flame-ionisation detector,

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 2	40	–	isothermal
	2 - 7.3	40 → 200	30	linear gradient
	7.3 - 10.3	200	–	isothermal
Injection port		200		
Detector		300		

Inject 1 µL of the test solution and 1 µL of the reference solution.

The test is not valid unless the resolution between the peaks due to 2-ethylhexanoic acid (first peak) and the internal standard is at least 2.0.

Calculate the percentage content of 2-ethylhexanoic acid from the expression:

$$\frac{A_T \times I_R \times m_R \times 2}{A_R \times I_T \times m_T}$$

A_T = area of the peak due to 2-ethylhexanoic acid in the chromatogram obtained with the test solution,

A_R = area of the peak due to 2-ethylhexanoic acid in the chromatogram obtained with the reference solution,

I_T = area of the peak due to the internal standard in the chromatogram obtained with the test solution,

I_R = area of the peak due to the internal standard in the chromatogram obtained with the reference solution,

m_T = mass of the substance to be examined in the test solution, in grams,

m_R = mass of 2-ethylhexanoic acid in the reference solution, in grams.

P. Total Protein

(Ph. Eur. method 2.5.33)

Many of the assay methods described in this chapter can be performed using kits from commercial sources.

METHOD 1

Protein in solution absorbs ultraviolet light at a wavelength of 280 nm, due to the presence of aromatic amino acids, mainly tyrosine and tryptophan, in the protein structure. This property can be used for assay purposes. If the buffer used to dissolve the protein has a high absorbance relative to that of water, an interfering substance is present. This interference may be obviated by using the buffer as compensation liquid but if the interfering substance produces a high absorbance, the results may nevertheless be compromised. At low concentrations, protein adsorbed onto the cell may significantly reduce the content in solution. This can be prevented by preparing samples at higher concentration or by using a non-ionic detergent in the preparation.

Test solution Dissolve a suitable quantity of the substance to be examined in the prescribed buffer to obtain a solution having a protein concentration between 0.2 mg/mL and 2 mg/mL.

Reference solution Prepare a solution of a suitable reference substance for the protein to be determined, in the same buffer and at the same protein concentration as the test solution.

Procedure

Keep the test solution, the reference solution and the compensation liquid at the same temperature during the performance of this test. Determine the absorbances (*2.2.25*) of the test solution and the reference solution in quartz cells at 280 nm, using the prescribed buffer as the compensation liquid. The response must be linear in the range of protein concentrations to be assayed to obtain accurate results.

Light scattering

The accuracy of the determination of protein can be diminished by the scattering of light by the test sample. If the proteins in solution exist as particles comparable in size to the wavelength of the measuring light (250 nm to 300 nm), scattering of the light beam results in an apparent increase in absorbance of the test sample. To calculate the absorbance at 280 nm due to light scattering, determine the absorbances of the test solution at wavelengths of 320 nm, 325 nm, 330 nm, 335 nm, 340 nm, 345 nm and 350 nm. Plot the logarithm of the observed absorbance against the logarithm of the wavelength and determine the standard curve best fitting the plotted points by linear regression. Extrapolate the curve to determine the logarithm of the absorbance at 280 nm. The antilogarithm of this value is the absorbance attributed to light scattering. Correct the observed values by subtracting the absorbance attributed to light scattering from the total absorbance at 280 nm to obtain the absorbance value of the protein in solution. Filtration with a 0.2 µm filter that does not adsorb protein or clarification by centrifugation may be performed to reduce the effect of light scattering, especially if the solution is noticeably turbid.

Calculations

Use corrected values for the calculations. Calculate the concentration of protein in the test solution (C_U) from the following equation:

$$C_U = C_S(A_U/A_S)$$

where C_S is the concentration of protein in the reference solution and A_U and A_S are the corrected absorbances of the test solution and the reference solution, respectively.

METHOD 2

This method (commonly referred to as the Lowry assay) is based on the reduction by protein of the phosphomolybdotungstic mixed acid chromogen in the phosphomolybdotungstic reagent, which results in an absorbance maximum at 750 nm.

The phosphomolybdotungstic reagent reacts primarily with tyrosine residues in the protein. Colour development reaches a maximum in 20 min to 30 min at room temperature, after which there is a gradual loss of colour. Because the method is sensitive to interfering substances, a procedure for precipitation of the protein from the test sample may be used. Most interfering substances cause a lower colour yield; however, some detergents cause a slight increase in colour. A high salt concentration may cause a precipitate to form. Because different protein species may give different colour response intensities, the reference substance and test protein must be the same. Where separation of interfering substances from the protein in the test sample is necessary, proceed as directed below for interfering substances prior to preparation of the test solution. The effect of interfering substances may be minimised by dilution, provided the concentration of the test protein remains sufficient for accurate measurement.

Use *distilled water R* to prepare all buffers and reagents used for this method.

Test solution Dissolve a suitable quantity of the substance to be examined in the prescribed buffer to obtain a solution having a concentration within the range of the standard curve. A suitable buffer will produce a solution of pH 10.0 to 10.5.

Reference solutions Dissolve the reference substance for the protein to be determined in the prescribed buffer. Dilute portions of this solution with the same buffer to obtain not fewer than five reference solutions having protein concentrations evenly spaced over a suitable range situated between 5 µg/mL and 100 µg/mL.

Blank Use the buffer used to prepare the test solution and the reference solutions.

Copper sulfate reagent Dissolve 100 mg of *copper sulfate pentahydrate R* and 0.2 g of *sodium tartrate R* in *distilled*

water R and dilute to 50 mL with the same solvent. Dissolve 10 g of *anhydrous sodium carbonate R* in *distilled water R* and dilute to 50 mL with the same solvent. Slowly pour the sodium carbonate solution into the copper sulfate solution with mixing. Use within 24 h.

Alkaline copper reagent Mix 1 volume of copper sulfate reagent, 2 volumes of a 50 g/L solution of *sodium dodecyl sulfate R* and 1 volume of a 32 g/L solution of *sodium hydroxide R*. Store at room temperature and use within 2 weeks.

Diluted phosphomolybdotungstic reagent Mix 5 mL of *phosphomolybdotungstic reagent R* with 55 mL of *distilled water R*. Store in an amber bottle, at room temperature.

Procedure

To 1.0 mL of each reference solution, of the test solution and of the blank, add 1.0 mL of alkaline copper reagent and mix. Allow to stand for 10 min. Add 0.5 mL of the diluted phosphomolybdotungstic reagent, mix and allow to stand at room temperature for 30 min. Determine the absorbances (*2.2.25*) of the solutions at 750 nm, using the solution from the blank as compensation liquid.

Calculations

The relationship of absorbance to protein concentration is non-linear; however, if the range of concentrations used to prepare the standard curve is sufficiently small, the latter will approach linearity. Plot the absorbances of the reference solutions against the protein concentrations and use linear regression to establish the standard curve. From the standard curve and the absorbance of the test solution, determine the concentration of protein in the test solution.

Interfering substances

In the following procedure, deoxycholate-trichloroacetic acid is added to a test sample to remove interfering substances by precipitation of proteins before determination; this technique can also be used to concentrate proteins from a dilute solution.

Add 0.1 mL of a 1.5 g/L solution of *sodium deoxycholate R* to 1 mL of a solution of the substance to be examined. Mix using a vortex mixer and allow to stand at room temperature for 10 min. Add 0.1 mL of a 720 g/L solution of *trichloroacetic acid R* and mix using a vortex mixer. Centrifuge at 3000 *g* for 30 min, decant the liquid and remove any residual liquid with a pipette. Redissolve the protein pellet in 1 mL of alkaline copper reagent.

METHOD 3

This method (commonly referred to as the Bradford assay) is based on the absorption shift from 470 nm to 595 nm observed when the acid blue 90 dye binds to protein. The acid blue 90 dye binds most readily to arginine and lysine residues in the protein which can lead to variation in the response of the assay to different proteins. The protein used as reference substance must therefore be the same as the protein to be determined. There are relatively few interfering substances, but it is preferable to avoid detergents and ampholytes in the test sample. Highly alkaline samples may interfere with the acidic reagent.

Use *distilled water R* to prepare all buffers and reagents used for this method.

Test solution Dissolve a suitable quantity of the substance to be examined in the prescribed buffer to obtain a solution having a concentration within the range of the standard curve.

Reference solutions Dissolve the reference substance for the protein to be determined in the prescribed buffer. Dilute portions of this solution with the same buffer to obtain not fewer than five reference solutions having protein concentrations evenly spaced over a suitable range situated between 0.1 mg/mL and 1 mg/mL.

Blank Use the buffer used to prepare the test solution and the reference solutions.

Acid blue 90 reagent Dissolve 0.10 g of *acid blue 90 R* in 50 mL of *alcohol R*. Add 100 mL of *phosphoric acid R*, dilute to 1000 mL with *distilled water R* and mix. Filter the solution and store in an amber bottle at room temperature. Slow precipitation of the dye occurs during storage. Filter the reagent before using.

Procedure

Add 5 mL of acid blue 90 reagent to 0.100 mL of each reference solution, of the test solution and of the blank. Mix by inversion. Avoid foaming, which will lead to poor reproducibility. Determine the absorbances (*2.2.25*) of the standard solutions and of the test solution at 595 nm, using the blank as compensation liquid. Do not use quartz (silica) spectrophotometer cells because the dye binds to this material.

Calculations

The relationship of absorbance to protein concentration is non-linear; however, if the range of concentrations used to prepare the standard curve is sufficiently small, the latter will approach linearity. Plot the absorbances of the reference solutions against protein concentrations and use linear regression to establish the standard curve. From the standard curve and the absorbance of the test solution, determine the concentration of protein in the test solution.

METHOD 4

This method (commonly referred to as the bicinchoninic acid or BCA assay) is based on reduction of the cupric (Cu^{2+}) ion to cuprous (Cu^{1+}) ion by protein. The bicinchoninic acid reagent is used to detect the cuprous ion. Few substances interfere with the reaction. When interfering substances are present their effect may be minimised by dilution, provided that the concentration of the protein to be determined remains sufficient for accurate measurement. Alternatively, the protein precipitation procedure given in Method 2 may be used to remove interfering substances. Because different protein species may give different colour response intensities, the reference protein and protein to be determined must be the same.

Use *distilled water R* to prepare all buffers and reagents used for this method.

Test solution Dissolve a suitable quantity of the substance to be examined in the prescribed buffer to obtain a solution having a concentration within the range of the concentrations of the reference solutions.

Reference solutions Dissolve the reference substance for the protein to be determined in the prescribed buffer. Dilute portions of this solution with the same buffer to obtain not fewer than five reference solutions having protein concentrations evenly spaced over a suitable range situated between 10 µg/mL and 1200 µg/mL.

Blank Use the buffer used to prepare the test solution and the reference solutions.

BCA reagent Dissolve 10 g of *disodium bicinchoninate R*, 20 g of *sodium carbonate monohydrate R*, 1.6 g of *sodium tartrate R*, 4 g of *sodium hydroxide R*, and 9.5 g of *sodium hydrogen carbonate R* in *distilled water R*. Adjust, if necessary, to pH 11.25 with a solution of *sodium hydroxide R* or a solution of *sodium hydrogen carbonate R*. Dilute to 1000 mL with *distilled water R* and mix.

Copper-BCA reagent Mix 1 mL of a 40 g/L solution of *copper sulfate pentahydrate R* and 50 mL of BCA reagent.

Procedure

Mix 0.1 mL of each reference solution, of the test solution and of the blank with 2 mL of the copper-BCA reagent. Incubate the solutions at 37 °C for 30 min, note the time and allow the mixtures to cool to room temperature. Within 60 min of the end of incubation, determine the absorbances (*2.2.25*) of the reference solutions and of the test solution in quartz cells at 562 nm, using the blank as compensation liquid. After the solutions have cooled to room temperature, the colour intensity continues to increase gradually.

Calculations

The relationship of absorbance to protein concentration is non-linear; however, if the range of concentrations used to prepare the standard curve is sufficiently small, the latter will approach linearity. Plot the absorbances of the reference solutions against protein concentrations and use linear regression to establish the standard curve. From the standard curve and the absorbance of the test solution, determine the concentration of protein in the test solution.

METHOD 5

This method (commonly referred to as the biuret assay) is based on the interaction of cupric (Cu^{2+}) ion with protein in alkaline solution and resultant development of absorbance at 545 nm. This test shows minimal difference between equivalent IgG and albumin samples. Addition of the sodium hydroxide and the biuret reagent as a combined reagent, insufficient mixing after the addition of the sodium hydroxide, or an extended time between the addition of the sodium hydroxide solution and the addition of the biuret reagent will give IgG samples a higher response than albumin samples. The trichloroacetic acid method used to minimise the effects of interfering substances also can be used to determine the protein content in test samples at concentrations below 500 µg/mL.

Use *distilled water R* to prepare all buffers and reagents used for this method.

Test solution Dissolve a suitable quantity of the substance to be examined in a 9 g/L solution of *sodium chloride R* to obtain a solution having a concentration within the range of the concentrations of the reference solutions.

Reference solutions Dissolve the reference substance for the protein to be determined in a 9 g/L solution of *sodium chloride R*. Dilute portions of this solution with a 9 g/L solution of *sodium chloride R* to obtain not fewer than three reference solutions having protein concentrations evenly spaced over a suitable range situated between 0.5 mg/mL and 10 mg/mL.

Blank Use a 9 g/L solution of *sodium chloride R*.

Biuret reagent Dissolve 3.46 g of *copper sulfate pentahydrate R* in 10 mL of hot *distilled water R*, and allow to cool (Solution A). Dissolve 34.6 g of *sodium citrate R* and 20.0 g of *anhydrous sodium carbonate R* in 80 mL of hot *distilled water R*, and allow to cool (Solution B).
Mix solutions A and B and dilute to 200 mL with *distilled water R*. Use within 6 months. Do not use the reagent if it develops turbidity or contains any precipitate.

Procedure

To one volume of the test solution add an equal volume of a 60 g/L solution of *sodium hydroxide R* and mix. Immediately add biuret reagent equivalent to 0.4 volumes of the test solution and mix rapidly. Allow to stand at a temperature between 15 °C and 25 °C for not less than 15 min. Within 90 min of addition of the biuret reagent, determine the absorbances (*2.2.25*) of the reference solutions and of the test solution at the maximum at 545 nm, using the blank as compensation liquid. Any solution that develops turbidity or a precipitate is not acceptable for calculation of protein concentration.

Calculations

The relationship of absorbance to protein concentration is approximately linear within the indicated range of protein concentrations for the reference solutions. Plot the absorbances of the reference solutions against protein concentrations and use linear regression to establish the standard curve. Calculate the correlation coefficient for the standard curve. A suitable system is one that yields a line having a correlation coefficient not less than 0.99. From the standard curve and the absorbance of the test solution, determine the concentration of protein in the test solution.

Interfering substances

To minimise the effect of interfering substances, the protein can be precipitated from the test sample as follows: add 0.1 volumes of a 500 g/L solution of *trichloroacetic acid R* to 1 volume of a solution of the test sample, withdraw the supernatant layer and dissolve the precipitate in a small volume of *0.5 M sodium hydroxide*. Use the solution obtained to prepare the test solution.

METHOD 6

This fluorimetric method is based on the derivatisation of the protein with *o*-phthalaldehyde, which reacts with the primary amines of the protein (*N*-terminal amino acid and the ε-amino group of lysine residues). The sensitivity of the assay can be increased by hydrolysing the protein before adding *o*-phthalaldehyde. Hydrolysis makes the α-amino group of the constituent amino acids available for reaction with the phthalaldehyde reagent. The method requires very small quantities of the protein. Primary amines, such as tris (hydroxymethyl)aminomethane and amino acid buffers, react with phthalaldehyde and must be avoided or removed. Ammonia at high concentrations reacts with phthalaldehyde. The fluorescence obtained when amine reacts with phthalaldehyde can be unstable. The use of automated procedures to standardise this procedure may improve the accuracy and precision of the test.

Use *distilled water R* to prepare all buffers and reagents used for this method.

Test solution Dissolve a suitable quantity of the substance to be examined in a 9 g/L solution of *sodium chloride R* to obtain a solution having a concentration within the range of the concentrations of the reference solutions. Adjust the solution to pH 8 to 10.5 before addition of the phthalaldehyde reagent.

Reference solutions Dissolve the reference substance for the protein to be determined in a 9 g/L solution of *sodium chloride R*. Dilute portions of this solution with a 9 g/L solution of *sodium chloride R* to obtain not fewer than five reference solutions having protein concentrations evenly spaced over a suitable range situated between 10 µg/mL and 200 µg/mL. Adjust the solutions to pH 8 to 10.5 before addition of the phthalaldehyde reagent.

Blank solution Use a 9 g/L solution of *sodium chloride R*.

Borate buffer solution Dissolve 61.83 g of *boric acid R* in *distilled water R* and adjust to pH 10.4 with a solution of *potassium hydroxide R*. Dilute to 1000 mL with *distilled water R* and mix.

Phthalaldehyde stock solution Dissolve 1.20 g of *phthalaldehyde R* in 1.5 mL of *methanol R*, add 100 mL of borate buffer solution and mix. Add 0.6 mL of a 300 g/L solution of *macrogol 23 lauryl ether R* and mix. Store at room temperature and use within 3 weeks.

Phthalaldehyde reagent To 5 mL of phthalaldehyde stock solution add 15 µL of *2-mercaptoethanol R*. Prepare at least 30 min before use. Use within 24 h.

Procedure

Mix 10 µL of the test solution and of each of the reference solutions with 0.1 mL of phthalaldehyde reagent and allow to stand at room temperature for 15 min. Add 3 mL of *0.5 M sodium hydroxide* and mix. Determine the fluorescent intensities (*2.2.21*) of solutions from the reference solutions and from the test solution at an excitation wavelength of 340 nm and an emission wavelength between 440 and 455 nm. Measure the fluorescent intensity of a given sample only once, since irradiation decreases the fluorescence intensity.

Calculations

The relationship of fluorescence to protein concentration is linear. Plot the fluorescent intensities of the reference solutions against protein concentrations and use linear regression to establish the standard curve. From the standard curve and the fluorescent intensity of the test solution, determine the concentration of protein in the test solution.

METHOD 7

This method is based on nitrogen analysis as a means of protein determination. Interference caused by the presence of other nitrogen-containing substances in the test sample can affect the determination of protein by this method. Nitrogen analysis techniques destroy the test sample during the analysis but are not limited to protein presentation in an aqueous environment.

Procedure A

Proceed as prescribed for the determination of nitrogen by sulfuric acid digestion (*2.5.9*) or use commercial instrumentation for Kjeldahl nitrogen assay.

Procedure B

Commercial instrumentation is available for nitrogen analysis. Most nitrogen analysis instruments use pyrolysis (i.e. combustion of the sample in oxygen at temperatures approaching 1000 °C), which produces nitric oxide (NO) and other oxides of nitrogen (NO_x) from the nitrogen present in the substance to be examined. Some instruments convert the nitric oxides to nitrogen gas, which is quantified using a thermal-conductivity detector. Other instruments mix nitric oxide (NO) with ozone (O_3) to produce excited nitrogen dioxide (NO_2*), which emits light when it decays and can be quantified with a chemiluminescence detector. A protein reference material that is relatively pure and is similar in composition to the test proteins is used to optimise the injection and pyrolysis parameters and to evaluate consistency in the analysis.

Calculations

The protein concentration is calculated by dividing the nitrogen content of the sample by the known nitrogen content of the protein. The known nitrogen content of the protein can be determined from the chemical composition of the protein or by comparison with a suitable reference substance.

Q. Acetic Acid in Synthetic Peptides

(Ph. Eur. method 2.5.34)

Examine by liquid chromatography (*2.2.29*).

Test solution Prepare as described in the monograph. The concentration of peptide in the solution may be adapted, depending on the expected amount of acetic acid in the sample.

Reference solution Prepare a 0.10 g/L solution of *glacial acetic acid R* in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A.

The chromatographic procedure may be carried out using:
- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.2 mL/min:

Mobile phase A Dilute 0.7 mL of *phosphoric acid R* to 1000 mL with *water R*; adjust the pH to 3.0 with *strong sodium hydroxide solution R*,

Mobile phase B *Methanol R2*,

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0 - 5	95	5
5 - 10	95 → 50	5 → 50
10 - 20	50	50
20 - 22	50 → 95	50 → 5
22 - 30	95	5

- as detector a spectrophotometer set at 210 nm.

Inject 10 µL of the reference solution and 10 µL of the test solution. In the chromatograms obtained, the peak corresponding to acetic acid has a retention time of 3-4 min. The baseline presents a steep rise after the start of the linear gradient, which corresponds to the elution of the peptide from the column. Determine the content of acetic acid in the peptide.

R. Nickel in Hydrogenated Vegetable Oils

(Ph. Eur. method 2.4.31)

Atomic absorption spectrometry (*2.2.23, Method I*).

The reagents magnesium nitrate R and ammonium dihydrogen phosphate R must be controlled for nickel before use. The actual nickel content is taken into account in the calculation of the nickel content of the sample.

Test solution Weigh 0.250 g (*m*) of the substance to be examined into a suitable high-pressure-resistant digestion vessel (fluoropolymer or quartz glass), add 6.0 mL of *nickel-free nitric acid R* and 2.0 mL of *strong hydrogen peroxide solution R*. Prepare a blank solution in the same manner. Place the closed vessels in a laboratory microwave oven and digest with an appropriate programme, e.g. 1000 W for 40 min. Allow the digestion vessels to cool before opening. Add 2.0 mL of *strong hydrogen peroxide solution R* and repeat the digestion step. Allow the digestion vessels to cool before opening. Quantitatively transfer to a 25 mL flask, add 0.5 mL of a 10 g/L solution of *magnesium nitrate R* and 0.5 mL of a 100 g/L solution of *ammonium dihydrogen phosphate R*, dilute to 25.0 mL with *water for chromatography R* and mix.

Reference solutions Into 4 volumetric flasks, introduce 25 µL, 50 µL, 75 µL and 100 µL of *nickel standard solution (5 ppm Ni) R*. To each flask, add 0.5 mL of a 10 g/L solution of *magnesium nitrate R*, 0.5 mL of a 100 g/L solution of *ammonium dihydrogen phosphate R* and 6.0 mL of *nickel-free nitric acid R* and dilute to 25.0 mL with *water for chromatography R*. Mix to obtain reference solutions containing respectively 5 ng/mL, 10 ng/mL, 15 ng/mL and 20 ng/mL (ppb) of nickel.

Zero solution In a volumetric flask, introduce 1.0 mL of a 10 g/L solution of *magnesium nitrate R*, 1.0 mL of a 100 g/L solution of *ammonium dihydrogen phosphate R* and 12.0 mL of *nickel-free nitric acid R*. Dilute to 50.0 mL with *water for chromatography R* and mix.

Method Determine the absorbance of each solution at 232.0 nm using a suitable graphite furnace atomic absorption (GFAA) spectrometer equipped with a background compensation system, a pyrolytically-coated tube and a nickel hollow-cathode lamp. The optimal temperature programme may be different for each instrument, so the programme recommended by the spectrometer manufacturer may be used. The following temperature parameters for GFAA analysis are given as an example: maintain the drying temperature of the furnace at 120 °C for 35 s after a 5 s ramp, the ashing temperature at 1100 °C for 10 s after a 30 s ramp, the cooling temperature at 800 °C for 5 s after a 5 s decrease, and the atomisation temperature at 2600 °C for 7 s. Use the zero solution to set the instrument to zero. Using the calibration curve, determine the concentrations of the test solution and the blank solution from the corresponding absorptions. If necessary, dilute with the zero solution to obtain a reading within the calibrated absorbance range.

Calculate the content of Ni in micrograms per gram (ppm) using the following expression:

$$\frac{c \times f}{m \times 40}$$

c = measured concentration of Ni, in nanograms per millilitre;
f = dilution factor of the test solution;
m = mass of the substance to be examined, in grams.

S. Methyl, Ethyl and Isopropyl Methanesulfonate in Methanesulfonic Acid

(Ph. Eur. method 2.5.37)

The following method has been validated for the methyl, ethyl and isopropyl esters of methanesulfonic acid at concentrations in the range of 0.5 ppm to 100 ppm.

If it is intended to be used to determine levels of methanesulfonic acid esters outside this validated range, for example in early steps of the synthesis prior to their removal, the concentration of the test solution has to be adjusted accordingly.

Gas chromatography (*2.2.28*) coupled with mass spectrometry (*2.2.43*).

Internal standard solution Dilute 7 µL of *butyl methanesulfonate CRS* (BMS) to 10.0 mL with *methylene chloride R*. Dilute 10 µL of the solution to 100.0 mL with *methylene chloride R*.

Test solution Add 0.74 g of the substance to be examined to 10.0 mL of *water R* and extract with 10.0 mL of the internal standard solution. Allow to separate and transfer the organic layer to a vial containing *anhydrous sodium sulfate R*. Shake and filter.

Reference solution (a) Dissolve 50 mg each of *methyl methanesulfonate R* (MMS), *ethyl methanesulfonate R* (EMS) and *isopropyl methanesulfonate R* (IMS) in the internal standard solution and dilute to 50.0 mL with the same solution. Dilute 74 µL of the solution to 10.0 mL with the internal standard solution. Dilute 100 µL of this solution to 10.0 mL with the internal standard solution.

Reference solution (b) Dilute 3.0 mL of reference solution (a) to 10.0 mL with the internal standard solution.

Column:
- *material*: fused silica;
- *size*: l = 15 m, Ø = 0.25 mm;
- *stationary phase*: *methylpolysiloxane R* (film thickness 1 µm).

Carrier gas *helium for chromatography R*.

Flow rate 1 mL/min.

Pulsed splitless 250 kPa, 0.25 min.

Temperature:

		Time (min)	Temperature (°C)
Column		0 - 1	55
		1 - 9	55 → 135
Injection port			240
Detector:	transfer line		280
	source		230
	analyser		150

Detection Mass spectrometer as described below; adjust the detector settings so as to comply with the system suitability criteria:
- quadrupole mass spectrometer equipped with an electron impact ionisation mode (70 eV);
- mass spectrometer parameters for the fragmentometric mode (single-ion monitoring (SIM)) set as follows:

Substance	*m/z*	Duration of monitoring
Butyl methanesulfonate (BMS)	56	t_R between 7.0 min and 9.0 min
Methyl methanesulfonate (MMS)	80	t_R between 2.0 min and 3.5 min
Ethyl methanesulfonate (EMS)	79	t_R between 4.0 min and 4.7 min
Isopropyl methanesulfonate (IMS)	123	t_R between 4.7 min and 5.5 min

Injection 2 µL.

Relative retention With reference to the internal standard (BMS) (retention time = about 7.6 min): MMS = about 0.3; EMS = about 0.5; IMS = about 0.6.

System suitability:
- *resolution*: minimum 3.0 between the peaks due to EMS and IMS in the chromatogram obtained with reference solution (a);
- *signal-to-noise ratio*: minimum 10 for the peaks due to MMS, EMS and IMS in the chromatogram obtained with reference solution (b).

Calculate the content of MMS, EMS or IMS in parts per million using the following expression:

$$\frac{A_2 \times I_1 \times W_1 \times C \times 0.148}{A_1 \times I_2 \times W_2}$$

A_1 = area of the peak due to MMS, EMS or IMS in the chromatogram obtained with reference solution (a);
A_2 = area of the peak due to MMS, EMS or IMS in the chromatogram obtained with the test solution;
C = percentage content of MMS, EMS or IMS;
I_1 = area of the peak due to the internal standard in the chromatogram obtained with reference solution (a);
I_2 = area of the peak due to the internal standard in the chromatogram obtained with the test solution;
W_1 = mass of MMS, EMS or IMS used to prepare reference solution (a), in milligrams;
W_2 = mass of the substance to be examined in the test solution, in milligrams;
0.148 = dilution factor.

T. Methyl, Ethyl and Isopropyl Methanesulfonate in Active Substances

(Ph. Eur. method 2.5.38)

The following general method has been validated for the determination of methyl, ethyl and isopropyl esters of methanesulfonic acid (in concentrations between 0.2 ppm and 5 ppm) in betahistine mesilate.

If it is intended to use the method for other active substances, particularly those that contain different concentrations of the methanesulfonic acid esters, the concentrations of the test solution and reference solutions must be adjusted accordingly and the method must be suitably validated.

METHOD

Head-space gas chromatography (*2.2.28*) coupled with mass spectrometry (*2.2.43*). *Prepare the test solution and reference solutions immediately before use.*

Solvent mixture *water R, acetonitrile R* (20:80 *V/V*). *The use of acetonitrile of appropriate purity is essential.*

Solution A Dissolve with the aid of ultrasound 30 mg of *anhydrous sodium thiosulfate R* and 60.0 g of *sodium iodide R* in *water R* and dilute to 50.0 mL with the same solvent.

Internal standard solution Dilute 10 µL of *butyl methanesulfonate CRS* (BMS) to 10.0 mL with the solvent mixture. Dilute 20 µL of the solution to 100.0 mL with the solvent mixture.

Blank solution Introduce 0.50 mL of solution A and 0.50 mL of the internal standard solution into a headspace vial and seal the vial immediately with a polytetrafluoroethylene-coated silicon membrane and an aluminium cap.

Test solution Weigh 25.0 mg of the substance to be examined into a 20 mL headspace vial. Add 0.50 mL of solution A and 0.50 mL of the internal standard solution and seal the vial immediately with a polytetrafluoroethylene-coated silicon membrane and an aluminium cap.

Following the derivatisation reaction, a precipitate may be observed, however this does not affect the validity of the quantification.

Reference solution (a) Dissolve 25.0 mg each of *methyl methanesulfonate R* (MMS), *ethyl methanesulfonate R* (EMS) and *isopropyl methanesulfonate R* (IMS) in *toluene R* and dilute to 5.0 mL with the same solvent. Dilute 50 µL of the solution to 25.0 mL with the internal standard solution.

Reference solution (b) Dilute 20 µL of reference solution (a) to 20.0 mL with the internal standard solution. Introduce 0.50 mL of this solution and 0.50 mL of solution A into a 20 mL headspace vial and seal the vial immediately with a polytetrafluoroethylene-coated silicon membrane and an aluminium cap.

Reference solution (c) Dilute 500 µL of reference solution (a) to 20.0 mL with the internal standard solution. Introduce 0.50 mL of this solution and 0.50 mL of solution A into a 20 mL headspace vial and seal the vial immediately with a polytetrafluoroethylene-coated silicon membrane and an aluminium cap.

Column:
— *material*: fused silica;
— *size*: *l* = 30 m, Ø = 0.25 mm;
— *stationary phase*: *polar-deactivated macrogol R* (film thickness 1 µm).

Carrier gas *helium for chromatography R.*

The use of an inert inlet liner without glass wool significantly reduces the effect of carry-over between the injections.

Flow rate 0.5 mL/min.

Split ratio 1:20.

Static head-space conditions that may be used:
— *equilibration temperature*: 60 °C;
— *equilibration time*: 30 min;
— *transfer-line temperature*: 120 °C.

Temperature:

		Time (min)	Temperature (°C)
Column		0 - 1	40
		1 - 10	40 → 130
Injection port			220
Detector	transfer line		280
	source		250
	analyser		200

At the end of analysis, the temperature of the column is raised to 240 °C and maintained at this temperature for 7 min.

Detection Mass spectrometer as described below; adjust the detector settings so as to comply with the system suitability criteria; alternatively a suitable electron-capture detector may be used:
— quadrupole mass spectrometer equipped with an electron impact ionisation mode (70 eV);
— mass spectrometer parameters for the fragmentometric mode (single-ion monitoring (SIM)) set as follows:

Substance	Quantitation ion (*m/z*)	Qualification ion (*m/z*)
Butyl iodide (BuI)*	184	127
Methyl iodide (MeI)*	142	127
Ethyl iodide (EtI)*	156	127
Isopropyl iodide (iPrI)*	170	127

* formed from BMS, MMS, EMS and IMS in the derivatisation reaction.

Injection 1 mL of the gas phase of the test solution, reference solutions (b) and (c) and the blank solution.

Relative retention With reference to the internal standard (BuI) (retention time = about 8.5 min): MeI = about 0.51; EtI = about 0.63; iPrI = about 0.68.

System suitability:
- *resolution*: minimum 1.5 between the peaks due to EtI and iPrI in the chromatogram obtained with reference solution (c);
- *signal-to-noise ratio*: minimum 10 for the peak due to each alkyl iodide in the chromatogram obtained with reference solution (b).

Calculate the content in parts per million of each alkyl methanesulfonate using the following expression:

$$\frac{A_2 \times I_1 \times W_1 \times C \times 0.05}{A_1 \times I_2 \times W_2}$$

A_1 = area of the peak due to each alkyl iodide in the chromatogram obtained with reference solution (c);
A_2 = area of the peak due to each alkyl iodide in the chromatogram obtained with the test solution;
C = percentage content of each ester;
I_1 = area of the peak due to the internal standard in the chromatogram obtained with reference solution (c);
I_2 = area of the peak due to the internal standard in the chromatogram obtained with the test solution;
W_1 = mass of each ester used to prepare reference solution (a), in milligrams;
W_2 = mass of the substance to be examined in the test solution, in milligrams;
0.05 = dilution factor.

V. Methanesulfonyl Chloride in Methanesulfonic Acid

(Ph. Eur. method 2.5.39)

The following method has been validated for the determination of methanesulfonyl chloride in methanesulfonic acid at concentrations in the range of 0.05 ppm to 50 ppm.

Gas chromatography (*2.2.28*) coupled with mass spectrometry (*2.2.43*).

Internal standard solution Dissolve 7 µL of *butyl methanesulfonate CRS* (BMS) in *methylene chloride R* and dilute to 10.0 mL with the same solvent. Dilute 5.0 mL of this solution to 50.0 mL with *methylene chloride R*.

Test solution To 5 mL of *water R*, add 7.4 g of the substance to be examined and mix slowly. After cooling, add 5.0 mL of *methylene chloride R* and 100 µL of the internal standard solution and shake. Allow to separate and transfer the organic layer to a vial containing 1 g of *anhydrous sodium sulfate R*. Repeat the extraction twice with 5.0 mL of *methylene chloride R* each time, combine the organic layers and filter.

Reference solution (a) Dissolve 50.0 mg of *methanesulfonyl chloride R* in *methylene chloride R* and dilute to 10.0 mL with the same solvent. Dilute 1.0 mL of the solution to 10.0 mL with *methylene chloride R*. Dilute 300 µL of this solution to 10.0 mL with *methylene chloride R*.

Reference solution (b) Dilute 500 µL of reference solution (a) and 100 µL of the internal standard solution to 15.0 mL with *methylene chloride R*.

Reference solution (c) Dilute 25 µL of reference solution (a) and 100 µL of the internal standard solution to 15.0 mL with *methylene chloride R*.

Column:
- *material*: fused silica;
- *size*: l = 15 m, Ø = 0.25 mm;
- *stationary phase*: *methylpolysiloxane R* (film thickness 1 µm).

Carrier gas *helium for chromatography R*.

Flow rate 1 mL/min.

Pulsed splitless 60 kPa, 0.1 min.

Temperature:

		Time (min)	Temperature (°C)
Column		0 - 4	40
		4 - 8	40 → 200
Injection port			240
Detector:	transfer line		280
	source		230
	analyser		150

At the end of analysis the temperature of the column is raised to 270 °C and maintained at this temperature for 8 min.

Detection Mass spectrometer as described below; adjust the detector settings so as to comply with the system suitability criteria:
- quadrupole mass spectrometer equipped with an electron impact ionisation mode (70 eV);
- mass spectrometer parameters for the fragmentometric mode (single-ion monitoring (SIM)) set as follows:

Substance	*m/z*	Duration of monitoring
Methanesulfonyl chloride	79	t_R between 3.3 min and 6.0 min
Butyl methanesulfonate (BMS)	56	t_R between 6.0 min and 8.0 min

Injection 5 µL of the test solution, reference solutions (b) and (c), the internal standard solution and *methylene chloride R*.

Relative retention With reference to the internal standard (BMS) (retention time = about 7.2 min): methanesulfonyl chloride = about 0.68.

System suitability:
- in the chromatogram obtained with the internal standard solution, there is no peak with the same retention time as methanesulfonyl chloride;
- *resolution*: minimum 5.0 between the peaks due to methanesulfonyl chloride and BMS in the chromatogram obtained with reference solution (b);
- *signal-to-noise ratio*: minimum 10 for the peak due to methanesulfonyl chloride in the chromatogram obtained with reference solution (c).

Calculate the content of methanesulfonyl chloride in parts per million using the following expression:

$$\frac{A_2 \times I_1 \times W_1 \times C \times 1.5}{A_1 \times I_2 \times W_2}$$

A_1 = area of the peak due to methanesulfonyl chloride in the chromatogram obtained with reference solution (b);
A_2 = area of the peak due to methanesulfonyl chloride in the chromatogram obtained with the test solution;
C = percentage content of methanesulfonyl chloride;
I_1 = area of the peak due to BMS in the chromatogram obtained with reference solution (b);

I_2 = area of the peak due to BMS in the chromatogram obtained with the test solution;
W_1 = mass of methanesulfonyl chloride used to prepare reference solution (a), in milligrams;
W_2 = mass of the sample in the test solution, in milligrams;
1.5 = dilution factor.

W. Determination of Elemental Impurities

(Ph. Eur. method 2.4.20)

INTRODUCTION

This chapter describes the general approach for the determination of elemental impurities in medicinal products or substances for pharmaceutical use. As the chemical composition of the considered samples and the specification limits for the element(s) of interest vary considerably, it is not possible to describe all suitable sample preparation and measurement methods. Therefore, any method that fulfils the requirements described in this chapter may be used.

The results of the analysis are acceptable only if the system suitability has been demonstrated by a suitable test. Before the initial use of a method, the analyst must ensure that the method is appropriate for the samples and instruments used. This is accomplished by applying a validation procedure to methods not described in the individual monograph or by a system suitability test for methods which are described in the monograph. Decision trees for the choice of the sample preparation and the measurement procedures are presented in Figures 2.4.20.-1 and 2.4.20.-2.

PROCEDURES

As a reference procedure is not provided for each element, matrix and concentration, the choice of procedure according to Figures 2.4.20.-1 and 2.4.20.-2, including sample preparation, detection technique and instrument parameters, is the responsibility of the user.

Use the flow chart in Figure 2.4.20.-1 to define the sample preparation method and the flow chart in Figure 2.4.20.-2 to define the measurement method. The sample preparation method should yield a sufficient quantity of sample to allow quantification of each element at the specified limit stated in the individual monograph or the general chapter.
