Carry out a quantitative evaluation for enterobacteria and certain other Gram-negative bacteria, Appendix XVI B1. 0.01 mL of the preparation gives a negative result, Table I (most probable number of bacteria per gram fewer than 10^2).

www.webofpharma.com

ASSAY

For Al_2O_3

To a weighed quantity containing 1.5 g of dried aluminium hydroxide add 20 mL of *water*, stir and slowly add 10 mL of *hydrochloric acid*. Heat gently, if necessary, to aid solution, cool, filter, wash the filter well with *water*, dilute the combined filtrate and washings to 200 mL with *water* and mix. Reserve a portion of the solution for the Assay for magnesium hydroxide. To 10 mL add 20 mL of *water* and, with continuous stirring, 25 mL of 0.05M *disodium edetate VS* followed by 20 mL of a mixture of equal volumes of 2M *ammonium acetate* and 2M *acetic acid*. Heat near the boiling point for 5 minutes, cool, add 50 mL of *absolute ethanol* and 3 mL of a freshly prepared 0.025% w/v solution of *dithizone* in *absolute ethanol*. Titrate the excess of disodium edetate with 0.05M *zinc sulfate VS* until the colour of the solution changes from greenish blue to reddish violet. Each mL of 0.05M *disodium edetate VS* is equivalent to 2.549 mg of Al_2O_3. Determine the *weight per mL* of the suspension, Appendix V G, and calculate the percentage content of Al_2O_3, weight in volume.

For magnesium hydroxide

To a volume of the solution reserved in the Assay for Al_2O_3 containing about 40 mg of magnesium hydroxide add 200 mL of *water* and 20 mL of *triethanolamine* and stir. Add 10 mL of *ammonia buffer pH 10.9* and cool the solution to between 3° and 4° by immersion in iced water. Titrate the cooled solution with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 2.916 mg of $Mg(OH)_2$. Using the weight per mL of the suspension, calculate the percentage content of $Mg(OH)_2$, weight in volume.

STORAGE

Co-magaldrox Oral Suspension should not be allowed to freeze.

Co-magaldrox Tablets

Magnesium Hydroxide and Aluminium Hydroxide Tablets

Action and use

Antacid.

DEFINITION

Co-magaldrox Tablets contain Magnesium Hydroxide and Dried Aluminium Hydroxide. The amount of Dried Aluminium Hydroxide is adjusted to give the required content of Al_2O_3.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of magnesium hydroxide, $Mg(OH)_2$

90.0 to 110.0% of the stated amount.

Content of Al_2O_3

45.0 to 55.0% of the stated amount of dried aluminium hydroxide.

IDENTIFICATION

A. To a quantity of the powdered tablets containing about 0.2 g of magnesium hydroxide in 10 mL of 2M *hydrochloric acid* add 0.25 mL of *methyl red solution* and heat to boiling. Add 6M *ammonia* until the solution becomes yellow, continue boiling for 2 minutes and filter. To 1 mL of the filtrate add 1 mL of 6M *ammonia* and 1 mL of 2M *ammonium chloride*; no precipitate is produced. Add 0.25M *disodium hydrogen orthophosphate*; a white crystalline precipitate is produced which is insoluble in 6M *ammonia*.

B. Shake a quantity of the powdered tablets containing 0.25 g of dried aluminium hydroxide with 25 mL of 2M *hydrochloric acid* and filter. The filtrate yields the reaction characteristic of *aluminium salts*, Appendix VI.

ASSAY

For Al_2O_3

Weigh and powder 20 tablets. To a quantity of the powdered tablets containing 1.5 g of dried aluminium hydroxide add 20 mL of *water*, stir and slowly add 30 mL of 3M *hydrochloric acid*. Heat gently, if necessary, to aid solution, cool, filter, wash the filter well with *water*, dilute the combined filtrate and washings to 200 mL with *water* and mix. Reserve a portion of the solution for the Assay for magnesium hydroxide. To 10 mL add 20 mL of *water* and, with continuous stirring, 25 mL of 0.05M *disodium edetate VS* followed by 20 mL of a mixture of equal volumes of 2M *ammonium acetate* and 2M *acetic acid*. Heat near the boiling point for 5 minutes, cool, add 50 mL of *absolute ethanol* and 3 mL of a freshly prepared 0.025% w/v solution of *dithizone* in *absolute ethanol*. Titrate the excess of disodium edetate with 0.05M *zinc sulfate VS* until the colour of the solution changes from greenish blue to reddish violet. Each mL of 0.05M *disodium edetate VS* is equivalent to 2.549 mg of Al_2O_3.

For magnesium hydroxide

To a volume of the solution reserved in the Assay for Al_2O_3 containing about 40 mg of magnesium hydroxide add 200 mL of *water* and 20 mL of *triethanolamine* and stir. Add 10 mL of *ammonia buffer pH 10.9* and cool the solution to between 3° and 4° by immersion in iced water. Titrate the cooled solution with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 2.916 mg of $Mg(OH)_2$.

Co-proxamol Tablets

Dextropropoxyphene Hydrochloride and Paracetamol Tablets

NOTE: *Co-proxamol Tablets are not currently licensed in the United Kingdom.*

Action and use

Opioid analgesic + analgesic; antipyretic.

DEFINITION

Co-proxamol Tablets contain Dextropropoxyphene Hydrochloride and Paracetamol in the proportions, by weight, 1 part to 10 parts.

The tablets comply with the requirements stated under Tablets, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of dextropropoxyphene hydrochloride, $C_{22}H_{29}NO_2,HCl$

95.0 to 105.0% of the stated amount.

Content of paracetamol, $C_8H_9NO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Dextropropoxyphene Hydrochloride with 20 mL of 0.1M *hydrochloric acid* for 5 minutes and filter. To the filtrate add 5 mL of 2M *sodium hydroxide*, extract with two 25-mL quantities of *dichloromethane*, wash the combined extracts

www.webofpharma.com

with 10 mL of *water*, shake with *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 mL of *dichloromethane* and add 50 µL, drop wise, onto the surface of a disc prepared from about 0.3 g of *potassium bromide*, allowing the solvent to evaporate between applications; dry the disc at 50° for 2 minutes. The *infrared absorption spectrum* of the resulting thin film, Appendix II A, is concordant with the *reference spectrum* of dextropropoxyphene *(RS 091)*.

B. Shake a quantity of the powdered tablets containing 0.325 g of Paracetamol with 10 mL of *acetone* for 5 minutes, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of paracetamol *(RS 258)*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *phosphate buffer pH 5.8*, at a temperature of 37°, as the medium.

PROCEDURE

After 45 minutes withdraw a 20 mL sample of the medium and filter. Dilute the filtrate with 0.1M *sodium hydroxide*, if necessary, to give a solution expected to contain about 0.00075% w/v of Paracetamol. Measure the *absorbance* of this solution, Appendix II B, at the maximum at 257 nm using 0.1M *sodium hydroxide* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of paracetamol, $C_8H_9NO_2$, in the medium taking 715 as the value of A(1%, 1 cm) at the maximum at 257 nm.

4-Aminophenol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.5 g of Paracetamol with 50 mL of the mobile phase for 10 minutes and filter.

(2) 0.001% w/v of *4-aminophenol* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 272 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.01M *sodium butanesulfonate* in a mixture of 0.4 volumes of *formic acid*, 15 volumes of *methanol* and 85 volumes of *water*.

LIMIT

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 4-aminophenol is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.1%).

Peaks with a long retention time may occur due to excipients.

Related substances

A. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 25 mg of Dextropropoxyphene Hydrochloride with 5 mL of *acetonitrile* for 2 minutes, add 5 mL of *water*, shake for a further 5 minutes, dilute to 25 mL with *water*, mix and filter (Whatman GF/F filter paper is suitable).

(2) 0.0005% w/v of *4-dimethylamino-3-methyl-1,2-diphenylbutan-2-ol hydrochloride BPCRS* and 0.0005% w/v of *(1S,2R)-1-benzyl-3-dimethylamino-2-methyl-1-phenylpropyl acetate BPCRS* in a mixture of 1 volume of *acetonitrile* and 4 volumes of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 215 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of *acetonitrile* and 60 volumes of 0.2M *sodium perchlorate*, previously adjusted to pH 2.0 using 7M *hydrochloric acid*.

The peaks, in order of emergence, are due to 4-dimethylamino-3-methyl-1,2-diphenylbutan-2-ol hydrochloride and (1*S*,2*R*)-1-benzyl-3-dimethylamino-2-methyl-1-phenylpropyl acetate.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two peaks is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the areas of any peaks corresponding to 4-dimethylamino-3-methyl-1,2-diphenylbutan-2-ol hydrochloride and (1*S*,2*R*)-1-benzyl-3-dimethylamino-2-methyl-1-phenylpropyl acetate are not greater than the areas of the respective peaks in the chromatogram obtained with solution (2) (0.5%).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Transfer a quantity of the finely-powdered tablets containing 1.0 g of Paracetamol to a ground-glass-stoppered 15 mL centrifuge tube, add 5 mL of *peroxide-free ether*, shake for 30 minutes, centrifuge at 1000 revolutions per minute for 15 minutes or until a clear supernatant liquid is obtained and use the supernatant liquid.

(2) Dilute 1 mL of solution (1) to 10 mL with *ethanol (96%)*.

(3) 0.0050% w/v of *4'-chloroacetanilide* in *ethanol (96%)*.

(4) Dissolve 0.25 g of *4'-chloroacetanilide* and 0.10 g of *paracetamol* in sufficient *ethanol (96%)* to produce 100 mL.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase described below.

(c) Apply 200 µL of solution (1) and 40 µL of each of solutions (2), (3) and (4).

(d) Develop the plate to 14 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

10 volumes of *toluene*, 25 volumes of *acetone* and 65 volumes of *chloroform*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated principal spots, the spot corresponding to 4′-chloroacetanilide having the higher Rf value.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to 4′-chloroacetanilide is not more intense than the spot in the chromatogram obtained with solution (3) (0.005%).

In the chromatogram obtained with solution (2):

any *secondary spot* with an Rf value lower than that of 4′-chloroacetanilide is not more intense than the spot in the chromatogram obtained with solution (3) (0.25%).

ASSAY

Weigh and powder 20 tablets.

For dextropropoxyphene hydrochloride

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the powdered tablets containing 32.5 mg of Dextropropoxyphene Hydrochloride in 100 mL of 0.02M *hydrochloric acid*, mix with the aid of ultrasound for 15 minutes, allow to cool, dilute to 500 mL with a mixture of equal volumes of *acetonitrile* and 0.02M *hydrochloric acid* and filter (Whatman GF/C filter paper is suitable).

(2) 0.0065% w/v of *dextropropoxyphene hydrochloride BPCRS* in a mixture of 40 volumes of *acetonitrile* and 60 volumes of 0.02M *hydrochloric acid*.

(3) 0.0005% w/v of *4-dimethylamino-3-methyl-1,2-diphenylbutan-2-ol hydrochloride BPCRS* and 0.0005% w/v of *(1S,2R)-1-benzyl-3-dimethylamino-2-methyl-1-phenylpropyl acetate BPCRS* in a mixture of 1 volume of *acetonitrile* and 4 volumes of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 215 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of *acetonitrile* and 60 volumes of 0.2M *sodium perchlorate*, previously adjusted to pH 2.0 using 7M *hydrochloric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two peaks is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}NO_2$,HCl in the tablets using the declared content of $C_{22}H_{29}NO_2$,HCl in *dextropropoxyphene hydrochloride BPCRS*.

For paracetamol

Disperse a quantity of the powdered tablets containing 0.325 g of Paracetamol in 5 mL of *water*, add 100 mL of *methanol* and shake. Add 300 mL of *water*, shake for 5 minutes, allow to cool, dilute to 500 mL with *water*, mix and filter. Dilute 5 mL of the filtrate to 250 mL with 0.01M *sodium hydroxide* and measure the *absorbance* of the resulting solution at the maximum at 257 nm, Appendix II B. Calculate the content of $C_8H_9NO_2$ in the tablets taking 715 as the value of A(1%, 1 cm) at the maximum at 257 nm.

STORAGE

Co-proxamol Tablets should be protected from light.

Cortisone Tablets

Action and use

Corticosteroid.

DEFINITION

Cortisone Tablets contain Cortisone Acetate in *fine powder*.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of cortisone acetate, $C_{23}H_{30}O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 0.1 g of Cortisone Acetate with 5 mL of *chloroform*, filter and evaporate the chloroform. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with a spectrum prepared from the residue obtained by evaporating 5 mL of a 2% w/v solution of *cortisone acetate BPCRS* in *chloroform*. Use the same method of evaporation of the chloroform as that for the tablet extract. Prepare *potassium bromide* discs.

B. Complies with the test for *identification of steroids*, Appendix III A, using *impregnating solvent I* and *mobile phase B*.

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Mix a quantity of the powdered tablets containing 25 mg of Cortisone Acetate with 10 mL of the mobile phase, place in an ultrasonic bath for 10 minutes and filter (Whatman GF/C filter is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) 0.002% w/v each of *cortisone acetate BPCRS* and *hydrocortisone acetate BPCRS* in the mobile phase.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

(g) Continue the chromatography for twice the retention time of the principal peak.

MOBILE PHASE

Mix 400 mL *of acetonitrile* with 550 mL of *water*, allow to equilibrate and adjust the volume to 1000 mL with *water*.

SYSTEM SUITABILITY

Equilibrate the column with the mobile phase at a flow rate of 1 mL per minute for about 30 minutes.

Inject solution (3). When the chromatograms are recorded in the prescribed conditions the retention times are: hydrocortisone acetate, about 10 minutes and cortisone acetate, about 12 minutes.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to hydrocortisone acetate and cortisone acetate is at least 4.2; if necessary, adjust the concentration of acetonitrile in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of all the *secondary peaks* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%).

Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of a 0.3% w/v solution of *sodium dodecyl sulfate*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample at the maximum at 242 nm, Appendix II B using a 0.3% w/v solution of *sodium dodecyl sulfate* in the reference cell.

(2) Measure the *absorbance* of a 0.0028% w/v solution of *cortisone acetate BPCRS* using a 0.3% w/v solution of *sodium dodecyl sulfate* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of $C_{23}H_{30}O_6$, in the medium from the absorbances obtained and using the declared content of $C_{23}H_{30}O_6$, in *cortisone acetate BPCRS*.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute 50 mL of a solution in *methanol* containing 0.02% w/v each of *cortisone acetate BPCRS* and *prednisolone* to 100 mL with *water*.

(2) Add 50 mL of *methanol* to a quantity of the powdered tablets containing 10 mg of Cortisone Acetate, shake, mix with the aid of ultrasound for 2 minutes, dilute to 100 mL with *water*, shake, centrifuge and use the supernatant liquid.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of *water* and 60 volumes of *methanol*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (1), the *resolution factor* between the peaks due to cortisone acetate and prednisolone is at least 5.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{30}O_6$ in the tablets using the declared content of $C_{23}H_{30}O_6$ in *cortisone acetate BPCRS*.

STORAGE

Cortisone Tablets should be protected from light.

Co-tenidone Tablets

Atenolol and Chlortalidone Tablets

Action and use

Beta-adrenoreceptor antagonist + thiazide like diuretic.

DEFINITION

Co-tenidone Tablets contain Atenolol and Chlortalidone in the proportions, by weight, 4 parts to 1 part.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of atenolol, $C_{14}H_{22}N_2O_3$

95.0 to 105.0% of the stated amount.

Content of chlortalidone, $C_{14}H_{11}ClN_2O_4S$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Remove any film coating from the tablets, powder and shake a quantity of the powdered tablets containing 0.1 g of atenolol with 10 mL of *methanol* for 15 minutes and filter.

(2) 1.0% w/v of *atenolol BPCRS* in *methanol*.

(3) 0.25% w/v of *chlortalidone BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

www.webofpharma.com

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

30 volumes of 18M *ammonia* and 150 volumes of *butan-1-ol*.

CONFIRMATION

In the chromatogram obtained with solution (1) the two principal spots correspond in position, size and intensity to those of the principal spots in the chromatograms obtained with solutions (2) and (3).

B. In the Assay, the retention times of the two principal peaks in the chromatogram obtained with solution (1) correspond to those of the principal peaks in the chromatograms obtained with solutions (2) and (3).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Remove any film coating from the tablets, powder and shake a quantity of the powder containing 0.1 g of atenolol (and 0.025 g of chlortalidone) with 25 mL of the mobile phase for 30 minutes with the aid of ultrasound. Filter through a suitable filter (Whatman No 1 is suitable) and use the filtrate.

(2) Dilute 1 volume of solution (1) to 200 volumes with the mobile phase.

(3) Dissolve 50 mg of *atenolol impurity standard BPCRS* in 0.1 mL of *dimethyl sulfoxide*, with the aid of gentle heat, and dilute to 100 mL with the mobile phase.

(4) 0.002% w/v of *2-(4-chloro-3-sulfamoylbenzoyl)benzoic acid BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 226 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

20 volumes of *tetrahydrofuran*, 180 volumes of *methanol* and 800 volumes of 0.025M *potassium dihydrogen orthophosphate* containing 1.0 g of *sodium octanesulfonate* and 0.4 g of *tetrabutylammonium hydrogen sulfate* per litre and adjusted to pH 3.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *atenolol impurity standard BPCRS* and the peaks corresponding to tertiary amine, which is usually a doublet, and bis ether are clearly separated. If necessary, adjust the concentration of sodium octanesulfonate in the mobile phase; increasing the concentration increases the retention time of the tertiary amine.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 2-(4-chloro-3-sulfamoyl-benzoyl)benzoic acid is not greater than the area of the peak in the chromatogram obtained with solution (4) (2%, with reference to the content of chlortalidone);

the area of any peak corresponding to blocker acid is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%, with reference to the content of atenolol);

the area of any peak corresponding to either tertiary amine or bis ether is not greater than half of the area of the principal peak in the chromatogram obtained with solution (2) (0.25%, with reference to the content of atenolol).

ASSAY

Weigh 20 tablets, remove the film coating and powder. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Extract a quantity of the powder containing 0.1 g of atenolol with 70 mL of the mobile phase by shaking with the aid of ultrasound for 30 minutes, allow to cool, add sufficient of the mobile phase to produce 100 mL, filter and use the filtrate.

(2) 0.1% w/v of *atenolol BPCRS* in the mobile phase.

(3) 0.025% w/v of *chlortalidone BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 275 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

10 volumes of *sulfuric acid (10%)*, 50 volumes of *propan-2-ol*, 200 volumes of *acetonitrile* and 740 volumes of *water* containing 0.5 g per litre of *sodium octanesulfonate* and adjusted to pH 3.0 with 2M *sodium hydroxide*.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{22}N_2O_3$ and of $C_{14}H_{11}ClN_2O_4S$ using the declared contents of $C_{14}H_{22}N_2O_3$ and of $C_{14}H_{11}ClN_2O_4S$ in *atenolol BPCRS* and in *chlortalidone BPCRS*, respectively.

When atenolol and chlorthalidone tablets are prescribed or demanded, Co-tenidone Tablets shall be dispensed or supplied.

Co-triamterzide Tablets

Triamterene and Hydrochlorothiazide Tablets

Action and use

Potassium-sparing diuretic + thiazide diuretic.

DEFINITION

Co-triamterzide Tablets contain Triamterene and Hydrochlorothiazide in the proportions, by weight, 2 parts to 1 part.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of triamterene, $C_{12}H_{11}N_7$

95.0 to 105.0% of the stated amount.

Content of hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$

95.0 to 105.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 50 mg of hydrochlorothiazide with 25 mL of *acetone*, filter, evaporate the filtrate to dryness and dry the residue at 100° for 1 hour. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of hydrochlorothiazide *(RS 178)*.

B. In test A for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (3).

C. In the Assay, the two principal peaks in the chromatogram obtained with solution (3) have the same retention times as the peak due to triamterene in the chromatogram obtained with solution (1) and as the peak due to hydrochlorothiazide in the chromatogram obtained with solution (2).

TESTS

5-Nitroso-2,4,6-triaminopyrimidine

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* HF_{254} as the coating substance. Apply separately to the plate, as 1.5-cm bands, two 10-µL applications of each of the following four freshly prepared solutions. For solution (1) shake a quantity of the powdered tablets containing 0.10 g of triamterene with 10 mL of *anhydrous formic acid* for 5 minutes, centrifuge and use the clear supernatant liquid. For solution (2) dissolve 5 mg of *5-nitroso-2,4,6-triaminopyrimidine EPCRS* in 50 mL of *anhydrous formic acid* and dilute 1 volume of the solution to 10 volumes with the same solvent. Prepare solution (3) in the same manner as solution (1) but shaking with 10 mL of solution (2) in place of the formic acid. For solution (4) dissolve 5 mg of *hydrochlorothiazide BPCRS* in 1 mL of *acetone*.

Develop over a path of 5 cm using *ether* as the mobile phase, remove the plate, allow it to dry in air and develop over a path of 10 cm using a 0.05% w/v solution of *fluorescein sodium* in a mixture of 10 volumes of *glacial acetic acid*, 10 volumes of *methanol* and 80 volumes of *ethyl acetate* as the mobile phase. After removal of the plate, dry it in a current of air, expose to ammonia vapour for a few seconds and examine under *ultraviolet light (254* and *365 nm)*. Any band corresponding to 5-nitroso-2,4,6-triaminopyrimidine in the chromatogram obtained with solution (1) is not more intense than the band in the chromatogram obtained with solution (2) (0.1%). The test is not valid unless, in the chromatogram obtained with solution (3), a band corresponding to the band due to hydrochlorothiazide (obtained with solution (4)), appears above, and is clearly separated from, the band due to 5-nitroso-2,4,6-triaminopyrimidine.

Related substances

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of 18M *ammonia*, 10 volumes of *methanol* and 90 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.10 g of triamterene with 20 mL of *dimethyl sulfoxide*, centrifuge and dilute 2 volumes of the supernatant liquid to 50 volumes with *methanol*. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. For solution (3) dissolve 20 mg of *triamterene BPCRS* in 4 mL of *dimethyl sulfoxide* and add sufficient *methanol* to produce 100 mL. After removal of the plate, allow it to dry in air until the solvent has evaporated and examine under *ultraviolet light (365 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%, with reference to the content of triamterene).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 15 volumes of *propan-2-ol* and 85 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) vigorously shake a quantity of the powdered tablets containing 50 mg of hydrochlorothiazide with 50 mL of *acetone*, filter, evaporate the filtrate to dryness and dissolve the residue in 10 mL of *acetone*. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *acetone*. After removal of the plate, dry it in a current of air and reveal the spots by *Method I*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%, with reference to the content of hydrochlorothiazide). Disregard any spot close to the line of application.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 25 mL of *acetonitrile* and 4 mL of *glacial acetic acid* to a quantity of the powdered tablets containing 25 mg of hydrochlorothiazide, mix, immediately add 20 mL of *water*, shake for 15 minutes, dilute to 100 mL with *water* and filter through glass-fibre paper (Whatman GF/A is suitable). Dilute 10 mL of the filtrate to 100 mL with *water*. For solution (2) dissolve 50 mg of *triamterene BPCRS* in 25 mL of *acetonitrile*, add 4 mL of *glacial acetic acid* and immediately add sufficient *water* to produce 100 mL. Dilute 10 mL to 100 mL with *water*. For solution (3) dissolve 25 mg of *hydrochlorothiazide BPCRS* in 25 mL of *acetonitrile*, add 4 mL of *glacial acetic acid* and immediately add sufficient *water* to produce 100 mL. Dilute 10 mL to 100 mL with *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) a mixture of 2 volumes of *methanol*, 18 volumes of *acetonitrile*, 40 volumes of a 0.5% w/v solution of *ammonium chloride* and 40 volumes of 0.01M *sodium perchlorate* as the mobile phase with a flow rate of 2.0 mL per minute and (c) a detection wavelength of 273 nm.

Calculate the content of $C_{12}H_{11}N_7$ and $C_7H_8ClN_3O_4S_2$ using the declared contents of $C_{12}H_{11}N_7$ and $C_7H_8ClN_3O_4S_2$ in *triamterene BPCRS* and *hydrochlorothiazide BPCRS* respectively.

STORAGE

Co-triamterzide Tablets should be protected from moisture.

Co-trimoxazole Infusion

Co-trimoxazole Intravenous Infusion; Trimethoprim and Sulfamethoxazole Infusion; Trimethoprim and Sulfamethoxazole Intravenous Infusion

Action and use

Dihydrofolate reductase inhibitor + sulfonamide antibacterial.

DEFINITION

Co-trimoxazole Infusion is a sterile solution containing Trimethoprim and the sodium derivative of

www.webofpharma.com

Sulfamethoxazole. It is prepared by diluting Sterile Co-trimoxazole Concentrate with a suitable diluent in accordance with the manufacturer's instructions.

The infusion complies with the requirements stated under Parenteral Preparations.

STERILE CO-TRIMOXAZOLE CONCENTRATE

DEFINITION

Sterile Co-trimoxazole Concentrate is a sterile solution of Trimethoprim and sulfamethoxazole sodium, prepared by the interaction of Sulfamethoxazole and Sodium Hydroxide, in the proportion 1 part to 5 parts, in Water for Injections containing 40 to 45% v/v of Propylene Glycol.

The concentrate complies with the requirements for Concentrates for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of trimethoprim, $C_{14}H_{18}N_4O_3$
92.5 to 107.5% of the stated amount of trimethoprim.

Content of sulfamethoxazole, $C_{10}H_{11}N_3O_3S$
92.5 to 107.5% of the stated amount of sulfamethoxazole.

CHARACTERISTICS

A colourless or slightly yellow solution.

IDENTIFICATION

A. Add drop wise to 75 mL of 0.1M *hydrochloric acid* a volume of the sterile concentrate containing 0.8 g of Sulfamethoxazole, stirring continuously. Allow the suspension to stand for 5 minutes and filter through a sintered-glass filter. Wash the residue with 10 mL of *water*, recrystallise from *ethanol (96%)* and dry at 105°. Dissolve the residue in the minimum volume of a 5% w/v solution of *sodium carbonate*, add 1M *hydrochloric acid* drop wise until precipitation is complete, filter, wash the residue sparingly with *water* and dry at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of sulfamethoxazole *(RS 327)*.

B. To a volume containing 80 mg of Trimethoprim add 30 mL of 0.1M *sodium hydroxide* and extract with two 50 mL quantities of *chloroform*. Wash the combined extracts with two 10 mL quantities of 0.1M *sodium hydroxide* and then with 10 mL of *water*, shake with 5 g of *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness using a rotary evaporator. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of trimethoprim *(RS 354)*.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Evaporate to dryness a volume of the sterile concentrate containing 0.16 g of Sulfamethoxazole, shake the residue with 8 mL of *methanol* and filter.

(2) 2.0% w/v of *sulfamethoxazole BPCRS* in *methanol*.

(3) 0.4% w/v of *trimethoprim BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

5 volumes of *dimethylformamide*, 10 volumes of *methanol* and 100 volumes of *chloroform*.

CONFIRMATION

One of the principal spots in the chromatogram obtained with solution (1) corresponds to the spot in the chromatogram obtained with solution (2) and the other corresponds to that in the chromatogram obtained with solution (3).

TESTS

Alkalinity
pH, 9.5 to 11.0, Appendix V L.

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the sterile concentrate with *water BET* to give a solution containing 1 mg of Trimethoprim and 5 mg of Sulfamethoxazole [6 mg of co-trimoxazole] per mL (solution A). The endotoxin limit concentration of solution A is 0.5 IU per mL.

ASSAY

For trimethoprim
To a volume of the sterile concentrate containing 48 mg of Trimethoprim add 30 mL of 0.1M *sodium hydroxide* and extract with four 50 mL quantities of *chloroform*, washing each extract with the same two 10 mL quantities of 0.1M *sodium hydroxide*. Combine the chloroform extracts, extract with four 50 mL quantities of 1M *acetic acid*, wash the combined extracts with 5 mL of *chloroform* and dilute the aqueous extracts to 250 mL with 1M *acetic acid*. To 10 mL of the resulting solution add 10 mL of 1M *acetic acid* and sufficient *water* to produce 100 mL and measure the *absorbance* of the resulting solution at the maximum at 271 nm, Appendix II B. Calculate the content of $C_{14}H_{18}N_4O_3$ taking 204 as the value of A(1%, 1 cm) at the maximum at 271 nm.

For sulfamethoxazole
To a volume of the sterile concentrate containing 0.4 g of Sulfamethoxazole add 60 mL of *water* and 10 mL of *hydrochloric acid*. Add 3 g of *potassium bromide*, cool in ice and titrate slowly with 0.1M *sodium nitrite VS*, stirring constantly and determining the end point electrometrically. Each mL of 0.1M *sodium nitrite VS* is equivalent to 25.33 mg of $C_{10}H_{11}N_3O_3S$.

STORAGE

Sterile Co-trimoxazole Concentrate should be protected from light.

Co-trimoxazole Oral Suspension

Trimethoprim and Sulfamethoxazole Oral Suspension

Action and use
Dihydrofolate reductase inhibitor + sulfonamide antibacterial.

DEFINITION

Co-trimoxazole Oral Suspension is a suspension containing 1.6% w/v of Trimethoprim and 8.0% w/v of Sulfamethoxazole in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of trimethoprim, $C_{14}H_{18}N_4O_3$
1.44 to 1.76% w/v.

www.webofpharma.com

Content of sulfamethoxazole, $C_{10}H_{11}N_3O_3S$
7.40 to 8.60% w/v.

IDENTIFICATION

A. To a quantity containing 50 mg of Trimethoprim add 30 mL of 0.1M *sodium hydroxide* and extract with four 50 mL quantities of *chloroform*. Wash the combined extracts with two 10-mL quantities of 0.1M *sodium hydroxide* and extract with two 50 mL quantities of *chloroform*. Wash the combined chloroform extracts with two 10 mL quantities of 0.1M *sodium hydroxide* and then with 10 mL of *water*. Shake with 5 g of *anhydrous sodium sulfate*, filter and evaporate to dryness using a rotary evaporator. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of trimethoprim *(RS 354)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 20 mL of *methanol* to 5 mL of the oral suspension, mix, shake with 10 g of *anhydrous sodium sulfate*, centrifuge and use the supernatant liquid.

(2) 2.0% w/v of *sulfamethoxazole BPCRS* in *methanol*.

(3) 0.4% w/v of *trimethoprim BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

5 volumes of *dimethylformamide*, 10 volumes of *methanol* and 100 volumes of *chloroform*.

CONFIRMATION

One of the principal spots in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2) and the other corresponds in position and colour to that in the chromatogram obtained with solution (3).

TESTS

Acidity
pH, 5.0 to 6.5, Appendix V L.

ASSAY

For trimethoprim

Extract the chloroform solution reserved in the Assay for sulfamethoxazole with four 50 mL quantities of 1M *acetic acid*. Wash the combined extracts with 5 mL of *chloroform* and dilute the aqueous extracts to 250 mL with 1M *acetic acid*. To 10 mL of this solution add 10 mL of 1M *acetic acid* and sufficient *water* to produce 100 mL and measure the *absorbance* of the resulting solution at the maximum at 271 nm, Appendix II B. Calculate the content of $C_{14}H_{18}N_4O_3$ taking 204 as the value of A(1%, 1 cm) at the maximum at 271 nm. Using the weight per mL of the oral suspension, calculate the content of $C_{14}H_{18}N_4O_3$, weight in volume.

For sulfamethoxazole

To 4 g of the oral suspension add 30 mL of 0.1M *sodium hydroxide*, shake and extract with four 50 mL quantities of *chloroform*, washing each extract with the same two 10 mL quantities of 0.1M *sodium hydroxide*. Reserve the combined chloroform extracts for the Assay for trimethoprim. Dilute the combined aqueous solution and washings to 250 mL with *water*, filter and dilute 5 mL of the filtrate to 200 mL with *water* (solution A). Carry out the following procedure protected from light using 2 mL of solution A. Add 0.5 mL of 4M *hydrochloric acid* and 1 mL of a 0.1% w/v solution of *sodium nitrite* and allow to stand for 2 minutes. Add 1 mL of a 0.5% w/v solution of *ammonium sulfamate* and allow to stand for 3 minutes. Add 1 mL of a 0.1% w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride* and allow to stand for 10 minutes. Dilute the resulting solution to 25 mL with *water* and measure the *absorbance* at 538 nm, Appendix II B, using in the reference cell a solution prepared in the same manner but using 2 mL of *water* in place of solution A. Dissolve 0.25 g of *sulfamethoxazole BPCRS* in 50 mL of 0.1M *sodium hydroxide* and dilute to 250 mL with *water*. Dilute 5 mL of the resulting solution to 200 mL with *water* (solution B). Repeat the procedure using 2 mL of solution B and beginning at the words 'Add 0.5 mL of ...'. Calculate the content of $C_{10}H_{11}N_3O_3S$ from the values of the absorbances obtained using the declared content of $C_{10}H_{11}N_3O_3S$ in *sulfamethoxazole BPCRS*. Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{10}H_{11}N_3O_3S$, weight in volume.

STORAGE

Co-trimoxazole Oral Suspension should be protected from light and stored at a temperature not exceeding 30°.

Co-trimoxazole Oral Suspension contains, in 5 mL, 80 mg of Trimethoprim and 400 mg of Sulfamethoxazole.

Paediatric Co-trimoxazole Oral Suspension

Paediatric Trimethoprim and Sulfamethoxazole Oral Suspension

Action and use
Dihydrofolate reductase inhibitor + sulfonamide antibacterial.

DEFINITION

Paediatric Co-trimoxazole Oral Suspension is a suspension containing 0.8% w/v of Trimethoprim and 4% w/v of Sulfamethoxazole in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of trimethoprim, $C_{14}H_{18}N_4O_3$
0.72 to 0.88% w/v.

Content of sulfamethoxazole, $C_{10}H_{11}N_3O_3S$
3.60 to 4.40% w/v.

IDENTIFICATION

Complies with the tests described under Co-trimoxazole Oral Suspension but in test B for solution (2) use a 1.0% w/v solution of *sulfamethoxazole BPCRS* in *methanol* and for solution (3) use a 0.20% w/v solution of *trimethoprim BPCRS* in *methanol*. Apply to the plate 10 µL of each of the three solutions.

Acidity
pH, 5.0 to 6.5, Appendix V L.

ASSAY

Carry out the Assays for trimethoprim and sulfamethoxazole described under Co-trimoxazole Oral Suspension but using 8 g of the oral suspension.

www.webofpharma.com

STORAGE

Paediatric Co-trimoxazole Oral Suspension should be protected from light and stored at a temperature not exceeding 30°.

Paediatric Co-trimoxazole Oral Suspension contains, in 5 mL, 40 mg of Trimethoprim and 200 mg of Sulfamethoxazole.

Co-trimoxazole Tablets

Trimethoprim and Sulfamethoxazole Tablets

Action and use

Dihydrofolate reductase inhibitor + sulfonamide antibacterial.

DEFINITION

Co-trimoxazole Tablets contain Trimethoprim and Sulfamethoxazole in the proportions, by weight, 1 part to 5 parts.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of trimethoprim, $C_{14}H_{18}N_4O_3$

92.5 to 107.5% of the stated amount of trimethoprim.

Content of sulfamethoxazole, $C_{10}H_{11}N_3O_3S$

92.5 to 107.5% of the stated amount of sulfamethoxazole.

IDENTIFICATION

A. Filter the aqueous layer reserved in the Assay for trimethoprim. Add, drop wise, sufficient 2M *hydrochloric acid* to the filtrate to make it just acidic and extract with 50 mL of *ether*. Wash the ether layer with 10 mL of *water*, shake with 5 g of *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness using a rotary evaporator. Dissolve the residue in the minimum volume of a 5% w/v solution of *sodium carbonate*, add 1M *hydrochloric acid* drop wise until precipitation is complete and filter. Wash the residue sparingly with *water* and dry at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of sulfamethoxazole *(RS 327)*.

B. To a quantity of the powdered tablets containing 50 mg of Trimethoprim add 30 mL of 0.1M *sodium hydroxide* and extract with two 50 mL quantities of *chloroform*. Wash the combined chloroform extracts with two 10-mL quantities of 0.1M *sodium hydroxide* and then with 10 mL of *water*. Shake with 5 g of *anhydrous sodium sulfate*, filter and evaporate to dryness using a rotary evaporator. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of trimethoprim *(RS 354)*.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.4 g of Sulfamethoxazole with 20 mL of *methanol* and filter.

(2) 2.0% w/v of *sulfamethoxazole BPCRS* in *methanol*.

(3) 0.4% w/v of *trimethoprim BPCRS* in *methanol*

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

5 volumes of *dimethylformamide*, 10 volumes of *methanol* and 100 volumes of *chloroform*.

CONFIRMATION

One of the principal spots in the chromatogram obtained with solution (1) corresponds to the spot in the chromatogram obtained with solution (2) and the other corresponds to the spot in the chromatogram obtained with solution (3).

ASSAY

Weigh and powder 20 tablets.

For trimethoprim

To a quantity of the powder containing 50 mg of Trimethoprim add 30 mL of 0.1M *sodium hydroxide* and extract with four 50-mL quantities of *chloroform*, washing each extract with the same two 10-mL quantities of 0.1M *sodium hydroxide*. Reserve the aqueous layer for test A for Identification. Combine the chloroform extracts and extract with four 50-mL quantities of 1M *acetic acid*. Wash the combined extracts with 5 mL of *chloroform* and dilute the aqueous extracts to 250 mL with 1M *acetic acid*. To 10 mL of the solution add 10 mL of 1M *acetic acid* and sufficient *water* to produce 100 mL and measure the *absorbance* of the resulting solution at the maximum at 271 nm, Appendix II B. Calculate the content of $C_{14}H_{18}N_4O_3$ taking 204 as the value of A(1%, 1 cm) at the maximum at 271 nm.

For sulfamethoxazole

Dissolve, as completely as possible, a quantity of the powder containing 0.5 g of Sulfamethoxazole in 60 mL of *water* and 10 mL of *hydrochloric acid*. Add 3 g of *potassium bromide*, cool in ice and titrate slowly with 0.1M *sodium nitrite VS*, stirring constantly and determining the end point electrometrically. Each mL of 0.1M *sodium nitrite VS* is equivalent to 25.33 mg of $C_{10}H_{11}N_3O_3S$.

Dispersible Co-trimoxazole Tablets

Dispersible Trimethoprim and Sulfamethoxazole Tablets

Action and use

Dihydrofolate reductase inhibitor + sulfonamide antibacterial.

DEFINITION

Dispersible Co-trimoxazole Tablets contain Trimethoprim and Sulfamethoxazole in the proportions, by weight, 1 part trimethoprim to 5 parts sulfamethoxazole in a suitable dispersible basis.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of trimethoprim, $C_{14}H_{18}N_4O_3$

92.5 to 107.5% of the stated amount of trimethoprim.

Content of sulfamethoxazole, $C_{10}H_{11}N_3O_3S$

92.5 to 107.5% of the stated amount of sulfamethoxazole.

IDENTIFICATION

A. Filter the aqueous layer reserved in the Assay for trimethoprim. Add, drop wise, sufficient 2M *hydrochloric acid* to the filtrate to make it just acidic and extract with 50 mL of *ether*. Wash the ether layer with 10 mL of *water*, shake with 5 g of *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness using a rotary evaporator. Dissolve the residue in the minimum volume of a 5% w/v solution of

www.webofpharma.com

sodium carbonate, add 1M *hydrochloric acid* drop wise until precipitation is complete and filter. Wash the residue sparingly with *water* and dry at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of sulfamethoxazole *(RS 327)*.

B. To a quantity of the powdered tablets containing 50 mg of trimethoprim add 30 mL of 0.1M *sodium hydroxide* and extract with two 50 mL quantities of *chloroform*. Wash the combined chloroform extracts with two 10 mL quantities of 0.1M *sodium hydroxide* and then with 10 mL of *water*. Shake with 5 g of *anhydrous sodium sulfate*, filter and evaporate to dryness using a rotary evaporator. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of trimethoprim *(RS 354)*.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 100 volumes of *chloroform*, 10 volumes of *methanol* and 5 volumes of *dimethylformamide* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.4 g of Sulfamethoxazole with 20 mL of *methanol* and filter. Solution (2) contains 2.0% w/v of *sulfamethoxazole BPCRS* in *methanol*. Solution (3) contains 0.4% w/v of *trimethoprim BPCRS* in *methanol*. After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. One of the principal spots in the chromatogram obtained with solution (1) corresponds to the spot in the chromatogram obtained with solution (2) and the other corresponds to the spot in the chromatogram obtained with solution (3).

Disintegration
The tablets disintegrate within 2 minutes when examined by the *disintegration test for tablets and capsules*, Appendix XII A1, but using *water* at 19° to 21°.

ASSAY
Weigh and powder 20 tablets.

For trimethoprim
To a quantity of the powder containing 50 mg of Trimethoprim add 30 mL of 0.1M *sodium hydroxide* and extract with four 50 mL quantities of *chloroform*, washing each extract with the same two 10 mL quantities of 0.1M *sodium hydroxide*. Reserve the aqueous layer for test A for Identification. Combine the chloroform extracts and extract with four 50 mL quantities of 1M *acetic acid*. Wash the combined extracts with four 5 mL quantities of *chloroform* and dilute the aqueous extracts to 250 mL with 1M *acetic acid*. To 10 mL of the solution add 10 mL of 1M *acetic acid* and sufficient *water* to produce 100 mL and measure the *absorbance* of the resulting solution at the maximum at 271 nm, Appendix II B. Calculate the content of $C_{14}H_{18}N_4O_3$ taking 204 as the value of A(1%, 1 cm) at the maximum at 271 nm.

For sulfamethoxazole
Dissolve, as completely as possible, a quantity of the powder containing 0.5 g of Sulfamethoxazole in 60 mL of *water* and 10 mL of *hydrochloric acid*. Add 3 g of *potassium bromide*, cool in ice and titrate slowly with 0.1M *sodium nitrite VS*, stirring constantly and determining the end point electrometrically. Each mL of 0.1M *sodium nitrite VS* is equivalent to 25.33 mg of $C_{10}H_{11}N_3O_3S$.

Paediatric Co-trimoxazole Tablets

Paediatric Trimethoprim and Sulfamethoxazole Tablets

Action and use
Dihydrofolate reductase inhibitor + sulfonamide antibacterial.

DEFINITION
Paediatric Co-trimoxazole Tablets contain, in each, 20 mg of Trimethoprim and 100 mg of Sulfamethoxazole.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of trimethoprim, $C_{14}H_{18}N_4O_3$
0.0185 to 0.0215 g.

Content of sulfamethoxazole, $C_{10}H_{11}N_3O_3S$
0.0925 to 0.1075 g.

IDENTIFICATION
Comply with the tests described under Co-trimoxazole Tablets.

ASSAY
Carry out the Assays for trimethoprim and for sulfamethoxazole described under Co-trimoxazole Tablets.

Crotamiton Cream

Action and use
Acaricide.

DEFINITION
Crotamiton Cream contains Crotamiton in a suitable basis.
The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of crotamiton, $C_{13}H_{17}NO$
93.0 to 107.0% of the stated amount.

IDENTIFICATION
A. Mix a quantity of the cream containing 0.5 g of Crotamiton with 50 mL of *water* and then slowly add 50 mL of 1M *sodium hydroxide* while stirring vigorously. Filter the mixture, adjust the filtrate to pH 7 with 5M *hydrochloric acid* and extract with 50 mL of *ether*. Wash the ether layer with 10 mL of a saturated solution of *sodium chloride*, dry the organic layer over *anhydrous sodium sulfate*, filter and evaporate to an oily residue. The *light absorption*, Appendix II B, in the range 220 to 350 nm of a 0.003% w/v solution of the residue in *cyclohexane* exhibits a maximum only at 242 nm. The A(1%, 1 cm) at the maximum is about 315.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *absolute ethanol*.

(1) 0.25% w/v of the residue obtained in test A.

(2) 0.25% w/v of *crotamiton BPCRS*.

(3) A mixture of equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

www.webofpharma.com

MOBILE PHASE

Shake 98 volumes of *chloroform* with 2 volumes of 18M *ammonia*, dry over *anhydrous sodium sulfate*, filter and mix 97 volumes of the filtrate with 3 volumes of *propan-2-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2), but if not, the principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

C. In the Assay, the principal peak in the chromatogram obtained with solution (2) has the same retention time as the principal peak in the chromatogram obtained with solution (3).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using solutions (1), (4), (5), (6) and (7) as described under the Assay. For solution (1) allow the chromatography to proceed for 2.5 times the retention time of the principal peak.

CHROMATOGRAPHIC CONDITIONS

Use the chromatographic conditions described under Assay.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (6), the *resolution factor* between the peaks corresponding to the *E*-isomer and to crotamiton impurity A is at least 4.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to crotamiton impurity A is not greater than the area of the corresponding peak in the chromatogram obtained with solution (4) (3%);

the sum of the areas of any *secondary peaks* apart from any peaks corresponding to the *Z*-isomer and to crotamiton impurity A is not greater than the sum of the areas of the peaks corresponding to the *E*- and *Z*-isomers in the chromatogram obtained with solution (5) (1%).

Disregard any peak with an area less than 0.02 times the area of the principal peak in the chromatogram obtained with solution (5) (0.02%) and any peak with the same retention time as the principal peak in the chromatogram obtained with solution (7).

Z-Isomer

Not more than 15% of the total content of *E*- and *Z*-isomers determined in the Assay.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 2 mL of *water* and 100 mL of *cyclohexane* to a quantity of the preparation being examined containing 0.1 g of Crotamiton, shake for 10 minutes and separate the lower, aqueous layer. Repeat the extraction using two 10 mL quantities of *cyclohexane*, filter the combined extracts and add sufficient *cyclohexane* to produce 200 mL.

(2) Dilute 1 volume of solution (1) to 20 volumes with *cyclohexane*.

(3) 0.0025% w/v of *crotamiton BPCRS* in *cyclohexane*.

(4) 0.0015% w/v of *crotamiton impurity A EPCRS* in *cyclohexane*.

(5) Dilute 1 volume of solution (1) to 100 volumes with *cyclohexane*.

(6) Dilute 1 volume of a 0.015% w/v solution of *crotamiton impurity A EPCRS* to 10 volumes with solution (1).

(7) 0.001% w/v of *methyl hydroxybenzoate* in *cyclohexane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *silica gel for chromatography* (5 µm) (Lichrosorb Si60 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 242 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

8 volumes of *tetrahydrofuran* and 92 volumes of *cyclohexane*.

SYSTEM SUITABILITY

For solutions (4) and (6), when the chromatograms are recorded under the prescribed conditions, the retention times relative to the principal peak (*E*-crotamiton) are: *Z*-isomer, about 0.5; *N*-ethyl-*N*-(2-methylphenyl)but-3-enamide (crotamiton impurity A), about 0.8. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with solution (4) is at least 70% of the full scale of the recorder.

The test is not valid unless, in the chromatogram obtained with solution (6), the *resolution factor* between the peaks corresponding to the *E*-isomer and to crotamiton impurity A is at least 4.5.

DETERMINATION OF CONTENT

Using chromatograms (2) and (3), calculate the contents of the *E*- and *Z*-isomers in the preparation being examined using the declared contents of *E*- and *Z*-crotamiton in *crotamiton BPCRS* and hence calculate the content of $C_{13}H_{17}NO$ in the preparation being examined.

Crotamiton Lotion

Crotamiton Cutaneous Suspension

DEFINITION

Crotamiton Lotion is a *cutaneous suspension*. It contains Crotamiton in a suitable vehicle.

The lotion complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of crotamiton, $C_{13}H_{17}NO$

93.0 to 107.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the lotion containing 0.5 g of Crotamiton add 30 mL of 1M *hydrochloric acid* and shake to produce a uniform suspension. Extract with 100 mL of *petroleum spirit (boiling range, 40° to 60°)*, wash the petroleum spirit layer with 10 mL of 1M *hydrochloric acid*, with two 10 mL quantities of 1M *sodium hydroxide* and then with 10 mL of a saturated solution of *sodium chloride*. Dry the organic layer over *anhydrous sodium sulfate*, filter and evaporate to an oily residue. The *light absorption*, Appendix II B, in the range 220 to 350 nm of a 0.003% w/v solution of the residue in *cyclohexane* exhibits a maximum only at 242 nm.
The A(1%, 1 cm) at the maximum is about 315.

www.webofpharma.com

B. Carry out Identification test B described under Crotamiton Cream using the residue from test A above in the preparation of solution (1).

C. In the Assay, the principal peak in the chromatogram obtained with solution (2) has the same retention time as the principal peak in the chromatogram obtained with solution (3).

TESTS

Related substances
Complies with the test described under Crotamiton Cream.

***Z*-Isomer**
Not more than 15% of the total content of *E*- and *Z*-isomers determined in the Assay.

ASSAY
Carry out the Assay described under Crotamiton Cream using a quantity of the lotion containing 0.1 g of Crotamiton.

Cyanocobalamin Oral Solution

Action and use
Vitamin B_{12} analogue.

DEFINITION
Cyanocobalamin Oral Solution contains Cyanocobalamin in a suitable vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of cyanocobalamin, $C_{63}H_{88}CoN_{14}O_{14}P$
90.0 to 115.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the oral solution containing 0.1 mg of Cyanocobalamin with 10 mL of *ether*, allow to separate and retain the aqueous layer. Evaporate this solution to dryness and dissolve the residue in 0.5 mL of a mixture of equal volumes of *ethanol (96%)* and *water*.

(2) 0.02% w/v of *cyanocobalamin BPCRS* in a mixture of equal volumes of *ethanol (96%)* and *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel*.

(b) Use the mobile phase as described below.

(c) Apply 50 µL of each solution.

(d) Develop the plate to 12 cm.

(e) After removal of the plate, dry in air and examine in daylight.

MOBILE PHASE

3 volumes of *dilute ammonia R1*, 10 volumes of *methanol* and 15 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to cyanocobalamin in the chromatogram obtained with solution (2).

TESTS

Acidity
pH, 4.0 to 5.0, Appendix V L.

ASSAY
Carry out the procedure protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Dilute a weighed quantity of the oral solution with sufficient *water* to produce a solution expected to contain 0.0005% w/v of cyanocobalamin.

(2) 0.0005% w/v of *cyanocobalamin BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *hexylsilyl silica gel for chromatography* (PhenoSphere C6 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 361 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

1 volume of *methanol* and 3 volumes of a pH 3 buffer solution prepared by mixing 1000 mL of a 2.1% w/v solution of *citric acid* with 250 mL of a 2.84% w/v solution of *anhydrous disodium hydrogen orthophosphate*.

DETERMINATION OF CONTENT

Calculate the content of $C_{63}H_{88}CoN_{14}O_{14}P$ in *cyanocobalamin BPCRS* as specified in the leaflet which accompanies *cyanocobalamin BPCRS*.

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of cyanocobalamin, $C_{63}H_{88}CoN_{14}O_{14}P$, in the oral solution using the calculated content of $C_{63}H_{88}CoN_{14}O_{14}P$ in *cyanocobalamin BPCRS*.

STORAGE
Cyanocobalamin Oral Solution should be protected from light.

When Vitamin B_{12} Oral Solution is prescribed or demanded, Cyanocobalamin Oral Solution shall be dispensed or supplied.

Cyanocobalamin Tablets

Action and use
Vitamin B_{12} analogue.

DEFINITION
Cyanocobalamin Tablets contain Cyanocobalamin. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of cyanocobalamin, $C_{63}H_{88}CoN_{14}O_{14}P$
90.0 to 115.0% of the stated amount.

IDENTIFICATION
A. In the test for Uniformity of content, the principal peak in the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

www.webofpharma.com

B. Gently shake 10 tablets with 20 mL of *chloroform* to remove the coating and dry the tablet cores in a current of air. Transfer to a clean flask and powder with the aid of a glass rod. To a quantity of the powdered tablet cores containing 0.2 mg of cyanocobalamin, add 10 mL of a mixture of 1 volume of *2-ethoxyethanol* and 3 volumes of *water*, shake vigorously for 5 minutes, centrifuge at 3000 revolutions per minute for 15 minutes and filter using a filter with a pore size of 0.45 µm. The *light absorption* of the filtrate, Appendix II B, in the range 345 to 560 nm exhibits maxima at about 361 nm and 550 nm. No maximum is exhibited at 351 nm (distinction from hydroxocobalamin).

TESTS

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Cyanocobalamin comply with the requirements stated under Tablets using the following method of analysis. Carry out the procedure protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Shake one tablet with 6 mL of *water* for 5 minutes, dilute to 10 mL with *water* and centrifuge. Dilute a quantity of the supernatant liquid with sufficient *water* to produce a solution expected to contain 0.0005% w/v of cyanocobalamin.

(2) 0.0005% w/v of *cyanocobalamin BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *hexylsilyl silica gel for chromatography*.

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 361 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

1 volume of *methanol* and 3 volumes of a pH 3 buffer solution prepared by mixing 1000 mL of a 2.1% w/v solution of *citric acid* with 250 mL of a 2.84% w/v solution of *anhydrous disodium hydrogen orthophosphate*.

DETERMINATION OF CONTENT

Calculate the content of $C_{63}H_{88}CoN_{14}O_{14}P$ in *cyanocobalamin BPCRS* as specified in the leaflet which accompanies *cyanocobalamin BPCRS*.

Calculate the content of cyanocobalamin, $C_{63}H_{88}CoN_{14}O_{14}P$, in each tablet using the calculated content of $C_{63}H_{88}CoN_{14}O_{14}P$ in *cyanocobalamin BPCRS*.

ASSAY

Use the average of the 10 individual results obtained in the test for Uniformity of content.

STORAGE

Cyanocobalamin Tablets should be protected from light.

When vitamin B_{12} tablets are prescribed or demanded, Cyanocobalamin Tablets shall be dispensed or supplied.

Cyclizine Injection

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Cyclizine Injection is a sterile solution in Water for Injections containing 5% w/v of cyclizine lactate prepared by the interaction of Cyclizine and Lactic Acid.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of cyclizine lactate, $C_{18}H_{22}N_2,C_3H_6O_3$

4.75 to 5.25% w/v.

CHARACTERISTICS

A clear, colourless solution.

IDENTIFICATION

A. To 0.5 mL add 10 mL of *water* followed by 5M *sodium hydroxide* until strongly alkaline to *litmus paper*. Extract with two 10-mL quantities of *dichloromethane* and reserve the aqueous layer for test B. Wash each dichloromethane extract with 5 mL of *water*, dry the combined extracts with *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness. Dissolve the residue in *ethanol (96%)* and evaporate to dryness. The *infrared absorption spectrum* of the final residue, Appendix II A, is concordant with the *reference spectrum* of cyclizine *(RS 075)*.

B. The aqueous solution reserved in test A, after acidification with 1M *sulfuric acid*, yields the reaction characteristic of *lactates*, Appendix VI.

TESTS

Acidity

pH, 3.3 to 3.7, Appendix V L.

Related substances

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions in *methanol* preparing the solutions immediately before use.

(1) Dilute 1 volume of the injection to 10 volumes.

(2) Dilute 1 volume of solution (1) to 100 volumes and dilute 1 volume of the resulting solution to 5 volumes.

(3) 0.0025% w/v of *cyclizine hydrochloride BPCRS*, 0.0025% w/v of *1-methylpiperazine BPCRS* (impurity A) and 0.0025% w/v of *diphenylmethanol BPCRS* (impurity B).

CHROMATOGRAPHIC CONDITIONS

(a) Use a fused silica column (25 m × 0.33 mm) coated with a 0.5-µm film of *poly(dimethyl)(diphenyl)siloxane* (HP-5 is suitable).

(b) Use *helium* as the carrier gas at a flow rate of 1 mL per minute.

(c) Use the gradient conditions described below.

(d) Use a split injection ratio of 1:25.

(e) Use a flame ionisation detector at 290°.

(f) Inject 1 µL of each solution.

(g) The peaks elute in the order: methanol, 1-methylpiperazine, diphenylmethanol, cyclizine.

www.webofpharma.com

Time (minutes)	Temperature	Comment
0→14	100°→240°	linear gradient
14→16	240°→270°	linear gradient
16→30	270°	isocratic

SYSTEM SUITABILITY

Inject solution (3) 6 times. The relative standard deviation of each of the areas of the 3 principal peaks is not more than 5.0%.

The test is not valid unless, in the chromatogram obtained with solution (3);

the *peak-to-valley ratio* between methanol and 1-methylpiperazine is at least 50;

the *resolution factor* between diphenylmethanol and cyclizine is at least 18.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 1-methylpiperazine (impurity A) is not greater than the peak corresponding to 1-methylpiperazine in solution (3) (0.5%);

the area of any peak corresponding to diphenylmethanol (impurity B) is not greater than the peak corresponding to diphenylmethanol in solution (3) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than 0.5 times that of the peak due to cyclizine in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Dilute 5 mL to 100 mL with 1M *sulfuric acid*. To 20 mL of the resulting solution add 2 g of *sodium chloride*, shake with two 50-mL quantities of *ether*, allow to separate and wash the ether with the same two 10-mL quantities of *water*. To the combined aqueous solution and washings add 20 mL of 5M *sodium hydroxide* and extract with three 50-mL quantities of *ether*. Combine the ether extracts and wash with two 10-mL quantities of a saturated solution of *sodium chloride*. Extract the ether layer with two 25-mL quantities of 0.05M *sulfuric acid* and then with two 10-mL quantities of *water*. Combine the acidic and aqueous extracts and dilute to 100 mL with *water*. Dilute 5 mL of this solution to 200 mL with 0.05M *sulfuric acid* and measure the *absorbance* of the resulting solution at the maximum at 225 nm, Appendix II B. Calculate the content of $C_{18}H_{22}N_2,C_3H_6O_3$ taking 331 as the value of A(1%, 1 cm) at the maximum at 225 nm.

LABELLING

The strength is stated in terms of the amount of cyclizine lactate in a suitable dose-volume.

Cyclizine Tablets

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Cyclizine Tablets contain Cyclizine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of cyclizine hydrochloride, $C_{18}H_{22}N_2,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 0.1 g of Cyclizine Hydrochloride with 10 mL of *ethanol (96%)*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of Cyclizine Hydrochloride *(RS 076)*.

B. Extract a quantity of the powdered tablets containing 0.5 g of Cyclizine Hydrochloride with 20 mL of *water* and filter. The filtrate yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Related substances

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions prepared immediately before use.

(1) Triturate a quantity of the powdered tablets containing 0.20 g of Cyclizine Hydrochloride with 8 mL of *methanol*, add 2 mL of 1M *sodium hydroxide* and filter. Dilute 1 volume of the resulting solution to 4 volumes with *methanol*.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol* and dilute 1 volume of the resulting solution to 5 volumes with *methanol*.

(3) 0.0025% w/v of *cyclizine hydrochloride BPCRS*, 0.0025% w/v of *1-methylpiperazine BPCRS* (impurity A) and 0.0025% w/v of *diphenylmethanol BPCRS* (impurity B) in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a fused silica column (25 m × 0.33 mm) coated with a 0.5-µm film of *poly(dimethyl)(diphenyl)siloxane* (HP-5 is suitable).

(b) Use *helium* as the carrier gas with a constant flow rate of 1 mL per minute.

(c) Use the gradient system described below.

(d) Use a split injection ratio of 1:25.

(e) Use a flame ionisation detector at 290°.

(f) Inject 1 µL of each solution.

(g) The peaks elute in the order: methanol, 1-methylpiperazine, diphenylmethanol, cyclizine.

Time (minutes)	Temperature	Comment
0→14	100°→240°	linear gradient
14→16	240°→270°	linear gradient
16→30	270°	isocratic

www.webofpharma.com

SYSTEM SUITABILITY

Inject solution (3) six times. The relative standard deviation of each of the areas of the three principal peaks is not more than 5.0%.

The test is not valid unless in the chromatogram obtained with solution (3);

the *peak-to-valley ratio* between methanol and 1-methylpiperazine is at least 50;

the *resolution factor* between diphenylmethanol and cyclizine is at least 18.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 1-methylpiperazine (impurity A) is not greater than the peak corresponding to 1-methylpiperazine in solution (3) (0.5%);

the area of any peak corresponding to diphenylmethanol (impurity B) is not greater than the peak corresponding to diphenylmethanol in solution (3) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than 0.5 times that of the peak due to cyclizine in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.125 g of Cyclizine Hydrochloride with 400 mL of 0.05M *sulfuric acid* for 15 minutes. Add sufficient 0.05M *sulfuric acid* to produce 500 mL, filter, dilute 5 mL of the filtrate to 100 mL with 0.05M *sulfuric acid* and measure the *absorbance* of the resulting solution at the maximum at 225 nm, Appendix II B. Calculate the content of $C_{18}H_{22}N_2,HCl$ taking 390 as the value of A(1%, 1 cm) at the maximum at 225 nm.

Cyclopenthiazide Tablets

Action and use

Thiazide-like diuretic.

DEFINITION

Cyclopenthiazide Tablets contain Cyclopenthiazide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of cyclopenthiazide, $C_{13}H_{18}ClN_3O_4S_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 5 mg of Cyclopenthiazide with 5 mL of *acetone* and filter.

(2) 0.1% w/v of *cyclopenthiazide BPCRS* in *acetone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, examine under *ultraviolet light (254 nm)* and then reveal the spots by *Method I*.

MOBILE PHASE

ethyl acetate.

CONFIRMATION

By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 10 mg of Cyclopenthiazide with 50 mL of *acetone*, filter, evaporate the filtrate to dryness and dissolve the residue in 2 mL of *acetone*.

(2) Dilute 1 volume of solution (1) to 100 volumes with *acetone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and reveal the spots by *Method I*.

MOBILE PHASE

ethyl acetate.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Cyclopenthiazide comply with the requirements stated under Tablets using the following method of analysis. To one tablet add 50 mL of *methanol*, shake for 20 minutes, filter and measure the *absorbance* of the filtrate at the maximum at 273 nm, Appendix II B. Calculate the content of $C_{13}H_{18}ClN_3O_4S_2$ taking 585 as the value of A(1%, 1 cm) at the maximum at 273 nm.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 7.5 mg of Cyclopenthiazide with 50 mL of *methanol* for 10 minutes and dilute to 100 mL with *methanol*. Mix, filter, dilute 20 mL of the filtrate to 100 mL with *methanol* and measure the *absorbance* of the resulting solution at the maximum at 273 nm, Appendix II B. Calculate the content of $C_{13}H_{18}ClN_3O_4S_2$ taking 585 as the value of A(1%, 1 cm) at the maximum at 273 nm.

www.webofpharma.com

Cyclopentolate Eye Drops

Action and use
Anticholinergic.

DEFINITION
Cyclopentolate Eye Drops are a sterile solution of Cyclopentolate Hydrochloride in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of cyclopentolate hydrochloride, $C_{17}H_{25}NO_3,HCl$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
Add 2M *ammonia* to a volume of the eye drops containing 25 mg of Cyclopentolate Hydrochloride until alkaline and extract immediately with 50 mL of *ether*. Wash the extract with 5 mL of *water*, filter through *anhydrous sodium sulfate* and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the oily residue, Appendix II A, is concordant with the *reference spectrum* of cyclopentolate *(RS 078)*.

TESTS
Acidity
pH, 3.0 to 5.5, Appendix V L.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Use the eye drops diluted, if necessary, to contain 0.5% w/v of Cyclopentolate Hydrochloride.

(2) Dilute 1 volume of solution (1) to 50 volumes with *water*.

(3) Dilute 1 volume of solution (1) to 200 volumes with *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry at 120° for 5 minutes, spray with *ethanolic sulfuric acid (10%)*, heat at 120° for 30 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

5 volumes of 13.5M *ammonia*, 15 volumes of *water*, 30 volumes of *butyl acetate* and 50 volumes of *propan-2-ol*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare a solution containing 0.25% w/v of *4-chlorophenol* (internal standard) in *methanol* (solution A).

(1) Dilute a volume of the eye drops containing 20 mg of Cyclopentolate Hydrochloride to 10 mL with the mobile phase.

(2) Add 4 mL of solution A to a volume of the eye drops containing 20 mg of Cyclopentolate Hydrochloride and dilute to 10 mL with the mobile phase.

(3) Add 4 mL of solution A to 4 mL of a 0.5% w/v solution of *cyclopentolate hydrochloride BPCRS* in *water* and dilute to 10 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

45 volumes of 0.2M *sodium dihydrogen orthophosphate* and 55 volumes of *methanol*, the mixture adjusted to pH 3.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cyclopentolate hydrochloride and the internal standard is greater than 4.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{25}NO_3,HCl$ in the eye drops using the declared content of $C_{17}H_{25}NO_3,HCl$ in *cyclopentolate hydrochloride BPCRS*.

Cyclophosphamide Injection

Action and use
Cytotoxic alkylating agent.

DEFINITION
Cyclophosphamide Injection is a sterile, isotonic solution of Cyclophosphamide in Water for Injections. It is prepared by dissolving Cyclophosphamide for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE
Cyclophosphamide Injection deteriorates on storage and should be used immediately after preparation.

CYCLOPHOSPHAMIDE FOR INJECTION

DEFINITION
Cyclophosphamide for Injection is a sterile material consisting of Cyclophosphamide with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of cyclophosphamide, $C_7H_{15}Cl_2N_2O_2P$
92.5 to 107.5% of the stated amount of anhydrous cyclophosphamide.

IDENTIFICATION
A. Shake a quantity containing the equivalent of 0.2 g of anhydrous cyclophosphamide with 2 mL of *chloroform* and filter. The *infrared absorption spectrum* of the filtrate,

www.webofpharma.com

Appendix II A, is concordant with the *reference spectrum* of cyclophosphamide *(RS 079)*.

B. Extract a quantity containing the equivalent of 0.1 g of anhydrous cyclophosphamide with *ether* and evaporate the extract to dryness. Dissolve the residue in 10 mL of *water* and add 5 mL of *silver nitrate solution*; no precipitate is produced. Boil; a white precipitate is produced which is insoluble in *nitric acid* but soluble in 5M *ammonia* from which it is reprecipitated on the addition of *nitric acid*.

TESTS

Acidity

pH of a freshly prepared 2% w/v solution, 4.0 to 6.0, Appendix V L.

Uniformity of content

Sealed containers containing the equivalent of 1 g or less of anhydrous cyclophosphamide comply with the requirements stated under Parenteral Preparations, Powders for Injections or Infusions. Use the individual results obtained in the Assay.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the contents of the sealed container containing the equivalent of 0.2 g of anhydrous cyclophosphamide in sufficient *ethanol (96%)* to produce 10 mL.

(2) Dilute 1 volume of solution (1) to 100 volumes with *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and heat at 100° for 10 minutes. Place the plate while hot in a chromatography tank in which is placed an evaporating dish containing equal volumes of a 5% w/v solution of *potassium permanganate* and *hydrochloric acid*, close the tank and allow to stand for 2 minutes. Remove the plate and place it in a current of cold air until excess chlorine is removed and an area of coating below the line of application gives not more than a very faint blue colour with *potassium iodide and starch solution*; avoid prolonged exposure to cold air. Spray the plate with *potassium iodide and starch solution* and allow to stand for 5 minutes.

MOBILE PHASE

2 volumes of *anhydrous formic acid*, 4 volumes of *acetone*, 12 volumes of *water* and 80 volumes of *butan-2-one*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%). Disregard any spot remaining on the line of application.

ASSAY

Dissolve the contents of a sealed container containing the equivalent of 0.1 g of anhydrous cyclophosphamide in 30 mL of *chloroform*, shake vigorously for 15 minutes, filter (Whatman GF/F is suitable) and wash the filter with 15 mL of *chloroform*. Evaporate the combined filtrate and washings to dryness and dissolve the residue in 50 mL of a 0.1% w/v solution of *sodium hydroxide* in *ethane-1,2-diol*. Boil the solution under a reflux condenser for 30 minutes and allow to cool. Rinse the condenser with 25 mL of *water*, add 75 mL of *propan-2-ol*, 15 mL of 2M *nitric acid*, 10 mL of 0.1M *silver nitrate VS* and 2 mL of *ammonium iron(III) sulfate solution R2* and titrate with 0.1M *ammonium thiocyanate VS*. Each mL of 0.1M *silver nitrate VS* is equivalent to 13.05 mg of $C_7H_{15}Cl_2N_2O_2P$. Calculate the content of $C_7H_{15}Cl_2N_2O_2P$ in the sealed container.

Repeat the procedure with a further nine sealed containers. Calculate the content of $C_7H_{15}Cl_2N_2O_2P$ per container from the average of the 10 individual results thus obtained.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous cyclophosphamide.

Cyclophosphamide Oral Solution

NOTE: *Cyclophosphamide Oral Solution is not currently licensed in the United Kingdom.*

Action and use

Cytotoxic alkylating agent.

DEFINITION

Cyclophosphamide Oral Solution is a solution containing Cyclophosphamide in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of anhydrous cyclophosphamide, $C_7H_{15}Cl_2N_2O_2P$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak due to cyclophosphamide in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 3.0 to 6.0, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *ethanol (96%)*.

(1) Dilute a volume of the oral solution, if necessary, to produce a solution containing the equivalent of 1% w/v of anhydrous cyclophosphamide.

(2) 1% w/v of *cyclophosphamide BPCRS*.

(3) Dilute 1 volume of solution (1) to 100 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Analtech GHL plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in a current of warm air and heat at 100° for 10 minutes. Place the plate, while hot, in a chromatography tank in which is placed an evaporating dish containing equal volumes of a 5% w/v solution of *potassium permanganate* and *hydrochloric acid*; close the tank

www.webofpharma.com

and allow to stand for 2 minutes. Remove the plate and place it in a current of cold air until excess chlorine is removed and an area of coating below the line of application gives not more than a very faint blue colour with *potassium iodide and starch solution*; avoid prolonged exposure to cold air. Spray the plate with *potassium iodide and starch solution* and allow to stand for 5 minutes.

MOBILE PHASE

2 volumes of *anhydrous formic acid*, 4 volumes of *acetone*, 12 volumes of *water* and 80 volumes of *butan-2-one*.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (1%).

Disregard any spot remaining on the line of application.

Chlorides

Dilute a quantity of the oral solution containing the equivalent of 15 mg of anhydrous cyclophosphamide to 15 mL with *water*. The resulting solution complies with the *limit test for chlorides*, Appendix VII (0.33%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Dilute a weighed quantity of the oral solution containing the equivalent of 10 mg of anhydrous cyclophosphamide to 10 mL with *water*.

(2) 0.1% w/v of *cyclophosphamide BPCRS* in *water*.

(3) 0.1% w/v of *methyl-4-hydroxybenzoate* in solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 200 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

3 volumes of *acetonitrile R1* and 7 volumes of 0.01M *potassium dihydrogen orthophosphate*, adjusted to pH 6.0 using 1M *sodium hydroxide*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cyclophosphamide and methyl-4-hydroxybenzoate is at least 2.0.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_7H_{15}Cl_2N_2O_2P$, weight in volume, using the declared content of $C_7H_{15}Cl_2N_2O_2P$ in *cyclophosphamide BPCRS*.

STORAGE

Cyclophosphamide Oral Solution should be stored at a temperature of 2° to 8°.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous cyclophosphamide.

Cyclophosphamide Tablets

Action and use

Cytotoxic alkylating agent.

DEFINITION

Cyclophosphamide Tablets contain Cyclophosphamide. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of cyclophosphamide, $C_7H_{15}Cl_2N_2O_2P,H_2O$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.2 g of Cyclophosphamide with 2 mL of *chloroform* and filter. The *infrared absorption spectrum* of the filtrate, Appendix II A, is concordant with the *reference spectrum* of cyclophosphamide *(RS 079)*.

B. Extract a quantity of the powdered tablets containing 0.1 g of Cyclophosphamide with *ether* and evaporate the extract to dryness. Dissolve the residue in 10 mL of *water* and add 5 mL of *silver nitrate solution*; no precipitate is produced. Boil; a white precipitate is produced which is insoluble in *nitric acid* but dissolves in 5M *ammonia* from which it is reprecipitated on the addition of *nitric acid*.

TESTS

Acidity

Shake a quantity of the powdered tablets containing 0.25 g of Cyclophosphamide with 20 mL of *carbon dioxide-free water*, filter and titrate the filtrate with 0.1M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Not more than 0.2 mL of 0.1M *sodium hydroxide VS* is required to change the colour of the solution.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake vigorously a quantity of the powdered tablets containing 0.2 g of Cyclophosphamide with 50 mL of *chloroform* for 15 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 10 mL of *ethanol (96%)*.

(2) Dilute 1 volume of solution (1) to 100 volumes with *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in a current of warm air and heat at 100° for 10 minutes. Place the plate while hot in a chromatography tank in which is placed an evaporating dish containing equal volumes of a 5% w/v solution of *potassium permanganate* and *hydrochloric acid*, close the tank and allow to stand for 2 minutes. Remove the plate and place it in a current of cold air until excess chlorine is removed and an area of coating below the line of application gives not more than a very faint blue colour with *potassium iodide and starch solution*; avoid prolonged exposure to cold air. Spray the plate with *potassium iodide and starch solution* and allow to stand for 5 minutes.

MOBILE PHASE

2 volumes of *anhydrous formic acid*, 4 volumes of *acetone*, 12 volumes of *water* and 80 volumes of *butan-2-one*.

www.webofpharma.com

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

Disregard any spot remaining on the line of application.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powdered tablets containing 0.1 g of Cyclophosphamide in 30 mL of *chloroform*, shake vigorously for 15 minutes, filter (Whatman GF/F is suitable) and wash the filter with 15 mL of *chloroform*. Evaporate the combined filtrate and washings to dryness and dissolve the residue in 50 mL of a 0.1% w/v solution of *sodium hydroxide* in *ethane-1,2-diol*. Boil under a reflux condenser for 30 minutes and allow to cool. Rinse the condenser with 25 mL of *water*, add 75 mL of *propan-2-ol*, 15 mL of 2M *nitric acid*, 10 mL of 0.1M *silver nitrate VS* and 2 mL of *ammonium iron(III) sulfate solution R2* and titrate with 0.1M *ammonium thiocyanate VS*. Each mL of 0.1M *silver nitrate VS* is equivalent to 13.94 mg of $C_7H_{15}Cl_2N_2O_2P,H_2O$.

Cyproheptadine Tablets

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Cyproheptadine Tablets contain Cyproheptadine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous cyproheptadine hydrochloride, $C_{21}H_{21}N,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing the equivalent of 20 mg of anhydrous cyproheptadine hydrochloride add 10 mL of *water* and 2.5 mL of 0.1M *sodium hydroxide*, extract with 10 mL of *dichloromethane*, filter through *anhydrous sodium sulfate* moistened with *dichloromethane* on absorbent cotton and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of cyproheptadine *(RS 080)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (3) corresponds to that in the chromatogram obtained with solution (5).

C. Extract a quantity of the powdered tablets containing the equivalent of 20 mg of anhydrous cyproheptadine hydrochloride with 7 mL of *water*, filter, add 0.3 mL of 5M *ammonia* to the filtrate and filter again. The filtrate yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and as the mobile phase a mixture of 10 volumes of *methanol* and 90 volumes of *dichloromethane*. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) add a quantity of the powdered tablets containing the equivalent of 50 mg of anhydrous cyproheptadine hydrochloride to 5 mL of the mobile phase, shake mechanically for 10 minutes and filter (Whatman GF/C filter paper is suitable). Solution (2) contains 0.002% w/v of *dibenzocycloheptene EPCRS* in the mobile phase. For solution (3) dilute 1 volume of solution (1) to 10 volumes with the mobile phase. For solution (4) dilute 1 volume of solution (1) to 100 volumes with the mobile phase and dilute 1 volume to 10 volumes with the mobile phase. Solution (5) contains 0.1% w/v of *cyproheptadine hydrochloride EPCRS* in the mobile phase. Allow the plate to dry in air and spray with *ethanolic sulfuric acid (20%)*. Heat at 110° for 30 minutes and examine under *ultraviolet light (365 nm)*. In the chromatogram obtained with solution (1) any spot corresponding to dibenzocycloheptene is not more intense than the spot in the chromatogram obtained with solution (2) (0.2%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing the equivalent of 1.5 mg of anhydrous cyproheptadine hydrochloride add sufficient *ethanol (96%)* to produce 100 mL and filter if necessary. Measure the *absorbance* of the resulting solution at the maximum at 286 nm, Appendix II B. Calculate the content of $C_{21}H_{21}N,HCl$ taking 355 as the value of A(1%, 1 cm) at the maximum at 286 nm.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous cyproheptadine hydrochloride.

Cyproterone Tablets

Action and use

Antiandrogen.

DEFINITION

Cyproterone Tablets contain Cyproterone Acetate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of cyproterone acetate, $C_{24}H_{29}ClO_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Cyproterone Acetate with 20 mL of *dichloromethane*, filter through a glass-fibre filter paper (Whatman GF/C is suitable) and evaporate the filtrate to dryness using a rotary evaporator and a water bath at 40°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of cyproterone acetate *(RS 395)*.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

www.webofpharma.com

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid* containing 0.25% w/v *sodium dodecyl sulfate*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a sample of the medium and filter. Measure the *absorbance* of the filtered medium, suitably diluted with the dissolution medium, if necessary, to produce a solution containing the equivalent of 0.0011% w/v of cyproterone acetate, at the maximum at 285 nm, Appendix II B using dissolution medium in the reference cell.

(2) 0.0011% w/v of *cyproterone acetate BPCRS* in dissolution medium.

DETERMINATION OF CONTENT

Calculate the total content of cyproterone acetate, $C_{24}H_{29}ClO_4$, in the medium from the absorbances obtained and using the declared content of $C_{24}H_{29}ClO_4$, in *cyproterone acetate BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 g of Cyproterone Acetate with 50 mL of a 4:1 mixture of *acetonitrile* and *water* for 5 minutes, dilute to 100 mL with *water* and filter through a glass-fibre filter (Whatman GF/C is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) Dilute 1 volume of a solution containing 0.01% w/v each of *cyproterone acetate BPCRS* and *medroxyprogesterone acetate BPCRS* in a 4:1 mixture of *acetonitrile* and *water* to 10 volumes with the mobile phase.

(4) Dilute 1 volume of solution (2) to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of *acetonitrile* and 60 volumes of *water*.

When the chromatograms are recorded under the prescribed conditions the retention time of cyproterone acetate is about 22 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of all the *secondary peaks* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 50 mg of Cyproterone Acetate with 50 mL of a 4:1 mixture of *acetonitrile* and *water* for 5 minutes, dilute to 100 mL with the same solvent mixture and filter through a glass-fibre filter (Whatman GF/C is suitable); dilute 1 volume of the filtrate to 10 volumes with the mobile phase.

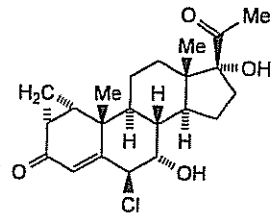
(2) Dilute 1 volume of a 0.05% w/v solution of *cyproterone acetate BPCRS* in a 4:1 mixture of *acetonitrile* and *water* to 10 volumes with the mobile phase.

(3) Dilute 1 volume of a solution containing 0.01% w/v each of *cyproterone acetate BPCRS* and *medroxyprogesterone acetate BPCRS* in a 4:1 mixture of *acetonitrile* and *water* to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

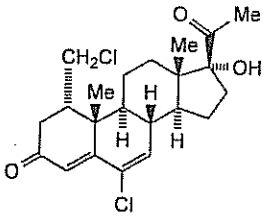
SYSTEM SUITABILITY



The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the two principal peaks is at least 3.0.

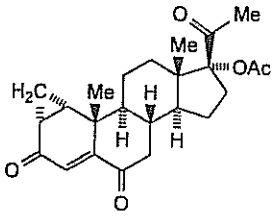
DETERMINATION OF CONTENT

Calculate the content of $C_{24}H_{29}ClO_4$ in the tablets, using the declared content of $C_{24}H_{29}ClO_4$ in *cyproterone acetate BPCRS*.

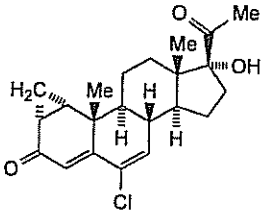


IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Cyproterone Acetate and the following:



1. 6β-Chloro-7α,17α-dihydroxy-1α,2α-methylenepregna-4-ene-3,20-dione (*chlorohydrin derivative*)



www.webofpharma.com

2. 17α-Hydroxy-6-chloro-1α-chloromethylpregna-4,6-diene-3,20-dione (*1-chloromethyl derivative*)

3. 1α,2α-Methylene-3,6,20-trioxopregna-4-en-17α-yl acetate

4. 17α-Hydroxy-6-chloro-1α,2α-methylenepregna-4,6-diene-3,20-dione (*cyproterone*)

Cytarabine Injection

Action and use
Pyrimidine analogue; cytotoxic.

DEFINITION
Cytarabine Injection is a sterile solution of Cytarabine in Water for Injections. It is supplied as a ready-to-use injection or it is prepared immediately before use by dissolving Cytarabine for Injection in the requisite amount of the liquid stated on the label.

The injection complies with the requirements stated under Parenteral Preparations.

When supplied as a ready-to-use injection, the injection complies with the following requirements.

Content of cytarabine, $C_9H_{13}N_3O_5$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Evaporate a volume of the injection containing 0.1 g of Cytarabine to dryness at 60° at a pressure of 0.7 kPa, mix the residue with a minimum amount of hot *ethanol (96%)*, filter, allow the filtrate to cool and induce crystallisation if necessary. Filter, wash the crystals with 2 mL of *ethanol (96%)* and dry at 60° at a pressure of 0.7 kPa. The *infrared absorption spectrum* of the dried crystals, Appendix II A, is concordant with the *reference spectrum* of cytarabine *(RS 081)*.

TESTS
Acidity or alkalinity
pH, 7.0 to 9.5, Appendix V L.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *water*.

(1) Dilute, if necessary, a volume of the injection to produce a solution containing 2% w/v of Cytarabine.

(2) Dilute 1 volume of solution (1) to 200 volumes.

(3) 0.040% w/v of *uracil arabinoside EPCRS*.

(4) 0.020% w/v each of *uridine* and *uracil arabinoside EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel 60 F_{254}* (Merck plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

15 volumes of *water*, 20 volumes of *acetone* and 65 volumes of *butan-2-one*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to uracil arabinoside is not more intense than the spot in the chromatogram obtained with solution (3) (2%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve 20 mg of *cytarabine BPCRS* in *water* and dilute to 100 mL with the same solvent. Dilute 10 mL to 100 mL with *water*.

(2) Dilute a volume of the injection to produce a solution containing 0.002% w/v of Cytarabine.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

7.5 volumes of *methanol* and 100 volumes of 0.005M *sodium pentanesulfonate* adjusted to pH 2.8 using *glacial acetic acid*.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_{13}N_3O_5$ in the injection using the declared content of $C_9H_{13}N_3O_5$ in *cytarabine BPCRS*.

www.webofpharma.com

CYTARABINE FOR INJECTION

DEFINITION

Cytarabine for Injection is a sterile material consisting of Cytarabine with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of cytarabine, $C_9H_{13}N_3O_5$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

Mix a quantity of the contents of the sealed container containing 0.1 g of Cytarabine with 10 mL of hot *ethanol (96%)*, filter, allow the filtrate to cool and induce crystallisation if necessary. Filter, wash the crystals with 2 mL of *ethanol (96%)* and dry at 60° at a pressure of 0.7 kPa. The *infrared absorption spectrum* of the crystals, Appendix II A, is concordant with the *reference spectrum* of cytarabine.

Acidity
pH of a solution containing 2% w/v of Cytarabine in the liquid stated on the label, 4.0 to 6.0, Appendix V L.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *water*.

(1) Dissolve the contents of the sealed container in a sufficient volume to produce a solution containing 2% w/v of Cytarabine.

(2) Dilute 1 volume of solution (1) to 200 volumes.

(3) 0.020% w/v of *uracil arabinoside EPCRS*.

(4) 0.020% w/v each of *uridine* and *uracil arabinoside EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

15 volumes of *water*, 20 volumes of *acetone* and 65 volumes of *butan-2-one*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to uracil arabinoside is not more intense than the spot in the chromatogram obtained with solution (3) (1%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

Water
Not more than 3.0% w/w, Appendix IX C. Use 0.8 g.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Use. Carry out the Assay described for the ready-to-use injection but using the following solution as solution (2). Dissolve sufficient of the mixed contents of the 10 containers in *water* to produce a solution containing 0.002% w/v of Cytarabine.

Calculate the content of $C_9H_{13}N_3O_5$ in a container of average content weight using the declared content of $C_9H_{13}N_3O_5$ in *cytarabine BPCRS*.

Dacarbazine Injection

Action and use
Cytotoxic alkylating agent.

DEFINITION

Dacarbazine Injection is a sterile solution of Dacarbazine in Water for Injections. It is prepared by dissolving Dacarbazine for Injection in the requisite amount of Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Dacarbazine Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

DACARBAZINE FOR INJECTION

DEFINITION

Dacarbazine for Injection is a sterile material consisting of Dacarbazine with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of dacarbazine, $C_6H_{10}N_6O$
90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A white or very pale yellow powder.

IDENTIFICATION

A. Dissolve a quantity of the contents of the sealed container containing 0.1 g of Dacarbazine in 200 mL of 0.1M *mixed phosphate buffer pH 7.0*, dilute with the buffer solution to 250 mL and dilute 3 mL to 200 mL with the same buffer solution. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits two maxima, at 237 nm and 330 nm.

B. In the test for 5-aminoimidazole-4-carboxamide hydrochloride, the principal peak in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (3).

TESTS

5-Aminoimidazole-4-carboxamide hydrochloride
Carry out the method for *liquid chromatography*, Appendix III D protected from light, using the following solutions in low-actinic glassware.

(1) Dissolve a quantity of the contents of the sealed container containing 0.20 g of Dacarbazine in 40 mL of 0.1M *acetic acid* and add sufficient 0.1M *acetic acid* to produce 50 mL.

(2) Dilute 1 volume of solution (1) to 100 volumes with 0.1M *acetic acid*.

(3) 0.004% w/v of *dacarbazine BPCRS* in 0.1M *acetic acid*.

(4) 0.0024% w/v of *5-aminoimidazole-4-carboxamide hydrochloride* in 0.1M *acetic acid*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used using the mobile phase described below. Inject each sample within 1 hour of preparation.

MOBILE PHASE

0.005M *dioctyl sodium sulfosuccinate* in a mixture of 3 volumes of *glacial acetic acid*, 87 volumes of *water* and 110 volumes of *methanol*.

LIMITS

The area of any peak corresponding to 5-aminoimidazole-4-carboxamide hydrochloride in the chromatogram obtained with solution (1) is not greater than the area of the peak in the chromatogram obtained with solution (4) (0.6%).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D protected from light, using the following solutions.

(1) Dissolve a quantity of the contents of the sealed container containing 0.20 g of Dacarbazine in 40 mL of 0.25M *acetic acid* and add sufficient 0.25M *acetic acid* to produce 50 mL.

(2) 0.0040% w/v of *2-azahypoxanthine BPCRS* in 0.25M *acetic acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution within 1 hour of preparation.

(g) After use the column should be thoroughly flushed with *methanol* to remove dacarbazine which does not elute with the mobile phase.

MOBILE PHASE

0.005M *dioctyl sodium sulfosuccinate* in a mixture of 1.5 volumes of *glacial acetic acid* and 98.5 volumes of *water*.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

not more than one such peak has an area greater than half the area of the peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of all such peaks is not greater than three times the area of the peak in the chromatogram obtained with solution (2) (3%).

Uniformity of content

Sealed containers containing 200 mg or less of Dacarbazine comply with the requirements stated under Parenteral Preparations, Powders for Injections or Infusions. Use the individual results obtained in the Assay.

ASSAY

Carry out the following procedure protected from light. Dissolve the contents of one container in 0.1M *hydrochloric acid* and dilute with sufficient 0.1M *hydrochloric acid* to produce a final solution containing 0.0008% w/v of Dacarbazine. Measure the *absorbance* of the resulting solution at the maximum at 323 nm, Appendix II B. Calculate the content of $C_6H_{10}N_6O$ in the sealed container taking 1090 as the value of A(1%, 1 cm) at the maximum at 323 nm.

Repeat the procedure with a further nine sealed containers and calculate the average content of $C_6H_{10}N_6O$ per container from the 10 individual results thus obtained.

STORAGE

The sealed container should be protected from light and stored at a temperature of 2° to 8°.

Dalteparin Sodium Injection

Action and use

Low molecular weight heparin.

DEFINITION

Dalteparin Sodium Injection is a sterile solution of Dalteparin Sodium in a suitable diluent.

PRODUCTION

The final product is produced by methods of manufacturing designed to ensure that substances lowering blood pressure are not introduced and to ensure freedom from contamination by over-sulfated glycosaminoglycans.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Activity

The estimated activity for anti-factor Xa is not less than 90% and not more than 110% of the stated activity.

The ratio of anti-factor Xa to anti-factor IIa is not less than 1.9 and not more than 3.2.

IDENTIFICATION

A. Carry out the method for *size-exclusion chromatography*, Appendix III C, using the following solutions in the mobile phase.

(1) Dilute the injection to contain 1600 units of anti-factor Xa per mL.

(2) 1% w/v of *heparin low-molecular-mass for calibration EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a column (30 cm × 7.5 mm) packed with appropriate porous silica beads (5 µm) with a fractionation range for proteins of approximately 15 000 to 100 000 (Waters Protein-Pak and Toso Hass TSK G2000SW are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.5 mL per minute.

(d) Use an ambient column temperature.

(e) For detection use a differential refractometer (RI) detector connected in series to an ultraviolet spectrophotometer (UV) set at 234 nm such that the UV monitor is connected to the column outlet, and the RI detector to the UV-monitor outlet. It is necessary to measure the time lapse between the 2 detectors accurately so that their chromatograms can be aligned correctly. The retention times used in the calibration must be those from the RI detector.

(f) Inject 25 µL of each solution.

www.webofpharma.com

The normalisation factor used to calculate the relative molecular mass from the RI/UV ratio is obtained as follows. Calculate the total area under the UV_{234} (ΣUV_{234}) and the RI (ΣRI) curves by numerical integration over the range of interest (i.e. excluding salt and solvent peaks at the end of the chromatogram). Calculate the ratio r using the following expression:

$$\frac{\sum RI}{\sum UV_{234}}$$

Calculate the factor f using the following expression:

$$\frac{M_{na}}{r}$$

where:

M_{na} = assigned number-average relative molecular mass of the *heparin low-molecular-mass for calibration EPCRS* found in the leaflet supplied with the EPCRS.

Provided the UV_{234} and the RI responses are aligned, the relative molecular mass M at any point is calculated using the following expression:

$$f\frac{RI}{UV_{234}}$$

The resulting table of retention times and relative molecular masses may be used to derive a calibration curve for the chromatographic system by fitting a suitable mathematical relationship to the data. A polynomial of the 3rd degree is recommended. *It must be stressed that the extrapolation of this fitted calibration curve to higher molecular masses is not valid.*

Inject 25 µL of the test solution and record the chromatogram for a period of time, ensuring complete elution of sample and solvent peaks.

The mass-average relative molecular mass is defined by the following expression:

$$\frac{\sum(RI_i M_i)}{\sum RI_i}$$

where:

RI_i = mass of substance eluting in the fraction i;

M_i = relative molecular mass corresponding to fraction i.

MOBILE PHASE

2.84% w/v solution of *anhydrous sodium sulfate* adjusted to pH 5.0 with *dilute sulfuric acid.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *column efficiency* is not less than 20 000 per metre.

CONFIRMATION

The mass-average relative molecular mass ranges between 5600 and 6400. The mass percentage of chains lower than 3000 is not more than 13.0%. The mass percentage of chains higher than 8000 ranges between 15.0% and 25.0%.

B. The ratio of anti-factor Xa activity to anti-factor IIa activity, determined as described under Assay, is not less than 1.9 and not more than 3.2.

C. Yields reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Clarity and colour of solution

The solution is *clear*, Appendix IV A, and not more intensely coloured than *reference solution* Y_5, Appendix IV B, Method II.

Acidity or alkalinity

pH, 5.0 to 7.5, Appendix V L.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is less than 0.01 IU per International Unit of anti-Xa activity.

ASSAY

The anticoagulant activity of low-molecular-mass heparins is determined *in vitro* by two assays which determine its ability to accelerate the inhibition of factor Xa (anti-Xa assay) and thrombin, factor IIa (anti-IIa assay), by antithrombin III.

The International Units for anti-Xa and anti-IIa activity are the activities contained in a stated amount of the International Standard for low-molecular-mass heparin.

Heparin low-molecular-mass for assay EPBRP, calibrated in International Units by comparison with the International Standard using the two assays given below, is used as the reference preparation.

For anti-factor Xa activity

Test solutions (1) to *(4)* Prepare a series of 4 independent dilutions of the injection being examined in *tris-chloride buffer pH 7.4;* the concentration range of the solutions should be within 0.025 IU to 0.2 IU of anti-factor Xa activity per mL and the dilutions chosen should give a linear response when results are plotted as absorbance against log concentration.

Reference solutions (1) to *(4)* Prepare a series of 4 dilutions of the reference preparation of low-molecular-mass heparin in *tris-chloride buffer pH 7.4;* the concentration range of the solutions should be within 0.025 IU to 0.2 IU of anti-factor Xa activity per mL and the dilutions chosen should give a linear response when results are plotted as absorbance against log concentration.

Label 16 tubes in duplicate: T1, T2, T3, T4 for the dilutions of the injection being examined and R1, R2, R3, R4 for the dilutions of the reference preparation. To each tube add 50 µL of *antithrombin III solution R1* and 50 µL of the appropriate dilution of the injection being examined, or the reference preparation. After each addition, mix but do not allow bubbles to form. Treating the tubes in the order R1, R2, R3, R4, T1, T2, T3, T4, T1, T2, T3, T4, R1, R2, R3, R4, allow to equilibrate at 37° (in a water-bath or heating block) for 1 minute and add to each tube 100 µL of *bovine factor Xa solution.* Incubate for exactly 1 minute and add 250 µL of *chromophore substrate R1.* Stop the reaction after exactly 4 minutes by adding 375 µL of *acetic acid.* Transfer the mixtures to semi-micro cuvettes and measure the *absorbance* at 405 nm, Appendix II B, using a suitable reading device. Determine the blank amidolytic activity at the beginning and at the end of the procedure in a similar manner, using *tris-chloride buffer pH 7.4* instead of the reference and test solutions; the 2 blank values do not differ significantly. Calculate the regression of the absorbance on log concentrations of the solutions of the injection being examined and of the reference preparation of low-molecular-

www.webofpharma.com

mass heparins and calculate the potency of the substance being examined in International Units of anti-factor Xa activity per mL using the usual statistical methods for parallel-line assays.

For anti-factor IIa activity

Test solutions (1) to *(4)* Prepare a series of 4 independent dilutions of the injection being examined in *tris-chloride buffer pH 7.4*; the concentration range should be within 0.015 IU to 0.075 IU of anti-factor IIa activity per mL and the dilutions chosen should give a linear response when results are plotted as absorbance against log concentration.

Reference solutions (1) to *(4)* Prepare a series of 4 independent dilutions of the reference preparation of low molecular-mass heparin in *tris-chloride buffer pH 7.4*; the concentration range should be within 0.015 IU to 0.075 IU of anti-factor IIa activity per mL and the dilutions chosen should give a linear response when results are plotted as absorbance against log concentration.

Label 16 tubes in duplicate: T1, T2, T3, T4 for the dilutions of the injection being examined and R1, R2, R3, R4 for the dilutions of the reference preparation. To each tube add 50 µL of *antithrombin III solution R2* and 50 µL of the appropriate dilution of the injection being examined or the reference preparation. After each addition, mix but do not allow bubbles to form. Treating the tubes in the order R1, R2, R3, R4, T1, T2, T3, T4, T1, T2, T3, T4, R1, R2, R3, R4, allow to equilibrate at 37° (in a water-bath or heating block) for 1 minute and add to each tube 100 µL of *human thrombin solution*. Incubate for exactly 1 minute and add 250 µL of *chromophore substrate R2*. Stop the reaction after exactly 4 minutes by adding 375 µL of *acetic acid*. Transfer the mixtures to semi-micro cuvettes and measure the *absorbance* at 405 nm, Appendix II B, using a suitable reading device. Determine the blank amidolytic activity at the beginning and at the end of the procedure in a similar manner, using *tris-chloride buffer pH 7.4* instead of the reference and test solutions; the 2 blank values do not differ significantly. Calculate the regression of the absorbance on log concentrations of the solutions of the substance to be examined and of the reference preparation of low-molecular-mass heparins, and calculate the potency of the substance being examined in International Units of anti-factor IIa activity per mL using the usual statistical methods for parallel-line assays.

LABELLING

The label states the number of IU (Units) of anti-factor Xa per unit volume.

Dantrolene Oral Suspension

NOTE: *Dantrolene Oral Suspension is not currently licensed in the United Kingdom.*

Action and use

Skeletal muscle relaxant.

DEFINITION

Dantrolene Oral Suspension is a suspension of Dantrolene Sodium in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of dantrolene sodium, $C_{14}H_9N_4NaO_5,3½H_2O$

95.0 to 105.0% of the stated amount.

Shake the oral suspension vigorously before carrying out the following tests.

IDENTIFICATION

A. Shake a quantity of the oral suspension containing 0.1 g of Dantrolene Sodium with sufficient 0.01M *sodium hydroxide* to produce 100 mL, dilute 1 mL to 100 mL with 0.01M *sodium hydroxide*, filter and use the filtrate. The *light absorption*, Appendix II B, in the range 230 nm to 350 nm, of the final solution, exhibits a maximum at 314 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.5 to 5.5, Appendix V L.

Dissolution

Complies with the requirements stated under Unlicensed Medicines, Oral Suspensions. Use a volume of the oral suspension containing one dose.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the oral suspension containing 50 mg of Dantrolene Sodium in 20 mL of *tetrahydrofuran* and 2 mL of *glacial acetic acid* and dilute with sufficient *absolute ethanol* to produce 100 mL.

(2) Dilute 1 mL of solution (1) to 100 mL with *absolute ethanol*.

(3) Dissolve 5 mg of *dantrolene sodium BPCRS* and 0.1 g of *theophylline BPCRS* in 20 mL of *tetrahydrofuran* and 2 mL of *glacial acetic acid* and dilute with sufficient *absolute ethanol* to produce 100 mL. Dilute 10 mL of the resulting solution to 100 mL with *absolute ethanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Zorbax Sil is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Adjust the flow rate of the mobile phase so that the retention time of the peak corresponding to Dantrolene Sodium is about 8 minutes.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 300 nm.

(f) Inject 10 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for at least twice the retention time of the principal peak.

MOBILE PHASE

9 volumes of *absolute ethanol*, 10 volumes of *glacial acetic acid* and 90 volumes of *hexane*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to theophylline and dantrolene is at least 6.0.

LIMITS

In the chromatogram obtained with solution (1):

the total area of all the *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

www.webofpharma.com

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 50 mL of *dimethylformamide* to a weighed quantity of the oral suspension containing 60 mg of Dantrolene Sodium and dilute 1 volume of this solution to 100 volumes with the mobile phase.

(2) Dilute 1 volume of a 0.12% w/v solution of *dantrolene sodium BPCRS* in *dimethylformamide* to 100 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with spherical particles of silica, 5 µm in diameter, the surface of which has been modified with chemically-bonded nitrile groups (Spherisorb CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 262 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

15 volumes of *acetonitrile* and 85 volumes of a phosphate buffer pH 6.8 prepared by dissolving 11.88 g of *disodium hydrogen orthophosphate* and 9.08 g of *potassium dihydrogen orthophosphate* in 1000 mL of *water*.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{14}H_9N_4NaO_5,3½H_2O$, weight in volume, using the declared content of $C_{14}H_9N_4NaO_5$ in *dantrolene sodium BPCRS*. Each mg of $C_{14}H_9N_4NaO_5$ is equivalent to 1.1873 mg of $C_{14}H_9N_4NaO_5,3½H_2O$.

STORAGE

Dantrolene Oral Suspension should be protected from light.

Dapsone Tablets

Action and use

Folic acid synthesis inhibitor; treatment of leprosy.

DEFINITION

Dapsone Tablets contain Dapsone.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of dapsone, $C_{12}H_{12}N_2O_2S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Dapsone with 20 mL of *acetone*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of dapsone *(RS 084)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) is similar in position, colour and size to that in the chromatogram obtained with solution (5).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 20 mL sample of the medium. To a volume of the filtered sample expected to contain 0.1 mg of Dapsone add 1 mL of a freshly prepared 0.5% w/v solution of *sodium nitrite*, and allow to stand for 3 minutes. Add 1.5 mL of a 1% w/v solution of *sulfamic acid*, allow to stand for 3 minutes, add 2.5 mL of a freshly prepared 0.2% w/v solution of *N-(1-naphthyl)-ethylenediamine dihydrochloride* in 0.1M *hydrochloric acid* and dilute to 20 mL with 1M *hydrochloric acid* (solution A). Carry out the procedure at the same time and in the same manner using a volume of 0.1M *hydrochloric acid* equal to that of the filtered sample and beginning at the words 'add 1 mL of a freshly prepared 0.5% w/v solution of *sodium nitrite...*' (solution B). Allow solutions A and B to stand for at least 2 minutes and measure the *absorbance* of solution A at the maximum at 538 nm, Appendix II B, using solution B in the reference cell.

(2) Repeat the operation using a solution containing 0.1 mg of *dapsone BPCRS* in a volume of 0.1M *hydrochloric acid* equal to that of the filtered sample and beginning at the words 'add 1 mL of a freshly prepared 0.5% w/v solution of *sodium nitrite* ...' and using solution B in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of dapsone, $C_{12}H_{12}N_2O_2S$, in the medium from the absorbances obtained and using the declared content of $C_{12}H_{12}N_2O_2S$ in *dapsone BPCRS*.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 g of Dapsone with 10 mL of *methanol* and filter.

(2) Dilute 1 volume of solution (1) to 10 volumes with *methanol*.

(3) Dilute 1 volume of solution (2) to 10 volumes with *methanol*.

(4) Dilute 1 volume of solution (3) to 5 volumes with *methanol*.

(5) 0.1% w/v of *dapsone BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel G plate*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each of solutions (1), (3) and (4) and 1 µL of each of solutions (2) and (5).

(d) Develop the plate to 15 cm in an unsaturated tank.

(e) After removal of the plate, dry in air, spray with a 0.1% w/v solution of *4-dimethylaminocinnamaldehyde* in a mixture of 1 volume of *hydrochloric acid* and 99 volumes of *ethanol (96%)* and examine in daylight.

www.webofpharma.com

MOBILE PHASE

1 volume of 13.5M *ammonia*, 6 volumes of *methanol*, 20 volumes of *ethyl acetate* and 20 volumes of n-*heptane*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense that the spot in the chromatogram obtained with solution (3) (1%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.2%).

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.25 g of Dapsone in a mixture of 15 mL of *water* and 15 mL of 2M *hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice and titrate slowly with 0.1M *sodium nitrite VS*, stirring constantly and determining the end point electrometrically. Each mL of 0.1M *sodium nitrite VS* is equivalent to 12.42 mg of $C_{12}H_{12}N_2O_2S$.

Demeclocycline Capsules

Action and use

Tetracycline antibacterial.

DEFINITION

Demeclocycline Capsules contain Demeclocycline Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of demeclocycline hydrochloride, $C_{21}H_{21}ClN_2O_8,HCl$

90.0 to 107.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract a quantity of the contents of the capsules containing 10 mg of Demeclocycline Hydrochloride with 20 mL of *methanol* and centrifuge.

(2) 0.05% w/v of *demeclocycline hydrochloride BPCRS* in *methanol*.

(3) 0.05% w/v of each of *demeclocycline hydrochloride BPCRS*, *oxytetracycline hydrochloride BPCRS* and *metacycline hydrochloride EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel H*. Adjust the pH of a 10% w/v solution of *disodium edetate* to 7.0 with 10M *sodium hydroxide* and spray the solution evenly onto the plate (about 10 mL for a plate 100 mm × 200 mm). Allow the plate to dry in a horizontal position for at least 1 hour. At the time of use, dry the plate in an oven at 110° for 1 hour.

(b) Use the mobile phase as described below.

(c) Apply 1 µl of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in a stream of air and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

6 volumes of *water*, 35 volumes of *methanol* and 59 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows three clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Add 20 mL of warm *methanol* to a quantity of the contents of the capsules containing 10 mg of Demeclocycline Hydrochloride, allow to stand for 20 minutes, filter and evaporate the filtrate to dryness on a water bath. To 0.5 mg of the residue add 2 mL of *sulfuric acid*; a purple colour is produced. Add 1 mL of *water*; the colour changes to yellow.

C. To 1 mg of the residue obtained in test B add 7 mL of *water* and 7 mL of 2M *hydrochloric acid* and heat gently for 30 seconds. No colour is produced immediately.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 ml of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes, withdraw a 10 ml sample of the medium and filter. Dilute the filtered solution, if necessary, with sufficient 0.1M *hydrochloric acid* to give a solution expected to contain about 0.015% w/v of Demeclocycline Hydrochloride.

(2) 0.015% w/v of *demeclocycline hydrochloride BPCRS* in 0.1M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrosorb RP18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 ml per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 355 nm.

(f) Inject 20 µl of each solution.

MOBILE PHASE

20 volumes of *dimethylformamide* and 80 volumes of 0.1M *oxalic acid* the pH of which has been adjusted to 2.2 with *triethylamine*.

DETERMINATION OF CONTENT

Calculate the total content of demeclocycline hydrochloride, $C_{21}H_{21}ClN_2O_8,HCl$, in the medium using the declared content of $C_{21}H_{21}ClN_2O_8,HCl$ in *demeclocycline hydrochloride BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a quantity of the contents of the capsules containing 0.5 g of Demeclocycline Hydrochloride with 50 mL of 0.01M *hydrochloric acid*, add sufficient 0.01M *hydrochloric acid* to produce 100 mL, filter and dilute 1 volume of the filtrate to 5 volumes with 0.01M *hydrochloric acid*.

www.webofpharma.com

(2) 0.010% w/v of *demeclocycline hydrochloride BPCRS* in 0.01M *hydrochloric acid.*

(3) 0.015% w/v of each of *demeclocycline hydrochloride BPCRS* and *4-epidemeclocycline hydrochloride EPCRS* in 0.01M *hydrochloric acid.*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (10%);

the sum of the areas of all the *secondary peaks* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (15%).

Loss on drying

When dried at 60° at a pressure not exceeding 0.7 kPa for 3 hours, the contents of the capsules lose not more than 5.0% of their weight. Use 1 g.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a quantity of the mixed contents of 20 capsules containing 0.5 g of Demeclocycline Hydrochloride with 50 mL of 0.01M *hydrochloric acid*, add sufficient 0.01M *hydrochloric acid* to produce 100 mL, filter and dilute 1 volume of the filtrate to 5 volumes with 0.01M *hydrochloric acid.*

(2) 0.10% w/v of *demeclocycline hydrochloride BPCRS* in 0.01M *hydrochloric acid.*

(3) 0.015% w/v of each of *demeclocycline hydrochloride BPCRS* and *4-epidemeclocycline hydrochloride EPCRS* in 0.01M *hydrochloric acid.*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{21}ClN_2O_8,HCl$ in the capsules using the declared content of $C_{21}H_{21}ClN_2O_8,HCl$ in *demeclocycline hydrochloride BPCRS.*

Desferrioxamine Injection

Action and use

Chelating agent (iron).

DEFINITION

Desferrioxamine Injection is a sterile solution of Desferrioxamine Mesilate in Water for Injections. It is prepared by dissolving Desferrioxamine Mesilate for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Desferrioxamine Injection deteriorates on storage and should be used immediately after preparation. Cloudy solutions should be discarded.

DESFERRIOXAMINE MESILATE FOR INJECTION

DEFINITION

Desferrioxamine Mesilate for Injection is a sterile material consisting of Desferrioxamine Mesilate with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of desferrioxamine mesilate, $C_{25}H_{48}N_6O_8,CH_4SO_3$

94.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Dissolve 40 mg of the contents of the sealed container in 2 mL of *absolute ethanol* by heating on a water bath at 60°, cool in ice until the substance begins to crystallise and evaporate to dryness at room temperature under a gentle current of *nitrogen.* The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of desferrioxamine mesilate *(RS 086).*

B. In the test for Related substances the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (3).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare the solutions immediately before use and protect from light.

(1) Dissolve a quantity of the contents of the sealed containers containing 75 mg of Desferrioxamine Mesilate in sufficient of the mobile phase to produce 50 mL.

(2) Dilute 1 volume of solution (1) to 25 volumes with the mobile phase.

(3) 0.15% w/v of *desferrioxamine mesilate EPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

(g) For solutions (1) and (2) allow the chromatography to proceed for three times the retention time of the principal peak.

www.webofpharma.com

MOBILE PHASE

55 volumes of *tetrahydrofuran* and 950 volumes of a solution containing 0.039% w/v of *disodium edetate* and 0.139% w/v of *ammonium phosphate* adjusted to pH 2.8 with *orthophosphoric acid* in *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peak with relative retention time of about 0.8 and the principal peak is at least 1.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (4%);

the sum of the areas of any such peaks is not greater than 1.75 times the area of the principal peak in the chromatogram obtained with solution (2) (7%).

Disregard any peak with an area less than 0.02 times the area of the principal peak in the chromatogram obtained with solution (2) (0.08%).

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Use.

Dissolve a quantity of the mixed contents of the 10 containers containing 0.3 g of Desferrioxamine Mesilate in 15 mL of *water* and add 2 mL of 0.05M *sulfuric acid*. Titrate slowly with 0.1M *ammonium iron(III) sulfate VS* determining the end point potentiometrically and using a platinum electrode and a calomel reference electrode. Each mL of 0.1M *ammonium iron(III) sulfate VS* is equivalent to 65.68 mg of $C_{25}H_{48}N_6O_8,CH_4SO_3$. Calculate the content of $C_{25}H_{48}N_6O_8,CH_4SO_3$ in a container of average content weight.

Desipramine Tablets

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

Desipramine Tablets contain Desipramine Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of desipramine hydrochloride, $C_{18}H_{22}N_2,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Triturate a quantity of the powdered tablets containing 0.25 g of Desipramine Hydrochloride with 10 mL of *chloroform*, filter and evaporate the filtrate to 3 mL. Add *ether* until a slight turbidity is produced and allow to stand; filter, wash the crystals with a mixture of 1 volume of *chloroform* and 5 volumes of *ether* and dry at 100° at a pressure of 2 kPa for 90 minutes. The *infrared absorption spectrum* of the dried crystals, Appendix II A, is concordant with the *reference spectrum* of desipramine hydrochloride *(RS 087)*.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions protected from light.

(1) Shake a quantity of the powdered tablets containing 0.2 g of Desipramine Hydrochloride with three 10 mL quantities of *chloroform* and filter, evaporate the combined filtrates to dryness and dissolve the residue in 10 mL of a mixture of equal volumes of *chloroform* and *absolute ethanol*.

(2) Dilute 1 volume of solution (1) to 500 volumes with equal volumes of *chloroform* and *absolute ethanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 7 cm.

(e) After removal of the plate, dry in air for 10 minutes, spray with a 0.5% w/v solution of *potassium dichromate* in *sulfuric acid (20%)* and examine immediately.

MOBILE PHASE

5 volumes of *water*, 50 volumes of *glacial acetic acid* and 50 volumes of *toluene*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 75 mg of Desipramine Hydrochloride with 100 mL of 0.1M *hydrochloric acid* for 30 minutes, add sufficient 0.1M *hydrochloric acid* to produce 250 mL and filter. Dilute 5 mL to 100 mL with 0.1M *hydrochloric acid* and measure the *absorbance* of the resulting solution at the maximum at 250 nm, Appendix II B. Calculate the content of $C_{18}H_{22}N_2,HCl$ taking 270 as the value of A(1%, 1 cm) at the maximum at 250 nm.

Desmopressin Injection

Action and use

Vasopressin analogue; treatment of diabetes insipidus; nocturnal enuresis; haemophillia; von Willebrand's disease.

DEFINITION

Desmopressin Injection is a sterile solution of Desmopressin in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of desmopressin, $C_{46}H_{64}N_{14}O_{12}S_2$

90.0 to 110.0% of the stated amount of the peptide.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

In the Assay, the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

www.webofpharma.com

TESTS

Acidity

pH, 3.5 to 6.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions and the *normalisation procedure*.

(1) Dilute the injection, if necessary, with *water* to give a final concentration of 0.0004% w/v of the peptide.

(2) Dissolve the contents of a vial of *oxytocin/desmopressin validation mixture EPCRS* in 25mL of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12 cm x 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 200 µL of each solution.

MOBILE PHASE

Mobile phase A *0.067M mixed phosphate buffer solution pH 7.0.*

Mobile phase B A mixture of *acetonitrile for chromatography* and mobile phase A in equal volumes.

Time (Minutes)	Mobile phase A%	Mobile phase B%	Comment
0 - 4	76	24	isocratic
4 - 18	76 → 58	24 → 42	linear gradient
18 - 35	58 → 48	42 → 52	linear gradient
35 - 40	48 → 76	52 → 24	linear gradient
40 - 50	76	0	re-equilibration

The retention time of desmopressin is about 16 minutes and the retention time for oxytocin is about 17 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two principal peaks is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not more than 4.0%;

the total area of any such peaks is not more than 5.0%.

Disregard any peak due to the solvent or with an area less than 2.0%.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is less than 10 IU per µg peptide.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the injection in *water* to give a final concentration of 0.0004 % w/v of the peptide.

(2) 0.0004% w/v of *desmopressin EPCRS* in *water*.

(3) Dissolve the contents of a vial of *oxytocin/desmopressin validation mixture EPCRS* in 25 mL of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12 cm x 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 200 µL of each solution.

MOBILE PHASE

20 volumes of *acetonitrile for chromatography* and 80 volumes of *0.067 M mixed phosphate buffer solution, pH 7.0.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks at least 1.5.

The retention time of desmopressin is about 5 minutes; if necessary adjust the concentration of acetonitrile in the mobile phase to obtain a retention time of about 5 minutes.

DETERMINATION OF CONTENT

Calculate the content of $C_{46}H_{64}N_{14}O_{12}S_2$ in the injection from the chromatograms obtained and from the declared content of $C_{46}H_{64}N_{14}O_{12}S_2$ in *desmopressin EPCRS*.

STORAGE

Desmopressin Injection should be protected from light and stored at a temperature of 2° to 8°.

Desmopressin Intranasal Solution

Action and use

Vasopressin analogue; treatment of diabetes insipidus; haemophillia; von Willebrand's disease.

DEFINITION

Desmopressin Intranasal Solution is a solution of Desmopressin containing suitable buffering agents and preservatives.

The intranasal solution complies with the requirements stated under Nasal Preparations and with the following requirements.

Content of desmopressin, $C_{46}H_{64}N_{14}O_{12}S_2$

90.0 to 110.0% of the stated amount of the peptide.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

In the Assay, the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 3.5 to 5.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions and the *normalisation procedure*.

(1) Dilute a volume of the intranasal solution in *water* to give a final concentration of 0.0025% w/v of the peptide.

www.webofpharma.com

(2) Dissolve the contents of a vial of *oxytocin/desmopressin validation mixture EPCRS* in 10 mL of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm). (Nucleosil C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 200 µL of each solution.

MOBILE PHASE

Mobile phase A *0.067M mixed phosphate buffer solution, pH 7.0.*

Mobile phase B 10 volumes of *acetonitrile for chromatography* and 10 volumes of mobile phase A.

Time (Minutes)	Mobile phase A%	Mobile phase B%	Comment
0 - 4	76	24	isocratic
4 - 18	76 → 58	24 → 42	linear gradient
18 - 35	58 → 48	42 → 52	linear gradient
35 - 40	48 → 76	52 → 24	linear gradient
40 - 50	76	0	re-equilibration

Using the prescribed conditions the retention time of desmopressin is about 16 minutes and the retention time of oxytocin is about 17 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two principal peaks is at least 1.5;

the peak due to desmopressin is clearly separated from the peak due to the antimicrobial preservative stated on the label.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not more than 4.0%.

the total area of any such peaks is not more than 5.0%.

Disregard any peak due to the solvent, any antimicrobial preservative stated on the label and any peak with an area less than 0.3%.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the intranasal solution in *water* to give a final concentration of 0.0025% w/v of the peptide.

(2) 0.0025% w/v of *desmopressin EPCRS* in *water*.

(3) Dissolve the contents of a vial of *oxytocin/desmopressin validation mixture EPCRS* in 1 mL of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 200 µL of each solution.

MOBILE PHASE

A mixture of 2 volumes of *acetonitrile for chromatography* and 8 volumes of *0.067M mixed phosphate buffer solution, pH 7.0.*

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 1.5.

the peak due to desmopressin is clearly separated from the peak due to the antimicrobial preservative stated on the label.

The retention time of desmopressin is about 5 minutes. If necessary adjust the concentration of acetonitrile in the mobile phase to obtain the correct retention time and *resolution factor*.

DETERMINATION OF CONTENT

Calculate the content of $C_{46}H_{64}N_{14}O_{12}S_2$ in the intranasal solution from the chromatograms obtained and from the declared content of $C_{46}H_{64}N_{14}O_{12}S_2$ in *desmopressin EPCRS*.

STORAGE

Desmopressin Intranasal Solution should be protected from light and stored at a temperature of 2° to 8°, unless otherwise justified and authorised.

Desmopressin Tablets

Action and use

Vasopressin analogue; treatment of diabetes insipidus; nocturnal enuresis; haemophillia; von Willebrand's disease.

DEFINITION

Desmopressin Tablets contain Desmopressin.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of desmopressin, $C_{46}H_{64}N_{14}O_{12}S_2$

90.0 to 110.0% of the stated amount of the peptide.

IDENTIFICATION

In the test for Uniformity of content, the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B 1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 500 mL of *water* as the medium.

PROCEDURE

(c) After 45 minutes, withdraw a 20 mL sample of the medium and filter.

(d) Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use the filtered dissolution medium.

(2) Prepare a solution of *desmopressin EPCRS* in *water* with a final concentration equal to that expected for solution (1).

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the total content of desmopressin $C_{46}H_{64}N_{14}O_{12}S_2$, in the medium using the declared content of $C_{46}H_{64}N_{14}O_{12}S_2$ in *desmopressin EPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions and the *normalisation procedure*:

(1) Shake a quantity of powdered tablets containing 0.5 mg with 1 mL *water* to give a final concentration of 0.05% w/v of the peptide.

(2) Dissolve the contents of a vial of *oxytocin/desmopressin validation mixture EPCRS* in 0.5 mL of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12 cm x 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm).

(b) Use linear gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 50 µL of each solution.

Mobile phase A *0.067M mixed phosphate buffer solution pH 7.0.*

Mobile phase B 10 volumes of *acetonitrile for chromatography* and 10 volumes of mobile phase A.

Time (Minutes)	Mobile phase A%	Mobile phase B%	Comment
0 - 4	76	24	isocratic
4 - 18	76 → 58	24 → 42	linear gradient
18 - 35	58 → 48	42 → 52	linear gradient
35 - 40	48 → 76	52 → 24	linear gradient
40 - 50	76	0	re-equilibration

The retention time of desmopressin is about 16 minutes and the retention time for oxytocin is about 17 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two principal peaks is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not more than 2.0%.

the total area of any such peaks is not more than 4.0%.

Disregard any peak due to the solvent or with a relative amount less than 0.05%.

Uniformity of content

Tablets containing less than 2 mg of Desmopressin comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions:

(1) Add sufficient *water* to one tablet to produce a solution containing 0.01% w/v of Desmopressin.

(2) 0.01% w/v of *desmopressin EPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12 cm x 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

4 volumes of *acetonitrile for chromatography* and 6 volumes of *0.067M mixed phosphate buffer solution pH 7.0.*

The retention time of desmopressin is about 5 minutes.

DETERMINATION OF CONTENT

Calculate the content of $C_{46}H_{64}N_{14}O_{12}S_2$ in each tablet from the chromatograms obtained and from the declared content of $C_{46}H_{64}N_{14}O_{12}S_2$ in *desmopressin EPCRS*.

ASSAY

Use the average of the 10 individual results obtained in the test for Uniformity of content.

STORAGE

Desmopressin Tablets should be protected from moisture.

Desogestrel Tablets

Action and use

Progestogen.

DEFINITION

Desogestrel Tablets contain Desogestrel.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of desogestrel, $C_{22}H_{30}O$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *dichloromethane*.

(1) Disperse a quantity of powdered tablets containing 0.75 mg of Desogestrel in 8 mL of *dichloromethane*, mix with the aid of ultrasound and dilute to 10 mL with *dichloromethane* and filter.

(2) 0.0075% w/v of *desogestrel BPCRS*.

(3) 0.0075% w/v each of *desogestrel BPCRS* and *lynestrenol BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel 60 precoated plate for high performance thin-layer chromatography (Merck silica gel 60 HPTLC plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 2 µL of each solution.

www.webofpharma.com

(d) After removal of the plate, dry in air, spray it with *ethanolic sulfuric acid* (2%), heat at 110° for 10 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

A mixture of 20 volumes of *ethyl acetate* and 80 volumes of *toluene*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in colour, position and size to the principal spot in the chromatogram obtained with solution (2).

TESTS

Solution A

80 volumes of *acetonitrile* and 20 volumes of *water*.

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 500 mL of a 0.3% w/v solution of *sodium lauryl sulfate*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a sample of the medium and filter. Use the filtered medium, diluted with a 0.3% w/v solution of *sodium lauryl sulfate* if necessary, expected to contain 0.000015% w/v of Desogestrel.

(2) 0.000015% w/v of *desogestrel BPCRS* in a mixture of 1 volume of *2-propanol* and 99 volumes of a 0.3% w/v solution of *sodium lauryl sulfate*.

CHROMATOGRAPHIC CONDITIONS

(a) A stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography R* (5 µm) (Zorbax ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°C.

(e) Use a detection wavelength of 205 nm.

(f) Inject 200 µL of each solution.

MOBILE PHASE

5 volumes of *water* and 95 volumes of *acetonitrile*.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{30}O$ in the medium from the chromatograms obtained and using the declared content of $C_{22}H_{30}O$ in *desogestrel BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 80 volumes of *acetonitrile* and 20 volumes of *water* (Solution A).

(1) Disperse a quantity of powdered tablets containing 0.75 mg of Desogestrel in 15 mL of solution A, mix with the aid of ultrasound and dilute with sufficient solution A to produce 20 mL, mix and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with solution A and further dilute 2 mL of this solution to 10 mL with solution A.

(3) 0.00375% w/v of *desogestrel BPCRS*, 0.000075% w/v of *desogestrel impurity D BPCRS* and 0.0000375% w/v of *desogestrel impurity E BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography R* (5 µm) (Zorbax ODS is suitable).

(b) Use a gradient elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 40°C.

(e) Use detection wavelengths of 230 nm and 210 nm.

(f) Inject 25 µL of each solution.

MOBILE PHASE

Mobile phase A *acetonitrile*.

Mobile phase B 50 volumes of *acetonitrile* and 50 volumes of *water*.

Time (Minutes)	Mobile phase A%	Mobile phase B%	Comment
0-4.5	0	100	isocratic
4.5-4.6	0→100	100→0	linear gradient
4.6-10.7	100	0	isocratic
10.7-10.8	100→0	0→100	linear gradient
10.8-14	0	100	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), at 210 nm the *resolution* between the peaks due to desogestrel impurity E and desogestrel impurity D is at least 1.5 and the retention time of desogestrel impurity D is not greater than 6 minutes.

LIMITS

In the chromatogram obtained with solution (1) at 210 nm:

the area of any peak due to desogestrel impurity E is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (1%);

the area of any other peak other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%).

In the chromatogram obtained with solution (1) at 230 nm:

the area of any peak due to desogestrel impurity D is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (2%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Desogestrel comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 80 volumes of *acetonitrile* and 20 volumes of *water* (Solution A).

(1) To one tablet add 5 mL of solution A, mix with the aid of ultrasound and add sufficient solution A to produce a solution expected to contain 0.00075% w/v of Desogestrel.

www.webofpharma.com

(2) 0.00075% w/v of *desogestrel BPCRS*.

(3) 0.00075% w/v of *desogestrel BPCRS*, 0.000015% w/v of *desogestrel impurity D BPCRS* and 0.0000075% w/v of *desogestrel impurity E BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used with the following amendments:

(a) Use a detection wavelength of 210 nm.

(b) Inject 125 µL of each solution.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to desogestrel impurity D and desogestrel is at least 1.5 and the retention time of desogestrel impurity D is not greater than 6 minutes.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{30}O$ in the tablets using the declared content of $C_{22}H_{30}O$ in *desogestrel BPCRS*.

ASSAY

For tablets containing less than 2 mg and/or less than 2% w/w of Desogestrel

Use the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing 2 mg or more and 2% w/w of Desogestrel

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 80 volumes of *acetonitrile* and 20 volumes of *water* (Solution A).

(1) To a quantity of powdered tablets containing 0.75 mg of Desogestrel add 10 mL of solution A, mix with the aid of ultrasound and add sufficient solution A to produce 20 mL.

(2) 0.00375% w/v of *desogestrel BPCRS*.

(3) 0.00375% w/v of *desogestrel BPCRS*, 0.000075% w/v of *desogestrel impurity D BPCRS* and 0.0000375% w/v of *desogestrel impurity E BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used with a detection wavelength of 210 nm.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to desogestrel impurity D and desogestrel is at least 1.5 and the retention time of desogestrel impurity D is not greater than 6 minutes.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{30}O$ in the tablets using the declared content of $C_{22}H_{30}O$ in *desogestrel BPCRS*.

IMPURITIES

D. 13-ethyl-17-hydroxy-11-methylidene-18,19-dinor-17α-pregn-4-en-20-yn-3-one (European Pharmacopoeia impurity D),

E. 13-ethyl-11-methylidene-18,19-dinor-17α-pregn-4-en-20-yne-3α,17-diol (European Pharmacopoeia impurity E).

Dexamethasone Eye Drops, Suspension

Action and use
Glucocorticoid.

DEFINITION

Dexamethasone Eye Drops, Suspension are a sterile suspension of Dexamethasone in a suitable vehicle.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of dexamethasone, $C_{22}H_{29}FO_5$
95.0 to 105.0% of the stated amount.

The eye drops should be shaken vigorously before carrying out the following tests.

IDENTIFICATION

Mix a quantity of the Eye drops containing 20 mg of Dexamethasone with 5 mL of 0.1M *sodium hydroxide*, add 50 mL of *dichloromethane* and mix with the aid of ultrasound for 20 minutes, filter the dichloromethane layer and evaporate to dryness using a rotary evaporator. Dry the residue at 105° for 2 hours. The *infrared absorption* spectrum of the dried residue, Appendix II A, is concordant with the *reference spectrum* of dexamethasone *(RS 089)*.

TESTS

Particle size
The eye drops are a suspension and comply with the following test:

Examine using an automated light obscuration instrument such as that described in Appendix XIII A. Not more than 20 particles greater than 25 µm, not more than 2 particles greater than 50 µm and no particles greater than 90 µm.

Acidity
pH, 5.0 to 6.0, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Disperse a quantity of the eye drops containing 20 mg of Dexamethasone in 70 mL of mobile phase, mix with the aid of ultrasound for 10 minutes, dilute with sufficient mobile phase to produce 100 mL and filter.

(2) Dilute 3 volume of solution (1) to 100 volumes with the mobile phase.

(3) 0.02% w/v of *dexamethasone impurity standard BPCRS*.

(4) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase, dilute 1 mL of this solution to 10 volumes with mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography R* (5 µm) (Waters Symmetry C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for six times the retention time of dexamethasone.

www.webofpharma.com

MOBILE PHASE

27 volumes of *acetonitrile* and 73 volumes of a 0.3% w/v solution of *orthophosphoric acid* that has been previously adjusted to pH 3.0 with *dilute sodium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless, the chromatogram obtained with solution (3):

the *resolution factor* between the peaks due to impurity 3 and dexamethasone is at least 1.5;

closely resembles the chromatogram supplied with *dexamethasone impurity standard BPCRS*.

LIMITS

In the chromatogram obtained with solution (1):

the sum of the areas of any peaks, apart from the principal peak, is not greater than the area of the peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than the area of the peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Disperse a quantity of the eye drops containing 20 mg of Dexamethasone in 70 mL of mobile phase, mix with the aid of ultrasound for 10 minutes, dilute with sufficient mobile phase to produce 100 mL and filter.

(2) 0.02% w/v of *dexamethasone BPCRS*.

(3) 0.01% w/v of *dexamethasone impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

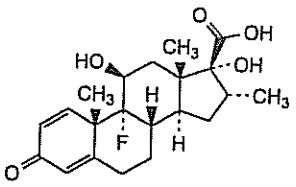
The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3):

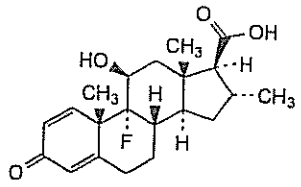
the *resolution factor* between the peaks due to impurity 3 and dexamethasone is at least 1.5;

closely resembles the chromatogram supplied with *dexamethasone impurity standard BPCRS*.



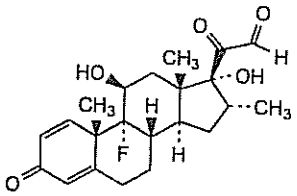
DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in the eye drops using the declared content of $C_{22}H_{29}FO_5$ in *dexamethasone BPCRS*.

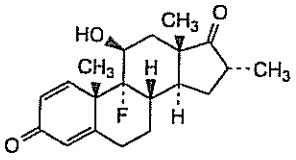


STORAGE

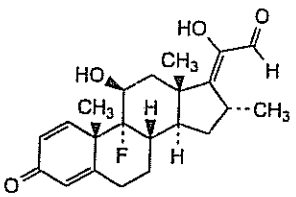
Dexamethasone Eye Drops, Suspension should be stored in accordance with the manufacturer's instructions.



IMPURITIES



1. Dexamethasone-17β-carboxylic acid.



2. Dexamethasone-17α-dehydroxy-17β-carboxylic acid.

3. Dexamethasone-21-aldehyde.

4. Dexamethasone-17-ketone.

5. Dexamethasone-17(20)-enol-21-aldehyde.

Dexamethasone Tablets

Action and use
Glucocorticoid.

DEFINITION

Dexamethasone Tablets contain Dexamethasone.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of dexamethasone, $C_{22}H_{29}FO_5$

95.0 to 105.0% of the stated amount.

Carry out all of the following procedures protected from light.

IDENTIFICATION

Mix a quantity of the powdered tablets containing 20 mg of Dexamethasone with 5 mL of 0.1M *sodium hydroxide*, add 50 mL of *dichloromethane* and mix with the aid of ultrasound for 20 minutes, filter and evaporate to dryness using a rotary evaporator. Dry the residue at 105° for 2 hours. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of dexamethasone *(RS 089)*.

www.webofpharma.com

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the powdered tablets containing 2.5 mg of Dexamethasone add 10 mL of *acetonitrile*, mix with the aid of ultrasound and filter through a 0.45-µm filter. Dilute 4 mL of the filtrate to 10 mL with *water*.

(2) Dilute 1 volume of solution (1) to 100 volume with mobile phase A.

(3) 0.002% w/v each of *dexamethasone BPCRS* and *methylprednisolone BPCRS* in mobile phase A.

(4) Dilute 1 volume of solution (2) to 20 volumes with mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 2.5 mL per minute.

(d) Use a column temperature of 45°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

(g) The retention times are: methylprednisolone about 13 min and dexamethasone about 16 min.

MOBILE PHASE

Mobile phase A 15% v/v *acetonitrile*.

Mobile phase B *acetonitrile*.

Time (min)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comments
0	100	0	isocratic
15	100 → 0	0 → 100	begin linear gradient
40	0	100	end chromatogram, return to 100 A
41	100	0	begin equilibration with A
46 = 0	100	0	end equilibration, begin next chromatogram

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between methylprednisolone and dexamethasone is at least 2.8.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of all the *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak due to mobile phase A and any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (4) (0.05%).

Uniformity of content

Tablets containing less than 2 mg and or less than 2% w/w of Dexamethasone comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To one tablet, add sufficient *methanol (50%)* to produce a solution containing 0.0025% w/v of Dexamethasone, shake for 10 minutes and filter through glass-fibre filter (Whatman GF/C is suitable).

(2) 0.0025% w/v of *dexamethasone BPCRS* in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.4 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 238 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

47 volumes of *methanol and* 53 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in each tablet using the declared content of $C_{22}H_{29}FO_5$ in *dexamethasone BPCRS*.

ASSAY

For tablets containing less than 2 mg and/or less than 2% w/w of Dexamethasone

Use the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing 2 mg or more and 2% w/w of Dexamethasone

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the powdered tablets containing 2.5 mg of Dexamethasone add 20 mL of *methanol (50%)*, shake for 20 minutes and filter through glass-fibre filter (Whatman GF/C is suitable).

(2) 0.0125% w/v of *dexamethasone BPCRS* in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in the tablets using the declared content of $C_{22}H_{29}FO_5$ in *dexamethasone BPCRS*.

STORAGE

Dexamethasone Tablets should be protected from light.

www.webofpharma.com

Dexamethasone and Neomycin Ear Spray

Action and use
Glucocorticoid.

DEFINITION
Dexamethasone and Neomycin Ear Spray is an emulsion containing Dexamethasone in *microfine powder* and Neomycin Sulfate in a suitable vehicle in a suitable metered-dose container. It may contain acetic acid.

The ear spray complies with the requirements stated under Ear Preparations and with the following requirements.

Content of dexamethasone, $C_{22}H_{29}FO_5$
80.0 to 120.0% of the amount stated to be delivered by actuation of the valve.

Shake the ear spray vigorously before carrying out the following tests.

IDENTIFICATION
A. In the Assay for dexamethasone, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Discharge the container a sufficient number of times to obtain a suitable quantity and dilute with *methanol*, if necessary, to produce a solution containing 0.1% w/v of Dexamethasone.

(2) 0.1% w/v of *dexamethasone BPCRS* in *methanol*.

(3) 0.1% w/v of each of *dexamethasone BPCRS* and *betamethasone BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel F_{254} plate* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)* (detection method A). Spray with *alcoholic solution of sulfuric acid*. Heat at 120° for 10 minutes or until the spots appear. Allow to cool. Examine the chromatograms in daylight and under *ultraviolet light (365 nm)* (detection method B).

MOBILE PHASE

5 volumes of *butan-2-ol* saturated with *water*, 10 volumes of *toluene* and 85 volumes of *ether*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two spots which may, however, not be completely separated.

CONFIRMATION

Method A The principal spot in the chromatogram obtained with solution (1) is similar in position and size to the principal spot in the chromatogram obtained with solution (2).

Method B The principal spot in the chromatogram obtained with solution (1) is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with solution (2).

C. In the test for Neomycin C, the principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to the principal spot in the chromatogram obtained with solution (4).

Dexamethasone and Neomycin Ear Spray containing acetic acid complies with the following additional test.

D. Discharge the container a sufficient number of times to produce 0.2 g. The solution yields reaction A characteristic of *acetates*, Appendix VI.

TESTS
Acidity
pH, 2.0 to 3.0, Appendix V L.

Neamine
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Discharge the container a sufficient number of times to obtain a suitable quantity (0.5% w/w of neomycin sulfate is suitable).

(2) 0.01% w/v of *neamine EPCRS* in *water*.

(3) Mix 1 volume of solution (1) and 1 volume of solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel plate*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution, as 5-mm bands.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it at 100° to 105° for 10 minutes, spray with *ninhydrin and stannous chloride reagent*, heat at 110° for 15 minutes, spray with the same reagent and heat at 110° for 15 minutes.

MOBILE PHASE

10 volumes of *dichloromethane*, 20 volumes of 13.5M *ammonia* and 30 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots.

LIMITS

In the chromatogram obtained with solution (1) any spot corresponding to neamine is not more intense than the spot in the chromatogram obtained with solution (2) (2%).

Neomycin C
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Discharge the container a sufficient number of times to obtain a suitable quantity (0.5% w/w of neomycin sulfate is suitable).

(2) 0.075% w/v of *framycetin sulfate EPCRS* in *water*.

(3) Dilute 1 volume of solution (2) to 5 volumes with *water*.

(4) 0.5% w/v of *neomycin sulfate EPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel plate*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution, as 5-mm bands.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it at 100° to 105° for 10 minutes, spray with *ninhydrin solution R1* and heat at 100° to 105° for 10 minutes.

www.webofpharma.com

MOBILE PHASE

20 volumes of *methanol* and 80 volumes of a 20% w/v solution of *sodium chloride*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), a spot appears with an Rf value slightly less than that of the principal spot.

LIMITS

In the chromatogram obtained with solution (1) the spot with an Rf value slightly less than that of the principal spot (neomycin C) is not more intense than the spot in the chromatogram obtained with solution (2) (15%) but is more intense than the spot in the chromatogram obtained with solution (3) (3%).

Related substances

Dexamethasone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After priming the pump, discharge the container a sufficient number of times to obtain 2.5 mg of Dexamethasone, add 1.5 mL of *acetonitrile R* and 5 mL of mobile phase A. Mix with the aid of ultrasound, add sufficient mobile phase A to produce 10 mL and filter through a 0.45-µm filter.

(2) Dilute 1 mL of solution (1) to 100 mL with mobile phase A.

(3) 0.002% w/v of each of *methylprednisolone BPCRS* and *dexamethasone BPCRS* in mobile phase A.

(4) Dilute 1 mL of solution (2) to 20 mL with mobile phase A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 2.5 mL per minute.

(d) Use a column temperature of 45°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 25% v/v *acetonitrile*.

Mobile phase B *acetonitrile*.

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)	Comment
0	100	0	isocratic
15	100→0	0→100	begin linear gradient
40	0	100	end chromatogram, return to 100 A
41	100	0	begin equilibration with A
46 = 0	100	0	end equilibration, begin next chromatogram

When the chromatograms are recorded under the prescribed conditions, the retention times are: methylprednisolone, about 12 minutes; dexamethasone, about 14 minutes.

SYSTEM SUITABILITY

The test is not valid unless:

(a) in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to methylprednisolone and dexamethasone is at least 1.5 (if necessary, adjust the concentration of acetonitrile in mobile phase A);

(b) in the chromatogram obtained with solution (4), the *signal to noise ratio* of the peak due to dexamethasone is at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of all the *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak due to mobile phase A and any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (4) (0.05%).

ASSAY

For dexamethasone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light.

(1) After priming the pump, discharge the container a sufficient number of times to obtain 1 mg of Dexamethasone, add 10 mL of *methanol*, place in an ultrasonic bath for 10 minutes, cool, dilute to 25 mL with *water*, mix and filter through a 0.45-µm PTFE filter.

(2) Dilute 10 volumes of a 0.010% w/v solution of *dexamethasone BPCRS* in *methanol* to 25 volumes with *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mix 10 volumes of *glacial acetic acid*, 350 volumes of *acetonitrile* and 640 volumes of *water* and filter (Whatman GF/F is suitable).

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_5$ in the ear spray using the declared content of $C_{22}H_{29}FO_5$ in *dexamethasone BPCRS*

For neomycin sulfate

Prime the pump and discharge the container a sufficient number of times to obtain a quantity of the emulsion containing 3250 IU; dilute to 50 mL with *sterile phosphate buffer pH 8.0*. Dilute 10 mL of the resulting solution to 100 mL with the same solvent and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of

www.webofpharma.com

error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated number of IU per mL.

STORAGE

Dexamethasone and Neomycin Ear Spray should not be allowed to freeze.

LABELLING

The strength with respect to Neomycin Sulfate is stated as the number of IU (Units) per mL.

Dexamethasone Sodium Phosphate Eye Drops, Solution

Action and use

Glucocorticoid.

DEFINITION

Dexamethasone Sodium Phosphate Eye Drops, Solution are a sterile Solution of Dexamethasone Sodium Phosphate in a suitable vehicle.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of dexamethasone sodium phosphate, $C_{22}H_{28}FNa_2O_8P$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Mix a quantity of the eye drops containing 20 mg of Dexamethasone Sodium Phosphate with 5 mL of 0.1M *sodium hydroxide*, add 50 mL of *dichloromethane* and mix with the aid of ultrasound for 20 minutes, filter the dichloromethane layer and evaporate to dryness using a rotary evaporator. Dry the residue at 105° for 2 hours. The *infrared absorption* spectrum of the dried residue, Appendix II A, is concordant with the *reference spectrum* of dexamethasone *(RS 089)*.

TESTS

Alkalinity

pH, 7.0 to 7.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Disperse a quantity of the eye drops containing 20 mg of Dexamethasone Sodium Phosphate in 70 mL, mix with the aid of ultrasound for 10 minutes, dilute to 100 mL and filter.

(2) Dilute 3 volumes of solution (1) to 100 volumes.

(3) 0.02% w/v of *dexamethasone impurity standard BPCRS*.

(4) Dilute 1 volume of solution (1) to 100 volumes and dilute 1 volume of this solution to 10 volumes

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography R* (5 µm) (Waters Symmetry C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for six times the retention time of dexamethasone sodium phosphate.

MOBILE PHASE

27 volumes of *acetonitrile* and 73 volumes of a 0.3% w/v solution of *orthophosphoric acid* that has been previously adjusted to pH 3.0 with 2M *sodium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the peaks due to impurity 3 and dexamethasone is at least 1.5;

the chromatogram closely resembles the chromatogram supplied with *dexamethasone impurity standard BPCRS*.

LIMITS

In the chromatogram obtained with solution (1):

the sum of the areas of any *secondary peaks* is not greater than the area of the peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than the area of the peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Disperse a quantity of the eye drops containing 20 mg of Dexamethasone Sodium Phosphate in 70 mL, mix with the aid of ultrasound for 10 minutes, dilute to 100 mL and filter.

(2) 0.015% w/v of *dexamethasone BPCRS*.

(3) 0.02% w/v of *dexamethasone impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

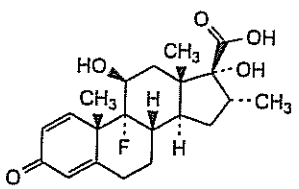
The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the peaks due to impurity 3 and dexamethasone is at least 1.5;

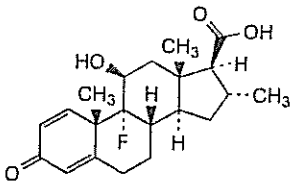
the chromatogram closely resembles the chromatogram supplied with *dexamethasone impurity standard BPCRS*.



DETERMINATION OF CONTENT

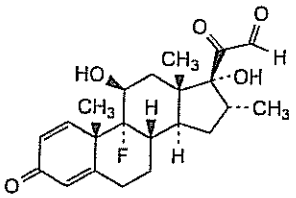
Calculate the content of $C_{22}H_{28}FNa_2O_8P$ in the eye drops using the declared content of $C_{22}H_{29}FO_5$ in *dexamethasone BPCRS*. Each mg of $C_{22}H_{29}FO_5$ is equivalent to 1.3157 mg of $C_{22}H_{28}FNa_2O_8P$.

STORAGE

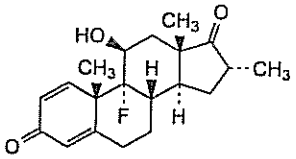


Dexamethasone Sodium Phosphate Eye Drops should be stored in accordance with the manufacturer's instructions.

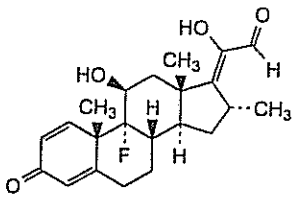
IMPURITIES



1. dexamethasone-17β-carboxylic acid,



www.webofpharma.com



2. dexamethasone-17α-dehydroxy-17β-carboxylic acid,

3. dexamethasone-21-aldehyde,

4. dexamethasone-17-ketone,

5. dexamethasone-17(20)-enol-21-aldehyde.

Dexamethasone Sodium Phosphate Injection

Action and use
Glucocorticoid.

DEFINITION
Dexamethasone Sodium Phosphate Injection is a sterile solution of Dexamethasone Sodium Phosphate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of dexamethasone phosphate, $C_{22}H_{30}FO_8P$
95.0 to 105.0% of the stated amount.

CHARACTERISTICS
A clear, colourless solution.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

(1) Dilute, if necessary, a volume of the injection to contain the equivalent of 0.1% w/v of dexamethasone phosphate.

(2) 0.1% w/v of *dexamethasone phosphate BPCRS*.

(3) 0.1% w/v each of *dexamethasone phosphate BPCRS* and *prednisolone sodium phosphate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, heat at 110° for 10 minutes, spray the hot plate with *ethanolic sulfuric acid (20%)* and heat at 120° for 10 minutes; cool and examine in daylight and under *ultraviolet light (365 nm)*.

MOBILE PHASE

20 volumes of *water*, 20 volumes of *acetic acid* and 60 volumes of *butan-1-ol*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two spots which may, however, not be completely separated.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS
Alkalinity
pH, 7.0 to 8.5, Appendix V L.

Free dexamethasone
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a volume of the injection to produce a solution containing the equivalent of 0.25% w/v of dexamethasone phosphate.

(2) 0.00125% w/v of *dexamethasone BPCRS*.

(3) 0.25% w/v of *dexamethasone phosphate BPCRS*, 0.01% w/v of *propyl hydroxybenzoate* and 0.001% w/v of *dexamethasone BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography R* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute. Equilibrate the column with the mobile phase for about 45 minutes.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

(g) For solutions (1) and (2), continue the chromatography for twice the retention time of the principal peak.

MOBILE PHASE

A mixture prepared as follows: to 1.360 g of *potassium dihydrogen phosphate* add 0.600 g of *hexylamine*, mix, allow to

www.webofpharma.com

stand for 10 minutes, dissolve in 182.5 mL of *water*, add 67.5 mL of *acetonitrile*, mix and filter (0.45 µm).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the peak corresponding to dexamethasone is completely separated from the peaks due to dexamethasone phosphate and propyl hydroxybenzoate. If necessary, adjust slightly the concentration of acetonitrile or increase the concentration of water in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1) the area of the peak corresponding to dexamethasone is not greater than that of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a volume of the injection to produce a solution containing the equivalent of 0.008% w/v of dexamethasone phosphate.

(2) 0.008% w/v of *dexamethasone phosphate BPCRS*.

(3) 0.002% w/v each of *dexamethasone phosphate BPCRS* and *betamethasone sodium phosphate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Free dexamethasone may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to betamethasone sodium phosphate and dexamethasone phosphate is at least 2.2. If necessary, adjust slightly the concentration of acetonitrile or increase the concentration of water in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{30}FO_8P$ in the injection from the peak areas obtained and from the declared content of $C_{22}H_{30}FO_8P$ in *dexamethasone phosphate BPCRS*.

STORAGE

Dexamethasone Sodium Phosphate Injection should be protected from light. It should not be allowed to freeze.

LABELLING

The content of active ingredient is stated as the amount of dexamethasone phosphate in a suitable dose-volume.

Dexamethasone Sodium Phosphate Oral Solution

Action and use

Glucocorticoid

DEFINITION

Dexamethasone Sodium Phosphate Oral Solution contains Dexamethasone Sodium Phosphate in a suitable vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of dexamethasone sodium phosphate, $C_{22}H_{28}FNa_2O_8P$

95.0 to 105.0% of the stated amount.

Carry out all of the following procedures protected from light.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) To a quantity of the oral solution containing 25 mg of Dexamethasone Sodium Phosphate add sufficient *methanol* to produce 100 mL, centrifuge and use the supernatant liquid.

(2) 0.025% w/v of *dexamethasone sodium phosphate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

20 volumes of *glacial acetic acid*, 20 volumes of *water* and 60 volumes of *butanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol (40%)*.

(1) To a quantity of the oral solution containing 10 mg of Dexamethasone Sodium Phosphate add sufficient *methanol (40%)* to produce 100 mL and filter.

(2) 0.0001% w/v of *dexamethasone sodium phosphate BPCRS*.

(3) 0.0001% w/v of *betamethasone sodium phosphate BPCRS*.

(4) 0.0025% w/v of each of *dexamethasone BPCRS* and *betamethasone BPCRS*.

(5) Dilute 5 volumes of solution (2) to 100 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 2.0 mm) packed with *octylsilyl silica gel for chromatography* (3 µm) (Luna C8 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 0.25 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 25 µL of each solution.

MOBILE PHASE

Mobile phase A 39 volumes of *methanol* and 61 volumes of a 0.68% w/v solution of *potassium dihydrogen orthophosphate*; adjust the pH to 3.5 with *dilute orthophosphoric acid* or *dilute sodium hydroxide*.

Mobile phase B 41 volumes of *methanol* and 59 volumes of a 0.68% w/v solution of *potassium dihydrogen orthophosphate*; adjust the pH to 3.5 with *dilute orthophosphoric acid* or *dilute sodium hydroxide*.

www.webofpharma.com

Time (min)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0	100	0	isocratic
30→40	100→0	0→100	linear gradient
40→75	0	100	isocratic
75→80	0→100	100→0	linear gradient
80→90	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to dexamethasone and betamethasone is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to betamethasone sodium phosphate is not greater than half the area of the principal peak in the chromatogram obtained with solution (3) (0.5%);

the area of any *secondary peak* is not greater than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the impurities is not greater than 1.0%.

Disregard any peak due to dexamethasone and any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.05%).

Free dexamethasone

In the Assay, the area of any peak due to dexamethasone in the chromatogram obtained with solution (1) is not greater than the area of the corresponding peak in the chromatogram obtained with solution (2) (34%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol (45%)*.

(1) To a quantity of the oral solution containing the equivalent of 8 mg of Dexamethasone Sodium Phosphate add sufficient *methanol (45%)* to produce 100 mL and filter through a 0.45-µm nylon filter.

(2) 0.008% w/v of *dexamethasone sodium phosphate BPCRS* and 0.0027% w/v of *dexamethasone BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

44 volumes of *methanol* and 56 volumes of a 0.68% w/v solution of *potassium dihydrogen orthophosphate*, adjust the pH to 3.5 with *dilute orthophosphoric acid* or *dilute sodium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to dexamethasone sodium phosphate and dexamethasone is at least 10.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{28}FNa_2O_8P$ using the declared content of $C_{22}H_{28}FNa_2O_8P$ in *dexamethasone sodium phosphate BPCRS* and the declared content of $C_{22}H_{29}FO_5$ in *dexamethasone BPCRS*. Each mg of $C_{22}H_{29}FO_5$ is equivalent to 1.3158 mg of $C_{22}H_{28}FNa_2O_8P$.

Calculate the total content of $C_{22}H_{28}FNa_2O_8P$ in the oral solution from the equivalent amount of dexamethasone sodium phosphate due to Free dexamethasone and combining this with the content of dexamethasone sodium phosphate.

Dexamfetamine Tablets

Action and use

Amfetamine.

DEFINITION

Dexamfetamine Tablets contain Dexamfetamine Sulfate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of dexamfetamine sulfate, $(C_9H_{13}N)_2,H_2SO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the powdered tablets containing 0.1 g of dexamfetamine sulfate as completely as possible in 20 mL of *water*, filter, add 2 mL of 5M *sodium hydroxide* and extract with three 25 mL quantities of *ether*, washing the combined extracts with 5 mL of *water*. To the ether solution add 10 mL of 0.05M *sulfuric acid* and shake well. The acid layer, after warming to dispel residual ether and cooling to 20°, is dextrorotatory.

B. Extract a quantity of the powdered tablets containing 50 mg of dexamfetamine sulfate with 10 mL of *water*, filter, cool to about 15°, add 3 mL of 1M *sodium hydroxide* and shake for 2 minutes with 1 mL of a mixture of 1 volume of *benzoyl chloride* and 2 volumes of *ether*. Filter, wash the residue with 15 mL of *water* and recrystallise twice from *ethanol (50%)*. The *melting point* of the crystals, after drying at 105° for 1 hour, is about 156°, Appendix V A.

ASSAY

Weigh and powder 20 tablets, or more if necessary. Dissolve a quantity of the powder containing 0.1 g of Dexamfetamine Sulfate as completely as possible in 20 mL of *water*, add 8 g of *sodium chloride* and 2 mL of 5M *sodium hydroxide* and extract with successive quantities of 50, 20, 20 and 20 mL of *ether*. Extract the combined ether extracts with four 10 mL quantities of 0.1M *hydrochloric acid* and make the combined acid extracts alkaline with 5M *sodium hydroxide*. Dilute to 120 mL with *water* and distil into 20 mL of 0.05M *hydrochloric acid VS* until only 5 mL of liquid remains in the distillation flask. Boil, cool and titrate the excess of acid with 0.05M *sodium hydroxide VS* using *methyl red solution* as indicator. Each mL of 0.05M *hydrochloric acid VS* is equivalent to 9.212 mg of $(C_9H_{13}N)_2,H_2SO_4$.

www.webofpharma.com

Dextran 40 Infusion

Dextran 40 Injection, Dextran 40 Intravenous Infusion

Action and use
Plasma substitute.

DEFINITION
Dextran 40 Infusion is a sterile solution containing Dextran 40 for Injection in Glucose Infusion or in Sodium Chloride Infusion. It is supplied as a ready-to-use solution.

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of dextrans
9.0 to 11.0% w/v.

CHARACTERISTICS
An almost colourless, slightly viscous solution.

TESTS

Acidity
Titrate 25 mL with 0.01M *sodium hydroxide VS* using *phenol red solution* as indicator. Not more than 2.0 mL of 0.01M *sodium hydroxide VS* is required to neutralise the solution.

Molecular size
For solutions in Glucose Infusion, before proceeding with tests A, B and C add 4 volumes of *ethanol (96%)*, centrifuge and dissolve the residue in sufficient Sodium Chloride Infusion to restore the original volume.

A. Determine the viscosities, Appendix V H, Method I, at 37°, using a U-tube viscometer (size C) of solutions in *saline solution* containing about 3.5, 2.5, 1.5 and 0.75% w/v of Dextrans, accurately determined. Calculate the viscosity ratio by dividing the time taken for the meniscus to fall from E to F using the liquid being examined by the time taken using *saline solution*. For each solution plot (viscosity ratio − 1.00) /concentration against concentration. The intercept on the viscosity ratio axis of a straight line through the points represents the intrinsic viscosity. The intrinsic viscosity is 0.16 to 0.20.

B. Dilute the solution being examined with *saline solution* to contain 6% w/v of Dextrans. Place 100 mL in each of five stoppered flasks and adjust the temperature to 24.9° to 25.1°. Maintaining this temperature, add slowly with continuous stirring sufficient *absolute ethanol* to produce a faint cloudiness (about 45 mL). To the separate flasks add 0.5, 1.0, 1.5, 2.0 and 2.5 mL of *absolute ethanol*, stopper the flasks and immerse in a water bath at about 35°, shaking occasionally, until clear solutions are obtained. Transfer the flasks to a water bath maintained at 24.9° to 25.1° and allow to stand overnight or until two clear liquid phases are formed. Discard the supernatant liquids, dissolve separately the syrupy residues in sufficient *saline solution* to produce 25.0 mL, remove the ethanol by evaporation at a pressure of 2 kPa, dilute to 25.0 mL with *water* and determine the *optical rotation*, Appendix V F. From the optical rotations calculate the amounts of dextrans precipitated as described in the Assay. Choose that fraction containing as nearly as possible but not more than 10% of the dextrans present in the infusion and determine its intrinsic viscosity by the method described under test A using a U-tube viscometer (size A). The intrinsic viscosity is not more than 0.27.

C. Place in each of four stoppered flasks 100 mL of the diluted infusion in *saline solution* containing 6% w/v of Dextrans and add slowly, with continuous stirring, 80, 90, 100 and 110 mL respectively of *absolute ethanol*. Stopper the flasks, transfer to a water bath maintained at 24.9° to 25.1° and allow to stand overnight or until two clear liquid phases are formed. Separate the supernatant solutions from the syrupy residues. Remove the ethanol from each supernatant solution separately by evaporation at a pressure of 2 kPa, dialyse in cellophane tubing against *water* to remove sodium chloride, adjust the volume to 25.0 mL with *water*, add sufficient *sodium chloride* to produce solutions containing 0.9% w/v and determine the *optical rotation*, Appendix V F. From the optical rotations calculate the amounts of dextrans present as described in the Assay. Choose that fraction containing as nearly as possible but not more than 10% of the dextrans present in the infusion and determine the intrinsic viscosity by the method in test A above. The intrinsic viscosity is not less than 0.08.

Content of glucose
For solutions in Glucose Infusion, 4.5 to 5.5% w/v, when determined by the following method. Dilute 15 mL to 50 mL with *water*. To 5 mL in a stoppered flask add 25 mL of a buffer solution containing 14.3% w/v of *sodium carbonate* and 4.0% w/v of *potassium iodide* and 25 mL of 0.05M *iodine VS*. Stopper the flask, allow to stand for exactly 30 minutes at 20°, add 35 mL of 2M *hydrochloric acid* and titrate immediately with 0.1M *sodium thiosulfate VS*. Repeat the operation using 5 mL of *water* beginning at the words 'add 25 mL...'. The difference between the titrations represents the amount of iodine required to oxidise the glucose. Each mL of 0.05M *iodine VS* is equivalent to 9.01 mg of glucose.

Bacterial endotoxins
The endotoxin limit concentration is 1.25 IU per mL, Appendix XIV C.

ASSAY

For solutions in Glucose Infusion
Add 0.05 mL of 5M *ammonia* to the required volume and measure the *optical rotation*, Appendix V F. Calculate the content of dextrans from the expression

$$0.5076(\alpha - 0.528D)$$

where α is the observed angular rotation and D is the content of glucose as a percentage w/v determined in the test for Content of glucose.

For solutions in Sodium Chloride Infusion
Measure the *optical rotation*, Appendix V F, and multiply the value obtained by 0.5076.

STORAGE
Dextran 40 Infusion should not be exposed to undue fluctuations of temperature.

LABELLING
The strength is stated as the percentage w/v of dextrans. The label states (1) the name of the solvent; (2) that the infusion should not be used if it is cloudy or if a deposit is present.

Dextran 70 Infusion

Dextran 70 Injection, Dextran 70 Intravenous Infusion

Action and use
Plasma substitute.

DEFINITION
Dextran 70 Infusion is a sterile solution containing Dextran 70 for Injection, in Glucose Infusion or in Sodium Chloride Infusion. It is supplied as a ready-to-use solution.

www.webofpharma.com

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of dextrans
5.5 to 6.5% w/v.

CHARACTERISTICS
An almost colourless, slightly viscous solution.

TESTS
Acidity
Titrate 25 mL with 0.01M *sodium hydroxide VS* using *phenol red solution* as indicator. Not more than 1.25 mL of 0.01M *sodium hydroxide VS* is required to neutralise the solution.

Molecular size
For solutions in Glucose Infusion, before proceeding with tests A, B and C add 4 volumes of *ethanol (96%)*, centrifuge and dissolve the residue in sufficient Sodium Chloride Infusion to restore the original volume.

A. Determine the viscosities, Appendix V H, Method I, at 37°, using a U-tube viscometer (size C) of solutions in *saline solution* containing about 3.5, 2.5, 1.5 and 0.75% w/v of Dextrans, accurately determined. Calculate the viscosity ratio by dividing the time taken for the meniscus to fall from E to F using the liquid being examined by the time taken using *saline solution*. For each solution plot (viscosity ratio – 1.00)/concentration against concentration. The intercept on the viscosity ratio axis of a straight line through the points represents the intrinsic viscosity. The intrinsic viscosity is 0.22 to 0.27.

B. Place 100 mL in each of five stoppered flasks and adjust the temperature to 24.9° to 25.1°. Maintaining this temperature, add slowly with continuous stirring sufficient *absolute ethanol* to produce a faint cloudiness (about 45 mL). To the separate flasks add 0.5, 1.0, 1.5, 2.0 and 2.5 mL of *absolute ethanol*, stopper the flasks and immerse in a water bath at about 35°, shaking occasionally, until clear solutions are obtained. Transfer the flasks to a water bath maintained at 24.9° to 25.1° and allow to stand overnight or until two clear liquid phases are formed. Discard the supernatant liquids, dissolve separately the syrupy residues in sufficient *saline solution* to produce 25.0 mL, remove the ethanol by evaporation at a pressure of 2 kPa, dilute to 25.0 mL with *water* and determine the *optical rotation*, Appendix V F. From the optical rotations calculate the amounts of dextrans precipitated as described in the Assay. Choose that fraction containing as nearly as possible but not more than 10% of the dextrans present in the infusion and determine its intrinsic viscosity by the method described under test A using a U-tube viscometer (size A). The intrinsic viscosity is not more than 0.36.

C. Dilute the solution being examined with *saline solution* to contain 6% w/v of Dextrans. Place 100 mL in each of four stoppered flasks and add slowly, with continuous stirring, 80, 90, 100 and 110 mL respectively of *absolute ethanol*. Stopper the flasks, transfer to a water bath maintained at 24.9° to 25.1° and allow to stand overnight or until two clear liquid phases are formed. Separate the supernatant solutions from the syrupy residues. Remove the ethanol from each supernatant solution separately by evaporation at a pressure of 2 kPa, dialyse in cellophane tubing against *water* to remove sodium chloride, adjust the volume to 25.0 mL with *water*, add sufficient *sodium chloride* to produce solutions containing 0.9% w/v and determine the *optical rotation*, Appendix V F. From the optical rotations calculate the amounts of dextrans present as described in the Assay. Choose that fraction containing as nearly as possible but not more than 10% of the dextrans present in the infusion and determine the intrinsic viscosity by the method in test A. The intrinsic viscosity is not less than 0.13.

Content of glucose
For solutions in Glucose Infusion, 4.5 to 5.5% w/v, when determined by the following method. Dilute 15 mL to 50 mL with *water*. To 5 mL in a stoppered flask add 25 mL of a buffer solution containing 14.3% w/v of *sodium carbonate* and 4.0% w/v of *potassium iodide* and 25 mL of 0.05M *iodine VS*. Stopper the flask, allow to stand for exactly 30 minutes at 20°, add 35 mL of 2M *hydrochloric acid* and titrate immediately with 0.1M *sodium thiosulfate VS*. Repeat the operation using 5 mL of *water* and beginning at the words 'add 25 mL...'. The difference between the titrations represents the amount of iodine required to oxidise the glucose. Each mL of 0.05M *iodine VS* is equivalent to 9.01 mg of glucose.

Bacterial endotoxins
The endotoxin limit concentration is 1.21 IU per mL, Appendix XIV C.

ASSAY
For solutions in Glucose Infusion
Add 0.05 mL of 5M *ammonia* to the required volume and measure the *optical rotation*, Appendix V F. Calculate the content of dextrans from the expression

$$0.5076(\alpha - 0.528D)$$

where α is the observed angular rotation and D is the content of glucose as a percentage w/v determined in the test for Content of glucose.

For solutions in Sodium Chloride Infusion
Measure the *optical rotation*, Appendix V F, and multiply the value obtained by 0.5076.

STORAGE
Dextran 70 Infusion should not be exposed to undue fluctuations in temperature.

LABELLING
The strength is stated as the percentage w/v of dextrans. The label states (1) the name of the solvent; (2) that the infusion should not be used if it is cloudy or if a deposit is present.

Dextromoramide Tablets

Action and use
Opioid receptor agonist; analgesic.

DEFINITION
Dextromoramide Tablets contain Dextromoramide Tartrate.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of dextromoramide, $C_{25}H_{32}N_2O_2$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Shake a quantity of the powdered tablets containing the equivalent of 30 mg of dextromoramide with 10 mL of *water* and filter. Make the filtrate alkaline with 5M *ammonia* and extract with two 5 mL quantities of *ether*. Dry the combined ether extracts over *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of dextromoramide *(RS 090)*.

www.webofpharma.com

B. Shake a quantity of the powdered tablets containing the equivalent of 25 mg of dextromoramide with 25 mL of 1M *hydrochloric acid* and filter. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits maxima at 254, 259 and 264 nm.

TEST

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing the equivalent of 20 mg of dextromoramide with 1 mL of *methanol* for 5 minutes, centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

methanol

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing the equivalent of 0.1 g of dextromoramide with 25 mL of 1M *hydrochloric acid* for 5 minutes. Add 25 mL of *water*, make alkaline with 5M *sodium hydroxide* and extract with four 25 mL quantities of *chloroform*. Wash the combined chloroform extracts with two 10-mL quantities of *water* and extract the combined washings with 10 mL of *chloroform*. Filter the combined chloroform extracts through absorbent cotton moistened with *chloroform* and wash the filter with a small quantity of *chloroform*. Heat on a water bath until the volume is reduced to about 25 mL, cool, add 50 mL of *anhydrous acetic acid*, previously neutralised to *crystal violet solution*, and titrate with 0.02M *perchloric acid VS* using *crystal violet solution* as indicator. Each mL of 0.02M *perchloric acid VS* is equivalent to 7.851 mg of $C_{25}H_{32}N_2O_2$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of dextromoramide.

Dextropropoxyphene Capsules

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Dextropropoxyphene Capsules contain Dextropropoxyphene Napsilate.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of dextropropoxyphene, $C_{22}H_{29}NO_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Shake a quantity of the contents of the capsules containing the equivalent of 0.15 g of dextropropoxyphene with 5 mL of *chloroform* and filter. The filtrate complies with the following tests.

A. Evaporate 3 mL to dryness and dry the residue at 105° for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of dextropropoxyphene napsilate *(RS 092)*.

B. Evaporate 0.05 mL in a porcelain dish and streak the spot with *sulfuric acid* containing 0.05 mL of *formaldehyde solution* per mL. A purple colour is produced.

C. Evaporate 0.4 mL on a piece of filter paper and burn the residue by the method for *oxygen-flask combustion*, Appendix VIII C, using 5 mL of 1.25M *sodium hydroxide* as the absorbing liquid. When the process is complete, dilute the liquid to 25 mL with *water*. To 5 mL of the solution so obtained add 1 mL of *hydrogen peroxide solution (100 vol)* and 1 mL of 1M *hydrochloric acid*, mix and add 0.05 mL of *barium chloride solution*. The solution becomes turbid.

ASSAY

Stir a quantity of the mixed contents of 20 capsules containing the equivalent of 0.5 g of dextropropoxyphene with 25 mL of *chloroform* and filter through absorbent cotton, washing the flask and filter with small quantities of *chloroform*. Add to the combined filtrates a mixture of 50 mL of *water* and 5 mL of 5M *sodium hydroxide*, shake, allow the layers to separate and wash the chloroform extract with 25 mL of *water*. Extract the aqueous layer with five 25 mL quantities of *chloroform*, washing each extract with the 25 mL of *water* and adding it to the original extract. Dry the combined extracts with *anhydrous sodium sulfate*, evaporate to about 3 mL on a water bath in a current of air, remove from the water bath and allow to evaporate to dryness at room temperature. Carry out Method I for *non-aqueous titration*, Appendix VIII A, on the residue using *crystal violet solution* as indicator. Each mL of 0.1M *perchloric acid VS* is equivalent to 33.95 mg of $C_{22}H_{29}NO_2$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of dextropropoxyphene.

Diamorphine Injection

Action and use

Opioid receptor agonist analgesic.

DEFINITION

Diamorphine Injection is a sterile solution of Diamorphine Hydrochloride in Water for Injections. It is prepared by dissolving Diamorphine Hydrochloride for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Diamorphine Injection deteriorates on storage and should be used immediately after preparation.

www.webofpharma.com

DIAMORPHINE HYDROCHLORIDE FOR INJECTION

DEFINITION

Diamorphine Hydrochloride for Injection is a sterile material prepared from Diamorphine Hydrochloride with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of diamorphine hydrochloride, $C_{21}H_{23}NO_5,HCl,H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Dissolve a sufficient quantity of the contents of the sealed container in the minimum volume of *dichloromethane* and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of diamorphine hydrochloride *(RS 093)*.

TESTS

6-*O*-Acetylmorphine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the contents of the sealed container containing 0.2 g of Diamorphine Hydrochloride in 10 mL of *water*.

(2) Dilute 1 volume of solution (1) to 20 volumes with *water*.

(3) Dissolve a sufficient quantity of the contents of the sealed container to give a solution containing the equivalent of 0.1% w/v of Diamorphine Hydrochloride in 0.01M *sodium hydroxide*; the solution should be freshly prepared.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Lichrospher RP-select B is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 283 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.11% w/v of *sodium octanesulfonate* in a mixture of 10 volumes of *glacial acetic acid*, 10 volumes of *methanol*, 115 volumes of *acetonitrile* and 365 volumes of *water*.

SYSTEM SUITABILITY

The chromatogram obtained with solution (3) exhibits two *secondary peaks* with retention times relative to the principal peak of about 0.23 (morphine) and 0.43 (6-*O*-acetyl-morphine). The test is not valid unless the *resolution factor* between the peaks due to morphine and 6-*O*-acetyl-morphine is at least 2.

LIMITS

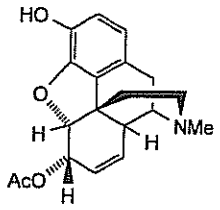
In the chromatogram obtained with solution (1):

the area of any peak corresponding to 6-*O*-acetylmorphine is not greater than the area of the peak in the chromatogram obtained with solution (2) (5%).

Uniformity of content

The content of $C_{21}H_{23}NO_5,HCl,H_2O$ in each of 10 individual containers as determined in the Assay is not less than 90.0% and not more than 110.0% of the average except that in one container the content may be not less than 80.0% and not more than 120.0% of the average.

ASSAY



Dissolve the contents of a sealed container in a suitable volume of *water* and dilute with sufficient *water* to produce a solution containing 0.025% w/v of Diamorphine Hydrochloride. To 5 mL add 5 mL of 1M *hydrochloric acid* and boil vigorously under a reflux condenser for 15 minutes. Cool, add 5 mL of a freshly prepared 0.5% w/v solution of *sodium nitrite*, mix and add 2.5 mL of 5M *ammonia* and sufficient *water* to produce 25 mL. Repeat the operation with a further nine sealed containers. Measure the *absorbance* of each of the resulting solutions at the maximum at 435 nm, Appendix II B, and calculate the content of $C_{21}H_{23}NO_5,HCl,H_2O$ in each container by comparing the absorbances with that obtained by treating a mixture of 5 mL of a 0.015% w/v solution of *anhydrous morphine* in 1M *hydrochloric acid* and 5 mL of *water* in the same manner, beginning at the words 'add 5 mL of a freshly prepared...'. Each g of *anhydrous morphine* is equivalent to 1.486 g of $C_{21}H_{23}NO_5,HCl,H_2O$. Calculate the average content of $C_{21}H_{23}NO_5,HCl,H_2O$ per container from the 10 individual results thus obtained.

STORAGE

The sealed container should be protected from light.

IMPURITIES

The impurity limited by the requirements of this monograph is:

A. 6-*O*-Acetylmorphine.

Diazepam Injection

Action and use

Benzodiazepine.

DEFINITION

Diazepam Injection is a sterile solution of Diazepam in Water for Injections or other suitable solvent.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of diazepam, $C_{16}H_{13}ClN_2O$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, of the solution obtained in the Assay exhibits a maximum at 368 nm.

B. Complies with test B for Identification described under Diazepam Tablets applying separately to the plate 10 µL of each of the following solutions. For solution (1) dilute a suitable volume of the injection with sufficient *methanol* to produce a solution containing 0.10% w/v of Diazepam. Solution (2) contains 0.10% w/v of *diazepam BPCRS* in *methanol*.

www.webofpharma.com

TESTS

Acidity or alkalinity
pH, 6.2 to 7.0, Appendix V L.

ASSAY
To a volume containing 10 mg of Diazepam add 20 mL of *mixed phosphate buffer pH 7.0* and extract with four 20 mL quantities of *chloroform*, passing each extract through the same 5 g of *anhydrous sodium sulfate*. Combine the chloroform extracts, dilute to 100 mL with *chloroform* and mix. Evaporate 10 mL to dryness in a current of nitrogen, dissolve the residue in 25 mL of 0.05M *methanolic sulfuric acid*, mix and measure the *absorbance* of the resulting solution at the maximum at 368 nm, Appendix II B. Calculate the content of $C_{16}H_{13}ClN_2O$ taking 151 as the value of A(1%, 1 cm) at the maximum at 368 nm.

STORAGE
Diazepam Injection should be protected from light.

Diazepam Oral Solution

Action and use
Benzodiazepine.

DEFINITION
Diazepam Oral Solution is a solution of Diazepam in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of diazepam, $C_{16}H_{13}ClN_2O$
95.0 to 115.0% of the stated amount.

IDENTIFICATION
A. The *light absorption*, Appendix II B, in the range 320 to 400 nm of the final solution obtained in the Assay exhibits a maximum at 368 nm. The *light absorption* in the range 230 to 330 nm of a solution prepared by diluting 1 volume of the final solution obtained in the Assay to 5 volumes with 0.1M *methanolic sulfuric acid* exhibits two maxima, at 243 nm and 286 nm.

B. Carry out the method described under Related substances applying separately to the plate 10 µL of each of solution (1) and solution (2) and using as solution (2) a 0.4% w/v solution of *diazepam BPCRS* in *ethanol (96%)*. After removal of the plate, allow the solvent to evaporate and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Acidity
pH, 4.0 to 6.6, Appendix V L.

Related substances
Carry out in subdued light the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF_{254}* as the coating substance and a mixture of equal volumes of *ethyl acetate* and *hexane* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 25 µL of each of the following solutions. For solution (1) add 40 mL of *water* to a volume of the oral solution containing 8 mg of Diazepam and extract with three 50-mL quantities of *ether*. Wash the combined ether extracts with 30 mL of 1M *sodium hydroxide* followed by two 40 mL quantities of *water*. Shake the extract with *anhydrous sodium sulfate*, filter, evaporate to dryness and dissolve the residue in 2 mL of *ethanol (96%)*. Solution (2) contains 0.0080% w/v of *5-chloro-2-methylaminobenzophenone BPCRS* in *ethanol (96%)*. Solution (3) contains 0.0040% w/v of *3-amino-6-chloro-1-methyl-4-phenylquinolin-2-ol BPCRS* in *ethanol (96%)*. For solution (4) dilute 2 mL of solution (1) to 100 mL with *ethanol (96%)* and dilute 1 mL of the resulting solution to 10 mL with the same solvent. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. In the chromatogram obtained with solution (1) any spot corresponding to 5-chloro-2-methylaminobenzophenone is not more intense than the spot in the chromatogram obtained with solution (2) and any spot corresponding to 3-amino-6-chloro-1-methyl-4-phenylquinolin-2-ol is not more intense than the spot in the chromatogram obtained with solution (3). Any other *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (4).

ASSAY
To a weighed quantity containing 1 mg of Diazepam add 25 mL of a mixture of equal volumes of 1M *sodium hydroxide* and *methanol* and shake for 2 minutes. Extract with five 25 mL quantities of *chloroform*, shaking for 2 minutes each time. Combine the chloroform extracts, shake with 5 g of *anhydrous sodium sulfate* and filter. Evaporate to dryness, dissolve the residue in 25 mL of 0.1M *methanolic sulfuric acid* and filter. Measure the *absorbance* of the filtrate, Appendix II B, at the maximum at 368 nm. Calculate the content of $C_{16}H_{13}ClN_2O$ taking 151 as the value of A(1%, 1 cm) at the maximum at 368 nm. Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{16}H_{13}ClN_2O$, weight in volume.

STORAGE
Diazepam Oral Solution should be protected from light.

Diazepam Rectal Solution

Action and use
Benzodiazepine.

DEFINITION
Diazepam Rectal Solution is a solution of Diazepam in a suitable vehicle.

The rectal solution complies with the requirements stated under Rectal Preparations and with the following requirements.

Content of diazepam, $C_{16}H_{13}ClN_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. The *light absorption*, Appendix II B, of the solution obtained in the Assay exhibits a maximum at 368 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of *methanol* and 100 volumes of *chloroform* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) dilute a suitable volume of the rectal solution with sufficient *methanol* to produce a solution containing 0.10% w/v of Diazepam. Solution (2) contains 0.10% w/v of *diazepam BPCRS* in *methanol*. After removal of the plate, spray it with a 10% v/v solution of *sulfuric acid* in *absolute ethanol*, heat at 105° for 10 minutes and examine under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

www.webofpharma.com

TESTS

Acidity or alkalinity
pH, 6.2 to 7.2, Appendix V L.

ASSAY

To a volume containing 10 mg of Diazepam add 20 mL of *mixed phosphate buffer pH 7.0* and extract with four 20 mL quantities of *chloroform*, passing each extract through the same 5 g of *anhydrous sodium sulfate*. Combine the chloroform extracts, dilute to 100 mL with *chloroform* and mix. Evaporate 10 mL to dryness in a current of nitrogen, dissolve the residue in 25 mL of 0.05M *methanolic sulfuric acid*, mix and measure the *absorbance* of the resulting solution at the maximum at 368 nm, Appendix II B. Calculate the content of $C_{16}H_{13}ClN_2O$ taking 151 as the value of A(1%, 1 cm) at the maximum at 368 nm.

STORAGE

Diazepam Rectal Solution should be protected from light.

Diazepam Tablets

Action and use
Benzodiazepine.

DEFINITION

Diazepam Tablets contain Diazepam.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of diazepam, $C_{16}H_{13}ClN_2O$
92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits two maxima, at 242 nm and 284 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

(1) Shake a quantity of the powdered tablets with sufficient solvent to produce a solution containing 0.50% w/v of Diazepam, allow to settle and decant the supernatant liquid.

(2) 0.5% w/v of *diazepam BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, spray it with a 10% v/v solution of *sulfuric acid* in *absolute ethanol*, heat at 105° for 10 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

10 volumes of *methanol* and 100 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Related substances and decomposition products
Carry out the procedure in subdued light. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *ethanol (96%)*.

(1) Shake a quantity of the powdered tablets containing 50 mg of Diazepam with 5 mL of solvent, filter and use immediately.

(2) Dilute 1 volume of solution (1) to 50 volumes and use immediately.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254}.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of solution (1) and 5 µL of solution (2).

(d) Develop the plate to 12 cm.

(e) After removal of the plate, allow the solvent to evaporate and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

Equal volumes of *ethyl acetate* and *hexane*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a sample of the medium and measure the *absorbance* of a layer of suitable thickness of the filtered sample, suitably diluted with 0.1M *hydrochloric acid* if necessary, at the maximum at 286 nm, Appendix II B using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of diazepam, $C_{16}H_{13}ClN_2O$, in the medium taking 488 as the value of A(1%, 1 cm) at the maximum at 286 nm.

Uniformity of content
Tablets containing less than 2 mg and/or less than 2% w/w of Diazepam comply with the requirement stated under Tablets using the following method of analysis. To one tablet add 1 mL of *water*, allow the tablet to disintegrate and stand for 15 minutes. Add 80 mL of a 0.5% w/v solution of *sulfuric acid* in *methanol*, shake for 15 minutes, add sufficient of the methanolic sulfuric acid to produce 100 mL and filter. Measure the *absorbance* of the filtrate at the maximum at 284 nm, Appendix II B. Calculate the content of $C_{16}H_{13}ClN_2O$ taking 450 as the value of A(1%, 1 cm) at the maximum at 284 nm.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 10 mg of Diazepam add 5 mL of *water*, mix and allow to stand for 15 minutes. Add 70 mL of a 0.5% w/v solution of *sulfuric acid* in *methanol*, shake for 15 minutes, add sufficient of the methanolic sulfuric acid to produce 100 mL and filter. Dilute 10 mL of the filtrate to 50 mL with the same solvent and measure the *absorbance* of the resulting solution at the maximum at 284 nm, Appendix II B. Calculate the content of $C_{16}H_{13}ClN_2O$ taking 450 as the value of A(1%, 1 cm) at the maximum at 284 nm.

STORAGE

Diazepam Tablets should be protected from light.

www.webofpharma.com

Diazoxide Injection

Action and use
Vasodilator; treatment of hypertension.

DEFINITION
Diazoxide Injection is a sterile solution of Diazoxide in Water for Injections, prepared with the aid of Sodium Hydroxide.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of diazoxide, $C_8H_7ClN_2O_2S$
95.0 to 105.0% of the stated amount.

CHARACTERISTICS
A colourless solution.

IDENTIFICATION
To a volume containing 0.3 g of Diazoxide add 2 mL of 2M *hydrochloric acid*, stir, filter the precipitate and wash the filter thoroughly with *water* until the filtrate is free from acid. The precipitate, after drying at 105°, complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of diazoxide *(RS 094)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.001% w/v solution in 0.1M *sodium hydroxide* exhibits a maximum only at 280 nm.

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Use the injection, diluted if necessary, with *methanol* to contain 0.02% w/v of Diazoxide.

(2) 0.02% w/v of *diazoxide EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air until the solvent has evaporated, examine under *ultraviolet light (254 nm)* and then treat the plate by *Method I* and examine again.

MOBILE PHASE

20 volumes of *acetone*, 30 volumes of *ether* and 50 volumes of *toluene*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

TESTS

Alkalinity
pH, 11.2 to 11.9, Appendix V L.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Use the injection diluted, if necessary, with 0.1M *sodium hydroxide* to contain 1.5% w/v of Diazoxide.

(2) Dilute 1 volume of solution (1) to 200 volumes with 0.1M *sodium hydroxide*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

7 volumes of 18M *ammonia*, 25 volumes of *methanol* and 68 volumes of *chloroform*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY
To a volume containing 75 mg of Diazoxide add sufficient 0.1M *sodium hydroxide* to produce 500 mL. Dilute 5 mL to 100 mL with 0.1M *sodium hydroxide* and measure the *absorbance* of the resulting solution at the maximum at 280 nm, Appendix II B. Calculate the content of $C_8H_7ClN_2O_2S$ taking 585 as the value of A(1%, 1 cm) at the maximum at 280 nm.

STORAGE
Diazoxide Injection should be protected from light.

Diazoxide Tablets

Action and use
Vasodilator; treatment of hypertension.

DEFINITION
Diazoxide Tablets contain Diazoxide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of diazoxide, $C_8H_7ClN_2O_2S$
92.5 to 107.5% of the stated amount.

IDENTIFICATION
Shake a quantity of the powdered tablets containing 0.2 g of Diazoxide with 50 mL of *absolute ethanol*, filter and evaporate the filtrate to dryness at a pressure of 2 kPa. The residue complies with the following tests.

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.001% w/v solution in 0.1M *sodium hydroxide* exhibits a maximum only at 280 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) 0.02% w/v of the residue in *methanol*.

(2) 0.02% w/v of *diazoxide EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use *silica gel GF_{254}* as the coating.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air until the solvent has evaporated, examine under *ultraviolet light (254 nm)* and then treat the plate by *Method I* and examine again.

MOBILE PHASE

20 volumes of *acetone*, 30 volumes of *ether*, and 50 volumes of *toluene*.

www.webofpharma.com

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in colour and intensity to that in the chromatogram obtained with solution (2).

TEST

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.75 g of Diazoxide with 40 mL of 0.1M *sodium hydroxide* for 30 minutes, filter and dilute the filtrate to 50 mL with 0.1M *sodium hydroxide*.

(2) Dilute 1 volume of solution (1) to 200 volumes with 0.1M *sodium hydroxide*.

CHROMATOGRAPHIC CONDITIONS

(a) Use *a TLC silica gel GF_{254} plate*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

7 volumes of 18M *ammonia*, 25 volumes of *methanol* and 68 volumes of *chloroform*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 50 mg of Diazoxide add 70 mL of *methanol*, shake for 1 hour, add sufficient *methanol* to produce 100 mL, mix and filter. Dilute 5 mL of the filtrate to 250 mL with 0.1M *sodium hydroxide* and measure the *absorbance* of the resulting solution at the maximum at 280 nm, Appendix II B. Calculate the content of $C_8H_7ClN_2O_2S$ taking 585 as the value of A(1%, 1 cm) at the maximum at 280 nm.

Dichlorophen Tablets

Action and use

Antihelminthic.

DEFINITION

Dichlorophen tablets contain Dichlorophen.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of dichlorophen, $C_{13}H_{10}Cl_2O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of dichlorophen with 50 mL of 0.1M *sodium hydroxide* for 15 minutes, add sufficient 0.1M *sodium hydroxide* to produce 100 mL, centrifuge and dilute a suitable volume of the supernatant liquid with 0.1M *sodium hydroxide* to produce a solution containing 0.002% w/v of dichlorophen. The *light absorption* of the resulting solution, Appendix II B, in the range 220 to 350 nm exhibits two maxima, at 245 nm and 304 nm. The *absorbances* at the maxima are about 1.3 and about 0.54, respectively.

B. Shake a quantity of the powdered tablets containing 0.2 g of dichlorophen with a mixture of 5 mL of *water* and 5 mL of 5M *sodium hydroxide*, filter, cool in ice and add a solution prepared by mixing 1 mL of *sodium nitrite solution* with a cold solution containing 0.15 mL of *aniline* in a mixture of 4 mL of *water* and 1 mL of *hydrochloric acid*. A reddish brown precipitate is produced.

C. Fuse a quantity of the powdered tablets containing 0.5 g of dichlorophen with 2 g of *anhydrous sodium carbonate*, cool, extract the residue with *water* and filter. The filtrate yields reaction A characteristic *of chlorides*, Appendix VI.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.50 g of dichlorophen with 20 mL of *methanol* for 10 minutes, filter, add 7 mL of *water* and dilute to 50 mL with the mobile phase. Solution (2) contains 1.0% w/v of *dichlorophen impurity standard BPCRS* in the mobile phase. Solution (3) contains 0.0010% w/v of *4-chlorophenol* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable), (b) as the mobile phase with a flow rate of 1.5 mL per minute a mixture of 1 volume of *glacial acetic acid* and 25 volumes of *water* and sufficient *methanol* to produce a chromatogram with solution (2) closely resembling the reference chromatogram supplied with the impurity standard (75 volumes of *methanol* is usually suitable) and (c) a detection wavelength of 280 nm. Record the chromatograms until all of the peaks named on the reference chromatogram have emerged.

In the chromatogram obtained with solution (1) the area of any peak corresponding to 4-chlorophenol is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.1%). Calculate the content of 4,4′-dichloro-2,2′-(2-hydroxy-4-chloro-*m*-xylene-α,α′-diyl) diphenol and the sum of the nominal contents of any other impurities, excluding 4-chlorophenol, with reference to dichlorophen using the declared content of 4,4′-dichloro-2,2′-(2-hydroxy-4-chloro-*m*-xylene-α,α′-diyl) diphenol in *dichlorophen impurity standard BPCRS*. The content of 4,4′-dichloro-2,2′-(2-hydroxy-4-chloro-*m*-xylene-α,α′-diyl)diphenol does not exceed 8.0% w/w and the sum of the nominal contents of any other impurities does not exceed 2% w/w.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.1 g of dichlorophen with 50 mL of 0.1M *sodium hydroxide* for 15 minutes and add sufficient 0.1M *sodium hydroxide* to produce 100 mL. Centrifuge, dilute 10 mL of the clear supernatant liquid to 100 mL with 0.1M *sodium hydroxide*, dilute 20 mL of this solution to 100 mL with 0.1M *sodium hydroxide* and measure the *absorbance* of the resulting solution at the maximum at 304 nm, Appendix II B. Calculate the content of $C_{13}H_{10}Cl_2O_2$ taking 275 as the value of A(1%, 1 cm) at the maximum at 304 nm.

www.webofpharma.com

Prolonged-release Diclofenac Capsules

Prolonged-release Diclofenac Capsules from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

DEFINITION

Prolonged-release Diclofenac Capsules contain Diclofenac Sodium. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of Diclofenac Sodium. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of diclofenac sodium, $C_{14}H_{10}Cl_2NNaO_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

Add 0.5 mL of *glacial acetic acid* and 15 mL of *methanol* to a quantity of the powdered capsule contents containing 0.15 g of Diclofenac Sodium and mix with the aid of ultrasound for 40 minutes. Shake gently for 1 minute, filter and collect the filtrate in 15 mL of *water*. Filter the precipitate (Whatman GF/C is suitable) under reduced pressure, wash with four 5-mL quantities of *water* and dry at 105° for 2 to 3 hours. The *infrared absorption spectrum* of the dried precipitate, Appendix II A, is concordant with the *reference spectrum* of diclofenac *(RS 096)*.

TESTS

RELATED SUBSTANCES

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

To 30 volumes of *acetonitrile for chromatography* add 70 volumes of *water* (solvent A).

(1) Add 30 mL of solvent A to a quantity of the powdered contents of the capsules containing 0.1 g of Diclofenac Sodium and mix with the aid of ultrasound for 10 minutes with occasional shaking. Cool, add sufficient solvent A to produce 50 mL and filter (Whatman GF/C is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent A and dilute 1 volume of this solution to 5 volumes with solvent A.

(3) 0.0005% w/v of *diclofenac sodium BPCRS* and 0.0005% w/v of *diclofenac impurity A BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrospher RP Select B or equivalent is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A mixture of 5 volumes of *tetrahydrofuran*, 30 volumes of *acetonitrile* and 65 volumes of 0.05M *ammonium dihydrogen orthophosphate*, previously adjusted to pH 5.0 using 18M *ammonia*.

When the chromatograms are recorded under the prescribed conditions, the retention times are about 18 minutes for diclofenac and about 26 minutes for diclofenac impurity A. Continue the chromatography for 5 times the retention time of diclofenac.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to diclofenac and diclofenac impurity A is at least 4.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Dissolve 6.8 g of *potassium dihydrogen orthophosphate* in 1000 mL of *water* and adjust the pH to 6.8 with 1M *sodium hydroxide* (solution A). To a quantity of the mixed contents of 20 capsules containing 100 mg of Diclofenac Sodium add 10 mL of *ethanol (96%)* and mix with the aid of ultrasound for 20 minutes or until completely dispersed. Add 150 mL of solution A and mix with the aid of ultrasound for a further 20 minutes or until completely dispersed. Cool to room temperature, dilute to 250 mL with solution A and shake thoroughly. Filter the resulting solution and dilute 5 mL to 100 mL with solution A. Prepare a reference standard in the following manner. Dissolve 50 mg of *diclofenac sodium BPCRS* in 10 mL of *ethanol (96%)* with the aid of ultrasound for 5 minutes. Add 150 mL of solution A and mix with the aid of ultrasound for a further 5 minutes. Cool to room temperature, dilute to 250 mL with solution A and shake thoroughly. Dilute 5 mL of the resulting solution to 50 mL with solution A. Measure the *absorbance*, Appendix II B, of the solutions at 275 nm using in the reference cell a 0.4% v/v solution of *ethanol (96%)* in solution A.

Calculate the content of $C_{14}H_{10}Cl_2NNaO_2$ in the capsules using the *absorbances* at the maximum at 275 nm and the declared content of $C_{14}H_{10}Cl_2NNaO_2$ in *diclofenac sodium BPCRS*.

STORAGE

Prolonged-release Diclofenac Capsules should be protected from moisture.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Diclofenac Sodium.

www.webofpharma.com

Diclofenac Gel

Action and use
Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION
Diclofenac Gel contains Diclofenac Diethylamine in a suitable basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of diclofenac diethylamine, $C_{18}H_{22}Cl_2N_2O_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add to a quantity of the gel containing 50 mg of Diclofenac Diethylamine 12.5 mL of 0.5M *lithium chloride* and shake until a homogeneous suspension is obtained. Add 12.5 mL of *chloroform*, shake briefly and mix with the aid of ultrasound for 5 minutes. Allow to separate, filter the chloroform layer through a glass fibre filter (Whatman GF/C is suitable) and use the filtrate.

(2) 0.2% w/v of *diclofenac diethylamine BPCRS* in a mixture of equal volumes of 0.5M *lithium chloride* and *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel 60* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in a stream of warm air for 10 minutes. Spray with *ninhydrin solution* and heat at 110° for 15 minutes.

MOBILE PHASE

1 volume of *hydrochloric acid*, 1 volume of *water*, 6 volumes of *glacial acetic acid* and 11 volumes of *ethyl acetate*.

CONFIRMATION

The two principal spots in the chromatogram obtained with solution (1) correspond in position and colour to those in the chromatogram obtained with solution (2).

TESTS

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the gel containing 50 mg of Diclofenac Diethylamine with 50 mL of *acetone* for 10 minutes, filter and evaporate the filtrate to dryness under reduced pressure. Dissolve the residue in 10 mL of a mixture of 40 volumes of *water* and 60 volumes of *methanol*, dilute 1 volume of this solution to 5 volumes with the mobile phase and filter through a glass fibre filter (Whatman GF/C is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol*.

(3) 0.01% w/v of *diclofenac sodium BPCRS* and 0.01% w/v of *diclofenac impurity A BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (end-capped Zorbax C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for 1.5 times the retention time of diclofenac.

MOBILE PHASE

34 volumes of a mixture of equal volumes of a 0.1% w/v solution of *orthophosphoric acid* and a 0.16% w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 2.5, and 66 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions, the retention times are about 25 minutes for diclofenac and about 12 minutes for diclofenac impurity A.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to diclofenac and diclofenac impurity A is at least 6.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the gel containing 50 mg of Diclofenac Diethylamine with 50 mL of *acetone* for 10 minutes, filter and evaporate the filtrate to dryness under reduced pressure. Dissolve the residue in 100 mL of a mixture of 40 volumes of *water* and 60 volumes of *methanol*, dilute 1 volume of this solution to 10 volumes with the mobile phase and filter through a glass fibre filter (Whatman GF/C is suitable).

(2) 0.005% w/v of *diclofenac sodium BPCRS* in *methanol*.

(3) 0.01% w/v of *diclofenac sodium BPCRS* and 0.01% w/v of *diclofenac impurity A BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (end-capped Zorbax C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

20 volumes of a mixture of equal volumes of a 0.1% w/v solution of *orthophosphoric acid* and a 0.16% w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 2.5, and 80 volumes of *methanol*.

www.webofpharma.com

When the chromatograms are recorded under the prescribed conditions, the retention times are about 5 minutes for diclofenac and about 4 minutes for diclofenac impurity A.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to diclofenac and diclofenac impurity A is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{22}Cl_2N_2O_2$ in the gel using the declared content of $C_{14}H_{10}Cl_2NNaO_2$ in *diclofenac sodium BPCRS*. Each mg of $C_{14}H_{10}Cl_2NNaO_2$ is equivalent to 1.1609 mg of $C_{18}H_{22}Cl_2N_2O_2$.

Gastro-resistant Diclofenac Tablets

Diclofenac Tablets

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Gastro-resistant Diclofenac Tablets contain Diclofenac Sodium. They are made gastro-resistant by enteric-coating or by other means.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of diclofenac sodium, $C_{14}H_{10}Cl_2NNaO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Remove the coating from 10 tablets and powder the cores. Add 0.5 mL of *glacial acetic acid* and 15 mL of *methanol* to a quantity of the powdered tablet cores containing 0.15 g of Diclofenac Sodium and mix with the aid of ultrasound. Shake gently for 1 minute, filter and collect the filtrate in 15 mL of *water*. Filter the precipitate under reduced pressure (A Whatman GF/C filter paper is suitable), wash with four 5-mL quantities of *water* and dry at 105° for 2 to 3 hours. The *infrared absorption spectrum* of the dried precipitate, Appendix II A, is concordant with the *reference spectrum* of diclofenac *(RS 096)*.

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 50 mg of Diclofenac Sodium with 70 mL of the mobile phase for 30 minutes, add sufficient of the mobile phase to produce 100 mL, mix, centrifuge an aliquot and filter the supernatant liquid through a 0.45-µm filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase and dilute 1 volume of this solution to 5 volumes with the mobile phase.

(3) 0.0005% w/v of *diclofenac sodium BPCRS* and 0.0005% w/v of *diclofenac impurity A BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (end-capped Zorbax C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 1.5 times the retention time of diclofenac.

MOBILE PHASE

34 volumes of a mixture of equal volumes of a 0.1% w/v solution of *orthophosphoric acid* and a 0.16% w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 2.5, and 66 volumes of *methanol*.

When the chromatograms are recorded in the prescribed conditions, the retention times are about 25 minutes for diclofenac and about 12 minutes for diclofenac impurity A.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to diclofenac and diclofenac impurity A is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of the *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%) and any peaks with retention times relative to the principal peak of 0.67 and 0.1.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake 10 tablets with 700 mL of *methanol (50%)* for 30 minutes with the aid of ultrasound, add sufficient mobile phase to produce 1000 mL, centrifuge an aliquot and filter the supernatant liquid through a 0.45-µm filter. Dilute the filtrate with the mobile phase to produce a solution containing 0.005% w/v of Diclofenac Sodium.

(2) 0.005% w/v of *diclofenac sodium BPCRS* in the mobile phase.

(3) 0.0005% w/v of *diclofenac sodium BPCRS* and 0.0005% w/v of *diclofenac impurity A BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (end-capped Zorbax C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

20 volumes of a mixture of equal volumes of a 0.1% w/v solution of *orthophosphoric acid* and a 0.16% w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 2.5, and 80 volumes of *methanol*.

www.webofpharma.com

When the chromatograms are recorded in the prescribed conditions, the retention times are about 5 minutes for diclofenac and about 4 minutes for diclofenac impurity A.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to diclofenac and diclofenac impurity A is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{10}Cl_2NNaO_2$ in the tablets using the declared content of $C_{14}H_{10}Cl_2NNaO_2$ in *diclofenac sodium BPCRS*.

STORAGE

Gastro-resistant Diclofenac Tablets should be protected from moisture.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Diclofenac Sodium.

Prolonged-release Diclofenac Tablets

Prolonged-release Diclofenac Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Prolonged-release Diclofenac Tablets contain Diclofenac Sodium. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of diclofenac sodium. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of diclofenac sodium, $C_{14}H_{10}Cl_2NNaO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Remove the coating from 10 tablets and powder the cores. To a quantity of the powdered tablet cores containing 0.15 g of Diclofenac Sodium, add 0.5 mL of *glacial acetic acid* and 15 mL of *methanol* and mix with the aid of ultrasound. Shake gently for 1 minute, filter and collect the filtrate in 15 mL of *water*. Filter the precipitate under reduced pressure (A Whatman GF/C filter paper is suitable), wash with four 5-mL quantities of *water* and dry at 105° for 2 to 3 hours. The *infrared absorption spectrum* of the dried precipitate, Appendix II A, is concordant with the *reference spectrum* of diclofenac *(RS 096)*.

TESTS

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to diclofenac and diclofenac impurity A is at least 6.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the powdered tablets containing 0.5 g of Diclofenac Sodium add 800 mL of *methanol* and mix with the aid of ultrasound. Dilute the resulting solution with the mobile phase to produce a solution containing 0.005% w/v of Diclofenac Sodium.

(2) 0.005% w/v of *diclofenac sodium BPCRS* in the mobile phase.

(3) 0.0005% w/v of *diclofenac sodium BPCRS* and 0.0005% w/v of *diclofenac impurity A BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (Zorbax C8 is suitable).

www.webofpharma.com

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

20 volumes of a mixture of equal volumes of a 0.1% w/v solution of *phosphoric acid* and a 0.16% w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 2.5, and 80 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions, the retention times are about 5 minutes for diclofenac and about 4 minutes for diclofenac impurity A.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to diclofenac and diclofenac impurity A is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{10}Cl_2NNaO_2$ in the tablets using the declared content of $C_{14}H_{10}Cl_2NNaO_2$ in *diclofenac sodium BPCRS*.

STORAGE

Prolonged-release Diclofenac Tablets should be protected from moisture.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Diclofenac Sodium.

Dicycloverine Oral Solution

Action and use
Anticholinergic.

DEFINITION

Dicycloverine Oral Solution is a solution of Dicycloverine Hydrochloride in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of dicycloverine hydrochloride, $C_{19}H_{35}NO_2$,HCl

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a volume containing 0.1 g of dicycloverine hydrochloride add 10 mL of *water* and 1 mL of *hydrochloric acid*, shake with 30 mL of *ether* and allow to separate. Extract the aqueous layer with 30 mL of *chloroform*, wash the extract with two 10 mL quantities of *water* and filter the chloroform solution through *anhydrous sodium sulfate*. Evaporate the filtrate to dryness, recrystallise the residue from hot *acetone* and dry the precipitate at 105° for 30 minutes. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of dicycloverine hydrochloride (*RS 098*).

B. Acidify the oral solution with 2M *nitric acid* and add *silver nitrate solution*. A white precipitate is produced.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 10 mL of *water* and 1 mL of *hydrochloric acid* to a volume containing 0.1 g of dicycloverine hydrochloride, shake with 30 mL of *ether* and allow to separate. Extract the aqueous layer with 30 mL of *dichloromethane*, wash the extract with two 10 mL quantities of *water*, shake with *anhydrous sodium sulfate*, filter (Whatman 1PS paper is suitable), evaporate the filtrate to dryness and dissolve the residue in 4 mL of *dichloromethane*.

(2) Dilute 1 volume of solution (1) to 500 volumes with *dichloromethane*.

(3) 0.1% w/v of each of *dicycloverine hydrochloride BPCRS* and *tropicamide BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in a current of warm air and spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

5 volumes of 13.5M *ammonia*, 10 volumes of *ethyl acetate*, 10 volumes of *water* and 75 volumes of *propan-1-ol*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.2%).

Disregard any spot remaining on the line of application.

ASSAY

To a weighed quantity containing 5 mg of dicycloverine hydrochloride add 5 mL of *sulfuric acid (10%)* and 2 mL of 0.02M *potassium permanganate*, mix, allow to stand, add 20 mL of *water* and 20 mL of *chloroform* to the decolourised solution and titrate with 0.001M *sodium dodecyl sulfate VS* using 1 mL of *dimethyl yellow solution* as indicator. Each mL of 0.001M *sodium dodecyl sulfate VS* is equivalent to 0.3460 mg of $C_{19}H_{35}NO_2$,HCl. Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{19}H_{35}NO_2$,HCl, weight in volume.

STORAGE

Dicycloverine Oral Solution should be protected from light.

Dicycloverine Tablets

Action and use
Anticholinergic.

DEFINITION

Dicycloverine Tablets contain Dicycloverine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of dicycloverine hydrochloride, $C_{19}H_{35}NO_2$,HCl

92.5 to 107.5% of the stated amount.

www.webofpharma.com

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 0.2 g of Dicycloverine Hydrochloride with 20 mL of *chloroform*, filter, evaporate the filtrate to dryness, recrystallise the residue from *acetone* and dry at 105° for 4 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of dicycloverine hydrochloride *(RS 098)*.

B. Shake a quantity of the powdered tablets containing 10 mg of Dicycloverine Hydrochloride with 5 mL of *water* and 0.2 mL of 2M *nitric acid*, filter and add 0.5 mL of *silver nitrate solution* to the filtrate. A white precipitate is produced.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.2 g of Dicycloverine Hydrochloride with 8 mL of *water* and 2 mL of 13.5M *ammonia*, extract with two 20-mL quantities of *dichloromethane*, shake with *anhydrous sodium sulfate*, filter (Whatman 1PS paper is suitable), evaporate the filtrate to dryness and dissolve the residue in 4 mL of *dichloromethane*.

(2) Dilute 1 volume of solution (1) to 500 volumes with *dichloromethane*.

(3) 0.1% w/v of each of *dicycloverine hydrochloride BPCRS* and *tropicamide BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel G plate*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in a current of warm air and spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

5 volumes of 13.5M *ammonia*, 10 volumes of *ethyl acetate*, 10 volumes of *water* and 75 volumes of *propan-1-ol*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1), any *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.2%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 30 mg of Dicycloverine Hydrochloride add 20 mL of *water* and shake. Add 10 mL of 1M *sulfuric acid*, 1 mL of *dimethyl yellow solution* and 40 mL of *chloroform*, shake and titrate with 0.004M *sodium dodecyl sulfate VS*, shaking vigorously and allowing the layers to separate after each addition, until a permanent orange–pink colour is produced in the chloroform layer. Each mL of 0.004M *sodium dodecyl sulfate VS* is equivalent to 1.384 mg of $C_{19}H_{35}NO_2$,HCl.

Diethylamine Salicylate Cream

DEFINITION

Diethylamine Salicylate Cream is a dispersion of Diethylamine Salicylate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of diethylamine salicylate, $C_{11}H_{17}NO_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To 5 g add 50 mL of 2M *sodium hydroxide*, shake well and filter. Acidify 30 mL of the filtrate with 2M *hydrochloric acid*, cool and allow to stand. The *infrared absorption spectrum* of the resulting precipitate, after recrystallisation from *water* and drying at 105°, Appendix II A, is concordant with the *reference spectrum* of salicylic acid *(RS 316)*.

B. To 5 mL of the filtrate obtained in test A, add 10 mL of *water* and 0.05 mL of *iron(III) chloride solution R1*. A deep violet colour is produced.

C. Mix 3 g with 25 mL of *chloroform* and shake with 20 mL of 0.1M *hydrochloric acid*. To the acidic layer add 10 mL of 2M *sodium hydroxide* and boil. Diethylamine vapour is evolved, which turns moist *red litmus paper* blue.

ASSAY

To a quantity containing 50 mg of diethylamine salicylate add 30 mL of 0.5M *sodium hydroxide* and 15 mL of *ethanol (96%)*, mix, heat under a reflux condenser for 30 minutes and cool. To the resulting mixture add 20 mL of 1M *hydrochloric acid*, mix, dilute to 250 mL with *water* and filter. Shake 15 mL of the filtrate with 25 mL of *chloroform* for 2 minutes. To 5 mL of the chloroform layer add 10 mL of *iron(III) nitrate solution* and shake for 5 minutes. Centrifuge the aqueous layer and measure the *absorbance* at the maximum at 530 nm, Appendix II B, using *iron(III) nitrate solution* in the reference cell. Calculate the content of salicylate as salicylic acid, $C_7H_6O_3$, from the *absorbance* obtained by repeating the operation using 15 mL of a 0.013% w/v solution of *salicylic acid* in 0.02M *hydrochloric acid*, beginning at the words 'Shake 15 mL...'. Each g of salicylic acid is equivalent to 1.530 g of $C_{11}H_{17}NO_3$.

Diethylcarbamazine Tablets

Action and use

Antihelminthic.

DEFINITION

Diethylcarbamazine Tablets contain Diethylcarbamazine Citrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of diethylcarbamazine citrate, $C_{10}H_{21}N_3O$, $C_6H_8O_7$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the powdered tablets containing 0.15 g of Diethylcarbamazine Citrate add 15 mL of *ethanol (96%)*, shake for 5 minutes, filter and evaporate the filtrate to dryness. To the residue add 10 mL of 2M *sodium hydroxide*, filter if necessary, and extract with three 10-mL quantities of *dichloromethane*. Dry the combined extracts over *anhydrous sodium sulfate*, filter and evaporate. The *infrared absorption*

www.webofpharma.com

spectrum of the oily residue, Appendix II A, is concordant with the *reference spectrum* of diethylcarbamazine (*RS 411*).

B. In the test for related substances, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to citric acid in the chromatogram obtained with solution (3).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of *water* and rotate the paddle at 50 revolutions per minute. Carry out the method for *liquid chromatography*, Appendix III D. Dissolve 31.24 g of *potassium dihydrogen orthophosphate* in *water*, add sufficient *water* to produce 1000 mL and mix (solution A). Solution (1) contains 0.0025% w/v of *diethylcarbamazine citrate BPCRS* in solution A. For solution (2) dilute 10 mL of the filtered dissolution medium with an equal volume of a 6.248% w/v solution of *potassium dihydrogen orthophosphate*, filter and dilute with solution A to produce a solution expected to contain about 0.0025% w/v of Diethylcarbamazine Citrate.

The chromatographic procedure described under Assay may be used.

Calculate the total content of diethylcarbamazine citrate, $C_{10}H_{21}N_3O,C_6H_8O_7$, in the medium using the declared content of $C_{10}H_{21}N_3O,C_6H_8O_7$ in *diethylcarbamazine citrate BPCRS*.

Dimethylpiperazine and methylpiperazine

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 5 volumes of 13.5M *ammonia*, 30 volumes of *butan-2-one* and 65 volumes of *methanol* as the mobile phase. Allow the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 20 µL of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.50 g of Diethylcarbamazine Citrate with 20 mL of *methanol* and filter. For solution (2) dissolve 0.05 g of *diethylcarbamazine citrate BPCRS* in *methanol* and dilute to 2.0 mL with the same solvent. For solution (3) dissolve 10 mg of *methylpiperazine* in *methanol* and dilute to 200 mL with the same solvent. For solution (4) dissolve 10 mg of *dimethylpiperazine* in *methanol* and dilute to 200 mL with the same solvent. Dry the plate at 105° and expose to iodine vapour for 30 minutes. Any spots corresponding to methylpiperazine and dimethylpiperazine in the chromatogram obtained with solution (1) are not more intense than the spots in the chromatogram obtained with solutions (3) and (4) respectively (0.2% of each).

Related substances

Weigh and finely powder 20 tablets. Dissolve 31.24 g of *potassium dihydrogen orthophosphate* in *water*, add sufficient *water* to produce 1000 mL and mix (solution A). Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.3 g of Diethylcarbamazine Citrate in 100 mL of solution A, centrifuge and use the clear supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 100 volumes with solution A and further dilute 1 volume of the resulting solution to 10 volumes with solution A to produce a solution containing 0.0003% w/v Diethylcarbamazine Citrate. Solution (3) contains 0.2% w/v of *citric acid* in solution A.

The chromatographic procedure described under Assay may be used.

The area of any *secondary peak* in the chromatogram obtained with solution (1) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%). Disregard any peak with the same retention time as citric acid in the chromatogram obtained with solution (1).

ASSAY

Weigh and finely powder 20 tablets. Dissolve 31.24 g of *potassium dihydrogen orthophosphate* in *water*, add sufficient *water* to produce 1000 mL and mix (solution A). Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve a quantity of the powdered tablets containing 25 mg of Diethylcarbamazine Citrate in 100 mL of solution A, shake and filter. Dilute 10 volumes to 50 volumes with solution A. Solution (2) contains 0.005% w/v *diethylcarbamazine citrate BPCRS* in solution A.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm x 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry is suitable), (b) as the mobile phase with a flow rate of 0.8 mL per minute a mixture of 100 mL of *methanol* and 900 mL of a solution containing 10 g of *potassium dihydrogen orthophosphate* in 1000 mL of *water* and (c) a detection wavelength of 220 nm.

Calculate the content of $C_{10}H_{21}N_3O,C_6H_8O_7$ in the tablets using the declared content of $C_{10}H_{21}N_3O,C_6H_8O_7$ in *diethylcarbamazine citrate BPCRS*.

Diethylstilbestrol Pessaries

Action and use

Estrogen.

DEFINITION

Diethylstilbestrol Pessaries are moulded pessaries containing Diethylstilbestrol and Propylene Glycol in a suitable basis.

The pessaries comply with the requirements stated under Vaginal Preparations and with the following requirements.

Content of diethylstilbestrol, $C_{18}H_{20}O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 450 nm of the irradiated solution prepared as directed in the Assay exhibits maxima at 292 nm and 418 nm.

B. Carry out the method of extraction described under the Assay and dissolve the residue obtained in 0.2 mL of *glacial acetic acid*. Add 1 mL of *orthophosphoric acid* and heat in a water bath for 3 minutes. A deep yellow colour is produced, which almost disappears on dilution with 3 mL of *glacial acetic acid*.

ASSAY

Weigh five pessaries, melt together by warming and allow to cool, stirring continuously. Dissolve a quantity of the mass containing 2.5 mg of Diethylstilbestrol in 25 mL of 2M *hydrochloric acid*, cool and dilute to 250 mL with *water*. Extract 50 mL with three 50 mL quantities of *chloroform*. Discard the aqueous layer and extract the combined chloroform extracts with three 15 mL quantities of 1M *sodium hydroxide*. Discard the chloroform layer and wash the combined aqueous extracts with two 10 mL quantities of

www.webofpharma.com

chloroform. Adjust the pH of the aqueous layer to 9.5 with a 16% v/v solution of *orthophosphoric acid* and extract with four 20 mL quantities of *chloroform*. Filter the combined chloroform extracts through a layer of *anhydrous sodium sulfate*, wash the filter with *chloroform* and evaporate the combined chloroform extracts to dryness. Dissolve the residue in 25 mL of *absolute ethanol*, add 25 mL of a solution prepared by dissolving 1 g of *dipotassium hydrogen orthophosphate* in 55 mL of *water*, transfer a portion of the mixture to a 1-cm closed quartz cell, place the cell 10 cm from a 15-watt, short-wave ultraviolet lamp and irradiate for 10 minutes. Measure the *absorbance* of the irradiated solution at the maximum at 418 nm, Appendix II B, and calculate the content of $C_{18}H_{20}O_2$ from the *absorbance* obtained by repeating the operation using 25 mL of a 0.002% w/v solution of *diethylstilbestrol BPCRS* in *absolute ethanol* and beginning at the words 'add 25 mL of a solution...'.

Diethylstilbestrol Tablets

Action and use
Estrogen.

DEFINITION
Diethylstilbestrol Tablets contain Diethylstilbestrol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of diethylstilbestrol, $C_{18}H_{20}O_2$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
Extract a quantity of the powdered tablets containing 3 mg of Diethylstilbestrol with *ether*, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.002% w/v solution in *absolute ethanol* exhibits a maximum only at 241 nm.

B. The *light absorption*, Appendix II B, in the range 230 to 450 nm of the irradiated solution prepared as directed in the Assay exhibits two maxima, at 292 nm and 418 nm.

C. Dissolve 0.5 mg in 0.2 mL of *glacial acetic acid*, add 1 mL of *orthophosphoric acid* and heat in a water bath for 3 minutes. A deep yellow colour is produced which almost disappears on dilution with 3 mL of *glacial acetic acid* (distinction from dienoestrol).

ASSAY
Weigh and powder 20 tablets. To a quantity of the powder containing 5 mg of Diethylstilbestrol add 50 mL of *absolute ethanol*, shake for 15 minutes, add sufficient *absolute ethanol* to produce 100 mL and centrifuge. Dilute 20 mL of the clear supernatant liquid to 50 mL with *absolute ethanol* and to 25 mL of the resulting solution add 25 mL of a solution prepared by dissolving 1 g of *dipotassium hydrogen orthophosphate* in 55 mL of *water*. Transfer a portion of the mixture to a 1 cm, closed quartz cell, place the cell 10 cm from a 15-watt, short-wave, ultraviolet lamp and irradiate for 10 minutes. Measure the *absorbance* of the irradiated solution at the maximum at 418 nm, Appendix II B, and calculate the content of $C_{18}H_{20}O_2$ from the *absorbance* obtained by repeating the operation using *diethylstilbestrol BPCRS* in place of the powdered tablets.

STORAGE
Diethylstilbestrol Tablets should be protected from light.

Diflucortolone Cream

Action and use
Glucocorticoid.

DEFINITION
Diflucortolone Cream contains Diflucortolone Valerate in a suitable non-oily basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of diflucortolone valerate, $C_{27}H_{36}F_2O_5$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel 60 F_{254} precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 2 volumes of *diethylamine*, 50 volumes of *cyclohexane* and 50 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) disperse a quantity of the cream containing 1 mg of Diflucortolone Valerate in 5 mL of *dichloromethane* by heating on a water bath, shake vigorously for 15 seconds, cool in ice, filter the dispersion and use the filtrate. Solution (2) contains 0.02% w/v of *diflucortolone valerate BPCRS* in *dichloromethane*. Solution (3) contains a mixture of equal volumes of solutions (1) and (2). Develop the chromatogram twice drying the plate in air for 15 minutes between developments. After removal of the plate, allow it to dry in air for 15 minutes and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).
The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to diflucortolone valerate in the chromatogram obtained with solution (1).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, injecting 20 µL of each of the following solutions. For solution (1) dissolve 20 mg of *diflucortolone valerate BPCRS* in a 0.02% w/v solution of *clocortolone hexanoate BPCRS* (internal standard) in *methanol* and dilute to 200 mL with the internal standard solution. Add 30 mL of *methanol* to 10 mL of the resulting solution and dilute to 50 mL with *water*. For solution (2) add 40 mL of *methanol* to a quantity of the cream containing 1 mg of Diflucortolone Valerate, disperse by heating on a water bath at 60° for 5 minutes and shake for 30 seconds. Add 10 mL of *water*, cool in ice for 10 minutes and filter. Prepare solution (3) in the same manner as solution (2) but adding 10 mL of a 0.02% w/v solution of *clocortolone hexanoate BPCRS* in *methanol* and 30 mL of *methanol*.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) as the mobile phase with a flow rate of 2 mL per minute a mixture of 250 volumes of *water* and 750 volumes of *methanol* and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{27}H_{36}F_2O_5$ in the cream using the declared content of $C_{27}H_{36}F_2O_5$ in *diflucortolone valerate BPCRS*.

www.webofpharma.com

Diflucortolone Oily Cream

Action and use
Glucocorticoid.

DEFINITION
Diflucortolone Oily Cream contains Diflucortolone Valerate in a suitable oily basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of diflucortolone valerate, $C_{27}H_{36}F_2O_5$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel 60 F_{254} precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 2 volumes of *diethylamine*, 50 volumes of *cyclohexane* and 50 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 20 µL of each of the following solutions. For solution (1) disperse a quantity of the cream containing 1 mg of Diflucortolone Valerate in 10 mL of *dichloromethane* by heating on a water bath, shake vigorously for 1 minute, cool in ice, filter the dispersion and use the filtrate. Solution (2) contains 0.01% w/v of *diflucortolone valerate BPCRS* in *dichloromethane*. Solution (3) contains a mixture of equal volumes of solutions (1) and (2). Develop the chromatogram twice drying the plate in air for 15 minutes between developments. After removal of the plate, allow it to dry in air for 15 minutes and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to diflucortolone valerate in the chromatogram obtained with solution (1).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, injecting 20 µL of each of the following solutions. For solution (1) dissolve 20 mg of *diflucortolone valerate BPCRS* in a 0.02% w/v solution of *clocortolone hexanoate BPCRS* (internal standard) in *methanol* and dilute to 200 mL with the internal standard solution. Add 30 mL of *methanol* to 10 mL of the resulting solution and dilute to 50 mL with *water*. For solution (2) add 40 mL of *methanol* to a quantity of the cream containing 1 mg of Diflucortolone Valerate, disperse by heating on a water bath at 60° for 5 minutes and shake for 30 seconds. Add 10 mL of *water*, cool in ice for 10 minutes and filter. Prepare solution (3) in the same manner as solution (2) but adding 10 mL of a 0.02% w/v solution of *clocortolone hexanoate BPCRS* in *methanol* and 30 mL of *methanol*.

The chromatographic procedure described under Diflucortolone Cream may be used.

Calculate the content of $C_{27}H_{36}F_2O_5$ in the cream using the declared content of $C_{27}H_{36}F_2O_5$ in *diflucortolone valerate BPCRS*.

Diflucortolone Ointment

Action and use
Glucocorticoid.

DEFINITION
Diflucortolone Ointment contains Diflucortolone Valerate in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of diflucortolone valerate, $C_{27}H_{36}F_2O_5$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the ointment containing 1 mg of Diflucortolone Valerate in 5 mL of *dichloromethane* by heating on a water bath, shake vigorously for 15 seconds, cool in ice, filter the dispersion and use the filtrate.

(2) 0.02% w/v of *diflucortolone valerate BPCRS* in *dichloromethane*.

(3) A mixture of equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel 60 GF_{254}* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air for 15 minutes.

(f) Place the plate in the same tank using the mobile phase as described below.

(g) After removal of the plate, dry in air for 15 minutes and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

2 volumes of *diethylamine*, 50 volumes of *cyclohexane* and 50 volumes of *ethyl acetate*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to diflucortolone valerate in the chromatogram obtained with solution (1).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve 20 mg of *diflucortolone valerate BPCRS* in a 0.02% w/v solution of *clocortolone hexanoate BPCRS* (internal standard) in *methanol* and dilute to 200 mL with the internal standard solution. Add 30 mL of *methanol* to 10 mL of the resulting solution and dilute to 50 mL with *water*.

(2) Shake a quantity of the ointment containing 1 mg of Diflucortolone Valerate with 10 mL of a 0.02% w/v solution of *clocortolone hexanoate BPCRS* in *methanol* and add 30 mL of *methanol*. Disperse by heating on a water bath at 60° for 5 minutes and shake for 30 seconds. Add 10 mL of *water*, cool in ice for 10 minutes and filter.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

250 volumes of *water* and 750 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{36}F_2O_5$ in the ointment using the declared content of $C_{27}H_{36}F_2O_5$ in *diflucortolone valerate BPCRS*.

Digitoxin Tablets

Action and use
Na /K-ATPase inhibitor; cardiac glycoside.

DEFINITION
Digitoxin Tablets contain Digitoxin.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of digitoxin, $C_{41}H_{64}O_{13}$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
To a quantity of the powdered tablets containing 0.25 mg of Digitoxin add 1 mL of *glacial acetic acid* containing 0.01% w/v of *iron(III) chloride*, shake for a few minutes, filter through sintered glass and cautiously add 1 mL of *sulfuric acid* to the filtrate without mixing. A brown ring free from red colour is produced at the interface and, after a short time, an indigo colour is produced in the upper layer.

TEST

Uniformity of content
Tablets containing less than 2 mg and/or less than 2% w/w of Digitoxin comply with the requirements stated under Tablets using the following method of analysis. Shake one tablet with 15 mL of *methanol (50%)* for 30 minutes and dilute to 25 mL with the same solvent. Filter through a suitable membrane filter disc having an average pore diameter not greater than 0.8 µm, discarding the first few mL of the filtrate, and transfer 1 mL to a 10 mL graduated flask. Add 3 mL of a 0.1% w/v solution of *L-ascorbic acid* in *methanol* and 0.2 mL of a 0.009M solution of hydrogen peroxide prepared by accurately diluting *hydrogen peroxide solution (100 vol)* that has been standardised by titration with 0.02M *potassium permanganate VS*, mix and dilute to volume with *hydrochloric acid*. After exactly 30 minutes measure the *fluorescence* of the solution, Appendix II E, using an excitation wavelength of 400 nm and an emission wavelength of 570 nm and setting the instrument to zero with *water*. Calculate the content of digitoxin, $C_{41}H_{64}O_{13}$, from the *fluorescence* obtained by carrying out the operation at the same time using a 0.0004% w/v solution of *digitoxin BPCRS* in *methanol (50%)* and beginning at the words 'transfer 1 mL ...'.

ASSAY
Weigh and finely powder 20 tablets. To a quantity of the powder containing 1.25 mg of Digitoxin add 3 mL of *water*, swirl to disperse the powder and allow to stand for 10 minutes, swirling occasionally. Add 25 mL of *glacial acetic acid*, shake for 1 hour and filter (Whatman No. 1 paper is suitable), discarding the first few mL of filtrate. To 4 mL of the filtrate add 1 mL of *dimethyl sulfoxide*, dilute to 25 mL with *xanthydrol reagent*, mix well and allow to stand in the dark for 4.5 hours (solution A). At the same time prepare two further solutions in the same manner but using for solution B 4 mL of *digitoxin standard solution* and for solution C 4 mL of a mixture of 25 volumes of *glacial acetic acid* and 3 volumes of *water* and beginning at the words 'add 1 mL of *dimethyl sulfoxide* ...'. Measure the *absorbances* of solutions A and B at the maximum at 550 nm, Appendix II B, using solution C in the reference cell.

Digoxin Injection

Action and use
Na /K-ATPase inhibitor; cardiac glycoside.

DEFINITION

Digoxin	25 mg
Ethanol (80 per cent)	12.5 mL
Propylene Glycol	40 mL
Citric Acid Monohydrate	75 mg
Disodium Hydrogen Phosphate Dodecahydrate	0.45 g
Water for Injections	Sufficient to produce 100 mL

Extemporaneous preparation
The following directions apply.

Dissolve the digoxin in the ethanol (80 per cent) and add the propylene glycol, a solution of the citric acid monohydrate and the disodium hydrogen phosphate dodecahydrate in Water for Injections and sufficient Water for Injections to produce 100 mL. Sterilise by *heating in an autoclave*.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of digoxin, $C_{41}H_{64}O_{14}$
0.0225 to 0.0275% w/v.

IDENTIFICATION
Evaporate 2 mL to dryness, dissolve the residue in 1 mL of *glacial acetic acid* containing 0.01% w/v of *iron(III) chloride* and cautiously add 1 mL of *sulfuric acid* without mixing. A brown ring, free from red colour, is produced at the interface and, after a short time, an indigo colour is produced in the upper layer.

TEST

Acidity or alkalinity
pH, 6.7 to 7.3, Appendix V L.

ASSAY
Transfer 20 mL to a separating funnel containing 10 mL of *water*. Make alkaline with 5M *ammonia* and extract with four 25 mL quantities of *chloroform*. Wash each extract with the same 10 mL of *water*. Evaporate the combined chloroform extracts to dryness on a water bath, dry the residue at 105° for 15 minutes, cool, dissolve the residue in 5 mL of a mixture of 65 volumes of *chloroform* and 35 volumes of *methanol* and add 20 mL of *glacial acetic acid* (solution A). To 5 mL of a 0.2% w/v solution of *digoxin EPCRS* in *glacial acetic acid* add 10 mL of a mixture of 65 volumes of *chloroform* and 35 volumes of *methanol* and sufficient *glacial acetic acid* to produce 50 mL (solution B). Dilute 5 mL of

www.webofpharma.com

solution A to 25 mL with *digoxin reagent*, mix, allow to stand for 1 hour and measure the *absorbance* of the resulting solution at 590 nm, Appendix II B, using *water* in the reference cell. Calculate the content of $C_{41}H_{64}O_{14}$ from the *absorbance* obtained by treating 5 mL of solution B at the same time and in the same manner.

STORAGE
Digoxin Injection should be protected from light.

Paediatric Digoxin Injection

Action and use
Na /K-ATPase inhibitor; cardiac glycoside.

DEFINITION

Digoxin	10 mg
Ethanol (80 per cent)	12.5 mL
Propylene Glycol	40 mL
Citric Acid Monohydrate	75 mg
Disodium Hydrogen Phosphate Dodecahydrate	0.45 g
Water for Injections	Sufficient to produce 100 mL

Extemporaneous preparation
The following directions apply.

Dissolve the digoxin in the ethanol (80 per cent) and add the propylene glycol, a solution of the citric acid monohydrate and the disodium hydrogen phosphate dodecahydrate in Water for Injections and sufficient Water for Injections to produce 100 mL. Sterilise by *heating in an autoclave.*

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of digoxin, $C_{41}H_{64}O_{14}$
0.0090 to 0.0110% w/v.

IDENTIFICATION
Evaporate 5 mL to dryness, dissolve the residue in 1 mL of *glacial acetic acid* containing 0.01% w/v of *iron(III) chloride* and cautiously add 1 mL of *sulfuric acid* without mixing. A brown ring, free from red colour, is produced at the interface and, after a short time, an indigo colour is produced in the upper layer.

Acidity or alkalinity
pH, 6.7 to 7.3, Appendix V L.

ASSAY
Carry out the Assay described under Digoxin Injection, using 50 mL.

STORAGE
Paediatric Digoxin Injection should be protected from light.

Paediatric Digoxin Oral Solution

Action and use
Na /K-ATPase inhibitor; cardiac glycoside.

DEFINITION
Paediatric Digoxin Oral Solution is a solution containing 0.005% w/v of Digoxin in a suitable flavoured vehicle.

Paediatric Digoxin Oral Solution should not be diluted.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of digoxin, $C_{41}H_{64}O_{14}$
0.0045 to 0.0055% w/v.

IDENTIFICATION
Extract 5 mL with four 20 mL quantities of *chloroform*, washing each extract with the same 10 mL of *water*, evaporate the combined extracts to dryness and dissolve the residue in 1 mL of *glacial acetic acid* containing 0.01% w/v of *iron(III) chloride hexahydrate.* Cautiously add 1 mL of *sulfuric acid* without mixing. A brown ring, free from red colour, is produced at the interface and, after a short time, an indigo colour is produced in the upper layer.

Acidity or alkalinity
pH, 6.8 to 7.2, Appendix V L.

ASSAY
Extract 100 mL with four 25 mL quantities of *chloroform*, washing each extract with the same 5 mL of *water*, and evaporate the combined extracts to dryness. To the residue add 3 mL of *absolute ethanol* and carefully evaporate to dryness on a water bath with the aid of a gentle current of air. Repeat the evaporation using a further 3 mL of *absolute ethanol* and cool. Dissolve the residue in 5 mL of a mixture of 65 volumes of *chloroform* and 35 volumes of *methanol*, add 20 mL of *glacial acetic acid* and filter if necessary. Dilute 5 mL of the filtrate to 25 mL with *digoxin reagent*, allow to stand for 2 hours and measure the *absorbance* of the resulting solution at the maximum at 590 nm, Appendix II B. Calculate the content of $C_{41}H_{64}O_{14}$ from the *absorbance* obtained by carrying out the operation at the same time but using a solution prepared by mixing 5 mL of a 0.2% w/v solution of *digoxin EPCRS* in *glacial acetic acid* with 10 mL of a mixture of 65 volumes *chloroform* and 35 volumes of *methanol* and adding sufficient *glacial acetic acid* to produce 50 mL, beginning at the words 'Dilute 5 mL of the filtrate ...' and using *water* in the reference cell.

STORAGE
Paediatric Digoxin Oral Solution should be protected from light.

Digoxin Tablets

Action and use
Na/K-ATPase inhibitor; cardiac glycoside.

DEFINITION
Digoxin tablets contain digoxin.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of digoxin, $C_{41}H_{64}O_{14}$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
To a quantity of the powdered tablets containing 0.25 mg of Digoxin, add 1 mL of *glacial acetic acid* containing 0.01% w/v of *iron(III) chloride hexahydrate*, shake for a few minutes, filter through sintered glass and cautiously add 1 mL of *sulfuric acid* without mixing. A brown ring, free from red colour, is produced at the interface and, after a short time, an indigo colour is produced in the upper layer.

TESTS
Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, placing six tablets in the basket, using as the medium 600 mL of *water* freshly prepared by distillation and rotating the basket at 120 revolutions per minute for

www.webofpharma.com

60 minutes. Withdraw a sample of 5 mL of the medium. Filter the sample through a membrane filter disc with a nominal pore size not greater than 0.8 µm, discarding the first 1 mL of the filtrate, and transfer 1 mL to a 10 mL graduated flask. Add 3 mL of a 0.1% w/v solution of *L-ascorbic acid* in *methanol* and 0.2 mL of a 0.009M solution of hydrogen peroxide, prepared by accurately diluting *hydrogen peroxide solution (100 vol)* that has been standardised by titration with 0.02M *potassium permanganate VS*, mix and dilute to volume with *hydrochloric acid*. After exactly 2 hours measure the *fluorescence* of the solution, Appendix II E, using an excitation wavelength of 360 nm and an emission wavelength of 490 nm and setting the instrument to zero with *water* and to 100 with a solution prepared at the same time as the test solution in the following manner. Dilute 2.5 mL of a 0.100% w/v solution of *digoxin EPCRS* in *ethanol (80%)* to 100 mL with *water*, dilute the resulting solution further with *water* to produce a solution containing in 1 mL an amount of Digoxin equal to one-hundredth of the strength of the tablets being examined, transfer 1 mL of the solution to a 10 mL graduated flask and carry out the operation described above, beginning at the words 'Add 3 mL ... '. The amount of digoxin, $C_{41}H_{64}O_{14}$, per tablet in solution is not less than 75% of the stated amount.

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Digoxin comply with the requirements stated under Tablets using the following method of analysis. For tablets containing 0.125 mg of digoxin, place one tablet in 5 mL of *water* at 37°, agitate to disintegrate, add 28 mL of *ethanol (96%)*, shake for 1 hour and add sufficient *ethanol (80%)* to produce 50 mL. For tablets containing more or less than 0.125 mg of Digoxin carry out the same procedure but using correspondingly greater or smaller quantities of *water*, *ethanol (96%)* and *ethanol (80%)*. Filter the resulting solution through a suitable membrane filter disc with a nominal pore size not greater than 0.8 µm, discarding the first few mL of the filtrate, and transfer 1.0 mL to a 10 mL graduated flask. Add 3 mL of a 0.1% w/v solution of *L-ascorbic acid* in *methanol*, 0.2 mL of a 0.009M solution of hydrogen peroxide prepared by accurately diluting *hydrogen peroxide solution (100 vol)* that has been standardised by titration with 0.02M *potassium permanganate VS*, mix and dilute to volume with *hydrochloric acid*. After exactly 2 hours measure the *fluorescence* of the solution, Appendix II E, using an excitation wavelength of 360 nm and an emission wavelength of 490 nm and setting the instrument to zero with *water*. Calculate the content of digoxin, $C_{41}H_{64}O_{14}$, from the *fluorescence* obtained by carrying out the operation at the same time using a solution containing 2.5 µg per mL of *digoxin EPCRS* in *ethanol (80%)* and beginning at the words 'transfer 1.0 mL ...'.

ASSAY

Weigh and finely powder 20 tablets. To a quantity of the powder containing 1.25 mg of Digoxin add 3 mL of *water*, swirl to disperse the powder and allow to stand for 10 minutes swirling occasionally. Add 25 mL of *glacial acetic acid*, shake for 1 hour and filter (Whatman No. 1 paper is suitable), discarding the first few mL. To 4 mL of the filtrate add 1 mL of *dimethyl sulfoxide*, dilute to 25 mL with *xanthydrol reagent*, mix well and allow to stand in the dark for 4 hours (solution A). At the same time prepare two further solutions in the same manner but using for solution B 4 mL of *digoxin standard solution* and for solution C 4 mL of a mixture of 25 volumes of *glacial acetic acid* and 3 volumes of *water* and beginning at the words 'add 1 mL of *dimethyl sulfoxide* ...'. Measure the *absorbances* of solutions A and B at the maximum at 545 nm, Appendix II B, using solution C in the reference cell.

Dihydrocodeine Injection

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Dihydrocodeine Injection is a sterile solution of Dihydrocodeine Tartrate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of dihydrocodeine tartrate, $C_{18}H_{23}NO_3,C_4H_6O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Add 0.05 mL to a mixture of 5 mL of *sulfuric acid* and 0.05 mL of *formaldehyde solution*. A purple colour is produced (distinction from pholcodine).

B. To a volume containing 10 mg of Dihydrocodeine Tartrate add 0.05 mL of *nitric acid*. A yellow but no red colour is produced (distinction from morphine).

C. Evaporate a volume containing 0.1 g of Dihydrocodeine Tartrate to dryness on a water bath. Dissolve the residue in 1 mL of *sulfuric acid*, add 0.05 mL of *iron(III) chloride solution R1* and warm gently. A brownish yellow colour is produced which does not become red on the addition of 0.05 mL of 2M *nitric acid* (distinction from codeine and morphine).

D. Yields reaction B characteristic *of tartrates*, Appendix VI.

TESTS

Acidity

pH, 3.0 to 4.5, Appendix V L.

ASSAY

Dilute a volume containing 50 mg of Dihydrocodeine Tartrate to 500 mL with *water* and measure the *absorbance* of the resulting solution at the maximum at 284 nm, Appendix II B. Calculate the content of $C_{18}H_{23}NO_3,C_4H_6O_6$ taking 35.7 as the value of A(1%, 1 cm) at the maximum at 284 nm.

STORAGE

Dihydrocodeine Injection should be protected from light.

Dihydrocodeine Oral Solution

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Dihydrocodeine Oral Solution is a solution of Dihydrocodeine Tartrate in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of dihydrocodeine tartrate, $C_{18}H_{23}NO_3,C_4H_6O_6$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a volume of the oral solution containing 20 mg of Dihydrocodeine Tartrate add 10 mL of *water* and extract

www.webofpharma.com

with two 25 mL quantities of *chloroform*. Discard the chloroform extracts, add 3 mL of 5M *sodium hydroxide* to the aqueous layer, mix and extract with 25 mL of *chloroform*. Wash the chloroform layer with 10 mL of *water*, shake with *anhydrous sodium sulfate* and filter. Wash the filter with *chloroform* and evaporate the combined filtrate and washings to dryness. Dissolve the residue in 1 mL of *dichloromethane* and apply 0.2 mL drop wise on to the surface of a disc prepared using 0.3 g of *potassium bromide*, allowing the solvent to evaporate between applications, and dry the disc at 50° for 2 minutes. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of dihydrocodeine *(RS 102)*.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 10 mL of *water* and 3 mL of 5M *sodium hydroxide* to a quantity of the oral solution containing 20 mg of Dihydrocodeine Tartrate, mix, extract with two 30 mL quantities of *chloroform* and wash each extract successively with the same 10 mL of *water*. Filter each extract in turn through *anhydrous sodium sulfate* on a plug of absorbent cotton moistened with *chloroform*, wash the filter with *chloroform*, evaporate the combined filtrate and washings to dryness and dissolve the residue in 2 mL of *methanol*.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol*.

(3) Dilute 1 volume of solution (2) to 2 volumes with *methanol*.

(4) 0.0050% w/v of *codeine phosphate BPCRS* in *methanol*.

(5) A mixture containing 1 volume of solution (1) and 1 volume of solution (4).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

1 volume of 13.5M *ammonia* and 10 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (5) shows two clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1):

any spot due to codeine is not more intense that the corresponding spot in the chromatogram obtained with solution (4) (0.5%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

not more than one such spot is more intense that the spot in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a weighed quantity of the oral solution containing 10 mg of Dihydrocodeine Tartrate in *water*, dilute to 25 mL with *water*.

(2) 0.04% w/v of *dihydrocodeine tartrate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 284 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.01M *sodium acetate* and 0.005M *dioctyl sodium sulfosuccinate* in a mixture of 40 volumes of *water* and 60 volumes of *methanol*, the pH of the mixture being adjusted to 5.5 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2) the *symmetry factor* of the peak corresponding to dihydrocodeine is less than 1.5.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{18}H_{23}NO_3,C_4H_6O_6$, weight in volume, using the declared content of $C_{18}H_{23}NO_3,C_4H_6O_6$ in *dihydrocodeine tartrate BPCRS*.

STORAGE

Dihydrocodeine Oral Solution should be protected from light.

Dihydrocodeine Tablets

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Dihydrocodeine Tablets contain Dihydrocodeine Tartrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of dihydrocodeine tartrate, $C_{18}H_{23}NO_3,C_4H_6O_6$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.15 g of Dihydrocodeine Tartrate with 50 mL of *water*, filter and evaporate the filtrate to dryness on a water bath. The residue complies with the following tests.

A. Add 10 mg, in powder, to 1 mL of a mixture of *sulfuric acid* and 0.05 mL of *formaldehyde solution*. A purple colour is produced (distinction from pholcodine).

B. Dissolve 10 mg in 0.05 mL of *nitric acid*. A yellow but no red colour is produced (distinction from morphine).

C. Dissolve 0.1 g in 1 mL of *sulfuric acid*, add 0.05 mL of *iron(III) chloride solution R1* and warm gently. A brownish yellow colour is produced which does not become red on the addition of 0.05 mL of 2M *nitric acid* (distinction from codeine and morphine).

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.15 g of Dihydrocodeine Tartrate as

www.webofpharma.com

completely as possible in 30 mL of *water*, make alkaline with 5M *ammonia* and extract with five 20 mL quantities of *chloroform*, washing each extract with the same 10 mL of *water*. Filter the combined extracts through absorbent cotton moistened with *chloroform* and wash the filter with a small quantity of *chloroform*. Evaporate on a water bath until the volume is reduced to about 50 mL and titrate with 0.02M *perchloric acid VS* using *crystal violet solution* as indicator. Each mL of 0.02M *perchloric acid VS* is equivalent to 9.030 mg of $C_{18}H_{23}NO_3,C_4H_6O_6$.

STORAGE
Dihydrocodeine Tablets should be protected from light.

Diloxanide Tablets

Action and use
Antiprotozoal.

DEFINITION
Diloxanide Tablets contain Diloxanide Furoate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of diloxanide furoate, $C_{14}H_{11}Cl_2NO_4$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Extract a quantity of the powdered tablets containing 0.2 g of Diloxanide Furoate with 20 mL of *chloroform*, filter and evaporate the filtrate to dryness. The dried residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of diloxanide furoate *(RS 103)*.

B. Burn 20 mg by the method for *oxygen-flask combustion*, Appendix VIII C, using 10 mL of 1M *sodium hydroxide* as the absorbing liquid. When the process is complete acidify the liquid with *nitric acid* and add *silver nitrate solution*. A white precipitate is produced.

C. *Melting point*, about 115°, Appendix V A.

TEST
Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel HF_{254}* as the coating substance and a mixture of 96 volumes of *dichloromethane* and 4 volumes of *methanol* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.5 g of Diloxanide Furoate with 5 mL of *chloroform*, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 400 volumes with *chloroform*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

ASSAY
Weigh and powder 20 tablets. Shake a quantity of the powder containing 40 mg of Diloxanide Furoate with 150 mL of *ethanol (96%)* for 30 minutes, add sufficient *ethanol (96%)* to produce 200 mL, mix and filter. Dilute 10 mL of the filtrate to 250 mL with *ethanol (96%)* and measure the *absorbance* of the resulting solution at the maximum at 258 nm, Appendix II B. Calculate the content of $C_{14}H_{11}Cl_2NO_4$ taking 705 as the value of A (1%, 1 cm) at the maximum at 258 nm.

STORAGE
Diloxanide Tablets should be protected from light.

Prolonged-release Diltiazem Tablets

Prolonged-release Diltiazem Tablets from different manufacturers containing more than 60 mg of Diltiazem Hydrochloride, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use
Calcium channel blocker.

DEFINITION
Prolonged-release Diltiazem Tablets contain Diltiazem Hydrochloride. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION
A suitable dissolution test is carried out to demonstrate the appropriate release of Diltiazem Hydrochloride. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of diltiazem hydrochloride, $C_{22}H_{26}N_2O_4S,HCl$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 50 mg of Diltiazem Hydrochloride with 25 mL of *methanol* for 15 minutes and filter through a 0.45-µm PTFE filter.

(2) 0.2% w/v of *diltiazem hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel F_{254}* precoated plate (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 10 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of 5M *acetic acid*, 3 volumes of *water*, 10 volumes of *dichloromethane* and 12 volumes of *absolute ethanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS
Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

www.webofpharma.com

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 0.12 g of Diltiazem Hydrochloride with 70 mL of *methanol (50%)*, filter through a 0.45-µm PTFE filter and dilute to 100 mL with *methanol (50%)*.

(2) Dilute 1 volume of solution (1) to 500 volumes with *methanol (50%)*.

(3) 0.12% w/v of *diltiazem impurity standard BPCRS* in *methanol (50%)*.

(4) 0.00036% w/v of *diltiazem impurity F EPCRS* in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil BDS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 5 times the retention time of diltiazem.

MOBILE PHASE

5 volumes of *absolute ethanol*, 25 volumes of *acetonitrile* and 70 volumes of a phosphate buffer prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 250 mL of *water*, adding 0.1 mL of N,N-*dimethyloctylamine* and sufficient *water* to produce 1000 mL and adjusting the pH to 4.5 with 2M *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the peaks due to diltiazem impurity A and diltiazem is at least 4.0;

the *symmetry factor* of each peak is not more than 2.0.

If necessary, adjust the concentration of *N,N*-dimethyloctylamine in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity F is not greater than the corresponding peak obtained in the chromatogram obtained with solution (4) (0.3%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all such *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

Disregard any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 50 mg of Diltiazem Hydrochloride with 70 mL of *methanol (50%)* for 20 minutes, cool to room temperature, dilute to 100 mL with *methanol (50%)* and filter through a 0.45-µm PTFE filter. Dilute 1 volume of the resulting filtrate to 5 volumes with *methanol (50%)*.

(2) 0.01% w/v of *diltiazem hydrochloride BPCRS* in *methanol (50%)*.

(3) 0.01% w/v of *diltiazem impurity standard BPCRS* in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the peaks due to diltiazem impurity A and diltiazem is at least 4.0;

the *symmetry factor* of each peak is not more than 2.0.

If necessary, adjust the concentration of *N,N*-dimethyloctylamine in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{26}N_2O_4S,HCl$ in the tablets using the declared content of $C_{22}H_{26}N_2O_4S,HCl$ in *diltiazem hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those impurities listed under Diltiazem Hydrochloride.

Dimenhydrinate Tablets

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Dimenhydrinate Tablets contain Dimenhydrinate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of dimenhydrinate, $C_{17}H_{21}NO,C_7H_7ClN_4O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.1 g of Dimenhydrinate with 10 mL of a mixture of equal volumes of *chloroform* and *ether* for 5 minutes, filter and evaporate the filtrate to an oily residue on a water bath. Add 3 mL of *ether* to the residue and scratch the interface between the residue and the ether gently with a glass rod until crystals appear in the liquid. Transfer the suspension of crystalline material in ether to a watch glass, allow the solvent to evaporate in a current of air and dry the residue at 60°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of dimenhydrinate *(RS 104)*.

TEST

Theophylline and substances related to diphenhydramine

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 g of Dimenhydrinate with three 10-mL quantities of *chloroform*, filter, evaporate the combined filtrates almost to dryness and dissolve the residue in 5 mL of *chloroform*.

www.webofpharma.com

(2) Dilute 1 volume of solution (1) to 100 volumes with *chloroform*.

(3) 0.010% w/v of *theophylline* in *chloroform*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in a current of cold air and examine under *ultraviolet light (254 nm)* (first examination). Spray the plate with *potassium iodobismuthate solution*, allow it to dry in air and spray with *hydrogen peroxide solution (10 vol)* and examine in daylight (second examination).

MOBILE PHASE

1 volume of 13.5M *ammonia*, 9 volumes of *methanol* and 90 volumes of *dichloromethane*.

LIMITS

In the first examination:

any spot corresponding to theophylline in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

In the second examination:

any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

Disregard any spot extending from the line of application to an Rf value of about 0.1.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.1 g of Dimenhydrinate as completely as possible in 20 mL of *water*, add 10 mL of 5M *ammonia*, mix, extract with successive quantities of 15, 15, 15, 10 and 10 mL of *ether* and wash the combined extracts with 10 mL of *water*. Evaporate the ether, warm the residue with 10 mL of *ethanol (96%)* until dissolved, cool, add 50 mL of 0.01M *hydrochloric acid VS* and titrate the excess of acid with 0.01M *sodium hydroxide VS* using *methyl red mixed solution* as indicator. Each mL of 0.01M *hydrochloric acid VS* is equivalent to 4.700 mg of $C_{17}H_{21}NO,C_7H_7ClN_4O_2$.

Dimercaprol Injection

Action and use

Chelating agent for use in heavy metal poisoning.

DEFINITION

Dimercaprol	5 g
Benzyl Benzoate	9.6 mL
Arachis Oil	Sufficient to produce 100 mL

Extemporaneous preparation

The following directions apply.

Dissolve the dimercaprol in the benzyl benzoate and add sufficient arachis oil to produce 100 mL. Add sufficient of a 35% v/v solution of strong ammonia solution in ethanol (96 per cent) until the acidity, when determined by the method described below, corresponds to a pH of 6.8 to 7.0. Add about 0.2 g of activated charcoal, stir, allow to stand for not less than 1 hour and filter. Distribute the solution in ampoules, the air in which is replaced by nitrogen or other suitable gas and seal immediately. Sterilise by *dry heat* at a minimum of 150° for not less than 1 hour.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of dimercaprol, $C_3H_8OS_2$

4.75 to 5.25% w/v.

CHARACTERISTICS

A bright, pale yellow solution.

TESTS

Acidity

Shake with an equal volume of *water* for 2 minutes and allow to separate. The pH of the aqueous layer, after filtration through neutral filter paper, is 4.5 to 6.5, Appendix V L.

Refractive index

1.482 to 1.486, Appendix V E.

Weight per mL

0.940 to 0.955 g, Appendix V G.

ASSAY

To 1 g add 20 mL of 0.1M *hydrochloric acid* and titrate with 0.05M *iodine VS*. Each mL of 0.05M *iodine VS* is equivalent to 6.21 mg of $C_3H_8OS_2$. Use the *weight per mL* of the injection to calculate the percentage w/v of $C_3H_8OS_2$.

STORAGE

Dimercaprol Injection should be protected from light.

LABELLING

The label states (1) the nature of the solvent; (2) that the preparation is intended for intramuscular injection only.

Dinoprostone Oral Solution

NOTE: *Dinoprostone Oral Solution is not currently licensed in the United Kingdom.*

DEFINITION

Dinoprostone Oral Solution is a solution of Dinoprostone in a suitable aqueous vehicle. It is intended to be diluted before use.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of dinoprostone, $C_{20}H_{32}O_5$

90.0 to 105.0% of the stated amount.

TESTS

IDENTIFICATION

A. Evaporate about 20 mL of the oral solution to 15 mL under a stream of nitrogen, extract the remaining solution with two 5-mL quantities of *chloroform*, combine the chloroform extracts and evaporate almost to dryness using a rotary evaporator. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of dinoprostone (*RS 448*).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

Prostaglandin A_2

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. The solutions should be injected immediately after preparation.

www.webofpharma.com

(1) Dilute a quantity of the oral solution with sufficient *methanol (60%)* to produce a solution containing 0.01% w/v of Dinoprostone.

(2) Dilute 1 volume of solution (1) to 10 volumes with *methanol (60%)* and further dilute 1 volume to 10 volumes with *methanol (60%)*.

(3) Dissolve 1 mg of *dinoprostone BPCRS* in 100 µL of 1M *sodium hydroxide* (the solution becomes brownish-red), allow to stand for 4 minutes and then add 150 µL of 1M *acetic acid* (a yellowish-white opalescent solution is produced). Dilute the resulting solution to 5 mL with *methanol (60%)* and further dilute 1 mL of this solution to 10 mL with *methanol (60%)*. The solution contains a mixture of prostaglandin A_2 (Ph Eur impurity D) and prostaglandin B_2 (Ph Eur impurity E).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm x 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Kromasil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 200 µL of each solution.

MOBILE PHASE

40 volumes of a 1% v/v solution of *triethylamine*, adjusted to pH 2.3 with *orthophosphoric acid*, and 60 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention time of Dinoprostone is about 22 minutes. The retention times relative to Dinoprostone are: impurity D, about 1.7; impurity E, about 1.8.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity D and impurity E is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

identify any peak corresponding to prostaglandin A_2 using solution (3) and multiply the area of this peak by the corresponding correction factor: 0.2;

the area of any peak corresponding to prostaglandin A_2 is not greater than five times the area of the principal peak in the chromatogram obtained with solution (2) (5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. The solutions should be injected immediately after preparation.

(1) Dilute a quantity of the oral solution with sufficient *methanol (60%)* to produce a solution containing 0.01% w/v of Dinoprostone.

(2) Dissolve 10 mg of *dinoprostone BPCRS in methanol (60%)* with the aid of ultrasound for 5 minutes and dilute to 100 mL with *methanol (60%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under the test for Prostaglandin A_2 may be used, but injecting 20 µL of each solution.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{20}H_{32}O_5$, weight in volume, using the declared content of $C_{20}H_{32}O_5$ in *dinoprostone BPCRS*.

STORAGE

The oral solution should be protected from light and stored at a temperature of 2° to 8°.

LABELLING

The label states (1) that the preparation is to be diluted before use; (2) that any oral solution not used within 7 days of the date of preparation should be discarded.

Diphenhydramine Oral Solution

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Diphenhydramine Oral Solution is a solution of Diphenhydramine Hydrochloride in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of diphenhydramine hydrochloride, $C_{17}H_{21}NO,HCl$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 50 volumes of *ethanol (96%)*, 30 volumes of *glacial acetic acid* and 20 volumes of *water* as the mobile phase. Apply separately to the plate 5 µL of each of the following freshly prepared solutions. For solution (1) acidify a quantity of the oral solution containing 50 mg of diphenhydramine hydrochloride with 2M *hydrochloric acid*, shake with three 20 mL quantities of *ether*, discard the ether, extract with two 20 mL quantities of *chloroform*, dry the combined extracts over *anhydrous sodium sulfate*, filter, evaporate the chloroform and dissolve the cooled residue in 5 mL of *chloroform*. Solution (2) contains 1% w/v of *diphenhydramine hydrochloride BPCRS* in *chloroform*. After removal of the plate, allow it to dry in air and spray with a solution containing 0.25% w/v of *chloroplatinic(IV) acid* and 5% w/v of *potassium iodide*. The principal spot in the chromatogram obtained with solution (1) corresponds in colour and position to that in the chromatogram obtained with solution (2).

B. Evaporate to dryness 1 mL of solution (1) obtained in test A, dissolve the residue in 0.15 mL of *water* and add 2 mL of *sulfuric acid*; a yellow colour is produced which, on the addition of 0.5 mL of *nitric acid*, changes to red. Add 15 mL of *water*, cool, add 5 mL of *chloroform*, shake and allow to separate; the chloroform layer is violet.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel H* as the coating substance and a mixture of 80 volumes of *chloroform* and 20 volumes of *methanol* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) use solution (1) described under test A for Identification. For solution (2) dilute 1 volume of solution (1) to

www.webofpharma.com

100 volumes with *chloroform*. After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

ASSAY

Acidify a quantity containing 0.1 g of diphenhydramine hydrochloride with 2M *hydrochloric acid*, shake with three 20 mL quantities of *ether*, discard the ether, make the aqueous solution alkaline with 5M *sodium hydroxide* and extract with successive 15 mL quantities of *ether* until extraction is complete. Wash the combined ether extracts with two 5 mL quantities of *water*, extract the combined washings with 15 mL of *ether* and evaporate the combined ether extracts to dryness. Dissolve the residue in 15 mL of 0.05M *sulfuric acid VS* and titrate the excess of acid with 0.1M *sodium hydroxide VS* using *methyl red solution* as indicator. Each mL of 0.05M *sulfuric acid VS* is equivalent to 29.18 mg of $C_{17}H_{21}NO,HCl$.

STORAGE

Diphenhydramine Oral Solution should be protected from light.

Diphenhydramine Tablets

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Diphenhydramine Tablets contain Diphenhydramine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of diphenhydramine hydrochloride, $C_{17}H_{21}NO,HCl$

95.0 to 105.0% of the stated amount.

Carry out all of the following procedures protected from light.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.5 g of Diphenhydramine Hydrochloride with 50 mL of *ethanol*, centrifuge and filter the supernatant liquid. Evaporate the filtrate to dryness under a stream of nitrogen and dry the residue at 105° for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of diphenhydramine hydrochloride *(RS 450)*.

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, and rotate the basket at 100 revolutions per minute.

(b) Use 500 mL of *mixed phosphate buffer pH 6.8*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 25 mL sample of the medium and measure the *absorbance* of the filtered sample (a 0.45μm filter is suitable), suitably diluted with the dissolution medium, if necessary, to produce a solution expected to contain 0.005% w/v of Diphenhydramine Hydrochloride, at the maximum at 254 nm, Appendix II B, using *mixed phosphate buffer pH 6.8* in the reference cell.

(2) Measure the *absorbance* of a 0.005% w/v solution of *diphenhydramine hydrochloride BPCRS* using *mixed phosphate buffer pH 6.8* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of diphenhydramine hydrochloride, $C_{17}H_{21}NO,HCl$, in the medium from the absorbances obtained and using the declared content of $C_{17}H_{21}NO,HCl$ in *diphenhydramine hydrochloride BPCRS*.

LIMITS

The amount of diphenhydramine hydrochloride released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the powdered tablets containing 70 mg of Diphenhydramine Hydrochloride in 20 mL of the mobile phase. Dilute 1 volume to 5 volumes with the mobile phase.

(2) Dilute 1 volume of solution (1) to 200 volumes with the mobile phase.

(3) Dissolve 5 mg of *diphenhydramine impurity A EPCRS* and 5 mg of *diphenylmethanol* in the mobile phase and dilute to 10 mL with the mobile phase. To 4 volumes of this solution add 3 volumes of solution (1) and dilute to 20 volumes with the mobile phase.

(4) Dilute 1 volume of solution (2) to 5 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *base-deactivated octylsilyl silica gel for chromatography* (5μm) (Lichrospher RP Select B is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 10 μL of each solution.

(g) Allow the chromatography to proceed for 7 times the retention time of the peak due to diphenhydramine.

MOBILE PHASE

35 volumes of *acetonitrile* and 65 volumes of a 0.54% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 3.0 using *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to diphenhydramine (retention time = about 6 minutes) are: impurity A = about 0.9; impurity B = about 1.5; impurity C = about 1.8; impurity D = about 2.6; impurity E = about 5.1.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to diphenhydramine and impurity A is at least 2.0.

LIMITS

Identify any peak in the chromatogram obtained with solution (1) corresponding to impurity D and multiply the area of this peak by a correction factor of 0.7.

In the chromatogram obtained with solution (1):

www.webofpharma.com

the area of any peak corresponding to impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to impurity B, C, D or E is not greater than 0.6 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3% of each);

the area of any other *secondary peak* is not greater than 0.4 times the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of the *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix for 10 minutes, with the aid of ultrasound, a quantity of the powdered tablets containing 50 mg of Diphenhydramine Hydrochloride with 50 mL of *water*, add sufficient *water* to produce 100 mL, mix and filter, use the filtrate.

(2) 0.05% w/v *diphenhydramine hydrochloride BPCRS*.

(3) Dissolve 5 mg of *benzophenone* in 5 mL of *acetonitrile;* add sufficient water to produce 100 mL. To 1 mL of this solution add 5 mg of *diphenhydramine hydrochloride BPCRS* and add sufficient *water* to produce 10 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5µm).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

1 volume of *triethylamine*, 60 volumes of *acetonitrile* and 140 volumes of *water* adjusted to pH 5.5 using *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to benzophenone and diphenhydramine is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{21}NO,HCl$ in the tablets using the declared content of $C_{17}H_{21}NO,HCl$ in *diphenhydramine hydrochloride BPCRS*.

STORAGE

Diphenhydramine Tablets should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Diphenhydramine Hydrochloride.

Dipipanone and Cyclizine Tablets

Action and use
Opioid receptor agonist.

DEFINITION

Dipipanone and Cyclizine Tablets contain, in each, 10 mg of Dipipanone Hydrochloride and 30 mg of Cyclizine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of dipipanone hydrochloride, $C_{24}H_{31}NO,HCl,H_2O$
9.0 to 11.0 mg.

Content of cyclizine hydrochloride, $C_{18}H_{22}N_2,HCl$
27.75 to 32.25 mg.

IDENTIFICATION

A. In the Assay, the chromatogram obtained with solution (3) exhibits two peaks having the same retention times as those due to dipipanone and cyclizine in the chromatogram obtained with solution (1).

B. Shake a quantity of the powdered tablets containing 60 mg of Cyclizine Hydrochloride with 10 mL of *acetone* and filter, reserving the filtrate for test C. Add 10 mL of *chloroform* to the residue, mix with the aid of ultrasound for 2 to 3 minutes, filter and evaporate to dryness. The residue yields reaction A characteristic of *chlorides*, Appendix VI.

C. Evaporate the filtrate reserved in test B to dryness. The residue yields reaction A characteristic of *chlorides*, Appendix VI.

TEST

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and as the mobile phase the lower layer obtained after shaking together a mixture of 2 volumes of 13.5M *ammonia*, 8 volumes of *methanol* and 90 volumes of *dichloromethane* and allowing the layers to separate. Apply separately to the plate 20 µL of each of the following freshly prepared solutions. For solution (1) shake a quantity of the powdered tablets containing 30 mg of Cyclizine Hydrochloride with 50 mL of a mixture of equal volumes of *methanol* and *dichloromethane*, filter, evaporate the filtrate to dryness and dissolve the residue in 3 mL of the same solvent mixture. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. Solution (3) contains 0.0050% w/v of *N-methylpiperazine* in *methanol*. Solution (4) contains 0.10% w/v of each of *cyclizine hydrochloride BPCRS* and *hydroxyzine hydrochloride BPCRS* in *methanol*. After removal of the plate, allow it to dry in air and expose to iodine vapour for 10 minutes. Any spot corresponding to *N-methylpiperazine* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%). Any other *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%). The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated spots.

ASSAY

Weigh and finely powder 20 tablets. Dissolve 0.5 g of *chlorcyclizine hydrochloride BPCRS* (internal standard) in sufficient *dichloromethane* to produce 100 mL (solution A). Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. For solution

www.webofpharma.com

(1) add 25 mL of solution A to 0.15 g of *cyclizine hydrochloride BPCRS* and 50 mg of *dipipanone hydrochloride BPCRS* and dilute to 50 mL with *dichloromethane*. For solution (2) add 40 mL of *dichloromethane* to a quantity of the powdered tablets containing 50 mg of Dipipanone Hydrochloride and mix with the aid of ultrasound for 20 minutes; dilute to 50 mL with *dichloromethane* and filter. Prepare solution (3) in the same manner as solution (2) but add 25 mL of solution A and 15 mL of *dichloromethane* in place of the 40 mL of dichloromethane.

The chromatographic procedure may be carried out using a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (80 to 100 mesh) coated with 3% w/w of silicone grease (Apiezon L is suitable) and 5% w/w of *potassium hydroxide* and maintained at 250°. In the chromatogram obtained with solution (2) the peaks, in order of emergence, are due to cyclizine, chlorcyclizine and dipipanone.

Calculate the content of $C_{24}H_{31}NO,HCl,H_2O$ using the declared content of $C_{24}H_{31}NO,HCl,H_2O$ in *dipipanone hydrochloride BPCRS* and the content of $C_{18}H_{22}N_2,HCl$ using the declared content of $C_{18}H_{22}N_2,HCl$ in *cyclizine hydrochloride BPCRS*.

Dipivefrine Eye Drops

Action and use
Adrenaline prodrug; treatment of glaucoma.

DEFINITION
Dipivefrine Eye Drops are a sterile solution of Dipivefrine Hydrochloride in purified water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of dipivefrine hydrochloride, $C_{19}H_{29}NO_5,HCl$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel 60 F_{254} precoated plate (Merck plates are suitable) and a mixture of 1 volume of *formic acid*, 10 volumes of *methanol* and 30 volumes of *chloroform* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) use the eye drops diluted with *water*, if necessary, to produce a solution containing 0.1% w/v of dipivefrine hydrochloride. Solution (2) is a 0.1% w/v solution of *dipivefrine hydrochloride BPCRS* in *water*. After removal of the plate, allow it to dry in air and spray with a mixture of 5 volumes of *ethylenediamine*, 45 volumes of *ethanol (96%)* and 50 volumes of a 0.1% w/v solution of *potassium hexacyanoferrate(III)* until saturated, allow to dry, heat at 100° for 10 minutes and examine in daylight. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS
Clarity of solution
The eye drops are *clear*, Appendix IV A.

Acidity
pH, 2.5 to 3.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the eye drops diluted, if necessary, to contain 0.1% w/v of dipivefrine hydrochloride. For solution (2) dilute 4 volumes of solution (1) to 10 volumes with *water* and further dilute 1 volume of this solution to 100 volumes with *water*. For solution (3) dissolve the contents of one vial of *dipivefrine impurity standard BPCRS* (the impurity standard contains 99 mg of dipivefrine hydrochloride and 1 mg of dipivalyladrenalone hydrochloride) in 0.0015M *hydrochloric acid*, wash the container with the same solvent and dilute the solution and washings to 100 mL with the same solvent.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) as the mobile phase with a flow rate of 1 mL per minute a mixture of 1 volume of *glacial acetic acid*, 15 volumes of 0.014M *sodium dodecyl sulfate* and 24 volumes of *acetonitrile*, (c) a detection wavelength of 254 nm and (d) an electronic integrator.

The test is not valid unless the chromatogram obtained with solution (3) resembles the appropriate chromatogram provided with the impurity standard.

In the chromatogram obtained with solution (1) the area of any peak corresponding to dipivalyladrenalone hydrochloride is not greater than the area of the peak corresponding to dipivalyladrenalone hydrochloride in the chromatogram obtained with solution (3) (1%) and the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.4%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the eye drops diluted, if necessary, with *water* to contain 0.1% w/v of dipivefrine hydrochloride. Solution (2) contains 0.1% w/v of *dipivefrine hydrochloride BPCRS* in *water*. For solution (3) use solution (3) prepared for the Related substances.

The chromatographic procedure described under Related substances may be used.

The test is not valid unless the chromatogram obtained with solution (3) resembles the appropriate chromatogram provided with the impurity standard.

Calculate the content of $C_{19}H_{29}NO_5,HCl$ in the eye drops from the chromatograms obtained and using the declared content of $C_{19}H_{29}NO_5,HCl$ in *dipivefrine hydrochloride BPCRS*.

Dipotassium Hydrogen Phosphate Injection

Dipotassium Phosphate Injection

DEFINITION
Dipotassium Hydrogen Phosphate Injection is a sterile solution of Dipotassium Hydrogen Phosphate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of dipotassium hydrogen phosphate, K_2HPO_4
95.0 to 105.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION
Yields the reactions characteristic of *potassium salts* and reaction B characteristic of *phosphates*, Appendix VI.

TESTS
Alkalinity
pH, 9.0 to 10.0, Appendix V L.

ASSAY
Dilute, if necessary, a volume of the injection with sufficient *carbon dioxide-free water* to produce a solution containing 8.71% w/v (1 millimole of potassium ion per mL) of dipotassium hydrogen phosphate. Titrate 20 mL with 0.5M *hydrochloric acid VS* using a mixture of 4 volumes of *bromocresol green solution* and 1 volume of *methyl red solution* as indicator. Each mL of 0.5M *hydrochloric acid VS* is equivalent to 87.1 mg of K_2HPO_4.

LABELLING
The label states (1) the percentage w/v of Dipotassium Phosphate; (2) the concentration of the potassium ion in millimoles.

Prolonged-release Dipyridamole Capsules

Prolonged-release Dipyridamole Capsules from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use
Adenosine reuptake inhibitor; inhibitor of platelet aggregation.

DEFINITION
Prolonged-release Dipyridamole Capsules contain Dipyridamole. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION
A suitable dissolution test is carried out to demonstrate the appropriate release of Dipyridamole. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of dipyridamole, $C_{24}H_{40}N_8O_4$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the powdered capsule contents containing 50 mg of Dipyridamole with 20 mL of *dichloromethane*, filter and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of dipyridamole *(RS 108)*.

TESTS
Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in amber glassware and protected from light.

(1) Shake, with the aid of ultrasound for 5 minutes, a quantity of the powdered capsule contents containing 0.2 g of Dipyridamole with 10 mL of *methanol (60%)*, dilute to 100 mL with *methanol (60%)*, filter through a 0.45-µm filter and use the clear solution.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol (60%)*.

(3) 0.05% w/v of *dipyridamole impurity standard BPCRS* (containing dipyridamole and impurities 1 and 2) in *methanol (60%)*.

(4) Dissolve the contents of a vial of *dipyridamole for peak identification EPCRS* (containing dipyridamole and impurities A to F) in 1 mL of *methanol (60%)*.

(5) Dilute 1 volume of solution (2) to 20 volumes with *methanol (60%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.0 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Inertsil ODS2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use a column temperature maintained at 45°.

(e) Use a detection wavelength of 290 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

Mobile phase A Dissolve 1.0 g of *potassium dihydrogen orthophosphate* in 900 mL of *water*, adjust to pH 7.0 with 0.5M *sodium hydroxide* and dilute to 1000 mL with *water*.

Mobile phase B *methanol*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	40	60	isocratic
5-19	40→5	60→95	linear gradient
19-24	5→40	95→60	linear gradient
24-29	40	60	isocratic

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) closely resembles the chromatogram supplied with *dipyridamole for peak identification EPCRS*;

the *resolution factor* between the peaks due to impurity D and dipyridamole is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

identify any peak corresponding to impurity B and multiply the area of this peak by a correction factor of 1.7;

the area of any peak corresponding to impurity 1 is not greater than 4 times the area of the principal peak in the chromatogram obtained with solution (2) (4.0%);

the area of any peak corresponding to impurity 2 is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

the area of any peak corresponding to impurity A, B, C, D or E is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5% of each);

the area of any other *secondary peak* is not greater than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any such peaks is not greater than 5.5 times the area of the principal peak in the chromatogram obtained with solution (2) (5.5%).

Disregard any peak with an area less than the area of principal peak in the chromatogram obtained with solution (5) (0.05%).

www.webofpharma.com

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in amber glassware and protected from light.

(1) Shake with the aid of ultrasound for 5 minutes, a quantity of the mixed contents of 20 capsules containing 50 mg of Dipyridamole with 10 mL of *methanol (60%)*, dilute to 100 mL with *methanol (60%)* and filter through a 0.45-µm filter. Dilute 1 mL of the filtrate to 10 mL with the mobile phase.

(2) 0.005% w/v of *dipyridamole BPCRS* in *methanol (60%)*.

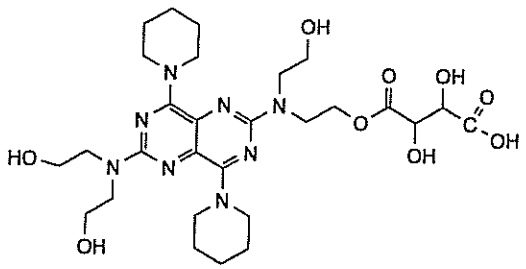
(3) Dissolve the contents of a vial of *dipyridamole for peak identification EPCRS* (containing impurities A to F) in 1 mL of *methanol (60%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions procedure described under Related substances test may be used.

SYSTEM SUITABILITY

The Assay is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *dipyridamole for peak identification EPCRS*;



the *resolution factor* between the peaks due to impurity D and dipyridamole is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{24}H_{40}N_8O_4$ in the capsules using the declared content of $C_{24}H_{40}N_8O_4$ in *dipyridamole BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Dipyridamole and the following.

1. Dipyridamole tartaric acid monoester,

2. Dipyridamole ditartaric acid ester.

Dipyridamole Infusion

Action and use

Adenosine reuptake inhibitor; inhibitor of platelet aggregation.

DEFINITION

Dipyridamole Infusion is a sterile solution containing Dipyridamole. It is supplied as a ready-to-use solution.

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of dipyridamole, $C_{24}H_{40}N_8O_4$

93.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dilute a volume of the infusion with a mixture of 1 volume of 0.1M *hydrochloric acid*, 4 volumes of *water* and 5 volumes of *methanol* to produce a solution containing 0.05% w/v of Dipyridamole and further dilute 1 volume of the resulting solution to 10 volumes with *methanol*. The *light absorption* of the resulting solution, Appendix II B, in the range 220 to 450 nm exhibits three maxima, at 231, 284 and 405 nm.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak due to dipyridamole in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 2.5 to 3.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in amber glassware and protected from light.

(1) Dilute the infusion with *methanol (60%)* to produce a solution containing 0.01% w/v of Dipyridamole.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol (60%)*.

(3) Dilute 1 volume of solution (2) to 5 volumes with *methanol (60%)*.

(4) Dissolve the contents of a vial of *dipyridamole for peak identification EPCRS* (contains dipyridamole and impurities A to F) in 1 mL of *methanol (60%)*.

(5) 0.01% w/v of *dipyridamole impurity standard BPCRS* in *methanol (60%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.0 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Inertsil ODS2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use a column temperature of 45°.

(e) Use a detection wavelength of 295 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

Mobile phase A Dissolve 1.0 g of *potassium dihydrogen orthophosphate* in 900 mL of *water*, adjust to pH 7.0 with *0.5M sodium hydroxide* and dilute to 1000 mL with *water*.

Mobile phase B *methanol*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	40	60	isocratic
5-19	40→5	60→95	linear gradient
19-24	5→40	95→60	linear gradient
24-29	40	60	isocratic

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *dipyridamole for peak identification EPCRS*;

the *resolution factor* between impurity D and dipyridamole is at least 2.0.

www.webofpharma.com

LIMITS

In the chromatogram obtained with solution (1):

identify any peak corresponding to impurity B and multiply the area of this peak by a correction factor of 1.7;

the area of any peak corresponding to Impurity 1 is not greater than 4 times the area of the principal peak in the chromatogram obtained with solution (2) (4.0%);

the area of any peak corresponding to Impurity 2 is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%);

the area of any peak corresponding to impurity A, B, or C is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of all *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (5%).

Disregard any peak with an area less than 0.5 times that of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in amber glassware and protected from light.

(1) Dilute the infusion with *methanol (60%)* to produce a solution containing 0.005% w/v of Dipyridamole.

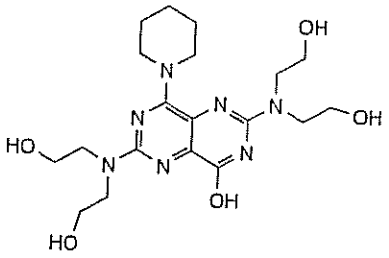
(2) 0.005% w/v of *dipyridamole BPCRS* in *methanol (60%)*.

(3) Dissolve the contents of a vial of *dipyridamole for peak identification EPCRS* (contains dipyridamole and impurities A to F) in 1 mL of *methanol (60%)*.

CHROMATOGRAPHIC CONDITIONS

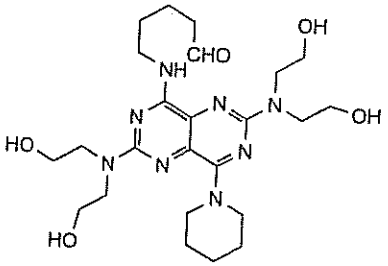
The chromatographic conditions described under the Related substances test may be used.

SYSTEM SUITABILITY



The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *dipyridamole for peak identification EPCRS*;

the *resolution factor* between impurity D and dipyridamole is at least 2.0.



Calculate the content of $C_{24}H_{40}N_8O_4$ in the infusion using the declared content of $C_{24}H_{40}N_8O_4$ in *dipyridamole BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Dipyridamole and the following.

1.Dipyridamole tartaric acid monoester

2.Dipyridamole ditartaric acid ester

Dipyridamole Oral Suspension

Action and use

Adenosine reuptake inhibitor; inhibitor of platelet aggregation.

DEFINITION

Dipyridamole Oral Suspension is a suspension of Dipyridamole in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of dipyridamole, $C_{24}H_{40}N_8O_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To 10 mL of solution (1) prepared in the Assay add 1 mL of 1M *hydrochloric acid* and sufficient *methanol* to produce 100 mL. The *light absorption*, Appendix II B, of the solution in the range 220 to 450 nm, exhibits three maxima at 230, 285 and 405 nm.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the peak due to dipyridamole in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 5.6 to 6.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use in amber glassware and protected from light.

(1) To a volume of the oral suspension containing 50 mg of Dipyridamole add 1.0 g of *sodium chloride* and 20 mL of *water*, shake, add 90 mL of *methanol*, shake vigorously, cool and add sufficient *methanol* to produce 100 mL. Filter

www.webofpharma.com

through a 0.45-µm nylon filter and dilute 10 mL of the filtrate to 20 mL with *water.*

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol (50%)* and further dilute 1 volume of the resulting solution to 5 volumes with *methanol (50%).*

(3) Dissolve the contents of a vial of *dipyridamole for peak identification EPCRS* in 1 mL of *methanol (50%).*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.0 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Inertsil ODS2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use a column temperature of 45°.

(e) Use a detection wavelength of 295 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

Mobile phase A Dissolve 1.0 g of *potassium dihydrogen phosphate* in 900 mL of *water,* adjust to pH 7.0 with 0.5M *sodium hydroxide* and dilute to 1000 mL with *water.*

Mobile phase B *methanol.*

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	40	60	isocratic
5-19	40→5	60→95	linear gradient
19-24	5→40	95→60	linear gradient
24-29	40	60	isocratic

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *dipyridamole for peak identification EPCRS;*

the *resolution factor* between impurity D and dipyridamole is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

multiply the area of any peak corresponding to impurity B by a correction factor of 1.7;

the area of any peaks corresponding to impurity A, impurity B or impurity C is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peaks corresponding to impurity D or impurity E is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

the sum of the areas of any such peaks is not greater than 5 times the area of the peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than 0.5 times that of the peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions prepared immediately before use in amber glassware and protected from light.

(1) To a weighed quantity of the oral suspension containing 50 mg of Dipyridamole add 1.0 g of *sodium chloride* and 20 mL of *water,* shake, add 90 mL of *methanol,* shake vigorously, cool and add sufficient *methanol* to produce 100 mL. Filter through a 0.45-µm nylon filter and dilute 10 mL of the filtrate to 100 mL with *methanol (50%).*

(2) 0.005% w/v of *dipyridamole BPCRS* in *methanol (50%).*

(3) Dissolve the contents of a vial of *dipyridamole for peak identification EPCRS* in 1 mL of *methanol (50%).*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under the Related substances test may be carried out.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *dipyridamole for peak identification EPCRS;*

the *resolution factor* between impurity D and dipyridamole is at least 2.0.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{24}H_{40}N_8O_4$, weight in volume, using the declared content of $C_{24}H_{40}N_8O_4$ in *dipyridamole BPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Dipyridamole.

Dipyridamole Tablets

Action and use

Adenosine reuptake inhibitor; inhibitor of platelet aggregation.

DEFINITION

Dipyridamole Tablets contain Dipyridamole. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of dipyridamole, $C_{24}H_{40}N_8O_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 50 mg of Dipyridamole with 20 mL of *dichloromethane,* filter and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of dipyridamole *(RS 108).*

TESTS

Related substances

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions in amber glassware and protected from light.

(1) Shake a quantity of the powdered tablets containing 50 mg of Dipyridamole with 100 mL of *methanol (60%)* for 15 minutes, filter (Whatman GF/C filter is suitable) and use the filtrate.

(2) Dilute 1 mL of solution (1) to 200 mL with *methanol (60%).*

www.webofpharma.com

(3) Dissolve the contents of a vial of *dipyridamole for peak identification EPCRS* (dipyridamole and impurities A to F) in 1 mL of *methanol (60%)*.

(4) Dilute 1 mL of solution (2) to 10 mL with *methanol (60%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.0 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Inertsil ODS2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use a column temperature of 45°.

(e) Use a detection wavelength of 290 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

Mobile phase A Dissolve 1.0 g of *potassium dihydrogen orthophosphate* in 900 mL of *water*, adjust to pH 7.0 with 0.5M *sodium hydroxide* and dilute to 1000 mL with *water*.

Mobile phase B *methanol*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-5	40	60	isocratic
5-19	40→5	60→95	linear gradient
19-24	5→40	95→60	linear gradient
24-29	40	60	isocratic

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *dipyridamole for peak identification EPCRS*;

the *resolution factor* between impurity D and dipyridamole is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

identify any peak corresponding to impurity B and multiply the area of this peak by a correction factor of 1.7;

the area of any peak corresponding to impurity A, B, C, D or E is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* not greater than 0.4 times the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in amber glassware and protected from light.

(1) Shake a quantity of the powdered tablets containing 50 mg of Dipyridamole with 100 mL of *methanol (60%)* for 15 minutes and filter (Whatman GF/C is suitable). Dilute 1 mL of the filtrate to 10 mL with *methanol (60%)*.

(2) 0.005% w/v of *dipyridamole BPCRS in methanol (60%)*.

(3) Dissolve the contents of a vial of *dipyridamole for peak identification EPCRS* (dipyridamole and impurities A to F) in 1 mL of *methanol (60%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under the Related substances test may be used.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *dipyridamole for peak identification EPCRS*;

the *resolution factor* between impurity D and dipyridamole is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{24}H_{40}N_8O_4$ in the tablets using the declared content of $C_{24}H_{40}N_8O_4$ in *dipyridamole BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Dipyridamole.

Disodium Edetate Eye Drops

NOTE: Disodium Edetate Eye Drops are not currently licensed in the United Kingdom.

Action and use

Chelating agent.

DEFINITION

Disodium Edetate Eye Drops are a sterile solution of Disodium Edetate in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of disodium edetate, $C_{10}H_{14}N_2Na_2O_8,2H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Add 6 mL of *lead nitrate solution* to 25 mL of the eye drops, shake and add 3 mL of *potassium iodide solution*; no yellow precipitate is produced. Make alkaline to *red litmus paper* with *dilute ammonia R2* and add 3 mL of *ammonium oxalate solution*; no precipitate is produced.

B. Add 0.5 mL of *calcium chloride solution* to 10 mL of the eye drops, make alkaline to *red litmus paper* with *dilute ammonia R2* and add 3 mL of *ammonium oxalate solution*; no precipitate is produced.

C. Yield the reactions characteristic of *sodium salts*, Appendix VI.

TESTS

Acidity or alkalinity

pH, 6.0 to 7.5, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the eye drops containing 20 mg of Disodium Edetate with sufficient *water* to produce 100 mL.

(2) 0.02% w/v of *disodium edetate BPCRS* in *water*.

Before injection, mix solutions (1) and (2) with an equal volume of a 0.04% w/v solution of *copper(II) nitrate*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak or Bondclone C18 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Add 6 volumes of *tetrabutylammonium hydroxide solution* to 195 volumes of *water*; adjust the pH to 6.5 with *orthophosphoric acid*, add 200 volumes of *acetonitrile* and sufficient *water* to produce 1000 volumes.

DETERMINATION OF CONTENT

Calculate the content of $C_{10}H_{14}N_2Na_2O_8,2H_2O$ in the eye drops using the declared content of $C_{10}H_{14}N_2Na_2O_8,2H_2O$ in *disodium edetate BPCRS*.

STORAGE

Disodium Edetate Eye Drops should be protected from light.

Disopyramide Capsules

Action and use

Class I antiarrhythmic.

DEFINITION

Disopyramide Capsules contain Disopyramide.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of disopyramide, $C_{21}H_{29}N_3O$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing 0.2 g of Disopyramide with 50 mL of *chloroform* for 15 minutes, filter, evaporate the filtrate to dryness using a rotary evaporator and dissolve the residue in 2 mL of *chloroform*. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of disopyramide *(RS 110)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the solution obtained in the Assay exhibits a maximum only at 269 nm.

TEST

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 0.20 g of Disopyramide with 20 mL of *methanol* for 30 minutes and filter.

(2) Dilute 1 volume of solution (1) to 400 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel GF_{254} plate*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in a current of air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of 18M *ammonia*, 30 volumes of *acetone* and 30 volumes of *cyclohexane*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.25%).

ASSAY

To a quantity of the mixed contents of 20 capsules containing 40 mg of Disopyramide, add 40 mL of 0.05M *methanolic sulfuric acid*, shake for 15 minutes, dilute to 100 mL with the same solvent and filter. Dilute 5 mL of the filtrate to 100 mL with 0.05M *methanolic sulfuric acid* and measure the *absorbance* of the resulting solution at the maximum at 269 nm, Appendix II B. Calculate the content of $C_{21}H_{29}N_3O$ taking 198.5 as the value of A(1%, 1 cm) at the maximum at 269 nm.

Disopyramide Phosphate Capsules

Action and use

Class I antiarrhythmic.

DEFINITION

Disopyramide Phosphate Capsules contain Disopyramide Phosphate.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of disopyramide, $C_{21}H_{29}N_3O$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Suspend a quantity of the contents of the capsules containing the equivalent of 0.2 g of disopyramide in 50 mL of *chloroform*, add 2 mL of 13.5M *ammonia*, shake and filter through *anhydrous sodium sulfate*. Evaporate the filtrate to dryness using a rotary evaporator and dissolve the residue in 2 mL of *chloroform*. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of disopyramide *(RS 110)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the solution obtained in the Assay exhibits a maximum only at 269 nm and a shoulder at 263 nm.

C. Shake a quantity of the contents of the capsules containing the equivalent of 0.4 g of disopyramide with 20 mL of *water* and filter. The filtrate yields the reactions characteristic of *phosphates*, Appendix VI.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water* at a temperature of 37°, as the medium.

PROCEDURE

After 45 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably

www.webofpharma.com

diluted with the dissolution medium if necessary, at the maximum at 262 nm, Appendix II B, using *water* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of disopyramide, $C_{21}H_{29}N_3O$, in the medium taking 125 as the value of A(1%, 1 cm) at the maximum at 262 nm.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing the equivalent of 0.20 g of disopyramide with 20 mL of *methanol* for 30 minutes and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in a current of air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of 18M *ammonia*, 30 volumes of *acetone* and 30 volumes of *cyclohexane*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

To a quantity of the mixed contents of 20 capsules containing the equivalent of 40 mg of disopyramide, add 40 mL of 0.05M *methanolic sulfuric acid*, shake for 15 minutes, dilute to 100 mL with the same solvent and filter. Dilute 5 mL of the filtrate to 100 mL with 0.05M *methanolic sulfuric acid* and measure the *absorbance* of the resulting solution at the maximum at 269 nm, Appendix II B. Calculate the content of $C_{21}H_{29}N_3O$ taking 125 as the value of A(1%, 1 cm) at the maximum at 269 nm.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of disopyramide.

Disulfiram Tablets

Action and use

Aldehyde dehyrogenase inhibitor; treatment of alcoholism.

DEFINITION

Disulfiram Tablets contain Disulfiram.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of disulfiram, $C_{10}H_{20}N_2S_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 0.2 g of Disulfiram by shaking with 5 mL of *dichloromethane* and filter. Evaporate the filtrate to dryness and dry the residue at 40° at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of disulfiram *(RS 111)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (3).

C. Extract a quantity of the powdered tablets containing 0.3 g of disulfiram with *ethanol (96%)*, filter and evaporate the filtrate to dryness. Dissolve 50 mg of the residue in 5 mL of *ethanol (96%)* and add 1 mL of *potassium cyanide solution*. A yellow colour is produced which becomes green and then darkens to bluish green.

TESTS

Diethyldithiocarbamate

Shake a quantity of the powdered tablets containing 0.1 g of Disulfiram with 10 mL of *chloroform* and filter. Add 10 mL of 0.1M *sodium hydroxide* to the filtrate, shake, discard the chloroform layer and wash the aqueous layer with three 10 mL quantities of *chloroform*. To the aqueous layer add 0.25 mL of a 0.4% w/v solution of *copper(II) sulfate* and 2 mL of *dichloromethane*, shake and allow to separate. The lower layer is not more intensely coloured than a standard prepared at the same time and in the same manner by adding 10 mL of 0.1M *sodium hydroxide* to 0.2 mL of a freshly prepared 0.0075% w/v solution of *sodium diethyldithiocarbamate* and beginning at the words 'add 0.25 mL of a 0.4% w/v solution of *copper(II) sulfate* ...' (0.01%, calculated as the acid).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF_{254}* as the coating substance and a mixture of 30 volumes of *butyl acetate* and 70 volumes of n-*hexane* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions.

For solution (1) extract a quantity of the powdered tablets containing 0.50 g of Disulfiram with 20 mL of *ethyl acetate* and filter. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *ethyl acetate*. Solution (3) contains 0.025% w/v of *disulfiram BPCRS* in *ethyl acetate*. Solution (4) contains 0.050% w/v of *monosulfiram BPCRS* in *ethyl acetate*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. In the chromatogram obtained with solution (1) any spot corresponding to monosulfiram is not more intense than the spot in the chromatogram obtained with solution (4) (2%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 0.4 g of Disulfiram add 75 mL of *methanol* and shake for 30 minutes. Add sufficient *methanol* to produce 100 mL, filter and dilute 5 mL of the filtrate to 100 mL with *methanol*. To 5 mL of this solution add sufficient of a 0.1% w/v solution of *copper(II) chloride* in *methanol* to produce 25 mL, mix and allow to stand for 1 hour. Measure the *absorbance* of the resulting solution at the maximum at 400 nm, Appendix II B, using in the reference cell a solution prepared by diluting 5 mL of *methanol* to 25 mL with the copper(II) chloride solution. Repeat the operation using 5 mL of a 0.020% w/v solution of *disulfiram BPCRS* in *methanol*, beginning at the words 'add sufficient of a 0.1% w/v solution of *copper(II) chloride* ...'. Calculate the content of $C_{10}H_{20}N_2S_4$ from the *absorbances* obtained and using the declared content of $C_{10}H_{20}N_2S_4$ in *disulfiram BPCRS*.

STORAGE

Disulfiram Tablets should be protected from light.

www.webofpharma.com

Dithranol Cream

Action and use
Coal tar extract; treatment of psoriasis.

DEFINITION

Dithranol Cream contains Dithranol in a suitable oil-in-water emulsified basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of dithranol, $C_{14}H_{10}O_3$
85.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the Assay the principal peak in the chromatogram obtained with solution (1) has the same retention time as that in the chromatogram obtained with solution (2).

B. Suspend a quantity containing 0.5 mg of dithranol in 5 mL of 1M *sodium hydroxide* and heat on a water bath for 1 minute while stirring. A pink colour is produced.

TESTS

Dihydroxyanthraquinone and dithranol dimer
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) For creams containing more than 0.5% w/v of Dithranol, use as solution (1) solution A obtained in the Assay. For creams containing 0.5% w/v or less of Dithranol, use as solution (1) solution B obtained in the Assay.

(2) For creams containing more than 0.5% w/v of Dithranol, add 4 mL of *glacial acetic acid* to 20 mL of a solution containing 0.005% w/v of *1,8-dihydro-xyanthraquinone* and 0.005% w/v of *dithranol dimer BPCRS* in *dichloromethane* and add sufficient n-*hexane* to produce 100 mL. For creams containing 0.5% w/v or less of Dithranol, add 20 mL of *glacial acetic acid* to 10 mL of a solution containing 0.005% w/v of *1,8-dihydroxyanthraquinone* and 0.005% w/v of *dithranol dimer BPCRS* in *dichloromethane* and add sufficient *dichloromethane* to produce 100 mL.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used but using a detection wavelength of 380 nm.

In the chromatogram obtained with solution (2), the substances elute in the following order: dihydroxyanthraquinone and dithranol dimer.

LIMIT

Not more than 10.0% of the stated amount of dithranol, calculated as the sum of the amounts of dihydroxyanthraquinone and dithranol dimer. Calculate the amounts of dihydroxyanthraquinone and dithranol dimer in the cream with reference to the corresponding peaks in the chromatogram obtained with solution (2).

1-Hydroxy-9-anthrone
Carry out the method for *liquid chromatography*, Appendix III D, in subdued light using the following freshly prepared solutions.

(1) Disperse a quantity of the cream containing 10 mg of Dithranol in 30 mL of *water* at about 50°, add 30 mL of a warm, saturated solution of *sodium chloride*, cool and extract with three 40-mL quantities of *chloroform*. Filter the extract successively through *anhydrous sodium sulfate* on a suitable filter (Whatman GF/C is suitable). Evaporate the filtrate under reduced pressure to a volume of about 2 mL, add 25 mL of warm *methanol*, shake, cool in ice for 15 minutes and filter (Whatman GF/C paper is suitable). Evaporate the filtrate to dryness under reduced pressure and dissolve the residue in 10 mL of a mixture of 5 volumes of *glacial acetic acid* and 95 volumes of *acetonitrile*; filter if necessary.

(2) Dissolve 25 mg of *1-hydroxy-9-anthrone BPCRS* in 0.5 mL of *glacial acetic acid* and add sufficient *acetonitrile* to produce 50 mL (solution A); dilute 1 mL of solution A to 20 mL with *acetonitrile*.

(3) Dilute 1 volume of solution (1) to 40 mL with a mixture of 5 volumes of *glacial acetic acid* and 95 volumes of *acetonitrile*.

(4) Dissolve 50 mg of *dithranol BPCRS* in 0.5 mL of *glacial acetic acid*, add 2 mL of solution A and sufficient *acetonitrile* to produce 50 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 and Spherisorb ODS 2 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2.5 volumes of *glacial acetic acid*, 40 volumes of *tetrahydrofuran* and 60 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) closely resembles the chromatogram supplied with *dithranol BPCRS*.

LIMITS

In the chromatogram obtained with solution (1) the area of any peak corresponding to the principal peak in the chromatogram obtained with solution (2) (1-hydroxy-9-anthrone) is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (2.5%).

ASSAY

Carry out the following procedure protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) For creams containing more than 0.5% w/w of Dithranol, disperse by shaking a quantity of the cream containing 50 mg of Dithranol in 10 mL of *glacial acetic acid* and 20 mL of *dichloromethane*, filter through a glass microfibre filter paper (Whatman GF/C is suitable) into a 100 mL graduated flask, wash the filter with *dichloromethane* and add sufficient *dichloromethane* to produce 100 mL. Shake the flask vigorously and allow to stand until two layers are obtained, add *dichloromethane* until the dichloromethane and water interface is level with the calibration mark, shake vigorously and again allow to stand until two layers are obtained. Dilute 20 volumes of the lower layer to 50 volumes with n-*hexane* (solution A). Dilute a suitable volume of solution A with n-*hexane* to contain 0.002% w/v of Dithranol. For creams containing 0.5% w/w or less of Dithranol, disperse, by shaking, a quantity of the cream containing 5 mg of Dithranol in 10 mL of *glacial acetic acid* and 20 mL of *dichloromethane*, filter through a glass microfibre filter paper (Whatman GF/C is suitable) into a 50 mL graduated flask, wash the filter with *dichloromethane* and add sufficient *dichloromethane* to produce 50 mL. Shake the flask vigorously

www.webofpharma.com

and allow to stand until two layers are obtained, add *dichloromethane* until the dichloromethane and water interface is level with the calibration mark, shake vigorously and again allow to stand until two layers are obtained (solution B). Dilute a suitable volume of solution B with n-*hexane* to contain 0.002% w/v of Dithranol.

(2) Add 1 mL of *glacial acetic acid* to 10 mL of a 0.02% w/v solution of *dithranol BPCRS* in *dichloromethane* and add sufficient of the mobile phase to produce 100 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Lichrosorb Si 60 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 354 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of *glacial acetic acid*, 5 volumes of *dichloromethane* and 82 volumes of n-*hexane*.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{10}O_3$ in the cream using the declared content of $C_{14}H_{10}O_3$ in *dithranol BPCRS*.

STORAGE

Dithranol Cream should be protected from light.

Dithranol Ointment

Action and use

Coal tar extract; treatment of psoriasis.

DEFINITION

Dithranol Ointment contains Dithranol, in *fine powder*, in a suitable hydrophobic basis.

Extemporaneous preparation

The following directions apply.

Triturate dithranol, in *fine powder*, with Yellow Soft Paraffin, add sufficient Yellow Soft Paraffin to produce an ointment of the required strength and mix thoroughly. Part of the Yellow Soft Paraffin may be replaced by Hard Paraffin to produce an ointment of stiffer consistency.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of dithranol, $C_{14}H_{10}O_3$

85.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the principal peak in the chromatogram obtained with solution (1) corresponds to the principal peak in the chromatogram obtained with solution (2).

B. Heat a quantity containing 0.5 mg of dithranol with 5 mL of 1M *sodium hydroxide* on a water bath with constant stirring. A pink colour is produced in the aqueous layer.

TESTS

Dihydroxyanthraquinone and dithranol dimer

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the ointment containing 20 mg of Dithranol in 20 mL of *dichloromethane*, add 1 mL of *glacial acetic acid*, dilute to 100 mL with *hexane* and filter through a fine glass microfibre filter paper (Whatman GF/C is suitable).

(2) Add 1 mL of *glacial acetic acid* to 20 mL of a solution containing 0.0050% w/v of *1,8-dihydroxyanthraquinone* and 0.0050% w/v of *dithranol dimer BPCRS* in *dichloromethane* and add sufficient *hexane* to produce 100 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Lichrosorb Si 60 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 380 nm.

(f) Inject 20 µL of each solution.

In the chromatogram obtained with solution (2), the substances elute in the following order: dihydroxyanthraquinone and dithranol dimer.

MOBILE PHASE

1 volume of *glacial acetic acid*, 5 volumes of *dichloromethane* and 82 volumes of *hexane*.

LIMIT

Not more than 10.0% of the stated amount of dithranol, calculated as the sum of the amounts of dihydroxyanthraquinone and dithranol dimer. Calculate the amounts of dihydroxyanthraquinone and dithranol dimer in the ointment with reference to the corresponding peaks in the chromatogram obtained with solution (2).

1-Hydroxy-9-anthrone

Carry out the method for *liquid chromatography*, Appendix III D, in subdued light using the following freshly prepared solutions.

(1) Disperse a quantity of the ointment containing 10 mg of Dithranol in 25 mL of *chloroform*, evaporate under reduced pressure to a volume of about 2 mL, add 25 mL of warm *methanol*, shake, cool in ice for 15 minutes and filter (Whatman GF/C paper is suitable). Evaporate the filtrate to dryness under reduced pressure and dissolve the residue in 10 mL of a mixture of 5 volumes of *glacial acetic acid* and 95 volumes of *acetonitrile*; filter if necessary.

(2) Dissolve 25 mg of *1-hydroxy-9-anthrone BPCRS* in 0.5 mL of *glacial acetic acid* and add sufficient *acetonitrile* to produce 50 mL (solution A); dilute 1 mL of solution A to 20 mL with *acetonitrile*.

(3) Dilute 1 volume of solution (1) to 40 mL with a mixture of 5 volumes of *glacial acetic acid* and 95 volumes of *acetonitrile*.

(4) Dissolve 50 mg of *dithranol BPCRS* in 0.5 mL of *glacial acetic acid*, add 2 mL of solution A and sufficient *acetonitrile* to produce 50 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 and Spherisorb ODS 2 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

www.webofpharma.com

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2.5 volumes of *glacial acetic acid*, 40 volumes of *tetrahydrofuran* and 60 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) closely resembles the reference chromatogram supplied with *dithranol BPCRS*.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to the principal peak in the chromatogram obtained with solution (2) (1-hydroxy-9-anthrone) is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (2.5%).

ASSAY

Carry out the following procedure protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the ointment containing 5 mg of Dithranol in 20 mL of *dichloromethane*, add 1 mL of *glacial acetic acid*, dilute to 100 mL with *hexane* and filter through a fine glass microfibre filter paper (Whatman GF/C is suitable).

(2) Add 1 mL of *glacial acetic acid* to 20 mL of a 0.025% w/v solution of *dithranol BPCRS* in *dichloromethane* and add sufficient *hexane* to produce 100 mL.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dihydroxyanthraquinone and dithranol dimer may be used but using a detection wavelength of 354 nm.

MOBILE PHASE

1 volume of *glacial acetic acid*, 5 volumes of *dichloromethane* and 82 volumes of *hexane*.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{10}O_3$ in the ointment using the declared content of $C_{14}H_{10}O_3$ in *dithranol BPCRS*.

STORAGE

Dithranol Ointment should be protected from light.

Dithranol Paste

NOTE: *Dithranol Paste is not currently licensed in the United Kingdom.*

Action and use

Treatment of psoriasis.

DEFINITION

Dithranol Paste contains Dithranol in a suitable hydrophobic basis containing Zinc Oxide and Salicylic Acid.

The paste complies with the requirements stated under Topical Semi-solid Preparations, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of dithranol, $C_{14}H_{10}O_3$

85.0 to 110.0% of the stated amount.

Content of salicylic acid, $C_7H_6O_3$

93.0 to 107.0% of the stated amount.

Content of zinc oxide, ZnO

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay for dithranol, the principal peak in the chromatogram obtained with solution (1) corresponds to the principal peak in the chromatogram obtained with solution (2).

B. Suspend a quantity containing 0.5 mg of Dithranol in 5 mL of 1M *sodium hydroxide* and heat on a water bath for 1 minute while stirring. A pink colour is produced.

C. Disperse 0.5 g in 10 mL of *chloroform*, filter, extract the filtrate with 10 mL of a 1% w/v solution of *sodium hydrogen carbonate* and wash the extract with 5 mL of *chloroform*. To 5 mL add 3 mL of *iron(III) chloride solution R1*. A violet colour is produced which persists after the addition of 0.5 mL of 5M *acetic acid*.

TESTS

Dihydroxyanthraquinone and dithranol dimer

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the paste containing 20 mg of Dithranol in 20 mL of *dichloromethane* with warming and stirring, centrifuge and decant the supernatant layer into a 100 mL flask. Disperse the residue in 20 mL of *hexane*, centrifuge, decant the supernatant layer into the 100 mL flask and repeat the procedure with a further two 20-mL quantities of *hexane*. Add 1 mL of *glacial acetic acid* to the combined extracts, dilute to 100 mL with *hexane* and filter through a fine glass microfibre filter paper (Whatman GF/C paper is suitable).

(2) Add 1 mL of *glacial acetic acid* to 20 mL of a solution containing 0.0050% w/v of *1,8-dihydroxyanthraquinone* and 0.0050% w/v of *dithranol dimer BPCRS* in *dichloromethane* and add sufficient *hexane* to produce 100 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Lichrosorb Si 60 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 380 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of *glacial acetic acid*, 5 volumes of *dichloromethane* and 82 volumes of *hexane*.

In the chromatogram obtained with solution (2) the peaks, other than the solvent peak, in order of emergence are due to: dihydroxyanthraquinone and dithranol dimer.

LIMITS

Calculate the amounts of dihydroxyanthraquinone and dithranol dimer in the paste using the chromatograms obtained with solutions (1) and (2).

The sum of the amounts of dihydroxyanthraquinone and dithranol dimer is not more than 10.0% of the stated amount of dithranol.

ASSAY

For dithranol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the paste containing 5 mg of Dithranol in 20 mL of *dichloromethane* with warming and

www.webofpharma.com

stirring, centrifuge and decant the supernatant layer into a 100 mL flask. Disperse the residue in 20 mL of *hexane*, centrifuge, decant the supernatant layer into the 100 mL flask and repeat the procedure with a further two 20-mL quantities of *hexane*. Add 1 mL of *glacial acetic acid* to the combined extracts, dilute to 100 mL with *hexane* and filter through a fine glass microfibre filter paper (Whatman GF/C is suitable).

(2) Add 1 mL of *glacial acetic acid* to 20 mL of a 0.025% w/v solution of *dithranol BPCRS* in *dichloromethane* and add sufficient *hexane* to produce 100 mL.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dihydroxyanthraquinone and dithranol dimer may be used but using a detection wavelength of 354 nm.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{10}O_3$ in the paste using the declared content of $C_{14}H_{10}O_3$ in *dithranol BPCRS*.

For salicylic acid

Shake 0.5 g with 10 mL of 1M *hydrochloric acid* and 10 mL of *ether* until fully dispersed. Decant and reserve the aqueous layer. Extract the ether layer with two further 10-mL quantities of 1M *hydrochloric acid*, combine the aqueous extracts with the reserved aqueous layer, wash with 10 mL of *ether* and reserve for the Assay for zinc oxide. Combine the ether extract and washings, add 15 mL of *petroleum spirit (boiling range, 40° to 60°)* and extract with successive quantities of 20 mL, 10 mL and 10 mL of *borate buffer pH 9.0*. Dilute the combined extracts to 100 mL with 2M *hydrochloric acid*, dilute 15 mL of the resulting solution to 50 mL with the same solvent and measure the *absorbance* of the final solution at the maximum at 302 nm, Appendix II B. Calculate the content of $C_7H_6O_3$ taking 260 as the value of A(1%, 1 cm) at the maximum at 302 nm.

For zinc oxide

To the combined aqueous extracts obtained in the Assay for salicylic acid add 20 mL of 1M *sodium hydroxide* and 50 mg of *xylenol orange triturate*. To the resulting solution add sufficient *hexamine* to change the colour of the solution to red, and then a further 3 g of *hexamine*, and titrate with 0.1M *disodium edetate VS*. Each mL of 0.1M *disodium edetate VS* is equivalent to 8.137 mg of ZnO.

STORAGE

Dithranol Paste should be protected from light.

Dithranol and Salicylic Acid Ointment

NOTE: Dithranol and Salicylic Acid Ointment is not currently licensed in the United Kingdom.

Action and use

Treatment of psoriasis.

DEFINITION

Dithranol and Salicylic Acid Ointment contains Dithranol and Salicylic Acid in a suitable emulsifying basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of dithranol, $C_{14}H_{10}O_3$

90.0 to 110.0% of the stated amount.

Content of salicylic acid, $C_7H_6O_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the Assay for Dithranol, the principal peak in the chromatogram obtained with solution (1) corresponds to the principal peak in the chromatogram obtained with solution (2).

B. Heat a quantity of the ointment containing 0.5 mg of Dithranol with 5 mL of 1M *sodium hydroxide* on a water bath with constant stirring. A pink colour is produced in the aqueous layer.

C. Shake 1 g with 10 mL of *water*, filter and add to the filtrate *iron(III) chloride solution R1*; an intense reddish violet colour is produced which persists on the addition of 6M *acetic acid*. Add 2M *hydrochloric acid*; the colour disappears and a white, crystalline precipitate is produced.

TESTS

Dihydroxyanthraquinone and dithranol dimer

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the ointment containing 20 mg of Dithranol in 20 mL of *dichloromethane*, add 1 mL of *glacial acetic acid*, dilute to 100 mL with *hexane* and filter through a fine glass microfibre filter paper (Whatman GF/C is suitable).

(2) Add 1 mL of *glacial acetic acid* to 20 mL of a solution containing 0.0050% w/v of *1,8-dihydroxyanthraquinone* and 0.0050% w/v of *dithranol dimer BPCRS* in *dichloromethane* and add sufficient *hexane* to produce 100 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Lichrosorb Si 60 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 380 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of *glacial acetic acid*, 5 volumes of *dichloromethane* and 82 volumes of *hexane*.

In the chromatogram obtained with solution (2) the peaks, other than the solvent peak, in order of emergence are due to: dihydroxyanthraquinone and dithranol dimer.

LIMITS

Calculate the amounts of dihydroxyanthraquinone and dithranol dimer in the ointment using the chromatograms obtained with solutions (1) and (2).

The sum of the amounts of dihydroxyanthraquinone and dithranol dimer is not more than 10.0% of the stated amount of dithranol.

ASSAY

For dithranol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the ointment containing 5 mg of Dithranol in 20 mL of *dichloromethane*, add 1 mL of *glacial acetic acid*, dilute to 100 mL with *hexane* and filter through a fine glass microfibre filter paper (Whatman GF/C is suitable).

www.webofpharma.com

(2) Add 1 mL of *glacial acetic acid* to 20 mL of a 0.025% w/v solution of *dithranol BPCRS* in *dichloromethane* and add sufficient *hexane* to produce 100 mL.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dihydroxyanthraquinone and dithranol dimer may be used but using a detection wavelength of 354 nm.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{10}O_3$ in the ointment using the declared content of $C_{14}H_{10}O_3$ in *dithranol BPCRS*.

For salicylic acid

Shake a quantity of the ointment containing 10 mg of Salicylic Acid with 10 mL of 1M *hydrochloric acid* and 10 mL of *ether* until fully dispersed. Decant the aqueous layer and extract the ether layer with two further 10-mL quantities of 1M *hydrochloric acid*. To the ether layer add 15 mL of *petroleum spirit (boiling range, 40° to 60°)* and extract with successive quantities of 20 mL, 10 mL and 10 mL of *borate buffer pH 9.0*. Dilute the combined extracts to 100 mL with 2M *hydrochloric acid*, dilute 15 mL of the resulting solution to 50 mL with the same solvent and measure the *absorbance* of the final solution at the maximum at 302 nm, Appendix II B. Calculate the content of $C_7H_6O_3$ taking 260 as the value of A(1%, 1 cm) at the maximum at 302 nm.

STORAGE

Dithranol and Salicylic Acid Ointment should be protected from light.

Dobutamine Infusion

Dobutamine Intravenous Infusion

Action and use

$Beta_1$-adrenoceptor agonist.

DEFINITION

Dobutamine Infusion is a sterile solution containing Dobutamine Hydrochloride. It is supplied as a ready-to-use solution or it is prepared by diluting either Sterile Dobutamine Concentrate or Dobutamine Hydrochloride for Injection with a suitable diluent in accordance with the manufacturer's instructions.

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

TEST

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C, Method D. Dilute the infusion, if necessary, with *water BET* to give a solution containing the equivalent of 10 mg of dobutamine per mL (solution A). The endotoxin limit concentration of solution A is 10 IU per mL.

STORAGE

Dobutamine Infusion prepared from Sterile Dobutamine Concentrate or from Dobutamine Hydrochloride for Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

When supplied as a ready-to-use solution, the infusion complies with the following requirements.

Content of dobutamine, $C_{18}H_{23}NO_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

B. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Use the infusion being examined diluted, if necessary, in a mixture of 1 volume of *water* and 4 volumes of *methanol* to produce a solution containing the equivalent of 0.05% w/v of dobutamine.

(2) 0.05% w/v of *dobutamine hydrochloride BPCRS* in a mixture of 1 volume of *water* and 4 volumes of *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and spray with a 0.5% w/v solution of *potassium permanganate* in 1M *sodium hydroxide*.

MOBILE PHASE

2 volumes of *water*, 6 volumes of *glacial acetic acid*, 12 volumes of *ether* and 18 volumes of *butan-1-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

TEST

Related substances

Complies with the test described in the requirements for Sterile Dobutamine Concentrate but using the following solutions.

(1) Use the infusion diluted, if necessary, with a mixture of equal volumes of mobile phase A and mobile phase B to produce a solution containing the equivalent of 0.05% w/v of dobutamine.

(2) Dilute 4 volumes of solution (1) to 100 volumes with a 0.0005% w/v solution of *anisaldehyde* in a mixture of equal volumes of mobile phase A and mobile phase B and dilute 1 volume of the solution to 10 volumes with the same mixture of mobile phases.

(3) Dilute 1 volume of solution (1) to 100 volumes with a mixture of equal volumes of mobile phase A and mobile phase B.

ASSAY

Carry out the Assay described under the requirements for Sterile Dobutamine Concentrate but for solution (1) use the infusion being examined diluted, if necessary, with the mobile phase to contain the equivalent of 0.05% w/v of dobutamine.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of dobutamine.

STERILE DOBUTAMINE CONCENTRATE

DEFINITION

Sterile Dobutamine Concentrate is a sterile solution of Dobutamine Hydrochloride in Water for Injections.

www.webofpharma.com

The concentrate complies with the requirements for Concentrates for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of dobutamine, $C_{18}H_{23}NO_3$
95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or pale yellow solution.

IDENTIFICATION

A. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

B. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Use the concentrate being examined diluted, if necessary, with *water* to produce a solution containing the equivalent of 1.25% w/v of dobutamine.

(2) 1.25% w/v of *dobutamine hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel 60 F_{254} precoated plate.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Spray the plate with a 6.0% w/v solution of *iron(III) chloride hexahydrate* and then with a 2% w/v solution of *potassium hexacyanoferrate(III)*.

MOBILE PHASE

5 volumes of *glacial acetic acid*, 15 volumes of *water*, 40 volumes of *propan-1-ol* and 100 volumes of *ethyl acetate*.

CONFIRMATION

By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH of the concentrate diluted, if necessary, to contain the equivalent of 1.25% w/v of dobutamine, 2.5 to 4.0, Appendix V L.

Clarity of solution

Dilute the concentrate, if necessary, to contain the equivalent of 1.25% w/v of dobutamine. The solution is not more opalescent than *reference suspension I*, Appendix IV A.

Light absorption

The *light absorption*, Appendix II B, at 400 nm of the concentrate diluted, if necessary, to contain the equivalent of 1.25% w/v of dobutamine is not more than 0.20.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the concentrate with a mixture of equal volumes of mobile phase A and mobile phase B to produce a solution containing the equivalent of 0.5% w/v of dobutamine.

(2) Dilute 4 volumes of solution (1) to 100 volumes with a 0.005% w/v solution of *anisaldehyde* in a mixture of equal volumes of mobile phase A and mobile phase B and dilute 1 volume of the solution to 10 volumes with the same mixture of mobile phases.

(3) Dilute 1 volume of solution (1) to 100 volumes with a mixture of equal volumes of mobile phase A and mobile phase B.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Supelcosil LC-18-DB is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A Dissolve 2.60 g of *sodium octanesulfonate* in 1000 mL of *water* and add 3 mL of *triethylamine*; adjust to pH 2.5 with *orthophosphoric acid*.

Mobile phase B 18 volumes of *acetonitrile* and 82 volumes of *methanol*.

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0–5	65	35
5–20	65→20	35→80
20–25	20	80

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks corresponding to dobutamine hydrochloride and anisaldehyde is at least 4.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (3) (0.5%);

the sum of the areas of any *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%).

Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (3) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the concentrate with the mobile phase to produce a solution containing the equivalent of 0.05% w/v of dobutamine.

(2) 0.06% w/v of *dobutamine hydrochloride BPCRS* in the mobile phase.

(3) 0.06% w/v of *dobutamine hydrochloride BPCRS* and 0.03% w/v of *4-(4-hydroxyphenyl)butan-2-one* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Supelcosil LC-18-DB is suitable).

(b) Use isocratic elution and the mobile phase described below.

www.webofpharma.com

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

14 volumes of *methanol*, 28 volumes of *acetonitrile* and 58 volumes of a solution prepared by dissolving 3.38 g of *sodium octanesulfonate* in 1000 mL of *water*, adding 3 mL of *triethylamine* and adjusting the pH to 2.5 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to dobutamine hydrochloride and 4-(4-hydroxyphenyl)butan-2-one is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{23}NO_3$ in the concentrate from the chromatograms obtained using the declared content of $C_{18}H_{23}NO_3$ in *dobutamine hydrochloride BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of dobutamine.

DOBUTAMINE HYDROCHLORIDE FOR INJECTION

DEFINITION

Dobutamine Hydrochloride for Injection is a sterile material consisting of Dobutamine Hydrochloride with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of dobutamine, $C_{18}H_{23}NO_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

B. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions.

(1) Dissolve the contents of the sealed container in sufficient of a mixture of 1 volume of *water* and 4 volumes of *methanol* to produce a solution containing the equivalent of 1.0% w/v of dobutamine.

(2) 1% w/v of *dobutamine hydrochloride BPCRS* in a mixture of 1 volume of *water* and 4 volumes of *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and spray with a 0.5% w/v solution of *potassium permanganate* in 1M *sodium hydroxide*.

MOBILE PHASE

2 volumes of *water*, 6 volumes of *glacial acetic acid*, 12 volumes of *ether* and 18 volumes of *butan-1-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH of a solution containing the equivalent of 2.5% w/v of dobutamine, 2.5 to 4.5, Appendix V L.

Clarity of solution

A solution containing the equivalent of 2.5% w/v of dobutamine is not more opalescent than *reference suspension II*, Appendix IV A.

Light absorption

The *absorbance*, Appendix II B, at 480 nm of a solution containing the equivalent of 2.5% w/v of dobutamine is not more than 0.065.

Related substances

Comply with the test described in the requirements for Sterile Dobutamine Concentrate but preparing solution (1) in the following manner. Dissolve the contents of the sealed container in a mixture of equal volumes of mobile phase A and mobile phase B to produce a solution containing the equivalent of 0.5% w/v of dobutamine.

Water

Not more than 2.0%, Appendix IX C. Use the contents of a single container and add 7 g of *salicylic acid* and 20 mL of *formamide* before the determination.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve the contents of one container in the mobile phase to produce a solution containing the equivalent of 0.05% w/v of dobutamine.

(2) 0.06% w/v of *dobutamine hydrochloride BPCRS* in the mobile phase.

(3) 0.06% w/v of *dobutamine hydrochloride BPCRS* and 0.03% w/v of *4-(4-hydroxyphenyl)butan-2-one* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay in the requirements for Sterile Dobutamine Concentrate may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to dobutamine hydrochloride and 4-(4-hydroxyphenyl) butan-2-one is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{23}NO_3$ in the container using the declared content of $C_{18}H_{23}NO_3$ in *dobutamine hydrochloride BPCRS*.

Repeat the procedure on the contents of a further two containers. Determine the content of $C_{18}H_{23}NO_3$ using the average of the three individual results obtained.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of dobutamine.

www.webofpharma.com

Docusate Capsules

Action and use
Stimulant laxative; faecal softener.

DEFINITION
Docusate Capsules contain a solution of Docusate Sodium in a suitable water miscible vehicle.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of docusate sodium, $C_{20}H_{37}NaO_7S$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 2 volumes of 13.5M *ammonia*, 20 volumes of *ethanol (96%)*, 40 volumes of *water* and 50 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 20 µL of each of the following solutions. For solution (1) dissolve, by heating on a water bath, a capsule in sufficient *water* to produce a solution containing 1% w/v of docusate sodium. Pass 1 mL of this solution with the aid of vacuum through a solid-phase extraction column of 1 mL capacity and containing 0.1 g of an octadecyl-bonded silica sorbent (a Sep-pak C18 column is suitable) previously washed with 2 mL of *methanol*, followed by 5 mL of *water*. Wash the column with 2 mL of *water*, discarding the aqueous eluate and then elute the docusate sodium with 4 mL of *methanol*, retaining the methanol solution. Solution (2) contains 0.25% w/v of *docusate sodium BPCRS* in *methanol*. After removal of the plate, allow it to dry in air and expose to iodine vapour. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 200 mL of *water* to a number of whole capsules containing 1 g of docusate sodium and warm on a water bath until the capsules have dissolved. Add 200 mL of *acetonitrile*, shake the mixture thoroughly and cool. Add sufficient of a mixture of equal volumes of *acetonitrile* and *water* to produce 1000 mL, mix well and filter to obtain a clear solution (Whatman No. 1 paper followed by a 0.4-µm filter is suitable). Solution (2) contains 0.1% w/v of *docusate sodium BPCRS* in a mixture of equal volumes of *acetonitrile* and *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Ultracarb ODS is suitable), (b) as the mobile phase with a flow rate of 1.5 mL per minute a mixture of 30 volumes of 0.005M *tetrabutylammonium dihydrogen orthophosphate* and 70 volumes of *acetonitrile* and (c) a detection wavelength of 214 nm.

Calculate the content of $C_{20}H_{37}NaO_7S$ in the capsules using the declared content of $C_{20}H_{37}NaO_7S$ in *docusate sodium BPCRS*.

STORAGE
Docusate Capsules should be kept in an airtight container.

Compound Docusate Enema

Action and use
Stimulant laxative; faecal softener.

DEFINITION
Compound Docusate Enema is a *rectal solution* containing Docusate Sodium and Glycerol in a suitable water-miscible vehicle.

The enema complies with the requirements stated under Rectal Preparations and with the following requirements.

Content of docusate sodium, $C_{20}H_{37}NaO_7S$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 2 volumes of 13.5M *ammonia*, 20 volumes of *ethanol (96%)*, 40 volumes of *water* and 50 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 20 µL of each of the following solutions. For solution (1) dissolve, by heating on a water bath, a quantity of the enema containing 50 mg of Docusate Sodium in 5 mL of *water*. Pass 1 mL of this solution with the aid of vacuum through a solid-phase extraction column of 1 mL capacity and containing 0.1 g of an octadecyl-bonded silica sorbent (a Sep-pak C18 column is suitable) previously washed with 2 mL of *methanol*, followed by 5 mL of *water*. Wash the column with 2 mL of *water*, discarding the aqueous eluate and then elute the Docusate Sodium with 4 mL of *methanol*, retaining the methanol solution. Solution (2) contains 0.25% w/v of *docusate sodium BPCRS* in *methanol*. After removal of the plate, allow it to dry in air and expose to iodine vapour. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

C. Mix 1 g with 0.5 mL of *nitric acid* and superimpose 0.5 mL of *potassium dichromate solution*. A blue ring develops at the interface of the liquids, which does not diffuse into the lower layer within 10 minutes.

TESTS
Acidity or alkalinity
pH, 5.0 to 8.0, Appendix V L.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 50 mL of *ether* to a quantity of the enema containing 50 mg of Docusate Sodium, shake thoroughly and allow to stand for 16 hours. Filter the ether extract through *anhydrous sodium sulfate* using a glass-fibre filter (Whatman GF/C is suitable). Extract the aqueous layer with a further 50 mL quantity of *ether* and filter through *anhydrous sodium sulfate*. Evaporate the combined ether extracts to dryness and dissolve the residue obtained in 100 mL of a mixture of 70 volumes of *acetonitrile* and 30 volumes of *water*. Solution (2) contains 0.05% w/v of *docusate sodium BPCRS* in a mixture of 70 volumes of *acetonitrile* and 30 volumes of *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with silica gel with a chemically bonded, strongly basic quaternary ammonium anion-exchange coating (10 µm) (Spherisorb

www.webofpharma.com

SAX is suitable), (b) as the mobile phase with a flow rate of 2 mL per minute a mixture of 1.6 volumes of *orthophosphoric acid*, 350 volumes of *water* and 650 volumes of *acetonitrile* and (c) a detection wavelength of 214 nm.

Calculate the content of $C_{20}H_{37}NaO_7S$ in the enema using the declared content of $C_{20}H_{37}NaO_7S$ in *docusate sodium BPCRS*.

Docusate Oral Solution

Action and use
Stimulant laxative; faecal softener.

DEFINITION
Docusate Oral Solution contains 1.0% w/v of Docusate Sodium in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of docusate sodium, $C_{20}H_{37}NaO_7S$
0.95 to 1.05% w/v.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Pass a volume of the oral solution containing 10 mg of docusate sodium, with the aid of vacuum, through a solid phase extraction column of 1 mL capacity and containing 0.1 g of an octadecyl-bonded silica sorbent (a Sep-pak C18 column is suitable) which has been previously washed with 2 mL of *methanol*, followed by 5 mL of *water*. Wash the column with 2 mL of *water*, discarding the aqueous eluate and then elute the docusate sodium with 4 mL of *methanol*, retaining the methanol solution.

(2) 0.25% w/v of *docusate sodium BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, expose to iodine vapour and examine in daylight.

MOBILE PHASE

2 volumes of 13.5M *ammonia*, 20 volumes of *ethanol (96%)*, 40 volumes of *water* and 50 volumes of *ethyl acetate*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Pass a weighed quantity of the oral solution containing 10 mg of docusate sodium, with the aid of vacuum, through a solid-phase extraction column of 1 mL capacity and containing 0.1 g of an octadecyl-bonded silica sorbent (a Sep-pak C18 column is suitable) previously washed with 2 mL of *methanol*, followed by 5 mL of *water*. Wash the column with 2 mL of *water*, discarding the aqueous eluate. Elute the docusate sodium with 4 mL of *methanol* and dilute to 20 mL with a mixture of 70 volumes of *acetonitrile* and 30 volumes of *water*.

(2) 0.05% w/v of *docusate sodium BPCRS* in a mixture of 70 volumes of *acetonitrile* and 30 volumes of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with silica gel with a chemically bonded, strongly basic quaternary ammonium anion-exchange coating (10 µm) (Spherisorb SAX is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 214 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1.6 volumes of *orthophosphoric acid*, 350 volumes of *water* and 650 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2) the *symmetry factor* of the peak corresponding to docusate sodium is less than 1.5.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{20}H_{37}NaO_7S$, weight in volume, using the declared content of $C_{20}H_{37}NaO_7S$ in *docusate sodium BPCRS*.

Paediatric Docusate Oral Solution

Action and use
Stimulant laxative; faecal softener.

DEFINITION
Paediatric Docusate Oral Solution contains 0.25% w/v of Docusate Sodium in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of docusate sodium, $C_{20}H_{37}NaO_7S$
0.238 to 0.263% w/v.

IDENTIFICATION
Complies with the tests described under Docusate Oral Solution.

ASSAY
Carry out the Assay described under Docusate Oral Solution but preparing solution (1) in the following manner.
For solution (1) pass a weighed quantity of the oral solution containing 5 mg of docusate sodium, with the aid of vacuum, through a solid-phase extraction column of 1 mL capacity and containing 0.1 g of an *octadecyl-bonded silica sorbent* (a Sep-pak C18 column is suitable) previously washed with 2 mL of *methanol*, followed by 5 mL of *water*. Wash the column with 2 mL of *water*, discarding the aqueous eluate. Elute the docusate sodium with 4 mL of *methanol* and dilute to 10 mL with a mixture of equal volumes of *acetonitrile* and *water*.

www.webofpharma.com

Domperidone Tablets

Action and use
Peripheral dopamine receptor antagonist; antiemetic.

DEFINITION

Domperidone Tablets contain Domperidone Maleate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of domperidone, $C_{22}H_{24}ClN_5O_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in a mixture of equal volumes of *dichloromethane* and *methanol*.

(1) Shake a quantity of the powdered tablets containing the equivalent of 10 mg of domperidone with 10 mL of solvent and filter through a glass microfibre filter (Whatman GF/C is suitable).

(2) 0.127% w/v of *domperidone maleate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a precoated *silica gel F_{254}* plate (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*. Spray the plate with *potassium iodobismuthate solution* and examine again.

MOBILE PHASE

5 volumes of a solution prepared by dissolving 1.36 g of *sodium acetate* in 50 mL of *water*, adjusting the pH to 4.7 with *dilute acetic acid* and adding sufficient *water* to produce 100 mL, 18 volumes of *methanol*, 23 volumes of *dichloromethane* and 54 volumes of *ethyl acetate*.

CONFIRMATION

Using each method of visualisation, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 20 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 286 nm, Appendix II B using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a 0.001% w/v solution of *domperidone maleate BPCRS* in the dissolution medium using dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of domperidone, $C_{22}H_{24}ClN_5O_2$, in the medium from the absorbances obtained and using the declared content of $C_{22}H_{24}ClN_5O_2$, in *domperidone maleate BPCRS*.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) To a quantity of the powdered tablets containing the equivalent of 50 mg of domperidone add 10 mL of a mixture of equal volumes of 0.01M *hydrochloric acid* and *methanol*, mix with the aid of ultrasound for 20 minutes and filter through a glass microfibre filter (Whatman GF/C is suitable).

(2) Dilute 1 volume of solution (1) to 200 volumes with a mixture of equal volumes of 0.01M *hydrochloric acid* and *methanol*. Dilute 1 volume of the resulting solution to 2 volumes with the same solvent.

(3) Dilute 1 volume of solution (2) to 5 volumes of a mixture of equal volumes of 0.01M *hydrochloric acid* and *methanol*.

(4) 0.01% w/v of *domperidone maleate BPCRS* and 0.015% w/v of *droperidol EPCRS* in a mixture of equal volumes of 0.01M *hydrochloric acid* and *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *base-deactivated, end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil BDS is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute. Equilibrate the column for at least 30 minutes with *methanol* and equilibrate with the initial mobile phase for at least 5 minutes.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 10 µL of each solution. Inject a mixture of equal volumes of 0.01M *hydrochloric acid* and *methanol* as a blank prior to the solutions.

MOBILE PHASE

Mobile phase A *methanol*.

Mobile phase B 0.5% w/v solution of *ammonium acetate*.

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)
0	30	70
10	100	0
12	100	0

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the two principal peaks is at least 2.

LIMITS

In the chromatogram obtained with solution (1):

www.webofpharma.com

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.25%);

the sum of the areas of any *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak in the chromatogram obtained with the blank solution, any peak due to maleic acid near the start of the chromatogram and any peak with an area less than the area of the peak in the chromatogram obtained with solution (3) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add sufficient *methanol* to 10 whole tablets to produce a solution containing 0.02% w/v of domperidone, mix with the aid of ultrasound for 20 minutes and filter through a glass microfibre filter (Whatman GF/C is suitable). To 50 mL of the filtrate add 1 mL of 0.1M *hydrochloric acid* and sufficient *water* to produce 100 mL.

(2) 0.0127% w/v of *domperidone maleate BPCRS* in a mixture of equal volumes of 0.002M *hydrochloric acid* and *methanol*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{24}ClN_5O_2$ in the tablets using the declared content of $C_{22}H_{24}ClN_5O_2$ in *domperidone maleate BPCRS*.

STORAGE

Domperidone Tablets should be stored in an airtight container.

LABELLING

The quantity of the active ingredient is stated in terms of the equivalent amount of domperidone.

Dopamine Infusion

Dopamine Intravenous Infusion

Action and use

Dopamine receptor antagonist; beta$_1$-adrenoceptor agonist; alpha-adrenoceptor agonist.

DEFINITION

Dopamine Infusion is a sterile solution containing Dopamine Hydrochloride. It is supplied as a ready-to-use solution or it is prepared by diluting either Sterile Dopamine Concentrate or Dopamine Hydrochloride for Injection with a suitable diluent in accordance with the manufacturer's instructions.

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

When supplied as a ready-to-use solution, the intravenous infusion complies with the following requirements.

Content of dopamine hydrochloride, $C_8H_{11}NO_2,HCl$
95.0 to 105.0% of the stated amount.

Content of glucose, $C_6H_{12}O_6$
4.75 to 5.25% w/v.

CHARACTERISTICS

A colourless liquid.

IDENTIFICATION

A. Saturate a volume containing 0.1 g of Dopamine Hydrochloride with *sodium chloride* and extract with three 20-mL quantities of *butan-1-ol*. Filter the combined extracts through *anhydrous sodium sulfate* and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of dopamine hydrochloride *(RS 113)*.

B. To a volume containing 10 mg of Dopamine Hydrochloride add 0.1 mL of *iron(III) chloride solution R1*. An intense green colour is produced.

TESTS

Acidity
pH, 3.0 to 4.5, Appendix V L.

5-Hydroxymethylfurfural
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use the intravenous infusion.

(2) 0.0025% w/v of *5-hydroxymethylfurfural* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 284 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.05M *disodium hydrogen orthophosphate* adjusted to pH 7.0 with *orthophosphoric acid*.

LIMITS

In the chromatogram obtained with solution (1), the area of any peak corresponding to 5-hydroxymethylfurfural is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.05%, determined with reference to the content of glucose).

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the infusion with sufficient mobile phase to produce a solution expected to contain 0.032% w/v of Dopamine Hydrochloride.

(2) Dilute 1 volume of solution (1) to 50 volumes with the mobile phase.

(3) Dilute 1 volume of solution (1) and 1 volume of a solution containing 0.030% w/v each of *4-ethylcatechol* and *3,4-dimethoxyphenethylamine* to 50 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

Under the prescribed conditions, the retention time of dopamine is about 5 minutes, of 4-ethylcatechol about 3 minutes and of 3,4-dimethoxyphenethylamine, about 12 minutes.

LIMITS

In the chromatogram obtained with solution (1):

www.webofpharma.com

the area of any *secondary peak* is not greater than 1.25 times the area of the principal peak in the chromatogram obtained with solution (2) (2.5%);

not more than one such peak has an area greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the intravenous infusion, if necessary, with *water BET* to give a solution containing 1.6 mg of Dopamine Hydrochloride per mL (solution A). The endotoxin limit concentration of solution A is 26.67 IU per mL.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a suitable volume of the infusion with mobile phase to produce a solution expected to contain 0.0032% w/v of Dopamine Hydrochloride.

(2) 0.0032% w/v of *dopamine hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2 volumes of 0.1M *disodium edetate*, 10 volumes of *glacial acetic acid*, 300 volumes of *acetonitrile* and 700 volumes of 0.005M *sodium dodecyl sulfate*.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{11}NO_2$,HCl in the infusion using the declared content of $C_8H_{11}NO_2$,HCl in *dopamine hydrochloride BPCRS*.

STERILE DOPAMINE CONCENTRATE

DEFINITION

Sterile Dopamine Concentrate is a sterile solution of Dopamine Hydrochloride in Water for Injections.

The concentrate complies with the requirements for Concentrates for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of dopamine hydrochloride, $C_8H_{11}NO_2$,HCl

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or pale yellow solution.

IDENTIFICATION

A. Extract a volume containing 0.1 g of Dopamine Hydrochloride with 10 mL of *butan-1-ol*. Filter the extract through *anhydrous sodium sulfate* and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of dopamine hydrochloride *(RS 113)*.

B. To a volume containing 10 mg of Dopamine Hydrochloride add 0.05 mL of *iron(III) chloride solution R1*. An intense green colour is produced.

TESTS

Acidity

pH, 2.5 to 5.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the concentrate containing 0.15 g of Dopamine Hydrochloride to 5 mL with *methanol*.

(2) 0.0075% w/v of *4-O-methyldopamine hydrochloride* in *methanol*.

(3) 0.0075% w/v each of *3-O-methyldopamine hydrochloride* and *4-O-methyldopamine hydrochloride* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air for 15 minutes and spray evenly and abundantly with a mixture, prepared immediately before use, of equal volumes of *iron(III) chloride solution R1* and *potassium hexacyanoferrate(III) solution*.

MOBILE PHASE

2 volumes of *anhydrous formic acid*, 7 volumes of *water*, 36 volumes of *methanol* and 52 volumes of *chloroform*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

LIMITS

Any *secondary spot* with an Rf value higher than that of the principal spot in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.25%).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the sterile concentrate with *water BET* to give a solution containing 1.6 mg of Dopamine Hydrochloride per mL (solution A). The endotoxin limit concentration of solution A is 26.67 IU per mL.

ASSAY

Carry out the method described in the requirements for the ready-to-use solution.

STORAGE

Sterile Dopamine Concentrate should be protected from light.

DOPAMINE HYDROCHLORIDE FOR INJECTION

DEFINITION

Dopamine Hydrochloride for Injection is a sterile material consisting of Dopamine Hydrochloride with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of dopamine hydrochloride, $C_8H_{11}NO_2$,HCl

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A white or almost white, crystalline powder.

www.webofpharma.com

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of dopamine hydrochloride *(RS 113)*.

B. Dissolve 10 mg of the substance being examined in 2 mL of *water* and add 0.05 mL of *iron(III) chloride solution R1*. An intense green colour is produced.

TESTS

Acidity

pH of a 4% w/v solution in a 1.0% w/v solution of *sodium metabisulfite*, 2.5 to 5.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

(1) Dissolve a quantity of the contents of the sealed container to produce a solution containing 3.0% w/v of Dopamine Hydrochloride.

(2) 0.0075% w/v of *4-O-methyldopamine hydrochloride*.

(3) 0.0075% w/v each of *3-O-methyldopamine hydrochloride* and *4-O-methyldopamine hydrochloride*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air for 15 minutes and spray evenly and abundantly with a mixture, prepared immediately before use, of equal volumes of *iron(III) chloride solution R1* and *potassium hexacyanoferrate(III) solution*.

MOBILE PHASE

2 volumes of *anhydrous formic acid*, 7 volumes of *water*, 36 volumes of *methanol* and 52 volumes of *chloroform*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

LIMITS

Any *secondary spot* with an Rf value higher than that of the principal spot in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.25%).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing 1.6 mg of Dopamine Hydrochloride per mL (solution A). The endotoxin limit concentration of solution A is 26.67 IU per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve sufficient of the mixed contents of the 10 containers in the mobile phase to produce a solution containing 0.0032% w/v of Dopamine Hydrochloride.

(2) 0.0032% w/v of *dopamine hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under the Assay for the ready-to-use solution may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{11}NO_2,HCl$ in a container of average content weight using the declared content of $C_8H_{11}NO_2,HCl$ in *dopamine hydrochloride BPCRS*.

Dorzolamide Eye Drops

Action and use

Carbonic anhydrase inhibitor; treatment of glaucoma and ocular hypertension.

DEFINITION

Dorzolamide Eye Drops are a sterile solution of Dorzolamide Hydrochloride in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of dorzolamide, $C_{10}H_{16}N_2O_4S_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for thin-layer chromatography, Appendix III A, using the following solutions in *methanol*.

(1) Dilute a quantity of the eye drops to produce a solution containing the equivalent of 0.5% w/v of dorzolamide.

(2) 0.5% w/v of *dorzolamide hydrochloride BPCRS*.

(3) 0.5% w/v of *dorzolamide hydrochloride BPCRS* and 0.15% w/v of *timolol maleate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *concentrated ammonia*, 20 volumes of *methanol* and 80 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 5.0 to 6.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Use the eye drops diluted to contain the equivalent of 0.01% w/v of dorzolamide.

(2) Dilute 1 volume of solution (1) to 100 volumes.

www.webofpharma.com

(3) Dilute 1 volume of solution (2) to 5 volumes.

(4) 0.011% w/v of *dorzolamide hydrochloride BPCRS* and 0.000011% w/v each of *dorzolamide impurity B BPCRS* and *dorzolamide impurity D BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Zorbax Rx-C8 and Zorbax SB-C8 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 253 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for twice the retention time of dorzolamide.

MOBILE PHASE

1 volume of *acetonitrile* and 19 volumes of a 0.2% v/v solution of *orthophosphoric acid*, previously adjusted to pH 3.0 using *triethylamine*.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to dorzolamide (retention time = about 11 minutes) are: impurity D = about 0.9; impurity B = about 1.1.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4):

the *resolution factor* between the peaks due to dorzolamide and impurity B is at least 3.0;

the *resolution factor* between the peaks due to impurity D and dorzolamide is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B is not greater than 1.3 times the area of the principal peak obtained with solution (2) (1.3%);

the area of any peak corresponding to impurity D is not greater than the area of the principal peak obtained with solution (3) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal peak obtained with solution (3) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 1.5 times the area of the principal peak obtained with solution (2) (1.5%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Use the eye drops diluted to contain the equivalent of 0.01% w/v of dorzolamide.

(2) 0.011% w/v of *dorzolamide hydrochloride BPCRS*.

(3) 0.011% w/v of *dorzolamide hydrochloride BPCRS* and 0.000011% w/v each of *dorzolamide impurity B BPCRS* and *dorzolamide impurity D BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the peaks due to dorzolamide and impurity B is at least 3.0;

the *resolution factor* between the peaks due to impurity D and dorzolamide is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{10}H_{16}N_2O_4S_3$ in the eye drops using the declared content of $C_{10}H_{16}N_2O_4S_3$,HCl in *dorzolamide hydrochloride BPCRS*. Each mg of $C_{10}H_{16}N_2O_4S_3$,HCl is equivalent to 0.8990 mg of $C_{10}H_{16}N_2O_4S_3$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of dorzolamide.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities B and D listed under Dorzolamide Hydrochloride.

Dorzolamide and Timolol Eye Drops

Action and use

Carbonic anhydrase inhibitor + beta-adrenoceptor antagonist; treatment of glaucoma and ocular hypertension.

DEFINITION

Dorzolamide and Timolol Eye Drops are a sterile solution of Dorzolamide Hydrochloride and Timolol Maleate in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of dorzolamide, $C_{10}H_{16}N_2O_4S_3$

95.0 to 105.0% of the stated amount.

Content of timolol, $C_{13}H_{24}N_4O_3S_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

(1) Dilute a quantity of the eye drops to produce a solution containing the equivalent of 0.5% w/v of dorzolamide.

(2) 0.15% w/v of *timolol maleate BPCRS*.

(3) 0.5% w/v of *dorzolamide hydrochloride BPCRS*.

(4) 0.5% w/v of *dorzolamide hydrochloride BPCRS* and 0.15% w/v of *timolol maleate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *concentrated ammonia*, 20 volumes of *methanol* and 80 volumes of *dichloromethane*.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated spots.

CONFIRMATION

In the chromatogram obtained with solution (1) the spot with the lower Rf value corresponds to the principal spot in the chromatogram obtained with solution (2) and the spot with the higher Rf value corresponds to the principal spot in the chromatogram obtained with solution (3).

B. In the Assay for dorzolamide, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

C. In the Assay for timolol, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 5.0 to 6.0, Appendix V L.

Related substances

For dorzolamide

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 1 volume of *acetonitrile* and 19 volumes of a 0.2% v/v solution of *orthophosphoric acid*.

(1) Use the eye drops diluted to contain the equivalent of 0.01% w/v of dorzolamide.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) Dilute 1 volume of solution (2) to 5 volumes.

(4) 0.011% w/v of *dorzolamide hydrochloride BPCRS* and 0.000011% w/v each of *dorzolamide impurity B BPCRS* and *dorzolamide impurity D BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Zorbax Rx-C8 and Zorbax SB-C8 are suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 253 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A *Acetonitrile.*

Mobile phase B 0.2% v/v *orthophosphoric acid.*

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0 - 15.0	5	95	isocratic
15.0 - 15.1	5 → 95	95 → 5	linear gradient
15.1 - 20.0	95	5	isocratic
20.0 - 20.1	95 → 5	5 → 95	linear gradient
20.1 - 30.0	5	95	re-equilibration

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to dorzolamide (retention time = about 12 minutes) are: impurity D = about 0.8; impurity B = about 1.2.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4):

the *resolution factor* between the peaks due to dorzolamide and impurity B is at least 3.0;

the *resolution factor* between the peaks due to impurity D and dorzolamide is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B is not greater than 1.1 times the area of the principal peak in the chromatogram obtained with solution (2) (1.1%);

the area of any peak corresponding to impurity D is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 1.3 times the area of the principal peak in the chromatogram obtained with solution (2) (1.3%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

For timolol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase.

(1) Use the eye drops diluted to contain the equivalent of 0.025% w/v of timolol.

(2) Dilute 1 volume of volume (1) to 200 volumes. Dilute 2 volumes of this solution to 5 volumes.

(3) Add 8 mL of 0.1M *sodium hydroxide* to 90 mg of *timolol maleate BPCRS*, heat at 70° for 15 hours, cool and add sufficient mobile phase to produce 50 mL. Mix 1 volume of this solution with 4 volumes of a 0.140% w/v solution of *dorzolamide hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Inertsil ODS-2 and Symmetry C18 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 295 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for twice the retention time of timolol.

MOBILE PHASE

2 volumes of *methanol* and 3 volumes of a 1.1% w/v solution of *sodium dihydrogen orthophosphate monohydrate* adjusted to pH 2.8 with *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to timolol (retention time = about 5.7 minutes) are: dorzolamide = about 0.5; impurity G = about 0.6, impurity B = about 0.7; impurity D = about 1.5.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the peaks due to impurity G and impurity B is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B, D or G is not greater than twice the area of the principal peak obtained with solution (2) (0.4% of each);

the area of any other *secondary peak* is not greater than the area of the principal peak obtained with solution (2) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 2.5 times the area of the principal peak obtained with solution (2) (0.5%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

For dorzolamide

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 1 volume of *acetonitrile* and 19 volumes of 0.2% v/v solution of *orthophosphoric acid*.

(1) Use the eye drops diluted to contain the equivalent of 0.01% w/v of dorzolamide.

(2) 0.011% w/v of *dorzolamide hydrochloride BPCRS*.

(3) 0.011% w/v of *dorzolamide hydrochloride BPCRS* and 0.000011% w/v each of *dorzolamide impurity B BPCRS* and *dorzolamide impurity D BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances for dorzolamide may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the peaks due to dorzolamide and impurity B is at least 3.0;

the *resolution factor* between the peaks due to impurity D and dorzolamide is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{10}H_{16}N_2O_4S_3$ in the eye drops using the declared content of $C_{10}H_{16}N_2O_4S_3$,HCl in *dorzolamide hydrochloride BPCRS*. Each mg of $C_{10}H_{16}N_2O_4S_3$,HCl is equivalent to 0.8990 mg of $C_{10}H_{16}N_2O_4S_3$.

For timolol

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase.

(1) Use the eye drops diluted to contain the equivalent of 0.025% w/v of timolol.

(2) 0.0342% w/v of *timolol maleate BPCRS*.

(3) Add 8 mL of 0.1M *sodium hydroxide* to 90 mg of *timolol maleate BPCRS*, heat at 70° for 15 hours, cool and add sufficient mobile phase to produce 50 mL. Mix 1 volume of this solution with 4 volumes of a 0.140% w/v solution of *dorzolamide hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances for timolol may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the peaks due to timolol impurity G and timolol impurity B is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{13}H_{24}N_4O_3S_3$, in the eye drops using the declared content of $C_{13}H_{24}N_4O_3S_3$,$C_4H_4O_4$ in *timolol maleate BPCRS*. Each mg of $C_{13}H_{24}N_4O_3S_3$,$C_4H_4O_4$ is equivalent to 0.7316 mg of $C_{13}H_{24}N_4O_3S_3$.

LABELLING

The quantity of Dorzolamide Hydrochloride is stated in terms of the equivalent amount of dorzolamide and the quantity of Timolol Maleate is stated in terms of the equivalent amount of timolol.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities B and D listed under Dorzolamide Hydrochloride and impurities B, D and G listed under Timolol Maleate.

Dosulepin Capsules

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

Dosulepin Capsules contain Dosulepin Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of dosulepin hydrochloride, $C_{19}H_{21}NS$,HCl

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Extract a quantity of the contents of the capsules containing 0.1 g of Dosulepin Hydrochloride with 20 ml of *absolute ethanol*, filter and remove the ethanol from the filtrate by evaporation. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of dosulepin hydrochloride *(RS 114)*.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract a quantity of the contents of the capsules containing 0.25 g of Dosulepin Hydrochloride by shaking for 2 minutes with 5 ml of *chloroform*, centrifuge and use the supernatant liquid.

(2) Dilute 2 ml of solution (1) to 5 ml with *chloroform*.

(3) 0.010% w/v each of *3-(dibenzo*[b,e]*thiepin-11(6H)-ylidene)-N,N-dimethylaminopropan-1-amine S-oxide hydrochloride BPCRS* and *dibenzo*[b,e]*thiepin-11(6H)-one BPCRS* in *chloroform*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel 60 F_{254} precoated plate* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

www.webofpharma.com

(c) Apply 5 µl of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of 13.5M *ammonia*, 10 volumes of *propan-2-ol* and 90 volumes of *1,2-dichloroethane*.

LIMITS

The spot with the lower Rf value in the chromatogram obtained with solution (3) is more intense than any corresponding spot in the chromatogram obtained with solution (2) (0.5%).

In the chromatogram obtained with solution (1), any *secondary spot* other than any spot corresponding to the spot with the lower Rf value in the chromatogram obtained with solution (3) is not more intense than the proximate spot in the chromatogram obtained with solution (3) (0.2%).

Z-Isomer

Carry out the method for *gas chromatography*, Appendix III B.

(1) Extract a quantity of the mixed contents of 20 capsules containing 25 mg of Dosulepin Hydrochloride with 5 ml of *methanol*, centrifuge and use the supernatant liquid.

(2) 0.50% w/v of *dosulepin hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (1.8 m × 3 mm) packed with *acid-washed, silanised diatomaceous support* (100 to 120 mesh) coated with 3% w/w of cyanopropylmethyl phenyl methyl silicone fluid (OV-225 is suitable).

(b) Use *helium* as the carrier gas at 1.7 ml per minute.

(c) Use isothermal conditions maintained at 200°.

(d) Use an inlet temperature of 200°.

(e) Use a flame ionisation detector at a temperature of 200°.

(f) Inject 1 µl of each solution.

LIMITS

In the chromatogram obtained with solution (2), a peak due to *Z*-dosulepin is present with a retention time of approximately 0.83 relative to the retention time of the principal peak which is due to *E*-dosulepin.

In the chromatogram obtained with solution (1), the area of any peak corresponding to *Z*-dosulepin is not greater than 7.5% of the sum of the areas of the peaks due to *Z*-dosulepin and *E*-dosulepin.

ASSAY

Extract a quantity of the mixed contents of 20 capsules containing 0.5 g of Dosulepin Hydrochloride with 20 ml followed by four 10 ml quantities of *chloroform*, filtering each extract through the same filter. Evaporate the combined extracts to dryness, dissolve the residue in 100 ml of *acetone*, add 10 ml of *mercury(II) acetate solution* and carry out Method I for *non-aqueous titration*, Appendix VIII A, using 3 ml of a saturated solution of *methyl orange* in *acetone* as indicator. Each ml of 0.1M *perchloric acid VS* is equivalent to 33.19 mg of $C_{19}H_{21}NS,HCl$.

Dosulepin Oral Solution

NOTE: Dosulepin Oral Solution is not currently licensed in the United Kingdom.

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

Dosulepin Oral Solution is a solution of Dosulepin Hydrochloride in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of dosulepin hydrochloride, $C_{19}H_{21}NS,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 2 mL of 10M *sodium hydroxide* to a quantity of the oral solution containing 25 mg of Dosulepin Hydrochloride and extract with three 5-mL quantities of *dichloromethane*. Combine the dichloromethane extracts, evaporate to dryness and dissolve the residue in sufficient *dichloromethane* to produce 5 mL.

(2) 0.5% w/v of *dosulepin hydrochloride BPCRS* in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel 60 F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of 13.5M *ammonia*, 10 volumes of *propan-2-ol* and 90 volumes of *1,2-dichloroethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.5 to 5.5, Appendix V L.

Impurity A and Z-isomer

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the oral solution with the mobile phase, shake well and add sufficient mobile phase to produce a solution containing 0.05% w/v of Dosulepin Hydrochloride.

(2) Dissolve 12.5 mg of *[3-(dibenzo[b,e]thiepin-11(6H)-ylidene-N,N-dimethylaminopropan-1-amine S-oxide hydrochloride BPCRS* (impurity A) in 5 mL of *methanol*, add sufficient mobile phase to produce 50 mL and dilute 3 volumes of the resulting solution to 100 volumes with the mobile phase.

www.webofpharma.com

(3) Dilute 1 volume of a 0.5% w/v solution of *dosulepin hydrochloride BPCRS* in *methanol* to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5 µm) (Genesis CN, Luna CN and Microsorb CN are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 229 nm.

(f) Inject 5 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for 2.5 times the retention time of dosulepin.

MOBILE PHASE

1 volume of 0.83% v/v *perchloric acid*, 10 volumes of *propanol*, 30 volumes of *methanol* and 60 volumes of *water*.

When the chromatograms are recorded under the prescribed conditions, the retention time of dosulepin (*E*-isomer) is about 25 minutes and the relative retention of *Z*-dosulepin to *E*-dosulepin is about 0.9.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* is at least 4.0 where H_p is the height above the baseline of the peak due to *Z*-dosulepin and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to *E*-dosulepin.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.5%);

the area of any peak corresponding to *Z*-dosulepin is not greater than 5% of the sum of the areas of the principal peak (*E*-dosulepin) and the peak due to Z-dosulepin in the chromatogram obtained with solution (3) (5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a weighed quantity of the oral solution containing 50 mg of Dosulepin Hydrochloride in the mobile phase, add sufficient mobile phase to produce 200 mL, mix thoroughly and filter through a 0.45-µm nylon filter.

(2) 0.025% w/v of *dosulepin hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (22 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (RP-18 Spheri-10 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

15 volumes of 0.04M *sodium dihydrogen orthophosphate*, which has been adjusted to pH 5.6 with *triethylamine*, 20 volumes of *acetonitrile* and 65 volumes of *methanol*.

SYSTEM SUITABILITY

The Assay is not valid unless the *symmetry factor* of the principal peak in the chromatogram obtained with solution (2) is not less than 2.0 and not more than 3.0.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{19}H_{21}NS,HCl$, weight in volume, using the declared content of $C_{19}H_{21}NS,HCl$ in *dosulepin hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of the monograph include impurities A and E listed under Dosulepin Hydrochloride.

Dosulepin Tablets

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

Dosulepin Tablets contain Dosulepin Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of dosulepin hydrochloride, $C_{19}H_{21}NS$, HCl

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Remove the coating. Shake a quantity of the powdered tablet cores containing 0.2 g of Dosulepin Hydrochloride with 20 mL of *dichloromethane*, centrifuge, filter the supernatant liquid and evaporate the filtrate to dryness. Dissolve the residue in the minimum quantity of *ethanol (70%)* and add an excess of *ether*. Filter the precipitate, wash with *ether* and dry at 60° at a pressure of 2 kPa for 5 minutes. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of dosulepin hydrochloride *(RS 114)*. Examine the substance as a dispersion in *liquid paraffin*.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel 60 F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 1 volume of 13.5M *ammonia*, 10 volumes of *propan-2-ol* and 90 volumes of *1,2-dichloroethane* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.25 g of Dosulepin Hydrochloride for 2 minutes with 5 mL of *dichloromethane*, centrifuge and use the supernatant liquid. For solution (2) dilute 2 mL of solution (1) to 5 mL with *dichloromethane*. Solution (3) contains 0.010% w/v each of *3-(dibenzo[b,e]thiepin-11(6H)-ylidene)-N,N-dimethylaminopropan-1-amine S-oxide hydrochloride BPCRS* and *dibenzo[b,e]thiepin-11(6H)-one BPCRS* in *chloroform*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. In the chromatogram obtained with solution (3) the spot with the lower Rf value is more intense than any corresponding spot in the chromatogram obtained with

www.webofpharma.com

solution (2) (0.5%). In the chromatogram obtained with solution (1) any *secondary spot* other than any spot corresponding to the spot with the lower Rf value in the chromatogram obtained with solution (3) is not more intense than the proximate spot in the chromatogram obtained with solution (3) (0.2%).

Z-Isomer

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. Solution (1) contains 0.50% w/v of *dosulepin hydrochloride BPCRS* in *methanol*. For solution (2) shake a quantity of the powdered tablets containing 25 mg of Dosulepin Hydrochloride with 5 mL of *methanol* for 15 minutes, centrifuge and use the supernatant liquid.

The chromatographic procedure may be carried out using a glass column (1.8 m × 3 mm) packed with *acid-washed, silanised diatomaceous support* (100 to 120 mesh) coated with 3% w/w of cyanopropylmethyl phenyl methyl silicone fluid (OV-225 is suitable) and maintained at 200°.

In the chromatogram obtained with solution (1) a peak due to *Z*-dosulepin is present with a retention time of approximately 0.83 relative to the retention time of the principal peak which is due to *E*-dosulepin. In the chromatogram obtained with solution (2) the area of any peak corresponding to *Z*-dosulepin is not greater than 7.5% of the sum of the areas of the peaks due to *Z*-dosulepin and *E*-dosulepin.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 50 mg of Dosulepin Hydrochloride with 60 mL of 0.1M *hydrochloric acid* for 30 minutes, dilute to 100 mL with 0.1M *hydrochloric acid* and filter. Discard the first 25 mL of the filtrate. Dilute 25 mL of the remaining filtrate to 100 mL with 0.1M *hydrochloric acid*. Solution (2) contains 0.0125% w/v of *dosulepin hydrochloride BPCRS* in 0.1M *hydrochloric acid*.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) as the mobile phase with a flow rate of 1.5 mL per minute a mixture of 10 volumes of *tetrahydrofuran*, 40 volumes of *acetonitrile* and 50 volumes of a 0.5% w/v solution of *potassium dihydrogen orthophosphate*, the pH of the mixture being adjusted to 3.0 with *orthophosphoric acid* and (c) a detection wavelength of 231 nm.

Calculate the content of $C_{19}H_{21}NS,HCl$ using the declared content of $C_{19}H_{21}NS,HCl$ in *dosulepin hydrochloride BPCRS*.

Doxapram Injection

Action and use

Respiratory stimulant.

DEFINITION

Doxapram Injection is a sterile solution of Doxapram Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of doxapram hydrochloride, $C_{24}H_{30}N_2O_2,HCl,H_2O$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a volume containing 50 mg of Doxapram Hydrochloride add 10 mL of *water* and 2 mL of 1M *sodium hydroxide* and extract with two 10 mL quantities of *ether*. Wash the combined extracts with 5 mL of *water*, dry over *anhydrous sodium sulfate*, filter and evaporate to dryness. Recrystallise the residue from 10 mL of 0.01M *methanolic hydrochloric acid*. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of doxapram hydrochloride *(RS 116)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the solution obtained in the Assay exhibits maxima at 253, 258 and 265 nm.

C. Yields the reactions characteristic *of chlorides*, Appendix VI.

TEST

Acidity

pH of a solution containing 1% w/v of doxapram hydrochloride, 3.5 to 5.0, Appendix V L.

ASSAY

Dilute a volume containing 0.2 g of Doxapram Hydrochloride to 250 mL with *water*. Measure the *absorbance* of the resulting solution at the maximum at 258 nm, Appendix II B. Calculate the content of $C_{24}H_{30}N_2O_2,HCl,H_2O$ in the injection from the *absorbance* of a 0.08% w/v solution of *doxapram hydrochloride BPCRS* using the declared content of $C_{24}H_{30}N_2O_2,HCl,H_2O$ in *doxapram hydrochloride BPCRS*.

STORAGE

Doxapram Injection should not be allowed to freeze.

Doxepin Capsules

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

Doxepin Capsules contain Doxepin Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of doxepin, $C_{19}H_{21}NO$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Wash a quantity of the contents of the capsules containing the equivalent of 100 mg of doxepin with three 5-mL quantities of *petroleum spirit (boiling range, 40° to 60°)*. Dry in air, extract the residue with three 10-mL quantities of *chloroform*, evaporate the combined extracts to dryness and dry the residue at 105°. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of doxepin hydrochloride *(RS 117)*.

B. Yields reaction A characteristic of *chlorides*, Appendix VI.

TESTS

***Z*-Isomer**

13.0 to 18.5%, when determined by the following method.

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions.

www.webofpharma.com

(1) Extract a quantity of the mixed contents of 20 capsules containing the equivalent of 25 mg of doxepin with 5 mL of *methanol*, centrifuge and use the supernatant liquid.

(2) 0.5% w/v of *doxepin hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a fused silica capillary column (30 m × 0.53 mm) bonded with a film (3 µm) of 6% cyanopropylphenyl siloxane and 94% polydimethylsiloxane (DB-624 is suitable).

(b) Use *helium* as the carrier gas at 20 mL/min.

(c) Use an oven temperature maintained at 200°.

(d) Use an inlet temperature of 240°.

(e) Use a flame ionisation detector maintained at a temperature of 300°.

(f) Use a split ratio of 1:10.

(g) Inject 1 µL of each solution.

When the chromatograms are recorded under the prescribed conditions the retention of *E*-doxepin is about 29 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), a peak due to *Z*-doxepin immediately precedes the principal peak due to *E*-doxepin and the *resolution* between the peaks due to *Z*-doxepin and *E*-doxepin is at least 2.0.

DETERMINATION OF CONTENT

Measure the areas or heights of the peaks due to the *Z*- and *E*-isomers in the chromatograms obtained with solutions (1) and (2) and calculate the content of *Z*-isomer in the substance being examined using the declared content of *Z*-isomer in *doxepin hydrochloride BPCRS*.

Related substances (other than the *Z*-Isomer)

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in solvent A.

Solvent A A mixture of 2 volumes of 2M *sodium hydroxide* and 1000 volumes of mobile phase.

(1) Dissolve with the aid of ultrasound a quantity of the contents of the capsules containing the equivalent of 100 mg of doxepin in 100 mL of solvent A and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent A and further dilute 1 volume to 10 volumes with solvent A.

(3) Dissolve the contents of a vial of *doxepin impurity standard BPCRS* in 1 mL of the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Luna C18 (2) is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 215 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for twice the retention time of the principal peak.

MOBILE PHASE

20 volumes of *acetonitrile*, 30 volumes of 0.01M *disodium hydrogen orthophosphate*, adjusted to pH 7.7 using 0.02M *orthophosphoric acid*, and 50 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to impurity A and impurity C is at least 1.5;

the *resolution* between the peaks due to impurity B and impurity C is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

identify any peaks corresponding to impurity A, B and C using the chromatogram obtained with solution (3) and the chromatogram supplied with *doxepin impurity standard BPCRS*;

the *Z*-isomer may appear as a shoulder on the peak due to Doxepin;

the area of any peak corresponding to impurity A is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the area of any peak corresponding to impurity B is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the area of any peak corresponding to impurity C is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other peak is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than 4 times the area of the principal peak in the chromatogram obtained with solution (2) (0.4%);

the sum of the areas of all the peaks is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder the contents of 20 capsules. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in solvent A, as described under Related substances (other than the *Z*-isomer).

(1) Dissolve with the aid of ultrasound a quantity of the contents of the capsules containing the equivalent of 100 mg of doxepin in 100 mL of solvent A, filter and dilute 1 volume to 10 volumes with solvent A.

(2) Prepare a solution of *doxepin hydrochloride BPCRS* containing the equivalent of 0.01% w/v doxepin in solvent A.

(3) Dissolve the contents of a vial of *doxepin impurity standard BPCRS* in 1 mL of the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances (other than the Z-isomer) may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to impurity A and impurity C is at least 1.5;

the *resolution* between the peaks due to impurity B and impurity C is at least 1.5.

www.webofpharma.com

DETERMINATION OF CONTENT

Calculate the content of $C_{19}H_{21}NO$ in the capsules using the declared content of $C_{19}H_{21}NO,HCl$ in *doxepin hydrochloride BPCRS*. Each mg of $C_{19}H_{21}NO,HCl$ is equivalent to 0.884g of $C_{19}H_{21}NO$.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Doxepin Hydrochloride.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of doxepin.

Doxorubicin Injection

Action and use

Anthracycline antibacterial; cytotoxic.

DEFINITION

Doxorubicin Injection is a sterile solution of Doxorubicin Hydrochloride in Water for Injections or Sodium Chloride Injection. It is either supplied as a ready-to-use solution or it is prepared by dissolving Doxorubicin Hydrochloride for Injection in the requisite amount of Water for Injections or Sodium Chloride Injection.

The injection complies with the requirements stated under Parenteral Preparations and, when supplied as a ready-to-use solution, with the following requirements.

Content of doxorubicin hydrochloride, $C_{27}H_{29}NO_{11},HCl$

95.0 to 110.0% of the stated amount.

CHARACTERISTICS

A red solution.

IDENTIFICATION

A. Dilute the injection with sufficient *ethanol (96%)* to produce a solution containing 0.001% w/v of Doxorubicin Hydrochloride. The *light absorption* of the resulting solution, Appendix II B, in the range 220 to 550 nm exhibits two maxima, at 234 and 252 nm, and four less clearly defined maxima at 288, 475, 495 and 530 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 2.5 to 3.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase. The solutions should be prepared immediately before use.

(1) Dilute a quantity of the injection to produce a solution containing 0.1% w/v of Doxorubicin Hydrochloride.

(2) 0.002% w/v of each of *doxorubicin hydrochloride BPCRS* and *epirubicin hydrochloride BPCRS*.

(3) Dissolve 10 mg of *doxorubicin hydrochloride BPCRS* in a mixture of 5 mL of *water* and 5 mL of *orthophosphoric acid* and allow to stand for 30 minutes. Adjust the pH to 2.6 with an 8% w/v solution of *sodium hydroxide*, add 15 mL of *acetonitrile* and 10 mL of *methanol* and mix [generation of doxorubicin aglycone (doxorubicinone)].

(4) Dilute 5 volumes of solution (2) to 20 volumes.

(5) 0.001% w/v of *methyl 4-hydroxybenzoate*.

(6) Mix equal volumes of solution (3) and solution (5).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

50 volumes of *acetonitrile* and 50 volumes of a solution containing 0.288% w/v of *sodium dodecyl sulfate* and 0.225% w/v of *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions the retention time of doxorubicin is about 8 minutes. For solution (1) allow the chromatography to proceed for 3.5 times the retention time of the principal peak. Use solution (3) to identify the peak due to doxorubicin aglycone (second most abundant peak).

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to doxorubicin and epirubicin is at least 2.0;

in the chromatogram obtained with solution (6), the *resolution factor* between the peaks due to doxorubicin aglycone and methyl 4-hydroxybenzoate is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to doxorubicin aglycone is not greater than six times the area of the peak due to doxorubicin in the chromatogram obtained with solution (4) (3%);

the area of any other *secondary peak* is not greater than the area of the peak due to doxorubicin in the chromatogram obtained with solution (4) (0.5%).

Disregard any peak corresponding to the principal peak in the chromatogram obtained with solution (5).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection, if necessary, with *water BET* to give a solution containing 2 mg of Doxorubicin Hydrochloride per mL (solution A). The endotoxin limit concentration of solution A is 4.4 IU of endotoxin per mL.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase. The solutions should be prepared immediately before use.

(1) Dilute a quantity of the injection to produce a solution containing 0.01% w/v of Doxorubicin Hydrochloride.

(2) 0.01% w/v of *doxorubicin hydrochloride BPCRS*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

50 volumes of *acetonitrile* and 50 volumes of a solution containing 0.288% w/v of *sodium dodecyl sulfate* and 0.225% w/v of *orthophosphoric acid*.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{29}NO_{11}$,HCl in the injection using the declared content of $C_{27}H_{29}NO_{11}$,HCl in *doxorubicin hydrochloride BPCRS*.

STORAGE

When supplied as a ready-to-use solution, Doxorubicin Injection should be stored at a temperature of 2° to 8°.

Doxorubicin Injection prepared by dissolving the contents of a sealed container in the liquid stated on the label should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

DOXORUBICIN HYDROCHLORIDE FOR INJECTION

DEFINITION

Doxorubicin Hydrochloride for Injection is a sterile material consisting of Doxorubicin Hydrochloride with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of doxorubicin hydrochloride, $C_{27}H_{29}NO_{11}$,HCl
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powder containing 10 mg of Doxorubicin Hydrochloride with 5 mL of 0.01M *hydrochloric acid*, extract 2 mL of the resulting solution with two 5-mL quantities of *ether* and discard the ether layer. Dilute the aqueous solution with *ethanol (96%)* to contain 0.001% w/v of Doxorubicin Hydrochloride. The *light absorption* of the resulting solution, Appendix II B, in the range 220 to 550 nm exhibits two maxima, at 234 and 252 nm, and four less clearly defined maxima at 288, 475, 495 and 530 nm.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH of a solution containing 0.2% w/v of Doxorubicin Hydrochloride in *Water for Injections*, 4.5 to 6.5, Appendix V L.

Related substances

Complies with the test described for the ready-to-use solution but preparing solution (1) in the following manner. Dissolve a quantity of the powder in sufficient of the mobile phase to produce a solution containing 0.1% w/v of Doxorubicin Hydrochloride.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to doxorubicin aglycone is not greater than twice the area of the peak due to doxorubicin in the chromatogram obtained with solution (4) (1%);

the area of any other *secondary peak* is not greater than the area of the peak due to doxorubicin in the chromatogram obtained with solution (4) (0.5%).

Disregard any peak corresponding to the principal peak in the chromatogram obtained with solution (5).

Water

Not more than 4.0% w/w, Appendix IX C. Use 0.1 g.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing 10 mg of Doxorubicin Hydrochloride per mL (solution A). The endotoxin limit concentration of solution A is 22 IU of endotoxin per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. The solutions should be prepared immediately before use.

(1) Dissolve a quantity of the mixed contents of the 10 containers in sufficient of the mobile phase to produce a solution containing 0.01% w/v of Doxorubicin Hydrochloride.

(2) 0.01% w/v of *doxorubicin hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under the Assay for the ready-to-use solution may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{29}NO_{11}$,HCl in a container of average content weight using the declared content of $C_{27}H_{29}NO_{11}$,HCl in *doxorubicin hydrochloride BPCRS*.

Doxycycline Capsules

Action and use

Tetracycline antibacterial.

DEFINITION

Doxycycline Capsules contain Doxycycline Hyclate.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of anhydrous doxycycline, $C_{22}H_{24}N_2O_8$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel H* as the coating substance and a mixture of 6 volumes of *water*, 35 volumes of *methanol* and 59 volumes of *dichloromethane* as the mobile phase. Spray the plate evenly with a 10% w/v solution of *disodium edetate*

www.webofpharma.com

the pH of which has been adjusted to 9.0 with 10M *sodium hydroxide* (about 10 mL for a 100 mm × 200 mm plate). Allow the plate to dry in a horizontal position for at least 1 hour. Immediately before use dry it at 110° for 1 hour. Apply separately to the plate 1 µL of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing the equivalent of 50 mg of anhydrous doxycycline with 100 mL of *methanol* for 1 to 2 minutes, centrifuge and use the supernatant liquid. Solution (2) contains 0.05% w/v of *doxycycline hyclate BPCRS* in *methanol*. Solution (3) contains 0.05% w/v each of *doxycycline hyclate BPCRS* and *tetracycline hydrochloride BPCRS* in *methanol*. After removal of the plate, dry it in a current of air and examine under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

B. To 0.5 mg of the contents of the capsules add 2 mL of *sulfuric acid*. A yellow colour is produced.

C. The contents of the capsules yield the reactions characteristic *of chlorides*, Appendix VI.

TESTS

Light-absorbing impurities

Dissolve the contents of five capsules as completely as possible in sufficient of a mixture of 1 volume of 1M *hydrochloric acid* and 99 volumes of *methanol* to produce a solution containing the equivalent of 1.0% w/v of anhydrous doxycycline and filter. The *absorbance* of the filtrate at 490 nm is not more than 0.20, calculated with reference to the dried capsule contents, Appendix II B.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use. For solution (1) dissolve a quantity of the contents of the capsules containing the equivalent of 7.0 mg of anhydrous doxycycline in 10 mL of 0.01M *hydrochloric acid*, filter and use the filtrate. Solutions (2) to (5) are solutions in 0.01M *hydrochloric acid* containing (2) 0.080% w/v of *doxycycline hyclate BPCRS*, (3) 0.080% w/v of *6-epidoxycycline hydrochloride BPCRS*, (4) 0.080% w/v of *metacycline hydrochloride EPCRS* and (5) 0.0016% w/v each of *6-epidoxycycline hydrochloride BPCRS* and *metacycline hydrochloride EPCRS*. For solution (6) dilute a mixture of 4 volumes of solution (2), 1.5 volumes of solution (3) and 1 volume of solution (4) to 25 volumes with 0.01M *hydrochloric acid*.

The chromatographic procedure may be carried out using (a) a column (25 cm × 4.6 mm) packed with *styrene-divinylbenzene co-polymer* (8 µm) with a pore size of 10 nm (PLRP-S from Polymer Laboratories is suitable) and maintained at 60°, (b) as the mobile phase with a flow rate of 1 mL per minute a solution prepared as described below and (c) a detection wavelength of 254 nm. For the mobile phase add 60 g of *2-methylpropan-2-ol* to a graduated flask with the aid of 200 mL of *water*, add 400 mL of *phosphate buffer pH 8.0*, 50 mL of a 1% w/v solution of *tetrabutylammonium hydrogen sulfate* previously adjusted to pH 8.0 with 2M *sodium hydroxide* and 10 mL of a 4% w/v solution of *disodium edetate* previously adjusted to pH 8.0 with 2M *sodium hydroxide* and dilute to 1000 mL with *water*. Inject 20 µL of each solution.

The test is not valid unless, in the chromatogram obtained with solution (6), the *resolution factor* between the first peak (metacycline) and the second peak (6-epidoxycycline) is at least 1.25 and the *resolution factor* between the second peak and the third peak (doxycycline) is at least 2.0. If necessary, adjust the content of 2-methylpropan-2-ol in the mobile phase.

In the chromatogram obtained with solution (1) the area of any peak corresponding to metacycline or 6-epidoxycycline is not greater than the area of the corresponding peak in the chromatogram obtained with solution (5) (2%, with reference to doxycycline hyclate) and the area of any other *secondary peak* is not greater than 0.25 times the area of the peak corresponding to 6-epidoxycycline in the chromatogram obtained with solution (5) (0.5%, with reference to doxycycline hyclate).

Loss on drying

When dried at 105° for 2 hours, the contents of the capsules lose not more than 8.5% of their weight. Use 1 g.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve the mixed contents of 20 capsules containing the equivalent of 17.5 mg of anhydrous doxycycline in sufficient 0.01M *hydrochloric acid* to produce 25 mL and dilute 4 mL of the solution to 25 mL with the same solvent. Solution (2) contains 0.0128% w/v of *doxycycline hyclate BPCRS* in 0.01M *hydrochloric acid*.

The chromatographic conditions described under Related substances may be used.

Calculate the content of $C_{22}H_{24}N_2O_8$ using the declared content of $C_{22}H_{24}N_2O_8$ in *doxycycline hyclate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous doxycycline.

Dispersible Doxycycline Tablets

Action and use

Tetracycline antibacterial.

DEFINITION

Dispersible Doxycycline Tablets contain Doxycycline Monohydrate in a suitable dispersible basis.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous doxycycline, $C_{22}H_{24}N_2O_8$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel H* as the coating substance and a mixture of 6 volumes of *water*, 35 volumes of *methanol* and 59 volumes of *dichloromethane* as the mobile phase. Spray the plate evenly with a 10% w/v solution of *disodium edetate* the pH of which has been adjusted to 9.0 with 10M *sodium hydroxide* (about 10 mL for a 100 mm × 200 mm plate). Allow the plate to dry in a horizontal position for at least 1 hour. Immediately before use dry it at 110° for 1 hour. Apply separately to the plate 1 µL of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing the equivalent of 50 mg of anhydrous doxycycline with 100 mL of *methanol* for 1 to 2 minutes, centrifuge and use the supernatant liquid. Solution (2) contains 0.05% w/v of *doxycycline hyclate BPCRS* in *methanol*. Solution (3) contains 0.05% w/v of each of *doxycycline*

www.webofpharma.com

hyclate BPCRS and *tetracycline hydrochloride BPCRS* in *methanol*. After removal of the plate, dry it in a current of air and examine under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Disintegration

Comply with the requirements for Dispersible Tablets.

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of a solution prepared by dissolving 2 g of *sodium chloride* in 7 mL of *hydrochloric acid* and sufficient *water* to produce 1000 mL and rotate the paddle at 75 revolutions per minute. Withdraw a sample of 15 mL of the medium and filter. Immediately measure the *absorbance* of the filtrate, Appendix II B, diluted with the dissolution medium if necessary, at 276 nm using dissolution medium in the reference cell. Measure the *absorbance* of a suitable solution of *doxycycline hyclate BPCRS* in the dissolution medium and calculate the total content of anhydrous doxycycline, $C_{22}H_{24}N_2O_8$, in the medium using the declared content of $C_{22}H_{24}N_2O_8$ in *doxycycline hyclate BPCRS*.

Light-absorbing impurities

Dissolve a quantity of the powdered tablets as completely as possible in sufficient of a mixture of 1 volume of 1M *hydrochloric acid* and 99 volumes of *methanol* to produce a solution containing the equivalent of 1.0% w/v of anhydrous doxycycline and filter. The *absorbance* of the filtrate at 490 nm is not more than 0.20, calculated with reference to the dried powdered tablets, Appendix II B.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use. For solution (1) add a quantity of the powdered tablets containing the equivalent of 80 mg of anhydrous doxycycline to 80 mL of 0.01M *hydrochloric acid*, mix with the aid of ultrasound and add sufficient 0.01M *hydrochloric acid* to produce 100 mL. Centrifuge and use the supernatant liquid. Solutions (2) to (5) are solutions in 0.01M *hydrochloric acid* containing (2) 0.080% w/v of *doxycycline hyclate BPCRS*, (3) 0.080% w/v of *6-epidoxycycline hydrochloride BPCRS*, (4) 0.080% w/v of *metacycline hydrochloride EPCRS* and (5) 0.0016% w/v each of *6-epidoxycycline hydrochloride BPCRS* and *metacycline hydrochloride EPCRS*. For solution (6) dilute a mixture of 4 volumes of solution (2), 1.5 volumes of solution (3) and 1 volume of solution (4) to 25 volumes with 0.01M *hydrochloric acid*.

The chromatographic procedure may be carried out using (a) a column (25 cm × 4.6 mm) packed with *styrene-divinylbenzene co-polymer* (8 µm) with a pore size of 10 nm (PLRP-S from Polymer Laboratories is suitable) and maintained at 60°, (b) as the mobile phase with a flow rate of 1 mL per minute a solution prepared as described below and (c) a detection wavelength of 254 nm. For the mobile phase add 60 g of *2-methylpropan-2-ol* to a graduated flask with the aid of 200 mL of *water*, add 400 mL of *phosphate buffer pH 8.0*, 50 mL of a 1% w/v solution of *tetrabutylammonium hydrogen sulfate* previously adjusted to pH 8.0 with 2M *sodium hydroxide* and 10 mL of a 4% w/v solution of *disodium edetate* previously adjusted to pH 8.0 with 2M *sodium hydroxide* and dilute to 1000 mL with *water*. Inject 20 µL of each solution.

The test is not valid unless, in the chromatogram obtained with solution (6), the *resolution factor* between the first peak (metacycline) and the second peak (6-epidoxycycline) is at least 1.25 and the *resolution factor* between the second peak and the third peak (doxycycline) is at least 2.0. If necessary, adjust the content of 2-methylpropan-2-ol in the mobile phase.

In the chromatogram obtained with solution (1) the area of any peak corresponding to metacycline or 6-epidoxycycline is not greater than the area of the corresponding peak in the chromatogram obtained with solution (5) (2%) and the area of any other *secondary peak* is not greater than 0.25 times the area of the peak corresponding to 6-epidoxycycline in the chromatogram obtained with solution (5) (0.5%).

Loss on drying

When dried at 60° at a pressure of 2 kPa for 2 hours, the powdered tablets lose not more than 6.0% of their weight. Use 1 g.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add a quantity of the powdered tablets containing the equivalent of 0.1 g of anhydrous doxycycline to 20 mL of 0.1M *hydrochloric acid*, mix with the aid of ultrasound until fully dispersed (about 10 minutes), add sufficient *water* to produce 200 mL, mix, centrifuge and use the supernatant liquid. For solution (2) dissolve 0.115 g of *doxycycline hyclate BPCRS* in 20 mL of 0.1M *hydrochloric acid* and add sufficient *water* to produce 200 mL.

The chromatographic conditions described under Related substances may be used.

Calculate the content of $C_{22}H_{24}N_2O_8$ in the tablets using the declared content of $C_{22}H_{24}N_2O_8$ in *doxycycline hyclate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous doxycycline.

Droperidol Injection

Action and use

Dopamine receptor antagonist; $beta_1$-adrenoceptor agonist; alpha-adrenoceptor agonist neuroleptic.

DEFINITION

Droperidol Injection is a sterile solution of Droperidol in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of droperidol, $C_{22}H_{22}FN_3O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak

www.webofpharma.com

due to droperidol in the chromatogram obtained with solution (2).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 10 volumes of *acetone* and 90 volumes of *methanol* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) shake a volume of the injection containing 10 mg of Droperidol with two successive 10 mL quantities of *dichloromethane* and use the combined extracts. Solution (2) contains 0.05% w/v of *droperidol BPCRS* in *dichloromethane*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) is similar to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 2.5 to 4.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the injection, if necessary, with a mixture of equal volumes of *dimethylformamide* and a 1% w/v solution of *tetrabutylammonium hydrogen sulfate* to give a solution containing 0.5% w/v of Droperidol. For solution (2) dilute 1 volume of solution (1) to 100 volumes with a mixture of equal volumes of *dimethylformamide* and a 1% w/v solution of *tetrabutylammonium hydrogen sulfate* and dilute 5 volumes of this solution to 20 volumes with the same solvent mixture. Solution (3) contains 0.0025% w/v each of *droperidol BPCRS* and *benperidol EPCRS* in a mixture of equal volumes of *dimethylformamide* and a 1% w/v solution of *tetrabutylammonium hydrogen sulfate*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil C18 BDS 3µ is suitable), (b) as the mobile phase with a flow rate of 1.5 mL per minute a 1% w/v solution of *tetrabutylammonium hydrogen sulfate* changing by linear gradient to a mixture of 60 volumes of a 1% w/v solution of *tetrabutylammonium hydrogen sulfate* and 40 volumes of *acetonitrile* over 15 minutes, followed by the final mixture for 5 minutes and (c) a detection wavelength of 275 nm. Equilibrate the column with *acetonitrile* for at least 30 minutes before use and then equilibrate at the initial mobile phase composition for at least 30 minutes.

Inject 20 µL of solution (3). When the chromatogram is recorded under the prescribed conditions, the retention times for benperidol and droperidol are about 6.5 minutes and about 7 minutes respectively. The test is not valid unless in the chromatogram obtained with solution (3) the *resolution factor* between the peaks due to droperidol and benperidol is at least 2.0. If necessary, adjust the final concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient.

When solution (1) is prepared by diluting Droperidol Injection inject 20 µL of a mixture of equal volumes of *dimethylformamide* and a 1% w/v solution of *tetrabutylammonium hydrogen sulfate* as a blank solution. When solution (1) is the undiluted injection, inject 20 µL of *water* as a blank solution. In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.25%) and the sum of the areas of any *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peak obtained with the blank solution and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the injection, if necessary, with *methanol (50%)* to give a solution containing 0.010% w/v of Droperidol. Solution (2) contains 0.010% w/v of *droperidol BPCRS* in *methanol (50%)*. Solution (3) contains 0.0025% w/v of each of *droperidol BPCRS* and *benperidol EPCRS* in *methanol (50%)*.

The chromatographic procedure described under Related substances may be used.

Inject 20 µL of solution (3). When the chromatogram is recorded under the prescribed conditions, the retention times for benperidol and droperidol are about 6.5 minutes and about 7 minutes respectively. The assay is not valid unless in the chromatogram obtained with solution (3) the *resolution factor* between the peaks due to droperidol and benperidol is at least 2.0. If necessary, adjust the final concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient.

Calculate the content of $C_{22}H_{22}FN_3O_2$ in the injection using the declared content of $C_{22}H_{22}FN_3O_2$ in *droperidol BPCRS*.

Droperidol Tablets

Action and use

Dopamine receptor antagonist; $beta_1$-adrenoceptor agonist; alpha-adrenoceptor agonist; neuroleptic.

DEFINITION

Droperidol Tablets contain Droperidol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of droperidol, $C_{22}H_{22}FN_3O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 20 mg of Droperidol with 10 mL of *dichloromethane* for 10 minutes, filter, evaporate the filtrate to dryness and dry the residue for 30 minutes at 90°. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of droperidol (*RS 384*).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to droperidol in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

www.webofpharma.com

PROCEDURE

(1) Withdraw a sample of 10 mL of the medium, filter through a 15-µm membrane filter and immediately measure the *absorbance* of the filtered solution, diluted if necessary with the dissolution medium, at the maximum at 247 nm, Appendix II B, using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *droperidol BPCRS* using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of droperidol, $C_{22}H_{22}FN_3O_2$, in the medium using the declared content of $C_{22}H_{22}FN_3O_2$ in *droperidol BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 0.1 g of Droperidol with 20 mL of *dimethylformamide* for 20 minutes, filter and dilute 5 volumes of the filtrate to 10 volumes with a 1% w/v solution of *tetrabutylammonium hydrogen sulfate*.

(2) Dilute 1 volume of solution (1) to 100 volumes with a mixture containing equal volumes of *dimethylformamide* and a 1% w/v solution of *tetrabutylammonium hydrogen sulfate* and further dilute 5 volumes of this solution to 20 volumes with the same solvent mixture.

(3) 0.0025% w/v each of *droperidol BPCRS* and *benperidol EPCRS* in a mixture containing equal volumes of *dimethylformamide* and a 1% w/v solution of *tetrabutylammonium hydrogen sulfate*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *base-deactivated octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil C18 BDS 3µ is suitable).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 275 nm.

(f) Inject 20 µL of each solution.

(g) Inject 20 µL of a mixture of equal volumes of *dimethylformamide* and a 1% w/v solution of *tetrabutylammonium hydrogen sulfate* as a blank solution.

(h) Equilibrate the column with *acetonitrile* for at least 30 minutes before use and then equilibrate at the initial mobile phase composition for at least 30 minutes.

MOBILE PHASE

Mobile phase A 1% w/v solution of *tetrabutylammonium hydrogen sulfate*.

Mobile phase B 40 volumes of *acetonitrile* and 60 volumes of a 1% w/v solution of *tetrabutylammonium hydrogen sulfate*.

Time (Minutes)	Mobile phase A%	Mobile phase B%	Comment
0-15	100→0	0→100	linear gradient
15-20	0	100	isocratic
20-30	100	0	re-equilibration

SYSTEM SUITABILITY

When the chromatogram is recorded under the prescribed conditions, the retention times for benperidol and droperidol are about 6.5 minutes and about 7 minutes respectively. The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to droperidol and benperidol is at least 2.0. If necessary, adjust the final concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.25%);

the sum of the areas of any *secondary peaks* is not greater than four times the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak obtained with the blank solution and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 20 mg of Droperidol with 75 mL of *methanol* for 30 minutes, dilute to 100 mL with *methanol*, filter and dilute 10 mL of the resulting solution to 20 mL with *water*.

(2) 0.010% w/v of *droperidol BPCRS* in *methanol (50%)*.

(3) 0.0025% w/v each of *droperidol BPCRS* and *benperidol EPCRS* in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

Inject solution (3). When the chromatogram is recorded under the prescribed conditions, the retention times for benperidol and droperidol are about 6.5 minutes and about 7 minutes respectively. The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to droperidol and benperidol is at least 2.0. If necessary, adjust the final concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{22}FN_3O_2$ in the tablets using the declared content of $C_{22}H_{22}FN_3O_2$ in *droperidol BPCRS*.

Dydrogesterone Tablets

Action and use

Progestogen.

DEFINITION

Dydrogesterone Tablets contain Dydrogesterone.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of dydrogesterone, $C_{21}H_{28}O_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 60 mg of Dydrogesterone with 20 mL of *methanol*, filter and

www.webofpharma.com

evaporate the filtrate to dryness. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of dydrogesterone *(RS 118)*.

B. Complies with the test for *identification of steroids*, Appendix III A, using *impregnating solvent II* and *mobile phase E*.

TESTS

Related substances

Comply with the test described under Dydrogesterone using the following solutions. For solution (1) extract a quantity of the powdered tablets containing 20 mg of Dydrogesterone with 50 mL of a 0.020% w/v solution of *1,2,3,4-tetraphenylcyclopenta-1,3-diene* (internal standard) in *chloroform* and filter. For solution (2) extract a quantity of the powdered tablets containing 20 mg of Dydrogesterone with 20 mL of *chloroform*, filter, evaporate to dryness using a rotary evaporator and dissolve the residue in 1 mL of *chloroform*. Prepare solution (3) in the same manner as solution (2) but extracting the powdered tablets with 20 mL of a 0.0010% w/v solution of the internal standard in *chloroform*.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 10 mg of Dydrogesterone for 15 minutes with 70 mL of *methanol*, dilute to 200 mL with *methanol* and filter. Dilute 5 mL of the filtrate to 100 mL with *methanol* and measure the *absorbance* of the resulting solution at the maximum at 286 nm, Appendix II B. Calculate the content of $C_{21}H_{28}O_2$ taking 845 as the value of A (1%, 1 cm) at the maximum at 286 nm.

STORAGE

Dydrogesterone Tablets should be protected from light.

Econazole Cream

Action and use

Antifungal.

DEFINITION

Econazole Cream contains Econazole Nitrate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of econazole nitrate, $C_{18}H_{15}Cl_3N_2O,HNO_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Mix a quantity of the cream containing 40 mg of Econazole Nitrate with 20 mL of a mixture of 1 volume of 1M *sulfuric acid* and 4 volumes of *methanol* and shake with two 50-mL quantities of *carbon tetrachloride* discarding the organic layers. Make the aqueous phase alkaline with 2M *ammonia* and extract with two 40-mL quantities of *chloroform*. Combine the *chloroform* extracts, shake with 5 g of *anhydrous sodium sulfate*, filter and dilute the filtrate to 100 mL with *chloroform*. Evaporate 50 mL to dryness and dissolve the residue in 50 mL of a mixture of 1 volume of 0.1M *hydrochloric acid* and 9 volumes of *propan-2-ol*. The *light absorption* of the resulting solution, Appendix II B, in the range 240 to 350 nm exhibits maxima at 265, 271 and 280 nm. The ratio of the *absorbance* at the maximum at 271 nm to that at the maximum at 280 nm is 1.55 to 1.77. The test is not valid unless the ratio of the *absorbance* in the test for *resolution* is at least 2.

B. In the Assay, the principal peak in the chromatogram obtained with solution (3) has the same retention time as the peak due to econazole in the chromatogram obtained with solution (4).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Buffer Solution

Dissolve 2.5 g of *potassium dihydrogen orthophosphate* and 2.5 g of *dipotassium hydrogen orthophosphate* in 1000 mL of *water*.

(1) 0.05% w/v solution of miconazole nitrate in *methanol* (internal standard solution).

(2) Mix a quantity of the cream containing 10 mg of Econazole Nitrate with 20 mL of internal standard solution and 55 mL of *methanol*, warm on a water-bath for 30 seconds, shake for 1 minute, repeat the process twice and add 25 mL of buffer solution. Cool in an ice bath for 15 minutes, centrifuge for 10 minutes and use the supernatant liquid, filtered if necessary.

(3) Prepare in the same manner as solution (2) but using 20 mL of *methanol* in place of internal standard solution.

(4) 10 mL of a 0.1% w/v solution of *econazole nitrate BPCRS* in *methanol* with 20 mL of internal standard solution, 45 mL of *methanol* and 25 mL of buffer solution.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 232 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of buffer solution and 3 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{15}Cl_3N_2O,HNO_3$ in the cream using the declared content of $C_{18}H_{15}Cl_3N_2O,HNO_3$ in *econazole nitrate BPCRS*.

STORAGE

If Econazole Cream is kept in aluminium tubes, their inner surfaces should be coated with a suitable lacquer.

Econazole Pessaries

Action and use

Antifungal.

DEFINITION

Econazole Pessaries are either moulded pessaries or *vaginal tablets* containing Econazole Nitrate in a suitable basis.

The pessaries comply with the requirements stated under Vaginal Preparations and with the following requirements.

Content of econazole nitrate, $C_{18}H_{15}Cl_3N_2O,HNO_3$

90.0 to 110.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

A. Mix a quantity of the crushed pessaries containing 40 mg of Econazole Nitrate with 20 mL of a mixture of 1 volume of 1M *sulfuric acid* and 4 volumes of *methanol* and shake with two 50-mL quantities of *hexane*, discarding the organic layers. Make the aqueous phase alkaline with 2M *ammonia* and extract with two 40-mL quantities of *chloroform*. Combine the *chloroform* extracts, shake with 5 g of *anhydrous sodium sulfate*, filter and dilute the filtrate to 100 mL with *chloroform*. Evaporate 50 mL to dryness and dissolve the residue in 50 mL of a mixture of 1 volume of 0.1M *hydrochloric acid* and 9 volumes of *propan-2-ol*. The *light absorption* of the resulting solution, Appendix II B, in the range 240 to 350 nm exhibits maxima at 265, 271 and 280 nm. The ratio of the *absorbance* at the maximum at 271 nm to that at the maximum at 280 nm is 1.55 to 1.77. The test is not valid unless the ratio of the *absorbance* in the test for *resolution* is at least 2.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (3).

TEST

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Mix a quantity of the crushed pessaries containing 40 mg of Econazole Nitrate with 40 mL of *methanol* and heat under a reflux condenser for 15 minutes. Allow to cool, filter (Whatman No. 1 paper is suitable), wash the filter paper with *methanol* and evaporate the filtrate and washings to a volume of about 5 mL. Filter (Whatman No. 50 paper is suitable), wash the paper with *methanol*, evaporate the filtrate and washings to dryness and dissolve the residue in 2 mL of *methanol*.

(2) Dilute 0.5 mL of solution (1) to 100 mL with *methanol*.

(3) 2% w/v of *econazole nitrate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating silica gel (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and expose to iodine vapour for 1 hour.

MOBILE PHASE

70 volumes of *dichloromethane*, 20 volumes of *methanol* and 10 volumes of an 85% w/v solution of *formic acid*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2). Disregard any spot with an Rf value higher than 0.9.

ASSAY

Dissolve five pessaries in 250 mL of *anhydrous acetic acid* with the aid of gentle heat, allow to cool and carry out Method I for *non-aqueous titration*, Appendix VIII A, using a quantity of the solution containing 0.3 g of Econazole Nitrate and determining the end point potentiometrically. Each mL of 0.1M *perchloric acid VS* is equivalent to 44.47 mg of $C_{18}H_{15}Cl_3N_2O,HNO_3$.

Edrophonium Injection

Action and use

Cholinesterase inhibitor.

DEFINITION

Edrophonium Injection is a sterile solution of Edrophonium Chloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of edrophonium chloride, $C_{10}H_{16}ClNO$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dilute a sufficient volume of the injection with 0.1M *sodium hydroxide* to give a solution containing 0.001% w/v of Edrophonium Chloride. The *light absorption* of the resulting solution, Appendix II B, in the range 220 to 350 nm exhibits two maxima, at 240 nm and 294 nm. The *absorbances* at the maxima are about 1.1 and about 0.34 respectively.

B. To a volume containing 20 mg of Edrophonium Chloride add 0.05 mL of *iron(III) chloride solution R1*. A reddish violet colour is produced.

C. Yields reaction A characteristic *of chlorides*, Appendix VI.

TESTS

Acidity

pH, 5.0 to 6.0, Appendix V L.

Dimethylaminophenol

To a volume containing 50 mg of Edrophonium Chloride add 10 mL of *phosphate buffer pH 8.0* and extract with two 20 mL quantities of *chloroform*. Wash the extracts successively with two 10 mL quantities of *water*, extract with 10 mL of 0.1M *sodium hydroxide* and discard the chloroform. The *absorbance* of the resulting solution at 293 nm is not more than 0.125, Appendix II B.

ASSAY

To a volume containing 50 mg of Edrophonium Chloride add sufficient *water* to produce 100 mL. Dilute 10 mL of this solution to 100 mL with *water* and measure the *absorbance* of the resulting solution at the maximum at 273 nm, Appendix II B. Calculate the content of $C_{10}H_{16}ClNO$ taking 110 as the value of A (1%, 1 cm) at the maximum at 273 nm.

STORAGE

Edrophonium Injection should be protected from light.

Emulsifying Ointment

DEFINITION

Emulsifying Wax	300 g
White Soft Paraffin	500 g
Liquid Paraffin	200 g

Extemporaneous preparation

The following directions apply.

Melt together and stir until cold.

The ointment complies with the requirements stated under Topical Semi-solid Preparations.

www.webofpharma.com

Emulsifying Wax

Anionic Emulsifying Wax

DEFINITION

Emulsifying Wax contains Cetostearyl Alcohol and either Sodium Lauryl Sulfate or sodium salts of similar sulfated higher primary aliphatic alcohols.

Extemporaneous preparation

The following formula and directions apply.

Cetostearyl Alcohol	90 g
Sodium Lauryl Sulfate	10 g
Purified Water	4 mL

Melt the Cetostearyl Alcohol and heat to about 95°. Add the Sodium Lauryl Sulfate, mix, add the Purified Water, heat to 115° and maintain at this temperature, stirring vigorously, until frothing ceases and the product is translucent. Cool quickly.

CHARACTERISTICS

An almost white or pale yellow, waxy solid or flakes, becoming plastic when warmed.

Practically insoluble in *water*, forming an emulsion; partly soluble in *ethanol (96%)*.

IDENTIFICATION

A. *Melting point* of the residue obtained in the test for Unsaponifiable matter, about 52°, Appendix V A.

B. Complies with the test for sulfated ash.

TESTS

Acidity

To 20 g add a mixture of 40 mL of *ether* and 75 mL of *ethanol (96%)* previously neutralised to *phenolphthalein solution R1* and warm gently until solution is effected. Titrate with 0.1M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator until a pink colour which persists for at least 15 seconds is obtained. Not more than 1.0 mL of 0.1M *sodium hydroxide VS* is required.

Alkalinity

Disperse 5.0 g in 25 mL of warm *ethanol (96%)* previously neutralised to *phenolphthalein solution R1* and cool. No colour is produced on the addition of 0.5 mL of *phenolphthalein solution R1*.

Alcohols

To 3.5 g of the residue obtained in the test for Unsaponifiable matter add 12 g of *stearic anhydride* and 10 mL of *xylene* and heat gently under a reflux condenser for 30 minutes. Cool, add a mixture of 40 mL of *pyridine* and 4 mL of *water*, heat under a reflux condenser for a further 30 minutes and titrate the hot solution with 1M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Repeat the operation without the residue. The difference between the titrations is 12.8 to 14.2 mL.

Iodine value

Not more than 3.0 *(iodine monochloride method)*, Appendix X E.

Saponification value

Not more than 2.0, Appendix X G. Use 20 g.

Sodium alkyl sulfates

Not less than 8.7%, calculated as $C_{12}H_{25}O_4SNa$ with reference to the anhydrous substance, when determined by the following method. Dissolve 0.25 g as completely as possible in 15 mL of *chloroform*, add 30 mL of *water*, 10 mL of 1M *sulfuric acid* and 1 mL of *dimethyl yellow and oracet blue 2R solution* and titrate with 0.004M *benzethonium chloride VS*, shaking vigorously and allowing the layers to separate after each addition, until the chloroform layer acquires a permanent clear green colour. Each mL of 0.004M *benzethonium chloride VS* is equivalent to 1.154 mg of $C_{12}H_{25}O_4SNa$.

Sulfated ash

1.8 to 3.3%, Appendix IX A.

Unsaponifiable matter

Not less than 86.0%, calculated with reference to the anhydrous substance, Appendix X H. Use 5 g and omit the titration of the residue.

Water

Not more than 4.0% w/w, Appendix IX C. Use 0.6 g.

Enalapril Tablets

Action and use

Angiotensin converting enzyme inhibitor.

DEFINITION

Enalapril Tablets contain Enalapril Maleate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of enalapril maleate, $C_{20}H_{28}N_2O_5,C_4H_4O_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck silica gel 60 HPTLC plates are suitable) and a mixture of 15 volumes of *glacial acetic acid*, 25 volumes of *water* and 60 volumes of *butan-1-ol* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 20 mg of Enalapril Maleate with 10 mL of *ethanol (90%)* for 10 minutes, centrifuge and use the clear supernatant liquid (if necessary, filter through a 0.45 µm membrane filter). Solution (2) contains 0.2% w/v of *enalapril maleate BPCRS* in *ethanol (90%)*. After removal of the plate, allow it to dry in air, spray with a solution prepared by mixing equal volumes of a 40% w/v solution of *potassium iodide* in *water* and a solution prepared by dissolving 0.85 g of *bismuth oxynitrate* in a mixture of 10 mL of *glacial acetic acid* and 40 mL of *water* and diluting 10 volumes of the mixture with 20 volumes of *glacial acetic acid* and 70 volumes of *water* immediately before use, then spray with *dilute hydrogen peroxide solution*. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of *water* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 20 mL of the medium and filter, discarding the first 10 mL of filtrate. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the filtered

www.webofpharma.com

dissolution medium diluted, if necessary, to produce a solution expected to contain about 0.00028% w/v of Enalapril Maleate. Solution (2) contains 0.00028% w/v of *enalapril maleate BPCRS* in *water*.

The chromatographic procedure described under Related substances may be used.

Calculate the total content of enalapril maleate, $C_{20}H_{28}N_2O_5,C_4H_4O_4$, in the medium using the declared content of $C_{20}H_{28}N_2O_5,C_4H_4O_4$ in *enalapril maleate BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use. Dissolve 0.136 g of *potassium dihydrogen orthophosphate* in 800 mL of *water*, adjust the pH of the solution to 2.0 with *orthophosphoric acid*, add sufficient *water* to produce 1000 mL and filter through a 0.45 µm filter (solution A). For solution (1) shake a quantity of the powdered tablets containing 50 mg of Enalapril Maleate with 50 mL of Solution A for 15 minutes, centrifuge and use the clear supernatant liquid (if necessary, filter through a 0.45 µm membrane filter). For solution (2) dilute 1 volume of solution (1) to 100 volumes with solution A and further dilute 1 volume to 5 volumes with solution A. For solution (3) dilute 3 volumes of a 0.01% w/v solution of *enalaprilat BPCRS* in solution A (solution B) to 20 volumes with Solution A. For solution (4) dilute 1 volume of a 0.01% w/v solution of *enalapril diketopiperazine BPCRS* in Solution A (solution C) to 20 volumes with solution A. For solution (5) mix 1 volume of solution B and 1 volume of solution C and dilute to 20 volumes with Solution (1).

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable) and maintained at 70°, (b) as the mobile phase with a flow rate of 1 mL per minute a mixture of 40 volumes of *acetonitrile* and 60 volumes of solution A and (c) a detection wavelength of 215 nm.

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between the peaks due to enalaprilat and enalapril diketopiperazine is at least 3.0 and the *resolution factor* between the peaks due to enalapril diketopiperazine and enalapril is at least 2.0. If necessary, adjust the ratio of the components of the mobile phase.

In the chromatogram obtained with solution (1) the area of any peak corresponding to enalaprilat is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1.5%), the area of any peak corresponding to enalapril diketopiperazine is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.5%), the area of any other *secondary peak* is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%) and the sum of the areas of any *secondary peaks* other than any peak corresponding to enalaprilat or enalapril diketopiperazine is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Dissolve 0.136 g of *potassium dihydrogen orthophosphate* in 800 mL of *water*, adjust the pH of the solution to 2.0 with *orthophosphoric acid*, add sufficient *water* to produce 1000 mL and filter through a 0.45 µm filter (solution A). For solution (1) shake a quantity of the powdered tablets containing 10 mg of Enalapril Maleate with 50 mL of solution A for 15 minutes, centrifuge and use the clear supernatant (if necessary, filter through a 0.45 µm membrane filter). Solution (2) contains 0.02% w/v of *enalapril maleate BPCRS* in solution A. Solution (3) contains 0.01% w/v of *enalaprilat BPCRS* in solution A. Solution (4) contains 0.01% w/v of *enalapril diketopiperazine BPCRS* in solution A. For solution (5) mix 1 volume of solution (3) and 1 volume of solution (4) and dilute to 20 volumes with solution (1).

The chromatographic procedure described under Related substances may be used.

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between the peaks due to enalaprilat and enalapril diketopiperazine is at least 3.0 and the *resolution factor* between the peaks due to enalapril diketopiperazine and enalapril is at least 2.0. If necessary, adjust the ratio of the components of the mobile phase.

Calculate the content of $C_{20}H_{28}N_2O_5,C_4H_4O_4$ in the tablets using the declared content of $C_{20}H_{28}N_2O_5,C_4H_4O_4$ in *enalapril maleate BPCRS*.

STORAGE

Enalapril Tablets should be protected from light and moisture.

Enoxaparin Sodium Injection

Action and use

Low molecular weight heparin.

DEFINITION

Enoxaparin Sodium Injection is a sterile solution of Enoxaparin Sodium in Water for Injections. It may contain, in multidose containers, a suitable antimicrobial preservative.

PRODUCTION

The final product is produced by methods of manufacturing designed to ensure that substances lowering blood pressure are not introduced and to ensure freedom from contamination by over-sulfated glycosaminoglycans.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Activity

The estimated activity for anti-factor Xa is not less than 90% and not more than 110% of the stated activity.

The ratio of anti-factor Xa to anti-factor IIa is not less than 3.3 and not more than 5.3.

IDENTIFICATION

A. Carry out the method for *size-exclusion chromatography*, Appendix III C, using the following solutions in the mobile phase.

(1) Dilute the injection to contain 1000 units of anti-factor Xa per mL.

(2) 1% w/v of *heparin low-molecular-mass for calibration EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a column (30 cm × 7.5 mm) packed with appropriate porous silica beads (5 µm) with a fractionation range for proteins of approximately 15 000 to 100 000 (Waters Protein-Pak is suitable).

(b) Use isocratic elution and the mobile phase described below.

www.webofpharma.com

(c) Use a flow rate of 0.5 mL per minute.

(d) Use an ambient column temperature.

(e) For detection use a differential refractometer (RI) detector connected in series to an ultraviolet spectrophotometer (UV) set at 234 nm such that the UV monitor is connected to the column outlet and the RI detector to the UV-monitor outlet. It is necessary to measure the time lapse between the 2 detectors accurately so that their chromatograms can be aligned correctly. The retention times used in the calibration must be those from the RI detector.

(f) Inject 25 µL of each solution.

The normalisation factor used to calculate the relative molecular mass from the RI/UV ratio is obtained as follows. Calculate the total area under the UV_{234} (ΣUV_{234}) and the RI (ΣRI) curves by numerical integration over the range of interest (i.e. excluding salt and solvent peaks at the end of the chromatogram). Calculate the ratio r using the following expression:

$$\frac{\sum RI}{\sum UV_{234}}$$

Calculate the factor f using the following expression:

$$\frac{M_{na}}{r}$$

where:

M_{na} = assigned number-average relative molecular mass of the *heparin low-molecular-mass for calibration EPCRS* found in the leaflet supplied with the EPCRS.

Provided the UV_{234} and the RI responses are aligned, the relative molecular mass M at any point is calculated using the following expression:

$$f\frac{RI}{UV_{234}}$$

The resulting table of retention times and relative molecular masses may be used to derive a calibration curve for the chromatographic system by fitting a suitable mathematical relationship to the data. A polynomial of the 3rd degree is recommended. *It must be stressed that the extrapolation of this fitted calibration curve to higher molecular masses is not valid.*

Inject 25 µL of the test solution and record the chromatogram for a period of time, ensuring complete elution of sample and solvent peaks.

The mass-average relative molecular mass is defined by the following expression:

$$\frac{\sum(RI_i M_i)}{\sum RI_i}$$

where:

RI_i = mass of substance eluting in the fraction i;

M_i = relative molecular mass corresponding to fraction i.

MOBILE PHASE

2.84% w/v solution of *anhydrous sodium sulfate* adjusted to pH 5.0 with *dilute sulfuric acid.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *column efficiency* is at least 20 000 *theoretical plates* per metre.

CONFIRMATION

The mass-average relative molecular mass ranges between 3800 and 5000. The mass percentage of chains lower than 2000 is between 12.0 and 20.0%. The mass percentage of chains between 2000 and 8000 ranges between 68.0 and 82.0%.

B. The ratio of anti-factor Xa activity to anti-factor IIa activity, determined as described under Assay, is not less than 3.3 and not more than 5.3.

C. Yields reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Clarity and colour of solution

The solution is *clear*, Appendix IV A, and not more intensely coloured than *reference solution Y_4 or BY_4*, Appendix IV B, Method II.

Acidity or alkalinity

pH, 5.5 to 7.5, Appendix V L.

Light absorption

The *light absorption*, Appendix II B, of a solution containing the total contents of a single dose container, or 0.4 mL from a multi-dose container, diluted to 100.0 mL with a solution of 0.01M *hydrochloric acid* exhibits a maximum at 231 nm.

Sodium

11.3 to 13.5%, when determined by *atomic absorption spectrophotometry*, Appendix II D Method I.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is less than 0.01 IU per International Unit of anti-Xa activity.

ASSAY

The anticoagulant activity of low-molecular-mass heparins is determined *in vitro* by two assays which determine its ability to accelerate the inhibition of factor Xa (anti-Xa assay) and thrombin, factor IIa (anti-IIa assay), by antithrombin III.

The International Units for anti-Xa and anti-IIa activity are the activities contained in a stated amount of the International Standard for low-molecular-mass heparin.

Heparin low-molecular-mass for assay EPBRP, calibrated in International Units by comparison with the International Standard using the two assays given below, is used as the reference preparation.

For anti-factor Xa activity

Test solutions (1) to *(4)* Prepare a series of 4 independent dilutions of the injection being examined in *tris-chloride buffer pH 7.4;* the concentration range of the solutions should be within 0.025 IU to 0.2 IU of anti-factor Xa activity per mL and the dilutions chosen should give a linear response when results are plotted as absorbance against log concentration.

Reference solutions (1) to *(4)* Prepare a series of 4 dilutions of the reference preparation of low-molecular-mass heparin in *tris-chloride buffer pH 7.4;* the concentration range of the solutions should be within 0.025 IU to 0.2 IU of anti-factor Xa activity per mL and the dilutions chosen should give a

www.webofpharma.com

linear response when results are plotted as absorbance against log concentration.

Label 16 tubes in duplicate: T1, T2, T3, T4 for the dilutions of the injection being examined and R1, R2, R3, R4 for the dilutions of the reference preparation. To each tube add 50 µL of *antithrombin III solution R1* and 50 µL of the appropriate dilution of the injection being examined, or the reference preparation. After each addition, mix but do not allow bubbles to form. Treating the tubes in the order R1, R2, R3, R4, T1, T2, T3, T4, T1, T2, T3, T4, R1, R2, R3, R4, allow to equilibrate at 37° (in a water-bath or heating block) for 1 minute and add to each tube 100 µL of *bovine factor Xa solution*. Incubate for exactly 1 minute and add 250 µL of *chromophore substrate R1*. Stop the reaction after exactly 4 minutes by adding 375 µL of *acetic acid*. Transfer the mixtures to semi-micro cuvettes and measure the *absorbance* at 405 nm, Appendix II B, using a suitable reading device. Determine the blank amidolytic activity at the beginning and at the end of the procedure in a similar manner, using *tris-chloride buffer pH 7.4* in place of the reference and test solutions; the 2 blank values do not differ significantly. Calculate the regression of the absorbance on log concentrations of the solutions of the injection being examined and of the reference preparation of low-molecular-mass heparins and calculate the potency of the substance being examined in International Units of anti-factor Xa activity per mL using the usual statistical methods for parallel-line assays.

For anti-factor IIa activity

Test solutions (1) to *(4)* Prepare a series of 4 independent dilutions of the injection being examined in *tris-chloride buffer pH 7.4*; the concentration range should be within 0.015 IU to 0.075 IU of anti-factor IIa activity per mL and the dilutions chosen should give a linear response when results are plotted as absorbance against log concentration.

Reference solutions (1) to *(4)* Prepare a series of 4 independent dilutions of the reference preparation of low-molecular-mass heparin in *tris-chloride buffer pH 7.4*; the concentration range should be within 0.015 IU to 0.075 IU of anti-factor IIa activity per mL and the dilutions chosen should give a linear response when results are plotted as absorbance against log concentration.

Label 16 tubes in duplicate: T1, T2, T3, T4 for the dilutions of the injection being examined and R1, R2, R3, R4 for the dilutions of the reference preparation. To each tube add 50 µL of *antithrombin III solution R2* and 50 µL of the appropriate dilution of the injection being examined or the reference preparation. After each addition, mix but do not allow bubbles to form. Treating the tubes in the order R1, R2, R3, R4, T1, T2, T3, T4, T1, T2, T3, T4, R1, R2, R3, R4, allow to equilibrate at 37° (in a water-bath or heating block) for 1 minute and add to each tube 100 µL of *human thrombin solution*. Incubate for exactly 1 minute and add 250 µL of *chromophore substrate R2*. Stop the reaction after exactly 4 minutes by adding 375 µL of *acetic acid*. Transfer the mixtures to semi-micro cuvettes and measure the *absorbance* at 405 nm, Appendix II B, using a suitable reading device. Determine the blank amidolytic activity at the beginning and at the end of the procedure in a similar manner, using *tris-chloride buffer pH 7.4* in place of the reference and test solutions; the 2 blank values do not differ significantly. Calculate the regression of the absorbance on log concentrations of the solutions of the substance to be examined and of the reference preparation of low-molecular-mass heparins, and calculate the potency of the substance being examined in International Units of anti-factor IIa activity per mL using the usual statistical methods for parallel-line assays.

LABELLING

The label states the number of IU (Units) of anti-factor Xa per unit volume.

Ephedrine Elixir

Ephedrine Oral Solution

Action and use

Adrenoceptor agonist.

DEFINITION

Ephedrine Elixir is an *oral solution* containing 0.3% w/v of Ephedrine Hydrochloride in a suitable flavoured vehicle containing a sufficient volume of Ethanol (96%) or of an appropriate Dilute Ethanol to give a final concentration of 12% v/v of ethanol.

The elixir complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ephedrine hydrochloride, $C_{10}H_{15}NO,HCl$

0.27 to 0.33% w/v.

IDENTIFICATION

A. To 30 mL of the elixir add 2 mL of 2M *hydrochloric acid*, extract with two 20-mL quantities of *ether* and discard the ether. Add sufficient 5M *ammonia* to the aqueous phase to make it alkaline, extract with two 30-mL quantities of *ether*, wash the combined ether extracts with three 15-mL quantities of *water*, dry with *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ephedrine *(RS 121)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (4).

TESTS

Ethanol content

11 to 13% v/v, Appendix VIII F.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add sufficient 5M *ammonia* to 50 mL of the elixir to make it alkaline, extract with two 100-mL quantities of *ether*, wash the combined extracts with 10 mL of *water*, dry with *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness. Dissolve the oily residue in sufficient *methanol* to produce 5 mL.

(2) Dilute 1 volume of solution (1) to 10 volumes with *methanol*.

(3) Dilute 1 volume of solution (1) to 200 volumes with *methanol*.

(4) 0.30% w/v of *ephedrine hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with *ninhydrin solution* and heat at 100° for 5 minutes.

www.webofpharma.com

MOBILE PHASE

5 volumes of *chloroform*, 15 volumes of 13.5M *ammonia* and 80 volumes of *propan-2-ol*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3). Disregard any spot of lighter colour than the background.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the elixir containing 60 mg of Ephedrine Hydrochloride to 50 mL with *methanol (65%)*.

(2) 0.12% w/v of *ephedrine hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 263 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.005M *dioctyl sodium sulfosuccinate* in a mixture of 1 volume of *glacial acetic acid*, 35 volumes of *water* and 65 volumes of *methanol*.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the elixir, Appendix V G, and calculate the content of $C_{10}H_{15}NO,HCl$, weight in volume, using the declared content of $C_{10}H_{15}NO,HCl$ in *ephedrine hydrochloride BPCRS*.

Ephedrine Injection

Action and use

Adrenoceptor agonist; reversal of hypotension from spinal or epidural anaesthesia.

DEFINITION

Ephedrine Injection is a sterile solution of Ephedrine Hydrochloride. It is supplied as a ready-to-use solution in Water for Injections or it is prepared immediately before use in accordance with the manufacturer's instructions from Sterile Ephedrine Concentrate.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

When supplied as a ready-to-use solution, the injection complies with the following requirements.

Content of ephedrine hydrochloride, $C_{10}H_{15}NO,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a quantity of the injection containing 10 mg of Ephedrine Hydrochloride add 2 mL of 2M *hydrochloric acid*, shake with two 20-mL quantities of *dichloromethane* and discard the dichloromethane. Add 5M *ammonia* until the aqueous layer is alkaline, extract with two 30-mL quantities of a mixture of 3 volumes of *dichloromethane* and 1 volume of *ethanol*, dry the combined extracts over *anhydrous sodium sulfate*, filter and evaporate to dryness at a pressure of 2 kPa, heating gently to remove the last traces of solvent. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ephedrine hydrochloride *(RS 436)*.

TESTS

Acidity or alkalinity

pH, 4.5 to 7.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the injection, if necessary, with sufficient of the mobile phase to produce a solution containing 0.75% w/v of Ephedrine Hydrochloride.

(2) Dilute 1 volume of solution (1) to 500 volumes with mobile phase.

(3) 0.01% w/v of *ephedrine hydrochloride BPCRS* and 0.01% w/v of *pseudoephedrine hydrochloride BPCRS* in mobile phase.

(4) Dilute 1 volume of solution (2) to 10 volumes with mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with particles of silica the surface of which has been modified by chemically bonded phenyl groups (5 µm) (Spherisorb Phenyl is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 257 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for three times the retention time of the peak due to Ephedrine.

Under the prescribed conditions, the retention time of ephedrine is about 13 minutes and the retention time of pseudoephedrine is about 16 minutes.

MOBILE PHASE

6 volumes of *methanol* and 94 volumes of a 1.16% w/v solution of *ammonium acetate* adjusted to pH 4.0 using *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to ephedrine and pseudoephedrine is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.02%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

www.webofpharma.com

(1) Dilute the injection with *methanol (80%)* to produce a solution containing 0.1% w/v of Ephedrine Hydrochloride.

(2) 0.1% w/v of *ephedrine hydrochloride BPCRS* in *methanol (65%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 263 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.005M *dioctyl sodium sulfosuccinate* in a mixture of 1 volume of *glacial acetic acid*, 35 volumes of *water* and 65 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{10}H_{15}NO,HCl$ in the injection using the declared content of $C_{10}H_{15}NO,HCl$ in *ephedrine hydrochloride BPCRS*.

STERILE EPHEDRINE CONCENTRATE

DEFINITION

Sterile Ephedrine Concentrate is a sterile solution of Ephedrine Hydrochloride in Water for Injections.

The concentrate complies with the requirements for Concentrates for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of ephedrine hydrochloride, $C_{10}H_{15}NO,HCl$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a quantity of the concentrate containing 10 mg of Ephedrine Hydrochloride add 2 mL of 2M *hydrochloric acid*, shake with two 20-mL quantities of *dichloromethane* and discard the dichloromethane. Add 5M *ammonia* until the aqueous layer is alkaline, extract with two 30-mL quantities of a mixture of 3 volumes of *dichloromethane* and 1 volume of *ethanol*, dry the combined extracts over *anhydrous sodium sulfate*, filter and evaporate to dryness at a pressure of 2 kPa, heating gently to remove the last traces of solvent.
The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ephedrine hydrochloride *(RS 436)*.

TESTS

Acidity
pH, 4.5 to 7.0, Appendix V L.

Related substances
Carry out the method described in the requirements for the ready to use injection.

ASSAY

Carry out the Assay described in the requirements for the ready to use injection.

Ephedrine Nasal Drops

Action and use
Adrenoceptor agonist.

DEFINITION

Ephedrine Nasal Drops are a solution of Ephedrine Hydrochloride in a suitable aqueous vehicle.

The nasal drops comply with the requirements stated under Nasal Preparations and with the following requirements.

Content of ephedrine hydrochloride, $C_{10}H_{15}NO,HCl$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the nasal drops containing 0.1 g of Ephedrine Hydrochloride add 2 mL of 2M *hydrochloric acid*, shake with two 20 mL quantities of *chloroform* and discard the chloroform. Add 5M *ammonia* until the aqueous layer is alkaline, extract with two 30 mL quantities of a mixture of 3 volumes of *chloroform* and 1 volume of *ethanol*, dry the combined extracts over *anhydrous sodium sulfate*, filter and evaporate to dryness at a pressure of 2 kPa, heating gently to remove the last traces of solvent. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ephedrine *(RS 121)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (4).

TESTS

Acidity or alkalinity
pH, 4.0 to 7.0, Appendix V L.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 80 volumes of *propan-2-ol*, 15 volumes of 13.5M *ammonia* and 5 volumes of *chloroform* as the mobile phase. Apply separately to the plate 20 µL of each of the following solutions. For solution (1) use the nasal drops diluted, if necessary, with *water* to contain 0.5% w/v of Ephedrine Hydrochloride. For solution (2) dilute 1 volume of solution (1) to 5 volumes with *methanol*. For solution (3) dilute 1 volume of solution (1) to 200 volumes with *water*. Solution (4) contains 0.1% w/v of *ephedrine hydrochloride BPCRS* in *methanol*. After removal of the plate, allow it to dry in air, spray with *ninhydrin solution* and heat at 100° for 5 minutes. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3). Disregard any spot of lighter colour than the background and any spot remaining on the line of application.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) is a 0.1% w/v solution of *ephedrine hydrochloride BPCRS* in *methanol (65%)*. For solution (2) dilute the nasal drops with *methanol (80%)* to contain 0.1% w/v of Ephedrine Hydrochloride.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable), (b) 0.005M *dioctyl sodium sulfosuccinate* in a mixture of 65 volumes of *methanol*, 35 volumes of *water* and 1 volume of *glacial acetic acid* as the mobile phase with a flow rate of 2 mL per minute and (c) a detection wavelength of 263 nm.

www.webofpharma.com

Calculate the content of $C_{10}H_{15}NO,HCl$ in the nasal drops using the declared content of $C_{10}H_{15}NO,HCl$ in *ephedrine hydrochloride BPCRS*.

When ephedrine nasal drops are prescribed or demanded no strength being stated, nasal drops containing 0.5% w/v of ephedrine hydrochloride shall be dispensed or supplied.

Ephedrine Hydrochloride Tablets

Action and use
Adrenoceptor agonist.

DEFINITION
Ephedrine Hydrochloride Tablets contain Ephedrine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ephedrine hydrochloride, $C_{10}H_{15}NO,HCl$
92.5 to 107.5% of the stated amount.

IDENTIFICATION
A. Shake a quantity of the tablets containing 0.1 g of Ephedrine Hydrochloride with 20 mL of 0.1M *hydrochloric acid*, filter, wash the filtrate with two 20 mL quantities of *chloroform* and discard the chloroform. Make the aqueous layer alkaline with 5M *ammonia* and extract with two 30 mL quantities of a mixture of 3 volumes of *chloroform* and 1 volume of *ethanol (96%)*. Dry the combined extracts over *anhydrous sodium sulfate*, filter and evaporate to a low volume at a pressure of 2 kPa. Prepare a disc using 0.3 g of *potassium bromide*, apply the chloroform solution to the surface of the disc and heat at 50° for 2 minutes. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of ephedrine *(RS 121)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (3).

C. Triturate a quantity of the powdered tablets containing 0.4 g of Ephedrine Hydrochloride with two 10 mL quantities of *chloroform* and discard the chloroform. Macerate the residue with 30 mL of warm *ethanol (96%)* for 20 minutes, filter, evaporate the filtrate to dryness on a water bath and dry the residue at 80°. Dissolve 10 mg of the residue in 1 mL of *water* and add 0.1 mL of *weak copper sulfate solution* followed by 1 mL of 5M *sodium hydroxide*; a violet colour is produced. Add 1 mL of *ether* and shake; the ether layer is purple and the aqueous layer is blue.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract a quantity of the powdered tablets containing 0.10 g of Ephedrine Hydrochloride with 5 mL of *methanol*, filter and use the filtrate.

(2) Dilute 1 volume of solution (1) to 10 volumes with *methanol*.

(3) 0.20% w/v of *ephedrine hydrochloride BPCRS* in *methanol*.

(4) Dilute 1 volume of solution (1) to 200 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with *ninhydrin solution* and heat at 110° for 5 minutes.

MOBILE PHASE

5 volumes of *chloroform*, 15 volumes of 13.5M *ammonia* and 80 volumes of *propan-2-ol*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (4). Disregard any spot of lighter colour than the background.

ASSAY
Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 50 mg of Ephedrine Hydrochloride with 30 mL of *methanol* for 10 minutes, add sufficient *water* to produce 50 mL, filter through glass-fibre paper (Whatman GF/C is suitable) and use the filtrate.

(2) 0.1% w/v of ephedrine hydrochloride BPCRS in methanol (60%).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable)

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 263 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.005M *dioctyl sodium sulfosuccinate* in a mixture of 1 volume of *glacial acetic acid*, 35 volumes of *water* and 65 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{10}H_{15}NO,HCl$ using the declared content of $C_{10}H_{15}NO,HCl$ in *ephedrine hydrochloride BPCRS*.

Epirubicin Injection

Action and use
Anthracycline antibacterial; cytostatic.

DEFINITION
Epirubicin Injection is a sterile solution of Epirubicin Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of epirubicin hydrochloride, $C_{27}H_{29}NO_{11},HCl$
95.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Dilute a volume of the injection containing 10 mg of Epirubicin Hydrochloride to 100 mL with *water* and further dilute 5 mL to 50 mL with *water*. The *light absorption* of the resulting solution, Appendix II B, in the range 220 to 350 nm exhibits three maxima at 233, 253 and 292 nm.

www.webofpharma.com

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 2.5 to 4.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Allow the solutions to stand for 3 hours before use.

(1) Dilute a volume of the injection with sufficient of the mobile phase to produce a solution containing 0.1% w/v of Epirubicin Hydrochloride.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) 0.01% w/v of each of *doxorubicin hydrochloride BPCRS* and *epirubicin hydrochloride BPCRS* in the mobile phase.

(4) Dissolve 10 mg of *doxorubicin hydrochloride BPCRS* in a mixture of 5 mL of *water* and 5 mL of *orthophosphoric acid* and allow to stand for 30 minutes. Adjust the pH of the solution to 2.6 with an 8% w/v solution of *sodium hydroxide*, add 15 mL of *acetonitrile* and 10 mL of *methanol* and mix (generation of impurity A).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *trimethylsilyl silica gel for chromatography* (6 µm) (Zorbax TMS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2.5 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for 3.5 times the retention time of epirubicin.

MOBILE PHASE

17 volumes of *methanol*, 29 volumes of *acetonitrile* and 54 volumes of a solution containing 0.37% w/v of *sodium dodecyl sulfate* and 2.8% v/v of 1M *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions the retention times relative to epirubicin (retention time about 9.5 minutes) are: impurity A, about 0.3; impurity B, about 0.4; impurity C, about 0.8; impurity E, about 1.1; impurity D, about 1.5; impurity F, about 1.7; impurity G, about 2.1.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to doxorubicin and epirubicin is at least 2.0.

LIMITS

Identify any peak in the chromatogram obtained with solution (1) corresponding to impurity A using the second most abundant peak in the chromatogram obtained with solution (4) and multiply the area of this peak by the corresponding correction factor: 0.7.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A (doxorubicin aglycone, doxorubicinone), is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the area of any peak corresponding to impurity C (doxorubicin) is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the area of any other *secondary peak* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of all the *secondary peaks* is not greater than four times the area of the principal peak in the chromatogram obtained with solution (2) (4%).

Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

Bacterial endotoxins

Carry out the test for *bacterial endotoxins*, Appendix XIV C. Dilute the injection, if necessary, with *water BET* to give a solution containing 2 mg per mL of Epirubicin Hydrochloride (solution A). The endotoxin limit concentration of solution A is not more than 2.2 IU per mL.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Allow the solutions to stand for 3 hours before use.

(1) Dilute a volume of the injection with sufficient of the mobile phase to produce a solution containing 0.1% w/v of Epirubicin Hydrochloride.

(2) 0.1% w/v of *epirubicin hydrochloride BPCRS* in the mobile phase.

(3) 0.01% w/v of each of *doxorubicin hydrochloride BPCRS* and *epirubicin hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *trimethylsilyl silica gel for chromatography* (6 µm) (Zorbax TMS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2.5 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

17 volumes of *methanol*, 29 volumes of *acetonitrile* and 54 volumes of a solution containing 0.37% w/v of *sodium dodecyl sulfate* and 2.8% v/v of 1M *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to doxorubicin and epirubicin is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{27}H_{29}NO_{11}$,HCl in the injection using the declared content of $C_{27}H_{29}NO_{11}$,HCl in *epirubicin hydrochloride BPCRS*.

STORAGE

Epirubicin Injection should be stored at a temperature of 2° to 8°.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Epirubicin Hydrochloride.

www.webofpharma.com

Ergocalciferol Injection

Action and use
Vitamin D analogue (Vitamin D_2).

DEFINITION
Ergocalciferol Injection is a sterile solution containing 0.75% w/v of Ergocalciferol in Ethyl Oleate.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of ergocalciferol, $C_{28}H_{44}O$
0.67 to 0.83% w/v.

CHARACTERISTICS
A pale yellow, oily liquid.

IDENTIFICATION
To 1 mL of a 0.2% v/v solution of the injection in *ethanol-free chloroform* add 9 mL of *antimony trichloride solution*. The *light absorption* of the resulting solution, Appendix II B, exhibits a maximum at 500 nm.

ASSAY
Carry out the following procedure in subdued light. Dilute 0.1 g of the injection to 50 mL with dry *1,2-dichloroethane* that has been purified by passing it through a column of *silica gel*. To 1 mL of this solution add rapidly 9 mL of *antimony trichloride in dichloroethane solution* and measure the *absorbance* of the solution at 500 and 550 nm, Appendix II B, 90 to 120 seconds after adding the reagent. Repeat the operation using 1 mL of a 0.002% w/v solution of *ergocalciferol BPCRS* in the dry, purified 1,2-dichloroethane, beginning at the words 'add rapidly 9 mL of *antimony trichloride solution* ...'. Calculate the result of the assay from the difference between the absorbances at 500 and 550 nm and using the declared content of $C_{28}H_{44}O$ in *ergocalciferol BPCRS*. Calculate the percentage w/v of ergocalciferol taking 0.87 g as the value of the weight per mL of the injection.

STORAGE
Ergocalciferol Injection should be protected from light.

LABELLING
The label states (1) that the preparation is for intramuscular use only; (2) the equivalent number of IU (units) of antirachitic activity (vitamin D) in 1 mL.

Each µg of ergocalciferol is equivalent to 40 IU of antirachitic activity (vitamin D).

When calciferol injection is prescribed or demanded, Colecalciferol Injection or Ergocalciferol Injection shall be dispensed or supplied.

Ergocalciferol Tablets

Action and use
Vitamin D analogue (Vitamin D_2).

DEFINITION
Ergocalciferol Tablets contain Ergocalciferol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ergocalciferol, $C_{28}H_{44}O$
90.0 to 125.0% of the stated amount.

IDENTIFICATION
A. In the test for Uniformity of content, the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (1).

B. Extract one tablet, in powder, with 5 mL of *dichloromethane*, filter and to 1 mL of the filtrate add 9 mL of *antimony trichloride solution*. A brownish red colour is produced.

TESTS
Uniformity of content
Tablets containing less than 2 mg and/or less than 2% w/w of Ergocalciferol comply with the requirements stated under Tablets using the following method of analysis. Carry out the following procedure protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) 0.001% w/v of *ergocalciferol BPCRS* in *hexane*.

(2) For tablets containing more than 0.25 mg of ergocalciferol prepare the solution in the following manner. Add 4 mL of *water* to one tablet in an amber flask and disperse with the aid of ultrasound. Add 12 mL of *dimethyl sulfoxide*, mix, extract with 100 mL of *hexane* by shaking for 30 minutes, centrifuge the hexane layer and use the clear supernatant liquid.

For tablets containing 0.25 mg or less carry out the same procedure but using 2 mL of *water*, 6 mL of *dimethyl sulfoxide* and 25 mL of *hexane*.

(3) Dissolve 0.5 g of *cholecalciferol for performance test EPCRS* in 2 mL of *toluene* and dilute to 10 mL with the mobile phase; heat under a reflux condenser in a water bath at 90° for 45 minutes and cool.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Partisil is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

Inject a suitable volume of solution (1) and record the chromatogram using a sensitivity such that the height of the peak due to ergocalciferol is more than 50% of full-scale deflection. Repeat the operation using solution (2) and injecting the same volume.

MOBILE PHASE

8 volumes of *pentan-1-ol* and 992 volumes of *hexane*.

SYSTEM SUITABILITY

Inject 20 µL of solution (3) and record the chromatogram using a sensitivity such that the height of the peak due to colecalciferol is more than 50% of full-scale deflection. When the chromatogram is recorded under the prescribed conditions, approximate retention times relative to colecalciferol are 0.4 for precolecalciferol and 0.5 for *trans*-colecalciferol. The test is not valid unless the *resolution factor* between the peaks corresponding to precolecalciferol and *trans*-colecalciferol is at least 1.0. If necessary, adjust the proportions of the constituents and the flow rate of the mobile phase to obtain this resolution.

DETERMINATION OF CONTENT

Calculate the content of ergocalciferol, $C_{28}H_{44}O$, in each tablet using the declared content of $C_{28}H_{44}O$ in *ergocalciferol BPCRS* and using peak heights.

www.webofpharma.com

ASSAY

For tablets containing less than 2 mg and/or less than 2% w/w of Ergocalciferol

Use the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing 2 mg or more and 2% w/w or more of Ergocalciferol

Carry out the following procedure in subdued light. Weigh and powder 25 tablets, or more if necessary. To a quantity of the powdered tablets containing 6 mg of Ergocalciferol add 50 mL of *ethanol (96%)*, 14 mL of *glycerol* and 20 mL of a 50% w/v solution of *potassium hydroxide*. Boil under a reflux condenser for 30 minutes, swirling occasionally, add 110 mL of *water* and allow to stand for 10 minutes with occasional stirring. Cool and add sufficient *ethanol (96%)* to produce 250 mL. Shake 5 mL with 25 mL of *petroleum spirit (boiling range, 40° to 60°)* for 3 minutes and evaporate duplicate 5 mL portions of the extract to dryness in a current of *oxygen-free nitrogen*. Dissolve each residue in 1 mL of *ethanol-free chloroform*, add rapidly 9 mL of *antimony trichloride solution* and measure the *absorbance* of each solution at 500 nm and at 550 nm, 90 to 120 seconds after adding the reagent, Appendix II B. Repeat the operations using duplicate 1 mL portions of a solution containing a known amount of *ergocalciferol BPCRS* in *ethanol-free chloroform* and beginning at the words 'add rapidly 9 mL of *antimony trichloride solution*...'. Subtract the absorbance at 550 nm from that at 500 nm and calculate the content of ergocalciferol in mg from the average value so obtained and from the amount of ergocalciferol in the reference solution using the declared content of $C_{28}H_{44}O$ in *ergocalciferol BPCRS*.

LABELLING

The label states the equivalent number of IU (units) of antirachitic activity (vitamin D) per tablet.

Each µg of ergocalciferol is equivalent to 40 IU of antirachitic activity (vitamin D).

When calciferol tablets are prescribed or demanded, Colecalciferol Tablets or Ergocalciferol Tablets shall be dispensed or supplied.

Ergometrine Injection

Action and use
Oxytocic.

DEFINITION

Ergometrine Injection is a sterile solution of Ergometrine Maleate in Water for Injections. The acidity of the solution is adjusted to pH 3 by the addition of maleic acid.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of ergometrine maleate, $C_{19}H_{23}N_3O_2,C_4H_4O_4$
90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A colourless or faintly yellow solution.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (5).

B. Exhibits a blue fluorescence.

C. To a volume containing 0.1 mg of Ergometrine Maleate, add 0.5 mL of *water* and 2 mL of *dimethylaminobenzaldehyde solution R6*. A deep blue colour is produced after about 5 minutes.

TESTS

Acidity
pH, 2.7 to 3.5, Appendix V L.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, in subdued light, using the following solutions in *methanol*. Protect from light any solutions not used immediately.

(1) Evaporate a volume of the injection containing 1 mg of Ergometrine Maleate to dryness at 20° at a pressure of 2 kPa and dissolve the residue in 0.25 mL.

(2) 0.010% w/v of *ergometrine maleate BPCRS*.

(3) 0.020% w/v of *ergometrine maleate BPCRS*.

(4) 0.040% w/v of *ergometrine maleate BPCRS*.

(5) 0.40% w/v of *ergometrine maleate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a suspension of *silica gel G* in 0.1M *sodium hydroxide* to prepare the plate.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

10 volumes of *methanol* and 90 volumes of *chloroform*.

LIMITS

Assess the intensities of any *secondary spots* in the chromatogram obtained with solution (1) by reference to the spots in the chromatograms obtained with solutions (2), (3) and (4). The total of the intensities so assessed does not exceed 10% of the intensity of the principal spot.

ASSAY

Carry out the following procedure protected from light using the following two solutions prepared at the same time.

(1) Dilute a suitable volume with sufficient *water* to produce a solution containing 0.004% w/v of Ergometrine Maleate. To 3 mL add 6 mL of *dimethylaminobenzaldehyde solution R6*, mix, cool to room temperature and allow to stand for 30 minutes.

(2) To 3 mL of a 0.004% w/v solution of *ergometrine maleate BPCRS* add 6 mL of *dimethylaminobenzaldehyde solution R6*, mix, cool to room temperature and allow to stand for 30 minutes.

Measure the *absorbance* of solution (2) at the maximum at 545 nm, Appendix II B, using in the reference cell a solution prepared by mixing 6 mL of *dimethylaminobenzaldehyde solution R6* and 3 mL of *water*. Without delay replace solution (2) with solution (1), using the same cell, and measure the *absorbance* of solution (1) at the same wavelength. Calculate the content of $C_{19}H_{23}N_3O_2,C_4H_4O_4$ using the declared content of $C_{19}H_{23}N_3O_2,C_4H_4O_4$ in *ergometrine maleate BPCRS*.

STORAGE

Ergometrine Injection should be protected from light and stored at a temperature of 2° to 8°.

www.webofpharma.com

Ergometrine and Oxytocin Injection

Action and use
Oxytocic.

DEFINITION
Ergometrine and Oxytocin Injection is a sterile solution containing Ergometrine Maleate and either Oxytocin or Oxytocin Concentrated Solution in Water for Injections. The acidity of the solution is adjusted to pH 3.3 by the addition of maleic acid.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of ergometrine maleate, $C_{19}H_{23}N_3O_2,C_4H_4O_4$
90.0 to 110.0% of the stated amount.

Content of oxytocin, $C_{43}H_{66}N_{12}O_{12}S_2$
90.0 to 110.0% of the stated amount.

CHARACTERISTICS
A colourless solution.

IDENTIFICATION
A. In the test for Substances related to ergometrine, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. To a volume containing 0.1 mg of Ergometrine Maleate, add 0.5 mL of *water* and 2 mL of *dimethylaminobenzaldehyde solution R6*. After about 5 minutes a deep blue colour is produced.

C. In the Assay for oxytocin a peak in the chromatogram obtained with solution (2) corresponds to the peak due to oxytocin in the chromatogram obtained with solution (1).

TESTS
Acidity
pH, 2.9 to 3.5, Appendix V L.

Substances related to ergometrine
Carry out in subdued light the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 75 volumes of *chloroform*, 25 volumes of *methanol* and 3 volumes of *water* as the mobile phase but allowing the solvent front to ascend 14 cm above the line of application. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) add 10 mL of *absolute ethanol* to a volume of the injection containing 0.5 mg of Ergometrine Maleate and evaporate to dryness at a temperature not exceeding 30° at a pressure of 2 kPa; to the residue add 0.2 mL of a mixture of 1 volume of 13.5M *ammonia* and 9 volumes of *ethanol (80%)*, mix, centrifuge and use the supernatant liquid. Solutions (2), (3), (4), (5) and (6) contain 0.250% w/v, 0.0250% w/v, 0.0125% w/v, 0.0050% w/v and 0.00250% w/v of *ergometrine maleate BPCRS* respectively in a mixture of 1 volume of 3.5M *ammonia* and 9 volumes of *ethanol (80%)*. After removal of the plate, dry it in a current of cold air, spray with *dimethylaminobenzaldehyde solution R7* and dry the plate at 105° for 2 minutes. Assess the intensities of any *secondary spots* in the chromatogram obtained with solution (1) by reference to the spots in the chromatograms obtained with solutions (3) to (6), making allowance for area in assessing the intensities of spots of different Rf values. The sum of the intensities so assessed does not exceed 10% of the intensity of the principal spot.

ASSAY
For ergometrine maleate
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.05% w/v of *ergometrine maleate BPCRS*. Solution (2) is the injection diluted, if necessary, to give a solution containing 0.05% w/v of Ergometrine Maleate.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable) and maintained at 40°, (b) a mixture of 92 volumes of a 0.2% v/v solution of *orthophosphoric acid* and 8 volumes of *acetonitrile* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 320 nm.

Calculate the content of $C_{19}H_{23}N_3O_2,C_4H_4O_4$ from the declared content of $C_{19}H_{23}N_3O_2,C_4H_4O_4$ in *ergometrine maleate BPCRS*.

For oxytocin
Carry out the method for *liquid chromatography*, Appendix III D, injecting 0.2 mL of each of the following solutions. Solution (1) contains 8 µg of *oxytocin EPCRS* per mL. Solution (2) is the injection diluted, if necessary, to give a solution containing about 8 µg of Oxytocin per mL.

The chromatographic procedure may be carried out using a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable) and maintained at 40°, (b) a mixture of 85 volumes of a 0.2% v/v solution of *orthophosphoric acid* and 15 volumes of *acetonitrile* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 220 nm. If necessary adjust the content of *acetonitrile* in the mobile phase so that the retention time of oxytocin is about 14 minutes. Record the chromatogram for sufficient time to ensure elution of any preservatives.

The *column efficiency*, determined using the peak due to oxytocin in the chromatogram obtained with solution (1), should be not less than 50,000 theoretical plates per metre.

Calculate the content of $C_{43}H_{66}N_{12}O_{12}S_2$ from the declared content of peptide in *oxytocin EPCRS*.

STORAGE
Ergometrine and Oxytocin Injection should be protected from light and stored at a temperature of 2° to 8°.

LABELLING
The strength with respect to oxytocin is stated as the number of IU (units) per mL. The label also states the equivalent number of µg of oxytocin per mL.

Ergometrine Tablets

Action and use
Oxytocic.

DEFINITION
Ergometrine Tablets contain Ergometrine Maleate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ergometrine maleate, $C_{19}H_{23}N_3O_2,C_4H_4O_4$
90.0 to 110.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

A. In the test for Related substances the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (5).

B. Extract a quantity of the powdered tablets containing 2 mg of Ergometrine Maleate with 20 mL of *water*, filter and wash the residue with sufficient *water* to produce 20 mL. The solution exhibits a blue fluorescence.

C. To 2 mL of the solution obtained in test B add 4 mL of *dimethylaminobenzaldehyde solution R6*. A deep blue colour is produced after a few minutes.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions protected from light.

(1) Triturate a quantity of the powdered tablets containing 1 mg of Ergometrine Maleate with 0.2 mL of a 1% w/v solution of *domiphen bromide*, add 2 mL of *methanol*, centrifuge and remove the supernatant liquid. Extract the residue with two 1-mL quantities of *methanol*, evaporate the combined extracts to dryness at 20° at a pressure of 2 kPa and dissolve the residue in 0.25 mL of *methanol*; centrifuge if necessary.

(2) 0.010% w/v *ergometrine maleate BPCRS* in *methanol*.

(3) 0.020% w/v *ergometrine maleate BPCRS* in *methanol*.

(4) 0.040% w/v *ergometrine maleate BPCRS* in *methanol*.

(5) 0.40% w/v *ergometrine maleate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating a suspension of *silica gel G* in 0.1M *sodium hydroxide*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

10 volumes of *methanol* and 90 volumes of *chloroform*.

LIMITS

Assess the intensities of any *secondary spots* in the chromatogram obtained with solution (1) by reference to the spots in the chromatograms obtained with solutions (2), (3) and (4). The sum of the intensities so assessed does not exceed 10% of the intensity of the principal spot. In addition, no single *secondary spot* in the chromatogram obtained with solution (1) is more intense than the spot in the chromatogram obtained with solution (2).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Ergometrine Maleate comply with the requirements stated under Tablets using the following method of analysis. Carry out the following procedure protected from light. To one tablet add 10 mL of a 1% w/v solution of *(+)-tartaric acid*, shake for 30 minutes and centrifuge. Carry out the Assay described under Ergometrine Injection, beginning at the words 'Dilute a suitable volume...' and calculate the content of $C_{19}H_{23}N_3O_2,C_4H_4O_4$.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 2 mg of Ergometrine Maleate with 50 mL of a 1% w/v solution of *(+)-tartaric acid* for 30 minutes, centrifuge and use the supernatant liquid. Carry out the Assay described under Ergometrine Injection, beginning at the words 'To 3 mL...'.

STORAGE

Ergometrine Tablets should be protected from light.

Ergotamine Sublingual Tablets

Action and use

Oxytocic.

DEFINITION

Ergotamine Sublingual Tablets contain Ergotamine Tartrate. They may be flavoured.

The tablets comply with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of ergotamine tartrate, $(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (5).

B. Triturate a quantity of the powdered tablets containing 2 mg of Ergotamine Tartrate with 5 mL of *petroleum spirit (boiling range, 40° to 60°)*, discard the petroleum spirit and triturate the residue with 10 mL of *chloroform* saturated with 13.5M *ammonia*. Filter and evaporate the chloroform. Dissolve 1 mg of the residue in a mixture of 5 mL of *glacial acetic acid* and 5 mL of *ethyl acetate*. To 1 mL of this solution add 1 mL of *sulfuric acid*, with continuous shaking and cooling; a blue colour with a red tinge is produced. Add 0.1 mL of *iron(III) chloride solution R1* previously diluted with an equal volume of *water*; the red tinge becomes less apparent and the blue colour more pronounced.

TESTS

Related substances

Carry out the procedure protected from light and as rapidly as possible. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in a mixture of equal volumes of *dichloromethane* and *methanol*.

(1) Extract a quantity of the powdered tablets containing 1 mg of Ergotamine Tartrate with 2 mL of a mixture of equal volumes of *dichloromethane* and *methanol* and centrifuge. Remove the supernatant liquid, extract the residue with two 1-mL quantities of a mixture of equal volumes of *dichloromethane* and *methanol*, evaporate the combined extracts to dryness at 20° at a pressure of 2 kPa and dissolve the residue in 0.25 mL of a mixture of equal volumes of *dichloromethane* and *methanol*. Centrifuge and use the supernatant.

(2) 0.010% w/v of *ergotamine tartrate BPCRS*.

(3) 0.020% w/v of *ergotamine tartrate BPCRS*.

(4) 0.040% w/v of *ergotamine tartrate BPCRS*.

(5) 0.40% w/v of *ergotamine tartrate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254}.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

www.webofpharma.com

(e) After removal of the plate, dry in air and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

10 volumes of *methanol* and 90 volumes of *dichloromethane*.

LIMITS

Assess the intensities of any *secondary spots* in the chromatogram obtained with solution (1) by reference to the spots in the chromatograms obtained with solutions (2), (3) and (4). The sum of the intensities so assessed does not exceed 10% of the intensity of the principal spot in the chromatogram obtained with solution (1). In addition, any single *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (2.5%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Ergotamine Tartrate comply with the requirements stated under Oromucosal Preparations using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol (50%)* containing 1% v/v of 1M *hydrochloric acid*.

(1) Shake one tablet with *methanol (50%)* containing 1% v/v of 1M *hydrochloric acid* for 15 minutes and add a sufficient volume of the same solvent to produce a solution containing 0.008% w/v of Ergotamine Tartrate and filter.

(2) 0.008% w/v of *ergotamine tartrate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with particles of silica 5 µm in diameter the surface of which has been modified with chemically bonded hexyl groups (Spherisorb C6 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 volumes of a 9.0% w/v solution of *disodium hydrogen orthophosphate* adjusted to pH 5.0 with *orthophosphoric acid*, 45 volumes of *water* and 50 volumes of *methanol*. The mobile phase should be adjusted to pH 3.5 with *orthophosphoric acid*.

DETERMINATION OF CONTENT

Calculate the content of $(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$ in each tablet using the declared content of $(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$ in *ergotamine tartrate BPCRS*.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol (50%)* containing 1% v/v of 1M *hydrochloric acid*.

(1) Shake a quantity of powdered tablets containing 8 mg of Ergotamine Tartrate with 50 mL of *methanol (50%)* containing 1% v/v of 1M *hydrochloric acid* for 15 minutes, add a sufficient volume of the same solvent to produce 100 mL and filter.

(2) 0.008% w/v of *ergotamine tartrate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$ using the declared content of $(C_{33}H_{35}N_5O_5)_2,C_4H_6O_6$ in *ergotamine tartrate BPCRS*.

Gastro-resistant Erythromycin Capsules

Action and use

Macrolide antibacterial.

DEFINITION

Gastro-resistant Erythromycin Capsules contain Erythromycin. They are manufactured using gastro-resistant capsule shells or prepared by filling capsules with granules or particles covered with a gastro-resistant coating.

The capsules comply with the requirements stated under Capsules and with the following requirements.

IDENTIFICATION

A. Shake a quantity of the mixed capsule contents containing 0.1 g of Erythromycin with 5 mL of *dichloromethane*, decolourise, if necessary, with *activated charcoal*, filter through a 0.45-µm PTFE filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, after drying *in vacuo* at 60° for 10 minutes, is concordant with the *reference spectrum* of erythromycin *(RS 123)*.

B. Dissolve a quantity of the mixed capsule contents containing 3 mg of Erythromycin as completely as possible in 2 mL of *acetone* and add 2 mL of *hydrochloric acid*; an orange colour is produced which changes to red and then to deep purplish red. Add 2 mL of *chloroform* and shake; the chloroform layer becomes purple.

TESTS

Dissolution

Carry out the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 50 revolutions per minute.

(b) Use 900 mL of 0.06M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Place one capsule in the basket. After 1 hour remove the basket from the dissolution medium, replace the 0.06M *hydrochloric acid* with 900 mL of a 0.05M phosphate buffer solution pH 6.8, prepared as described below, previously held at 37° and immediately lower the basket into the dissolution medium and rotate at 50 revolutions per minute. After 1 hour withdraw a sample of the medium, filter (discarding the first 2 mL of filtrate), transfer 5 mL of the filtered solution to each of 2 volumetric flasks and then carry out the following procedures (A and B). Prepare the 0.05M phosphate buffer solution pH 6.8 in the following manner: Dissolve 136 g of *potassium dihydrogen orthophosphate* in 1000 mL of water; separately dissolve 17.9 g of *sodium hydroxide* in 1000 mL of *water*; mix the two solutions and dilute to 20 litres with *water*; the pH of the final solution is about 6.8.

Procedure A Add 1 mL of 0.5M *sulfuric acid*, mix well and stand at room temperature for 1 hour. Add 1 mL of 1M *sodium hydroxide* and mix. Add 2 mL of a solution containing 2.76% w/v of *sodium hydroxide* and 6.24% w/v of *anhydrous disodium hydrogen orthophosphate* in *water*, mix, heat

www.webofpharma.com

at 60° for 15 minutes and cool to room temperature in an ice bath. Add sufficient *water* to produce 25 mL and measure the *absorbance* of the final solution at the maximum at 236 nm, Appendix II B, using *water* in the reference cell.

Procedure B Add 2 mL of a solution containing 2.76% w/v of *sodium hydroxide* and 6.24% w/v of *anhydrous disodium hydrogen orthophosphate* in *water*, mix, heat at 60° for 15 minutes and cool to room temperature in an ice bath. Add sufficient *water* to produce 25 mL and measure the *absorbance* of the final solution at the maximum at 236 nm, Appendix II B, using *water* in the reference cell.

DETERMINATION OF CONTENT

Measure the *absorbances* of suitable solutions of *erythromycin A BPCRS* in dissolution medium which have been prepared in a similar manner beginning at the words "transfer 5 mL of the filtered solution to each of 2 volumetric flasks ..." and calculate the content of $C_{37}H_{67}NO_{13}$ in the medium from the difference in *absorbance* obtained using procedures A and B and using the declared content of $C_{37}H_{67}NO_{13}$ in *erythromycin A BPCRS*.

The amount of erythromycin released is not less than 80% of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the mixed capsule contents containing 40 mg of Erythromycin in 10 mL of a mixture of 1 volume of *methanol* and 3 volumes of *citro-phosphate buffer pH 7.0* (solvent A), filter and use the filtrate.

(2) 0.4% w/v of *erythromycin A BPCRS* in solvent A.

(3) 0.02% w/v of each of *erythromycin B BPCRS* and *erythromycin C BPCRS* in solvent A.

(4) 0.012% w/v of *erythromycin A BPCRS* in solvent A.

(5) Dissolve 5 mg of N-*demethylerythromycin A BPCRS* in solution (3), add 1 mL of solution (2) and sufficient of solution (3) to produce 25 mL.

(6) Transfer 40 mg of *erythromycin A BPCRS* to a glass vial and spread evenly such that it forms a layer not more than about 1 mm thick. Heat at 130° for 4 hours, allow to cool and dissolve in sufficient of solvent A to produce 10 mL (generation of impurities E and F).

CHROMATOGRAPHIC CONDITIONS

(a) Use a column (25 cm × 4.6 mm) packed with *styrene-divinylbenzene copolymer* (8 µm) with a pore size of 100 nm (PLRP-S is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2.0 mL per minute.

(d) Maintain the temperature of the column and at least one third of the tubing preceding the column at 70°.

(e) Use a detection wavelength of 215 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

To 50 mL of a 3.5% w/v solution of *dipotassium hydrogen orthophosphate*, adjusted to pH 9.0 with 1M *orthophosphoric acid*, add 400 mL of *water*, 165 mL of *2-methylpropan-2-ol* and 30 mL of *acetonitrile* and dilute to 1000 mL with *water*.

For solution (1) allow the chromatography to proceed for 5 times the retention time of the peak corresponding to erythromycin A.

When the chromatograms are recorded using the prescribed conditions the retention time of erythromycin A is about 15 minutes. The retention times relative to erythromycin A are: impurity A, about 0.3; impurity B, about 0.45; erythromycin C, about 0.5; impurity C, about 0.9; impurity D, about 1.4; impurity F, about 1.5; erythromycin B, about 1.8; impurity E, about 4.3.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between the peaks corresponding to *N*-demethylerythromycin A and erythromycin C is at least 0.8 and the *resolution factor* between the peaks corresponding to *N*-demethylerythromycin A and erythromycin A is at least 5.5. If necessary, adjust the concentration of *2-methylpropan-2-ol* in the mobile phase (180 mL has been found to be suitable) or reduce the flow rate to 1.5 or 1.0 mL per minute.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities E and F using solution (6) and multiply the areas of these peaks by the corresponding correction factors: impurity E, 0.09; impurity F, 0.15.

In the chromatogram obtained with solution (1):

the area of any peak other than those peaks corresponding to erythromycin A, erythromycin B and erythromycin C, identified from the peaks in the chromatograms obtained with solutions (2) and (3), is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (3%);

the sum of the areas of any such peaks is not greater than 2.3 times the area of the principal peak in the chromatogram obtained with solution (4) (7%).

Disregard any peaks due to excipients and any peak with an area less than 0.02 times the area of the principal peak in the chromatogram obtained with solution (4) (0.06%).

Water

The contents of the capsules contain not more than 7.5% w/w of water, Appendix IX C, using 10% w/v of *imidazole* in *methanol* in the titration vessel.

ASSAY

Dissolve a quantity of the mixed contents of 20 capsules containing the equivalent of 25 mg of erythromycin as completely as possible in sufficient *methanol* to produce 100 mL and carry out the *microbiological assay of antibiotics* for erythromycin, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. Calculate the content of erythromycin in the capsules, taking each 1000 IU found to be equivalent to 1 mg of erythromycin. The upper fiducial limit of error is not less than 95.0% and the lower fiducial limit of error is not more than 110.0% of the stated content.

STORAGE

Gastro-resistant Erythromycin Capsules should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Erythromycin.

www.webofpharma.com

Gastro-resistant Erythromycin Tablets

Erythromycin Tablets

Action and use
Macrolide antibacterial.

DEFINITION

Gastro-resistant Erythromycin Tablets contain Erythromycin. They are made gastro-resistant by enteric-coating or by other means.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of erythromycins, calculated as the sum of erythromycin A ($C_{37}H_{67}NO_{13}$), erythromycin B ($C_{37}H_{67}NO_{12}$) and erythromycin C ($C_{36}H_{65}NO_{13}$)
90.0 to 110.0% of the stated amount of Erythromycin.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.1 g of Erythromycin with 5 mL of *dichloromethane*, decolourise, if necessary, with *activated charcoal*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, after drying at a pressure not exceeding 0.7 kPa, is concordant with the *reference spectrum* of erythromycin *(RS 123)*.

B. Dissolve a quantity of the powdered tablets containing 3 mg of Erythromycin as completely as possible in 2 mL of *acetone* and add 2 mL of *hydrochloric acid*; an orange colour is produced which changes to red and then to deep purplish red. Add 2 mL of *chloroform* and shake; the chloroform layer becomes purple.

TESTS

Disintegration
Tablets covered with a gastro-resistant coating comply with the requirements stated under Tablets but operating the apparatus for 1 hour in 0.1M *hydrochloric acid*.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using solutions (1), (2), (3), (4) and (6) described under Assay.

The chromatographic conditions described under Assay may be used.

Inject 0.1 mL of each solution. For solution (1) allow the chromatography to proceed for 5 times the retention time of the peak corresponding to erythromycin A.

When the chromatograms are recorded using the prescribed conditions the retention time of erythromycin A is about 15 minutes. The retention times relative to erythromycin A are: impurity A, about 0.3; impurity B, about 0.45; erythromycin C, about 0.5; impurity C, about 0.9; impurity D, about 1.4; impurity F, about 1.5; erythromycin B, about 1.8; impurity E, about 4.3.

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities E and F using solution (6) and multiply the areas of these peaks by the corresponding correction factors: impurity E, 0.09; impurity F, 0.15. In the chromatogram obtained with solution (1) the area of any peak other than those peaks corresponding to erythromycin A, erythromycin B and erythromycin C, identified from the peaks in the chromatograms obtained with solutions (2) and (3), is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (3%) and the sum of the areas of any such peaks is not greater than 2.3 times the area of the principal peak in the chromatogram obtained with solution (4) (7%). Disregard any peak with an area less than 0.02 times the area of the principal peak in the chromatogram obtained with solution (4) (0.06%).

The content of each of erythromycin B and erythromycin C, as determined under Assay, is not more than 5%.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Weigh and powder 20 tablets (if necessary, remove the coating from 20 tablets using a sharp blade, taking care not to damage the cores, weigh the cores and powder). For solution (1) dissolve a quantity of the powdered tablets containing 40 mg of Erythromycin in 10 mL of a mixture of 1 volume of *methanol* and 3 volumes of *citro-phosphate buffer pH 7.0*, filter and use the filtrate. Solution (2) contains 0.4% w/v of *erythromycin A BPCRS* in a mixture of 1 volume of *methanol* and 3 volumes of *citro-phosphate buffer pH 7.0* (solvent A). Solution (3) contains 0.02% w/v of each of *erythromycin B BPCRS* and *erythromycin C BPCRS* in solvent A. Solution (4) contains 0.012% w/v of *erythromycin A BPCRS* in solvent A. For solution (5) dissolve 5 mg of *N-demethylerythromycin A BPCRS* in solution (3), add 1 mL of solution (2) and sufficient of solution (3) to produce 25 mL. For solution (6) transfer 40 mg of *erythromycin A BPCRS* to a glass vial and spread evenly such that it forms a layer not more than about 1 mm thick. Heat at 130° for 4 hours, allow to cool and dissolve in sufficient of solvent A to produce 10 mL (generation of impurities E and F). The solutions can be used within one day if stored at 5°.

The chromatographic procedure may be carried out using (a) a column (25 cm × 4.6 mm) packed with *styrene-divinylbenzene copolymer* (8 µm) with a pore size of 100 nm (PLRP-S is suitable), (b) as mobile phase at a flow rate of 2.0 mL per minute a solution prepared in the following manner: to 50 mL of a 3.5% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 9.0 with 1M *orthophosphoric acid* add 400 mL of *water*, 165 mL of *2-methylpropan-2-ol* and 30 mL of *acetonitrile* and dilute to 1000 mL with *water* and (c) a detection wavelength of 215 nm. Maintain the temperature of the column at 70° using a water bath for the column and at least one third of the tubing preceding the column.

Inject 0.1 mL of solution (5). Adjust the sensitivity of the detector so that the height of the peaks is at least 25% of the full scale of the recorder. The substances are eluted in the following order: *N*-demethylerythromycin A, erythromycin C, erythromycin A and erythromycin B. The test is not valid unless the *resolution factor* between the peaks corresponding to *N*-demethylerythromycin A and erythromycin C is at least 0.8 and the *resolution factor* between the peaks corresponding to *N*-demethylerythromycin A and erythromycin A is at least 5.5. If necessary, adjust the concentration of 2-methylpropan-2-ol in the mobile phase (180 mL has been found to be suitable) or reduce the flow rate to 1.5 or 1.0 mL per minute.

Inject alternately 0.1 mL of solutions (1), (2) and (3). Calculate the content of erythromycin A using the chromatograms obtained with solutions (1) and (2) and from the declared content of $C_{37}H_{67}NO_{13}$ in *erythromycin A BPCRS*. Calculate the contents of erythromycin B and erythromycin C using the chromatograms obtained with solutions (1) and (3) and from the declared contents of $C_{37}H_{67}NO_{12}$ and $C_{36}H_{65}NO_{13}$ in *erythromycin B BPCRS* and *erythromycin C BPCRS* respectively.

www.webofpharma.com

STORAGE
Gastro-resistant Erythromycin Tablets should be protected from light.

IMPURITIES
The impurities limited by the requirements of this monograph include those listed under Erythromycin.

Erythromycin Estolate Capsules

Action and use
Macrolide antibacterial.

DEFINITION
Erythromycin Estolate Capsules contain Erythromycin Estolate.

The capsules comply with the requirements stated under Capsules and with the following requirements.

IDENTIFICATION
A. The *infrared absorption spectrum* of the contents of the capsules, Appendix II A, is concordant with the *reference spectrum* of erythromycin estolate *(RS 124)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) is similar in position and colour to that in the chromatogram obtained with solution (3).

TESTS
Disintegration
Maximum time, 30 minutes, Appendix XII A1. Use a 0.6% v/v solution of *hydrochloric acid* in place of *water*.

Water
The contents of the capsules contain not more than 5.0% w/w of water, Appendix IX C. Use 0.5 g.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing the equivalent of 0.4 g of erythromycin with 100 mL of *acetone*, filter and use the filtrate.

(2) Dilute 1 volume of solution (1) to 4 volumes with *acetone*.

(3) 0.13% w/v of *erythromycin estolate BPCRS* in *acetone*.

(4) 0.1% w/v each of *erythromycin estolate BPCRS* and *erythromycin ethylsuccinate BPCRS* in *acetone*.

(5) 0.01% w/v of *erythromycin A BPCRS* in *acetone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate allow it to dry in air, spray with *anisaldehyde solution*, heat at 110° for 5 minutes and allow to cool.

MOBILE PHASE

1 volume of a 15% w/v solution of *ammonium acetate*, previously adjusted to pH 7.0, 15 volumes of *ethanol (96%)* and 85 volumes of *chloroform*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated spots.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (5) (2.5%, with respect to erythromycin).

ASSAY
Dissolve a quantity of the mixed contents of 20 capsules containing the equivalent of 0.25 g of erythromycin in 400 mL of *methanol* and add 200 mL of sterile *phosphate buffer pH 7.0* and sufficient *water for injections* to produce 1000 mL. Maintain the solution at 60° for 3 hours, cool, filter and carry out the *microbiological assay of antibiotics* for erythromycin, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of erythromycin in a capsule of average content weight, taking each 1000 IU found to be equivalent to 1 mg of erythromycin. The upper fiducial limit of error is not less than 95.0% and the lower fiducial limit of error is not more than 110.0% of the stated content.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of erythromycin.

Erythromycin Ethyl Succinate Oral Suspension

Action and use
Macrolide antibacterial.

DEFINITION
Erythromycin Ethyl Succinate Oral Suspension is a suspension of Erythromycin Ethyl Succinate in a suitable flavoured vehicle. It is prepared by dispersing the dry ingredients in the specified volume of water just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids.

For the following tests prepare the oral suspension as directed on the label. The suspension examined immediately after preparation, unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

IDENTIFICATION
Dilute a quantity of the oral suspension containing the equivalent of 0.1 g of erythromycin to 25 mL with *water* and extract with two 10 mL quantities of *dichloromethane*. Wash the combined extracts with five 10 mL quantities of *water*, filter using silicone-treated filter paper (Phase Separator paper is suitable) and evaporate to dryness. The residue, after drying at 105° for 15 minutes complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of erythromycin ethyl succinate *(RS 125)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 1 volume of a 15% w/v solution of

www.webofpharma.com

ammonium acetate previously adjusted to pH 7.0, 15 volumes of *ethanol (96%)* and 85 volumes of *chloroform* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) dissolve a quantity of the residue in *acetone* to produce a solution containing the equivalent of 0.1% w/v of erythromycin. Solution (2) contains 0.1% w/v of *erythromycin ethylsuccinate BPCRS* in *acetone*. Solution (3) contains 0.1% w/v of *erythromycin ethylsuccinate BPCRS* and 0.1% w/v of *erythromycin estolate BPCRS* in *acetone*. After removal of the plate, allow it to dry in air, spray with *anisaldehyde solution*, heat at 110° for 5 minutes and allow to cool. The principal spot in the chromatogram obtained with solution (1) is similar in position and colour to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

TESTS

Acidity or alkalinity

pH, 6.5 to 9.5, Appendix V L.

ASSAY

To a weighed quantity of the oral suspension containing the equivalent of 0.25 g of erythromycin add 10 mL of *water* and swirl to mix. Add 200 mL of *methanol*, shake for 1 hour and dilute to 500 mL with *methanol*. Dilute 10 mL to 100 mL with *phosphate buffer pH 8.0*, stand at room temperature for 16 hours and carry out the *microbiological assay of antibiotics* for erythromycin, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Repeat the procedure using a portion of the oral suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

Calculate the content of erythromycin in the oral suspension taking each 1000 IU found to be equivalent to 1 mg of erythromycin. When freshly constituted the lower fiducial limit of error is not more than 120.0% of the stated amount and when stored at the temperature and for the period stated on the label during which the oral suspension may be expected to be satisfactory for use, the upper fiducial limit of error is not less than 90.0% of the stated content.

STORAGE

The oral suspension should be stored at the temperature and used within the period stated on the label.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of erythromycin.

Erythromycin Ethyl Succinate Tablets

Action and use

Macrolide antibacterial.

DEFINITION

Erythromycin Ethyl Succinate Tablets contain Erythromycin Ethyl Succinate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing the equivalent of 0.1 g of erythromycin with 20 mL of a mixture of equal volumes of *chloroform* and *methanol* for 15 minutes. Centrifuge and evaporate the upper layer to dryness. Dissolve the residue in a minimum volume of *dichloromethane*, evaporate to dryness and dry at 105° for 15 minutes. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of erythromycin ethyl succinate *(RS 125)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) is similar in position and colour to that in the chromatogram obtained with solution (3).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing the equivalent of 0.1 g of erythromycin with 25 mL of a mixture of equal volumes of *chloroform* and *methanol* for 15 minutes, centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 4 volumes with a mixture of equal volumes of *chloroform* and *methanol*.

(3) 0.1% w/v of *erythromycin ethylsuccinate BPCRS* in *acetone*.

(4) 0.1% w/v of *erythromycin ethylsuccinate BPCRS* and 0.1% w/v of *erythromycin estolate BPCRS* in *acetone*.

(5) 0.020% w/v of *erythromycin A BPCRS* in *acetone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use *silica gel G* as the coating substance.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate allow it to dry in air, spray with *anisaldehyde solution*, heat at 110° for 5 minutes and allow to cool.

MOBILE PHASE

1 volume of a 15% w/v solution of *ammonium acetate*, previously adjusted to pH 7.0, 15 volumes of *ethanol (96%)* and 85 volumes of *chloroform* as the mobile phase.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated spots.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (5) (5%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powdered tablets containing the equivalent of 0.25 g of erythromycin add 200 mL of *methanol*, shake for 1 hour and dilute to 500 mL with *methanol*. Dilute 10 mL to 100 mL with *phosphate buffer pH 8.0*, stand at room temperature for 16 hours and carry out the *microbiological assay of antibiotics* for erythromycin, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of erythromycin in the tablets taking each 1000 IU found to be equivalent to 1 mg of erythromycin. The upper fiducial limit of error is not less than 97.0% and the lower fiducial limit of error is not more than 110.0% of the stated content.

www.webofpharma.com

STORAGE
Erythromycin Ethyl Succinate Tablets should be protected from light.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of erythromycin.

Erythromycin Lactobionate Infusion

Erythromycin Lactobionate Intravenous Infusion

Action and use
Macrolide antibacterial.

DEFINITION
Erythromycin Lactobionate Infusion is a sterile solution containing Erythromycin Lactobionate in Sodium Chloride Infusion. It is prepared by dissolving Erythromycin Lactobionate for Infusion in the requisite amount of Water for Injections and diluting the resulting solution with the requisite amount of Sodium Chloride Infusion.

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

STORAGE
Erythromycin Lactobionate Infusion should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

ERYTHROMYCIN LACTOBIONATE FOR INFUSION

Erythromycin Lactobionate for Intravenous Infusion

DEFINITION
Erythromycin Lactobionate for Infusion is a sterile material consisting of Erythromycin Lactobionate with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of erythromycins, calculated as the sum of erythromycin A ($C_{37}H_{67}NO_{13}$), erythromycin B ($C_{37}H_{67}NO_{12}$) and erythromycin C ($C_{36}H_{65}NO_{13}$)
90.0 to 110.0% of the stated amount of erythromycin.

IDENTIFICATION
A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of erythromycin lactobionate *(RS 126)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity of the contents of a sealed container in sufficient *methanol* to produce a solution containing the equivalent of 0.2% w/v of erythromycin.

(2) 0.2% w/v of *erythromycin A BPCRS* in *methanol*.

(3) 0.1% w/v of *lactobionic acid* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use *silica gel H* as the coating substance.

(b) Use the mobile phase described below.

(c) Apply 5 µL of each solution.

(d) Develop to 15 cm.

(e) Remove the plate, allow it to dry in air and spray with a 0.5% w/v solution of *potassium permanganate* in 1M *sodium hydroxide* and heat at 110° for 5 minutes.

MOBILE PHASE

A mixture of 3 volumes of *glacial acetic acid*, 10 volumes of *water* and 90 volumes of *methanol*.

CONFIRMATION

The chromatogram obtained with solution (1) shows two spots, one of which corresponds in position, colour and size to the principal spot in the chromatogram obtained with solution (2) and the other to the principal spot in the chromatogram obtained with solution (3).

C. To a quantity of the contents of a sealed container containing the equivalent of 5 mg of erythromycin add 5 mL of a 0.02% w/v solution of *xanthydrol* in a mixture of 1 volume of *hydrochloric acid* and 99 volumes of 5M *acetic acid*. A red colour develops.

TESTS

Acidity or alkalinity
pH of a solution containing the equivalent of 1.34% w/v of erythromycin, 6.5 to 7.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using solutions (1), (3) and (6) described under Assay.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used. For solution (1) allow the chromatography to proceed for 5 times the retention time of the peak corresponding to erythromycin A.

When the chromatograms are recorded using the prescribed conditions the retention time of erythromycin A is about 15 minutes. The retention times relative to erythromycin A are: impurity A, about 0.3; impurity B, about 0.45; erythromycin C, about 0.5; impurity C, about 0.9; impurity D, about 1.4; impurity F, about 1.5; erythromycin B, about 1.8; impurity E, about 4.3.

LIMITS

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities E and F using solution (6) and multiply the areas of these peaks by the corresponding correction factors: impurity E, 0.09; impurity F, 0.15.

In the chromatogram obtained with solution (1):

the area of any peak other than those peaks corresponding to erythromycin A, erythromycin B and erythromycin C is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (3%);

the sum of the areas of any such peaks is not greater than 2.3 times the area of the principal peak in the chromatogram obtained with solution (3) (7%).

Disregard any peak with an area less than 0.02 times the area of the principal peak in the chromatogram obtained with solution (3) (0.06%).

The content of each of erythromycin B and erythromycin C, as determined under Assay, is not more than 5%.

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 50 mg of erythromycin per mL; further dilute this solution with *water BET* to give a solution containing the equivalent of 0.2 mg of

www.webofpharma.com

erythromycin per mL (solution A). The endotoxin limit concentration of solution A is 0.07 IU of endotoxin per mL.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. The solutions can be used within one day if stored at 5°.

(1) Dissolve a quantity of the mixed contents of the 10 containers containing the equivalent of 40 mg of erythromycin in a mixture of 1 volume of *methanol* and 3 volumes of *citro-phosphate buffer pH 7.0* and dilute to 10 mL with the same mixture of solvents.

(2) 0.4% w/v of *erythromycin A BPCRS* in a mixture of 1 volume of *methanol* and 3 volumes of *citro-phosphate buffer pH 7.0.*

(3) 0.012% w/v of *erythromycin A BPCRS* in a mixture of 1 volume of *methanol* and 3 volumes of *citro-phosphate buffer pH 7.0.*

(4) 0.02% w/v of each of *erythromycin B BPCRS* and *erythromycin C BPCRS* in a mixture of 1 volume of *methanol* and 3 volumes of *citro-phosphate buffer pH 7.0.*

(5) Dissolve 5 mg of *N-demethylerythromycin A BPCRS* in solution (4), add 1 mL of solution (2) and sufficient of solution (4) to produce 25 mL.

(6) Transfer 40 mg of *erythromycin A BPCRS* to a glass vial and spread evenly such that it forms a layer not more than about 1 mm thick. Heat at 130° for 4 hours, allow to cool and dissolve in sufficient of solvent A to produce 10 mL (generation of impurities E and F).

CHROMATOGRAPHIC CONDITIONS

(a) Use a column (25 cm × 4.6 mm) packed with styrene-divinylbenzene copolymer (8 µm) with a pore size of 100 nm (PLRP-S is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2.0 mL per minute.

(d) Maintain the temperature of the column at 70° using a water bath for the column and at least one third of the tubing preceding the column.

(e) Use a detection wavelength of 215 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

To 50 mL of a 3.5% w/v solution of *dipotassium hydrogen orthophosphate*, adjusted to pH 9.0 with 1M *orthophosphoric acid*, add 400 mL of *water*, 165 mL of *2-methylpropan-2-ol* and 30 mL of *acetonitrile R1* and dilute to 1000 mL with *water*.

SYSTEM SUITABILITY

Inject solution (5). Adjust the sensitivity of the system so that the height of the peaks is at least 25% of the full-scale of the recorder. The substances are eluted in the following order: *N*-demethylerythromycin A, erythromycin C, erythromycin A and erythromycin B. The test is not valid unless the *resolution factor* between the peaks corresponding to *N*-demethylerythromycin A and erythromycin C is at least 0.8 and the *resolution factor* between the peaks corresponding to *N*-demethylerythromycin A and erythromycin A is at least 5.5. If necessary, adjust the concentration of 2-methylpropan-2-ol in the mobile phase or reduce the flow rate to 1.5 or 1.0 mL per minute.

DETERMINATION OF CONTENT

Calculate the percentage content of erythromycin A using the chromatograms obtained with solutions (1) and (2) and from the declared content of $C_{37}H_{67}NO_{13}$ in *erythromycin A BPCRS*. Calculate the percentage contents of erythromycin B and erythromycin C using the chromatograms obtained with solutions (1) and (4) and from the declared contents of $C_{37}H_{67}NO_{12}$ and $C_{36}H_{65}NO_{13}$ in *erythromycin B BPCRS* and *erythromycin C BPCRS* respectively.

LABELLING

The label of the sealed container states the quantity of active ingredient contained in it in terms of the equivalent amount of erythromycin.

Erythromycin Stearate Tablets

Action and use

Macrolide antibacterial.

DEFINITION

Erythromycin Stearate Tablets contain Erythromycin Stearate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

IDENTIFICATION

A. To a quantity of the powdered tablets containing the equivalent of 0.1 g of erythromycin add 10 mL of *water* and shake well. Decant the supernatant liquid and discard. Extract the residue by shaking with 10 mL of *methanol*, filter the extract and evaporate to dryness. The *infrared absorption spectrum*, Appendix II A, of the residue after drying at a pressure not exceeding 0.7 kPa is concordant with the *reference spectrum* of erythromycin stearate *(RS 127)*.

B. Dissolve a quantity of the powdered tablets containing the equivalent of 3 mg of erythromycin in 2 mL of *acetone* and add 2 mL of *hydrochloric acid*; an orange colour is produced which changes to red and then to deep violet-red. Add 2 mL of *chloroform* and shake; the chloroform layer becomes violet.

C. Extract a quantity of the powdered tablets containing the equivalent of 50 mg of erythromycin with 10 mL of *chloroform*, filter and evaporate to dryness. Heat 0.1 g of the residue gently with 5 mL of 2M *hydrochloric acid* and 10 mL of *water* until the solution boils; oily globules rise to the surface. Cool, remove the fatty layer, heat it with 3 mL of 0.1M *sodium hydroxide* and allow to cool; the solution sets to a gel. Add 10 mL of hot *water* and shake; the solution froths. To 1 mL add a 10% w/v solution of *calcium chloride*; a granular precipitate is produced which is insoluble in *hydrochloric acid*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of a 2.722% w/v solution of *sodium acetate*, the pH of which has been adjusted to 5.0 with *glacial acetic acid* and rotate the paddle at 50 revolutions per minute. Transfer 5 mL of a filtered sample to a graduated flask, add 40 mL of *glacial acetic acid* and 10 mL of a 0.5% w/v solution of *4-dimethylaminobenzaldehyde* in *glacial acetic acid* and dilute to 100 mL with a mixture of 35 volumes of *glacial acetic acid*

www.webofpharma.com

and 70 volumes of *hydrochloric acid*. Allow to stand for 15 minutes and measure the *absorbance* of the resulting solution at the maximum at 485 nm, Appendix II B, using in the reference cell dissolution medium that has been subjected to the conditions of the test. Prepare a suitable solution of *erythromycin stearate BPCRS* in the dissolution medium and filter. Transfer 5 mL of the filtered solution to a graduated flask, add 40 mL of *glacial acetic acid* and 10 mL of a 0.5% w/v solution of *4-dimethylaminobenzaldehyde* in *glacial acetic acid* and dilute to 100 mL with a mixture of 35 volumes of *glacial acetic acid* and 70 volumes of *hydrochloric acid*. Allow to stand for 15 minutes and measure the *absorbance* of the resulting solution at the maximum at 485 nm, Appendix II B, using in the reference cell dissolution medium that has been subjected to the conditions of the test. Calculate the total content of $C_{37}H_{67}NO_{13}$ in the medium from the *absorbances* obtained using the declared content of $C_{37}H_{67}NO_{13}$ in *erythromycin stearate BPCRS*.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing the equivalent of 25 mg of erythromycin as completely as possible in sufficient *methanol* to produce 100 mL and carry out the *microbiological assay of antibiotics* for erythromycin, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. Calculate the content of erythromycin in the tablets, taking each 1000 IU found to be equivalent to 1 mg of erythromycin. The upper fiducial limit of error is not less than 97.0% and the lower fiducial limit of error is not more than 110.0% of the stated content.

STORAGE

Erythromycin Stearate Tablets should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of erythromycin.

Erythromycin and Zinc Acetate Lotion

Erythromycin and Zinc Acetate Cutaneous Solution

Action and use
Macrolide antibacterial.

DEFINITION

Erythromycin and Zinc Acetate Lotion is a *cutaneous solution*. It contains 4% w/v of Erythromycin and 1.2% w/v of Zinc Acetate in a suitable ethanolic vehicle. It is prepared by dissolving the dry ingredients in the requisite volume of the vehicle provided before use.

The lotion complies with the requirements stated under Liquids for Cutaneous Application.

The dry ingredients comply with the requirements for Powders for Lotions stated under Liquids for Cutaneous Application and with the following requirements.

Content of erythromycins, calculated as the sum of erythromycin A ($C_{37}H_{67}NO_{13}$), erythromycin B ($C_{37}H_{67}NO_{12}$) and erythromycin C ($C_{36}H_{65}NO_{13}$)
95.0 to 105.0% of the stated amount of Erythromycin.

Content of zinc acetate, $C_4H_6O_4Zn,2H_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay for erythromycin, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Mix a quantity of the powder with sufficient *water* to produce a 5% w/v solution and filter. Add 0.5 mL of a 0.25M solution of *potassium hexacyanoferrate(II)* to 5 mL of the resulting solution and mix; a white precipitate is produced. Add 5 mL of 4M *hydrochloric acid*; the precipitate does not dissolve.

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using solutions (1), (2), (3), (4) and (6) described under Assay for erythromycin.

The chromatographic conditions described under the Assay for erythromycin may be used.

Inject 100 µL of each solution. For solution (1) allow the chromatography to proceed for 6 times the retention time of the peak corresponding to erythromycin A.

When the chromatograms are recorded using the prescribed conditions the retention time of erythromycin A is about 15 minutes. The retention times relative to erythromycin A are: impurity A, about 0.3; impurity B, about 0.45; erythromycin C, about 0.5; impurity C, about 0.9; impurity D, about 1.4; impurity F, about 1.5; erythromycin B, about 1.8; impurity E, about 4.3.

Identify any peaks in the chromatogram obtained with solution (1) corresponding to impurities E and F using solution (6) and multiply the areas of these peaks by the corresponding correction factors: impurity E, 0.09; impurity F, 0.15. In the chromatogram obtained with solution (1) the area of any peak other than those peaks corresponding to erythromycin A, erythromycin B and erythromycin C, identified from the peaks in the chromatograms obtained with solutions (2) and (3), is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (3%) and the sum of the areas of any such peaks is not greater than 2.3 times the area of the principal peak in the chromatogram obtained with solution (4) (7%). Disregard any peak with an area less than 0.02 times the area of the principal peak in the chromatogram obtained with solution (4) (0.06%).

The content of each of erythromycin B and erythromycin C, as determined under Assay, is not more than 5%.

ASSAY

For erythromycin

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 20 mL of a mixture of 1 volume of *methanol* and 3 volumes of *citro-phosphate buffer pH 7.0* (solvent A) to a quantity of the powder containing 80 mg of Erythromycin, mix with the aid of ultrasound for 5 minutes and allow to stand until phase separation has been completed. Centrifuge the lower layer and use the resulting clear solution. Solution (2) contains 0.4% w/v of *erythromycin A BPCRS* in solvent A. Solution (3) contains 0.02% w/v of each of *erythromycin B BPCRS* and *erythromycin C BPCRS* in solvent A. Solution (4) contains 0.012% w/v of *erythromycin A BPCRS* in solvent A. For solution (5) dissolve 5 mg of *N-demethylerythromycin A BPCRS* in solution (3), add 1 mL of solution (2) and sufficient of solution (3) to produce 25 mL. For solution (6) transfer 40 mg of *erythromycin A BPCRS* to a glass vial and

www.webofpharma.com

spread evenly such that it forms a layer not more than about 1 mm thick. Heat at 130° for 4 hours, allow to cool and dissolve in sufficient of solvent A to produce 10 mL (generation of impurities E and F). The solutions can be used within one day if stored at 5°.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *styrene-divinylbenzene copolymer* (8 µm) with a pore size of 100 nm (PLRP-S is suitable), (b) as the mobile phase with a flow rate of 2.0 mL per minute a solution prepared in the following manner: to 50 mL of a 3.5% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 9.0 with 1M *orthophosphoric acid* add 400 mL of *water*, 165 mL of *2-methylpropan-2-ol* and 30 mL of *acetonitrile* and dilute to 1000 mL with *water* and (c) a detection wavelength of 215 nm. Maintain the temperature of the column at 70° using a water bath for the column and at least one third of the tubing preceding the column.

Inject 100 µL of solution (5). Adjust the sensitivity of the detector so that the height of the peaks is at least 25% of the full scale of the recorder. The substances are eluted in the following order: *N*-demethylerythromycin A (impurity B), erythromycin C, erythromycin A and erythromycin B. The test is not valid unless the *resolution factor* between the peaks corresponding to *N*-demethylerythromycin A and erythromycin C is at least 0.8 and the *resolution factor* between the peaks corresponding to *N*-demethylerythromycin A and erythromycin A is at least 5.5. If necessary, adjust the concentration of 2-methylpropan-2-ol in the mobile phase (180 mL has been found to be suitable) or reduce the flow rate to 1.5 or 1.0 mL per minute.

Inject alternately 100 µL of solutions (1), (2) and (3). Calculate the content of erythromycin A using the chromatograms obtained with solutions (1) and (2) and from the declared content of $C_{37}H_{67}NO_{13}$ in *erythromycin A BPCRS*. Calculate the contents of erythromycin B and erythromycin C using the chromatograms obtained with solutions (1) and (3) and from the declared contents of $C_{37}H_{67}NO_{12}$ and $C_{36}H_{65}NO_{13}$ in *erythromycin B BPCRS* and *erythromycin C BPCRS* respectively.

For zinc acetate

To a quantity of the powder containing 0.2 g of Zinc Acetate add 5 mL of *dilute acetic acid*. Carry out the *complexometric titration of zinc*, Appendix VIII D. Each mL of 0.1M *disodium edetate VS* is equivalent to 21.95 mg of $C_4H_6O_4Zn,2H_2O$.

For the following tests prepare the lotion as directed on the label. The lotion complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of erythromycins, calculated as the sum of erythromycin A ($C_{37}H_{67}NO_{13}$), erythromycin B ($C_{37}H_{67}NO_{12}$) and erythromycin C ($C_{36}H_{65}NO_{13}$)

90.0 to 110.0% of the stated amount of Erythromycin.

Content of zinc acetate, $C_4H_6O_4Zn,2H_2O$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the Assay for erythromycin, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Evaporate a suitable volume of the lotion to dryness on a water bath, add 20 mL of water to the residue, mix, with shaking, and filter. Add 1 mL of a 0.25M solution of *potassium hexacyanoferrate(II)* to the resulting filtrate and mix; a white precipitate is produced. Add 10 mL of 4M *hydrochloric acid*; the precipitate does not dissolve.

TEST

Clarity and colour of solution

The solution is *clear*, Appendix IV A, and *colourless*, Appendix IV B, Method I.

ASSAY

For erythromycin

Carry out the Assay for erythromycin described in the requirements for the dry ingredients. For solution (1) use a volume of the lotion containing 80 mg of Erythromycin in place of the powder.

For zinc acetate

To a volume of the lotion containing 0.2 g of Zinc Acetate add 5 mL of *dilute acetic acid*. Carry out the *complexometric titration of zinc*, Appendix VIII D. Each mL of 0.1M *disodium edetate VS* is equivalent to 21.95 mg of $C_4H_6O_4Zn,2H_2O$.

STORAGE

Erythromycin and Zinc Acetate Lotion should be stored at the temperature and used within the period stated on the label.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Erythromycin.

Erythropoietin Injection

Action and use

Erythropoietin analogue.

DEFINITION

Erythropoietin Injection is a sterile solution of Erythropoietin Concentrated Solution in a suitable liquid. It is either supplied as a ready-to-use solution or it is prepared by dissolving Erythropoietin for Injection in the liquid stated on the label.

PRODUCTION

Where the product contains human serum albumin, it does not comply with the test for Dimers and related substances of higher molecular weight; however the manufacturing process is validated to show that aggregation does not occur.

The injection complies with the requirements stated under Parenteral Preparations and, when supplied as a ready-to-use solution, with the following requirements.

Potency

The estimated potency is not less than 80% and not more than 125% of the stated potency.

CHARACTERISTICS

A clear, colourless solution virtually free from particles.

IDENTIFICATION

A. It gives the appropriate response when examined using the conditions under Assay.

B. Carry out the method for *polyacrylamide gel electrophoresis*, Appendix III F, using slab gels 0.75 mm thick and about 16 cm square (or 7 cm × 8 cm) and 12% acrylamide as the resolving gel. For solution (1) concentrate or dilute, if necessary, the injection being examined to give a solution containing 2000 IU per mL in *water* and then add 1 volume of *SDS-PAGE sample buffer (concentrated)*. For solution (2) dissolve the contents of a vial of *erythropoietin EPBRP* in

www.webofpharma.com

water to give a solution containing 3012 IU per mL and then add 1 volume of *SDS-PAGE sample buffer (concentrated)*. Solution (3) is a solution of pre-stained molecular weight markers suitable for calibrating SDS-polyacrylamide gels in the range of 10 to 70 kDa and suitable for the electrotransfer to an appropriate membrane. Boil solutions (1), (2) and (3) for 2 minutes. Apply 20 µL (or 15 µL for 7 cm × 8 cm slab gels) of the solutions separately to the surface of the gel in the following order: solution (2), solution (1), solution (3). At the end of the separation, remove the gel-cassette from the apparatus.

Immunoblotting is carried out as follows. Transfer the gel onto a membrane suitable for the immobilisation of proteins, using commercially available electrotransfer equipment and following the manufacturer's instructions. After electrotransfer, incubate the membrane in a neutral isotonic buffer containing a suitable blocking agent (for example, 50 g per litre of dried milk or 10% v/v foetal calf serum), for 1 to 2 hours, followed by incubation for 1 to 14 hours in the same blocking solution with a suitable dilution of either a polyclonal or monoclonal anti-erythropoietin antibody. Detect erythropoietin-bound antibody using a suitable enzyme or radiolabelled antibody (for example, an alkaline phosphatase-conjugated second antibody). The precise details of blocking agents, concentrations and incubation times should be optimised using the principles set out in *Immunochemical methods*, Appendix XIV B.

The test is not valid unless, in the electrophoretogram obtained with solution (3), the molecular weight markers are resolved on the membrane into discrete bands, with a linear relationship between distance migrated and logarithm$_{10}$ of the molecular weight.

The electrophoretogram obtained with solution (1) shows a single broad band corresponding in position and intensity to the single band seen in the electrophoretogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 6.6 to 7.4, Appendix V L.

Dimers and related substances of higher molecular weight

Use method A or method B.

A. Carry out the method for *size-exclusion chromatography*, Appendix III C, using the following solutions.

(1) Dilute the injection, if necessary, with the mobile phase to give a solution containing 1,000 IU of Erythropoietin per mL.

(2) Dilute 0.02 mL of solution (1) to 1 mL with the mobile phase.

(3) Prepare aggregated erythropoietin by heating a 0.1% w/v solution of *erythropoietin EPBRP* in *citrate buffered saline* for 14 days at 55°. Dilute 0.1 mL to 1 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (60 cm × 7.5 mm) packed with *hydrophilic silica gel for chromatography* of a grade suitable for fractionation of globular proteins in the molecular weight range of 20,000 to 200,000 (TSK G 3000 SW is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use fluorimetric detection with an excitation wavelength of 280 nm and an emission wavelength of 340 nm.

(f) Inject 100 µL of each solution.

(g) Allow the chromatography to proceed for a minimum of 1 hour.

MOBILE PHASE

0.115% w/v of *anhydrous disodium hydrogen orthophosphate*, 0.02% w/v of *potassium dihydrogen orthophosphate* and 2.34% w/v of *sodium chloride* in *water;* if necessary, adjust to pH 7.4.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (3) aggregates are present, the *resolution factor* between the aggregate and monomer peaks is at least 0.8 and the relative standard deviation is less than 10%;

in the chromatogram obtained with solution (2) the area of the principal peak is 1.5 to 2.5% of the area of the principal peak in the chromatogram obtained with the solution (1).

LIMITS

In the chromatogram obtained with solution (1) the total area of any peaks eluting before the principal peak is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2.0%).

B. Carry out the method for *size-exclusion chromatography*, Appendix III C, using the following solutions.

(1) Prepare aggregated erythropoietin by heating a 0.1% w/v solution of *erythropoietin EPBRP* in *citrate buffered saline* for 14 days at 55°. Dilute 0.1 mL to 1 mL with the sample dilution buffer.

(2) Prepare the injection being examined as given in the Table using the following solutions.

Solution A 2.28% w/v *dipotassium hydrogen orthophosphate trihydrate* and 1.49% w/v *potassium chloride*, adjusted to pH 6.8 with 85% w/w *orthophosphoric acid*.

Solution B 0.43% w/v *sodium chloride*, 0.103% w/v *sodium dihydrogen orthophosphate monohydrate*, 0.223% w/v *disodium hydrogen orthophosphate dihydrate*, 0.5% w/v *glycine* and 0.03% w/v *polysorbate 80*, adjusted to pH 6.9.

Sample solution IU per ml	µg per ml	Dilution	Diluent	Final concentration of Polysorbate 80 w/v	Injection volume µl
2000	16.67	Undiluted	Not applicable	0.03%	50
4000	33.33	Undiluted	Not applicable	0.03%	50
10,000	83.33	1:3	Solution A	0.01%	100
40,000	333.33	1:6	Sample dilution buffer	0.01%	50

The sample dilution buffer contains 2 volumes of solution A and 1 volume of solution B.

(3) Dilute 0.02 mL of solution (2) to 1 mL with the sample dilution buffer.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 7.8 mm) packed with *hydrophilic silica gel for chromatography* of a grade suitable for fractionation of globular proteins in the molecular weight range of 20,000 to 200,000 (TSK G 3000 SWxl is suitable).

www.webofpharma.com

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.3 mL per minute.

(d) Use an ambient column temperature.

(e) Use fluorimetric detection with an excitation wavelength of 280 nm and an emission wavelength of 345 nm.

(f) Use injection volumes as stated in the sample preparation table.

(g) Allow the chromatography to proceed for a minimum of 1 hour.

MOBILE PHASE

25% v/v of *propanol-2-ol* in Solution A.

SYSTEM SUITABILITY

The test is not valid unless:

solution B shows no interfering peaks;

in the chromatogram obtained with solution (1), aggregates are present and the *resolution factor* between the aggregate and monomer peaks is at least 0.8.

LIMIT

In the chromatogram with solution (2) the total area of any peaks eluting before the principal peak is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (2.0%).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is less than 20 IU in a volume containing 10,000 IU of Erythropoietin.

ASSAY

Carry out the Assay using method A or method B.

The activity of the preparation is compared with that of *erythropoietin EPBRP* and expressed in International Units (IU).

The confidence limits of the estimated potency ($P = 0.95$) are not less than 64% and not more than 156% of the stated potency.

A. In polycythaemic mice

The activity of the preparation is estimated by examining, under given conditions, its effect in stimulating the incorporation of ^{59}Fe into circulating red blood cells of mice made polycythaemic by exposure to reduced atmospheric pressure.

The following schedule, using treatment in a hypobaric chamber, has been found to be suitable.

Induce polycythaemia in female mice of the same strain, weighing 16 to 18 g. Place the mice in a hypoxic chamber and reduce the pressure to 0.6 atmospheres. After 3 days at 0.6 atmospheres, further reduce the pressure to 0.4 to 0.5 atmospheres and maintain the animals at this pressure for a further 11 days (the partial vacuum is interrupted daily for a maximum of 1 hour at about 11:00 a.m., in order to clean the cages and feed the animals). At the end of the specified period, return the mice to normal atmospheric conditions. Randomly distribute the mice into cages, each containing 6 animals, and mark them.

Test solution (1) Dilute the substance to be examined in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 0.2 IU per mL.

Test solution (2) Mix equal volumes of test solution (1) and *phosphate-albumin buffered saline pH 7.2 R1.*

Test solution (3) Mix equal volumes of test solution (2) and *phosphate-albumin buffered saline pH 7.2 R1.*

Reference solution (1) Dissolve *erythropoietin EPBRP* in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 0.2 IU per mL.

Reference solution (2) Mix equal volumes of reference solution (1) and *phosphate-albumin buffered saline pH 7.2 R1.*

Reference solution (3) Mix equal volumes of reference solution (2) and *phosphate-albumin buffered saline pH 7.2 R1.*

Radiolabelled ferric [^{59}Fe] chloride solution, concentrated Use a commercially available solution of [^{59}Fe] ferric chloride (approximate specific activity: 100 to 1000 MBq per mg of Fe).

Radiolabelled [^{59}Fe] ferric chloride solution Dilute the concentrated radiolabelled [^{59}Fe] ferric chloride solution in *sodium citrate buffer solution pH 7.8* to obtain a solution with an activity of 3.7×10^4 Bq per mL.

The concentrations of the test solutions and reference solutions may need to be modified, based on the response range of the animals used.

Three days after returning the animals to atmospheric pressure, inject each animal subcutaneously with 0.2 mL of one of the solutions. The 6 animals in each cage must each receive one of the 6 different treatments (3 test solutions and 3 reference solutions); the order of injection must be separately randomised for each cage. A minimum of 8 cages is recommended. Two days after injection of the test or reference solution, inject each animal intraperitoneally with 0.2 mL of *radiolabelled [^{59}Fe] ferric chloride solution.* The order of the injections must be the same as that of the erythropoietin injections, and the time interval between administration of the erythropoietin and the radiolabelled ferric chloride solution must be the same for each animal. After a further 48 hours, anaesthetise each animal by injection of a suitable anaesthetic, record body weights and withdraw blood samples (0.65 mL) into haematocrit capillaries from the bifurcation of the aorta. After determining the packed cell volume for each sample, measure the radioactivity.

Calculate the response (percentage of ^{59}Fe in total circulating blood) for each mouse using the expression:

$$\frac{A_s \times M \times 7.5}{A_t \times V_s}$$

A_s = radioactivity in the sample,
A_t = total radioactivity injected,
7.5 = total blood volume as per cent body weight,
M = body weight, in grams,
V_s = sample volume.

Calculate the potency by the usual statistical methods for a parallel line assay. Eliminate from the calculation any animal where the packed cell volume is less than 54%, or where the body weight is more than 24 g.

B. In normocythaemic mice

The Assay is based on the measurement of stimulation of reticulocyte production in normocythaemic mice.

The Assay may be carried out using the following procedure:

Test solution (1) Dilute the preparation being examined in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 80 IU per mL.

Test solution (2) Mix equal volumes of test solution (1) and *phosphate-albumin buffered saline pH 7.2 R1.*

www.webofpharma.com

Test solution (3) Mix equal volumes of test solution (2) and *phosphate-albumin buffered saline pH 7.2 R1*.

Reference solution (1) Dissolve *erythropoietin EPBRP* in *phosphate-albumin buffered saline pH 7.2 R1* to obtain a concentration of 80 IU per mL.

Reference solution (2) Mix equal volumes of reference solution (1) and *phosphate-albumin buffered saline pH 7.2 R1*.

Reference solution (3) Mix equal volumes of reference solution (2) and *phosphate-albumin buffered saline pH 7.2 R1*.

The exact concentrations of the test solutions and reference solutions may need to be modified, based on the response range of the animals used.

At the beginning of the assay procedure, randomly distribute mice of a suitable age and strain (8-week old B6D2F1 mice are suitable) into 6 cages. A minimum of 8 mice per cage is recommended. Inject each animal subcutaneously with 0.5 mL of the appropriate treatment (one solution per cage) and put the animal in a new cage. Combine the mice in such a way that each cage housing the treated mice contains one mouse out of the 6 different treatments (3 test solutions and 3 reference solutions, 6 mice per cage). 4 days after the injections, collect blood samples from the animals and determine the number of reticulocytes using a suitable procedure.

The following method may be employed:

The volume of blood, dilution procedure and fluorescent reagent may need to be modified to ensure maximum development and stability of fluorescence.

Colorant solution, concentrated Use a solution of thiazole orange suitable for the determination of reticulocytes. Prepare at a concentration twice that necessary for the analysis.

Proceed with the following dilution steps. Dilute whole blood 500-fold in the buffer used to prepare the colorant solution. Dilute this solution 2-fold in the concentrated colorant solution. After staining for 3 to 10 minutes, determine the reticulocyte count microfluorometrically in a flow cytometer. The percentage of reticulocytes is determined using a biparametric histogram: number of cells/red fluorescence (620 nm).

Calculate the potency by the usual statistical methods for a parallel line assay.

STORAGE
Erythropoietin Injection should be protected from light.

LABELLING
The label states the number of IU (Units) in a suitable dose-volume.

ERYTHROPOIETIN FOR INJECTION

DEFINITION
Erythropoietin for Injection is a freeze-dried, sterile preparation prepared from Erythropoietin Concentrated Solution. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

IDENTIFICATION
A. It gives the appropriate response when examined using the conditions under Assay.

B. Comply with Identification test B as described for Erythropoietin Injection. Prepare solution (1) by dissolving a quantity of Erythropoietin for Injection in *water* to contain 2000 IU per mL. Prepare solution (2) by dissolving the contents of a vial of *erythropoietin EPBRP* in *water* to give a solution containing 3012 IU per mL. Add 1 volume of *SDS-PAGE sample buffer (concentrated)* to each solution.

TESTS
Dimers and related substances of higher molecular weight
Comply with the test described for Erythropoietin Injection using the following solutions.

(1) Dissolve a quantity of the powder in the mobile phase to give a solution containing 1,000 IU of erythropoietin per mL.

(2) Dilute 0.02 mL of solution (1) to 1 mL with the mobile phase.

Water
Not more than 4.0% w/w, Appendix IX C, Method 1.

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is less than 20 IU in a volume containing 10,000 IU of Erythropoietin.

ASSAY
Carry out the Assay as described for Erythropoietin Injection using the following solutions:

A. In polycythaemic mice
Test solution (1) 0.2 IU per mL in *phosphate-albumin buffered saline pH 7.2 R1*.

B. In normocythaemic mice
Test solution (1) 80 IU per mL in *phosphate-albumin buffered saline pH 7.2 R1*.

STORAGE
Erythropoietin Injection prepared by dissolving the contents of a sealed container in the liquid stated on the label should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

LABELLING
The label of the sealed container states the number of IU (Units) contained in it.

Estradiol Injection

Action and use
Estrogen.

DEFINITION
Estradiol Injection is a sterile solution of Estradiol Benzoate in Ethyl Oleate or other suitable ester, in a suitable fixed oil or in any mixture of these. It may contain suitable alcohols.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of estradiol benzoate, $C_{25}H_{28}O_3$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 10 mL of *2,2,4-trimethylpentane* to a volume of the injection containing 2 mg of Estradiol Benzoate and extract with three 10 mL quantities of *ethanol (70%)*. Wash the combined extracts with 15 mL of *2,2,4-trimethylpentane*, evaporate the ethanolic extract to dryness using a rotary evaporator and dissolve the residue in 2 mL of *chloroform*.

(2) 0.1% w/v of *estradiol benzoate BPCRS* in *chloroform*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *ethanolic sulfuric acid (20%)*, heat at 105° for 10 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

A mixture of 20 volumes of *ethyl acetate* and 80 volumes of *toluene*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D.

For injections containing 0.2% w/v or more of estradiol benzoate

Dissolve 15 mg of *4-hydroxybenzaldehyde* (internal standard) in 5 mL of *1,4-dioxan*, add sufficient *cyclohexane* to produce 10 mL (solution A) and use the following solutions.

(1) Add 1.0 mL of solution A to 10 mg of *estradiol benzoate BPCRS* and add sufficient of a mixture of 9 volumes of *cyclohexane* and 1 volume of *1,4-dioxan* to produce 10 mL.

(2) Prepare in the same manner as solution (1) using a quantity of the injection containing 10 mg of Estradiol Benzoate but omitting the addition of solution A.

(3) Prepare in the same manner as solution (1) using a quantity of the injection containing 10 mg of Estradiol Benzoate.

For injections containing less than 0.2% w/v of estradiol benzoate

Dissolve 15 mg of the internal standard in 10 mL of *1,4-dioxan*, add sufficient *cyclohexane* to produce 100 mL (solution B) and use the following solutions.

(1) Add 10 mL of solution B to 10 mg of *estradiol benzoate BPCRS* and add sufficient of a mixture of 9 volumes of *cyclohexane* and 1 volume of *1,4-dioxan* to produce 100 mL.

(2) Dilute a quantity of the injection containing 1 mg of Estradiol Benzoate to 10 mL with a mixture of 9 volumes of *cyclohexane* and 1 volume of *1,4-dioxan*.

(3) Add 1 mL of solution B to a quantity of the injection containing 1 mg of Estradiol Benzoate and dilute to 10 mL with the same solvent mixture.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 4 mm) packed with *silica gel for chromatography* (10 µm) (µPorasil is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A mixture of 1 volume of *1,4-dioxan* and 9 volumes of *cyclohexane*.

SYSTEM SUITABILITY

The assay is not valid unless the *resolution factor* between the peaks due to benzyl alcohol (if present) and estradiol benzoate and between the peaks due to estradiol benzoate and the internal standard is more than 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{28}O_3$ using the declared content of $C_{25}H_{28}O_3$ in *estradiol benzoate BPCRS*.

STORAGE

Estradiol Injection should be protected from light. If solid matter separates on standing it should be redissolved by warming before use.

LABELLING

The label states (1) that the preparation is for intramuscular injection only; (2) that any solid matter that has separated on standing should be redissolved by warming before use.

Estradiol Transdermal Patches

Action and use

Estrogen.

DEFINITION

Estradiol Transdermal Patches contain Estradiol Hemihydrate in a suitable matrix or reservoir presentation.

PRODUCTION

A suitable test is carried out to demonstrate the appropriate release of estradiol.

The transdermal patches comply with the requirements stated under Transdermal Patches and with the following requirements.

Content of estradiol, $C_{18}H_{24}O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Remove the release liner from a patch, score the exposed surface and cover the sticky surface with a small piece of glass wool. Place the patch in a centrifuge tube and add sufficient *methanol* to produce a solution containing the equivalent of 2 mg of estradiol in 5 mL of solvent, mix with the aid of ultrasound, shake for 15 minutes and, if necessary, filter through a glass-fibre filter paper (Whatman GF/C is suitable) followed by a 0.45-µm membrane filter.

(2) 0.04% w/v of *estradiol hemihydrate BPCRS* in *absolute ethanol*, dissolved with the aid of ultrasound.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254} (100 mm × 100 mm) (Merck plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 7 cm.

(e) After removal of the plate, dry in a stream of warm air for 5 minutes, spray with *methanolic sulfuric acid (50%)* and heat at 110° for 10 minutes. Allow to cool and examine under *ultraviolet light (366 nm)*.

MOBILE PHASE

2 volumes of *acetone* and 8 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

www.webofpharma.com

B. In the test for Uniformity of content, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Remove the release liners from 10 patches, score the exposed surfaces and cover the sticky surfaces with small pieces of glass wool. Place the patches in a flask containing sufficient mobile phase to produce a solution containing the equivalent of 0.01% w/v of estradiol, mix with the aid of ultrasound for 10 minutes, shake mechanically for 1 hour and filter through a glass-fibre filter paper (Whatman GF/C is suitable). If the filtrate is not clear, filter it through a membrane filter with a pore size of 0.45 µm.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecysilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 50 µL of each solution.

(g) Allow the chromatography to proceed for twice the retention time of the principal peak.

MOBILE PHASE

35 volumes of *acetonitrile* and 65 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *signal to-noise ratio* for the peak due to Estradiol is at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak due to diethyltoluamide.

Uniformity of content

Comply with the requirements stated under *uniformity of content*, Appendix XII C3, Test C, with respect to the individual content of each dosage unit and using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Remove the release liner from a patch, score the exposed surface and cover the sticky surface with a small piece of glass wool. Place the patch in a flask containing sufficient mobile phase to produce a solution containing the equivalent of 0.01% w/v of estradiol, mix with the aid of ultrasound for 10 minutes, shake mechanically for 1 hour and, if necessary, filter through a glass-fibre filter paper (Whatman GF/C is suitable). Using a disposable syringe, collect part of the supernatant liquid and filter through a membrane filter with a pore size of 0.45 µm.

(2) Dilute 1 volume of a 0.1% w/v solution of *estradiol hemihydrate BPCRS* in *acetonitrile* to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used but inject 20 µL of each solution.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{24}O_2$ in the transdermal patch using the declared content of $C_{18}H_{24}O_2$ in *estradiol hemihydrate BPCRS*.

ASSAY

Use the average of the 10 results obtained in the test for Uniformity of content.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of estradiol per patch.

Estradiol and Norethisterone Tablets

Action and use

Estrogen.

DEFINITION

Estradiol and Norethisterone Tablets contain Estradiol Hemihydrate and Norethisterone. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of estradiol, $C_{18}H_{24}O_2$

95.0 to 105.0% of the stated amount.

Content of norethisterone, $C_{20}H_{26}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 0.2 mL of *water* to two tablets and shake to disperse. Add sufficient *ethanol (96%)* to produce a solution containing 0.035% w/v of Norethisterone, centrifuge and use the clear supernatant liquid.

(2) A suitable concentration of *estradiol hemihydrate BPCRS* and *norethisterone BPCRS* in *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 8 cm.

(e) After removal of the plate, dry in air and spray with *ethanolic sulfuric acid (5%)*. Heat the plate at 105° for 15 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

10 volumes of *acetone* and 90 volumes of *dichloromethane*.

CONFIRMATION

The chromatogram obtained with solution (1) shows two clearly separated spots with R_f values corresponding to those observed in the chromatogram obtained with solution (2).

www.webofpharma.com

B. In the test for Uniformity of content, the chromatogram obtained with solution (1) shows two peaks having the same retention times as those due to estradiol and norethisterone in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 500 mL of a 0.3% w/v solution of *sodium lauryl sulfate* in *water*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a sample of the medium and filter, discarding the first 5 mL of the filtrate. Use the filtered medium.

(2) Dissolve a sufficient quantity of *estradiol hemihydrate BPCRS* and *norethisterone BPCRS* in *methanol (80%)* and dilute an aliquot with a 0.3% w/v solution of *sodium lauryl sulfate* in *water*; the concentration of the final solution should be the same as that expected for solution (1).

(3) 0.0017% w/v of *estradiol hemihydrate BPCRS*, 0.00084% w/v of *norethisterone acetate BPCRS*, 0.00066% w/v of *estrone BPCRS* and 0.00034% w/v of *norethisterone BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 200 µL of each solution.

MOBILE PHASE

450 volumes of *water* and 550 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between each pair of peaks (estradiol and norethisterone, and estrone and norethisterone acetate) is at least 1.0.

DETERMINATION OF CONTENT

Calculate the total content of estradiol, $C_{18}H_{24}O_2$, and norethisterone, $C_{20}H_{26}O_2$, in the medium from the chromatograms obtained and using the declared content of $C_{18}H_{24}O_2$ in *estradiol hemihydrate BPCRS* and $C_{20}H_{26}O_2$ in *norethisterone BPCRS*.

Estrone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Powder 20 tablets. Add 20 mL of the mobile phase to a quantity of the powdered tablets containing the equivalent of 5 mg of estradiol, mix with the aid of ultrasound and add sufficient mobile phase to produce 25 mL. Centrifuge and use the clear supernatant liquid.

(2) 0.0001% w/v of *estrone BPCRS* in the mobile phase.

(3) 0.0017% w/v of *estradiol hemihydrate BPCRS*, 0.00084% w/v of *norethisterone acetate BPCRS*, 0.00066% w/v of *estrone BPCRS* and 0.00034% w/v of *norethisterone BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used, but using an injection volume of 20 µL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between each pair of peaks (estradiol and norethisterone, and estrone and norethisterone acetate) is at least 1.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to estrone is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Uniformity of content

Tablets containing less than the equivalent of 2 mg and/or less than 2% w/w of estradiol comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 20 mL of the mobile phase to one tablet, mix with the aid of ultrasound, cool, add sufficient of the mobile phase to produce 25 mL and centrifuge. Dilute the supernatant liquid, if necessary, with the mobile phase to produce a solution containing the equivalent of 0.002% w/v of estradiol.

(2) Dissolve sufficient quantities of *estradiol hemihydrate BPCRS* and *norethisterone BPCRS* in the mobile phase and dilute an aliquot with the mobile phase; the concentrations in the final solution are the same as those expected for solution (1).

(3) 0.0017% w/v of *estradiol hemihydrate BPCRS*, 0.00084% w/v of *norethisterone acetate BPCRS*, 0.00066% w/v of *estrone BPCRS* and 0.00034% w/v of *norethisterone BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used, but using an injection volume of 20 µL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between each pair of peaks (estradiol and norethisterone, and estrone and norethisterone acetate) is at least 1.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{24}O_2$ and $C_{20}H_{26}O_2$ in each tablet using the declared content of $C_{18}H_{24}O_2$ in *estradiol hemihydrate BPCRS* and the declared content of $C_{20}H_{26}O_2$ in *norethisterone BPCRS*.

ASSAY

For estradiol

For tablets containing the equivalent of less than 2 mg and/or less than 2% w/w of estradiol

Use the average of the 10 individual results obtained in the test for Uniformity of content.

www.webofpharma.com

For tablets containing the equivalent of 2 mg or more and 2% w/w or more of estradiol

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 50 mL of the mobile phase to a quantity of powdered tablets containing the equivalent of 10 mg of estradiol, mix with the aid of ultrasound and centrifuge. Dilute 1 volume of the clear supernatant liquid to 10 volumes with mobile phase.

(2) 0.002% w/v of *estradiol hemihydrate BPCRS* in the mobile phase.

(3) 0.0017% w/v of *estradiol hemihydrate BPCRS*, 0.00084% w/v of *norethisterone acetate BPCRS*, 0.00066% w/v of *estrone BPCRS* and 0.00034% w/v of *norethisterone BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used, but using an injection volume of 20 µL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between each pair of peaks (estradiol and norethisterone, and estrone and norethisterone acetate) is at least 1.0.

DETERMINATION OF CONTENT

Calculate the total content of estradiol, $C_{18}H_{24}O_2$, in the tablets using the declared content of $C_{18}H_{24}O_2$ in *estradiol hemihydrate BPCRS*.

For norethisterone

Use the average of the 10 individual results obtained in the test for Uniformity of content.

STORAGE

Estradiol and Norethisterone Tablets should be protected from light.

LABELLING

The quantity of Estradiol Hemihydrate is stated in terms of the equivalent amount of estradiol.

IMPURITIES

The impurities limited by the requirements of this monograph include:

A. Estrone.

Estradiol and Norethisterone Acetate Tablets

Action and use

Estrogen.

DEFINITION

Estradiol and Norethisterone Acetate Tablets contain Estradiol Hemihydrate and Norethisterone Acetate. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of estradiol, $C_{18}H_{24}O_2$ and norethisterone acetate, $C_{22}H_{28}O_3$

Content		Limits	
Estradiol mg	Norethisterone Acetate mg	Estradiol % of stated amount	Norethisterone Acetate % of stated amount
2	1	95.0 to 105.0	92.5 to 105.0
1	1	95.0 to 105.0	92.5 to 105.0
1	0.5	95.0 to 105.0	92.5 to 105.0
0.5	0.1	95.0 to 105.0	90.0 to 105.0

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 0.2 mL of *water* to two tablets and shake to disperse. Add sufficient *ethanol (96%)* to produce a solution containing 0.035% w/v of Norethisterone Acetate, centrifuge and use the clear supernatant liquid.

(2) A suitable concentration of *estradiol hemihydrate BPCRS* and *norethisterone acetate BPCRS* in *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and spray with *ethanolic sulfuric acid (5%)*. Heat the plate at 105° for 15 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

10 volumes of *acetone* and 90 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (1) shows two clearly separated spots.

CONFIRMATION

The two principal spots in the chromatogram obtained with solution (1) correspond in position and colour to those in the chromatogram obtained with solution (2).

B. In the test for Uniformity of content, the chromatogram obtained with solution (1) shows two peaks having the same retention times as the peaks due to estradiol and norethisterone acetate in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 500 mL of a 0.3% w/v solution of *sodium lauryl sulfate*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a sample of the medium and filter. Use the filtered medium, diluted with a 0.3% w/v solution of *sodium lauryl sulfate* if necessary, to produce a solution expected to contain 0.0001% w/v of estradiol.

www.webofpharma.com

(2) Dissolve sufficient quantities of *estradiol hemihydrate BPCRS* and *norethisterone acetate BPCRS* in a 0.3% w/v solution of *sodium lauryl sulfate* and dilute with a sufficient volume of a 0.3% w/v solution of *sodium lauryl sulfate* to produce concentrations in the final solution the same as those expected for solution (1).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 200 µL of each solution.

MOBILE PHASE

450 volumes of *water* and 550 volumes of *acetonitrile.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between each pair of peaks (estradiol and norethisterone, and estrone and norethisterone acetate) is at least 1.0.

DETERMINATION OF CONTENT

Calculate the total content of estradiol, $C_{18}H_{24}O_2$, and of norethisterone acetate, $C_{22}H_{28}O_3$, in the medium using the declared content of $C_{18}H_{24}O_2$ in *estradiol hemihydrate BPCRS* and the declared content of $C_{22}H_{28}O_3$ in *norethisterone acetate BPCRS.*

Estrone and norethisterone

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase.

(1) Add 20 mL of the mobile phase to a quantity of the powdered tablets containing 5 mg of Estradiol, mix with the aid of ultrasound and add sufficient mobile phase to produce 25 mL. Centrifuge and use the clear supernatant liquid.

(2) Add 20 mL of the mobile phase to a quantity of the powdered tablets containing 2.5 mg of Norethisterone Acetate, mix with the aid of ultrasound and add sufficient mobile phase to produce 25 mL. Centrifuge and use the clear supernatant liquid.

(3) 0.0001% w/v of *estrone BPCRS.*

(4) 0.00005% w/v of *norethisterone BPCRS.*

(5) 0.0017% w/v of *estradiol hemihydrate BPCRS*, 0.00084% w/v of *norethisterone acetate BPCRS*, 0.00066% w/v of *estrone BPCRS* and 0.00034% w/v of *norethisterone BPCRS.*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used but injecting 20 µL of each solution.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between each pair of peaks (estradiol and norethisterone, and estrone and norethisterone acetate) is at least 1.0.

LIMITS

In the chromatogram obtained with solution (1) quantify the area of any peak due to estrone using the principal peak in the chromatogram obtained with solution (3).

In the chromatogram obtained with solution (2) quantify the area of any peak due to norethisterone using the principal peak in the chromatogram obtained with solution (4).

Content of		Limits	
Estradiol mg	Norethisterone Acetate mg	Estrone %	Norethisterone %
2	1	0.5	0.5
1	1	0.5	0.5
1	0.5	0.5	0.5
0.5	0.1	0.5	1.0

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of estradiol or less than 2 mg and/or less than 2% w/w of Norethisterone Acetate comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 20 mL of the mobile phase to one tablet, mix with the aid of ultrasound, cool, add sufficient of the mobile phase to produce 25 mL and centrifuge. Dilute the supernatant liquid if necessary, with the mobile phase to produce a solution containing the equivalent of 0.002% w/v of estradiol.

(2) Dissolve sufficient quantities of *estradiol hemihydrate BPCRS* and *norethisterone acetate BPCRS* in the mobile phase and dilute with sufficient mobile phase to produce concentrations in the final solution the same as those expected for solution (1).

(3) 0.0017% w/v of *estradiol hemihydrate BPCRS*, 0.00084% w/v of *norethisterone acetate BPCRS*, 0.00066% w/v of *estrone BPCRS* and 0.00034% w/v of *norethisterone BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used but injecting 20 µL of each solution.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between each pair of peaks (estradiol and norethisterone, and estrone and norethisterone acetate) is at least 1.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{24}O_2$ and of $C_{22}H_{28}O_3$ in each tablet using the declared content of $C_{18}H_{24}O_2$ in *estradiol hemihydrate BPCRS* and the declared content of $C_{22}H_{28}O_3$ in *norethisterone acetate BPCRS.*

ASSAY

For estradiol

For tablets containing less than 2 mg and/or less than 2% w/w of estradiol

Use the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing 2 mg or more and 2% w/w or more of estradiol

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Add 50 mL of the mobile phase to a quantity of powdered tablets containing the equivalent of 10 mg of estradiol, mix with the aid of ultrasound and centrifuge. Dilute 10 mL of the clear supernatant liquid to 100 mL with the mobile phase.

www.webofpharma.com

(2) 0.002% w/v of *estradiol hemihydrate BPCRS*.
(3) 0.0017% w/v of *estradiol hemihydrate BPCRS*, 0.00084% w/v of *norethisterone acetate BPCRS*, 0.00066% w/v of *estrone BPCRS* and 0.00034% w/v of *norethisterone BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used but injecting 20 µL of each solution.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between each pair of peaks (estradiol and norethisterone, and estrone and norethisterone acetate) is at least 1.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{24}O_2$ in each tablet using the declared content of $C_{18}H_{24}O_2$ in *estradiol hemihydrate BPCRS*.

For norethisterone acetate

For tablets containing less than 2 mg and/or less than 2% w/w of estradiol

Use the average of the 10 individual results obtained in the test for Uniformity of content.

STORAGE

Estradiol and Norethisterone Acetate Tablets should be protected from light.

LABELLING

The label states the quantity of estradiol hemihydrate in terms of the equivalent amount of estradiol.

IMPURITIES

The impurities limited by the requirements of this monograph include:

A. Estrone,

B. Norethisterone.

Estramustine Phosphate Capsules

Action and use

Cytotoxic alkylating agent.

DEFINITION

Estramustine Phosphate Capsules contain Estramustine Sodium Phosphate.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of estramustine phosphate, $C_{23}H_{32}Cl_2NO_6P$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing the equivalent of 0.2 g of Estramustine Phosphate with 10 mL of *methanol*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of estramustine sodium phosphate *(RS 128)*. In preparing the potassium bromide disc precautions should be taken to exclude moisture and avoid excessive grinding; if necessary heat the prepared disc at 90° for 2 minutes.

B. A 1% w/v solution of the residue obtained in test A yields the reactions characteristic *of sodium salts*, Appendix VI.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in a mixture of 1 volume of *triethylamine* and 49 volumes of *methanol*.

(1) 4.0% w/v of the residue obtained in test A for Identification.

(2) 0.020% w/v of the residue obtained in test A for Identification.

(3) 0.080% w/v of *17β,17′β-bis3-[bis(2-chloroethyl)carbamoyloxy]estra1,3,5(10)-trienyl pyrophosphate BPCRS*.

(4) 0.040% of *estramustine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *methanolic sulfuric acid (20%)* and heat at 110° for 10 minutes.

MOBILE PHASE

Equal volumes of *butan-2-one*, *propan-2-ol* and *triethylamine hydrogen carbonate solution*.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* due to 17β,17′β-bis3-[bis(2-chloroethyl)carbamoyloxy]estra1,3,5(10)-trienyl pyrophosphate is not more intense than the corresponding spot in the chromatogram obtained with solution (3) (2%);

any *secondary spot* due to estramustine is not more intense than the corresponding spot in the chromatogram obtained with solution (4) (1%);

Any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Shake a quantity of the mixed contents of 20 capsules containing the equivalent of 0.28 g of Estramustine Phosphate with 20 mL of *water*, dilute to 50 mL with *water* and filter. Dilute 5 mL of the filtrate to 100 mL with *ethanol (50%)* and measure the *absorbance* of the resulting solution at the maximum at 275 nm, Appendix II B. Calculate the content of $C_{23}H_{32}Cl_2NO_6P$ taking 15.4 as the value of A(1%, 1 cm) at the maximum at 275 nm.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of estramustine phosphate.

Estriol Cream

Action and use

Estrogen.

DEFINITION

Estriol Cream contains Estriol in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of estriol, $C_{18}H_{24}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

(1) To a quantity of cream containing 2 mg of Estriol add 50 mL of solvent, heat on a water bath and mix until the

www.webofpharma.com

cream has completely dispersed, cool the contents in ice, centrifuge and use the supernatant liquid.

(2) 0.004% w/v of *estriol BPCRS*.

(3) 0.004% w/v each of *estriol BPCRS* and *prednisolone BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel 60 high performance precoated plate (Merck HPTLC silica gel 60 is suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry the plate in a horizontal position at 100 to 105°. Dilute 2 mL of *sulfuric acid* to 100 mL with *ethanol (96%)* and spray the solution evenly onto the plate. Examine the plate in daylight.

MOBILE PHASE

10 volumes of *methanol* and 90 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 3.5 to 4.5, Appendix V L.

Disperse 10 g of the cream in 10 mL of *water*, with continuous stirring throughout the pH determination.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol*.

(1) To a quantity of cream containing 0.5 mg of Estriol add 20 mL of solvent, heat on a water bath and mix until the cream has completely dissolved, allow to cool to room temperature and add sufficient solvent to produce 25 mL. Cool the contents in ice for 15 minutes, centrifuge and use the supernatant liquid.

(2) Dilute 5 volumes of solution (1) to 100 volumes, further dilute 10 volumes of this solution to 100 volumes.

(3) Dilute 10 volumes of solution (2) to 100 volumes.

(4) 0.01% w/v of *estriol impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 280 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

5 volumes of *methanol*, 38 volumes of *acetonitrile* and 57 volumes of *water*.

For solutions (3) and (4), when the chromatograms are recorded under the prescribed conditions, the retention times for estriol and 16-epi-estriol are about 5 minutes and about 7 minutes respectively.

SYSTEM SUITABILITY

The test is not valid unless, (a) in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to estriol and 16-epi-estriol is at least 2.5 and (b) in the chromatogram obtained with solution (3) the *signal-to-noise ratio* of the principal peak is at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any *secondary peaks* is not greater than twice the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (3) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol*.

(1) To a quantity of cream containing 0.5 mg of Estriol add 20 mL of *methanol*, heat on a water bath and mix until the cream has completely dispersed, allow to cool to room temperature and add sufficient *methanol* to produce 25 mL, transfer to a centrifuge tube and cool the contents in ice for 15 minutes, centrifuge and dilute 5 volumes of the supernatant liquid to 100 volumes with *methanol*.

(2) 0.0001% w/v of *estriol BPCRS*.

(3) 0.01% w/v of *estriol impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to estriol and 16-epi-estriol is at least 2.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{24}O_3$ in the cream using the declared content of $C_{18}H_{24}O_3$ in *estriol BPCRS*.

Estropipate Tablets

Action and use

Estrogen.

DEFINITION

Estropipate Tablets contain Estropipate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of estropipate, $C_{18}H_{22}O_5S,C_4H_{10}N_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

www.webofpharma.com

TESTS

Free estrone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 5 mg of Estropipate with 20 mL of *methanol (50%)* for 30 minutes, centrifuge and filter the supernatant liquid.

(2) 0.0005% w/v of *estrone BPCRS* in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 213 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

35 volumes of *acetonitrile* and 65 volumes of 0.025M *potassium dihydrogen orthophosphate*.

SYSTEM SUITABILITY

The peak due to estrone has a retention time, relative to the peak due to estropipate, of about 5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to estrone is not greater than the area of the peak in the chromatogram obtained with solution (2) (2%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Estropipate comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 20 mL of *water* to one tablet and shake for 30 minutes, add 20 mL of *methanol* to the mixture and shake for a further 30 minutes, dilute to 50 mL with *methanol (50%)* and filter. Dilute 10 mL of the filtrate to 20 mL with *methanol (50%)*.

(2) 0.0015% w/v of *estropipate BPCRS* in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Free estrone may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{22}O_5S,C_4H_{10}N_2$ in each tablet using the declared content of $C_{18}H_{22}O_5S,C_4H_{10}N_2$ in *estropipate BPCRS*.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 3 mg of Estropipate with 40 mL of *methanol (50%)* for 30 minutes, dilute to 100 mL with the same solvent and filter.

(2) 0.003% w/v of *estropipate BPCRS* in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Free estrone may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{22}O_5S,C_4H_{10}N_2$ in the tablets using the declared content of $C_{18}H_{22}O_5S,C_4H_{10}N_2$ in *estropipate BPCRS*.

Ethambutol Tablets

Action and use

Antituberculosis drug.

DEFINITION

Ethambutol Tablets contain Ethambutol Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ethambutol hydrochloride, $C_{10}H_{24}N_2O_2,2HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 50 mg of ethambutol hydrochloride with 5 mL of *methanol*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ethambutol hydrochloride *(RS 134)*.

B. Shake a quantity of the powdered tablets containing 0.1 g of ethambutol hydrochloride with 10 mL of *water*, filter and add to the filtrate 2 mL of a 1% w/v solution of *copper(II) sulfate* followed by 1 mL of 1M *sodium hydroxide*. A blue colour is produced.

2-Aminobutanol

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of 13.5M *ammonia*, 15 volumes of *water* and 75 volumes of *methanol* as the mobile phase. Apply separately to the plate 2 µL of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.50 g of ethambutol hydrochloride for 5 minutes with sufficient *methanol* to produce 10 mL. Solution (2) contains 0.050% w/v of *2-aminobutan-1-ol* in *methanol*. After removal of the plate, allow it to dry in air, heat at 110° for 10 minutes, cool, spray with *ninhydrin solution R1* and heat at 110° for 5 minutes. Any spot corresponding to 2-aminobutanol in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY

Weigh and powder 20 tablets. Add 20 mL of 2M *sodium hydroxide* to a quantity of the powdered tablets containing 0.2 g of ethambutol hydrochloride, mix with the aid of ultrasound for 5 minutes and extract with three successive 25 mL quantities of a mixture of 3 volumes of *chloroform* and 1 volume of *propan-2-ol*. Filter each extract successively through the same filter consisting of *anhydrous sodium sulfate* on an absorbent cotton plug moistened with a mixture of 3 volumes of *chloroform* and 1 volume of *propan-2-ol* and wash the plug with 10 mL of the same solvent mixture. Add 100 mL of *anhydrous acetic acid* to the combined extracts and washings and carry out Method I for *non-aqueous titration*, Appendix VIII A, using *1-naphtholbenzein solution* as indicator. Each mL of 0.1M *perchloric acid VS* is equivalent to 13.86 mg of $C_{10}H_{24}N_2O_2,2HCl$.

www.webofpharma.com

Ethanolamine Oleate Injection

DEFINITION

Ethanolamine Oleate Injection is a sterile solution containing 5% w/v of Ethanolamine Oleate, prepared by the interaction of Ethanolamine and Oleic Acid, in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of oleic acid, $C_{18}H_{34}O_2$
3.9 to 4.5% w/v.

Content of ethanolamine, C_2H_7NO
0.85 to 0.95% w/v.

TESTS

Alkalinity
pH, 8.0 to 9.0, Appendix V L.

ASSAY

For oleic acid
To 10 mL add 20 mL of 0.05M *sulfuric acid VS* and extract with three 25 mL volumes of *chloroform*, washing each extract with the same 10 mL of *water*. Reserve the aqueous solution and washings for the Assay for ethanolamine. Evaporate the combined extracts to dryness, dissolve the residue in *ethanol (96%)* previously neutralised to *phenolphthalein solution R1* and titrate with 0.1M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Each mL of 0.1M *sodium hydroxide VS* is equivalent to 28.25 mg of $C_{18}H_{34}O_2$.

For ethanolamine
Titrate the excess of acid in the combined aqueous solution and washings reserved in the Assay for oleic acid with 0.1M *sodium hydroxide VS* using *methyl orange solution* as indicator. Each mL of 0.05M *sulfuric acid VS* is equivalent to 6.108 mg of C_2H_7NO.

STORAGE

Ethanolamine Oleate Injection should be protected from light.

Ethinylestradiol Tablets

Action and use
Estrogen.

DEFINITION

Ethinylestradiol Tablets contain Ethinylestradiol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ethinylestradiol, $C_{20}H_{24}O_2$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.25 mg of Ethinylestradiol with four 20-mL quantities of *acetone*, filter each extract in turn, evaporate the combined filtrates to dryness on a water bath in a current of *nitrogen* and dissolve the residue in 0.25 mL of *acetone*.

(2) 0.1% w/v of *ethinylestradiol BPCRS* in *acetone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *ethanolic sulfuric acid (20%)*, heat at 110° for 10 minutes and examine under *ultraviolet light (365 nm)* and in daylight.

MOBILE PHASE

10 volumes of *ethanol (96%)* and 90 volumes of *toluene*.

CONFIRMATION

By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. Triturate a quantity of the powdered tablets containing 0.1 mg of Ethinylestradiol with 0.5 mL of 0.1M *sodium hydroxide* and 5 mL of *water*, allow to stand for 5 minutes, filter, acidify the filtrate with 0.15 mL of *sulfuric acid*, add 3 mL of *ether*, shake and allow to separate. Evaporate the ether layer to dryness and heat the residue on a water bath for 5 minutes with 0.2 mL of *glacial acetic acid* and 2 mL of *orthophosphoric acid*. A pink colour with an intense orange fluorescence is produced.

TESTS

Uniformity of content
Tablets containing less than 2 mg and/or less than 2% w/w of Ethinylestradiol comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 2 mL of the mobile phase to one tablet, allow to stand for 5 minutes, mix with the aid of ultrasound for 5 minutes, centrifuge and use the clear supernatant liquid.

(2) 0.0025% w/v of *ethinylestradiol BPCRS* in the mobile phase. For tablets containing less than 50 µg of Ethinylestradiol, solution (2) contains 0.0005% w/v of *ethinylestradiol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column(20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Zorbax ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of *water* and 60 volumes of *acetonitrile*.

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{24}O_2$ in each tablet using the declared content of $C_{20}H_{24}O_2$ in *ethinylestradiol BPCRS*.

ASSAY

Use the average of the 10 individual results obtained in the test for Uniformity of content.

STORAGE

Ethinylestradiol tablets should be protected from light.

www.webofpharma.com

Ethosuximide Capsules

Action and use
Antiepileptic.

DEFINITION
Ethosuximide Capsules contain Ethosuximide.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of ethosuximide, $C_7H_{11}NO_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Heat a quantity of the contents of the capsules containing 0.1 g of Ethosuximide with 0.2 g of *resorcinol* and 0.1 mL of *sulfuric acid* at 140° for 5 minutes, add 5 mL of *water*, make alkaline with 5M *sodium hydroxide* and add 0.2 mL to a large volume of *water*. A bright green fluorescence is produced.

B. To a quantity of the contents of the capsules containing 0.5 g of Ethosuximide add 15 mL of a 40% w/v solution of *sodium hydroxide*. Boil under a reflux condenser for 30 minutes, cool, acidify with *hydrochloric acid* and extract with three 30 mL quantities of *ether*. Wash the combined extracts with 5 mL of *water* and evaporate to dryness. The *melting point* of the residue, after recrystallisation from *toluene* and *petroleum spirit (boiling range, 40° to 60°)*, is about 102°, Appendix V A.

ASSAY
Weigh 20 capsules. Open the capsules carefully without loss of shell material, express as much of the contents as possible and reserve the expressed material. Wash the shells with *ether*, discard the washings, allow the shells to stand at room temperature until the ether has evaporated and weigh. The difference between the weights represents the weight of the total contents. Dissolve a quantity of the contents containing 0.2 g of Ethosuximide in 30 mL of *dimethylformamide* and carry out Method II for *non-aqueous titration*, Appendix VIII A, using *magneson solution* as indicator and 0.1M *tetrabutylammonium hydroxide VS* as titrant. Each mL of 0.1M *tetrabutylammonium hydroxide VS* is equivalent to 14.12 mg of $C_7H_{11}NO_2$.

Ethosuximide Oral Solution

Action and use
Antiepileptic.

DEFINITION
Ethosuximide Oral Solution is a solution of Ethosuximide in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ethosuximide, $C_7H_{11}NO_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Extract a quantity containing 0.5 g of Ethosuximide with two 30 mL quantities of *chloroform*, filter the combined extracts through absorbent cotton and evaporate the filtrate to dryness. Heat 0.1 g of the residue with 0.2 g of *resorcinol* and 0.1 mL of *sulfuric acid* at 140° for 5 minutes, cool, add 5 mL of *water*, make alkaline with 5M *sodium hydroxide* and add 0.2 mL to a large volume of *water*. A bright green fluorescence is produced.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as that due to *ethosuximide BPCRS* in the chromatogram obtained with solution (1).

ASSAY
Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. For solution (1) add 2 mL of a 3.0% w/v solution of *dimethyl phthalate* (internal standard) in *chloroform* to 25 mL of a 0.2% w/v solution of *ethosuximide BPCRS* in *chloroform*. Prepare solution (2) in the same manner as solution (3) but omit the internal standard. For solution (3) add 10 mL of *water* and 2 g of *sodium hydrogen carbonate* to a weighed quantity of the oral solution containing 0.25 g of Ethosuximide and extract with five 25 mL quantities of *chloroform*, washing each extract with the same 10 mL of *water*. To the combined extracts add 10 mL of the internal standard solution, shake with 10 g of *anhydrous sodium sulfate* and filter.

The chromatographic procedure may be carried out using a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (80 to 100 mesh) coated with 3% w/w of cyanopropylmethyl phenyl methyl silicone fluid (OV-225 is suitable) and maintained at 165°.

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_7H_{11}NO_2$, weight in volume, using the declared content of $C_7H_{11}NO_2$ in *ethosuximide BPCRS*.

Etidronate Tablets

Action and use
Bisphosphonate; treatment of osteoporosis; Paget's disease.

DEFINITION
Etidronate Tablets contain Etidronate Disodium.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of etidronate disodium, $C_2H_6Na_2O_7P_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. To a quantity of the powdered tablets containing 1 g of Etidronate Disodium, add 10 mL of *water* and shake for 5 minutes. Filter the solution (Whatman No. 4 filter is suitable) and collect the filtrate. Add 15 mL of *methanol* to precipitate the solution, mix and centrifuge. Discard the supernatant liquid and dry the residue at 105° for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of etidronate disodium *(RS440)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS
Dissolution
Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

www.webofpharma.com

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 30 minutes withdraw a sample of the medium and filter. Use the filtered medium, diluted with *water*, if necessary, to produce a solution expected to contain 0.0222% w/v of Etidronate Disodium.

(2) 0.0222% w/v of *etidronate disodium BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *anion exchange resin* (10 µm) (Waters IC-Pak is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.6 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 200 µL of each solution.

(g) Allow the chromatography to proceed for 15 minutes.

MOBILE PHASE

0.0454% v/v solution of *nitric acid* in *water*.

DETERMINATION OF CONTENT

Calculate the total content of etidronate disodium, $C_2H_6Na_2O_7P_2$, in the medium from the chromatograms obtained and using the declared content of $C_2H_6Na_2O_7P_2$ in *etidronate disodium BPCRS*.

LIMITS

The amount of etidronate disodium released is not less than 70% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 20 mg of Etidronate Disodium with *water*, dilute to 10 mL with *water*, mix and filter.

(2) To 4 volumes of a 0.03% w/v solution of *orthophosphoric acid* add 4 volumes of a 0.025% w/v solution of *phosphorous acid* and dilute to 50 volumes with *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *anion exchange resin* (5 µm) (Allsep anion is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a differential refractometer for detection.

(f) Inject 100 µL of each solution.

MOBILE PHASE

0.2 volumes of *anhydrous formic acid* and 1000 volumes of *water*, adjust to pH 3.5 with an 8% w/v solution of *sodium hydroxide*.

When the chromatograms are recorded in the prescribed conditions, the retention times are: phosphate, about 9.4 minutes; phosphite, about 11.5 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to phosphate and phosphite is at least 2.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to phosphite is not greater than the area of the corresponding peak in the chromatogram obtained with solution (2) (1%);

the area of any peak corresponding to phosphate is not greater than the area of the corresponding peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Weigh a quantity of the powdered tablets containing 44 mg of Etidronate Disodium, add 190 mL of *water*, dissolve with the aid of ultrasound for 5 minutes and shake for 10 minutes. Dilute to 200 mL with *water* and mix well. Centrifuge an aliquot of this solution for 10 minutes and filter (a 0.45-µm HVLP filter is suitable).

(2) 0.022% w/v of *etidronate disodium BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_2H_6Na_2O_7P_2$ in the tablets using the declared content of $C_2H_6Na_2O_7P_2$ in *etidronate disodium BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Etidronate Disodium.

Etodolac Capsules

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Etodolac Capsules contain Etodolac.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of etodolac $C_{17}H_{21}NO_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the contents of the capsules containing about 0.1 g of Etodolac add 4 mL of 0.01M *hydrochloric acid* and mix with the aid of ultrasound for 5 minutes, shaking occasionally, centrifuge for 10 minutes, discard the supernatant liquid and wash the residue with 4 mL of *water*. Shake to disperse, centrifuge for 10 minutes and discard the supernatant liquid. Add 4 mL of 0.01M *sodium hydroxide* to the residue and mix with the aid of ultrasound for 5 minutes, shaking occasionally and centrifuge for 10 minutes. Transfer the supernatant liquid to a second centrifuge tube, add about 1 mL of 0.1M *hydrochloric acid* (the pH of the supernatant liquid should be 2 or less). Centrifuge for 10 minutes, discard the supernatant liquid and wash the residue with 4 mL of *water*, shake to disperse and centrifuge for 10 minutes. Discard the supernatant liquid and dry the residue at 105° for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of etodolac *(RS 139)*.

www.webofpharma.com

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to etodolac in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 mL of *phosphate buffer pH 7.5* and rotating the basket at 100 revolutions per minute. Withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted if necessary, at the maximum at 278 nm, Appendix II B. Measure the *absorbance* of a suitable solution of *etodolac BPCRS* prepared by dissolving 30 mg in 100 mL of the dissolution medium and diluting to a suitable volume with the dissolution medium and using dissolution medium in the reference cell. Calculate the total content of etodolac, $C_{17}H_{21}NO_3$ in the medium from the absorbances obtained and from the declared content of $C_{17}H_{21}NO_3$ in *etodolac BPCRS*.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable), previously activated by heating at 105° for 1 hour, and a mixture of 0.5 volumes of *glacial acetic acid*, 30 volumes of *absolute ethanol* and 70 volumes of *toluene* as the mobile phase. Place the plate in an unlined tank containing a solution prepared by dissolving 0.5 g of *L-ascorbic acid* in 20 mL of *water* and adding 80 mL of *methanol*. Allow the solution to ascend 1 cm above the line of application on the plate, remove the plate and allow it to dry for at least 30 minutes. Apply separately to the plate 10 µL of each of the following solutions in *acetone*. For solution (1) shake a quantity of the contents of the capsules containing 0.2 g of Etodolac with 20 mL of *acetone*, mix with the aid of ultrasound for 5 minutes and filter. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *acetone* and for solution (3) dilute 1 volume of solution (2) to 2 volumes with *acetone*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.25%).

Etodolac acid dimer

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable), previously activated by heating at 105° for 1 hour, and a mixture of 3 volumes of *glacial acetic acid*, 17 volumes of *1,4-dioxan* and 60 volumes of *toluene* as the mobile phase. Place the plate in an unlined tank containing a solution prepared by dissolving 0.5 g of *L-ascorbic acid* in 20 mL of *water* and adding 80 mL of *methanol*. Allow the solution to ascend 1 cm above the line of application on the plate, remove the plate and allow it to dry for at least 30 minutes. Apply separately to the plate 20 µL of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 0.6 g of Etodolac with 20 mL of *acetone*, mix with the aid of ultrasound for 5 minutes and filter. Solution (2) contains 0.003% w/v of *etodolac acid dimer BPCRS* in *acetone*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) corresponding to the acid dimer is not more intense than the spot in the chromatogram obtained with solution (2) (0.1%).

Total methyl analogue impurities

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 0.1 g of Etodolac with 40 mL of *methanol*, mix with the aid of ultrasound for 5 minutes, filter and dilute 10 mL of the filtrate to 25 mL with *water*. For solution (2) dilute 1 volume of a solution containing 0.025% w/v each of *etodolac 1-methyl analogue BPCRS* and *etodolac 8-methyl analogue BPCRS* in *methanol* to 50 volumes with *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 13 volumes of *acetonitrile*, 19 volumes of *methanol* and 68 volumes of a 1.74% w/v solution of *dipotassium hydrogen orthophosphate* as the mobile phase with a flow rate of 1.0 mL per minute and (c) a detection wavelength of 225 nm. Adjust the mobile phase, if necessary, to give a retention time of 14 to 20 minutes for etodolac. The order of elution of peaks in the chromatogram obtained with solution (2) is etodolac 8-methyl analogue and etodolac 1-methyl analogue. For solution (1) allow the chromatography to proceed for twice the retention time of the principal peak.

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two methyl analogue impurities is at least 0.75.

Calculate the percentage content of etodolac 1-methyl analogue and etodolac 8-methyl analogue in etodolac by reference to the corresponding peaks in the chromatogram obtained with solution (2). The total content is not greater than 1.0%.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the mixed contents of 20 capsules containing 50 mg of Etodolac with about 70 mL of 0.1M *sodium hydroxide* for 30 minutes, dilute to 100 mL with 0.1M *sodium hydroxide*, mix and filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 2 mL of the filtrate to 100 mL with the mobile phase. For solution (2) dilute 2 mL of a 0.05% w/v solution of *etodolac BPCRS* in 0.1M *sodium hydroxide* to 100 mL with the mobile phase. For solution (3) add 2 mL of a 0.05% w/v solution of *etodolac 1-methyl analogue BPCRS* in 0.1M *sodium hydroxide* to 2 mL of a 0.05% w/v solution of *etodolac BPCRS* in 0.1M *sodium hydroxide* and dilute to 100 mL with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 45 volumes of *acetonitrile* and 55 volumes of *phosphate buffer pH 4.75* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 225 nm.

The test is not valid unless the *resolution factor* between etodolac and etodolac 1-methyl analogue in the chromatogram obtained with solution (3) is at least 1.5.

Calculate the content of $C_{17}H_{21}NO_3$ using the declared content of $C_{17}H_{21}NO_3$ in *etodolac BPCRS*.

www.webofpharma.com

Etodolac Tablets

Action and use
Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION
Etodolac Tablets contain Etodolac.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of etodolac $C_{17}H_{21}NO_3$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Shake a quantity of the powdered tablets containing 0.5 g of etodolac with 30 mL of *hexane* for 5 minutes, centrifuge, discard the clear hexane layer and add about 40 mL of *ether* to the residue; shake for 5 minutes, centrifuge for 5 minutes, decant the ether layer and filter if necessary. Evaporate the solution to dryness under nitrogen and add about 5 mL of 0.1M *hydrochloric acid* to the residue. Warm on a water bath until the residue begins to crystallise and triturate with a glass rod to promote crystallisation. Cool the mixture in an ice bath, filter through a glass-fibre filter (Whatman GF/C is suitable) and dry the crystals at a pressure of 2 kPa at 60° for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of etodolac *(RS 139)*.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to etodolac in the chromatogram obtained with solution (2).

TESTS
Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of *phosphate buffer pH 7.5*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 278 nm, Appendix II B using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *etodolac BPCRS* prepared by dissolving 20 mg in 100 mL of the dissolution medium, suitably diluted with the dissolution medium, using dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of etodolac, $C_{17}H_{21}NO_3$ in the medium from the absorbances obtained and from the declared content of $C_{17}H_{21}NO_3$ in *etodolac BPCRS*.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in acetone.

(1) Shake a quantity of the powdered tablets containing 0.2 g of etodolac with 20 mL of solvent, mix with the aid of ultrasound for 5 minutes and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes.

(3) Dilute 1 volume of solution (2) to 2 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel F_{254}* precoated plate (Merck silica gel 60 F_{254} plates are suitable), previously activated by heating at 105° for 1 hour. Place the plate in an unlined tank containing a solution prepared by dissolving 0.5 g of L-*ascorbic acid* in 20 mL of *water* and adding 80 mL of *methanol*. Allow the solution to ascend 1 cm above the line of application on the plate, remove the plate and allow it to dry for at least 30 minutes.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

0.5 volumes of *glacial acetic acid*, 30 volumes of *absolute ethanol* and 70 volumes of *toluene*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.25%).

Etodolac acid dimer
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *acetone*.

(1) Shake a quantity of the powdered tablets containing 0.6 g of Etodolac with 20 mL of solvent, mix with the aid of ultrasound for 5 minutes and filter.

(2) 0.003% w/v of *etodolac acid dimer BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used injecting 20 µL of each solution and using the mobile phase as described below.

MOBILE PHASE

3 volumes of *glacial acetic acid*, 17 volumes of *1,4-dioxan* and 60 volumes of *toluene*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) corresponding to the acid dimer is not more intense than the spot in the chromatogram obtained with solution (2) (0.1%).

Total methyl analogue impurities
Carry out the method for *liquid chromatography*, Appendix III D, using the following solution.

(1) Shake a quantity of the powdered tablets containing 0.1 g of etodolac with 40 mL of *methanol*, mix with the aid of ultrasound for 5 minutes, filter and dilute 10 mL of the filtrate to 25 mL with *water*.

(2) Dilute 1 volume of a solution containing 0.025% w/v each of *etodolac 1-methyl analogue BPCRS* and *etodolac 8-methyl analogue BPCRS* in *methanol* to 50 volumes with *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below. Adjust the mobile phase, if necessary, to give a retention time of 14 to 20 minutes for etodolac.

(c) Use a flow rate of 1.0 mL per minute.

www.webofpharma.com

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 225 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for twice the retention time of the principal peak.

MOBILE PHASE

13 volumes of *acetonitrile*, 19 volumes of *methanol* and 68 volumes of a 1.74% w/v solution of *dipotassium hydrogen orthophosphate*.

SYSTEM SUITABILITY

The order of elution of peaks in the chromatogram obtained with solution (2) is etodolac 8-methyl analogue and etodolac 1-methyl analogue.

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two methyl analogue impurities is at least 0.75.

LIMITS

In the chromatogram obtained with solution (1):

Calculate the percentage content of etodolac 1-methyl analogue and etodolac 8-methyl analogue in etodolac by reference to the corresponding peaks in the chromatogram obtained with solution (2). The total content is not greater than 1.0%.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 50 mg of etodolac with about 70 mL of 0.1M *sodium hydroxide* for 30 minutes, dilute to 100 mL with 0.1M *sodium hydroxide*, mix, filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 2 mL of the resulting solution to 100 mL with the mobile phase.

(2) Dilute 2 mL of a 0.05% w/v solution of *etodolac BPCRS* in 0.1M *sodium hydroxide* to 100 mL with the mobile phase.

(3) Add 2 mL of a 0.05% w/v solution of *etodolac 1-methyl analogue BPCRS* in 0.1M *sodium hydroxide* to 2 mL of a 0.05% w/v solution of *etodolac BPCRS* in 0.1M *sodium hydroxide* and dilute to 100 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 225 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

45 volumes of *acetonitrile* and 55 volumes of *phosphate buffer pH 4.75*.

SYSTEM SUITABILITY

The test is not valid unless the *resolution factor* between etodolac and etodolac 1-methyl analogue in the chromatogram obtained with solution (3) is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{21}NO_3$ using the declared content of $C_{17}H_{21}NO_3$ in *etodolac BPCRS*.

Etoposide Capsules

Action and use

Inhibitor of DNA topoisomerase type II; cytotoxic.

DEFINITION

Etoposide Capsules contain a solution of Etoposide in a suitable water-miscible vehicle.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of etoposide, $C_{29}H_{32}O_{13}$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Add a quantity of the contents of the capsules containing 0.1 g of Etoposide to a separating funnel containing 100 mL of *water*, extract with two 20 mL quantities of *dichloromethane*, dry the combined organic extracts over *anhydrous sodium sulfate* and filter. Extract the filtrate with 30 mL of *water*, filter the dichloromethane layer through *anhydrous sodium sulfate* and evaporate to dryness at 25° to 35° under reduced pressure. Dissolve the oily residue in 5 mL of *water*, shake gently and allow to stand for 30 minutes. Filter through a sintered-glass funnel, wash the precipitate in the funnel with three 20 mL quantities of *water* and dry the precipitate in the funnel at 40° at a pressure of 2 kPa for 90 minutes. The *infrared absorption spectrum* of the dried precipitate, Appendix II A, is concordant with the *reference spectrum* of etoposide (*RS 396*).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of a pH 4.5 buffer prepared by dissolving 2.99 g of *sodium acetate* and 14 mL of 2M *acetic acid* in sufficient *water* to produce 1000 mL and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 mL of the medium and filter. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the filtrate diluted, if necessary, with dissolution medium to produce a solution expected to contain about 0.005% w/v of Etoposide. Solution (2) contains 0.005% w/v of *etoposide BPCRS* in the dissolution medium. Solution (3) contains 0.005% w/v of *etoposide BPCRS* and 0.00025% w/v of *ethyl parahydroxybenzoate* in the dissolution medium.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *phenyl silica gel for chromatography* (10 µm) (µBondapak phenyl is suitable), (b) as the mobile phase with a flow rate of 1.0 mL per minute a mixture of 26 volumes of *acetonitrile* and 74 volumes of a 0.272% w/v solution of *sodium acetate* adjusted to pH 4.0 with *glacial acetic acid* and (c) a detection wavelength of 254 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

Calculate the total content of etoposide, $C_{29}H_{32}O_{13}$, in the medium using the declared content of $C_{29}H_{32}O_{13}$ in *etoposide BPCRS*.

***cis*-Etoposide**

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 80 mL of the mobile phase to 10 whole capsules and stir mechanically for 15 minutes with occasional shaking.

www.webofpharma.com

Add sufficient mobile phase to produce 100 mL and stir for a further 5 minutes. Dilute, if necessary, a volume of the solution with the mobile phase to give a solution containing 0.5% w/v of Etoposide; use immediately. For solution (2) dilute 1 volume of solution (1) to 50 volumes with the mobile phase. For solution (3) prepare a 0.5% w/v solution of *etoposide BPCRS* in a mixture of 50 volumes of *acetonitrile*, 50 volumes of *water* and 0.1 volume of *triethylamine* and allow to stand for 40 minutes.

The chromatographic procedure described under Dissolution may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the principal peak and the peak immediately following the principal peak (*cis*-etoposide) is at least 1.0.

In the chromatogram obtained with solution (1) the area of any peak corresponding to *cis*-etoposide is not greater than the area of the peak in the chromatogram obtained with solution (2) (2%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 400 mL of the mobile phase to 10 whole capsules and stir mechanically for 15 minutes with occasional shaking. Add sufficient mobile phase to produce 500 mL and stir for a further 5 minutes. Dilute a volume of the solution with the mobile phase to give a solution containing 0.04% w/v of Etoposide. Solution (2) contains 0.04% w/v of *etoposide BPCRS* in the mobile phase. Solution (3) contains 0.005% w/v of *etoposide BPCRS* and 0.00025% w/v of *ethyl parahydroxybenzoate* in the mobile phase.

The chromatographic procedure described under Dissolution may be used.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

Calculate the content of $C_{29}H_{32}O_{13}$ in the capsules from the chromatograms obtained and using the declared content of $C_{29}H_{32}O_{13}$ in *etoposide BPCRS*.

STORAGE

Etoposide capsules should not be refrigerated.

Etoposide Infusion

Etoposide Intravenous Infusion

Action and use

Inhibitor of DNA topoisomerase type II; cytotoxic.

DEFINITION

Etoposide Infusion is a sterile solution containing Etoposide. It is prepared by diluting Sterile Etoposide Concentrate with a suitable diluent in accordance with the manufacturer's instructions.

The infusion complies with the requirements stated under Parenteral Preparations.

STORAGE

Etoposide Infusion should be used immediately after preparation.

STERILE ETOPOSIDE CONCENTRATE

DEFINITION

Sterile Etoposide Concentrate is a sterile solution of Etoposide in a suitable ethanolic vehicle.

The concentrate complies with the requirements for Concentrates for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of etoposide, $C_{29}H_{32}O_{13}$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the concentrate containing 20 mg of Etoposide to 25 mL with a mixture of 9 volumes of *dichloromethane* and 1 volume of *methanol*.

(2) 0.08% w/v of *etoposide BPCRS* in a mixture of 9 volumes of *dichloromethane* and 1 volume of *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel F_{254} plate* (Merck plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 17 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

0.5 volume of *water*, 2.5 volumes of *ethanol (96%)*, 25 volumes of *acetone* and 80 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

Dilute a volume of the concentrate containing 0.1g of Etoposide to 50 mL with *carbon dioxide-free water*. The pH of the solution is 3.0 to 4.0, Appendix V L.

***cis*-Etoposide**

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the concentrate with the mobile phase to produce a solution containing 0.5% w/v of Etoposide.

(2) Dilute 1 volume of solution (1) to 50 volumes with the mobile phase.

(3) 0.5% w/v solution of *etoposide BPCRS* in a mixture of 50 volumes of *acetonitrile*, 50 volumes of *water* and 0.1 volume of *triethylamine* and allow to stand for 40 minutes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *phenyl silica gel for chromatography* (10 µm) (µBondapak phenyl is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

www.webofpharma.com

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

26 volumes of *acetonitrile* and 74 volumes of a 0.272% w/v solution of *sodium acetate* adjusted to pH 4.0 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the principal peak and the peak immediately following the principal peak (*cis*-etoposide) is at least 1.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to *cis*-etoposide is not greater than the area of the peak in the chromatogram obtained with solution (2) (2%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the concentrate with the mobile phase to give a solution containing 0.04% w/v of Etoposide.

(2) 0.04% w/v of *etoposide BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under *cis*-Etoposide may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{29}H_{32}O_{13}$ in the concentrate using the declared content of $C_{29}H_{32}O_{13}$ in *etoposide BPCRS*.

STORAGE

Sterile Etoposide Concentrate should be protected from light.

Famotidine Tablets

Action and use

Histamine H_2 receptor antagonist; treatment of peptic ulceration.

DEFINITION

Famotidine Tablets contain Famotidine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of famotidine, $C_8H_{15}N_7O_2S_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak in the chromatogram obtained with solution (2).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Fischer Silica Gel GF plates are suitable) and a mixture of 2 volumes of 13.5M *ammonia*, 20 volumes of *toluene*, 25 volumes of *methanol* and 40 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 40 mg of Famotidine with 4 mL of *glacial acetic acid* with the aid of ultrasound, dilute to 10 mL with the same solvent, centrifuge and use the clear supernatant liquid. Solution (2) contains 0.4% w/v of *famotidine BPCRS* in *glacial acetic acid*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Rotate the paddle at 50 revolutions per minute and use as the medium 900 mL of phosphate buffer pH 4.5 prepared in the following manner. Dissolve 13.61 g of *potassium dihydrogen orthophosphate* in *water*, adjust the pH of the solution with *orthophosphoric acid* or 1M *potassium hydroxide* as necessary and add sufficient *water* to produce 1000 mL. Withdraw a sample of 10 mL of the medium, filter and centrifuge at 2000 revolutions per minute for 20 minutes. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.001% w/v of *famotidine BPCRS* in the dissolution medium. For solution (2) use the filtered and centrifuged dissolution medium, diluted if necessary, to give a solution expected to contain about 0.001% w/v of Famotidine.

The chromatographic procedure described under Related substances may be used. Inject 50 µL of each solution.

Calculate the total content of famotidine, $C_8H_{15}N_7O_2S_3$, in the medium using the declared content of $C_8H_{15}N_7O_2S_3$ in *famotidine BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 200 mL of 0.05M *potassium dihydrogen orthophosphate* adjusted to pH 6.0 with 1M *potassium hydroxide* (solution A) to a quantity of whole tablets containing 0.2 g of Famotidine, mix with the aid of ultrasound for 5 minutes, add about 200 mL of *methanol*, shake for 60 minutes and add sufficient solution A to produce 500 mL. For solution (2) dilute 1 volume of solution (1) to 100 volumes with solution A. For solution (3) dilute 1 volume of solution (1) to 10 volumes with solution A and dilute 1 volume of the resulting solution to 50 volumes with solution A. For solution (4) add 40 mL of *acetonitrile* to a mixture of 2 mg of each of *famotidine impurity C BPCRS*, *famotidine degradation impurity 1 BPCRS* and *famotidine degradation impurity 2 BPCRS*, mix with the aid of ultrasound for 2 minutes, cool, add 40 mL of *methanol* and sufficient solution A to produce 200 mL. Dilute 1 volume of the resulting solution to 5 volumes with solution A. For solution (5) dissolve 8 mg of *famotidine BPCRS* in 15 mL of solution A with the aid of ultrasound, cool and add sufficient solution A to produce 20 mL (solution B); to 1 mL of this solution add 0.05 mL of *hydrogen peroxide solution (10 vol)* (generates famotidine degradation impurity 3). For solution (6) dilute 1 volume of solution B with 100 volumes of solution A and further dilute a suitable volume with an equal volume of solution (4).

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Inertsil ODS-2 is suitable) maintaining the column temperature at 40°, (b) a mixture of 7 volumes of *acetonitrile* and a mixture of 93 volumes of 0.1M *sodium acetate* containing 0.1% v/v of *triethylamine* the pH adjusted to 6.0 with *glacial acetic acid* and as the mobile phase with a flow rate of 1.4 mL per minute and (c) a detection wavelength of

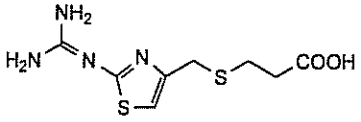
www.webofpharma.com

275 nm. Condition the column for approximately 30 minutes before the first injection.

Inject separately 50 µL of each solution. The substances are eluted in the following order: famotidine degradation impurity 3, famotidine degradation impurity 1, famotidine impurity C, famotidine and famotidine degradation impurity 2. The test is not valid unless, in the chromatogram obtained with solution (6), the *resolution factor* between the peaks due to famotidine and famotidine impurity C is at least 1.4 and that between the peaks due to famotidine and famotidine degradation impurity 2 is at least 1.4. If this resolution is not achieved adjust the content of acetonitrile or decrease the concentration of sodium acetate in the mobile phase.

In the chromatogram obtained with solution (1) the areas of any peaks corresponding to famotidine impurity C or famotidine degradation impurities 1 and 2 are not greater than the areas of the corresponding peaks in the chromatogram obtained with solution (4) (0.5% of each), the area of any peak with a relative retention time of about 0.4 with reference to famotidine in the chromatogram obtained with solution (5) (famotidine degradation impurity 3) is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%) and the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%). Calculate the contents of each of impurity C and degradation impurities 1 and 2 using the chromatogram obtained with solution (4) and the nominal content of any other impurities using the chromatograms obtained with solution (2) and (3). The sum of the contents of all the impurities so calculated is not greater than 2.5%. Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (3) (0.05%).

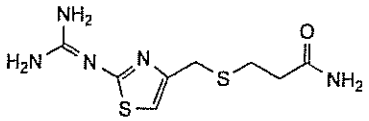
ASSAY



Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 200 mL of 0.05M *potassium dihydrogen orthophosphate* adjusted to pH 6.0 with 1M *potassium hydroxide* (solution A) to a quantity of whole tablets containing 0.2 g of Famotidine, mix with the aid of ultrasound for 5 minutes, add about 200 mL of *methanol*, shake for 60 minutes and add sufficient solution A to produce 500 mL. Dilute 1 volume of this solution to 5 volumes with solution A. For solution (2) dissolve 8 mg of *famotidine BPCRS* in 4 mL of *methanol*, mix with the aid of ultrasound for 5 minutes and add sufficient solution A to produce 20 mL. Dilute 1 volume of this solution to 5 volumes with solution A.

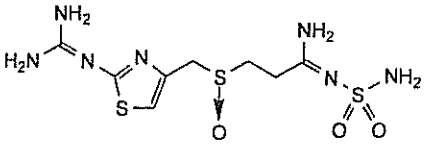
The chromatographic conditions described under Related substances may be used. Inject 50 µL of each solution.

Calculate the content of $C_8H_{15}N_7O_2S_3$ in the tablets using the declared content of $C_8H_{15}N_7O_2S_3$ in *famotidine BPCRS*.



IMPURITIES

The impurities limited by the requirements of this monograph include impurity C listed under famotidine and the following degradation impurities.



1. 3-[2-(Diaminomethyleneamino)-1,3-thiazol-4-ylmethylthio]propanoic acid,

Corresponds to impurity F listed under Famotidine

2. 3-[2-(Diaminomethyleneamino)-1,3-thiazol-4-ylmethylthio]propanamide,

Corresponds to impurity D listed under Famotidine

3. 3-[2-(Diaminomethyleneamino)-1,3-thiazol-4-ylmethylsulfinyl]-*N*-sulfamoylpropanamidine.

Felbinac Cutaneous Foam

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Felbinac Cutaneous Foam is a fluid foam containing Felbinac in solution in a suitable pressurised container.

The cutaneous foam complies with the requirements stated under Medicated Foams and with the following requirements.

Content of felbinac, $C_{14}H_{12}O_2$

95.0 to 105.0% of the stated amount.

In each of the following tests, discharge a quantity of the foam into a suitable vessel with the can upright. Quantitatively transfer the foam using methanol. Determine the sample weight by difference.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a weighed quantity of the foam containing 60 mg of Felbinac in *methanol*, warming slightly if necessary to break the foam, and add sufficient *methanol* to produce 100 mL.

(2) 0.06% w/v solution of *felbinac BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} plates are suitable)

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 10 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)* (first examination). Spray the plate with a mixture of equal volumes of *formaldehyde solution* and *sulfuric acid* and heat at 110° for 10 minutes (second examination).

MOBILE PHASE

1 volume of *glacial acetic acid*, 25 volumes of *acetone* and 50 volumes of *hexane*.

CONFIRMATION

In the first examination:

the principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

www.webofpharma.com

In the second examination:

the principal spots in the chromatograms obtained with solutions (1) and (2) are an intense purple colour.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Alkalinity

pH of the foam, 7.0 to 8.6, Appendix V L. Ensure good contact between the foam and the electrode.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a weighed quantity of the foam containing 30 mg of Felbinac in *methanol*, warming slightly if necessary to break the foam, and add sufficient *methanol* to produce 50 mL.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase and further dilute 1 volume of this solution to 10 volumes with the same solvent.

(3) 0.00006% w/v of *4-acetylbiphenyl* and 0.00006% w/v of *biphenyl* in *methanol*.

(4) 0.001% w/v of *felbinac BPCRS* and 0.001% w/v of *o-phenylbenzoic acid* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Partisil ODS3 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 50 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for at least twice the retention time of the principal peak.

MOBILE PHASE

45 volumes of a 0.1% v/v solution of *glacial acetic acid* and 55 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the two principal peaks is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 4-acetylbiphenyl is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.1%);

the area of any peak corresponding to biphenyl is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.1%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a weighed quantity of the foam containing 30 mg of felbinac in 60 mL of *methanol*, warming slightly, if necessary, to break the foam, add slowly, and with mixing, sufficient *water* to produce 100 mL and dilute 1 volume of the resulting solution to 20 volumes with the mobile phase.

(2) 0.0015% w/v of *felbinac BPCRS* in the mobile phase.

(3) 0.0015% w/v each of *felbinac BPCRS* and *o-phenylbenzoic acid* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

Use the chromatographic conditions described under Related substances, with the exception of the run time. Inject 20 µL of each solution.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{12}O_2$ in the foam using the declared content of $C_{14}H_{12}O_2$ in *felbinac BPCRS*.

STORAGE

Felbinac Cutaneous Foam should be kept protected from light. It should not be refrigerated.

Felbinac Gel

Action and use

Cyclo-oxygenase inhibitor; analgesic; antinflammatory.

DEFINITION

Felbinac Gel is a solution of Felbinac in a suitable water-miscible basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of felbinac, $C_{14}H_{12}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a precoated silica gel F_{254} plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 1 volume of *glacial acetic acid*, 25 volumes of *acetone* and 50 volumes of *hexane* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) dilute a quantity of the gel containing 30 mg of felbinac with sufficient *acetone* to produce 5 mL and mix. Solution (2) is a 0.6% w/v solution of *felbinac BPCRS* in *acetone*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). Spray the plate with a mixture of equal volumes of *formaldehyde solution* and *sulfuric acid* and heat at 110° for 10 minutes. The principal spots in the chromatograms obtained with solutions (1) and (2) are an intense purple colour.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 7.0 to 8.0, Appendix V L.

www.webofpharma.com

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve a weighed quantity of the gel containing 30 mg of felbinac in *methanol* and add sufficient *methanol* to produce 50 mL. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase and further dilute 1 volume of this solution to 10 volumes with the same solvent. Solution (3) contains 0.00006% w/v of *4-acetylbiphenyl* and 0.00006% w/v of *biphenyl* in *methanol*. Solution (4) contains 0.001% w/v of *felbinac BPCRS* and 0.001% w/v of *o-phenylbenzoic acid* in the mobile phase. Inject 50 µL of each solution.

The chromatographic procedure described under Assay may be used.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the two principal peaks is at least 3.

For solution (1) allow the chromatography to proceed for at least twice the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any peaks corresponding to 4-acetylbiphenyl or biphenyl is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.1% of each) and the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve a quantity of the gel containing 30 mg of felbinac in 70 mL of the mobile phase, add sufficient of the mobile phase to produce 100 mL, mix and dilute 1 volume of the resulting solution to 20 volumes with the mobile phase. Solution (2) contains 0.0015% w/v of *felbinac BPCRS* in the mobile phase. Solution (3) contains 0.0015% w/v of *felbinac BPCRS* and 0.0015% w/v of *o-phenylbenzoic acid* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Partisil ODS3 is suitable), (b) as the mobile phase with a flow rate of 2 mL per minute a mixture of 45 volumes of a 0.1% v/v solution of *glacial acetic acid* and 55 volumes of *methanol* and (c) a detection wavelength of 254 nm.

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.

Calculate the content of $C_{14}H_{12}O_2$ in the gel from the chromatograms obtained and using the declared content of $C_{14}H_{12}O_2$ in *felbinac BPCRS*.

Prolonged-release Felodipine Tablets

Prolonged-release Felodipine Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use
Calcium channel blocker.

DEFINITION
Prolonged-release Felodipine Tablets contain Felodipine. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION
A suitable dissolution test is carried out to demonstrate the appropriate release of Felodipine. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of felodipine, $C_{18}H_{19}Cl_2NO_4$
92.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Extract a quantity of the powdered tablets containing 15 mg of Felodipine with 100 mL of *ethanol (96%)*, filter, and dilute 5 mL of the filtrate to 50 mL with *ethanol (96%)*. The *light absorption*, Appendix II B, in the range 250 to 450 nm exhibits a maximum at 362 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 10 mg of Felodipine with 10 mL of *methanol* and filter through a 0.45-µm filter.

(2) 0.1% w/v of *felodipine BPCRS* in *methanol*.

(3) 0.1% w/v each of *felodipine BPCRS* and *nifedipine BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating substance *silica gel F_{254}*.

(b) Use the mobile phase described below.

(c) Apply 10 µL of each solution.

(d) Develop to 15 cm.

(e) Dry the plate in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

40 volumes of *ethyl acetate* and 60 volumes of *cyclohexane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots of different colours.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

C. In the Assay, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS
Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

SOLVENT A

A mixture of 0.08% w/v of *orthophosphoric acid R* and 0.8% w/v of *sodium dihydrogen orthophosphate*.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 10 mg of Felodipine with 10 mL of *methanol* and 20 mL of *acetonitrile* for 5 minutes, add 15 mL of solvent A and continue to disperse with the aid of ultrasound for a further 30 minutes. Cool, dilute to 50 mL with solvent A and filter through a 0.45-µm PTFE filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

www.webofpharma.com

(3) Dilute 1 volume of solution (2) to 10 volumes with the mobile phase.

(4) 0.006% w/v of *felodipine impurity standard BPCRS* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Waters Nova-Pak is suitable).

(b) Use isocratic elution using the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

20 volumes of *methanol*, 40 volumes of *acetonitrile* and 40 volumes of solvent A.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the two principal peaks is at least than 2.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to Impurity A is not greater than four times the area of the principal peak in the chromatogram obtained with solution (2) (4.0%);

the sum of the areas of the peaks corresponding to impurity B (relative retention about 0.7 with respect to felodipine and impurity C (relative retention about 1.4 with respect to felodipine) is not greater than the area of the principal peak in the chromatogram obtained with solution (2);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

SOLVENT A

A mixture of 0.08% w/v of *orthophosphoric acid R* and 0.8% w/v of *sodium dihydrogen orthophosphate.*

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix with the aid of ultrasound a quantity of the powdered tablets containing 10 mg of Felodipine with 10 mL of methanol and 20 mL of acetonitrile for 5 minutes, add 15 mL of solvent A and mix with the aid of ultrasound for a further 30 minutes. Cool, add sufficient solvent A to produce 50 mL and filter through a 0.45-µm PTFE filter. Dilute 1 volume of the resulting solution to 10 volumes with the mobile phase.

(2) 0.002% w/v of *felodipine BPCRS* in mobile phase.

(3) 0.006% w/v of *felodipine impurity standard BPCRS* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{19}Cl_2NO_4$ in the tablets using the declared content of $C_{18}H_{19}Cl_2NO_4$ in *felodipine BPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include those impurities listed under Felodipine.

Fenbufen Capsules

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Fenbufen Capsules contain Fenbufen.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of fenbufen, $C_{16}H_{14}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the contents of the capsules containing 0.9 g of fenbufen add 10 mL of *acetone*, triturate using a glass pestle, filter through filter paper wetted with *acetone* into 100 mL of *petroleum spirit (boiling point, 40° to 60°)*, stir rapidly with a glass rod to induce crystallisation and allow to stand for 15 minutes. Filter through a fine porosity sintered-glass funnel, rinse the crystals with 25 mL of *petroleum spirit (boiling point, 40° to 60°)*, remove the solvent under reduced pressure and dry the crystals at 105° for 15 minutes. The *infrared absorption spectrum* of the dried crystals, Appendix II A, is concordant with the *reference spectrum* of fenbufen *(RS 140)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of a phosphate buffer prepared by dissolving 6.69 g of *potassium dihydrogen orthophosphate* and 1.63 g of *sodium hydroxide* in sufficient *water* to produce 1000 mL, adjusting the pH to 7.5 with 5M *sodium hydroxide* if necessary, and rotate the paddle at 100 revolutions per minute. Withdraw a sample of 10 mL of the medium, filter (Whatman 541 paper is suitable) and dilute 1 mL of the filtrate to 50 mL with the dissolution medium. Measure the *absorbance* of this solution, Appendix II B, at 285 nm using dissolution medium in the reference cell. Measure the *absorbance* of a suitable solution of *fenbufen BPCRS* prepared by dissolving 50 mg in 50 mL of *methanol* and diluting to a suitable volume with the dissolution medium and using dissolution medium in the reference cell. Calculate the total content of fenbufen, $C_{16}H_{14}O_3$ in the medium from the absorbances obtained and from the declared content of $C_{16}H_{14}O_3$ in *fenbufen BPCRS.*

www.webofpharma.com

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add to a quantity of the contents of the capsules containing 0.25 g of fenbufen 20 mL of *dimethylformamide*, mix with the aid of ultrasound for 20 minutes, dilute to 50 mL with the initial mobile phase and filter (Whatman GF/F paper is suitable). For solution (2) dilute 1 volume of solution (1) to 100 volumes with the initial mobile phase and further dilute 1 volume of this solution to 10 volumes with the initial mobile phase. Solution (3) contains 0.0025% w/v of *fenbufen BPCRS* and 0.0006% w/v of *3-(4-chlorobenzoyl)propionic acid*.

The chromatographic procedure may be carried out using a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable). Use as the initial mobile phase a mixture of 32 volumes of *acetonitrile* and 68 volumes of a solution consisting of 1 volume of *glacial acetic acid* and 55 volumes of *water* and as the final mobile phase a mixture of 45 volumes of *acetonitrile* and 55 volumes of a solution consisting of 1 volume of *glacial acetic acid* and 55 volumes of *water*. Maintain the initial mobile phase for 15 minutes, carry out a linear gradient elution with a flow rate of 2 mL per minute for 5 minutes and maintain the final mobile phase for 15 minutes with the same flow rate. Use a detection wavelength of 254 nm.

The test is not valid unless in the chromatogram obtained with solution (3) the *resolution factor* between the two principal peaks is at least 10.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%) and the sum of the areas of any such peaks is not greater than five times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add to a quantity of the mixed contents of 20 capsules containing 0.1 g of fenbufen 30 mL of *methanol*, mix with the aid of ultrasound for 15 minutes, add sufficient of the mobile phase to produce 100 mL and dilute 1 volume of this solution to 10 volumes with the mobile phase. For solution (2) dissolve *fenbufen BPCRS* in *methanol*, add sufficient of the mobile phase to produce a 0.1% w/v solution and dilute 1 volume of this solution to 10 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), maintained about 40°, (b) a mixture of 1 volume of *glacial acetic acid*, 44 volumes of *acetonitrile* and 55 volumes of *water* as the mobile phase with a flow rate of 1.5 mL per minute and (c) a detection wavelength of 280 nm.

Calculate the content of $C_{16}H_{14}O_3$ in the capsules using the declared content of $C_{16}H_{14}O_3$ in *fenbufen BPCRS*.

Fenbufen Tablets

Action and use
Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION
Fenbufen Tablets contain Fenbufen.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of fenbufen, $C_{16}H_{14}O_3$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. To a quantity of the powdered tablets containing 0.9 g of Fenbufen add 10 mL of *acetone*, triturate using a glass pestle, filter through filter paper wetted with *acetone* into 100 mL of *petroleum spirit (boiling point, 40° to 60°)*, stir rapidly with a glass rod to induce crystallisation and allow to stand for 15 minutes. Filter through a fine porosity sintered-glass funnel, rinse the crystals with 25 mL of *petroleum spirit (boiling point, 40° to 60°)*, remove the solvent under reduced pressure and dry the crystals at 105° for 15 minutes. The *infrared absorption spectrum* of the dried crystals, Appendix II A, is concordant with the *reference spectrum* of fenbufen *(RS 140)*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak in the chromatogram obtained with solution (2).

TESTS
Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 100 revolutions per minute.

(b) Use 900 mL of a phosphate buffer prepared by dissolving 6.69 g of *potassium dihydrogen orthophosphate* and 1.63 g of *sodium hydroxide* in sufficient *water* to produce 1000 mL, adjusting the pH to 7.5 with 5M *sodium hydroxide* if necessary, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium, filter (Whatman 541 paper is suitable) and dilute 1 mL of the filtrate to 50 mL with the dissolution medium. Measure the *absorbance* of this solution, Appendix II B, at 285 nm using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *fenbufen BPCRS* prepared by dissolving 50 mg in 50 mL of *methanol* and diluting to volume with the dissolution medium and using dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of fenbufen, $C_{16}H_{14}O_3$, in the medium from the absorbances obtained and using the declared content of $C_{16}H_{14}O_3$, in *fenbufen BPCRS*.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the powdered tablets containing 0.25 g of Fenbufen add 20 mL of *dimethylformamide*, mix with the aid of ultrasound for 20 minutes, add sufficient of the initial

www.webofpharma.com

mobile phase to produce 50 mL and filter (Whatman GF/F is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with the initial mobile phase and further dilute 1 volume of this solution to 10 volumes with the initial mobile phase.

(3) 0.0025% w/v of *fenbufen BPCRS* and 0.0006% w/v of *3-(4-chlorobenzoyl)propionic acid.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 32 volumes of *acetonitrile* and 68 volumes of a solution consisting of 1 volume of *glacial acetic acid* and 55 volumes of *water.*

Mobile phase B 45 volumes of *acetonitrile* and 55 volumes of a solution consisting of 1 volume of *glacial acetic acid* and 55 volumes of *water.*

Time (Minutes)	Mobile phase A%	Mobile phase B%	Comment
0-15	100	0	isocratic
15-20	100→0	0→100	linear gradient
20-35	0	100	isocratic
35-40	0→100	100→0	linear gradient
40-50	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless in the chromatogram obtained with solution (3) the *resolution factor* between the two principal peaks is at least 10.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

the sum of the areas of any such peaks is not greater than five times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the powdered tablets containing 0.1 g of Fenbufen add 30 mL of *methanol*, mix with the aid of ultrasound for 15 minutes, add sufficient of the mobile phase to produce 100 mL, filter through a 0.45-µm filter (Whatman GF/C is suitable) and dilute 1 volume to 10 volumes with the mobile phase.

(2) Dissolve *fenbufen BPCRS* in *methanol*, add sufficient of the mobile phase to produce a 0.1% w/v solution and dilute 1 volume of this solution to 10 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

1 volume of *glacial acetic acid*, 44 volumes of *acetonitrile* and 55 volumes of *water.*

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{14}O_3$ in the capsules using the declared content of $C_{16}H_{14}O_3$ in *fenbufen BPCRS.*

Fenoprofen Tablets

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Fenoprofen Tablets contain Fenoprofen Calcium. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of fenoprofen, $C_{15}H_{14}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits two maxima, at 272 nm and 278 nm, and a shoulder at 266 nm.

B. Suspend a quantity of the powdered tablets containing the equivalent of 0.3 g of fenoprofen in 10 mL of 0.1M *hydrochloric acid.* Extract with 20 mL of *chloroform*, filter the extract through *anhydrous sodium sulfate* and evaporate the filtrate to dryness. The *infrared absorption spectrum* of a thin film of the residue, Appendix II A, is concordant with the *reference spectrum* of fenoprofen *(RS 141).*

C. Ignite a quantity of the powdered tablets. The residue yields the reactions characteristic *of calcium salts*, Appendix VI.

Related substances

Carry out the method for liquid chromatography, Appendix III D, using the following solutions.

(1) To a quantity of the powdered tablets containing the equivalent of 0.5 g of fenoprofen add 80 mL of the mobile phase, mix with the aid of ultrasound, allow to cool, add sufficient mobile phase to produce 100 mL and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes with the mobile phase.

(3) 0.04% w/v of *fenoprofen calcium* and 0.0015% w/v of *4,4'-dimethoxybenzophenone* in the mobile phase.

(4) Dilute 1 volume of solution (2) to 5 volumes with the mobile phase.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (7 to 8 µm) (Zorbax ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 270 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for 3 times the retention time of the peak due to fenoprofen.

MOBILE PHASE

2 volumes of *glacial acetic acid*, 7 volumes of *tetrahydrofuran*, 30 volumes of *acetonitrile* and 61 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to fenoprofen calcium and 4′,4′-dimethoxybenzophenone is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than twice the area of the peak in the chromatogram obtained with solution (2) (1.0%);

not more than one such peak has an area greater than the area of the peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of all such peaks is not greater than four times the area of the peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing the equivalent of 0.2 g of fenoprofen add 5 mL of *glacial acetic acid* and shake for 1 minute. Add 100 mL of *methanol*, shake for 5 minutes, dilute to 200 mL with *methanol* and filter. Dilute 10 mL of the filtrate to 200 mL with *methanol* and measure the *absorbance* of the resulting solution at the maximum at 272 nm, Appendix II B. Calculate the content of $C_{15}H_{14}O_3$ taking 80.7 as the value of A(1%, 1 cm) at the maximum at 272 nm.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of fenoprofen.

Fentanyl Injection

Action and use

Opioid receptor agonist; analgesic.

DEFINITION

Fentanyl Injection is a sterile solution of Fentanyl Citrate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of fentanyl, $C_{22}H_{28}N_2O$

95.0% to 105.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the injection diluted, if necessary, to contain the equivalent of 0.005% w/v of fentanyl exhibits two maxima at 251 and 257 nm and a shoulder at 262 nm.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) The injection being examined, diluted with the mobile phase if necessary, to contain the equivalent of 0.005% w/v of fentanyl.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase and dilute 5 volumes of the resulting solution to 20 volumes with the mobile phase.

(3) 0.00005% w/v of *fentanyl impurity A BPCRS* in the mobile phase.

(4) Dissolve 10 mg of *fentanyl citrate BPCRS* in 10 mL of 2M *hydrochloric acid*, heat on a waterbath under a reflux condenser for 4 hours and neutralise with 10 mL of 2M *sodium hydroxide*. Evaporate to dryness on a waterbath, cool, dissolve the residue in 10 mL of *methanol* and filter. Dilute 1 volume of the filtrate to 10 volumes with the mobile phase (generation of impurity D).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Bondclone C18 10µ is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.25 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 215 nm.

(f) Inject 100 µL of each solution. Inject *methanol* as a blank prior to the solutions.

(g) For solutions (1) and (2) allow the chromatography to proceed for twice the retention time of the principal peak.

MOBILE PHASE

0.3% w/v of *potassium dihydrogen orthophosphate* in a mixture of 4 volumes of *acetonitrile*, 40 volumes of *methanol* and 56 volumes of *water*, the solution adjusted to pH 3.2 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the retention time of fentanyl impurity D is about 0.8 relative to fentanyl.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to fentanyl impurity A is not greater than half the area of the peak in the chromatogram obtained with solution (3) (0.5%);

the area of any peak corresponding to fentanyl impurity D is not greater than twice the area of the peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.25%);

www.webofpharma.com

the sum of the areas of any *secondary peaks* apart from any peaks corresponding to fentanyl impurity A and fentanyl impurity D is not greater than three times the area of the principal peak in the chromatogram obtained with solution (2) (0.75%).

Disregard any peak obtained with the blank solution and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) The injection diluted, if necessary, to contain the equivalent of 0.005% w/v of fentanyl.

(2) 0.008% w/v solution of *fentanyl citrate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{28}N_2O$ in the injection using the declared content of $C_{22}H_{28}N_2O$ in *fentanyl citrate BPCRS*.

STORAGE

Fentanyl Injection should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of fentanyl.

IMPURITIES

The impurities limited by the requirements of this monograph include impurity A and impurity D listed under Fentanyl Citrate.

Ferrous Fumarate Capsules

DEFINITION

Ferrous Fumarate Capsules contain Ferrous Fumarate.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of ferrous iron, Fe(II)

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Heat 1 g of the contents of the capsules with 25 mL of a mixture of equal volumes of *hydrochloric acid* and *water* on a water bath for 15 minutes, cool and filter. Retain the residue for test B. The filtrate yields reaction A characteristic of *iron salts*, Appendix VI.

B. Wash the residue reserved in test A with a mixture of 1 volume of 2M *hydrochloric acid* and 9 volumes of *water* and dry at 105°. Suspend 0.1 g of the residue in 2 mL of *dilute sodium carbonate solution* and add *dilute potassium permanganate solution* drop wise. The permanganate is decolourised and a brownish solution is produced.

C. Mix a quantity of the contents of the capsules containing 0.5 g of ferrous fumarate with 1 g of *resorcinol*. To 0.5 g of the mixture in a crucible add 0.15 mL of *sulfuric acid* and heat gently; a deep red, semi-solid mass is produced. Add the mass to a large volume of *water*; an orange–yellow solution is produced which exhibits no fluorescence.

TESTS

Ferric iron

In a flask with a ground-glass stopper dissolve a quantity of the mixed contents of 20 capsules prepared for the Assay containing 1.5 g of ferrous fumarate in a mixture of 10 mL of *hydrochloric acid* and 100 mL of *water* by heating rapidly to boiling. Boil for 15 seconds. Cool rapidly, add 3 g of *potassium iodide*, stopper the flask and allow to stand protected from light for 15 minutes. Add 2 mL of *starch solution* as indicator. Titrate the liberated iodine with 0.05M *sodium thiosulfate VS*. Carry out a blank test. The difference between the volumes used in the two titrations corresponds to the amount of iodine liberated by ferric ion. The difference between the titrations is not more than 5.4 mL (1%).

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 100 mL sample of the medium and titrate the filtered sample with 0.01M *ammonium cerium(IV) sulfate VS* using *ferroin solution* as indicator.

DETERMINATION OF CONTENT

Calculate the total content of Fe(II), in the medium taking each mL of 0.01M *ammonium cerium(IV) sulfate VS* to be equivalent to 0.5585 mg of Fe(II).

ASSAY

Dissolve a quantity of the mixed contents of 20 capsules containing 0.3 g of ferrous fumarate in 7.5 mL of 1M *sulfuric acid* with gentle heating. Cool, add 25 mL of *water* and titrate immediately with 0.1M *ammonium cerium(IV) sulfate VS* using *ferroin solution* as indicator. Each mL of 0.1M *ammonium cerium(IV) sulfate VS* is equivalent to 5.585 mg of Fe(II).

LABELLING

The quantity of the active ingredient is stated both as the amount of ferrous fumarate and in terms of the equivalent amount of ferrous iron.

Ferrous Fumarate Oral Suspension

DEFINITION

Ferrous Fumarate Oral Suspension is a suspension of ferrous fumarate in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ferrous iron, Fe(II)

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Mix a volume of the oral suspension containing about 0.6 g of ferrous fumarate with 20 mL of *water*, centrifuge and discard the supernatant liquid. Repeat with a further 20 mL of *water*. Add 15 mL of 3M *hydrochloric acid* to the residue, dissolve with minimum warming, cool and extract with two 50 mL quantities of *ether*. Wash the combined ether extracts

www.webofpharma.com

with two 20 mL quantities of *water*, shake with *anhydrous sodium sulfate*, filter and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of fumaric acid *(RS 163)*.

B. Mix a volume of the oral suspension containing about 0.3 g of ferrous fumarate in 10 mL of *water*, centrifuge and discard the supernatant liquid. To 0.2 g of the residue add 10 mL of a mixture of equal volumes of *hydrochloric acid* and *water*, dissolve with minimum warming, cool and filter. The filtrate yields reaction A characteristic of *iron salts*, Appendix VI.

TESTS

Ferric iron

Disperse a quantity of the oral suspension containing 0.28 g of ferrous fumarate in 20 mL of *water*, centrifuge and decant the supernatant liquid into a 500 mL graduated flask. Dissolve the residue in 20 mL of 1M *sulfuric acid* with minimum warming, cool and transfer the resulting solution to the same graduated flask, dilute to 500 mL with *water* and filter. To 5 mL of the filtrate in a *Nessler cylinder* add 40 mL of *water* and 5 mL of a 10% w/v solution of *ammonium thiocyanate* and mix. Any red colour produced is not more intense than that obtained by treating in the same manner a mixture of 42 mL of *water*, 0.2 mL of 1M *sulfuric acid* and 3 mL of a 0.0173% w/v solution of *ammonium iron(III) sulfate* in 0.01M *hydrochloric acid* [6.0%, with respect to the content of Fe(II)].

ASSAY

Mix a quantity of the oral suspension containing 0.28 g of ferrous fumarate with 10 mL of *water* and 25 mL of *nitric acid*, carefully warm until the vigorous reaction subsides, add a further 25 mL of *nitric acid*, evaporate to about 10 mL and allow to cool. Carefully add 10 mL of *sulfuric acid* to the cooled solution, evaporate until white fumes are evolved, cool, add 10 mL of *nitric acid* and again evaporate until white fumes are evolved. Repeat the evaporation with 10 mL quantities of *nitric acid* until all of the organic matter has been destroyed. To the resulting solution add 10 mL of *water* and 0.5 g of *ammonium oxalate*, evaporate until white fumes are evolved, add 50 mL of *water*, boil until a clear solution is obtained, cool, dilute to 100 mL with *water* and add *dilute potassium permanganate solution*, drop wise, until a faint pink colour persists for 10 seconds. Add 10 mL of *hydrochloric acid* and 3 g of *potassium iodide*, allow to stand for 15 minutes protected from light, add 10 mL of *chloroform* and titrate the liberated iodine with 0.1M *sodium thiosulfate VS*, with vigorous shaking, until the chloroform layer becomes colourless. Repeat the procedure without the preparation being examined. The difference between the titrations represents the amount of sodium thiosulfate required. Each mL of 0.1M *sodium thiosulfate VS* is equivalent to 5.585 mg of Fe(II).

STORAGE

Ferrous Fumarate Oral Suspension should be protected from light.

LABELLING

The quantity of the active ingredient is stated both as the amount of ferrous fumarate and in terms of the equivalent amount of ferrous iron.

Ferrous Fumarate Tablets

DEFINITION

Ferrous Fumarate Tablets contain Ferrous Fumarate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ferrous iron, Fe(II)

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Heat 1 g of the powdered tablets with 25 mL of a mixture of equal volumes of *hydrochloric acid* and *water* on a water bath for 15 minutes, cool and filter. Retain the residue for test B. The filtrate yields reaction A characteristic of *iron salts*, Appendix VI.

B. Wash the residue reserved in Test A with a mixture of 1 volume of 2M *hydrochloric acid* and 9 volumes of *water* and dry at 105°. Suspend 0.1 g of the residue in 2 mL of *dilute sodium carbonate solution* and add *dilute potassium permanganate solution* drop wise. The permanganate is decolourised and a brownish solution is produced.

C. Mix a quantity of the powdered tablets containing 0.5 g of ferrous fumarate with 1 g of *resorcinol*. To 0.5 g of the mixture in a crucible add 0.15 mL of *sulfuric acid* and heat gently; a deep red, semi-solid mass is produced. Add the mass to a large volume of *water*; an orange–yellow solution is produced which exhibits no fluorescence.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

After 45 minutes withdraw a sample of 100 mL of the medium and filter. Titrate the filtrate with 0.01M *ammonium cerium(IV) sulfate VS* using *ferroin solution* as indicator.

DETERMINATION OF CONTENT

Calculate the total content of Fe(II) in the medium taking each mL of 0.01M *ammonium cerium(IV) sulfate VS* to be equivalent to 0.5585 mg of Fe(II).

Ferric iron

In a flask with a ground-glass stopper dissolve a quantity of the powder prepared for the Assay containing 1.5 g of ferrous fumarate in a mixture of 10 mL of *hydrochloric acid* and 100 mL of *water* by heating rapidly to boiling. Boil for 15 seconds. Cool rapidly, add 3 g of *potassium iodide*, stopper the flask and allow to stand protected from light for 15 minutes. Add 2 mL of *starch solution* as indicator. Titrate the liberated iodine with 0.1M *sodium thiosulfate VS*. Carry out a blank test. The difference between the volumes used in the two titrations corresponds to the amount of iodine liberated by ferric ion. The difference between the titrations is not more than 13.4 mL (5%).

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.3 g of ferrous fumarate in 7.5 mL of 1M *sulfuric acid* with gentle heating. Cool, add 25 mL of *water* and titrate immediately with 0.1M *ammonium cerium(IV)*

www.webofpharma.com

sulfate VS using *ferroin solution* as indicator. Each mL of 0.1M *ammonium cerium(IV) sulfate VS* is equivalent to 5.585 mg of Fe(II).

LABELLING
The quantity of the active ingredient is stated both as the amount of ferrous fumarate and in terms of the equivalent amount of ferrous iron.

Ferrous Fumarate and Folic Acid Tablets

Action and use
Vitamin B component.

DEFINITION
Ferrous Fumarate and Folic Acid Tablets contain Ferrous Fumarate and Folic Acid. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Carry out the tests avoiding exposure to actinic light.

Content of ferrous fumarate, $C_4H_2FeO_4$
90.0 to 105.0% of the stated amount.

Content of folic acid, $C_{19}H_{19}N_7O_6$
90.0 to 115.0% of the stated amount.

IDENTIFICATION
A. In the Assay for folic acid, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. Heat a quantity of the powdered tablets containing 0.77 g of Ferrous Fumarate with 25 mL of a mixture of equal volumes of *hydrochloric acid* and *water* on a water bath for 15 minutes, cool and filter. Retain the residue for test C. The filtrate yields reaction A characteristic of *iron salts*, Appendix VI.

C. Wash the residue reserved in test B with a mixture of 1 volume of 2M *hydrochloric acid* and 9 volumes of *water* and dry at 105°. Suspend 0.1 g of the residue in 2 mL of *sodium carbonate solution* and add *potassium permanganate solution* dropwise. The permanganate is decolourised and a brownish solution is produced.

TESTS
Ferric iron
Dissolve a quantity of the powder prepared for the Assay for ferrous fumarate containing 1.5 g of Ferrous Fumarate in a mixture of 100 mL of *water* and 10 mL of *hydrochloric acid* by heating rapidly to the boiling point. Boil for 15 seconds, cool rapidly, add 3 g of *potassium iodide*, stopper, allow to stand in the dark for 15 minutes and titrate the liberated iodine with 0.1M *sodium thiosulfate VS* using *starch mucilage* as indicator. Repeat the operation without the substance being examined. The difference between the titrations is not more than 13.4 mL (5% ferric iron in Ferrous Fumarate).

Uniformity of Content

For folic acid
Tablets containing less than 2mg and/or less than 2% w/w of Folic Acid comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 135 volumes of *methanol* and 800 volumes of a 0.57% w/v solution of *dipotassium hydrogen orthophosphate* (solvent A).

(1) Place one tablet in 40 mL of solvent A, shake for a further 15 minutes, dilute to 50 mL with solvent A and filter (a 0.45 µm nylon filter is suitable).

(2) 0.0007% w/v of *folic acid BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 277 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

135 volumes of *methanol* and 800 volumes of a solution containing 0.938% w/v of *sodium perchlorate* and 0.075% w/v of *potassium dihydrogen orthophosphate* adjusted to pH 7.2 with 0.1M *potassium hydroxide* and diluted to 1000 volumes with *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{19}H_{19}N_7O_6$ in each tablet using the declared content of $C_{19}H_{19}N_7O_6$ in *folic acid BPCRS*.

ASSAY
Weigh and powder 20 tablets.

For ferrous fumarate
Disperse a quantity of the powder containing 0.3 g of Ferrous Fumarate in 7.5 mL of 1M *sulfuric acid* with gentle heating. Cool, add 25 mL of *water* and titrate immediately with 0.1M *ammonium cerium(IV) sulfate VS* using *ferroin solution* as indicator. Each mL of 0.1M *ammonium cerium(IV) sulfate VS* is equivalent to 16.99 mg of $C_4H_2FeO_4$.

For folic acid

For tablets containing less than 2 mg and/or less than 2% w/w of folic acid
Use the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing 2 mg or more and 2% w/w or more of folic acid
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 135 volumes of *methanol* and 800 volumes of a 0.57% w/v solution of *dipotassium hydrogen orthophosphate* (solvent A).

(1) Mix a quantity of the powdered tablets containing 0.35 mg of Folic Acid in 40 mL of solvent A, shake for 5 minutes with the aid of ultrasound, shake for a further 15 minutes and dilute to 50 mL with solvent A and filter (a 0.45 µm nylon filter is suitable)

(2) 0.0007% w/v of *folic acid BPCRS* solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 277 nm.

(f) Inject 20 µL of each solution.

www.webofpharma.com

MOBILE PHASE

135 volumes of *methanol* and 800 volumes of a solution containing 0.938% w/v of *sodium perchlorate* and 0.075% w/v of *potassium dihydrogen orthophosphate* adjusted to pH 7.2 with 0.1M *potassium hydroxide* and diluted to 1000 volumes with *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{19}H_{19}N_7O_6$ in the tablets using the declared content of $C_{19}H_{19}N_7O_6$ in *folic acid BPCRS*.

STORAGE

Ferrous Fumarate and Folic Acid Tablets should be protected from light.

304 mg of ferrous fumarate is equivalent to 100 mg of ferrous iron.

Ferrous Gluconate Tablets

DEFINITION

Ferrous Gluconate Tablets contain Ferrous Gluconate. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ferrous iron, Fe(II)

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 0.5 g of ferrous gluconate with 10 mL of 2M *hydrochloric acid*, filter and add to the filtrate 1 mL of *barium chloride solution*. An opalescence may be produced but no precipitate is produced.

B. The powdered tablets yield reaction A characteristic of *iron salts*, Appendix VI.

TESTS

Ferric iron

Dissolve a quantity of the powder prepared for the Assay containing 5 g of ferrous gluconate as completely as possible without heating in a mixture of 100 mL of freshly boiled and cooled *water* and 10 mL of *hydrochloric acid* and add 3 g of *potassium iodide*. Close the vessel, allow to stand in the dark for 5 minutes and titrate the liberated iodine with 0.1M *sodium thiosulfate VS* using *starch mucilage* as indicator. Repeat the operation without the powder. The difference between the titrations represents the amount of iodine liberated by the ferric iron. Not more than 11.2 mL of 0.1M *sodium thiosulfate VS* is required.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 1 g of ferrous gluconate as completely as possible in a mixture of 30 mL of *water* and 20 mL of 1M *sulfuric acid* and titrate with 0.1M *ammonium cerium(IV) sulfate VS* using *ferroin solution* as indicator. Each mL of 0.1M *ammonium cerium(IV) sulfate VS* is equivalent to 5.585 mg of Fe(II).

LABELLING

The quantity of active ingredient is stated both as the amount of ferrous gluconate and in terms of the equivalent amount of ferrous iron.

Paediatric Ferrous Sulfate Oral Solution

Paediatric Ferrous Sulphate Oral Solution

DEFINITION

Paediatric Ferrous Sulfate Oral Solution is a solution containing 1.2% w/v of Ferrous Sulfate Heptahydrate and a suitable antioxidant in a suitable vehicle with an orange flavour. It is intended to be diluted well with water before use.

Extemporaneous preparation

The following formula and directions apply.

Ferrous Sulfate Heptahydrate	12 g
Ascorbic Acid	2 g
Orange Syrup	100 mL
Double-strength Chloroform Water	500 mL
Water	Sufficient to produce 1000 mL

Dissolve the Ascorbic Acid in the Double-strength Chloroform Water and use this solution to dissolve the Ferrous Sulfate Heptahydrate. Add the Orange Syrup and sufficient Water to produce 1000 mL and mix. The oral solution should be recently prepared.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ferrous sulfate heptahydrate, $FeSO_4,7H_2O$

1.10 to 1.30% w/v.

ASSAY

To 20 mL add 45 mL of *water*, 0.2 mL of *hydrochloric acid* and *dilute potassium permanganate solution* drop wise until a permanent pink colour is produced. Add 10 mL of *hydrochloric acid* and 3 mL of a 10% w/v solution of *ammonium thiocyanate* and titrate with 0.1M *titanium(III) chloride VS* maintaining a steady flow of *carbon dioxide* through the flask. Each mL of 0.1M *titanium(III) chloride VS* is equivalent to 27.80 mg of $FeSO_4,7H_2O$.

Paediatric Ferrous Sulfate Oral Solution contains in 5 mL about 12 mg of ferrous iron.

Ferrous Sulfate Tablets

Ferrous Sulphate Tablets

DEFINITION

Ferrous Sulfate Tablets contain Dried Ferrous Sulfate. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ferrous iron, Fe(II)

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The powdered tablets yield reaction A characteristic of *iron salts*, Appendix VI.

B. Extract the powdered tablets with 2M *hydrochloric acid* and filter. The filtrate yields reaction A characteristic of *sulfates*, Appendix VI.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.5 g of dried ferrous sulfate as completely as possible in a mixture of 30 mL of *water* and 20 mL of 1M *sulfuric acid* and titrate with 0.1M *ammonium cerium(IV) sulfate VS* using *ferroin solution* as indicator. Each mL of 0.1M *ammonium cerium(IV) sulfate VS* is equivalent to 5.585 mg of Fe(II).

www.webofpharma.com

LABELLING
The quantity of active ingredient is stated both as the amount of dried ferrous sulfate and in terms of the equivalent amount of ferrous iron.

Prolonged-release Ferrous Sulfate Tablets

Prolonged-release Ferrous Sulphate Tablets

Prolonged-release Ferrous Sulfate Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

DEFINITION
Prolonged-release Ferrous Sulfate Tablets contain Dried Ferrous Sulfate. They are formulated so that the medicament is released over a period of several hours. They are coated.

PRODUCTION
A suitable dissolution test is carried out to demonstrate the appropriate release of ferrous sulfate. The dissolution profile should reflect the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ferrous iron, Fe(II)
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. The powdered tablets yield reaction A characteristic of *iron salts*, Appendix VI.

B. Extract a quantity of the powdered tablets containing 0.15 g of Dried Ferrous Sulfate with 10 mL of 2M *hydrochloric acid* and filter. The filtrate yields reaction A characteristic of *sulfates*, Appendix VI.

ASSAY
Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 0.5 g of Dried Ferrous Sulfate as completely as possible in a mixture of 30 mL of *water* and 20 mL of 1M *sulfuric acid* and titrate with 0.1M *ammonium cerium(IV) sulfate VS* using *ferroin solution* as indicator. Each mL of 0.1M *ammonium cerium(IV) sulfate VS* is equivalent to 5.585 mg of Fe(II).

LABELLING
The quantity of active ingredient is stated both as the amount of dried ferrous sulfate and in terms of the equivalent amount of Fe(II).

Fexofenadine Tablets

Action and use
Histamine H_1 receptor antagonist; antihistamine.

DEFINITION
Fexofenadine Tablets contain Fexofenadine Hydrochloride. They may be coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

PRODUCTION
The manufacturing process of Fexofenadine Hydrochloride, used in the formulation of Fexofenadine Tablets, is validated to ensure that the content of the enantiomer impurity B is not more than 0.1%.

Content of fexofenadine hydrochloride, $C_{32}H_{39}NO_4$,HCl
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Shake a quantity of the powdered tablets containing 30 mg of Fexofenadine Hydrochloride with 10 mL of *methanol* for 5 minutes, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of fexofenadine hydrochloride (*RS 459*).

TESTS
Dissolution
Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.001M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a sample of the medium and filter. Use the filtered medium, diluted with 0.001M *hydrochloric acid* if necessary, to produce a solution expected to contain 0.003% w/v of Fexofenadine Hydrochloride.

(2) 0.003% w/v of *fexofenadine hydrochloride BPCRS* in 0.001M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the total content of fexofenadine hydrochloride, $C_{32}H_{39}NO_4$,HCl, in the medium from the chromatograms obtained and using the declared content of $C_{32}H_{39}NO_4$,HCl in *fexofenadine hydrochloride BPCRS*.

LIMITS

The amount of fexofenadine hydrochloride released is not less than 75% (Q) of the stated amount.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in solvent A.

SOLVENT A

Equal volumes of *acetonitrile* and a buffer solution containing 0.05M *sodium dihydrogen orthophosphate monohydrate* and 0.006M *sodium perchlorate*. The pH of the buffer solution is adjusted to 2.0 with *orthophosphoric acid* before the addition of acetonitrile.

(1) Shake a quantity of powdered tablets containing 25 mg of Fexofenadine Hydrochloride with 25 mL of solvent A and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent A and further dilute 1 volume of the resulting solution to 5 volumes with solvent A.

(3) 0.1% w/v of *fexofenadine impurity standard BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *phenylsilyl silica gel for chromatography* (5 µm) (Zorbax SB Phenyl is suitable).

(b) Use isocratic elution using the mobile phase described below.

www.webofpharma.com

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

350 volumes of *acetonitrile* and 650 volumes of a buffer solution containing 0.05M *sodium dihydrogen orthophosphate monohydrate* and 0.006M *sodium perchlorate* the pH of which is adjusted to 2.0 with *orthophosphoric acid*. To the resulting solution add 3 volumes of *triethylamine* and mix.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the principal peaks due to Fexofenadine and impurity A is at least 10.

LIMITS

In the chromatogram obtained with solution (1):

multiply the peak area of any peak corresponding to impurity A by 1.4;

the area of any *secondary peak* corresponding to impurity A is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.6%);

the area of any *secondary peak* corresponding to impurity C is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of powdered tablets containing 50 mg of Fexofenadine Hydrochloride with 50 mL of solvent A and filter.

(2) 0.1% w/v of *fexofenadine hydrochloride BPCRS* in solvent A.

(3) 0.1% w/v of *fexofenadine impurity standard BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the principal peaks due to Fexofenadine and impurity A is at least 10.

DETERMINATION OF CONTENT

Calculate the content of $C_{32}H_{39}NO_4,HCl$ in the tablets using the declared content of $C_{32}H_{39}NO_4,HCl$ in *fexofenadine hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A and C listed under Fexofenadine Hydrochloride.

Finasteride Tablets

Action and use

5-Alpha reductase inhibitor; treatment of benign prostatic hyperplasia.

DEFINITION

Finasteride Tablets contain Finasteride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of finasteride, $C_{23}H_{36}N_2O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the test for Dissolution, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to finasteride in the chromatogram obtained with solution (2).

B. In the test for Uniformity of content, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to finasteride in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a 10 mL sample of the medium and filter. Use the filtered medium.

(2) A suitable solution of *finasteride BPCRS* in a mixture of 3 volumes of *water* and 7 volumes of *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 45°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 200 µL of each solution.

MOBILE PHASE

21 volumes of *water* and 29 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the peak corresponding to finasteride is less than 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{36}N_2O_2$ in the medium from the chromatograms obtained using the declared content of $C_{23}H_{36}N_2O_2$ in *finasteride BPCRS*.

www.webofpharma.com

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 30 mL of a mixture of equal volumes of *acetonitrile* and *water* to a quantity of powdered tablets containing 100 mg of Finasteride, dilute to 50 mL with the same mixture of solvents, centrifuge and filter the supernatant liquid. (0.2%)

(2) Dilute 2 volumes of solution (1) to 100 volumes with a mixture of equal volumes of *acetonitrile* and *water*, dilute 1 volume of this solution to 10 volumes with a mixture of equal volumes of *acetonitrile* and *water*.

(3) 0.2% w/v of *finasteride for peak identification EPCRS* in a mixture of equal volumes of *acetonitrile* and *water*.

(4) Dilute 25 volumes of solution (2) to 100 volumes with equal volumes of *acetonitrile* and *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.0 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 50 µL of each solution.

When the chromatograms are recorded using the prescribed conditions the retention time of finasteride is about 28 minutes. The retention times relative to finasteride are: impurity A, about 0.9; impurity B, about 1.2; impurity C, about 1.4. For solution (1) allow the chromatography to run for twice the retention time of the finasteride peak.

MOBILE PHASE

10 volumes of *acetonitrile*, 10 volumes of *tetrahydrofuran* and 80 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid, unless in the chromatogram obtained with solution (3), the *peak to valley ratio* between finasteride impurity A and finasteride is at least 2.5.

LIMITS

In the chromatogram obtained with solution (1):

any peak corresponding to finasteride impurity A is not more than 0.3%, calculated using the area of the peak due to finasteride impurity A in solution (3) and the declared content of finasteride impurity A in *finasteride for peak identification EPCRS;*

the area of any peak corresponding to finasteride impurity B is not greater than 1.5 times the area of the principal peak in solution (2) (0.3%);

the area of any peak corresponding to finasteride impurity C is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other *secondary* peak is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%);

the sum of the areas of any *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.6%).

Disregard any peak with an area less than 0.25 times the area of the peak due to finasteride in the chromatogram obtained with solution (2) (0.05%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Finasteride comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 3 volumes of *water* and 7 volumes of *acetonitrile* (solvent A).

(1) Add 2.5 mL of *water* to one tablet, shake with the aid of ultrasound until the tablet is completely dispersed. Add 35 mL of solvent A mix with the aid of ultrasound for a further 30 minutes. Cool to room temperature, dilute to 50 mL with solvent A, centrifuge and use the clear supernatant liquid.

(2) A suitable solution of *finasteride BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use a column temperature of 45°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Equal volumes of *acetonitrile* and 0.0025M of *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to finasteride is less than 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{36}N_2O_2$ in each tablet using the declared content of $C_{23}H_{36}N_2O_2$ in *finasteride BPCRS*.

ASSAY

For tablets containing less than 2 mg and/or less than 2% w/w of Finasteride

Use the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing 2 mg or more and 2% w/w or more of Finasteride

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 3 volumes of *water* and 7 volumes of *acetonitrile* (solvent A).

(1) Add 25 mL of *water* to a quantity of the powdered tablets containing 50 mg of Finasteride, add 350 mL of solvent A, mix with the aid of ultrasound for 30 minutes. Allow to attain room temperature and dilute to 500 mL with solvent A, centrifuge and use the clear supernatant liquid.

(2) 0.010% w/v of *finasteride BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

www.webofpharma.com

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to finasteride is less than 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{36}N_2O_2$ in the tablets from the chromatograms obtained and using the declared content of $C_{23}H_{36}N_2O_2$ in *finasteride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Finasteride.

Flavoxate Tablets

Action and use

Anticholinergic.

DEFINITION

Flavoxate Tablets contain Flavoxate Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of flavoxate hydrochloride, $C_{24}H_{25}NO_4,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 0.2 g of Flavoxate Hydrochloride with 10 mL of *dichloromethane*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of flavoxate hydrochloride *(RS 143)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (5) corresponds to that in the chromatogram obtained with solution (6).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel GF_{254}* as the coating substance and a mixture of 1 volume of 18M *ammonia*, 80 volumes of *propan-2-ol* and 200 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate (1) 50 µL of a solution prepared by shaking a quantity of the powdered tablets containing 0.2 g of Flavoxate Hydrochloride with 10 mL of *chloroform* and filtering, (2) 10 µL of a 0.030% w/v solution of *3-methylflavone-8-carboxylic acid BPCRS* in *chloroform*, (3) 10 µL of a 0.015% w/v solution of *3-methylflavone-8-carboxylic acid ethyl ester BPCRS* in *chloroform*, (4) 25 µL of a solution obtained by diluting one volume of solution (1) to 500 volumes with *chloroform*, (5) 10 µL of a solution obtained by diluting 1 volume of solution (1) to 20 volumes with *chloroform* and (6) 10 µL of a 0.1% w/v solution of *flavoxate hydrochloride BPCRS* in *chloroform*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any spot corresponding to 3-methylflavone-8-carboxylic acid ethyl ester in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) (0.15%) and any other *secondary spot* in the chromatogram obtained with solution (1), other than the spot corresponding to 3-methyflavone-8-carboxylic acid, is not more intense than the spot in the chromatogram obtained with solution (4) (0.1%).

3-Methylflavone-8-carboxylic acid

Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel GF_{254} plate* (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 4 volumes of *glacial acetic acid*, 25 volumes of *ethyl acetate* and 70 volumes of *cyclohexane* as the mobile phase. Apply separately to the plate 50 µL of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.2 g of Flavoxate Hydrochloride with 10 mL of *chloroform* and filter. Solution (2) is a 0.010% w/v solution of *3-methylflavone-8-carboxylic acid BPCRS*. After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. Any spot corresponding to 3-methylflavone-8-carboxylic acid in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and finely powder 20 tablets. To a quantity of the powdered tablets containing 1 g of Flavoxate Hydrochloride add 600 mL of 0.1M *hydrochloric acid* and disperse with the aid of ultrasound for 10 minutes. Place in a water bath at 70° for 90 minutes, cool, add sufficient 0.1M *hydrochloric acid* to produce 1 litre and filter. Dilute 5 mL to 250 mL with 0.1M *hydrochloric acid* and measure the *absorbance* of the resulting solution at 293 nm, Appendix II B. Calculate the content of $C_{24}H_{25}NO_4,HCl$ from the absorbance obtained by repeating the measurement using a 0.002% w/v solution of *flavoxate hydrochloride BPCRS* in 0.1M *hydrochloric acid and* from the declared content of $C_{24}H_{25}NO_4,HCl$ in *flavoxate hydrochloride BPCRS*.

STORAGE

Flavoxate tablets should be protected from light.

Flecainide Injection

Action and use

Class I antiarrhythmic.

DEFINITION

Flecainide Injection is a sterile solution of Flecainide Acetate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of flecainide acetate, $C_{17}H_{20}F_6N_2O_3,C_2H_4O_2$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A clear, colourless or almost colourless solution.

IDENTIFICATION

A. The *light absorption*, Appendix II B, of the solution obtained in the Assay in the range 230 nm to 350 nm exhibits a maximum at 296 nm.

B. In the test for (Piperidin-2-yl)methanamine, examine the chromatograms under *ultraviolet light (254 nm)* before spraying. The principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (3).

TESTS

Acidity

pH, 5.0 to 6.5, Appendix V L.

www.webofpharma.com

(Piperidin-2-yl)methanamine
Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck plates are suitable) and a mixture of 2 volumes of *methanol*, 5 volumes of 18M *ammonia*, 100 volumes of *acetone* and 100 volumes of *dichloromethane* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 1 µL of solution (1) and 5 µL of each of solutions (2) and (3). Solution (1) contains 0.025% w/v of *flecainide acetate impurity B EPCRS* [(piperidin-2-yl)methanamine] in *methanol*. For solution (2) dilute the injection, if necessary, with *methanol* to contain 1% w/v of flecainide acetate. Solution (3) contains 1% w/v of *flecainide acetate BPCRS* in *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)* (for Identification test B). Spray the plate with a freshly prepared 0.2% w/v solution of *ninhydrin* in *methanol*, heat the plate at 105° for approximately 5 minutes and examine immediately. In the chromatogram obtained with solution (2) any bluish-purple spot corresponding to (piperidin-2-yl)methanamine is not more intense than the spot in the chromatogram obtained with solution (1) (0.5%).

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) is the injection diluted, if necessary, with a mixture of 29 volumes of *acetonitrile* and 71 volumes of *water* to contain 1.0% w/v of flecainide acetate. For solution (2) dilute 1 volume of solution (1) to 100 volumes with a mixture of 29 volumes of *acetonitrile* and 71 volumes of *water* and further dilute 1 volume of this solution to 5 volumes with the same solvent mixture. Solution (3) contains 0.01% w/v of each of *flecainide acetate BPCRS* and *flecainide impurity A EPCRS* in a mixture of 29 volumes of *acetonitrile* and 71 volumes of *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (Zorbax C8 is suitable), (b) as the mobile phase with a flow rate of 2 mL per minute a mixture of 5 volumes of 1M *tetrabutylammonium hydroxide*, 10 volumes of *glacial acetic acid*, 290 volumes of *acetonitrile* and 710 volumes of *water*, the mixture adjusted to pH 5.8 using 18M *ammonia*, and (c) a detection wavelength of 254 nm.

Inject 20 µL of each solution. The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to flecainide and flecainide impurity A is at least 3.5.

For solution (1) allow the chromatography to proceed for nine times the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of any such peaks is not greater than two and a half times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peak with an area less than 0.05 times the area of the peak in the chromatogram obtained with solution (2) (0.01%).

ASSAY
Dilute the injection with a 0.2% v/v solution of *lactic acid* to produce a solution containing 0.01% w/v of flecainide acetate and measure the *absorbance* of the resulting solution at the maximum at about 296 nm, Appendix II B, using a 0.2% v/v solution of *lactic acid* in the reference cell. Calculate the content of $C_{17}H_{20}F_6N_2O_3,C_2H_4O_2$ in the injection from the *absorbance* obtained with a solution containing 0.01% w/v of *flecainide acetate BPCRS* in a 0.2% v/v solution of *lactic acid* and using the declared content of $C_{17}H_{20}F_6N_2O_3,C_2H_4O_2$ in *flecainide acetate BPCRS*.

STORAGE
Flecainide Injection should not be allowed to freeze.

IMPURITIES
The impurities limited by the requirements of this monograph include impurities A, B and D stated under Flecainide Acetate.

Flecainide Tablets

Action and use
Class I antiarrhythmic.

DEFINITION
Flecainide Tablets contain Flecainide Acetate.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of flecainide acetate, $C_{17}H_{20}F_6N_2O_3,C_2H_4O_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. The *light absorption*, Appendix II B, of the solution obtained in the Assay in the range 230 nm to 350 nm exhibits a maximum at 296 nm.

B. Shake a quantity of the powdered tablets containing 0.1 g of flecainide acetate with 10 mL of *methanol* for 10 minutes, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of flecainide acetate *(RS 397)*.

TESTS
Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of 0.1M *hydrochloric acid* and rotate the paddle at 100 revolutions per minute. Withdraw a sample of 5 mL of the medium, filter and dilute the filtered solution, if necessary, with sufficient 0.1M *hydrochloric acid* to produce a solution expected to contain about 0.005% w/v of flecainide acetate. Measure the *absorbance* of the solution at the maximum at 298 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell. Calculate the total content of flecainide acetate, $C_{17}H_{20}F_6N_2O_3,C_2H_4O_2$, in the medium from the absorbance of a 0.005% w/v solution of *flecainide acetate BPCRS* in 0.1M *hydrochloric acid* using the declared content of $C_{17}H_{20}F_6N_2O_3,C_2H_4O_2$ in *flecainide acetate BPCRS*.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel F_{254} plate* (Merck plates are suitable) and a mixture of 2 volumes of *methanol*, 5 volumes of 18M *ammonia*, 100 volumes of *acetone* and 100 volumes of *dichloromethane* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 1 µL of each of the following solutions. For solution (1) add 2 mL of *methanol* to a quantity of the powdered tablets containing 0.2 g of flecainide acetate, shake, centrifuge and use the supernatant

www.webofpharma.com

liquid. Solution (2) contains 0.05% w/v of *flecainide acetate BPCRS* in *methanol*. Solution (3) contains 0.05% w/v of *flecainide impurity A EPCRS* in *methanol*. Solution (4) contains 0.02% w/v of *flecainide impurity B EPCRS* in *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. In the chromatogram obtained with solution (1) any spot corresponding to 3-[2,5-bis(2,2,2-trifluoroethoxy)phenyl]-1,5,6,7,8,8ahexahydroimidazo[1,5-*a*]pyridine (impurity A) is not more intense than the principal spot in the chromatogram obtained with solution (3) (0.5%). Spray the plate with a freshly prepared 0.2% w/v solution of *ninhydrin* in *absolute ethanol*, heat the plate at 105° for approximately 5 minutes and examine immediately. In the chromatogram obtained with solution (1) any bluish-purple spot corresponding to (piperidin-2-yl)methanamine (impurity B) is not more intense than the principal spot in the chromatogram obtained with solution (4) (0.2%) and any other *secondary spot* is not more intense than the principal spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Shake 20 tablets with 100 mL of a 2% v/v solution of *lactic acid* until the tablets have disintegrated, add 650 mL of *water*, shake with the aid of ultrasound for 30 minutes, add sufficient *water* to produce 1000 mL, mix and filter (Whatman GF/F paper is suitable), discarding the first 100 mL of filtrate. Dilute the filtrate with a 0.2% v/v solution of *lactic acid* to produce a solution containing 0.01% w/v of flecainide acetate and measure the *absorbance* of the resulting solution at the maximum at about 296 nm, Appendix II B, using a 0.2% v/v solution of *lactic acid* in the reference cell. Calculate the content of $C_{17}H_{20}F_6N_2O_3,C_2H_4O_2$ in the tablets from the *absorbance* obtained with a solution containing 0.01% w/v of *flecainide acetate BPCRS* in a 0.2% v/v solution of *lactic acid* and using the declared content of $C_{17}H_{20}F_6N_2O_3,C_2H_4O_2$ in *flecainide acetate BPCRS*.

STORAGE

Flecainide Tablets should be stored at a temperature not exceeding 30°.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A, B and D stated under Flecainide Acetate.

Flucloxacillin Capsules

Action and use

Penicillin antibacterial.

DEFINITION

Flucloxacillin Capsules contain Flucloxacillin Sodium.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of flucloxacillin, $C_{19}H_{17}ClFN_3O_5S$

92.5 to 110.0% of the stated amount.

IDENTIFICATION

The *infrared absorption spectrum* of the contents of the capsules, Appendix II A, is concordant with the *reference spectrum* of flucloxacillin sodium *(RS 145)*.

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the contents of the capsules containing the equivalent of 0.1 g of flucloxacillin with 80 mL of the mobile phase for 15 minutes, add sufficient of the mobile phase to produce 100 mL and filter. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase. Solution (3) contains 0.01% w/v of each of *flucloxacillin sodium BPCRS* and *cloxacillin sodium BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 ODS is suitable), (b) as the mobile phase with a flow rate of 1 mL per minute a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 0.27% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 5.0 with 2M *sodium hydroxide* and (c) a detection wavelength of 225 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to cloxacillin and flucloxacillin is at least 2.5.

For solution (1) allow the chromatography to proceed for six times the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%) and the sum of the areas of any such peaks is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (5%). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the mixed contents of 20 capsules containing the equivalent of 50 mg of flucloxacillin with 40 mL of the mobile phase for 15 minutes, add sufficient of the mobile phase to produce 50 mL, filter and dilute 5 volumes of the resulting solution to 50 volumes with the mobile phase. Solution (2) contains 0.011% w/v of *flucloxacillin sodium BPCRS* in the mobile phase. Solution (3) contains 0.01% w/v of each of *flucloxacillin sodium BPCRS* and *cloxacillin sodium BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 ODS is suitable), (b) as the mobile phase with a flow rate of 1 mL per minute a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 0.27% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 5.0 with 2M *sodium hydroxide* and (c) a detection wavelength of 225 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the first peak (cloxacillin) and the second peak (flucloxacillin) is at least 2.5.

Calculate the content of $C_{19}H_{17}ClFN_3O_5S$ in the capsules using the declared content of $C_{19}H_{16}ClFN_3NaO_5S$ in *flucloxacillin sodium BPCRS*. Each mg of $C_{19}H_{16}ClFN_3NaO_5S$ is equivalent to 0.9538 mg of $C_{19}H_{17}ClFN_3O_5S$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of flucloxacillin.

www.webofpharma.com

Flucloxacillin Injection

Action and use
Penicillin antibacterial.

DEFINITION
Flucloxacillin Injection is a sterile solution of Flucloxacillin Sodium in Water for Injections. It is prepared by dissolving Flucloxacillin Sodium for Injection in the requisite amount of Water for Injections before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE
Flucloxacillin Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

FLUCLOXACILLIN SODIUM FOR INJECTION

DEFINITION
Flucloxacillin Sodium for Injection is a sterile material consisting of Flucloxacillin Sodium with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of flucloxacillin, $C_{19}H_{17}ClFN_3O_5S$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of flucloxacillin sodium *(RS 145)*.

B. Yield reaction B characteristic of *sodium salts*, Appendix VI.

TESTS
Acidity or alkalinity
pH of a solution containing the equivalent of 10% w/v of flucloxacillin, 5.0 to 7.0, Appendix V L.

Related substances
Comply with the test described under Flucloxacillin Capsules but using a solution prepared in the following manner as solution (1). Shake a quantity of the contents of the sealed container containing the equivalent of 0.1 g of flucloxacillin with 80 mL of the mobile phase for 15 minutes, add sufficient of the mobile phase to produce 100 mL and filter.

Water
Not more than 4.5% w/w, Appendix IX C. Use 0.3 g.

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing the equivalent of 9 mg of flucloxacillin per mL (solution A). The endotoxin limit concentration of solution A is 3.5 IU per mL.

ASSAY
Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Administration.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve a quantity of the mixed contents of 10 containers containing the equivalent of 50 mg of flucloxacillin in sufficient of the mobile phase to produce 50 mL and dilute 5 volumes of the resulting solution to 50 volumes with the mobile phase. Solution (2) contains 0.011% w/v of *flucloxacillin sodium BPCRS* in the mobile phase. Solution (3) contains 0.01% w/v of each of *flucloxacillin sodium BPCRS* and *cloxacillin sodium BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 ODS is suitable), (b) as the mobile phase with a flow rate of 1 mL per minute a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 0.27% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 5.0 with 2M *sodium hydroxide* and (c) a detection wavelength of 225 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the first peak (cloxacillin) and the second peak (flucloxacillin) is at least 2.5.

Calculate the content of $C_{19}H_{17}ClFN_3O_5S$ in a container of average content weight using the declared content of $C_{19}H_{16}ClFN_3NaO_5S$ in *flucloxacillin sodium BPCRS*. Each mg of $C_{19}H_{16}ClFN_3NaO_5S$ is equivalent to 0.9538 mg of $C_{19}H_{17}ClFN_3O_5S$.

LABELLING
The label of the sealed container states the quantity of Flucloxacillin Sodium contained in it in terms of the equivalent amount of flucloxacillin.

Flucloxacillin Oral Solution

Action and use
Penicillin antibacterial.

DEFINITION
Flucloxacillin Oral Solution is a solution of Flucloxacillin Sodium in a suitable flavoured vehicle. It is prepared by dissolving the dry ingredients in the specified volume of water just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids.

For the following tests prepare the oral solution as directed on the label. The solution, examined immediately after preparation unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

Content of flucloxacillin, $C_{19}H_{17}ClFN_3O_5S$
When freshly constituted, not more than 120.0% of the stated amount. When stored at the temperature and for the period stated on the label during which the oral solution may be expected to be satisfactory for use, not less than 80.0% of the stated amount.

IDENTIFICATION
Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel silanised plate* (Merck silanised silica gel 60 plates are suitable) and a mixture of 30 volumes of *acetone* and 70 volumes of a 15.4% w/v solution of *ammonium acetate* adjusted to pH 5.0 with *glacial acetic acid* as the mobile phase. Apply separately to the plate 1 µL of each of the following solutions. For solution (1) dilute a quantity of the oral solution containing the equivalent of 50 mg of flucloxacillin to 20 mL with *phosphate buffer pH 7.0*. Solution (2) contains 0.25% w/v of *flucloxacillin sodium BPCRS* in *phosphate buffer pH 7.0*. Solution (3)

www.webofpharma.com

contains 0.25% w/v of each of *cloxacillin sodium BPCRS*, *dicloxacillin sodium BPCRS* and *flucloxacillin sodium BPCRS* in *phosphate buffer pH 7.0*. After removal of the plate, allow it to dry in air, expose to iodine vapour until the spots appear and examine in daylight. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows three clearly separated spots.

TESTS

Acidity or alkalinity

pH, 4.0 to 7.0, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a weighed quantity of the oral solution containing the equivalent of 50 mg of flucloxacillin to 50 mL with the mobile phase and dilute 5 volumes of this solution to 50 volumes with the mobile phase. Solution (2) contains 0.011% w/v of *flucloxacillin sodium BPCRS* in the mobile phase. Solution (3) contains 0.01% w/v of each of *flucloxacillin sodium BPCRS* and *cloxacillin sodium BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 ODS is suitable), (b) as the mobile phase with a flow rate of 1 mL per minute a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 0.27% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 5.0 with 2M *sodium hydroxide* and (c) a detection wavelength of 225 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the first peak (cloxacillin) and the second peak (flucloxacillin) is at least 2.5.

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{19}H_{17}ClFN_3O_5S$, weight in volume, using the declared content of $C_{19}H_{16}ClFN_3NaO_5S$ in *flucloxacillin sodium BPCRS*. Each mg of $C_{19}H_{16}ClFN_3NaO_5S$ is equivalent to 0.9538 mg of $C_{19}H_{17}ClFN_3O_5S$.

Repeat the procedure using a portion of the oral solution that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

STORAGE

The oral solution should be stored at the temperature and used within the period stated on the label.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of flucloxacillin.

Flucloxacillin Oral Suspension

Action and use

Penicillin antibacterial.

DEFINITION

Flucloxacillin Oral Suspension is a suspension of Flucloxacillin Magnesium Octahydrate in a suitable flavoured vehicle. It is prepared by dispersing the dry ingredients in the specified volume of water just before issue for use.

The dry ingredients comply with the requirements for Powders and Granules for Oral Solutions and Oral Suspensions stated under Oral Liquids.

For the following tests prepare the oral suspension as directed on the label. The suspension examined immediately after preparation, unless otherwise indicated, complies with the requirements stated under Oral Liquids and with the following requirements.

Content of flucloxacillin, $C_{19}H_{17}ClFN_3O_5S$

When freshly constituted, not more than 120.0% of the stated amount. When stored at the temperature and for the period stated on the label during which the oral suspension may be expected to be satisfactory for use, not less than 80.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel silanised plate* (Merck silanised silica gel 60 plates are suitable) and a mixture of 30 volumes of *acetone* and 70 volumes of a 15.4% w/v solution of *ammonium acetate* adjusted to pH 5.0 with *glacial acetic acid* as the mobile phase. Apply separately to the plate 1 µL of each of the following solutions. For solution (1) dilute a quantity of the oral suspension containing the equivalent of 50 mg of flucloxacillin to 20 mL with *phosphate buffer pH 7.0*. Solution (2) contains 0.25% w/v of *flucloxacillin sodium BPCRS* in *phosphate buffer pH 7.0*. Solution (3) contains 0.25% w/v of each of *cloxacillin sodium BPCRS*, *dicloxacillin sodium BPCRS* and *flucloxacillin sodium BPCRS* in *phosphate buffer pH 7.0*. After removal of the plate, allow it to dry in air, expose to iodine vapour until the spots appear and examine in daylight. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows three clearly separated spots.

B. Dilute a quantity of the oral suspension containing the equivalent of 50 mg of flucloxacillin to 20 mL with *water*, shake to dissolve and filter if necessary. The filtrate yields reaction B characteristic of *magnesium salts*, Appendix VI.

TESTS

Acidity

pH, 4.8 to 5.8, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a weighed quantity of the oral suspension containing the equivalent of 50 mg of flucloxacillin to 50 mL with the mobile phase and dilute 5 volumes of the solution to 50 volumes with the mobile phase. Solution (2) contains 0.011% w/v of *flucloxacillin sodium BPCRS* in the mobile phase. Solution (3) contains 0.01% w/v of each of *flucloxacillin sodium BPCRS* and *cloxacillin sodium BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil 5 ODS is suitable), (b) as the mobile phase with a flow rate of 1 mL per minute a mixture of 25 volumes of *acetonitrile* and 75 volumes of a 0.27% w/v solution of *potassium dihydrogen orthophosphate* adjusted to pH 5.0 with 2M *sodium hydroxide* and (c) a detection wavelength of 225 nm.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the first peak (cloxacillin) and the second peak (flucloxacillin) is at least 2.5.

www.webofpharma.com

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{19}H_{17}ClFN_3O_5S$, weight in volume, using the declared content of $C_{19}H_{16}ClFN_3NaO_5S$ in *flucloxacillin sodium BPCRS*. Each mg of $C_{19}H_{16}ClFN_3NaO_5S$ is equivalent to 0.9538 mg of $C_{19}H_{17}ClFN_3O_5S$.

Repeat the procedure using a portion of the oral suspension that has been stored at the temperature and for the period stated on the label during which it may be expected to be satisfactory for use.

STORAGE

The oral suspension should be stored at the temperature and used within the period stated on the label.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of flucloxacillin.

Flucytosine Tablets

Action and use
Antifungal.

DEFINITION

Flucytosine Tablets contain Flucytosine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of flucytosine, $C_4H_4FN_3O$
92.5 to 107.5% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.5 g of Flucytosine with 100 mL of *methanol* for 30 minutes, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of flucytosine *(RS 146)*.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.10 g of Flucytosine with 10 mL of a mixture of equal volumes of 13.5M *ammonia* and *methanol* and filter.

(2) Dilute 1 volume of solution (1) to 10 volumes with *methanol (60%)* and dilute 1 volume of the resulting solution to 100 volumes with *methanol (60%)*.

(3) Dilute 1 volume of solution (1) to 10 volumes and dissolve 5 mg of *fluorouracil BPCRS* in 5 mL of the resulting solution.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating silica gel.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 12 cm in an unsaturated tank.

(e) After removal of the plate, allow the solvent to evaporate, stand the plate in a tank of chlorine vapour prepared by the addition of *hydrochloric acid* to a 5% w/v solution of *potassium permanganate* contained in a beaker placed in the tank and allow to stand for 15 minutes. Remove the plate and place it in a current of cold air until the excess of chlorine is removed and an area of the coating substance below the line of application does not give a blue colour with a drop of *potassium iodide and starch solution*. Spray the plate with *potassium iodide and starch solution* and examine the plate in daylight.

MOBILE PHASE

1 volume of *anhydrous formic acid*, 15 volumes of *water*, 25 volumes of *methanol* and 60 volumes of *ethyl acetate*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 0.1 g of Flucytosine add 80 mL of 0.1M *hydrochloric acid* and shake for 15 minutes. Dilute to 100 mL with 0.1M *hydrochloric acid* and filter. Dilute 10 mL of the filtrate to 100 mL with 0.1M *hydrochloric acid* and further dilute 10 mL of the solution to 100 mL with 0.1M *hydrochloric acid*. Measure the *absorbance* of the resulting solution at the maximum at 286 nm, Appendix II B. Calculate the content of $C_4H_4FN_3O$ taking 709 as the value of A(1%, 1 cm) at the maximum at 286 nm.

STORAGE

Flucytosine tablets should be protected from light.

Fludrocortisone Tablets

Action and use
Mineralocorticoid.

DEFINITION

Fludrocortisone Tablets contain Fludrocortisone Acetate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of fludrocortisone acetate, $C_{23}H_{31}FO_6$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Complies with the test for *identification of steroids*, Appendix III A, using *impregnating solvent I* and *mobile phase B*. Apply separately to the plate 20 µL of each of the following solutions. For solution (1) shake a quantity of the powdered tablets containing 1 mg of fludrocortisone acetate with 20 mL of *chloroform* for 5 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 4 mL of a mixture of 9 volumes of *chloroform* and 1 volume of *methanol*. Solution (2) contains 0.025% w/v of *fludrocortisone acetate BPCRS* in a mixture of 9 volumes of *chloroform* and 1 volume of *methanol*.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to fludrocortisone acetate in the chromatogram obtained with solution (2).

TESTS

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Fludrocortisone Acetate comply with the requirement stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light. Solution A contains 0.002% w/v of *norethisterone BPCRS* in *acetonitrile*.

www.webofpharma.com

(1) Place a single tablet in a centrifuge tube, add 1 mL of *water*, shake on a vortex-type mixer for 1 minute, add 4.0 mL of solution A and shake again for 1 minute. Shake for a further 40 minutes on a mechanical shaker, centrifuge and use the clear supernatant solution.

(2) 4 volumes of a 0.0025% w/v solution of *fludrocortisone acetate BPCRS* in solution A and 1 volume of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of *acetonitrile* and 60 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{31}FO_6$ in each tablet using the declared content of $C_{23}H_{31}FO_6$ in *fludrocortisone acetate BPCRS*.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution A contains 0.01% w/v of *norethisterone BPCRS* (internal standard) in *acetonitrile*.

(1) Shake a quantity of the powdered tablets containing 0.5 mg of fludrocortisone acetate with 2 mL of *water* for 1 minute, add 4 mL of solution A and 4 mL of *acetonitrile* and shake on a mechanical shaker for 40 minutes. Dilute the mixture to 20 mL with *acetonitrile*, centrifuge and use the supernatant liquid.

(2) 20 mL of solution A, 25 mL of a 0.01% w/v solution of *fludrocortisone acetate BPCRS* in *acetonitrile* and 10 mL of *water* diluted to 100 mL with *acetonitrile*.

(3) Prepare in the same manner as solution (1) but using 8 mL of *acetonitrile* in place of 4 mL of solution A and 4 mL of *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{31}FO_6$ in the tablets using the declared content of $C_{23}H_{31}FO_6$ in *fludrocortisone acetate BPCRS*.

Fluocinolone Cream

Action and use
Glucocorticoid.

DEFINITION

Fluocinolone Cream contains Fluocinolone Acetonide or Fluocinolone Acetonide Dihydrate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of fluocinolone acetonide, $C_{24}H_{30}F_2O_6$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse, by shaking, a quantity of the preparation being examined containing 0.25 mg of Fluocinolone Acetonide in 2 mL of *chloroform*, add 10 mL of *methanol*, shake vigorously, cool in ice for 15 minutes, centrifuge at 3000 revolutions per minute for 15 minutes, decant the clear, supernatant liquid, evaporate to dryness on a water bath in a current of nitrogen and dissolve the residue in 1 mL of *chloroform*.

(2) 0.025% w/v solution of *fluocinolone acetonide BPCRS* in *chloroform*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air until the solvent has evaporated, heat at 105° for 5 minutes and spray whilst hot with *alkaline tetrazolium blue solution*.

MOBILE PHASE

1 volume of *triethylamine*, 10 volumes of *methanol*, 40 volumes of *chloroform* and 60 volumes of *n-hexane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to fluocinolone acetonide in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For creams containing 0.025% to 0.2% w/w of fluocinolone acetonide

(1) 0.025% w/v of *fluocinolone acetonide BPCRS* and 0.005% w/v of *phenacetin* (internal standard) in *chloroform*.

(2) To a quantity of the cream containing 2.5 mg of Fluocinolone Acetonide add 60 mL of a solution prepared by adding 80 mL of *methanol* to 20 mL of a 25% w/v solution of *lithium chloride* and disperse by shaking vigorously. Add 100 mL of *cyclohexane*, shake gently for 2 minutes and separate the lower, aqueous methanolic layer, taking care to exclude any solid matter that separates at the interface. Repeat the extraction using a further 25 mL of the lithium chloride solution. To the combined extracts add a solution of 11 g of *aluminium potassium sulfate* in 214 mL of *water* followed by 50 mL of *chloroform*, shake vigorously for about 3 minutes, allow the layers to separate and filter the chloroform extract through filter paper (Whatman No. 1 is suitable), previously moistened with *chloroform*, again excluding any solid matter at the interface. Repeat the extraction with 50- and 10-mL quantities of *chloroform*, filtering the extracts as before. Evaporate the combined extracts to dryness on a water bath in a current of nitrogen, dissolve the residue in 5 mL of *chloroform*, transfer to a 10-mL graduated flask with the aid of *chloroform* and add sufficient *chloroform* to produce 10 mL.

(3) Prepare in the same manner as solution (2) but add 1.0 mL of a 0.050% w/v solution of *phenacetin* to the chloroform solution before dilution to 10 mL.

www.webofpharma.com

For creams containing 0.01% w/w of fluocinolone acetonide

(1) 0.01% w/v of *fluocinolone acetonide BPCRS* and 0.002% w/v of *phenacetin* (internal standard) in *chloroform*.

(2) Prepare as described above but using a quantity of the cream containing 1 mg of Fluocinolone Acetonide.

(3) Prepare in the same manner as solution (2) but add 1 mL of a 0.02% w/v solution of *phenacetin* to the chloroform solution before diluting to 10 mL.

For creams containing 0.00625% w/w of fluocinolone acetonide

(1) 0.00625% w/v of *fluocinolone acetonide BPCRS* and 0.00125% w/v of *phenacetin* (internal standard) in *chloroform*.

(2) Prepare as described above but using a quantity of the cream containing 0.62 mg of Fluocinolone Acetonide.

(3) Prepare in the same manner as solution (2) but add 1 mL of a 0.0125% w/v solution of *phenacetin* to the chloroform solution before diluting to 10 mL.

For creams containing 0.0025% w/w of fluocinolone acetonide

(1) 0.0025% w/v of *fluocinolone acetonide BPCRS* and 0.0005% w/v of *phenacetin* (internal standard) in *chloroform*.

(2) Prepare as described above but using a quantity of the cream containing 0.25 mg of Fluocinolone Acetonide.

(3) Prepare in the same manner as solution (2) but add 1 mL of a 0.005% w/v solution of *phenacetin* to the chloroform solution before diluting to 10 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.8 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 243 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

58 volumes of *hexane*, 40 volumes of *chloroform*, 2 volumes of *methanol* and 0.1 volume of *glacial acetic acid*.

SYSTEM SUITABILITY

The assay is not valid unless the *resolution factor* (R_s) between the peaks due to fluocinolone acetonide and phenacetin is more than 2, and the *capacity factors* (k') of fluocinolone acetonide and phenacetin are about 3 and 2, respectively. If these conditions are not achieved, adjust the concentration of *methanol* in the mobile phase, increasing its concentration to reduce the value of k' and reducing its concentration to increase the value of k'. If the correct values cannot be obtained by this means, the column is faulty and must be repacked. If, when the correct k' values have been obtained, the value of R_s is less than 2, reduce the concentration of *chloroform* in the mobile phase by 5% to obtain an increased retention time for both fluocinolone acetonide and phenacetin and re-adjust the k' values to the specified values by increasing the concentration of *methanol*. Repeat the adjustment of chloroform and methanol concentrations until correct values for both R_s and k' have been obtained.

DETERMINATION OF CONTENT

Calculate the content of $C_{24}H_{30}F_2O_6$ in the cream using the declared content of $C_{24}H_{30}F_2O_6$ in *fluocinolone acetonide BPCRS*.

LABELLING

When the active ingredient is Fluocinolone Acetonide Dihydrate, the quantity is stated in terms of the equivalent amount of fluocinolone acetonide.

Fluocinolone Ointment

Action and use

Glucocorticoid.

DEFINITION

Fluocinolone Ointment contains Fluocinolone Acetonide or Fluocinolone Acetonide Dihydrate in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of fluocinolone acetonide, $C_{24}H_{30}F_2O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 60 volumes of *n-hexane*, 40 volumes of *chloroform*, 10 volumes of *methanol* and 1 volume of *triethylamine* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) disperse, by shaking, a quantity of the preparation being examined containing 0.25 mg of fluocinolone acetonide in 2 mL of *chloroform*, add 10 mL of *methanol*, shake vigorously, cool in ice for 15 minutes, centrifuge at 3000 revolutions per minute for 15 minutes, decant the clear, supernatant liquid, evaporate to dryness on a water bath in a current of nitrogen and dissolve the residue in 1 mL of *chloroform*. Solution (2) contains 0.025% w/v solution of *fluocinolone acetonide BPCRS* in *chloroform*. After removal of the plate, allow it to dry in air until the solvent has evaporated, heat at 105° for 5 minutes and spray whilst hot with *alkaline tetrazolium blue solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay the chromatogram obtained with solution (3) shows a peak with the same retention time as the peak due to fluocinolone acetonide in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.0050% w/v of *fluocinolone acetonide BPCRS* and 0.40% v/v of *toluene* (internal standard) in *methanol (80%)*.

For ointments containing 0.01% w/w or less of fluocinolone acetonide prepare solution (2) in the following manner. To a quantity of the ointment containing 0.5 mg of fluocinolone acetonide add 50 mL of *2,2,4-trimethylpentane* and 8 mL of *methanol (80%)*, warm gently on a water bath until the preparation is dispersed and shake vigorously for 2 minutes. Separate the lower, aqueous methanolic layer and wash the upper layer with 1 mL of *methanol (80%)*, adding the washing to the previous extract. To the combined extracts add sufficient *methanol (80%)* to produce 10 mL. Prepare solution (3) in the same manner as solution (2) but adding 1 mL of a 4% v/v solution of the internal standard in *methanol* to the combined extracts before dilution to 10 mL.

For ointments containing 0.025% w/w of fluocinolone acetonide, prepare solution (2) in the following manner. To a quantity of the ointment containing 1.25 mg of fluocinolone acetonide add 50 mL of *2,2,4-trimethylpentane* and 20 mL of

www.webofpharma.com

methanol (80%), warm gently on a water bath until the preparation is dispersed and shake vigorously for 2 minutes. Separate the lower, aqueous methanolic layer and wash the upper layer with 2 mL of *methanol (80%)*, adding the washing to the previous extract. To the combined extracts add sufficient *methanol (80%)* to produce 25 mL. Prepare solution (3) in the same manner as solution (2) but adding 1 mL of a 10% v/v solution of the internal standard in *methanol* to the combined extracts before dilution to 25 mL.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) a mixture of 55 volumes of *water*, 45 volumes of *acetonitrile* and 0.1 volume of *glacial acetic acid* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 238 nm.

Calculate the content of $C_{24}H_{30}F_2O_6$ in the ointment using the declared content of $C_{24}H_{30}F_2O_6$ in *fluocinolone acetonide BPCRS*.

LABELLING

When the active ingredient is Fluocinolone Acetonide Dihydrate, the quantity is stated in terms of the equivalent amount of fluocinolone acetonide.

Fluocinonide Cream

Action and use

Glucocorticoid.

DEFINITION

Fluocinonide Cream contains Fluocinonide in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of fluocinonide, $C_{26}H_{32}F_2O_7$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the cream containing 2.5 mg of Fluocinonide in 25 mL of *methanol (80%)*, add 50 mL of *ether* and shake vigorously to produce a clear, homogeneous solution. Add 15 mL of *water*, shake and transfer the lower layer to a second separating funnel. Add 100 mL of *water*, extract with 10 mL of *chloroform*, filter the chloroform layer through filter paper and evaporate to a volume of about 1 mL in a current of air on a water bath.

(2) 0.1% w/v of *fluocinonide BPCRS* in a mixture of 1 volume of *methanol* and 9 volumes of *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

12 volumes of *water*, 80 volumes of *methanol*, 150 volumes of *ether* and 770 volumes of *dichloromethane*. Mix the water and the methanol before adding to the remaining solvents of the mobile phase.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the cream containing 1.5 mg of Fluocinonide in 20 mL of *methanol (80%)*, warming gently over a water bath if necessary. Add 50 mL of *2,2,4-trimethylpentane*, shake for 2 minutes and transfer the lower aqueous methanol layer to a 50-mL flask. Repeat the extraction with a further 20 mL of *methanol (80%)*. Dilute the combined extracts to volume with the same solvent.

(2) 0.003% w/v of *fluocinonide BPCRS* in *methanol (80%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 238 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.1 volume of *glacial acetic acid*, 45 volumes of *acetonitrile* and 55 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{26}H_{32}F_2O_7$ in the cream using the declared content of $C_{26}H_{32}F_2O_7$ in *fluocinonide BPCRS*.

Fluocinonide Ointment

Action and use

Glucocorticoid.

DEFINITION

Fluocinonide Ointment contains Fluocinonide in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of fluocinonide, $C_{26}H_{32}F_2O_7$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the ointment containing 2 mg of fluocinonide in 20 mL of *methanol (80%)* in a 100-mL separating funnel containing 50 mL of *2,2,4-trimethylpentane*. Warm the contents over a water bath and shake gently. Allow the layers to separate and transfer the lower layer to a 250-mL separating funnel containing 100 mL of *water*. Add 10 mL of *chloroform* and shake for 3 minutes. Allow the layers to separate, evaporate the lower layer to dryness on a water bath in a current of air and dissolve the residue in 1 mL of *chloroform*.

(2) 0.2% w/v of *fluocinonide BPCRS* in *chloroform*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air until the solvent has evaporated. Heat at 105° for 5 minutes and spray while hot with *alkaline tetrazolium blue solution*.

MOBILE PHASE

12 volumes of *water*, 80 volumes of *methanol*, 150 volumes of *ether* and 770 volumes of *dichloromethane*. Mix the water and the methanol before adding to the remaining components of the mobile phase.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the ointment containing 1.5 mg of fluocinonide in 20 mL of *methanol (80%)* in a 100-mL separating funnel containing 50 mL of *2,2,4-tri-methylpentane*. Warm the contents over a water bath and shake gently for 2 minutes. Allow the layers to separate and transfer the lower layer to a 50 mL flask. Repeat the extraction with a further 20 mL of *methanol (80%)*. Dilute the combined extracts to 50 mL with the same solvent.

(2) 0.003% w/v of *fluocinonide BPCRS* in *methanol (80%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 238 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.1 volume of *glacial acetic acid*, 45 volumes of *acetonitrile* and 55 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{26}H_{32}F_2O_7$ in the ointment using the declared content of $C_{26}H_{32}F_2O_7$ in *fluocinonide BPCRS*.

Fluocortolone Cream

Action and use
Glucocorticoid.

DEFINITION

Fluocortolone Cream contains Fluocortolone Pivalate and Fluocortolone Hexanoate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of fluocortolone pivalate, $C_{27}H_{37}FO_5$
90.0 to 110.0% of the stated amount.

Content of fluocortolone hexanoate, $C_{28}H_{39}FO_5$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silanised silica gel precoated plate the surface of which has been modified by chemically-bonded octadecylsilyl groups (Whatman KC18F plates are suitable) and a mixture of 35 volumes of *water* and 65 volumes of *acetonitrile* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions. For solution (1), transfer a quantity of the preparation being examined containing 1 mg of fluocortolone pivalate to a separating funnel with the aid of 10 mL of *methanol*, add 50 mL of *2,2,4-trimethylpentane* and shake vigorously for 1 minute. Allow to stand, separate the lower methanol layer, add 100 mL of *water* and 50 mL of *dichloromethane*, shake vigorously for 1 minute and centrifuge at 1500 revolutions per minute for 5 minutes. Evaporate 25 mL of the dichloromethane layer to dryness on a water bath in a current of nitrogen and dissolve the residue in 1 mL of a mixture of 1 volume of *methanol* and 9 volumes of *dichloromethane*. For solution (2), mix 0.5 mL of a 0.1% w/v solution of *fluocortolone pivalate BPCRS* in a mixture of 1 volume of *methanol* and 9 volumes of *dichloromethane* with 0.5 mL of a 0.1% w/v solution of *fluocortolone hexanoate BPCRS* in the same solvent mixture. Solution (3) is a mixture of equal volumes of solutions (1) and (2). After removal of the plate, allow it to dry in air for 10 minutes and examine under *ultraviolet light (254 nm)*. Two principal spots in the chromatogram obtained with solution (1) correspond to those in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows two compact spots.

B. In the Assay, the chromatogram obtained with solution (3) shows two peaks with the same retention times as the peaks due to fluocortolone pivalate and fluocortolone hexanoate in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.004% w/v each of *fluocortolone pivalate BPCRS*, *fluocortolone hexanoate BPCRS* and *benzyl benzoate* (internal standard) in a mixture of 4 volumes of *acetonitrile* and 1 volume of *water*. For solution (2) add 20 mL of a mixture of 4 volumes of *acetonitrile* and 1 volume of *water* followed by 50 mL of *2,2,4-trimethylpentane* to a quantity of the preparation being examined containing 2 mg of fluocortolone pivalate and heat on a water bath, shaking intermittently, until the preparation is completely dispersed. Remove from the water bath, shake vigorously for 3 minutes, allow to separate and transfer the lower, aqueous acetonitrile layer to a flask. Repeat the extraction of the 2,2,4-trimethylpentane solution with a further 20 mL of the acetonitrile–water mixture and again transfer the lower, aqueous acetonitrile layer to the flask. Dilute the combined extracts to 50 mL with a mixture of 4 volumes of *acetonitrile* and 1 volume of *water* and filter a portion using a pressure filter (a Swinnex filter holder prepared with a double thickness of Whatman No. 42 filter paper is suitable). Prepare solution (3) in the same manner as solution (2) but adding 2 mL of a 0.100% v/v solution of *benzyl benzoate* in a mixture of 4 volumes of *acetonitrile* and 1 volume of *water* to the combined extracts before dilution to 50 mL.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 5 mm) packed with

www.webofpharma.com

octadecylsilyl silica gel for chromatography (5 µm) (Spherisorb ODS 1 is suitable), (b) as the mobile phase with a flow rate of 1 mL per minute, a mixture of *acetonitrile* and *water* each containing 1% v/v of *glacial acetic acid* adjusted so that the retention time of fluocortolone pivalate is about 9 minutes and baseline separation is obtained from benzyl benzoate and fluocortolone hexanoate (retention time, about 11 minutes) (a mixture of 53 volumes of *acetonitrile*, 47 volumes of *water* and 1 volume of *glacial acetic acid* is usually suitable) and (c) a detection wavelength of 238 nm.

Calculate the contents of $C_{27}H_{37}FO_5$ and $C_{28}H_{39}FO_5$ in the preparation being examined using the declared contents of $C_{27}H_{37}FO_5$ in *fluocortolone pivalate BPCRS* and $C_{28}H_{39}FO_5$ in *fluocortolone hexanoate BPCRS* respectively.

STORAGE

Fluocortolone Cream should be stored at a temperature not exceeding 30°.

Fluorescein Eye Drops

Action and use

Detection of corneal lesions, retinal angiography and pancreatic function testing.

DEFINITION

Fluorescein Eye Drops are a sterile solution of Fluorescein Sodium in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of fluorescein sodium, $C_{20}H_{10}Na_2O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Evaporate a volume containing 20 mg of fluorescein sodium and dry at 105° for 30 minutes. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of fluorescein sodium *(RS 151)*.

B. The eye drops are strongly fluorescent, even in extreme dilution; the fluorescence disappears when the solution is made acidic and reappears when it is made alkaline.

C. Dilute with *water* to produce a solution containing 0.05% w/v of fluorescein sodium. One drop of the solution, absorbed by a piece of filter paper, colours the paper yellow. On exposing the moist paper to bromine vapour for 1 minute and then to ammonia vapour the yellow colour becomes deep pink.

TESTS

Acidity or alkalinity

pH, 7.0 to 9.0, Appendix V L.

Chloroform-soluble matter

To a volume containing 0.1 g of fluorescein sodium add 1 mL of 2M *sodium hydroxide*, extract with 10 mL of *chloroform* and dry the chloroform layer with *anhydrous sodium sulfate*. The *absorbance* of the resulting solution at 480 nm is not more than 0.05, Appendix II B, using *chloroform* in the reference cell.

Dimethylformamide

Carry out the method for *gas chromatography*, Appendix III B.

(1) 0.0020% v/v of *dimethylformamide* and 0.0020% v/v of *dimethylacetamide* (internal standard).

(2) Dilute the eye drops with *water*, if necessary, to produce a solution containing 1.0% w/v of fluorescein sodium.

To 5 mL of this solution add, with stirring, 0.3 mL of 1M *hydrochloric acid*, allow to stand for 15 minutes and centrifuge; dissolve 10 mg of *trisodium orthophosphate* in 2 mL of the supernatant liquid.

(3) Prepare in the same manner as solution (2) but adding 1 mL of a 0.010% v/v solution of *dimethylacetamide* before the hydrochloric acid.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (80 to 100 mesh) coated with 10% w/w of *polyethylene glycol 1000*.

(b) Use *nitrogen* as the carrier gas at a suitable flow rate.

(c) Use isothermal conditions maintained at 120°.

(d) Use a suitable inlet temperature.

(e) Use a flame ionisation detector at a suitable temperature.

(f) Inject 1 µL of each solution.

LIMITS

In the chromatogram obtained with solution (3) the ratio of the area of any peak corresponding to dimethylformamide to the area of the peak due to the internal standard is not greater than the corresponding ratio in the chromatogram obtained with solution (1) (0.2%).

Related substances and resorcinol

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the eye drops with 0.1M *methanolic hydrochloric acid* to contain 0.5% w/v of fluorescein sodium.

(2) Add to a volume of the eye drops containing 25 mg of fluorescein sodium 2 mL of *phosphate buffer pH 8.0*, 3 mL of *water* and 2.5 g of *sodium chloride*, shake to dissolve the sodium chloride and extract with two 25-mL quantities of *peroxide-free ether*. Dry the combined extracts over *anhydrous sodium sulfate*, evaporate to dryness under reduced pressure and dissolve the residue in 1 mL of 0.1M *methanolic hydrochloric acid*.

(3) Dilute 1 volume of solution (1) to 100 volumes with 0.1M *methanolic hydrochloric acid*.

(4) Dilute 2 volumes of solution (3) to 5 volumes with 0.1M *methanolic hydrochloric acid*.

(5) 0.0125% w/v of *resorcinol* in 0.1M *methanolic hydrochloric acid*.

(6) Mix 5 volumes of a 0.025% w/v solution of *resorcinol* in 0.1M *methanolic hydrochloric acid* with 2 volumes of solution (1) and add sufficient *methanol* to produce 10 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel 60 F_{254} precoated plate (Merck plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of solution (1) and 5 µL of solutions (2) to (6).

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, expose the plate to iodine vapour for 30 minutes and examine in daylight and under *ultraviolet light (254 nm)*.

MOBILE PHASE

10 volumes of *methanol* and 90 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (6) shows two clearly separated spots in daylight.

www.webofpharma.com

LIMITS

In the chromatogram obtained with solution (1), under ultraviolet light (254 nm):

any *secondary spot*, other than any spot corresponding to resorcinol, is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%);

not more than one such spot is more intense than the spot in the chromatogram obtained with solution (4) (0.2%).

In the chromatogram obtained with solution (2), in daylight:

any spot corresponding to resorcinol in the chromatogram obtained with solution (2) is not more intense than the spot in the chromatogram obtained with solution (5) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the eye drops with the mobile phase to produce a solution containing 0.005% w/v of fluorescein sodium.

(2) Dissolve 55 mg of *diacetylfluorescein BPCRS* in a mixture of 5 mL of *ethanol (96%)* and 1 mL of 2.5M *sodium hydroxide*, heat on a water bath for 20 minutes, mixing frequently, cool and add sufficient *water* to produce 50 mL. Dilute 5 volumes of this solution to 100 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 volumes of *triethylamine*, 400 volumes of *acetonitrile* and 595 volumes of *water*, adjust the pH to 3.0 with *orthophosphoric acid*.

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{10}Na_2O_5$ in the eye drops using the declared content of anhydrous diacetylfluorescein in *diacetylfluorescein BPCRS*. Each mg of anhydrous diacetylfluorescein is equivalent to 0.9037 mg of $C_{20}H_{10}Na_2O_5$.

STORAGE

Fluorescein Eye Drops should be protected from light.

Fluorescein Injection

Action and use

Detection of corneal lesions, retinal angiography and pancreatic function testing.

DEFINITION

Fluorescein Injection is a sterile solution of Fluorescein Sodium in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of fluorescein sodium, $C_{20}H_{10}Na_2O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Evaporate 1 mL to dryness on a water bath and dry the residue at 105° for 30 minutes. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of fluorescein sodium *(RS 151)*.

B. The injection is strongly fluorescent, even in extreme dilution; the fluorescence disappears when the solution is made acidic and reappears when it is made alkaline.

C. Dilute with *water* to produce a solution containing 0.05% w/v of fluorescein sodium. One drop of the solution, absorbed by a piece of filter paper, colours the paper yellow. On exposing the moist paper to bromine vapour for 1 minute and then to ammonia vapour the yellow colour becomes deep pink.

TESTS

Alkalinity

pH, 8.0 to 9.8, Appendix V L.

Chloroform-soluble matter

Dilute the injection with *water*, if necessary, to produce a solution containing 1% w/v of fluorescein sodium. To 20 mL add 5 mL of 1M *sodium hydroxide*, dilute to 50 mL with *water*, extract with 10 mL of *chloroform* and dry the chloroform layer over *anhydrous sodium sulfate*. The *absorbance* of the resulting solution at 480 nm is not more than 0.10, Appendix II B, using *chloroform* in the reference cell.

Dimethylformamide

Carry out the method for *gas chromatography*, Appendix III B.

(1) 0.0020% v/v of *dimethylformamide* and 0.0020% v/v of *dimethylacetamide* (internal standard).

(2) For solution (2) dilute the injection with water, if necessary, to produce a solution containing 1.0% w/v of fluorescein sodium. To 5 mL of this solution add, with stirring, 0.3 mL of 1M *hydrochloric acid*, allow to stand for 15 minutes and centrifuge; dissolve 10 mg of *trisodium orthophosphate* in 2 mL of the supernatant liquid.

(3) Prepare solution (3) in the same manner as solution (2) but adding 1.0 mL of a 0.01% v/v solution of *dimethylacetamide* before the hydrochloric acid.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (80 to 100 mesh) coated with 10% w/w of *polyethylene glycol 1000*.

(b) Use *nitrogen* as the carrier gas at a suitable flow rate.

(c) Use isothermal conditions maintained at 120°.

(d) Use a suitable inlet temperature.

(e) Use a flame ionisation detector at a suitable temperature.

(f) Inject 1 µL of each solution.

LIMITS

In the chromatogram obtained with solution (3) the ratio of the area of any peak corresponding to dimethylformamide to the area of the peak due to the internal standard is not greater than the corresponding ratio in the chromatogram obtained with solution (1) (0.2%).

Related substances and resorcinol

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the injection with 0.1M *methanolic hydrochloric acid* to produce a solution containing 1.0% w/v of fluorescein sodium.

(2) Dilute a quantity of the injection containing 250 mg of fluorescein sodium to 5 mL with *water*, add 2 mL of

www.webofpharma.com

phosphate buffer pH 8.0, 3 mL of *water* and 2.5 g of *sodium chloride*, shake to dissolve the sodium chloride and extract with two 25-mL quantities of *peroxide-free ether*. Dry the combined extracts over *anhydrous sodium sulfate*, evaporate to dryness under reduced pressure and dissolve the residue in 10 mL of 0.1M *methanolic hydrochloric acid*.

(3) Dilute 1 volume of solution (1) to 100 volumes with 0.1M *methanolic hydrochloric acid*.

(4) Dilute 2 volumes of solution (3) to 5 volumes with 0.1M *methanolic hydrochloric acid*.

(5) 0.0125% w/v of *resorcinol* in 0.1M *methanolic hydrochloric acid*.

(6) Mix 1 volume of solution (1) with 9 volumes of solution (5).

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel 60 F_{254} precoated plate (Merck plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, expose the plate to iodine vapour for 30 minutes and examine in daylight and under *ultraviolet light (254 nm)*.

MOBILE PHASE

10 volumes of *methanol* and 90 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (6) shows two clearly separated spots in daylight.

LIMITS

In the chromatogram obtained with solution (1), under ultraviolet light (254 nm):

any *secondary spot*, other than any spot corresponding to resorcinol, is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%);

not more than one such spot is more intense than the spot in the chromatogram obtained with solution (4) (0.2%).

In the chromatogram obtained with solution (2), in daylight:

any spot corresponding to resorcinol in the chromatogram obtained with solution (2) is not more intense than the spot in the chromatogram obtained with solution (5) (0.5%).

On examination in daylight, any spot corresponding to resorcinol in the chromatogram obtained with solution (2) is not more intense than the spot in the chromatogram obtained with solution (5) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the injection with *water*, if necessary, to produce a solution containing 1.0% w/v of fluorescein sodium and dilute 1 volume of this solution to 200 volumes with the mobile phase.

(2) Dissolve 55 mg of *diacetylfluorescein BPCRS* in a mixture of 5 mL of *ethanol (96%)* and 1 mL of 2.5M *sodium hydroxide*, heat on a water bath for 20 minutes, mixing frequently, cool and add sufficient *water* to produce 50 mL. Dilute 5 volumes of this solution to 100 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 volumes of *triethylamine*, 400 volumes of *acetonitrile* and 595 volumes of *water*, adjust the pH to 3.0 with *orthophosphoric acid*

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{10}Na_2O_5$ in the eye drops using the declared content of anhydrous diacetylfluorescein in *diacetylfluorescein BPCRS*. Each mg of anhydrous diacetylfluorescein is equivalent to 0.9037 mg of $C_{20}H_{10}Na_2O_5$.

STORAGE

Fluorescein Injection should be protected from light.

Fluorometholone Eye Drops

Action and use

Glucocorticoid.

DEFINITION

Fluorometholone Eye Drops are a sterile suspension of Fluorometholone in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of fluorometholone, $C_{22}H_{29}FO_4$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the eye drops containing 5 mg of Fluorometholone with 20 mL of *acetone*, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 mL of *acetone*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of fluorometholone *(RS 152)*.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 6.0 to 7.5, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the eye drops containing 1 mg of Fluorometholone to 10 mL with a mixture of equal volumes of *methanol* and *water*.

(2) Dilute 1 volume of solution (1) to 20 volumes with *methanol* and further dilute 1 volume to 10 volumes with *methanol*.

(3) 0.00005% w/v each of *deltamedrane BPCRS* and *fluorometholone BPCRS*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of *water* and 60 volumes of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to deltamedrane and fluorometholone is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix the eye drops thoroughly and dilute a quantity containing 1 mg of Fluorometholone to 25 mL with a mixture of equal volumes of *methanol* and *water*.

(2) Dilute 4 mL of a 0.05% w/v solution of *fluorometholone BPCRS* in *methanol* to 50 mL with a mixture of equal volumes of *methanol* and *water*.

(3) 0.00005% w/v each of *deltamedrane BPCRS* and *fluorometholone BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to deltamedrane and fluorometholone is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{29}FO_4$ in the eye drops using the declared content of $C_{22}H_{29}FO_4$ in *fluorometholone BPCRS*.

Fluorouracil Cream

Action and use

Pyrimidine analogue; cytotoxic.

DEFINITION

Fluorouracil Cream contains Fluorouracil in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of fluorouracil, $C_4H_3FN_2O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Dry a quantity containing 50 mg of Fluorouracil at a pressure not exceeding 0.7 kPa, mix with 100 mL of *ether*, decant, wash the white, crystalline residue with 50 mL of *ether* and dry in air. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of fluorouracil *(RS 153)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits a maximum only at 266 nm.

TESTS

5-Hydroxyuracil

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the cream containing 0.10 g of Fluorouracil with 10 mL of *water* for 5 minutes, add 10 mL of *ethanol (96%)*, mix and filter through glass-fibre paper.

(2) 0.00125% w/v of *5-hydroxyuracil* in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with a freshly prepared 0.5% w/v solution of *fast blue B salt* and then with 0.1M *sodium hydroxide*.

MOBILE PHASE

10 volumes of *water* , 40 volumes of *acetone* and 70 volumes of *ethyl acetate*.

LIMITS

Any spot corresponding to 5-hydroxyuracil in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Urea

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the cream containing 0.10 g of Fluorouracil with 10 mL of *water* for 5 minutes, add 10 mL of *ethanol (96%)*, mix and filter through glass-fibre paper.

(2) 0.0050% w/v of *urea* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with a mixture of 10 volumes of a 1% w/v solution of *4-dimethylaminobenzaldehyde* in *ethanol (96%)* and 1 volume of *hydrochloric acid* and heat at 100° until maximum intensity of the spots is obtained.

MOBILE PHASE

10 volumes of *water*, 40 volumes of *acetone* and 70 volumes of *ethyl acetate*.

LIMITS

Any spot corresponding to urea in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

www.webofpharma.com

ASSAY

To a quantity containing 50 mg of Fluorouracil add 50 mL of 0.1M *hydrochloric acid* and shake for 5 minutes. Extract with three 25-mL quantities of *chloroform*, discard the chloroform, dilute the aqueous solution to 250 mL with 0.1M *hydrochloric acid* and filter (Whatman No. 42 paper is suitable). Dilute 5 mL to 100 mL with 0.1M *hydrochloric acid* and measure the *absorbance* of the resulting solution at the maximum at 266 nm, Appendix II B. Calculate the content of $C_4H_3FN_2O_2$ taking 552 as the value of A(1%, 1 cm) at the maximum at 266 nm.

Fluorouracil Injection

Action and use
Pyrimidine analogue; cytotoxic.

DEFINITION

Fluorouracil Injection is a sterile solution in Water for Injections of fluorouracil sodium, prepared by the interaction of Fluorouracil and Sodium Hydroxide.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of fluorouracil, $C_4H_3FN_2O_2$
90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. Carefully acidify a volume containing the equivalent of 0.1 g of fluorouracil with *glacial acetic acid*, stir, cool and filter. Wash the precipitate with 1 mL of *water* and dry over *phosphorus pentoxide* at 80° at a pressure of 2 kPa for 4 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of fluorouracil *(RS 153)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the solution obtained in the Assay exhibits a maximum only at 266 nm.

TESTS

Alkalinity
pH, 8.5 to 9.1, Appendix V L.

Urea
Carry out the method described under Related substances applying separately to the plate 20 µL of each of the following solutions. For solution (1) dilute a suitable quantity of the injection with *water* to produce a solution containing the equivalent of 0.50% w/v of fluorouracil. Solution (2) contains 0.020% w/v of *urea* in *water*. After removal of the plate, allow it to dry in air, spray with a mixture of 10 volumes of a 1% w/v solution of *4-dimethylaminobenzaldehyde* in *ethanol (96%)* and 1 volume of *hydrochloric acid* and heat at 100° until maximum intensity of the spots is obtained. Any spot corresponding to urea in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 70 volumes of *ethyl acetate*, 15 volumes of *methanol* and 15 volumes of *water* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) dilute a suitable quantity of the injection with *water* to produce a solution containing the equivalent of 2.0% w/v of fluorouracil. For solution (2) dilute 1 volume of solution (1) to 400 volumes with *methanol (50%)*. Solution (3) contains 0.0050% w/v of *5-hydroxyuracil* in *methanol (50%)*. After removal of the plate, allow it to dry in a current of air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2). Spray with a freshly prepared 0.5% w/v solution of *fast blue B salt* and then with 0.1M *sodium hydroxide*. Any spot corresponding to 5-hydroxyuracil in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3). Disregard any spots with Rf values lower than 0.2.

ASSAY

To a volume containing the equivalent of 75 mg of fluorouracil add 20 mL of 1M *hydrochloric acid* and sufficient *water* to produce 200 mL. Dilute 3 mL to 100 mL with 0.1M *hydrochloric acid* and measure the *absorbance* of the resulting solution at the maximum at 266 nm, Appendix II B. Calculate the content of $C_4H_3FN_2O_2$ taking 552 as the value of A(1%,1 cm) at the maximum at 266 nm.

STORAGE

Fluorouracil Injection should be protected from light. It should not be refrigerated.

LABELLING

The strength is stated in terms of the equivalent amount of Fluorouracil in a suitable dose-volume.

Fluoxetine Capsules

Action and use
Selective serotonin reuptake inhibitor; antidepressant.

DEFINITION

Fluoxetine Capsules contain Fluoxetine Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of fluoxetine, $C_{17}H_{18}F_3NO$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the contents of the capsules containing the equivalent of 20 mg of fluoxetine with 10 mL of *methanol*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of fluoxetine hydrochloride *(RS 385)*.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1. Prepare a mixture of 1 volume of *diethylamine* and 250 volumes of *acetonitrile*, mix well and

www.webofpharma.com

adjust the pH to 3.5 with *orthophosphoric acid* (solution A); a white precipitate may form, keep the mixture well stirred.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a sample of 20 mL of the medium and filter, discarding the first 5 mL of filtrate. Add to 5 mL of filtered medium 2 mL of solution A and mix well.

(2) Add to 5 mL of a 0.0022% w/v solution of *fluoxetine hydrochloride BPCRS*, 2 mL of solution A and mix well.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *cyanosilyl silica gel for chromatography* (5 µm) (Zorbax CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 226 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

2 volumes of *diethylamine*, 200 volumes of *acetonitrile* and 300 volumes of *water*, the mixture adjusted to pH 3.5 with *orthophosphoric acid*.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{18}F_3NO$ in the medium from the chromatograms obtained using the declared content of $C_{17}H_{18}F_3NO,HCl$ in *fluoxetine hydrochloride BPCRS* and taking each mg of $C_{17}H_{18}F_3NO,HCl$ to be equivalent to 0.8944 mg of $C_{17}H_{18}F_3NO$.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the contents of the capsules containing the equivalent of 20 mg of fluoxetine in sufficient of the mobile phase to produce 10 mL, filter and use the filtrate, discarding the first 2 mL.

(2) 0.001% w/v of *fluoxetine hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *cyanosilyl silica gel for chromatography* (5 µm) (DuPont Zorbax SB-CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 215 nm.

(f) Inject 10 µL of each solution.

(g) Allow the chromatography to proceed for twice the retention time of the peak due to fluoxetine hydrochloride.

If necessary, adjust the composition of the mobile phase so that, in the chromatogram obtained with solution (2), the retention time of the peak due to fluoxetine is between 10 and 20 minutes.

MOBILE PHASE

35 volumes of *acetonitrile* and 65 volumes of a solution containing 1 volume of *triethylamine* and 99 volumes of *water*, and adjusting the pH to 6.0 with *orthophosphoric acid*.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than half the area of the peak in the chromatogram obtained with solution (2) (0.25%);

the area of not more than two such peaks is greater than 0.2 times the area of the peak in the chromatogram obtained with solution (2) (0.1%);

and the sum of the areas of all the *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the mixed contents of 20 capsules containing the equivalent of 20 mg of fluoxetine in sufficient of the mobile phase to produce 200 mL, filter and use the filtrate, discarding the first 2 mL.

(2) 0.011% w/v of *fluoxetine hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (7.5 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (3.5 µm) (DuPont Zorbax RX-C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 227 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

33 volumes of a solution containing 0.3% w/v of *glacial acetic acid* and 0.64% w/v of *sodium pentanesulfonate*, adjusted to pH 5.0 with 5M *sodium hydroxide*, and 67 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{18}F_3NO$ in the capsules from the chromatograms obtained using the declared content of $C_{17}H_{18}F_3NO,HCl$ in *fluoxetine hydrochloride BPCRS* and taking each mg of $C_{17}H_{18}F_3NO,HCl$ to be equivalent to 0.8944 mg of $C_{17}H_{18}F_3NO$.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of fluoxetine.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A and B listed under Fluoxetine Hydrochloride.

www.webofpharma.com

Fluoxetine Oral Solution

Action and use
Selective serotonin reuptake inhibitor; antidepressant.

DEFINITION
Fluoxetine Oral Solution is a solution of Fluoxetine Hydrochloride in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of fluoxetine, $C_{17}H_{18}F_3NO$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. To a volume of the oral solution containing the equivalent of 0.1 g of fluoxetine add 5 mL of 4M *sodium hydroxide*, extract with 10 mL of *dichloromethane*, filter the dichloromethane layer (Whatman 1PS is suitable) and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of fluoxetine *(RS 398)*.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS
Acidity
pH, 2.5 to 4.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Add 4.33 g of *sodium octanesulfonate* and 13.8 g of *sodium dihydrogen orthophosphate monohydrate* to 1000 mL of *water*, adjust the pH, if necessary, to 3.0 with *orthophosphoric acid* and filter (solution A).

(1) Mix a quantity of the oral solution containing the equivalent of 20 mg of fluoxetine in 20 mL of a mixture of 1 volume of *acetonitrile*, 3 volumes of *methanol* and 6 volumes of solution A and use immediately.

(2) Dilute 1 volume of solution (1) to 25 volumes with a mixture of 1 volume of *acetonitrile*, 3 volumes of *methanol* and 6 volumes of solution A and further dilute 1 volume to 10 volumes with the same solvent mixture.

(3) Heat a 0.2% w/v solution of *fluoxetine hydrochloride BPCRS* in 0.5M *sulfuric acid* at 85° for 1 hour (generation of impurity A and 4-trifluoromethylphenol).

(4) Dilute 1 volume of solution (3) to 100 volumes with a solution containing 0.1% w/v of *fluoxetine hydrochloride BPCRS* in a mixture of 1 volume of *acetonitrile*, 3 volumes of *methanol* and 6 volumes of solution A.

(5) 0.1% w/v of *fluoxetine hydrochloride BPCRS* and 0.0003% w/v of *fluoxetine impurity C EPCRS* in a mixture of 1 volume of *acetonitrile*, 3 volumes of *methanol* and 6 volumes of solution A.

(6) 0.05% w/v of *benzoic acid* in a mixture of 1 volume of *acetonitrile*, 3 volumes of *methanol* and 6 volumes of solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Supelcosil LC-18-DB is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 215 nm.

(f) Inject 20 µL of each solution.

(g) Equilibrate the column with mobile phase A for at least 10 minutes.

MOBILE PHASE

Mobile phase A 21 volumes of *acetonitrile R1*, 26 volumes of *methanol R2* and 53 volumes of solution A.

Mobile phase B 22 volumes of *methanol R2*, 35 volumes of *acetonitrile R1* and 43 volumes of solution A.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-13	100	0	isocratic
13-15	100→0	0→100	linear gradient
15-29	0	100	isocratic
29-30	0→100	100→0	linear gradient
30-40	100	0	re-equilibration

When the chromatograms are recorded under the prescribed conditions the retention time of fluoxetine is about 26 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *peak-to-valley ratio* is at least 1.5, where H_p=height above the baseline of the peak due to impurity C and H_v=height above the baseline of the lowest point of the curve separating this peak from the peak due to fluoxetine.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.4%);

the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.8%).

Disregard any peak with a retention time corresponding to that of the principal peak in the chromatogram obtained with solution (6).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the oral solution with sufficient of the mobile phase to produce a solution containing the equivalent of 0.004% w/v of fluoxetine.

(2) 0.0045% w/v of *fluoxetine hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed *cyanosilyl silica gel for chromatography* (5 µm) (Dupont Zorbax CN Special is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 215 nm.

(f) Inject 20 µL of each solution.

www.webofpharma.com

(g) Allow the chromatography to proceed for at least 10 minutes.

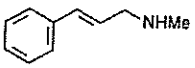
MOBILE PHASE

Equal volumes of a 1% v/v solution of *triethylamine*, adjusted to pH 6.0 with *orthophosphoric acid*, and *acetonitrile R1*.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{17}H_{18}F_3NO$, weight in volume, using the declared content of $C_{17}H_{18}F_3NO,HCl$ in *fluoxetine hydrochloride BPCRS*. Each mg of $C_{17}H_{18}F_3NO,HCl$ is equivalent to 0.8944 mg of $C_{17}H_{18}F_3NO$.

STORAGE

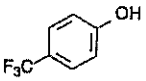


Fluoxetine Oral Solution should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of fluoxetine.

IMPURITIES



The impurities limited by the requirements of this monograph include those listed under Fluoxetine Hydrochloride and the following:

1. 3-Methylamino-1-phenylprop-1-ene,

2. 3-Methylamino-1-chloropropane,

3. 4-Trifluoromethylphenol.

Flupentixol Injection

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Flupentixol Injection is a sterile solution of Flupentixol Decanoate in a suitable vegetable oil.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of flupentixol decanoate, $C_{33}H_{43}F_3N_2O_2S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dilute 1 volume of solution A obtained in the Assay to 2 volumes with *ethanol (96%)*. The *light absorption*, Appendix II B, in the range 205 to 300 nm of the resulting solution exhibits two maxima at 230 nm and 264 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 3 volumes of *diethylamine* and 90 volumes of *cyclohexane* as the mobile phase and an unsaturated tank. Apply separately to the plate 5 µL of each of the following solutions.

For solution (1) dilute the injection with *ethanol (96%)* to contain 0.4% w/v of flupentixol decanoate. Solution (2) contains 0.4% w/v of *flupentixol decanoate dihydrochloride BPCRS* in *ethanol (96%)*. After removal of the plate, allow it to dry in air, spray with a 1% w/v solution of *sodium molybdate* in *sulfuric acid*, heat at 110° for 20 minutes and examine in daylight. The principal spot in the chromatogram obtained with solution (1) is similar in colour, position and size to that in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *acetonitrile*, protected from light. For solution (1) dilute the injection to contain 0.20% w/v of Flupentixol Decanoate. Solution (2) contains 0.0060% w/v of cis-*flupentixol BPCRS*. Solution (3) contains 0.001% w/v of *2-trifluoromethylthioxanthone BPCRS*. Solution (4) contains 0.002% w/v of trans-*flupentixol decanoate BPCRS*. Solution (5) contains 0.006% w/v of cis-*flupentixol BPCRS* and 0.001% w/v each of *2-trifluoromethylthioxanthone BPCRS* and trans-*flupentixol decanoate BPCRS* in solution (1).

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry C18 is suitable) maintained at a temperature of 40°, (b) as the mobile phase with a flow rate of 1 mL per minute a mixture of 0.1 volume of *orthophosphoric acid*, 25 volumes of a 20 millimole solution of *dioctyl sodium sulfosuccinate* (prepared by dissolving 8.89 g of *dioctyl sodium sulfosuccinate* in 500 mL of *water*, stirring for 6 to 8 hours and diluting to 1000 mL with *water*) and 75 volumes of *ethanol (96%)* and (c) a detection wavelength of 270 nm.

Inject solution (1) and allow the chromatography to proceed for 1.5 times the retention time of the principal peak. Inject 20 µL of each solution. The substances are eluted in the following order: 2-trifluoromethylthioxanthone, *cis*-flupentixol (free alcohol), flupentixol decanoate and *trans*-flupentixol decanoate. The test is not valid unless the chromatogram obtained with solution (5) shows clearly separated peaks.

In the chromatogram obtained with solution (1) the area of any peak corresponding to *cis*-flupentixol is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (3%), the area of any peak corresponding to 2-trifluoromethylthioxanthone is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%) and the area of any peak corresponding to *trans*-flupentixol decanoate is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (1.0%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *acetonitrile*, protected from light. For solution (1) dilute a volume of the injection to contain 0.20% w/v of Flupentixol Decanoate. Solution (2) contains 0.22% w/v of *flupentixol decanoate dihydrochloride BPCRS*.

The chromatographic procedure described under Related substances may be used.

Calculate the content of $C_{33}H_{43}F_3N_2O_2S$ using the declared content of $C_{33}H_{43}F_3N_2O_2S$ in *flupentixol decanoate dihydrochloride BPCRS*. Each mg of flupentixol decanoate

www.webofpharma.com

dihydrochloride is equivalent to 0.8897 mg of flupentixol decanoate.

STORAGE
Flupentixol Injection should be protected from light.

Fluphenazine Decanoate Injection

Action and use
Dopamine receptor antagonist; neuroleptic.

DEFINITION
Fluphenazine Decanoate Injection is a sterile solution of Fluphenazine Decanoate in refined sesame oil.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of fluphenazine decanoate, $C_{32}H_{44}F_3N_3O_2S$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out in subdued light the method for *thin-layer chromatography*, Appendix III A, using a plate 200 mm × 200 mm in size and *silica gel* GF_{254} as the coating substance. For the first development use *chloroform* as the mobile phase. Apply to the bottom right-hand corner of the plate a volume of the injection containing 25 µg of Fluphenazine Decanoate and develop over a path of 12 cm. After removal of the plate, allow it to dry in air, turn the plate through 90° in a clockwise direction, impregnate the coating with a 5% v/v solution of n-*tetradecane* in n-*hexane* and allow it to dry in air. Apply to the bottom right-hand corner of the plate, to the right of the solvent front of the first development, 1 µL of a 2.0% w/v solution of *fluphenazine decanoate EPCRS* in *ethanol (96%)*. For the second development use *methanol (90%)* as the mobile phase. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with the injection corresponds to that in the chromatogram obtained with the reference substance.

B. Shake a volume containing 5 mg of Fluphenazine Decanoate with 1 mL of a 1% w/v solution of *sucrose* in *hydrochloric acid* and allow to stand for 5 minutes. A red colour is produced in the acid layer.

Related substances
Protect the solutions from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute a volume of the injection with sufficient *chloroform* to produce a solution containing 0.50% w/v of Fluphenazine Decanoate, dilute 1 volume of this solution to 25 volumes with *acetonitrile* and mix. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *acetonitrile*. For solution (3) add 0.05 mL of 10M *sodium hydroxide* to 2 mL of solution (1) and allow to stand for 48 hours before use (generation of fluphenazine impurity). For solution (4) add 0.05 mL of *hydrogen peroxide solution (200 vol)* to 5 mg of *fluphenazine decanoate EPCRS*, allow to stand for 10 minutes, add sufficient *chloroform* to produce 1 mL, mix and dilute to 100 mL with *acetonitrile* (generation of mono- and di-*N*-oxide impurities).

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable) fitted with a guard column (2.5 cm × 4.6 mm) packed with the same material, (b) as the mobile phase with a flow rate of 1 mL per minute a solution prepared by adding 450 volumes of *acetonitrile* to a mixture of 75 volumes of a 1% w/v solution of *ammonium carbonate* and 450 volumes of *methanol* adjusted to pH 7.5 with 1M *acetic acid* and (c) a detection wavelength of 260 nm.

Inject separately 20 µL of each solution. After completion of the test, flush the column with a mixture of equal volumes of *methanol* and *water*.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to the two fluphenazine mono-*N*-oxides is at least 2.

In the chromatogram obtained with solution (1) the area of any peak corresponding to the peak due to fluphenazine impurity in the chromatogram obtained with solution (3) is not greater than 4 times the area of the peak in the chromatogram obtained with solution (2) (4%), the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%) and the sum of the areas of any *secondary peaks* other than any peak corresponding to fluphenazine is not greater than twice the area of the peak in the chromatogram obtained with solution (2) (2%). Disregard any peak with a retention time relative to fluphenazine decanoate of 0.2 or less.

ASSAY
Carry out Method I for *non-aqueous titration*, Appendix VIII A, using a volume containing 0.15 g of Fluphenazine Decanoate diluted with 75 mL of *anhydrous acetic acid* and *crystal violet solution* as indicator. Each mL of 0.1M *perchloric acid VS* is equivalent to 29.59 mg of $C_{32}H_{44}F_3N_3O_2S$.

STORAGE
Fluphenazine Decanoate Injection should be protected from light.

LABELLING
The label states that the injection is for intramuscular injection only.

Fluphenazine Tablets

Action and use
Dopamine receptor antagonist; neuroleptic.

DEFINITION
Fluphenazine Tablets contain Fluphenazine Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of fluphenazine hydrochloride, $C_{22}H_{26}F_3N_3OS,2HCl$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets with sufficient *methanol* to produce a solution containing 0.2% w/v of Fluphenazine Hydrochloride, centrifuge and use the supernatant liquid.

(2) 0.2% w/v of *fluphenazine hydrochloride BPCRS* in *methanol*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *kieselguhr G*. Impregnate the dry plate by placing it in a tank containing a shallow layer of a mixture of 5 volumes of *2-phenoxyethanol*, 15 volumes of *formamide* and 180 volumes of *acetone*, allowing the impregnating solvent to ascend to the top, removing the plate from the tank and using it immediately.

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, examine under *ultraviolet light (365 nm)* and observe the fluorescence produced after about 2 minutes. Heat the plate at 120° for 20 minutes, cool, spray with *ethanolic sulfuric acid (20%)* and observe the colour produced.

MOBILE PHASE

2 volumes of *diethylamine* and 100 volumes of *petroleum spirit (boiling range, 40° to 60°)* saturated with *2-phenoxyethanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position, fluorescence and colour to that in the chromatogram obtained with solution (2).

B. Extract a quantity of the powdered tablets containing 5 mg of Fluphenazine Hydrochloride with 5 mL of *acetone*, filter and evaporate the filtrate to dryness. Add 2 mL of *sulfuric acid* to the residue and allow to stand for 5 minutes. An orange colour is produced.

C. Extract a quantity of the powdered tablets containing 10 mg of Fluphenazine Hydrochloride with 10 mL of *absolute ethanol* containing 0.2% v/v of 13.5M *ammonia* and evaporate the extract to dryness. Heat 0.5 mL of *chromic–sulfuric acid mixture* in a small test tube in a water bath for 5 minutes; the solution wets the side of the tube readily and there is no greasiness. Add 2 or 3 mg of the residue and again heat in a water bath for 5 minutes; the solution does not wet the side of the tube and does not pour easily from the tube.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Remove the coating from a suitable number of tablets; shake a quantity of the powdered tablet cores containing 20 mg of Fluphenazine Hydrochloride with 10 mL of 0.1M *methanolic sodium hydroxide* for 5 minutes, centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 50 volumes with 0.1M *methanolic sodium hydroxide*.

(3) Dilute 1 volume of solution (1) to 100 volumes with 0.1M *methanolic sodium hydroxide*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 50 µL of solution (1). Apply 25 µL of solutions (2) and (3).

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of 13.5M *ammonia*, 30 volumes of *cyclohexane* and 80 volumes of *acetone*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.5%). Disregard any spot remaining on the line of application.

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Fluphenazine Hydrochloride comply with the requirements stated under Tablets using the following method of analysis. Carry out the following procedure protected from light. Record *second-derivative ultraviolet absorption spectra* of the following solutions in the range 230 to 300 nm, Appendix II B. For solution (1) add 2 mL of 0.1M *hydrochloric acid* to one tablet and mix with the aid of ultrasound until the tablet is dispersed. Add 60 mL of a mixture of 1 volume of 1M *hydrochloric acid* and 99 volumes of *ethanol (80%)*, shake for 20 minutes, dilute to 100 mL with the same solvent mixture, mix and filter. Solution (2) contains 0.001% w/v of *fluphenazine hydrochloride BPCRS*.

For each solution measure the amplitude from the peak at about 266 nm to the trough at about 258 nm. Calculate the content of $C_{22}H_{26}F_3N_3OS,2HCl$ in each tablet using the declared content of $C_{22}H_{26}F_3N_3OS,2HCl$ in *fluphenazine hydrochloride BPCRS*.

ASSAY

For tablets containing less than 2 mg and/or less than 2% w/w of Fluphenazine Hydrochloride

Use the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing 2 mg or more and 2% w/w or more of Fluphenazine Hydrochloride

Carry out the following procedure protected from light. Record *second-derivative ultraviolet absorption spectra* of the following solutions in the range 230 to 300 nm, Appendix II B. For solution (1) add 20 mL of 0.1M *hydrochloric acid* to 10 tablets, mix with the aid of ultrasound until the tablets are dispersed, add 600 mL of a mixture of 1 volume of 1M *hydrochloric acid* and 99 volumes of *ethanol (80%)*, shake for 20 minutes, dilute to 1000 mL with the same solvent mixture, mix and filter. Solution (2) contains 0.001% w/v of *fluphenazine hydrochloride BPCRS*.

For each solution measure the amplitude from the peak at about 266 nm to the trough at about 258 nm. Calculate the content of $C_{22}H_{26}F_3N_3OS,2HCl$ in the tablets using the declared content of $C_{22}H_{26}F_3N_3OS,2HCl$ in *fluphenazine hydrochloride BPCRS*.

Flurazepam Capsules

Action and use

Benzodiazepine.

DEFINITION

Flurazepam Capsules contain Flurazepam Monohydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of flurazepam, $C_{21}H_{23}ClFN_3O$

90.0 to 110.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing the equivalent of 0.15 g of flurazepam with 3 mL of *chloroform IR* and filter. The *infrared absorption spectrum* of the filtrate, Appendix II A, is concordant with the *reference spectrum* of flurazepam monohydrochloride *(RS 155)*.

B. The *light absorption*, Appendix II B, in the range 220 to 350 nm of the final solution obtained in the Assay exhibits two maxima, at 240 nm and 284 nm.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 2.5 volumes of *diethylamine* and 97.5 volumes of *ether* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) shake vigorously a quantity of the contents of the capsules containing the equivalent of 0.1 g of flurazepam with 2 mL of a mixture of 2 volumes of 13.5M *ammonia* and 98 volumes of *methanol* and centrifuge. For solution (2) dilute 1 volume of solution (1) to 200 volumes with the same solvent mixture. After removal of the plate, dry it in a current of air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the following procedure protected from light. Transfer a quantity of the capsule contents containing the equivalent of 0.1 g of flurazepam into about 150 mL of 1M *methanolic sulfuric acid*, washing the inner surfaces of the capsule shells, shake for 10 minutes and add sufficient 1M *methanolic sulfuric acid* to produce 250 mL. Further dilute this solution with 1M *methanolic sulfuric acid* to produce a solution containing the equivalent of about 0.002% w/v of flurazepam and measure the *absorbance* of the resulting solution at the maximum at 284 nm, Appendix II B. Calculate the content of $C_{21}H_{23}ClFN_3O$ taking 319 as the value of A(1%, 1 cm) at the maximum at 284 nm.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of flurazepam.

Flurbiprofen Eye Drops

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Flurbiprofen Eye Drops are a sterile solution of Flurbiprofen Sodium in purified water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of flurbiprofen sodium dihydrate, $C_{15}H_{12}FNaO_2,2H_2O$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 5 volumes of *propan-2-ol* and 95 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) dilute the eye drops, if necessary, with a mixture of 25 volumes of *water* and 50 volumes of *methanol* to produce a solution containing 0.01% w/v of flurbiprofen sodium. Solution (2) contains 0.01% w/v of *flurbiprofen sodium BPCRS* in a mixture of 25 volumes of *water* and 50 volumes of *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 6.0 to 7.0, Appendix V L.

2-(Biphenyl-4-yl)propionic acid

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the eye drops, if necessary, with a mixture of 25 volumes of *water* and 50 volumes of *methanol* to produce a solution containing 0.030% w/v of flurbiprofen sodium. Solution (2) contains 0.00015% w/v of *2-(biphenyl-4-yl)propionic acid BPCRS* in a mixture of 25 volumes of *water* and 50 volumes of *methanol*. Solution (3) contains 0.00050% w/v of *flurbiprofen sodium BPCRS* and 0.00050% w/v of *2-(biphenyl-4-yl)propionic acid BPCRS* in a mixture of 25 volumes of *water* and 50 volumes of *methanol*.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Resolve 5µ is suitable), (b) a mixture of 5 volumes of *glacial acetic acid*, 35 volumes of *acetonitrile* and 60 volumes of *water* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 254 nm. Adjust the sensitivity so that the heights of the principal peaks in the chromatogram obtained with solution (3) are about 40% of full-scale deflection on the chart paper.

The test is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (3) is at least 1.5.

In the chromatogram obtained with solution (1) the area of any peak corresponding to 2-(biphenyl-4-yl)propionic acid is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the eye drops, if necessary, with a mixture of 25 volumes of *water* and 50 volumes of *methanol* to produce a solution containing 0.015% w/v of flurbiprofen sodium. Solution (2) contains 0.015% w/v of *flurbiprofen sodium BPCRS* in a mixture of 25 volumes of *water* and 50 volumes of *methanol*. Solution (3) contains 0.0005% w/v of *flurbiprofen sodium BPCRS* and 0.0005% w/v of *2-(biphenyl-4-yl)propionic acid BPCRS* in a mixture of 25 volumes of *water* and 50 volumes of *methanol*.

The chromatographic procedure described under the test for 2-(Biphenyl-4-yl)propionic acid may be used.

The assay is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (3) is at least 1.5.

www.webofpharma.com

Calculate the content of $C_{15}H_{12}FNaO_2,2H_2O$ in the eye drops using the declared content of $C_{15}H_{12}FNaO_2,2H_2O$ in *flurbiprofen sodium BPCRS*.

Flurbiprofen Suppositories

Action and use
Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION
Flurbiprofen Suppositories contain Flurbiprofen in a suitable suppository basis.

The suppositories comply with the requirements stated under Rectal Preparations and with the following requirements.

Content of flurbiprofen, $C_{15}H_{13}FO_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck plates are suitable) and a mixture of 10 volumes of *glacial acetic acid*, 10 volumes of *methyl acetate* and 80 volumes of *trichloroethylene* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 2 µL of each of the following solutions. For solution (1) cut a suitable number of the suppositories into small pieces, add 50 mL of *methanol* to a quantity containing 0.1 g of flurbiprofen, heat gently until melted, shake mechanically for 10 minutes, allow to cool at 2° to 8°, filter (Whatman No. 1 paper is suitable) and evaporate to dryness. Dissolve the residue in 5 mL of a mixture of equal volumes of *methanol* and *water*. Solution (2) contains 0.2% w/v of *flurbiprofen sodium BPCRS* in a mixture of equal volumes of *methanol* and *water*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as that in the chromatogram obtained with solution (2).

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) cut a suitable number of the suppositories into small pieces, add 50 mL of *methanol* to a quantity containing 0.1 g of flurbiprofen, heat gently until melted, shake mechanically for 10 minutes and filter (Whatman No. 1 paper is suitable). Dilute the filtrate with sufficient of a mixture containing 35 volumes of *acetonitrile* and 65 volumes of *water* to produce 100 mL and filter. For solution (2) dilute 1 volume of solution (1) to 100 volumes with a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water* and further dilute 1 volume to 5 volumes with the same solvent mixture. Solution (3) contains 0.0005% w/v of *2-(biphenyl-4-yl)propionic acid BPCRS* in a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*. Solution (4) contains 0.0005% w/v of *4-acetyl-2-fluorobiphenyl BPCRS* in a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*. For solution (5) dilute 1 volume of solution (1) to 200 volumes with solution (3).

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Resolve 5µ is suitable) fitted with a stainless steel guard column (2 cm × 4.6 mm) packed with the same material, (b) a mixture of 5 volumes of *glacial acetic acid*, 35 volumes of *acetonitrile* and 60 volumes of *water* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 254 nm.

Adjust the sensitivity so that the heights of the principal peaks in the chromatogram obtained with solution (5) are about 40% of full-scale deflection on the chart paper.

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between the two principal peaks is at least 1.5.

In the chromatogram obtained with solution (1) the area of any peak corresponding to 2-(biphenyl-4-yl)propionic acid is not greater than the area of the peak in the chromatogram obtained with solution (3) (0.5%), the area of any peak corresponding to 4-acetyl-2-fluorobiphenyl is not greater than the area of the peak in the chromatogram obtained with solution (4) (0.5%), the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of any such peaks is not greater than 2.5 times the area of the peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) cut a suitable number of the suppositories into small pieces, add 50 mL of *methanol* to a quantity containing 0.1 g of flurbiprofen, heat gently until melted, shake mechanically for 10 minutes and filter (Whatman No. 1 paper is suitable). Dilute the filtrate with sufficient of a mixture containing 35 volumes of *acetonitrile* and 65 volumes of *water* to produce 100 mL, filter and dilute 1 volume of the filtrate to 25 volumes with the same solvent mixture. Solution (2) contains 0.005% w/v of *flurbiprofen sodium BPCRS* in a mixture of 35 volumes of *acetonitrile* and 65 volumes of *water*. Solution (3) contains 0.0005% w/v each of *flurbiprofen sodium BPCRS* and *2-(biphenyl-4-yl)propionic acid BPCRS* in a mixture of 35 volumes of *acetonitrile* and 65 volumes of *water*.

The chromatographic procedure described under Related substances may be used.

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 1.5.

Calculate the content of $C_{15}H_{13}FO_2$ in the suppositories using the declared content of $C_{15}H_{13}FO_2$ in *flurbiprofen sodium BPCRS*.

Flurbiprofen Tablets

Action and use
Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION
Flurbiprofen Tablets contain Flurbiprofen. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of flurbiprofen, $C_{15}H_{13}FO_2$
92.5 to 107.5% of the stated amount.

IDENTIFICATION
Extract a quantity of the powdered tablets containing 0.5 g of flurbiprofen with 25 mL of *acetone*, filter, evaporate the

www.webofpharma.com

filtrate to dryness with the aid of a current of air without heating and dry at 60° at a pressure of 2 kPa. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of flurbiprofen *(RS 156)*.

B. Heat 0.5 mL of *chromic–sulfuric acid mixture* in a small test tube in a water bath for 5 minutes; the solution wets the side of the tube readily and there is no greasiness. Add 2 or 3 mg of the residue and heat in a water bath for 5 minutes; the solution does not wet the side of the tube and does not pour easily from the tube.

C. *Melting point*, about 114°, Appendix V A.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) disperse a quantity of the powdered tablets containing 0.5 g of flurbiprofen in 50 mL of *water*, add 200 mL of *acetonitrile*, mix, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 100 volumes with a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water* and further dilute 1 volume to 5 volumes with the same solvent mixture. Solution (3) contains 0.0010% w/v of *2-(biphenyl-4-yl)propionic acid BPCRS* in a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*. For solution (4) dilute 1 volume of solution (1) to 200 volumes with solution (3).

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Resolve 5µ is suitable), (b) a mixture of 5 volumes of *glacial acetic acid*, 35 volumes of *acetonitrile* and 60 volumes of *water* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 254 nm.

Adjust the sensitivity so that the heights of the principal peaks in the chromatogram obtained with solution (4) are about 40% of full-scale deflection on the chart paper.

The test is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (4) is at least 1.5.

In the chromatogram obtained with solution (1) the area of any peak corresponding to 2-(biphenyl-4-yl)propionic acid is not greater than the area of the peak in the chromatogram obtained with solution (3) (0.5%), the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of any *secondary peaks* is not greater than five times the area of the peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.1 g of flurbiprofen with 60 mL of 0.1M *sodium hydroxide* for 5 minutes, dilute to 100 mL with 0.1M *sodium hydroxide*, filter if necessary and dilute 10 mL of the filtrate to 100 mL with the same solvent. Further dilute 10 mL to 100 mL with the same solvent and measure the *absorbance* of the resulting solution at the maximum at 247 nm, Appendix II B. Calculate the content of $C_{15}H_{13}FO_2$ taking 802 as the value of A(1%, 1 cm) at the maximum at 247 nm.

Fluticasone Cream

Action and use

Glucocorticoid.

DEFINITION

Fluticasone Cream contains Fluticasone Propionate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of fluticasone propionate, $C_{25}H_{31}F_3O_5S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Transfer a quantity of the cream containing 1 mg of Fluticasone Propionate to a separating funnel, add 25 mL of *acetonitrile* and 25 mL of n-*hexane*, shake for 3 minutes and allow to separate. Filter the lower layer through an absorbent cotton plug, previously washed with *acetonitrile*, into a 50-mL graduated flask, repeat the extraction with one 5-mL and then one 2-mL quantity of *acetonitrile*, filter and add the extracts to the filtered layer; wash the absorbent cotton plug with 1 to 2 mL of *acetonitrile*, add the washings to the filtered layer and dilute the combined extracts to 50 mL with *acetonitrile*. Evaporate 4 mL of the resulting solution to dryness using a rotary evaporator at a temperature of 40° and dissolve the residue in 0.2 mL of *acetonitrile*.

(2) 0.04% w/v of *fluticasone propionate BPCRS* in *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel F_{254}* precoated plate (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 40 µL of each solution.

(d) Develop the plate to 12 cm.

(e) After removal of the plate, dry it in a current of air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *glacial acetic acid*, 8 volumes of *ethyl acetate* and 30 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light.

(1) Transfer a quantity of the cream containing 1 mg of Fluticasone Propionate to a separating funnel, add 25 mL of *ethanol (65%)*, stopper and shake until the cream is completely dispersed. Add 25 mL of n-*hexane*, shake for 3 minutes and allow to separate, filter the lower aqueous layer through an absorbent cotton plug, previously washed with *ethanol (65%)*, into a graduated flask and repeat the extraction with one 5-mL and then one 2-mL quantity of *ethanol (65%)*, filtering the aqueous ethanol extracts into the same graduated flask. Wash the absorbent cotton plug with

www.webofpharma.com

ethanol (65%), collecting the washings in the flask and dilute the combined extracts to 50 mL with *ethanol (65%)*.

(2) 0.002% w/v of *fluticasone propionate BPCRS* in *methanol (80%)*.

(3) 0.0004% w/v of *fluticasone S-methyl impurity BPCRS* and 0.002% w/v of *fluticasone propionate BPCRS* in *methanol (80%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

15 volumes of *acetonitrile*, 35 volumes of 0.01M *ammonium dihydrogen orthophosphate* previously adjusted to pH 3.5 with *orthophosphoric acid* and 50 volumes of *methanol*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone *S*-methyl impurity and fluticasone propionate is at least 1.6. If necessary, adjust the proportion of acetonitrile in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{31}F_3O_5S$ in the cream using the declared content of $C_{25}H_{31}F_3O_5S$ in *fluticasone propionate BPCRS*.

Fluticasone Nasal Drops

Action and use
Glucocorticoid.

DEFINITION

Fluticasone Nasal Drops are a suspension of Fluticasone Propionate in a suitable liquid in a container fitted with an appropriate nasal delivery system.

The nasal drops comply with the requirements stated under Nasal Preparations and with the following requirements.

Content of fluticasone propionate, $C_{25}H_{31}F_3O_5S$
95.0 to 110.0% of the stated amount.

Carry out all the following procedures in the dark or under long-wavelength light (greater than 420 nm). Prepare solutions immediately before use and protect them from light.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) To a quantity of the nasal drops containing 2 mg of Fluticasone Propionate add sufficient *acetonitrile* to produce 5 mL, shake for 3 minutes and filter.

(2) 0.04% w/v of *fluticasone propionate BPCRS* in *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254} (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 40 µL of each solution.

(d) Develop the plate to 12 cm.

(e) After removal of the plate, allow it to dry in a current of air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *glacial acetic acid*, 8 volumes of *ethyl acetate* and 30 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the nasal drops containing 1 mg of Fluticasone Propionate to 5 mL with a mixture of equal volumes of mobile phase A and mobile phase B and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes with a mixture of equal volumes of mobile phase A and mobile phase B.

(3) 0.02% w/v of *fluticasone propionate BPCRS* and 0.00004% w/v of *fluticasone S-methyl impurity BPCRS* in a mixture of equal volumes of mobile phase A and mobile phase B.

(4) Dilute 1 volume of solution (2) to 10 volumes with a mixture of equal volumes of mobile phase A and mobile phase B.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

Mobile phase A A solution containing 0.05% v/v of *orthophosphoric acid* and 3.0% v/v of *methanol* in *acetonitrile*.

Mobile phase B A solution containing 0.05% v/v of *orthophosphoric acid* and 3.0% v/v of *methanol* in *water*.

Equilibrate the column with a mixture of 43 volumes of mobile phase A and 57 volumes of mobile phase B.

Time (Minutes)	Mobile phase A % v/v	Mobile phase B % v/v	Comment
0-40	43→55	57→45	linear gradient
40-60	55→90	45→10	linear gradient
60-70	90	10	isocratic
70-75	90→43	10→57	linear gradient
75-85	43	57	re-equilibration

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone *S*-methyl impurity and fluticasone propionate is at least 1.5;

in the chromatogram obtained with solution (4), the peak due to fluticasone propionate has a *signal-to-noise* ratio of at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the peak due to fluticasone propionate in the chromatogram obtained with solution (2) (0.5%),

the sum of the areas of any such peaks is not greater than 4 times the area of the peak due to fluticasone propionate in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than the area of the peak due to fluticasone propionate in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix the contents of 20 ampoules. Add 25 mL of *ethanol (65%)* to a quantity of the nasal drops containing 1 mg of Fluticasone Propionate, shake with the aid of ultrasound for 10 minutes. Add sufficient *ethanol (65%)* to produce 50 mL and filter.

(2) Dilute 2 mL of a 0.05% w/v solution of *fluticasone propionate BPCRS* in *methanol (80%)* to 50 mL with *ethanol (65%)*.

(3) 0.0004% w/v of *fluticasone S-methyl impurity BPCRS* and 0.002% w/v of *fluticasone propionate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

15 volumes of *acetonitrile*, 35 volumes of 0.01M *ammonium dihydrogen orthophosphate* previously adjusted to pH 3.5 with *orthophosphoric acid* and 50 volumes of *methanol*.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone *S*-methyl impurity and fluticasone propionate is at least 1.5. If necessary, adjust the proportion of *acetonitrile* in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{31}F_3O_5S$ in the nasal drops using the declared content of $C_{25}H_{31}F_3O_5S$ in *fluticasone propionate BPCRS*.

IMPURITIES

D. 6α,9-difluoro-17-[(methylsulfanyl)carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl propanoate (fluticasone *S*-methyl impurity, equivalent to Ph. Eur. fluticasone impurity D).

Fluticasone Nasal Spray

Action and use

Glucocorticoid.

DEFINITION

Fluticasone Nasal Spray is a suspension of Fluticasone Propionate in a suitable liquid in a container fitted with an appropriate nasal delivery system.

The nasal spray complies with the requirements stated under Nasal Preparations and with the following requirements.

Content of fluticasone propionate, $C_{25}H_{31}F_3O_5S$

80.0 to 120.0% of the amount stated to be delivered by actuation of the valve.

Carry out all the following procedures in the dark or under long-wavelength light (greater than 420 nm). Prepare solutions immediately before use and protect them from light.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) To a quantity of the nasal spray containing 2 mg of Fluticasone Propionate add sufficient *acetonitrile* to produce 5 mL, shake for 3 minutes and filter.

(2) 0.04% w/v of *fluticasone propionate BPCRS* in *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254} (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 40 µL of each solution.

(d) Develop the plate to 12 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *glacial acetic acid*, 8 volumes of *ethyl acetate* and 30 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the nasal spray containing 1 mg of Fluticasone Propionate to 5 mL with a mixture of equal volumes of mobile phase A and mobile phase B and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes with a mixture of equal volumes of mobile phase A and mobile phase B.

(3) 0.02% w/v of *fluticasone propionate BPCRS* and 0.00004% w/v of *fluticasone S-methyl impurity BPCRS* in a mixture of equal volumes of mobile phase A and mobile phase B.

(4) Dilute 1 volume of solution (2) to 10 volumes with a mixture of equal volumes of mobile phase A and mobile phase B.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

Mobile phase A A solution containing 0.05% v/v of *orthophosphoric acid* and 3.0% v/v of *methanol* in *acetonitrile.*

Mobile phase B A solution containing 0.05% v/v of *orthophosphoric acid* and 3.0% v/v of *methanol* in *water.*

Equilibrate the column with a mixture of 43 volumes of mobile phase A and 57 volumes of mobile phase B.

Time (Minutes)	Mobile phase A % v/v	Mobile phase B % v/v	Comment
0-40	43→55	57→45	linear gradient
40-60	55→90	45→10	linear gradient

70-75	90→43	10→57	linear gradient
75-85	43	57	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone *S*-methyl impurity and fluticasone propionate is at least 1.5;

in the chromatogram obtained with solution (4), the peak due to fluticasone propionate has a *signal-to-noise* ratio of at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the peak due to fluticasone propionate in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any such peaks is not greater than 4 times the area of the peak due to fluticasone propionate in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than the area of the peak due to fluticasone propionate in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) After priming the pump, discharge the container a sufficient number of times to obtain 1 mg of Fluticasone Propionate, add 25 mL of *ethanol (65%)* and shake with the aid of ultrasound for 10 minutes. Add sufficient *ethanol (65%)* to produce 50 mL, filter and use the filtrate.

(2) Dilute 2 mL of a 0.05% w/v solution of *fluticasone propionate BPCRS* in *methanol (80%)* to 50 mL with *ethanol (65%).*

(3) 0.0004% w/v of *fluticasone S-methyl impurity BPCRS* and 0.002% w/v of *fluticasone propionate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

15 volumes of *acetonitrile,* 35 volumes of 0.01M *ammonium dihydrogen orthophosphate* previously adjusted to pH 3.5 with *orthophosphoric acid* and 50 volumes of *methanol.*

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone *S*-methyl impurity and fluticasone propionate is at least 1.5. If necessary, adjust the proportion of acetonitrile in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{31}F_3O_5S$ in the nasal spray using the declared content of $C_{25}H_{31}F_3O_5S$ in *fluticasone propionate BPCRS.*

IMPURITIES

D. 6α,9-difluoro-17-[(methylsulfanyl)carbonyl]-11β-hydroxy-16α-methyl-3-oxoandrosta-1,4-dien-17α-yl propanoate (fluticasone *S*-methyl impurity, equivalent to Ph. Eur. fluticasone impurity D).

Fluticasone Ointment

Action and use
Glucocorticoid.

DEFINITION

Fluticasone Ointment contains Fluticasone Propionate in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of fluticasone propionate, $C_{25}H_{31}F_3O_5S$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions.

(1) Transfer a quantity of the ointment containing 0.1 mg of Fluticasone Propionate to a separating funnel, add 10 mL of *acetonitrile* and 50 mL of n-*hexane,* shake for 5 minutes and allow to separate. Filter the lower layer through an absorbent cotton plug previously washed with *acetonitrile,* extract the hexane layer with two 5 mL quantities of *acetonitrile,* filter each extract through the absorbent cotton plug and wash the absorbent cotton plug with 2 mL of *acetonitrile.* Add the washings to the combined filtrates, evaporate the resulting solution to dryness using a rotary evaporator at a temperature of 40° and dissolve the residue in 0.5 mL of *acetonitrile.*

(2) 0.020% w/v of *fluticasone propionate BPCRS* in *acetonitrile.*

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 12 cm.

(e) After removal of the plate, allow it to dry in a current of air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *glacial acetic acid*, 8 volumes of *ethyl acetate* and 30 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions, protected from light.

(1) Transfer a quantity of the ointment containing 0.1 mg of Fluticasone Propionate to a separating funnel, add 45 mL of n-*hexane*, previously heated to 60° in a water bath, stopper the funnel and shake until the ointment is dispersed, venting frequently. Wash the stopper and neck of the funnel with 5 mL of n-*hexane* collecting the washings in the funnel, allow the funnel to cool to room temperature, add 10 mL of *methanol (80%)*, stopper, shake for 1 minute and allow to separate. Filter the lower aqueous layer through an absorbent cotton plug, previously washed with *methanol (80%)*, into a graduated flask; repeat the extraction with two 5-mL quantities of *methanol (80%)*, filtering the aqueous methanol extracts into the same graduated flask. Wash the absorbent cotton plug with 2 mL of *methanol (80%)*, collecting the washings in the flask and dilute the extract to 25 mL with *methanol (80%)*.

(2) 0.0004% w/v of *fluticasone propionate BPCRS* in *methanol (80%)*.

(3) 0.0004% w/v of *fluticasone* S-*methyl impurity BPCRS* and 0.002% w/v of *fluticasone propionate BPCRS* in *methanol (80%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 50°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

15 volumes of *acetonitrile*, 35 volumes of 0.01M *ammonium dihydrogen orthophosphate* previously adjusted to pH 3.5 with *orthophosphoric acid* and 50 volumes of *methanol*.

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone *S*-methyl impurity and fluticasone propionate is at least 1.6. If necessary, adjust the proportion of acetonitrile in the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{31}F_3O_5S$ in the ointment using the declared content of $C_{25}H_{31}F_3O_5S$ in *fluticasone propionate BPCRS*.

Fluticasone Inhalation Powder

Fluticasone Powder for Inhalation, metered-dose powder inhaler

Action and use
Glucocorticoid.

DEFINITION

Fluticasone Inhalation Powder consists of Fluticasone Propionate in *microfine powder* either alone or combined with a suitable carrier. It is administered by a dry-powder inhaler.

The inhalation powder complies with the requirements stated under Preparations for Inhalation and with the following requirements.

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lung. The fine-particle characteristics of powders for inhalation are determined using the method described in Appendix XII C. 7. Preparations for Inhalation: Aerodynamic Assessment of Fine Particles.

Content of fluticasone propionate, $C_{25}H_{31}F_3O_5S$
80.0 to 120.0% of the stated amount.

IDENTIFICATION

A. Dilute a quantity of the inhalation powder in a mixture of 2 volumes of *water* and 8 volumes of *methanol* to produce a solution expected to contain 0.0005% w/v of Fluticasone Propionate. The light absorption, Appendix II B, in the range 210 to 300 nm closely resembles that of a solution containing 0.0005% w/v of *fluticasone propionate BPCRS* in solvent A and exhibits a single maximum at 240 nm.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the inhalation powder containing 0.5 mg of Fluticasone Propionate in 10 mL of a mixture of 7 volumes of *acetonitrile*, 20 volumes of *water* and 23 volumes of *methanol* and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes in equal volumes of *acetonitrile* and *water*.

(3) 0.0004% w/v of *fluticasone* S-*methyl impurity BPCRS* and 0.002% w/v of *fluticasone propionate BPCRS* in equal volumes of *acetonitrile* and *water*.

(4) Dilute 1 volume of solution (2) to 5 volumes in equal volumes of *acetonitrile* and *water*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS1 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 239 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 23 volumes of *acetonitrile* and 77 volumes of *methanol*.

Mobile phase B 0.01M *ammonium dihydrogen orthophosphate*, adjusted to pH 3.5 with *acetic acid* or *dilute ammonia*.

Equilibrate the column with a mobile phase ratio A:B of 60:40. Inject solutions (1) and (3) and start the elution isocratically with the chosen mobile phase. One minute after elution of the apex of the fluticasone propionate peak start a linear gradient elution to reach a mobile phase ratio A:B of 85:15 over a period of 10 minutes. Continue the chromatography for 10 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone propionate and fluticasone *S*-methyl impurity is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any *secondary peaks* is not greater than 5 times the principal peak in the chromatogram obtained with solution (2) (2.5%).

Disregard any peak with an area less than the area of the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

Uniformity of delivered dose

Complies with the requirements stated under Inhalation Powders using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 35 volumes of *water* and 65 volumes of *methanol* (solvent A).

(1) Collect single doses of the preparation being examined using the procedure described under Inhalation Powders, Uniformity of delivered dose and dissolve the collected dose in sufficient of solvent A to produce a solution expected to contain 0.0005% w/v of Fluticasone Propionate.

(2) 0.0005% w/v of *fluticasone propionate BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 239 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

15 volumes of *acetonitrile*, 35 volumes of 0.01M *ammonium dihydrogen orthophosphate* and 50 volumes of *methanol* adjusted to pH 3.5 with *orthophosphoric acid* or *dilute ammonia*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the principal peak is not greater than 2.5.

DETERMINATION OF CONTENT

Calculate the content of Fluticasone Propionate, $C_{25}H_{31}F_3O_5S$, per delivered dose using the declared content of $C_{25}H_{31}F_3O_5S$ in *fluticasone propionate BPCRS*. Repeat the procedure as described for reservoir systems under Inhalation Powders, Uniformity of delivered dose.

ASSAY

Use the average of the 10 individual results obtained in the test for Uniformity of delivered dose.

Fluticasone Inhalation Powder, pre-dispensed

Fluticasone Powder for Inhalation, pre-metered units

Action and use

Glucocorticoid.

DEFINITION

Fluticasone Inhalation Powder, pre-dispensed consists of Fluticasone Propionate in *microfine powder* either alone or combined with a suitable carrier. The blister is loaded into a dry-powder inhaler to generate an aerosol.

The inhalation powder, pre-dispensed complies with the requirements stated under Preparations for Inhalation and with the following requirements.

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lung. The fine-particle characteristics of powders for inhalation are determined using the method described in Appendix XII C. 7. Preparations for Inhalation: Aerodynamic Assessment of Fine Particles.

Content of fluticasone propionate, $C_{25}H_{31}F_3O_5S$

80.0 to 120.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 210 to 300 nm of the final solution obtained in the test for Uniformity of delivered dose closely resembles that of a solution containing 0.0005% w/v of *fluticasone propionate BPCRS* in solvent A and exhibits a single maximum at 240 nm.

B. In the test for Uniformity of delivered dose, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powder, containing 0.5 mg of Fluticasone Propionate in 10 mL of a mixture of 7 volumes

www.webofpharma.com

of *acetonitrile*, 20 volumes of *water* and 23 volumes of *methanol* and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes in equal volumes of *acetonitrile* and *water*.

(3) 0.0004% w/v of *fluticasone S-methyl impurity BPCRS* and 0.002% w/v of *fluticasone propionate BPCRS* in equal volumes of *acetonitrile* and *water*.

(4) Dilute 1 volume of solution (2) to 5 volumes in equal volumes of *acetonitrile* and *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS1 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 239 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 23 volumes of *acetonitrile* and 77 volumes of *methanol*.

Mobile phase B 0.01M *ammonium dihydrogen orthophosphate*, adjusted to pH 3.5 with *acetic acid* or *dilute ammonia*.

Equilibrate the column with a mobile phase ratio A:B of 60:40. Inject solutions (1) and (3) and start the elution isocratically with the chosen mobile phase. One minute after elution of the apex of the fluticasone propionate peak start a linear gradient elution to reach a mobile phase ratio A:B of 85:15 over a period of 10 minutes. Continue the chromatography for 10 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone propionate and fluticasone *S*-methyl impurity is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any *secondary peaks* is not greater than 5 times the principal peak in the chromatogram obtained with solution (2) (2.5%).

Disregard any peak with an area less than the area of the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

Uniformity of delivered dose

Complies with the requirements stated under Inhalation Powders using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 35 volumes of *water* and 65 volumes of *methanol* (solvent A).

(1) Collect single doses of the preparation being examined using the procedure described under Inhalation Powders, Uniformity of delivered dose and dissolve the collected dose in sufficient of solvent A to produce a solution expected to contain 0.0005% w/v of Fluticasone Propionate.

(2) 0.0005% w/v of *fluticasone propionate BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 239 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

15 volumes of *acetonitrile*, 35 volumes of 0.01M *ammonium dihydrogen orthophosphate* and 50 volumes of *methanol* adjusted to pH 3.5 with *orthophosphoric acid* or *dilute ammonia*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the principal peak is not greater than 2.5.

DETERMINATION OF CONTENT

Calculate the content of Fluticasone Propionate, $C_{25}H_{31}F_3O_5S$, per delivered dose using the declared content of $C_{25}H_{31}F_3O_5S$ in *fluticasone propionate BPCRS*. Repeat the procedure as described for pre-dispensed systems under Inhalation Powders, Uniformity of delivered dose.

ASSAY

Use the average of the individual results obtained in the test for Uniformity of delivered dose.

Fluticasone Pressurised Inhalation

Action and use
Glucocorticoid.

DEFINITION

Fluticasone Pressurised Inhalation is a suspension of Fluticasone Propionate in a suitable liquid in a pressurised container fitted with a metering dose valve.

The pressurised inhalation complies with the requirements stated under Preparations for Inhalation and with the following requirements.

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lung. The fine-particle characteristics of pressurised metered-dose preparations for inhalation are determined using the method described in Appendix XII C. 7. Preparations for Inhalation: Aerodynamic Assessment of Fine Particles.

Content of fluticasone propionate, $C_{25}H_{31}F_3O_5S$
80.0 to 120.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 210 to 300 nm of the final solution obtained in the test for Uniformity of delivered dose closely resembles that of a solution containing 0.0005% w/v of *fluticasone propionate BPCRS* in solvent A and exhibits a single maximum at 240 nm.

B. In the test for Uniformity of delivered dose, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

www.webofpharma.com

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the pressurised inhalation containing 0.5 mg of Fluticasone Propionate in 10 mL of a mixture of 7 volumes of *acetonitrile*, 20 volumes of *water* and 23 volumes of *methanol* and filter.

(2) Dilute 1 volume of solution (1) to 200 volumes in equal volumes of *acetonitrile* and *water*.

(3) 0.02% w/v of *fluticasone propionate BPCRS* and 0.00004% w/v of *fluticasone S-methyl BPCRS* in equal volumes of *acetonitrile* and *water*.

(4) Dilute 1 volume of solution (2) to 5 volumes in equal volumes of *acetonitrile* and *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS1 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 239 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 23 volumes of *acetonitrile* and 77 volumes of *methanol*.

Mobile phase B 0.01M *ammonium dihydrogen orthophosphate*, adjusted to pH 3.5 with *acetic acid* or *dilute ammonia*.

Equilibrate the column with a mobile phase ratio A:B of 60:40. Inject solutions (1) and (3) and start the elution isocratically with the chosen mobile phase. One minute after elution of the apex of the fluticasone propionate peak start a linear gradient elution to reach a mobile phase ratio A:B of 85:15 over a period of 10 minutes. Continue the chromatography for 10 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fluticasone propionate and fluticasone *S*-methyl impurity is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any *secondary peaks* is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (2.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

Uniformity of delivered dose

Complies with the requirements stated under Pressurised Metered-dose Preparations for Inhalation using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 35 volumes of *water* add 65 volumes of *methanol* (solvent A).

(1) Collect single doses of the preparation being examined using the procedure described under Pressurised Metered-dose Preparations for Inhalation, Uniformity of delivered dose and dissolve the collected dose in sufficient of solvent A to produce a solution expected to contain 0.0005% w/v of Fluticasone Propionate.

(2) 0.0005% w/v of *fluticasone propionate BPCRS* in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 239 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

15 volumes of *acetonitrile*, 35 volumes of 0.01M *ammonium dihydrogen orthophosphate* and 50 volumes of *methanol* adjusted to pH 3.5 with *orthophosphoric acid* or *dilute ammonia*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the principal peak is not greater than 2.5.

DETERMINATION OF CONTENT

Calculate the content of Fluticasone Propionate, $C_{25}H_{31}F_3O_5S$, per delivered dose using the declared content of $C_{25}H_{31}F_3O_5S$ in *fluticasone propionate BPCRS*. Repeat the procedure as described under Pressurised Metered-dose Preparations for Inhalation, Uniformity of delivered dose.

ASSAY

Use the average of the individual results obtained in the test for Uniformity of delivered dose.

Fluvoxamine Tablets

Action and use

Selective serotonin reuptake inhibitor; antidepressant.

DEFINITION

Fluvoxamine Tablets contain Fluvoxamine Maleate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of fluvoxamine maleate, $C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$

92.5 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 50 mg of Fluvoxamine Maleate with 10 mL of *acetonitrile* for 10 minutes, centrifuge and evaporate the supernatant liquid to dryness using a rotary evaporator. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of fluvoxamine maleate *(RS 159)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

www.webofpharma.com

(1) Shake a quantity of the powdered tablets containing 50 mg of Fluvoxamine Maleate with 5 mL of *methanol* for 10 minutes, centrifuge and use the supernatant liquid.

(2) 1.0% w/v of *fluvoxamine maleate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* HF_{254} (Analtech Uniplates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of 13.5M *ammonia* and 95 volumes of *ethanol (96%)*.

CONFIRMATION

The two principal spots in the chromatogram obtained with solution (1) correspond to those in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

After 20 minutes withdraw a 10 mL sample of the medium and centrifuge. Measure the *absorbance* of the clear supernatant liquid, suitably diluted with *water* if necessary, at the maximum at 244 nm, Appendix II B using *water* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of fluvoxamine maleate, $C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$, in the medium taking 270 as the value of A(1%, 1 cm) at the maximum at 244 nm.

LIMIT

The amount of $C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$ released is not less than 70% of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.25 g of Fluvoxamine Maleate with 125 mL of the mobile phase for 10 minutes, add sufficient mobile phase to produce 250 mL, mix, centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) Heat a 0.32% w/v solution of *fluvoxamine maleate impurity standard BPCRS* in 0.1M *hydrochloric acid* on a water bath for 10 minutes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (7 µm) (Zorbax C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of a solution containing 1.25% w/v of *diammonium hydrogen orthophosphate* and 0.275% w/v of *sodium heptanesulfonate monohydrate* and 60 volumes of *methanol*, adjusting the pH of the mixture to 3.5 with *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions described above, the retention time of fluvoxamine maleate is 7 to 9 minutes. If necessary, adjust the composition of the mobile phase (increasing the methanol content decreases the retention time, increasing the water content increases the retention time).

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *fluvoxamine maleate impurity standard BPCRS* and the *resolution factor* between the peaks corresponding to fluvoxamine and the *Z*-isomer is at least 1.0.

LIMITS

Identify the impurities from the chromatogram obtained with solution (3) and from the reference chromatogram supplied with the reference material.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to the 'addition product' is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard the peak corresponding to maleic acid (which elutes immediately after the solvent front) and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.25 g of Fluvoxamine Maleate with 125 mL of the mobile phase for 10 minutes, add sufficient of the mobile phase to produce 250 mL, mix, centrifuge and dilute 1 volume of the supernatant liquid to 10 volumes with the mobile phase.

(2) 0.010% w/v of *fluvoxamine maleate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$ in the tablets using the declared content of $C_{15}H_{21}F_3N_2O_2,C_4H_4O_4$ in *fluvoxamine maleate BPCRS*.

STORAGE

Fluvoxamine Tablets should be protected from light.

www.webofpharma.com

IMPURITIES
The impurities limited by the requirements of this monograph include those listed under Fluvoxamine Maleate.

Folic Acid Injection
NOTE: Folic Acid Injection is not currently licensed in the United Kingdom.

Action and use
Vitamin B component.

DEFINITION
Folic Acid Injection is a sterile solution of Folic Acid in a suitable liquid.

The injection complies with the requirements stated under Parenteral Preparations, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of folic acid, $C_{19}H_{19}N_7O_6$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a quantity of the injection containing 15 mg of Folic Acid with sufficient of a mixture of 1 volume of 13.5M *ammonia* and 9 volumes of *methanol* to produce 30 mL.

(2) 0.05% w/v of *folic acid BPCRS* in a mixture of 2 volumes of 13.5M *ammonia* and 9 volumes of *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

20 volumes of 13.5M *ammonia*, 20 volumes of *propan-1-ol* and 60 volumes of *ethanol (96%)*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position, fluorescence and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

TESTS
Alkalinity
pH, 8.0 to 11.0, Appendix V L.

Hydrolysis products
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light.

(1) Dilute a quantity of the injection with sufficient of the mobile phase to produce a solution containing 0.01% w/v of Folic Acid.

(2) 0.00005% w/v of *4-aminobenzoic acid* and 0.0002% w/v of *N-(4-aminobenzoyl)-L-glutamic acid* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 269 nm.

(f) Inject 20 µL of each solution.

In the chromatogram obtained with solution (2) the substances elute in the following order: *N*-(4-aminobenzoyl)-L-glutamic acid; 4-aminobenzoic acid.

MOBILE PHASE

0.05M *potassium dihydrogen orthophosphate*, adjusted to pH 5.5 with 5M *sodium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two principal peaks is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 4-aminobenzoic acid is not greater than the area of the peak due to 4-aminobenzoic acid in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to *N*-(4-aminobenzoyl)-L-glutamic acid is not greater than the area of the peak due to *N*-(4-aminobenzoyl)-L-glutamic acid in the chromatogram obtained with solution (2) (2%).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the injection containing 7.5 mg of Folic Acid to 100 mL with a buffer solution prepared by diluting 25 volumes of 0.1M *anhydrous sodium dihydrogen orthophosphate*, adjusted to pH 4.0 with 0.1M *sodium hydroxide*, to 250 volumes with *water*.

(2) 0.0075% w/v of *folic acid BPCRS* in the buffer solution.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrosorb RP-18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

4 volumes of *acetonitrile*, 6 volumes of *methanol* and 90 volumes of 0.01M *sodium acetate*, adjusted to pH 4.5 with *acetic acid*.

DETERMINATION OF CONTENT

Calculate the content of $C_{19}H_{19}N_7O_6$ in the injection using the declared content of $C_{19}H_{19}N_7O_6$ in *folic acid BPCRS*.

www.webofpharma.com

Folic Acid Tablets

Action and use
Vitamin B component.

DEFINITION

Folic Acid Tablets contain Folic Acid.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of folic acid, $C_{19}H_{19}N_7O_6$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract a quantity of the powdered tablets containing 0.5 mg of Folic Acid with 1 mL of a mixture of 1 volume of 13.5M *ammonia* and 9 volumes of *methanol*, centrifuge and use the supernatant liquid.

(2) 0.05% w/v of *folic acid BPCRS* in a mixture of 2 volumes of 13.5M *ammonia* and 9 volumes of *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

20 volumes of 13.5M *ammonia*, 20 volumes of *propan-1-ol* and 60 volumes of *ethanol (96%)*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position, fluorescence and size to that in the chromatogram obtained with solution (2).

TESTS

Hydrolysis products
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light.

(1) Shake a quantity of the powdered tablets containing 5.0 mg of Folic Acid with 50 mL of the mobile phase, centrifuge and use the supernatant liquid.

(2) 0.5 µg of *4-aminobenzoic acid* and 2.0 µg of *N-(4-aminobenzoyl)-L-glutamic acid* per mL in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 269 nm.

(f) Inject 20 µL of each solution.

In the chromatogram obtained with solution (2) the substances elute in the following order: *N*-(4-aminobenzoyl)-L-glutamic acid and 4-aminobenzoic acid.

MOBILE PHASE

0.05M *potassium dihydrogen orthophosphate*, adjusted to pH 5.5 with 5M *sodium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the two peaks is at least 3.

LIMITS

In the chromatogram obtained with solution (1):

the areas of the peaks corresponding to 4-aminobenzoic acid and *N*-(4-aminobenzoyl)-L-glutamic acid are not greater than the areas of the peaks corresponding to 4-aminobenzoic acid and *N*-(4-aminobenzoyl)-L-glutamic acid in the chromatogram obtained with solution (2).

Uniformity of content
Tablets containing less than 2 mg and/or less than 2% w/w of Folic Acid comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake one tablet with 5 mL of 0.1M *sodium hydroxide*, add sufficient mobile phase to produce a solution containing 0.001% w/v of Folic Acid, centrifuge and use the supernatant liquid.

(2) Add 1 mL of 0.5M *hydrochloric acid* to 5 mL of a 0.0020% w/v solution of *folic acid BPCRS* in 0.1M *sodium hydroxide* and dilute to 10 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 283 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

7 volumes of *acetonitrile* and 93 volumes of 0.05M *potassium dihydrogen orthophosphate* adjusted to pH 6.0 with 5M *sodium hydroxide*.

DETERMINATION OF CONTENT

Calculate the content of $C_{19}H_{19}N_7O_6$ in each tablet using the declared content of $C_{19}H_{19}N_7O_6$ in *folic acid BPCRS*.

ASSAY

For tablets containing less than 2 mg and/or less than 2% w/w of Folic Acid
Use the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing 2 mg or more and 2% w/w or more of Folic Acid
Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light.

(1) Shake a quantity of the powdered tablets containing 20 mg of Folic Acid with 50 mL of 0.1M *sodium hydroxide*, dilute to 100 mL with the same solvent, centrifuge and dilute 5 mL of the supernatant liquid to 100 mL with the mobile phase.

www.webofpharma.com

(2) Dilute 5 mL of a 0.020% w/v solution of *folic acid BPCRS* in 0.1M *sodium hydroxide* to 100 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{19}H_{19}N_7O_6$ in the tablets using the declared content of $C_{19}H_{19}N_7O_6$ in *folic acid BPCRS*.

STORAGE

Folic Acid Tablets should be protected from light.

Foscarnet Infusion

Foscarnet Intravenous Infusion

Action and use

Antiviral (cytomegalovirus).

DEFINITION

Foscarnet Infusion is a sterile solution containing Foscarnet Sodium. It is supplied as a ready-to-use solution.

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of foscarnet sodium, $CNa_3O_5P,6H_2O$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A clear, colourless solution.

IDENTIFICATION

A. Dry a quantity containing 48 mg of Foscarnet Sodium over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 16 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of foscarnet sodium *(RS 160)*. Disregard any peak occurring at 902 cm^{-1} or any shoulder at 1179 cm^{-1}.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Alkalinity

pH, 7.2 to 7.6, Appendix V L.

Phosphate and phosphite

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare a solution containing 0.04% w/v of *sodium dihydrogen orthophosphate monohydrate* and 0.06% w/v of *sodium phosphite* (solution A). For solution (1) add 6 mL of solution A to 60 mg of *foscarnet sodium BPCRS* and dilute to 25 mL with *water*. For solution (2) dilute a volume of the infusion with sufficient *water* to produce a solution containing 0.24% w/v of Foscarnet Sodium.

The chromatographic procedure may be carried out using (a) a stainless steel column (5 cm × 4.6 mm) packed with an anion exchange resin (Waters IC PAK is suitable) at a temperature of 25°, (b) as the mobile phase with a flow rate of 1.4 mL per minute a solution prepared by dissolving 0.204 g of *potassium hydrogen phthalate* in *water*, adding 5 mL of 1M *nitric acid VS* and sufficient *water* to produce 2000 mL and (c) a detection wavelength of 290 nm. Inject 20 µL of each solution.

Allow the column to stabilise by passing mobile phase through it for at least 2 hours before starting the chromatography. The test is not valid unless, in the chromatogram obtained with solution (1), the peak due to phosphate (which elutes first) shows baseline separation from the peak due to phosphite.

In the chromatogram obtained with solution (2) the area of any peak corresponding to phosphate is not greater than 0.7 times the area of the corresponding peak in the chromatogram obtained with solution (1) and the area of any peak corresponding to phosphite is not greater than half the area of the corresponding peak in the chromatogram obtained with solution (1) (2.0% of phosphate and 1.0% of phosphite).

Related esters

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase. Solutions (1) and (2) are solutions of the infusion diluted to contain (1) 1.0% w/v and (2) 0.0020% w/v respectively of Foscarnet Sodium. Solution (3) contains 0.02% w/v of *foscarnet sodium BPCRS* and 0.02% w/v of *foscarnet impurity B BPCRS*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Microsphere C18 is suitable), (b) as the mobile phase at a flow rate of 1 mL per minute a solution prepared as described below and (c) a detection wavelength of 230 nm. Prepare two solutions containing (A) 100 mL of 0.5M *acetic acid*, 6 mL of 0.1M *sodium pyrophosphate* and 3.22 g of *sodium sulfate* in sufficient *water* to produce 1000 mL and (B) 6.8 g of *sodium acetate*, 6 mL of 0.1M *sodium pyrophosphate* and 3.22 g of *sodium sulfate* in sufficient *water* to produce 1000 mL. Mix solution A and solution B to produce a solution of pH 4.4 and to 1000 mL of this solution add 0.25 g of *tetrahexylammonium hydrogen sulfate* and 100 mL of *methanol*. Inject 5 µL of each solution.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to foscarnet sodium and foscarnet impurity B (disodium (ethoxyoxydophosphanyl)formate) is at least 7.

For solution (1) allow the chromatography to proceed for at least 2.5 times the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of any such peaks is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Bacterial endotoxins

The endotoxin limit concentration is 2 IU per mL, Appendix XIV C.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase containing (1) a solution of the infusion diluted to contain 0.10% w/v of Foscarnet Sodium and (2) 0.10% w/v of *foscarnet sodium BPCRS*.

The chromatographic conditions described under Related esters may be used, but injecting 5 µL of each solution.

Calculate the content of $CNa_3O_5P,6H_2O$ in the infusion using the declared content of $CNa_3O_5P,6H_2O$ in *foscarnet sodium BPCRS*.

www.webofpharma.com

STORAGE
Foscarnet Infusion should be stored at a temperature not exceeding 30°. It should not be refrigerated.

IMPURITIES
The impurities limited by the requirements of this monograph include impurities B, C and D listed under Foscarnet Sodium.

Fosfestrol Injection

Action and use
Estrogen.

DEFINITION
Fosfestrol Injection is a sterile solution of Fosfestrol Sodium in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of anhydrous fosfestrol sodium, $C_{18}H_{18}Na_4O_8P_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds in position to that in the chromatogram obtained with solution (4).

B. The *light absorption*, Appendix II B, in the range 200 to 350 nm of the final solution obtained in the Assay exhibits a maximum at 240 nm.

TESTS
Alkalinity
pH, 7.7 to 8.5, Appendix V L.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel 60 F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 15 volumes of each of *pentan-1-ol*, *triethylamine* and *water* and 55 volumes of *propan-1-ol* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) dilute a volume of the injection containing the equivalent of 12 mg of anhydrous fosfestrol sodium to 5 mL with *methanol (50%)*. For solution (2) dilute 3 volumes of solution (1) to 200 volumes with *methanol (50%)*. For solution (3) dilute 1 volume of solution (1) to 200 volumes with *methanol (50%)*. Solution (4) contains 0.24% w/v of *fosfestrol sodium BPCRS* in *methanol (50%)*. Solution (5) contains 0.007% w/v of *diethylstilbestrol monophosphate BPCRS* (equivalent to 0.0079% w/v of disodium diethylstilbestrol monophosphate) in *methanol (50%)*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any spot in the chromatogram obtained with solution (1) corresponding to diethylstilbestrol monophosphate is not more intense than the spot in the chromatogram obtained with solution (5) (3.3%); any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1.5%) and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

Free diethylstilbestrol
Dilute a volume of the injection containing the equivalent of 0.6 g of anhydrous fosfestrol sodium with 20 mL of *water*, adjust the pH if necessary to between 7.9 and 8.2 with 0.1M *sodium hydroxide* and extract with two 30 mL quantities of *dichloromethane* and retain the aqueous phase. Wash the combined dichloromethane extracts with 30 mL of *water* and allow to separate. Extract the aqueous wash with 10 mL of *dichloromethane*, filter the dichloromethane extract, add to the original extract and add the aqueous extract to the original aqueous phase. Reserve the aqueous phase for the test for diethylstilbestrol disodium monophosphate. Evaporate the combined filtrates to dryness on a water bath and dissolve the residue in 5 mL of *absolute ethanol*. To the resulting solution add 5 mL of 0.01M *dipotassium hydrogen orthophosphate*. Transfer a portion of the mixture to a 1-cm closed silica cell, place the cell 10 cm from an 8-watt, short-wave ultraviolet lamp and irradiate for 60 minutes protected from daylight. The *absorbance* of the irradiated solution, measured within 1 hour after preparation of the solutions, at the maximum at 418 nm, Appendix II B, using *water* in the reference cell is not greater than that obtained by repeating the operation using a reference solution prepared in the following manner. To 20 mL of a 0.04% w/v solution of *diethylstilbestrol BPCRS* in *absolute ethanol* add 20 mL of 0.01M *dipotassium hydrogen orthophosphate* and mix (0.33%).

Diethylstilbestrol disodium monophosphate
Dilute the combined aqueous phase reserved in the test for Free diethylstilbestrol to 100 mL with *water* (solution A). Prepare a solution containing 0.0135% w/v of *diethylstilbestrol BPCRS* in *ethanol (96%)* (solution B). To 5 mL of each solution add 3 mL of *phosphomolybdotungstic reagent* and 2 mL of *ethanol (96%)*, dilute to 50 mL with a 5% w/v solution of *anhydrous sodium carbonate*, mix thoroughly and allow to stand for 30 minutes; filter the solutions through a polytetrafluoroethylene filter (0.45 µm) and measure the *absorbance*, Appendix II B, at 660 nm using *water* in the reference cell. The *absorbance* of solution A, multiplied by 1.46, is not greater than that obtained for solution B (3.3%).

ASSAY
Dilute a volume of the injection containing the equivalent of 60 mg of anhydrous fosfestrol sodium to 250 mL with a pH 7.9 buffer solution containing 1.134% w/v of *disodium hydrogen orthophosphate* and 0.04083% w/v of *potassium dihydrogen orthophosphate* and dilute 5 mL of the resulting solution to 100 mL with the same buffer solution. Measure the *absorbance* of the resulting solution at 240 nm, Appendix II B, and calculate the content of $C_{18}H_{18}Na_4O_8P_2$ taking 310 as the value of A(1%, 1 cm) at the maximum at 240 nm.

STORAGE
Fosfestrol Injection should be protected from light.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous fosfestrol sodium.

IMPURITIES
The impurities limited by the requirements of the monograph include:

A. diethylstilbestrol disodium monophosphate

B. diethylstilbestrol.

www.webofpharma.com

Fosfestrol Tablets

Action and use
Estrogen.

DEFINITION

Fosfestrol Tablets contain Fosfestrol Sodium. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous fosfestrol sodium, $C_{18}H_{18}Na_4O_8P_2$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds in position to that in the chromatogram obtained with solution (4).

B. The *light absorption* of the final solution obtained in the Assay, Appendix II B, in the range 200 to 350 nm, exhibits a maximum at 240 nm.

TESTS

Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 100 revolutions per minute.

(b) Use 500 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary to give a solution expected to contain the equivalent of 0.0024% w/v of, at the maximum at 240 nm, Appendix II B using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *anhydrous fosfestrol sodium BPCRS* using water in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of anhydrous fosfestrol sodium, $C_{18}H_{18}Na_4O_8P_2$, in the medium taking 313 as the value of $A^{1\%}_{1\,cm}$ (1%, 1 cm) at 240 nm.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a quantity of the powdered tablets containing the equivalent of 12 mg of anhydrous fosfestrol sodium to 5 mL with *methanol (50%)*.

(2) Dilute 3 volumes of solution (1) to 200 volumes with *methanol (50%)*.

(3) Dilute 1 volume of solution (1) to 200 volumes with *methanol (50%)*.

(4) 0.24% w/v of *fosfestrol sodium BPCRS* in *methanol (50%)*.

(5) 0.007% w/v of *diethylstilbestrol monophosphate BPCRS* (equivalent to 0.0079% w/v of disodium diethylstilbestrol monophosphate) in *methanol (50%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating silica gel 60 F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable)

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Allow the solvent front to ascend 10 cm above the line of application.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

15 volumes each of *pentan-1-ol*, *triethylamine* and *water* and 55 volumes of *propan-1-ol*.

LIMITS

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

In the chromatogram obtained with solution (1):

the spot corresponding to diethylstilbestrol monophosphate is not more intense than the spot in the chromatogram obtained with solution (5) (3.3%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (1.5%);

not more than two such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

Free diethylstilbestrol
Suspend a quantity of the powdered tablets containing the equivalent of 0.24 g of anhydrous fosfestrol sodium in 30 mL of *water*, add 10 mL of *ethanol (96%)*, dilute to 50 mL with *water*, stir for 45 minutes and centrifuge at 10,000 revolutions per minute. Extract 25 mL of the supernatant liquid with two 20 mL quantities of *dichloromethane* and reserve the aqueous phase for the test for Diethylstilbestrol disodium monophosphate. Wash the combined dichloromethane extracts with 30 mL of *water* and drain into a 100 mL round-bottomed flask. Extract the aqueous wash with 10 mL of *dichloromethane*, filter the dichloromethane extract and add to the original extract. Evaporate the combined filtrates to dryness using a rotary evaporator and dissolve the residue in 5 mL of *absolute ethanol*. To the resulting solution add 5 mL of 0.01M *dipotassium hydrogen orthophosphate*. Transfer a portion of the mixture to a 1-cm closed silica cell, place the cell 10 cm from an 8-watt, short-wave ultraviolet lamp and irradiate for 60 minutes protected from daylight. The *absorbance* of the irradiated solution, measured within 1 hour after preparation of the solutions, at the maximum at 418 nm, Appendix II B, using *water* in the reference cell is not greater than that obtained by repeating the operation using a reference solution prepared in the following manner. To 20 mL of a 0.008% w/v solution of *diethylstilbestrol BPCRS* in *absolute ethanol* add 20 mL of 0.01M *dipotassium hydrogen orthophosphate* and mix (0.33%).

Diethylstilbestrol disodium monophosphate
Dilute the aqueous phase reserved in the test for Free diethylstilbestrol to 50 mL with *water* (solution A). Prepare a solution containing 0.005% w/v of *diethylstilbestrol BPCRS* in *ethanol (96%)* (solution B). To 5 mL of each solution add 3 mL of *phosphomolybdotungstic reagent* and 2 mL of *ethanol (96%)*, dilute to 50 mL with a 5% w/v solution of *anhydrous sodium carbonate*, mix thoroughly and allow to stand for 30 minutes; filter the solutions through a polytetrafluoroethylene filter (0.45 µm) and measure the *absorbance*, Appendix II B, at 660 nm using *water* in the reference cell. The *absorbance* of solution A, multiplied by 1.46, is not greater than that obtained for solution B (3.3%).

www.webofpharma.com

ASSAY
Weigh and powder 20 tablets. Dilute a quantity of the powdered tablets containing the equivalent of 0.1 g of anhydrous fosfestrol sodium to 250 mL with *water*, stir the suspension for 1 hour, filter, discard the first 50 mL of filtrate and dilute 5 mL of the resulting solution to 100 mL with a pH 7.9 buffer solution containing 1.134% w/v of *disodium hydrogen orthophosphate* and 0.04083% w/v of *potassium dihydrogen orthophosphate*. Measure the *absorbance* of the resulting solution at 240 nm, Appendix II B, and calculate the content of $C_{18}H_{18}Na_4O_8P_2$ taking 310 as the value of A(1%, 1 cm) at the maximum at 240 nm.

STORAGE
Fosfestrol Tablets should be protected from light.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous fosfestrol sodium.

IMPURITIES
The impurities limited by the requirements of the monograph include:

A. diethylstilbestrol disodium monophosphate

B. diethylstilbestrol.

Fosinopril Tablets

Action and use
Angiotensin converting enzyme inhibitor.

DEFINITION
Fosinopril Tablets contain Fosinopril Sodium.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of fosinopril sodium, $C_{30}H_{45}NNaO_7P$
90.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Shake a quantity of the powdered tablets containing 50 mg of Fosinopril Sodium with 40 mL of water and filter. Centrifuge, adjust the pH of the supernatant to 3.0 with orthophosphoric acid and filter. Wash the filter with several quantities of dichloromethane, collect the washings and evaporate to dryness under a stream of air and dry the residue for 10 minutes at 60° under vacuum. The infrared absorption spectrum, Appendix II A, of the oily residue is concordant with the reference spectrum of fosinopril sodium (RS 472).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS
Dissolution
Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 30 minutes withdraw a sample of the medium and filter. Use the filtered dissolution medium, diluted with *water* if necessary, to produce a solution expected to contain 0.0005% w/v of Fosinopril Sodium.

(2) To 20 mg of *fosinopril sodium BPCRS* add 6 mL of *methanol*, dissolve with the aid of ultrasound and dilute to 100 mL with *water*. Dilute 1 volume of this solution to 40 volumes with *water*.

(3) 0.002% w/v each of *fosinopril sodium BPCRS* and *fosinopril impurity 1 BPCRS* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm)(Waters Nova-Pak is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 3 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 215 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

36 volumes of a 0.2% w/v solution of *orthophosphoric acid* and 64 volumes of *acetonitrile R1*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fosinopril and fosinopril impurity 1 is at least 1.7.

DETERMINATION OF CONTENT

Calculate the total content of fosinopril sodium, $C_{30}H_{45}NNaO_7P$, in the medium from the chromatograms obtained and using the declared content of $C_{30}H_{45}NNaO_7P$, in *fosinopril sodium BPCRS*.

LIMITS

The amount of fosinopril sodium released is not less than 80% (Q) of the stated amount.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 20 volumes of *acetonitrile R1* and 80 volumes of 0.2M *urea* (Solvent A).

(1) Dissolve a quantity of the powdered tablets containing 25 mg of Fosinopril Sodium with sufficient solvent A to produce a solution containing 0.05% w/v of Fosinopril Sodium.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) 0.007% w/v of *fosinopril sodium BPCRS* and 0.003% w/v of *fosinopril impurity A BPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Bondclone C18 or Hypersil ODS C18 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 215 nm.

www.webofpharma.com

(f) Inject 50 µL of each solution.

(g) Allow the chromatography to proceed for three times the retention time of Fosinopril.

MOBILE PHASE

22 volumes of 0.2% v/v solution of *orthophosphoric acid* and 78 volumes of *methanol R1*.

When the chromatograms are recorded under the prescribed conditions, the relative retention with reference to fosinopril (retention time, about 7.6 minutes) of impurity A is about 0.5.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fosinopril and fosinopril impurity A is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

identify any peak corresponding to impurity A (using solution (3)) and multiply the area of this peak by a correction factor of 0.8;

the area of any peak corresponding to fosinopril impurity A is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (5.0%);

the area of any other *secondary peak* is not greater than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* excluding fosinopril impurity A is not greater than the area of principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 20 volumes of *acetonitrile R1* and 80 volumes of 0.2M *urea* (Solvent B).

(1) To a quantity of the powdered tablets containing 50 mg of Fosinopril Sodium add 400 mL of solvent B, mix and add sufficient solvent B to produce 500 mL. Centrifuge an aliquot of the solution and use the supernatant liquid.

(2) 0.01% w/v of *fosinopril sodium BPCRS* in solvent B.

(3) 0.007% w/v of *fosinopril sodium BPCRS* and 0.003% w/v of *fosinopril impurity A BPCRS* in solvent B.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to fosinopril and fosinopril impurity A is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{30}H_{45}NNaO_7P$ in the tablets using the declared content of $C_{30}H_{45}NNaO_7P$ in *fosinopril sodium BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurity A listed under Fosinopril Sodium.

Fructose Infusion

Fructose Intravenous Infusion

DEFINITION

Fructose Infusion is a sterile solution containing Fructose. It is supplied as a ready-to-use solution.

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of fructose, $C_6H_{12}O_6$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or pale yellow solution.

IDENTIFICATION

A. Heat with *cupri-tartaric solution R1*. A copious red precipitate is produced.

B. The solution prepared in the Assay is laevorotatory.

TESTS

Acidity

pH, 3.0 to 5.5, Appendix V L, when determined on a solution diluted if necessary with *water for injections* to contain 5% w/v of Fructose and to which 0.30 mL of a saturated solution of *potassium chloride* has been added for each 100 mL of solution.

5-Hydroxymethylfurfural and related substances

Dilute a volume containing 1.0 g of Fructose to 500 mL with *water*. The *absorbance* of the resulting solution at the maximum at 284 nm is not more than 0.50, Appendix II B.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is 0.25 IU per mL of Fructose Intravenous Infusion.

ASSAY

To a volume containing 5 g of Fructose add 0.2 mL of 5M *ammonia* and sufficient *water* to produce 100 mL. Mix well, allow to stand for 30 minutes and determine the *optical rotation* in a 2-dm tube, Appendix V F. The observed rotation in degrees multiplied by 0.5427 represents the weight in g of fructose, $C_6H_{12}O_6$, in the volume taken for assay.

LABELLING

The strength is stated as the number of grams of Fructose per litre.

Furosemide Injection

Action and use

Loop diuretic.

DEFINITION

Furosemide Injection is a sterile solution of furosemide sodium, prepared by the interaction of Furosemide with Sodium Hydroxide, in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of furosemide, $C_{12}H_{11}ClN_2O_5S$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

www.webofpharma.com

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 220 to 320 nm of the final solution obtained in the Assay exhibits two maxima, at 228 nm and 271 nm.

B. In the test for Related substances, the chromatogram obtained with solution (2) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (3).

TESTS

Alkalinity

pH, 8.0 to 9.3, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare the solutions immediately before use and protect from light. For solution (1) dilute a quantity of the injection with sufficient of the mobile phase to produce a solution containing 0.1% w/v of Furosemide. For solution (2) dilute 1 volume of solution (1) to 400 volumes with the mobile phase. Solution (3) contains 0.00025% w/v of *furosemide BPCRS* in the mobile phase. Solution (4) contains 0.00025% w/v of each of *furosemide BPCRS* and *furosemide impurity A EPCRS* in the mobile phase. Solution (5) contains 0.001% w/v of *4-chloro-5-sulfamoylanthranilic acid BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (ChromSpher C8 is suitable), (b) as the mobile phase with a flow rate of 1 mL per minute a mixture prepared in the following manner: dissolve 0.2 g of *potassium dihydrogen orthophosphate* and 0.25 g of *cetrimide* in 70 mL of *water*, adjust the pH to 7.0 with 6M *ammonia* and add 30 mL of *propan-1-ol*, and (c) a detection wavelength of 238 nm.

Inject 100 µL of solution (4). Adjust the sensitivity of the system so that the heights of the two peaks in the chromatogram obtained are not less than 20% of the full-scale of the recorder. The test is not valid unless the *resolution factor* between the first peak (furosemide impurity A) and the second peak (furosemide) is at least 4.

Inject 100 µL of solution (1) and allow the chromatography to proceed for three times the retention time of the principal peak. The area of any peak corresponding to 4-chloro-5-sulfamoylanthranilic acid is not greater than the area of the peak in the chromatogram obtained with solution (5) (1%) and the sum of the areas of any other *secondary peaks* is not greater than twice the area of the first peak in the chromatogram obtained with solution (4) (0.5%). Disregard any peak with an area less than 0.1 times the area of the first peak in the chromatogram obtained with solution (4) (0.025%).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection with *water BET*, if necessary, to contain the equivalent of 10 mg of Furosemide per mL (solution A). The endotoxin limit concentration of this solution is 35 IU of endotoxin per mL.

ASSAY

To a volume containing the equivalent of 20 mg of Furosemide add sufficient *water* to produce 100 mL. Dilute 5 mL to 100 mL with 0.1M *sodium hydroxide* and measure the *absorbance* of the resulting solution at the maximum at 271 nm, Appendix II B. Calculate the content of $C_{12}H_{11}ClN_2O_5S$ taking 580 as the value of A(1%, 1 cm) at the maximum at 271 nm.

STORAGE

Furosemide Injection should be protected from light.

LABELLING

The strength is stated in terms of the equivalent amount of Furosemide in a suitable dose-volume.

Furosemide Tablets

Action and use

Loop diuretic.

DEFINITION

Furosemide Tablets contain Furosemide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of furosemide, $C_{12}H_{11}ClN_2O_5S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 220 to 320 nm of the final solution obtained in the Assay exhibits two maxima, at 228 nm and 271 nm.

B. In the test for Related substances, the principal peak in the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (3).

TESTS

Dissolution

Tablets containing less than 100 mg of Furosemide comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of *phosphate buffer pH 5.8* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 mL of the medium, filter and dilute the filtrate with sufficient of the dissolution medium to give a solution expected to contain about 0.001% w/v of Furosemide. Measure the *absorbance* of this solution, Appendix II B, at 277 nm using dissolution medium in the reference cell. Calculate the total content of furosemide, $C_{12}H_{11}ClN_2O_5S$, in the medium from the *absorbance* obtained from a 0.001% w/v solution of *furosemide BPCRS* in the dissolution medium and using the declared content of $C_{12}H_{11}ClN_2O_5S$ in *furosemide BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare the solutions immediately before use and protect from light. For solution (1) dissolve a quantity of the powdered tablets containing 20 mg of Furosemide in sufficient of the mobile phase to produce 50 mL and mix with the aid of ultrasound for 15 minutes. For solution (2) dilute 1 volume of solution (1) to 500 volumes with the mobile phase. Solution (3) contains 0.00008% w/v of *furosemide BPCRS* in the mobile phase. Solution (4) contains 0.00008% w/v of each of *furosemide BPCRS* and *furosemide impurity A EPCRS* in the mobile phase. Solution (5) contains 0.00032% w/v of *4-chloro-5-sulfamoylanthranilic acid BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with

www.webofpharma.com

octylsilyl silica gel for chromatography (5 µm) (ChromSpher C8 is suitable), (b) as the mobile phase with a flow rate of 1 mL per minute a mixture prepared in the following manner: dissolve 0.2 g of *potassium dihydrogen orthophosphate* and 0.25 g of *cetrimide* in 70 mL of *water*, adjust the pH to 7.0 with 6M *ammonia* and add 30 mL of *propan-1-ol* and (c) a detection wavelength of 238 nm.

Inject 100 µL of solution (4). Adjust the sensitivity of the system so that the heights of the two peaks in the chromatogram obtained are not less than 20% of the full-scale of the recorder. The test is not valid unless the *resolution factor* between the first peak (furosemide impurity A) and the second peak (furosemide) is at least 4.

Inject 100 µL of solution (1) and allow the chromatography to proceed for three times the retention time of the principal peak. In the chromatogram obtained with solution (1) the area of any peak corresponding to 4-chloro-5-sulfamoylanthranilic acid is not greater than the area of the peak in the chromatogram obtained with solution (5) (0.8%) and the sum of the areas of any other *secondary peaks* is not greater than 2.5 times the area of the first peak in the chromatogram obtained with solution (4) (0.5%). Disregard any peak with an area less than 0.1 times the area of the first peak in the chromatogram obtained with solution (4) (0.02%).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.2 g of Furosemide with 300 mL of 0.1M *sodium hydroxide* for 10 minutes, add sufficient 0.1M *sodium hydroxide* to produce 500 mL and filter. Dilute 5 mL to 250 mL with 0.1M *sodium hydroxide* and measure the *absorbance* of the resulting solution at the maximum at 271 nm, Appendix II B. Calculate the content of $C_{12}H_{11}ClN_2O_5S$ taking 580 as the value of A(1%, 1 cm) at the maximum at 271 nm.

Fusidic Acid Cream

Action and use

Antibacterial.

DEFINITION

Fusidic Acid Cream contains Fusidic Acid in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of anhydrous fusidic acid, $C_{31}H_{48}O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse, with shaking, a quantity of the cream containing the equivalent of 40 mg of anhydrous fusidic acid in 10 mL of *ethanol (96%)*, filter and use the filtrate.

(2) 0.5% w/v of *diethanolamine fusidate BPCRS* in *ethanol (96%)*.

(3) 0.05% w/v of *potassium sorbate* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel F_{254} plate* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 12.5 cm.

(e) After removal of the plate, dry in a current of air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

2.5 volumes of *methanol*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 80 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position and size to that in the chromatogram obtained with solution (2) and is well separated from any spot corresponding to the spot in the chromatogram obtained with solution (3).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to fusidic acid in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.5 to 6.0, determined directly on the cream, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the cream containing the equivalent of 15 mg of anhydrous fusidic acid in 25 mL of the mobile phase, heat the mixture until the cream has melted and shake vigorously for 15 minutes. Cool the mixture to below 10°, filter through a glass microfibre filter (Whatman GF/A is suitable), discarding the first few mL of filtrate, and allow to warm to room temperature.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) Dilute 30 µL of solution (1) to 100 mL with the mobile phase.

(4) 0.004% w/v of *potassium sorbate* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

For solution (1) allow the chromatography to proceed for 3.5 times the retention time of the principal peak.

When the chromatograms are recorded under the prescribed conditions, the retention time of fusidic acid is about 5.1 minutes and the retention time of 3-ketofusidic acid relative to that of fusidic acid is about 0.7.

SYSTEM SUITABILITY

The test is not valid unless:

in chromatogram obtained with solution (2), the *column efficiency*, determined on the peak due to fusidic acid, is at least 2000 *theoretical plates* per metre;

in the chromatogram obtained with solution (2), the *symmetry factor* of the principal peak is 2.0 or less;

in the chromatogram obtained with solution (3), the principal peak has a *signal-to-noise ratio* of at least 3.

If necessary, adjust the composition of the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the sum of the areas of any *secondary peaks* is not greater than five times the area of the peak corresponding to fusidic acid in the chromatogram obtained with solution (2) (5%).

www.webofpharma.com

Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (3) (0.03%) and any peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (4).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the cream containing the equivalent of 15 mg of anhydrous fusidic acid in 50 mL of the mobile phase, heat until the cream has melted and shake vigorously for 15 minutes. Cool the mixture to below 10°, filter through a glass microfibre filter (Whatman GF/A is suitable), discarding the first few mL of filtrate, and allow to warm to room temperature.

(2) 0.0375% w/v of *diethanolamine fusidate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Lichrospher 100 RP-18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

10 volumes of *methanol*, 40 volumes of 0.05M *orthophosphoric acid* and 50 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The Assay is not valid unless the *column efficiency*, determined on the peak due to fusidic acid in the chromatogram obtained with solution (2), is at least 2000 *theoretical plates* per metre and the *symmetry factor* of the principal peak is 2.0 or less.

DETERMINATION OF CONTENT

Calculate the content of $C_{31}H_{48}O_6$ in the cream using the declared content of $C_{31}H_{48}O_6$ in *diethanolamine fusidate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous fusidic acid.

Fusidic Acid Eye Drops

Action and use

Antibacterial.

DEFINITION

Fusidic Acid Eye Drops are a sterile suspension of Fusidic Acid in a suitable vehicle.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of anhydrous fusidic acid, $C_{31}H_{48}O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse, with shaking, a quantity of the eye drops containing the equivalent of 20 mg of anhydrous fusidic acid in 10 mL of *ethanol (70%)*, filter and use the filtrate.

(2) 0.25% w/v of *diethanolamine fusidate BPCRS* in *ethanol (70%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel F_{254} plate* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 12.5 cm.

(e) After removal of the plate, dry in a current of air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

2.5 volumes of *methanol*, 10 volumes of *glacial acetic acid*, 10 volumes of *cyclohexane* and 80 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) is similar in position and size to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to fusidic acid in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 5.2 to 6.2, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the eye drops with a mixture of 10 volumes of *methanol*, 30 volumes of 1% w/v solution of *glacial acetic acid* and 60 volumes of *acetonitrile* to contain the equivalent of 0.075% w/v of anhydrous fusidic acid. Shake vigorously for 15 minutes, add 0.5 g of *potassium nitrate* and shake for a further minute. Filter through a glass microfibre filter paper (Whatman GF/A is suitable), discarding the first few mL of filtrate, and dilute 10 volumes of the filtrate to 12.5 volumes with 0.05M *orthophosphoric acid*.

(2) Dilute one volume of solution (1) to 100 volumes with the mobile phase.

(3) Dilute 30 µL of solution (1) to 100 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

For solution (1) allow the chromatography to proceed for 3.5 times the retention time of the principal peak.

When the chromatograms are recorded under the prescribed conditions, the retention time of fusidic acid is about 5.1 minutes and the retention time of 3-ketofusidic acid relative to that of fusidic acid is about 0.7.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2), the *column efficiency*, determined on the peak due to fusidic acid is at least 2000 *theoretical plates* per metre;

in the chromatogram obtained with solution (2), the *symmetry factor* of the principal peak is 2.0 or less;

www.webofpharma.com

in the chromatogram obtained with solution (3), the principal peak has a *signal-to-noise ratio* of at least 3.

LIMITS

In the chromatogram obtained with solution (1):

the sum of the areas of any *secondary peaks* is not greater than four times the area of the peak corresponding to fusidic acid in the chromatogram obtained with solution (2) (4%).

Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (3) (0.03%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the eye drops with a mixture of 10 volumes of *methanol*, 30 volumes of 1% w/v solution of *glacial acetic acid* and 60 volumes of *acetonitrile* (solution A) to contain the equivalent of 0.075% w/v of anhydrous fusidic acid. Shake vigorously for 15 minutes, add 0.5 g of *potassium nitrate* and shake for a further minute. Filter through a glass microfibre filter paper (Whatman GF/A is suitable), discarding the first few mL of filtrate, and dilute 10 volumes of the filtrate to 12.5 volumes with 0.05M *orthophosphoric acid*.

(2) 0.075% w/v of *diethanolamine fusidate BPCRS* in a mixture of 40 volumes of solution A and 10 volumes of 0.05M *orthophosphoric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Lichrospher 100 RP-18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

10 volumes of *methanol*, 40 volumes of 0.05M *orthophosphoric acid* and 50 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The Assay is not valid unless the *column efficiency*, determined on the peak due to fusidic acid in the chromatogram obtained with solution (2), is at least 2000 *theoretical plates* per metre and the *symmetry factor* of the principal peak is 2.0 or less.

DETERMINATION OF CONTENT

Calculate the content of $C_{31}H_{48}O_6$ in the eye drops using the declared content of $C_{31}H_{48}O_6$ in *diethanolamine fusidate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous fusidic acid.

Fusidic Acid Oral Suspension

Action and use
Antibacterial.

DEFINITION

Fusidic Acid Oral Suspension is a suspension of Fusidic Acid in powder of suitable fineness in a suitable flavoured vehicle. It should not be diluted.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of anhydrous fusidic acid, $C_{31}H_{48}O_6$
92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. To a quantity containing the equivalent of 0.1 g of anhydrous fusidic acid add 5 mL of *water* and extract with three 10-mL quantities of *chloroform*. Wash the combined extracts with two 10-mL quantities of *water*, dry with *anhydrous sodium sulfate*, evaporate to dryness and dissolve the residue in 1 mL of *chloroform IR*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of fusidic acid *(RS 166)*.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to fusidic acid in the chromatogram obtained with solution (2).

TESTS

Acidity
pH, 4.8 to 5.2, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Extract a quantity of the oral suspension containing the equivalent of 0.10 g of anhydrous fusidic acid with two 20-mL quantities of *chloroform*, evaporate the combined extracts to dryness and dissolve the residue in 20 mL of the mobile phase.

(2) Dilute 0.2 mL of solution (1) to 20 mL with the mobile phase.

(3) Dilute 20 µL of solution (1) to 100 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 to 15 cm × 4 to 5 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Lichrospher 100 RP-18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for at least 3.5 times the retention time of the principal peak.

MOBILE PHASE

10 volumes of *methanol*, 20 volumes of a 1% w/v solution of *orthophosphoric acid*, 20 volumes of *water* and 50 volumes of *acetonitrile*.

When the chromatograms are recorded under the prescribed conditions, the retention time of fusidic acid is about

www.webofpharma.com

5.1 minutes and the retention time of 3-ketofusidic acid relative to that of fusidic acid is about 0.7.

SYSTEM SUITABILITY

The test is not valid unless:

in chromatogram obtained with solution (2), the *column efficiency*, determined on the peak due to fusidic acid, is at least 14,000 *theoretical plates* per metre;

in the chromatogram obtained with solution (3), the principal peak has a *signal-to-noise ratio* of at least 3.

If necessary, adjust the composition of the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the sum of the areas of any *secondary peaks* is not greater than three times the area of the peak corresponding to fusidic acid in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with solution (3) (0.02%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake thoroughly a weighed quantity of the oral suspension containing the equivalent of 30 mg of anhydrous fusidic acid with 25 mL of the mobile phase, dilute to 50 mL with the mobile phase, filter and use the clear filtrate.

(2) 0.07% w/v of *diethanolamine fusidate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (LiChrosorb RP-18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

10 volumes of *methanol*, 30 volumes of a 1% v/v solution of *glacial acetic acid* and 60 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The Assay is not valid unless the *column efficiency*, determined using the principal peak in the chromatogram obtained with solution (2), is at least 14,000 *theoretical plates* per metre.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{31}H_{48}O_6$, weight in volume, using the declared content of $C_{31}H_{48}O_6$ in *diethanolamine fusidate BPCRS*.

STORAGE

Fusidic Acid Oral Suspension should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous fusidic acid.

When Fusidic Acid Oral Suspension is prescribed or demanded, no strength being stated, an Oral Suspension containing the equivalent of 250 mg of anhydrous fusidic acid in 5 mL shall be dispensed or supplied.

Gemfibrozil Capsules

Action and use

Fibrate lipid-regulating drug.

DEFINITION

Gemfibrozil Capsules contain Gemfibrozil.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of gemfibrozil, $C_{15}H_{22}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the contents of the capsules containing about 0.5 g of Gemfibrozil with 10 mL of n-*hexane* for 10 minutes, filter through a filter paper previously washed with 20 mL of n-*hexane*, evaporate the filtrate to dryness on a water bath and then dry over *silica gel* at a pressure of 2 kPa for 2 hours or until a waxy solid is obtained. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of gemfibrozil *(RS 167)*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of 0.2M *phosphate buffer pH 7.5* and rotate the paddle at 50 revolutions per minute. Withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 276 nm, Appendix II B. At the same time measure the *absorbance* at the maximum at 276 nm of a suitable solution of *gemfibrozil BPCRS* in the dissolution medium, adding the minimum volume of 0.1M *sodium hydroxide*, if necessary, to complete dissolution. Calculate the total content of gemfibrozil, $C_{15}H_{22}O_3$, in the medium from the absorbances obtained and from the declared content of $C_{15}H_{22}O_3$ in *gemfibrozil BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 0.4 g of Gemfibrozil with 100 mL of *methanol* and filter. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase and further dilute 1 volume of this solution to 5 volumes with the mobile phase. Solution (3) contains 0.0004% w/v of *gemfibrozil impurity E BPCRS* in the mobile phase. Solution (4) contains 0.001% w/v of *gemfibrozil methyl ester BPCRS* and 0.0004% w/v of *gemfibrozil impurity E BPCRS* in solution (2).

The chromatographic procedure described under Assay may be used. For solution (1) allow the chromatography to proceed for twice the retention time of the principal peak.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to gemfibrozil and gemfibrozil methyl ester is at least 4.0 and the *resolution factor* between the peaks due to gemfibrozil methyl ester and gemfibrozil impurity E is at least 1.2.

In the chromatogram obtained with solution (1) the area of any peak corresponding to gemfibrozil impurity E is not greater than the area of the peak in the chromatogram obtained with solution (3) (0.1%), the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.2%) and the

www.webofpharma.com

sum of the areas of any *secondary peaks* other than any peak corresponding to gemfibrozil impurity E is not greater than 2.5 times the area of the peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 50 mL of *methanol* to a quantity of the mixed contents of 20 capsules containing 0.15 g of Gemfibrozil, shake on a mechanical shaker for 10 minutes, add 20 mL of *water*, 1 mL of *glacial acetic acid* and sufficient *methanol* to produce 100 mL, mix and filter (Whatman GF/C paper is suitable), discarding the first 20 mL of filtrate. Dilute 1 volume of the filtrate to 5 volumes with the mobile phase. For solution (2) dissolve 30 mg of *gemfibrozil BPCRS* in 80 mL of *methanol*, add 1 mL of *glacial acetic acid* and dilute to 100 mL with *water*. Solution (3) contains 0.01% w/v of *gemfibrozil methyl ester BPCRS* in a solution prepared by diluting 1 volume of solution (1) to 3 volumes with the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS 2 or Regis C18 are suitable), (b) a mixture of 1 volume of *glacial acetic acid*, 19 volumes of *water* and 80 volumes of *methanol* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 276 nm.

Inject 20 µL of each solution. The test is not valid unless in the chromatogram obtained with solution (3) the *resolution factor* between the peaks due to gemfibrozil and gemfibrozil methyl ester is at least 4.0.

Calculate the content of $C_{15}H_{22}O_3$ in the capsules from the declared content of $C_{15}H_{22}O_3$ in *gemfibrozil BPCRS*.

Gemfibrozil Tablets

Action and use

Fibrate lipid-regulating drug.

DEFINITION

Gemfibrozil Tablets contain Gemfibrozil.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of gemfibrozil, $C_{15}H_{22}O_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Mix a quantity of the powdered tablets containing 0.3 g of Gemfibrozil with 10 mL of 0.1M *sodium hydroxide*, filter (Whatman 541 paper is suitable), acidify with a few drops of 2M *sulfuric acid*, shake and centrifuge. Wash the precipitate with *water*, allow to dry in air and dry over *anhydrous silica gel* at a pressure of 2 kPa for 4 hours. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of gemfibrozil *(RS 167)*.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of 0.2M *phosphate buffer pH 7.5* and rotate the paddle at 50 revolutions per minute. Withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 276 nm, Appendix II B. At the same time measure the *absorbance* at the maximum at 276 nm of a suitable solution of *gemfibrozil BPCRS* prepared by dissolving the substance in the minimum volume of *methanol* and diluting with 0.2M *phosphate buffer pH 7.5*. Calculate the total content of gemfibrozil, $C_{15}H_{22}O_3$, in the medium from the absorbances obtained and from the declared content of $C_{15}H_{22}O_3$ in *gemfibrozil BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 0.6 g of Gemfibrozil with 70 mL of *methanol* for 15 minutes, add sufficient *methanol* to produce 100 mL and filter. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the mobile phase and further dilute 1 volume of this solution to 5 volumes with the mobile phase. Solution (3) contains 0.0006% w/v of *gemfibrozil impurity E BPCRS* in the mobile phase. Solution (4) contains 0.001% w/v of *gemfibrozil methyl ester BPCRS* and 0.0004% w/v of *gemfibrozil impurity E BPCRS* in solution (2).

The chromatographic procedure described under Assay may be used. For solution (1) allow the chromatography to proceed for twice the retention time of the principal peak.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to gemfibrozil and gemfibrozil methyl ester is at least 4.0 and the *resolution factor* between the peaks due to gemfibrozil methyl ester and gemfibrozil impurity E is at least 1.2.

In the chromatogram obtained with solution (1) the area of any peak corresponding to gemfibrozil impurity E is not greater than the area of the peak in the chromatogram obtained with solution (3) (0.1%), the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of any *secondary peaks* other than the peak corresponding to gemfibrozil impurity E is not greater than 2.5 times the area of the peak in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the powdered tablets containing 84 mg of Gemfibrozil with 80 mL of *methanol (80%)* on a mechanical shaker for 15 minutes, add sufficient *methanol (80%)* to produce 100 mL, mix and filter (Whatman 542 paper is suitable), discarding the first 20 mL of filtrate. Solution (2) contains 0.084% w/v of *gemfibrozil BPCRS* prepared by dissolving the substance in the minimum volume of *methanol* and diluting with *methanol (80%)*. Solution (3) contains 0.01% w/v of *gemfibrozil methyl ester BPCRS* in a solution prepared by diluting 1 volume of solution (1) to 10 volumes with a mixture of 2 volumes of *methanol* and 3 volumes of the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS 2 or Regis C18 are suitable), (b) a mixture of 1 volume of *glacial acetic acid*, 19 volumes of *water* and 80 volumes of *methanol* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 276 nm.

www.webofpharma.com

Inject 20 µL of each solution. The test is not valid unless the *resolution factor* between the peaks due to gemfibrozil and gemfibrozil methyl ester in the chromatogram obtained with solution (3) is at least 4.0.

Calculate the content of $C_{15}H_{22}O_3$ in the tablets from the declared content of $C_{15}H_{22}O_3$ in *gemfibrozil BPCRS*.

STORAGE

Gemfibrozil Tablets should be protected from light.

Gentamicin Cream

Action and use

Aminoglycoside antibacterial.

DEFINITION

Gentamicin Cream is a viscous oil-in-water emulsion containing Gentamicin Sulfate dissolved in the aqueous phase.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the cream containing the equivalent of 7.5 mg of gentamicin in 20 mL of *chloroform*, extract with 10 mL of *water* and use the aqueous layer.

(2) A solution of *gentamicin sulfate BPCRS* in *water* containing the equivalent of 0.075% w/v of gentamicin.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with *ninhydrin solution R1* and heat at 105° for 2 minutes.

MOBILE PHASE

The lower layer obtained by shaking together equal volumes of 13.5M *ammonia*, *chloroform* and *methanol* and allowing to separate.

CONFIRMATION

The three principal spots in the chromatogram obtained with solution (1) correspond to the three principal spots in the chromatogram obtained with solution (2).

B. In the test for Composition of gentamicin sulfate, the retention times of the four principal peaks in the chromatogram obtained with solution (1) correspond to those of the four principal peaks in the chromatogram obtained with solution (2).

TESTS

Composition of gentamicin sulfate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the cream containing the equivalent of 15 mg of gentamicin in 10 mL of *chloroform*, add 10 mL of a 0.25% w/v solution of *sodium tetraborate*, shake vigorously, centrifuge and separate the aqueous layer. Repeat the extraction with two 5 mL quantities of the sodium tetraborate solution, dilute the combined aqueous extracts to 25 mL with the same solution and filter. To 10 mL of the clear filtrate add 5 mL of *methanol*, swirl, add 4 mL of *phthalaldehyde reagent*, mix, add sufficient *methanol* to produce 25 mL, heat in a water bath at 60° for 15 minutes and cool. If the solution is not used immediately, cool to 0° and use within 4 hours.

(2) Prepare in the same manner as solution (1) but using 10 mL of a 0.065% w/v solution of *gentamicin sulfate BPCRS* in place of the preparation being examined and beginning at the words 'To 10 mL of the clear filtrate ...'.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS and Kromasil C18 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 330 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.025M *sodium heptanesulfonate monohydrate* in a mixture of 5 volumes of *glacial acetic acid*, 25 volumes of *water* and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention time of component C_2 is 10 to 20 minutes. The retention times relative to component C_2 are: about 0.13 (reagent); about 0.27 (component C_1); about 0.65 (component C_{1a}); about 0.85 (component C_{2a}).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to components C_{2a} and C_2 is at least 1.3.

LIMITS

Using the chromatogram obtained with solution (1) calculate the percentage content of components C_1, C_{1a}, C_2 and C_{2a} in the cream by *normalisation*. The proportions are within the following limits:

C_1, 25.0 to 50.0%;

C_{1a}, 10.0 to 35.0%;

C_2 plus C_{2a}, 25.0 to 55.0%.

ASSAY

Dissolve as completely as possible a quantity of the cream containing the equivalent of 3 mg of gentamicin in 20 mL of *chloroform*, shake vigorously with 75 mL of *phosphate buffer pH 8.0* and allow to separate. Dilute 10 mL of the aqueous layer to 50 mL with *phosphate buffer pH 8.0*. Carry out the *microbiological assay of antibiotics*, Appendix XIV A.

The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of gentamicin in the cream, taking each 1000 IU found to be equivalent to 1 mg of gentamicin.

The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated content.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of gentamicin.

www.webofpharma.com

Gentamicin Ear Drops

Action and use
Aminoglycoside antibacterial.

DEFINITION
Gentamicin Ear Drops are a solution of Gentamicin Sulfate in Purified Water.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the ear drops, if necessary, with sufficient *water* to produce a solution containing the equivalent of 0.3% w/v of gentamicin.

(2) 0.5% w/v of *gentamicin sulfate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating silica gel (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with *ninhydrin solution R1* and heat at 105° for 2 minutes.

MOBILE PHASE

The lower layer obtained by shaking together equal volumes of 13.5M *ammonia*, *chloroform* and *methanol* and allowing to separate.

CONFIRMATION

The three principal spots in the chromatogram obtained with solution (1) correspond to the three principal spots in the chromatogram obtained with solution (2).

B. In the test for Composition of gentamicin sulfate, the retention times of the four principal peaks in the chromatogram obtained with solution (1) correspond to those of the four principal peaks in the chromatogram obtained with solution (2).

TESTS

Composition of gentamicin sulfate
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 5 mL of *methanol* to 10 mL of a solution prepared by diluting a suitable volume of the ear drops with *water* to contain the equivalent of 0.045% w/v of gentamicin. Swirl and add 4 mL of *phthalaldehyde reagent*, mix and add sufficient *methanol* to produce 25 mL, heat in a water bath at 60° for 15 minutes and cool. If the solution is not used immediately, cool to 0° and use within 4 hours.

(2) Prepare in the same manner as solution (1) but using 10 mL of a 0.065% w/v solution of *gentamicin sulfate BPCRS* in place of 10 mL of the preparation being examined.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS and Kromasil C18 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 330 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.025M *sodium heptanesulfonate monohydrate* in a mixture of 5 volumes of *glacial acetic acid*, 25 volumes of *water* and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention time of component C_2 is 10 to 20 minutes. The retention times relative to component C_2 are: about 0.13 (reagent); about 0.27 (component C_1); about 0.65 (component C_{1a}); about 0.85 (component C_{2a}).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to components C_{2a} and C_2 is at least 1.3.

LIMITS

Using the chromatogram obtained with solution (1) calculate the percentage content of components C_1, C_{1a}, C_2 and C_{2a} in the ear drops by *normalisation*. The proportions are within the following limits:

C_1, 25.0 to 50.0%;

C_{1a}, 10.0 to 35.0%;

C_2 plus C_{2a}, 25.0 to 55.0%.

ASSAY
Dilute a volume of the ear drops containing the equivalent of 15 mg of gentamicin to 50 mL with sterile *phosphate buffer pH 8.0* and dilute 10 mL of the resulting solution to 50 mL with the same solvent. Carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of gentamicin in the ear drops, taking each 1000 IU found to be equivalent to 1 mg of gentamicin. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated content.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of gentamicin.

Gentamicin Eye Drops

Action and use
Aminoglycoside antibacterial.

DEFINITION
Gentamicin Eye Drops are a sterile solution of Gentamicin Sulfate in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the eye drops, if necessary, with sufficient *water* to produce a solution containing the equivalent of 0.3% w/v of gentamicin.

(2) 0.5% w/v of *gentamicin sulfate BPCRS* in *water*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating silica gel (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with *ninhydrin solution R1* and heat at 105° for 2 minutes.

MOBILE PHASE

The lower layer obtained by shaking together equal volumes of 13.5M *ammonia*, *chloroform* and *methanol* and allowing to separate.

CONFIRMATION

The three principal spots in the chromatogram obtained with solution (1) correspond to the three principal spots in the chromatogram obtained with solution (2).

B. In the test for Composition of gentamicin sulfate, the retention times of the four principal peaks in the chromatogram obtained with solution (1) correspond to those of the four principal peaks in the chromatogram obtained with solution (2).

TESTS

Composition of gentamicin sulfate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 5 mL of *methanol* to 10 mL of a solution prepared by diluting a suitable volume of the eye drops with *water* to contain the equivalent of 0.045% w/v of gentamicin. Swirl and add 4 mL of *phthalaldehyde reagent*, mix and add sufficient *methanol* to produce 25 mL, heat in a water bath at 60° for 15 minutes and cool. If the solution is not used immediately, cool to 0° and use within 4 hours.

(2) Prepare in the same manner as solution (1) but using 10 mL of a 0.065% w/v solution of *gentamicin sulfate BPCRS* in place of 10 mL of the preparation being examined.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS and Kromasil C18 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 330 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.025M *sodium heptanesulfonate monohydrate* in a mixture of 5 volumes of *glacial acetic acid*, 25 volumes of *water* and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention time of component C_2 is 10 to 20 minutes. The retention times relative to component C_2 are: about 0.13 (reagent); about 0.27 (component C_1); about 0.65 (component C_{1a}); about 0.85 (component C_{2a}).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to components C_{2a} and C_2 is at least 1.3.

Using the chromatogram obtained with solution (1) calculate the percentage content of components C_1, C_{1a}, C_2 and C_{2a} in the eye drops by *normalisation*. The proportions are within the following limits:

C_1, 25.0 to 50.0%;

C_{1a}, 10.0 to 35.0%;

C_2 plus C_{2a}, 25.0 to 55.0%.

ASSAY

Dilute a volume of the eye drops containing the equivalent of 15 mg of gentamicin to 50 mL with sterile *phosphate buffer pH 8.0* and dilute 10 mL of the resulting solution to 50 mL with the same solvent. Carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of gentamicin in the eye drops, taking each 1000 IU found to be equivalent to 1 mg of gentamicin. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated content.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of gentamicin.

Gentamicin Injection

Action and use

Aminoglycoside antibacterial.

DEFINITION

Gentamicin Injection is a sterile solution of Gentamicin Sulfate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the injection, if necessary, with sufficient *water* to produce a solution containing the equivalent of 0.5% w/v of gentamicin.

(2) 0.8% w/v of *gentamicin sulfate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating silica gel (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 6 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with *ninhydrin solution R1* and heat at 105° for 2 minutes.

MOBILE PHASE

The lower layer obtained by shaking together equal volumes of 13.5M *ammonia*, *chloroform* and *methanol* and allowing to separate.

CONFIRMATION

The three principal spots in the chromatogram obtained with solution (1) correspond to the three principal spots in the chromatogram obtained with solution (2).

www.webofpharma.com

B. In the test for Composition of gentamicin sulfate, the retention times of the four principal peaks in the chromatogram obtained with solution (1) correspond to those of the four principal peaks in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 3.0 to 5.5, Appendix V L.

Composition of gentamicin sulfate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 5 mL of *methanol* to 10 mL of a solution prepared by diluting a suitable volume of the injection with *water* to contain the equivalent of 0.045% w/v of gentamicin. Swirl and add 4 mL of *phthalaldehyde reagent*, mix and add sufficient *methanol* to produce 25 mL, heat in a water bath at 60° for 15 minutes and cool. If the solution is not used immediately, cool to 0° and use within 4 hours.

(2) Prepare in the same manner as solution (1) but using 10 mL of a 0.065% w/v solution of *gentamicin sulfate BPCRS* in place of 10 mL of the preparation being examined.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS and Kromasil C18 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 330 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.025M *sodium heptanesulfonate monohydrate* in a mixture of 5 volumes of *glacial acetic acid*, 25 volumes of *water* and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention time of component C_2 is 10 to 20 minutes. The retention times relative to component C_2 are: about 0.13 (reagent); about 0.27 (component C_1); about 0.65 (component C_{1a}); about 0.85 (component C_{2a}).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to components C_{2a} and C_2 is at least 1.3.

LIMITS

Using the chromatogram obtained with solution (1) calculate the percentage content of components C_1, C_{1a}, C_2 and C_{2a} in the injection by *normalisation*. The proportions are within the following limits:

C_1, 25.0 to 50.0%;

C_{1a}, 10.0 to 35.0%;

C_2 plus C_{2a}, 25.0 to 55.0%.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection, if necessary, with *water BET* to give a solution containing the equivalent of 10 mg of gentamicin per mL (solution A). The endotoxin limit concentration of solution A is 7.1 IU per mL.

ASSAY

Carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of gentamicin in the injection, taking each 1000 IU found to be equivalent to 1 mg of gentamicin. The upper fiducial limit of error is not less than 97.0% and the lower fiducial limit of error is not more than 110.0% of the stated content.

LABELLING

The strength is stated in terms of the equivalent amount of gentamicin in a suitable dose-volume.

Gentamicin Ointment

Action and use

Aminoglycoside antibacterial.

DEFINITION

Gentamicin Ointment is a dispersion of Gentamicin Sulfate in *microfine powder* in White Soft Paraffin or other suitable anhydrous greasy basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity of the ointment containing the equivalent of 7.5 mg of gentamicin in 20 mL of *chloroform*, extract with 10 mL of *water* and use the aqueous layer.

(2) A solution of *gentamicin sulfate BPCRS* in *water* containing the equivalent of 0.075% w/v of gentamicin.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with *ninhydrin solution R1* and heat at 105° for 2 minutes.

MOBILE PHASE

The lower layer obtained by shaking together equal volumes of 13.5M *ammonia*, *chloroform* and *methanol* and allowing to separate.

CONFIRMATION

The three principal spots in the chromatogram obtained with solution (1) correspond to the three principal spots in the chromatogram obtained with solution (2).

B. In the test for Composition of gentamicin sulfate, the retention times of the four principal peaks in the chromatogram obtained with solution (1) correspond to those of the four principal peaks in the chromatogram obtained with solution (2).

TESTS

Composition of gentamicin sulfate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the ointment containing the equivalent of 20 mg of gentamicin in 10 mL of *chloroform*, add 20 mL of a 0.25% w/v solution of *sodium tetraborate*, shake vigorously, centrifuge and separate the aqueous layer.

www.webofpharma.com

Filter and dilute to 50 mL with *water*. To 10 mL add 5 mL of *methanol*, swirl, add 4 mL of *phthalaldehyde reagent*, mix, add sufficient *methanol* to produce 25 mL, heat in a water bath at 60° for 15 minutes and cool. If the solution is not to be used immediately, cool to 0° and use within 4 hours

(2) Prepare in the same manner as solution (1) but using 10 mL of a 0.065% w/v solution of *gentamicin sulfate BPCRS* in place of the preparation being examined and beginning at the words 'To 10 mL add ...'.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS and Kromasil C18 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 330 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.025M *sodium heptanesulfonate monohydrate* in a mixture of 5 volumes of *glacial acetic acid*, 25 volumes of *water* and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention time of component C_2 is 10 to 20 minutes. The retention times relative to component C_2 are: about 0.13 (reagent); about 0.27 (component C_1); about 0.65 (component C_{1a}); about 0.85 (component C_{2a}).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to components C_{2a} and C_2 is at least 1.3.

LIMITS

Using the chromatogram obtained with solution (1) calculate the percentage content of components C_1, C_{1a}, C_2 and C_{2a} in the ointment by *normalisation*. The proportions are within the following limits:

C_1, 25.0 to 50.0%;

C_{1a}, 10.0 to 35.0%;

C_2 plus C_{2a}, 25.0 to 55.0%.

ASSAY

Dissolve as completely as possible a quantity of the ointment containing the equivalent of 4 mg of gentamicin in 50 mL of *chloroform*, extract with three 20-mL quantities of *phosphate buffer pH 8.0* and dilute the combined extracts to 100 mL with *phosphate buffer pH 8.0*. Dilute 10 mL of the resulting solution to 50 mL with *phosphate buffer pH 8.0*. Carry out the *microbiological assay of antibiotics*, Appendix XIV A.
The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of gentamicin in the ointment, taking each 1000 IU found to be equivalent to 1 mg of gentamicin. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated content.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of gentamicin.

Gentamicin and Hydrocortisone Acetate Ear Drops

Action and use

Aminoglycoside antibacterial (Gentamicin Sulfate); corticosteroid (Hydrocortisone Acetate).

DEFINITION

Gentamicin and Hydrocortisone Acetate Ear Drops contain Gentamicin Sulfate and Hydrocortisone Acetate suspended in a suitable vehicle.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the ear drops, if necessary, with sufficient *water* to produce a solution containing the equivalent of 0.3% w/v of gentamicin, filter and use the filtrate.

(2) 0.5% w/v of *gentamicin sulfate BPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray with *ninhydrin solution R1* and heat at 105° for 2 minutes.

MOBILE PHASE

The lower layer obtained by shaking together equal volumes of 13.5M *ammonia*, *dichloromethane* and *methanol* and allowing to separate.

CONFIRMATION

The three principal spots in the chromatogram obtained with solution (1) are similar in position, colour and size to those in the chromatogram obtained with solution (2).

B. Comply with the test for Composition of gentamicin sulfate.

C. Filter 20 mL of the well-mixed ear drops (Whatman No. 1 filter paper is suitable), wash the residue with the minimum amount of *water*, dry at 105° and dissolve 50 mg of the residue obtained in 50 mL of *ethanol (96%)*. Add 2 mL of *sulfuric acid* to 2 mL of the resulting solution; an intense yellow colour is produced which exhibits a green fluorescence which is particularly intense when viewed under *ultraviolet light (365 nm)*. Add the solution to 10 mL of *water* and mix; the fluorescence under ultraviolet light (365 nm) does not disappear.

D. In the Assay for hydrocortisone acetate, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity

pH, 6.0 to 7.0, Appendix V L.

Composition of gentamicin sulfate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

www.webofpharma.com

(1) Add 5 mL of *methanol* to 10 mL of a solution prepared by diluting a suitable volume of the ear drops with *water* to contain the equivalent of 0.045% w/v of gentamicin. Swirl and add 4 mL of *phthalaldehyde reagent*, mix and add sufficient *methanol* to produce 25 mL, heat in a water bath at 60° for 15 minutes and cool. If the solution is not used immediately, cool to 0° and use within 4 hours.

(2) Prepare in the same manner as solution (1) but using 10 mL of a 0.065% w/v solution of *gentamicin sulfate BPCRS* in place of 10 mL of the preparation being examined.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS and Kromasil C18 are suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 330 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

0.025M *sodium heptanesulfonate monohydrate* in a mixture of 5 volumes of *glacial acetic acid*, 25 volumes of *water* and 70 volumes of *methanol*.

When the chromatograms are recorded under the prescribed conditions the retention time of component C_2 is 10 to 20 minutes. The retention times relative to component C_2 are: about 0.13 (reagent); about 0.27 (component C_1); about 0.65 (component C_{1a}); about 0.85 (component C_{2a}).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks due to components C_{2a} and C_2 is at least 1.3.

LIMITS

Using the chromatogram obtained with solution (1) calculate the percentage content of components C_1, C_{1a}, C_2 and C_{2a} in the ear drops by *normalisation*. The proportions are within the following limits:

C_1, 25.0 to 50.0%;

C_{1a}, 10.0 to 35.0%;

C_2 plus C_{2a}, 25.0 to 55.0%.

ASSAY

For gentamicin

Dilute a volume of the ear drops containing the equivalent of 15 mg of gentamicin to 50 mL with sterile *phosphate buffer pH 8.0* and dilute 10 mL of the resulting solution to 50 mL with the same solvent. Carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency.

Calculate the content of gentamicin in the ear drops, taking each 1000 IU found to be equivalent to 1 mg of gentamicin. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 120.0% of the stated content.

For hydrocortisone acetate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the ear drops containing 0.1 g of Hydrocortisone Acetate with 25 mL of *methanol*, add sufficient *methanol* to produce 100 mL and dilute 10 mL of this solution to 50 mL with the mobile phase.

(2) Dilute 10 mL of a 0.1% w/v solution of *hydrocortisone acetate BPCRS* in *methanol* to 50 mL with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 256 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

400 volumes of *water* and 600 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{32}O_6$ in the ear drops using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

STORAGE

Gentamicin and Hydrocortisone Acetate Ear Drops should not be allowed to freeze.

LABELLING

The quantity of Gentamicin Sulfate is stated in terms of the equivalent amount of gentamicin.

Glibenclamide Tablets

Action and use

Inhibition of ATP-dependent potassium channels (sulfonylurea); treatment of diabetes mellitus.

DEFINITION

Glibenclamide Tablets contain Glibenclamide.

PRODUCTION

The dissolution test below is carried out to demonstrate the appropriate release of Glibenclamide subject to approval from the competent authority.

Prepare a mixture containing 0.8134% w/v of *anhydrous disodium hydrogen phosphate* and 0.1350% w/v of *potassium dihydrogen orthophosphate* (solution A).

Carry out the *dissolution test for tablets and capsules*, Appendix XII B1. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

TEST CONDITIONS

(a) Use Apparatus 2 rotating the paddle at 100 revolutions per minute.

(b) Use 900 mL of solution A at a temperature of 37° as the medium.

PROCEDURE

(1) Withdraw 10 mL of the medium, filter (Minisart GS 25mm filters are suitable) and use the filtrate, discarding the first 5 mL of the filtrate.

(2) Dissolve *glibenclamide BPCRS* in the minimum quantity of *methanol* and dilute to an appropriate concentration with solution A.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS is suitable).

(b) Use isocratic elution using the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 225 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

40 volumes of 0.1M *potassium dihydrogen orthophosphate* previously adjusted to pH 3.0 with *orthophosphoric acid* and 60 volumes of *acetonitrile*.

DETERMINATION OF CONTENT

Calculate the total content of glibenclamide, $C_{23}H_{28}ClN_3O_5S$, in the medium from the chromatograms obtained and using the declared content of $C_{23}H_{28}ClN_3O_5S$ in *glibenclamide BPCRS*.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of glibenclamide, $C_{23}H_{28}ClN_3O_5S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (4).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract a quantity of the powdered tablets containing 20 mg of Glibenclamide with four 5-mL quantities of a mixture of 10 volumes of *acetone* and 20 volumes of *dichloromethane*, evaporate the combined extracts to dryness at a temperature not exceeding 40° at a pressure of 2 kPa and dissolve the residue in 4 mL of a mixture of equal volumes of *chloroform* and *methanol*.

(2) 0.012% w/v of *4-[2-(5-chloro-2-methoxybenzamido)ethyl]benzenesulfonamide BPCRS* in a mixture of equal volumes of *chloroform* and *methanol*.

(3) 0.0020% w/v of *methyl N-4-[2-(5-chloro-2-methoxybenzamido)ethyl]benzenesulfonylcarbamate BPCRS* in a mixture of equal volumes of *chloroform* and *methanol*.

(4) 0.5% w/v of *glibenclamide BPCRS* in a mixture of equal volumes of *chloroform* and *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating substance *silica gel* GF_{254}.

(b) Use the mobile phase described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of *ethanol (96%)*, 5 volumes of *glacial acetic acid*, 45 volumes of *chloroform* and 45 volumes of *cyclohexane*.

LIMITS

In the chromatogram obtained with solution (1);

any spots corresponding to 4-[2-(5-chloro-2-methoxybenzamido)ethyl]benzenesulfonamide and methyl *N*-4-[2-(5-chloro-2-methoxybenzamido)ethyl] benzenesulfonylcarbamate are not more intense than the spots in the chromatograms obtained with solutions (2)(2.4%) and (3)(0.4%) respectively.

Uniformity of content

Tablets containing 5 mg or less of Glibenclamide comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Powder one tablet, add a mixture of 2 mL of *water* and 20 mL of *methanol*, mix with the aid of ultrasound until fully dispersed and filter through a 0.2-µm membrane filter (Anatop LC is suitable).

(2) Add 2 mL of *water* to 20 mL of a 0.025% w/v solution of *glibenclamide BPCRS* in *methanol*, mix with the aid of ultrasound until fully dispersed and filter (0.2-µm Anatop LC is suitable).

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{28}ClN_3O_5S$ in each tablet using the declared content of $C_{23}H_{28}ClN_3O_5S$ in *glibenclamide BPCRS*.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix, with the aid of ultrasound, a quantity of the powdered tablets containing 5 mg of Glibenclamide with a mixture of 2 mL of *water* and 20 mL of *methanol* until fully dispersed and filter through a 0.2-µm membrane filter (Anatop LC is suitable).

(2) Dissolve 50 mg of *glibenclamide BPCRS* in 10 mL of *methanol* with the aid of ultrasound for 20 minutes, add sufficient *methanol* to produce 50 mL and dilute 1 volume of this solution to 4 volumes with *methanol*. To 20 mL of this solution add 2 mL of *water* and mix.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS is suitable).

(b) Use isocratic elution using the mobile phase below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 300 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

47 volumes of *acetonitrile* and 53 volumes of a 1.36% w/v solution of *potassium dihydrogen orthophosphate* previously adjusted to pH 3.0 with *orthophosphoric acid*.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{28}ClN_3O_5S$ in the tablets using the declared content of $C_{23}H_{28}ClN_3O_5S$ in *glibenclamide BPCRS*.

www.webofpharma.com

Gliclazide Tablets

Action and use
Inhibition of ATP-dependent potassium channels (sulfonylurea); treatment of diabetes mellitus.

DEFINITION

Gliclazide Tablets contain Gliclazide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of gliclazide, $C_{15}H_{21}N_3O_3S$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.16 g of Gliclazide with 20 mL of *dichloromethane*, centrifuge and evaporate the supernatant liquid to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of gliclazide *(RS 168)*.

TESTS

Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 100 revolutions per minute.

(b) Use 900 mL of *phosphate buffer pH 7.4*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, expected to contain 0.00125% w/v of Gliclazide at 226 nm and 290 nm, Appendix II B using *phosphate buffer pH 7.4* in the reference cell. Correct the absorbance obtained at 226 nm by subtracting the absorbance obtained at 290 nm.

(2) Measure the *absorbance* of a 0.00124% w/v solution of *gliclazide BPCRS* using *phosphate buffer pH 7.4* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of Gliclazide, $C_{15}H_{21}N_3O_3S$, in the medium from the absorbances obtained and using the declared content of $C_{15}H_{21}N_3O_3S$, in *gliclazide BPCRS*.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare the solutions immediately before use.

(1) Shake a quantity of the powdered tablets containing 0.8 g of Gliclazide for 1 hour with 200 mL of *acetonitrile*, filter and dilute 10 mL of the filtrate to 50 mL with a mixture of 1 volume of *acetonitrile* and 2 volumes of *water*.

(2) Dilute 1 volume of solution (1) to 500 volumes with a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*.

(3) Dissolve 5 mg of *gliclazide BPCRS* and 15 mg of *1-(3-azabicyclo[3.3.0]oct-3-yl)-3-o-tolylsulfonylurea BPCRS* in 25 mL of *acetonitrile*, dilute to 50 mL with *water* and dilute 1 volume of the resulting solution to 20 volumes with a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*.

(4) Dissolve 8 mg of *1-(3-azabicyclo[3.3.0]oct-3-yl)-3-o-tolylsulfonylurea BPCRS* in 25 mL of *acetonitrile*, dilute to 50 mL with *water* and dilute 1 volume of the resulting solution to 100 volumes with a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *octylsilyl silica gel for chromatography* (4 µm) (Superspher 60RP8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.9 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for twice the retention time of the principal peak.

MOBILE PHASE

0.1 volume of *triethylamine*, 0.1 volume of *trifluoroacetic acid*, 45 volumes of *acetonitrile R1* and 55 volumes of *water*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to gliclazide and 1-(3-azabicyclo[3.3.0]oct-3-yl)-3-*o*-tolylsulfonylurea is at least 1.8.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 1-(3-azabicyclo[3.3.0]oct-3-yl)-3-*o*-tolylsulfonylurea is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.4%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.8 g of Gliclazide for 1 hour with 200 mL of *acetonitrile*, filter and dilute 10 mL of the filtrate to 200 mL with a mixture of 2 volumes of *acetonitrile* and 3 volumes of *water*.

(2) Dissolve 40 mg of *gliclazide BPCRS* in 10 mL of *acetonitrile* and dilute to 200 mL with a mixture of 2 volumes of *acetonitrile* and 3 volumes of *water*.

(3) Dissolve 5 mg of *gliclazide BPCRS* and 15 mg of *1-(3-azabicyclo[3.3.0]oct-3-yl)-3-o-tolylsulfonylurea BPCRS* in 25 mL of *acetonitrile*, dilute to 50 mL with *water* and dilute 1 volume of the resulting solution to 20 volumes with a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due

www.webofpharma.com

to gliclazide and 1-(3-azabicyclo[3.3.0]oct-3-yl)-3-*o*-tolylsulfonylurea is at least 1.8.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{21}N_3O_3S$ in the tablets using the declared content of $C_{15}H_{21}N_3O_3S$ in *gliclazide BPCRS*.

Glimepiride Tablets

Action and use
Inhibition of ATP-dependent potassium channels (sulfonylurea); treatment of diabetes mellitus.

DEFINITION
Glimepiride Tablets contain Glimepiride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of glimepiride, $C_{24}H_{34}N_4O_5S$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Extract a quantity of the powdered tablets containing 10 mg of Glimepiride with 20 mL of *acetonitrile*, centrifuge and filter the supernatant liquid, evaporate to dryness at a temperature not exceeding 30°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of glimepiride (*RS 463*).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS
Dissolution
Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1. *Store the solutions at a temperature not exceeding 12° and use within 15 hours.*

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 900 mL of a pH 7.8 buffer solution prepared by mixing 14.5 g of *potassium dihydrogen phosphate* and 277.76 g of *sodium dihydrogen phosphate dihydrate* with sufficient water to make 25 litres, adjusted to pH 7.8 with 10% v/v *orthophosphoric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a sample of the medium and filter. Use the filtrate, diluted with the dissolution medium, if necessary, to produce a solution expected to contain 0.0001% w/v of Glimepiride.

(2) Dilute 1 volume of a 0.001% w/v solution of *glimepiride BPCRS* in *acetonitrile* to 10 volumes with the dissolution medium.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Lichrospher RP 18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use an auto-sampler temperature of 12°.

(f) Use a detection wavelength of 228 nm.

(g) Inject 50 µL of each solution.

MOBILE PHASE

Equal volumes of a 0.1% w/v solution of *sodium dihydrogen phosphate dihydrate* and *acetonitrile R1*, the pH adjusted to 2.5 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the retention time of glimepiride is about 8 minutes.

DETERMINATION OF CONTENT

Calculate the total content of glimepiride, $C_{24}H_{34}N_4O_5S$, in the medium from the chromatograms obtained and using the declared content of $C_{24}H_{34}N_4O_5S$ in *glimepiride BPCRS*.

LIMITS

The amount of glimepiride released is not less than 75% (Q) of the stated amount.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 1 volume of *water* and 4 volumes of *acetonitrile*. *Store the solutions at a temperature not exceeding 12° and use within 15 hours.*

(1) Shake a quantity of the powdered tablets containing 2 mg of Glimepiride with 8 mL of a mixture of 1 volume of *water* and 4 volumes of *acetonitrile*. Dilute to 10 mL with the same solvent, centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) 0.04% w/v of *glimepiride for system suitability BPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (4 µm) (Supelco Superspher RP 18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use an auto-sampler temperature of 12°.

(f) Use a detection wavelength of 228 nm.

(g) Inject 10 µL of each solution.

(h) Allow the chromatography to proceed for 3.5 times the retention time of the peak due to glimepiride.

MOBILE PHASE

Equal volumes of a 0.1% w/v solution of *sodium dihydrogen phosphate dihydrate* and *acetonitrile R1*, the pH adjusted to 2.5 with *orthophosphoric acid*.

When the chromatograms are recorded under the prescribed conditions the retention time of glimepiride is about 17 minutes. Retention times relative to glimepiride are: impurity B = about 0.24; impurity C = about 0.3.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity B and impurity C is at least 4.0.

www.webofpharma.com

LIMITS

Identify the peak due to impurity B in solution (1) using solution (3) and multiply the peak area by the correction factor of 0.7.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity B is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2.0%);

the area of any other *secondary peak* is not greater than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the peak due to glimepiride in the chromatogram obtained with solution (4) (0.1%).

Uniformity of content

Tablets containing less than 2 mg and/or 2% w/w of Glimepiride comply with the requirements stated under Tablets using the following method of analysis.

Carry out the method for liquid chromatography, Appendix III D, using the following solutions. *Store the solutions at a temperature not exceeding 12° and use within 15 hours.*

(1) To one tablet add 1 mL of *water* and allow to disintegrate. Add 8 mL of a solution containing 1 volume of *water* and 9 volumes of *acetonitrile*, mix with the aid of ultrasound for 15 minutes. Dilute to 10 mL with the same solvent, centrifuge and use the supernatant liquid, diluted if necessary with mobile phase to produce a solution expected to contain 0.01% w/v of Glimepiride.

(2) 0.01% w/v of *glimepiride BPCRS* in the mobile phase.

(3) 0.04% w/v of *glimepiride for system suitability BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Phenomenex Lichrospher RP 18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use an auto-sampler temperature of 12°.

(f) Use a detection wavelength of 228 nm.

(g) Inject 10 µL of each solution.

MOBILE PHASE

Equal volumes of a 0.1% w/v solution of *sodium dihydrogen phosphate dihydrate* and *acetonitrile R1*, the pH adjusted to 2.5 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity B and impurity C is at least 4.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{24}H_{34}N_4O_5S$ in each tablet using the declared content of $C_{24}H_{34}N_4O_5S$ in *glimepiride BPCRS*.

ASSAY

For tablets containing less than 2 mg, or 2% w/w of glimepiride

Use the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing 2 mg or more, or 2% w/w or more of glimepiride

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions

(1) To a quantity of powdered tablets containing 10 mg of Glimepiride add 80 mL of a solution containing 1 volume of *water* and 9 volumes of *acetonitrile*, mix with the aid of ultrasound. Add sufficient of a mixture containing 1 volume of *water* and 9 volumes of *acetonitrile* to produce 100 mL, centrifuge and use the supernatant liquid.

(2) 0.01% w/v of *glimepiride BPCRS* in mobile phase.

(3) 0.04% w/v of *glimepiride for system suitability BPCRS* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity B and impurity C is at least 4.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{24}H_{34}N_4O_5S$ in the tablets using the declared content of $C_{24}H_{34}N_4O_5S$ in *glimepiride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Glimepiride.

Glipizide Tablets

Action and use

Inhibition of ATP-dependent potassium channels (sulfonylurea); treatment of diabetes mellitus.

DEFINITION

Glipizide Tablets contain Glipizide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of glipizide $C_{21}H_{27}N_5O_4S$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 210 to 320 nm of the final solution obtained in the Assay exhibits maxima at 226 nm and 274 nm.

B. Shake a quantity of the powdered tablets containing 25 mg of Glipizide with 10 mL of *dichloromethane* for 5 minutes, filter, dry the filtrate with *anhydrous sodium sulfate*, filter again and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of glipizide *(RS 169)*.

TEST

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

www.webofpharma.com

(1) Extract a quantity of the powdered tablets containing 0.1 g of Glipizide with four 10-mL quantities of *acetone*, evaporate the combined extracts to dryness under reduced pressure at a temperature not exceeding 30° and dissolve the residue in sufficient of a mixture of equal volumes of *dichloromethane* and *methanol* to produce 5 mL.

(2) Dilute 1 volume of solution (1) to 200 volumes with a mixture of equal volumes of *dichloromethane* and *methanol*.

(3) Dilute 1 volume of solution (1) to 500 volumes with the same solvent mixture.

(4) 0.010% w/v of *glipizide impurity A EPCRS* (5-methyl-*N*-[2-(4-sulfamoylphenyl)ethyl]pyrazine-2-carboxamide) in a mixture of equal volumes of *dichloromethane* and *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254} (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

20 volumes of *ethyl acetate*, 20 volumes of *anhydrous formic acid* and 40 volumes of *dichloromethane*.

LIMITS

In the chromatogram obtained with solution (1);

any spot corresponding to glipizide impurity A is not more intense than the spot in the chromatogram obtained with solution (4) (0.5%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%);

and not more than two such spots are more intense than the spot in the chromatogram obtained with solution (3) (0.2%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 15 mg of Glipizide add 30 mL of *methanol*, heat gently on a water bath whilst shaking, cool and add sufficient *methanol* to produce 50 mL. Filter and dilute 5 mL of the filtrate to 50 mL with *methanol*. Measure the *absorbance* of the resulting solution at the maximum at 274 nm, Appendix II B, using *methanol* in the reference cell. Calculate the content of $C_{21}H_{27}N_5O_4S$ taking 237 as the value of A(1%, 1 cm) at the maximum at 274 nm.

Gliquidone Tablets

Action and use

Inhibition of ATP-dependent potassium channels (sulfonylurea); treatment of diabetes mellitus.

DEFINITION

Gliquidone Tablets contain Gliquidone.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of gliquidone, $C_{27}H_{33}N_3O_6S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 30 mg of Gliquidone in 10 mL of *methanol* with the aid of ultrasound, filter, evaporate the filtrate to dryness using a rotary evaporator and dry the residue at a temperature of 50° at a pressure of 2 kPa for 1 hour. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of gliquidone *(RS 170)*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of a citro-phosphate buffer prepared by dissolving 35.6 g of *disodium hydrogen orthophosphate dihydrate* in sufficient *water* to produce 1000 mL, adjusting the pH to 8.5 with *citric acid*, and rotate the paddle at 75 revolutions per minute. Withdraw a sample of 50 mL of the medium and filter (Whatman No. 1 filter paper is suitable), discarding the first 15 mL of filtrate. Measure the *absorbance* of the filtered solution, Appendix II B, at the maximum at 314 nm using a filtered solution of the dissolution medium in the reference cell. Measure the *absorbance* of a solution of *gliquidone BPCRS* prepared in the following manner. Dissolve about 30 mg of *gliquidone BPCRS* in 10 mL of *dimethylformamide*, add sufficient dissolution medium to produce 100 mL and mix. Dilute 10 mL of this solution to 100 mL with dissolution medium, mix and filter (Whatman No. 1 filter paper is suitable), discarding the first 15 mL of filtrate. Calculate the total content of gliquidone, $C_{27}H_{33}N_3O_6S$, in the medium from the absorbances obtained and from the declared content of $C_{27}H_{33}N_3O_6S$ in *gliquidone BPCRS*.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 5 volumes of *glacial acetic acid*, 5 volumes of *ethanol (96%)*, 45 volumes of *chloroform* and 45 volumes of *cyclohexane* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 10 µL of each of the following five solutions. For solution (1) mix a quantity of the powdered tablets containing 0.1 g of Gliquidone with 8 mL of a mixture of 50 volumes of *dichloromethane* and 50 volumes of *methanol*, mix with the aid of ultrasound for 10 minutes, add sufficient of the same solvent mixture to produce 10 mL, filter (Whatman GF/C filter paper is suitable) and use the filtrate. Solution (2) contains 1.0% w/v of *gliquidone BPCRS* in a mixture of 50 volumes of *dichloromethane* and 50 volumes of *methanol*. Solution (3) contains 0.0030% w/v of *gliquidone BPCRS* in a mixture of 50 volumes of *dichloromethane* and 50 volumes of *methanol*. Solution (4) contains 0.010% w/v of *gliquidone sulfonamide BPCRS* in a mixture of 50 volumes of *dichloromethane* and 50 volumes of *methanol*. For solution (5) mix 1 volume of solution (3) and 1 volume of solution (4). After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. In the chromatogram obtained with solution (1) any spot corresponding to gliquidone sulfonamide is not more intense than the spot in the chromatogram obtained with solution (4) (1%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (0.3%). The test is not valid unless the chromatogram obtained with solution (5) shows two clearly separated principal spots.

www.webofpharma.com

ASSAY

Weigh and powder 20 tablets. To a quantity of the powdered tablets containing 0.1 g of Gliquidone add 50 mL of *methanol*, mix with the aid of ultrasound for 10 minutes, allow to cool, add sufficient *methanol* to produce 100 mL and filter. Dilute 15 mL of the filtrate to 100 mL with *methanol* and measure the *absorbance* of the resulting solution at the maximum at 310 nm, Appendix II B. Calculate the content of $C_{27}H_{33}N_3O_6S$ in the tablets from the *absorbance* of a 0.015% w/v solution of *gliquidone BPCRS* in *methanol* and using the declared content of $C_{27}H_{33}N_3O_6S$ in *gliquidone BPCRS*.

Human Glucagon for Injection

Action and use

Hormone; treatment of hyperglycaemia.

DEFINITION

Human Glucagon for Injection is a sterile material consisting of freeze-dried Human Glucagon (produced by recombinant DNA technology) with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections stated under Parenteral Preparations and with the following requirements.

Content of glucagon, $C_{153}H_{225}N_{43}O_{49}S$

75.0 to 104.0% of the stated amount.

IDENTIFICATION

In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH of a 0.1% w/v solution, 2.5 to 3.5, Appendix V L.

Related proteins and deamidated forms

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions and the normalisation procedure.

(1) Dissolve the powder being examined in 0.01M *hydrochloric acid* to obtain the equivalent of 0.05% w/v of human glucagon. *Maintain the solution at 2° to 8°.*

(2) Dissolve the contents of a vial of *human glucagon EPCRS* in 0.01M *hydrochloric acid* to obtain a concentration of 0.05 % w/v. *Maintain the solution at 2° to 8°.*

(3) Dissolve the powder being examined in 0.01M *hydrochloric acid* to obtain a concentration of about 0.05% w/v human glucagon. Heat at 50° for 48 hours (generation of all 4 deamidated forms of glucagon at a total concentration of not less than 7%).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.0 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (ACE 3 C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 0.5 mL per minute.

(d) Use a column temperature of 45°.

(e) Use a detection wavelength of 214 nm.

(f) Inject 15 µL of each solution.

MOBILE PHASE

Mobile phase A 200 volumes of *acetonitrile for chromatography* and 800 volumes of the solution prepared as described below.

Dissolve 16.3 g of *potassium dihydrogen orthophosphate* in 800 mL of *water*, adjust to pH 2.7 with *orthophosphoric acid.*

Mobile phase B 400 volumes of *acetonitrile for chromatography* and 600 volumes of *water.*

Use the following gradient elution.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-25	61	39	isocratic
25-29	61→12	39→88	linear gradient
29-30	12	88	isocratic
30-31	12→61	88→39	re-equilibration

Note: The relative retention time with respect to glucagon (retention time about 21 minutes) of deamidated glucagon 1 is about 1.1. The end time of the isocratic elution may be adjusted so that the gradient begins after elution of the peak due to deamidated glucagon 4 (relative retention with reference to glucagon about 1.4).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the peak due to glucagon and the following peak due to deamidated glucagon 1 is at least 1.5;

the 4 peaks eluting after the principal peak, that correspond to the deamidated forms, are clearly visible;

and, in the chromatogram obtained with solution (2):

the *symmetry factor* of the peak due to glucagon is a maximum of 1.8;

the *repeatability* has a maximum relative standard deviation of 2.0% after 5 injections.

LIMITS

In the chromatogram obtained with solution (1):

the total area of all deamidated forms is not greater than 10.0%;

the total area of all *secondary peaks* is not greater than 15.0%.

Water

Not more than 5.0%, Appendix IX C, Method III. Use the entire freeze dried contents of the sealed container (containing 1 mg of the powder).

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing 1 mg of Human Glucagon per mL (solution A). The endotoxin limit concentration of solution A is 10 IU of endotoxin per mL.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the method described under Related proteins and deamidated forms, injecting solutions (1) and (2).

DETERMINATION OF CONTENT

Calculate the content of human glucagon ($C_{153}H_{225}N_{43}O_{49}S$) from the chromatograms obtained and using the declared content of $C_{153}H_{225}N_{43}O_{49}S$ in *human glucagon EPCRS*.

www.webofpharma.com

STORAGE
Human Glucagon for Injection should be protected from light and stored strictly in accordance with the manufacturer's instructions.

Glucose Infusion

Glucose Injection

Glucose Intravenous Infusion

DEFINITION
Glucose Infusion is a sterile solution containing Anhydrous Glucose or Glucose. It is supplied as a ready-to-use solution.

The infusion complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of glucose, $C_6H_{12}O_6$
95.0 to 105.0% of the stated amount.

CHARACTERISTICS
A colourless solution. Solutions containing the equivalent of 200 g per litre or more of glucose, $C_6H_{12}O_6$, may be not more than faintly yellow in colour.

IDENTIFICATION
A. Heat with *cupri-tartaric solution R1*. A red precipitate is produced.

B. The solution prepared as directed in the Assay is dextrorotatory.

TESTS
Acidity
pH, 3.5 to 6.5, Appendix V L, when determined on a solution diluted, if necessary, with *water for injections*, to contain not more than the equivalent of 5% w/v of glucose, $C_6H_{12}O_6$, and to which 0.30 mL of a saturated solution of *potassium chloride* has been added for each 100 mL of solution.

5-Hydroxymethylfurfural and related substances
Dilute a volume containing the equivalent of 1.0 g of glucose, $C_6H_{12}O_6$, to 250 mL with *water*. The *absorbance* of the resulting solution at the maximum at 284 nm is not more than 0.25, Appendix II B.

Bacterial endotoxins
The endotoxin limit concentration is 0.25 IU per mL, Appendix XIV C. Dilute infusions containing more than 5% w/v of Glucose with *water BET* to contain 5% w/v.

ASSAY
To a volume containing the equivalent of 2 g to 5 g of glucose, $C_6H_{12}O_6$, add 0.2 mL of 5M *ammonia* and sufficient *water* to produce 100 mL. Mix well, allow to stand for 30 minutes and determine the *optical rotation* in a 2-dm tube, Appendix V F. The observed rotation in degrees multiplied by 0.9477 represents the weight in g of glucose, $C_6H_{12}O_6$, in the volume taken for assay.

LABELLING
The strength is stated as the equivalent number of grams of glucose, $C_6H_{12}O_6$, per litre.

When Glucose Infusion is required as a diluent for Injections or Infusions of the Pharmacopoeia, Glucose Infusion (50 g per litre) shall be used.

Glucose Irrigation Solution

DEFINITION
Glucose Irrigation Solution is a sterile solution of Anhydrous Glucose or Glucose in Water for Irrigation.

The irrigation solution complies with the requirements stated under Preparations for Irrigation and with the following requirements.

Content of glucose, $C_6H_{12}O_6$
95.0 to 105.0% of the stated amount.

CHARACTERISTICS
A colourless solution. Solutions containing the equivalent of 200 g per litre or more of glucose, $C_6H_{12}O_6$, may be not more than faintly straw coloured.

IDENTIFICATION
A. Heat with *cupri-tartaric solution R1*. A red precipitate is produced.

B. The solution prepared in the Assay is dextrorotatory.

TESTS
Acidity
pH, 3.5 to 6.5, Appendix V L, when determined in a solution diluted, if necessary, with *water* to contain not more than the equivalent of 5% w/v of glucose, $C_6H_{12}O_6$, and to which 0.30 mL of a saturated solution of *potassium chloride* has been added for each 100 mL of solution.

5-Hydroxymethylfurfural and related substances
Dilute a volume containing the equivalent of 1.0 g of glucose, $C_6H_{12}O_6$, to 250 mL with *water*. The *absorbance* of the resulting solution at the maximum at 284 nm is not more than 0.25, Appendix II B.

ASSAY
To a volume containing the equivalent of 2 to 5 g of glucose, $C_6H_{12}O_6$, add 0.2 mL of 5M *ammonia* and sufficient *water* to produce 100 mL. Mix well, allow to stand for 30 minutes and determine the *optical rotation* in a 2-dm tube, Appendix V F. The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of glucose, $C_6H_{12}O_6$, in the volume taken for assay.

LABELLING
The strength is stated in terms of the equivalent amount of glucose, $C_6H_{12}O_6$.

Compound Glucose, Sodium Chloride and Sodium Citrate Oral Solution

St. Marks Solution

NOTE: *Compound Glucose, Sodium Chloride and Sodium Citrate Oral Solution is not currently licensed in the United Kingdom.*

Action and use
Prevention and treatment of dehydration.

DEFINITION
Compound Glucose, Sodium Chloride and Sodium Citrate Oral Solution contains Anhydrous Glucose, Sodium Chloride and Sodium Citrate. It is prepared by dissolving the dry ingredients in the specified volume of Water just before issue for use.

www.webofpharma.com

Extemporaneous preparation
The following formula and directions apply.

Anhydrous Glucose	20 g
Sodium Chloride	3.5 g
Sodium Citrate	2.5 g
Water	Sufficient to produce 1000 mL

Dissolve the dry ingredients in Water and add sufficient Water to produce 1000 mL.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of glucose, $C_6H_{12}O_6$
1.9 to 2.1% w/v.

Content of sodium chloride, NaCl
0.33 to 0.37% w/v.

Content of sodium citrate, $C_6H_5Na_3O_7,2H_2O$
0.24 to 0.26% w/v.

IDENTIFICATION
A. Heat 10 mL with *cupri-tartaric solution R1*. A red precipitate is produced.

B. Yields reaction A characteristic of *sodium salts*, reaction A characteristic of *chlorides* and the reactions characteristic of *citrates*, Appendix VI.

C. The solution prepared as directed in the Assay for glucose is dextrorotatory.

TESTS
Acidity or alkalinity
pH, 5.5 to 7.5, Appendix V L.

ASSAY
For glucose
To 100 mL of the solution add 0.2 mL of 5M *ammonia* and mix well. Allow to stand for 30 minutes and determine the *optical rotation* in a 2-dm tube, Appendix V F. Multiply the observed rotation in degrees by 0.9477, then by 1.002 and then by 10 to calculate the weight in grams of glucose, $C_6H_{12}O_6$, in the original powder.

For sodium chloride
Titrate 20 mL of the solution with 0.1M *silver nitrate VS* using *potassium chromate solution* as indicator. Each mL of *silver nitrate VS* is equivalent to 5.844 mg of NaCl.

For sodium citrate
Evaporate 25 mL of the solution almost to dryness on a rotary evaporator, add 10 mL of *acetone* and evaporate to dryness. Add 10 mL of *acetone*, 10 mL of *acetic anhydride* and 20 mL of *anhydrous acetic acid* to the residue and warm to about 60° until dissolution is complete. Allow to cool and carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.25 mL of *crystal violet solution* as indicator, titrating to a blue end point. Each mL of 0.1M *perchloric acid VS* is equivalent to 9.803 mg of $C_6H_5Na_3O_7,2H_2O$.

STORAGE
Compound Glucose, Sodium Chloride and Sodium Citrate Oral Solution should be stored at a temperature of 2° to 8°.

LABELLING
The label states that any portion of the oral solution that remains unused 24 hours after preparation should be discarded.

Glutaraldehyde Solution

DEFINITION
Glutaraldehyde Solution is a dilution of Strong Glutaraldehyde Solution in a mixture of Purified Water and Ethanol (96 per cent).

In making Glutaraldehyde Solution, Ethanol (96 per cent) may be replaced by Industrial Methylated Spirit[1].

Content of glutaraldehyde, $C_5H_8O_2$
9.2 to 10.5% w/v.

IDENTIFICATION
A. Heat 5 mL with 10 mL of a solution containing 1 g of *hydroxylamine hydrochloride* and 2 g of *sodium acetate* on a water bath for 10 minutes, allow to cool and filter. The *melting point* of the residue, after washing with *water* and drying at 105°, is about 178°, Appendix V A.

B. To 1 mL add 2 mL of *ammoniacal silver nitrate solution* and mix gently for a few minutes. Silver is deposited.

TESTS
Ethanol content
50.0 to 60.0% v/v, Appendix VIII F.

ASSAY
Mix 10 mL with 100 mL of a 7% w/v solution of *hydroxylamine hydrochloride* previously neutralised to *bromophenol blue solution* with 1M *sodium hydroxide VS* and allow to stand for 30 minutes. Add 20 mL of *petroleum spirit (boiling range, 40° to 60°)* and titrate with 1M *sodium hydroxide VS* until the colour of the aqueous phase matches that of a 7% w/v solution of *hydroxylamine hydrochloride* previously neutralised to *bromophenol blue solution* with 1M *sodium hydroxide VS*. Each mL of 1M *sodium hydroxide VS* is equivalent to 50.05 mg of $C_5H_8O_2$.

[1]The *law and the statutory regulations governing the use of Industrial Methylated Spirit must be observed.*

Glycerol Eye Drops

DEFINITION
Glycerol Eye Drops are a sterile solution of Glycerol in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of glycerol, $C_3H_8O_3$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
Mix 1 mL of the eye drops with 0.5 mL of *nitric acid* and superimpose 0.5 mL of *potassium dichromate solution*. A blue ring develops at the interface of the liquids, which does not diffuse into the lower layer within 10 minutes.

TESTS
Acidity or alkalinity
pH, 4.5 to 7.5, Appendix V L.

ASSAY
Dilute a suitable volume of the eye drops with sufficient *water* to produce a solution containing 3% w/v of Glycerol. To 5 mL add 150 mL of *water* and neutralise with 0.1M *sodium hydroxide VS*, using *bromocresol purple solution* as indicator. Add 1.6 g of *sodium periodate* and allow to stand protected from light for 15 minutes. Add 3 mL of *propan-1,2-diol*, shake, allow to stand protected from light for

www.webofpharma.com

5 minutes and titrate with 0.1M *sodium hydroxide VS*. Each mL of 0.1M *sodium hydroxide VS* is equivalent to 9.21 mg of $C_3H_8O_3$.

STORAGE

Glycerol Eye Drops should be protected from light.

Strengths available

Eye Drops containing 10, 20, 30 and 50% w/v of glycerol are available.

Glycerol Suppositories

Glycerin Suppositories

DEFINITION

Gelatin	14 g
Glycerol	70 g
Purified Water	A sufficient quantity

In tropical and subtropical countries the quantity of Gelatin may be increased to an amount not exceeding 18 g.

Extemporaneous preparation

The following directions apply.

Add the Gelatin to about 30 mL of Purified Water heated nearly to boiling, then add the Glycerol previously heated to 100° and heat the mixture on a water bath for 15 minutes or until solution is complete. Adjust the weight of the product to 100 g by the addition of hot Purified Water or by evaporation on a water bath and pour into suitable moulds.

The suppositories comply with the requirements stated under Rectal Preparations and with the following requirements.

Content of glycerol, $C_3H_8O_3$

66.5 to 73.5% w/w.

Disintegration

Maximum time, 1 hour, Appendix XII A2.

ASSAY

Dissolve a number of suppositories containing 8 g of Glycerol in 50 mL of *water* and add sufficient *water* to produce 250 mL. To 5 mL add 150 mL of *water* and 0.25 mL of *bromocresol purple solution* and neutralise with 0.1M *sodium hydroxide VS* to the blue colour of the indicator. Add 1.6 g of *sodium periodate* and allow to stand for 15 minutes. Add 3 mL of *propan-1,2-diol*, shake, allow to stand for 5 minutes and titrate with 0.1M *sodium hydroxide VS* to the same blue colour. Each mL of 0.1M *sodium hydroxide VS* is equivalent to 9.210 mg of $C_3H_8O_3$.

Glyceryl Trinitrate Ointment

Action and use

Vasodilator.

DEFINITION

Glyceryl Trinitrate Ointment contains Glyceryl Trinitrate in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of glyceryl trinitrate, $C_3H_5N_3O_9$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) To a quantity of the ointment containing 40 mg of Glyceryl Trinitrate add 80 mL of *methanol*, disperse with the aid of ultrasound for 30 minutes, cool in ice and filter. Dilute 1 volume of the filtrate to 5 volumes with *methanol*.

(2) Dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient *methanol* to produce a solution containing approximately 0.01% w/v of Glyceryl Trinitrate.

(3) Equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel plate* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in a current of cool air, spray with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes and examine in daylight.

MOBILE PHASE

20 volumes of *ethyl acetate* and 80 volumes of *toluene*.

SYSTEM SUITABILITY

The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the ointment containing 50 mg of Glyceryl Trinitrate add 70 mL of *methanol* and completely disperse with the aid of ultrasound. Cool the contents in ice for 30 minutes, allow to attain room temperature, add sufficient *methanol* to produce 100 mL and centrifuge.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol*.

(3) Dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient 1M *hydrochloric acid* to produce a solution containing 0.05% w/v of Glyceryl Trinitrate and heat in a reaction vial at 100° for 30 minutes (production of the dinitrate impurities).

(4) Dilute 1 volume of solution (2) to 10 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

(f) Inject 50 µL of each solution.

www.webofpharma.com

(g) For solution (1), allow the chromatography to proceed for three times the retention time of the principal peak.

MOBILE PHASE

50 volumes of *acetonitrile R1* and 50 volumes of *water*.

When the chromatograms are recorded under the prescribed conditions the retention times relative to glyceryl trinitrate (retention time, about 11 minutes) are: glyceryl mononitrate, about 0.23; 1,3-glyceryl dinitrate, about 0.42; 1,2-glyceryl dinitrate, about 0.45.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) resembles the reference chromatogram supplied with *glyceryl trinitrate solution BPCRS*, in that it shows a principal peak due to glyceryl trinitrate and two clearly separated peaks due to the dinitrate impurities.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to glyceryl mononitrate, 1,3-glyceryl dinitrate or 1,2-glyceryl dinitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any other *secondary peaks* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of all *secondary peaks* is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the ointment containing 40 mg of Glyceryl Trinitrate add 70 mL of *methanol* and, completely disperse with the aid of ultrasound. Cool the contents in ice for 30 minutes, allow to attain room temperature, add sufficient *methanol* to produce 100 mL and centrifuge.

(2) Dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient *methanol* to produce a solution containing 0.04% w/v of Glyceryl Trinitrate.

(3) Dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient 1M *hydrochloric acid* to produce a solution containing 0.05% w/v of Glyceryl Trinitrate and heat in a reaction vial at 100° for 30 minutes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 225 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

50 volumes of *methanol* and 50 volumes of *water*.

When the chromatograms are recorded under the prescribed conditions the retention times relative to glyceryl trinitrate (retention time, about 9 minutes) are: 1,3-glyceryl dinitrate, about 0.4; 1,2-glyceryl dinitrate, about 0.45; isosorbide dinitrate, about 0.7.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the peak to valley ratio between 1,3-glyceryl dinitrate and 1,2-glyceryl dinitrate is at least 5.

DETERMINATION OF CONTENT

Calculate the content of $C_3H_5N_3O_9$ in the ointment using the declared content of $C_3H_5N_3O_9$ in *glyceryl trinitrate solution BPCRS*.

Glyceryl Trinitrate Sublingual Spray

DEFINITION

Glyceryl Trinitrate Sublingual Spray contains Glyceryl Trinitrate Solution in a suitable vehicle either in a suitable pressurised container or in a container fitted with a spray device.

PRODUCTION

A suitable test is carried out to demonstrate the uniformity of dose.

The oromucosal spray complies with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of glyceryl trinitrate, $C_3H_5N_3O_9$

80.0 to 120.0% of the amount stated to be delivered per metered dose.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck silica gel plates are suitable) and a mixture of 20 volumes of *ethyl acetate* and 80 volumes of *toluene* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) expel a number of metered doses containing the equivalent of about 4 mg of glyceryl trinitrate into a beaker, add 5 mL of *acetone*, transfer to a graduated flask and add sufficient *acetone* to produce 10 mL. For solution (2) dilute a quantity of *glyceryl trinitrate solution BPCRS* with *methanol (50%)* to produce a solution containing 0.04% w/v of glyceryl trinitrate. Solution (3) is a mixture of equal volumes of solutions (1) and (2). After removal of the plate, allow it to dry in air and spray with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes and examine in daylight. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) expel a number of metered doses containing the equivalent of about 5 mg of glyceryl trinitrate into a beaker, dilute to 5 mL with *methanol*, mix well and add sufficient *water* to produce 10 mL. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *methanol (50%)*. For solution (3) dilute a quantity of *glyceryl trinitrate*

www.webofpharma.com

solution BPCRS with sufficient 1M *hydrochloric acid* to produce a solution containing 0.05% w/v of glyceryl trinitrate and heat in a reaction vial at 100° for 30 minutes.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 1.0 mL per minute a mixture of 50 volumes of *acetonitrile* and 50 volumes of *water* and (c) a detection wavelength of 210 nm.

The test is not valid unless the chromatogram obtained with solution (3) resembles the reference chromatogram supplied with *glyceryl trinitrate solution BPCRS* in that it shows a principal peak due to glyceryl trinitrate and two clearly separated peaks due to the dinitrate impurities with retention times relative to glyceryl trinitrate of approximately 0.5.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%) and the sum of areas of any *secondary peaks* is not greater than three times the area of the principal peak in the chromatogram obtained with solution (2) (3%). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) collect 10 metered doses in a vessel avoiding loss of material, dissolve the expelled material in *methanol* and dilute with sufficient *methanol* to produce a solution containing the equivalent of 0.04% w/v of glyceryl trinitrate. For solution (2) dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient *methanol (50%)* to produce a solution containing 0.04% w/v of glyceryl trinitrate.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 1.3 mL per minute a mixture of 50 volumes of *methanol* and 50 volumes of *water* and (c) a detection wavelength of 225 nm.

Calculate the content of $C_3H_5N_3O_9$ per metered dose using the declared content of $C_3H_5N_3O_9$ in *glyceryl trinitrate solution BPCRS*.

Glyceryl Trinitrate Tablets

Glyceryl Trinitrate Sublingual Tablets; Trinitrin Tablets; Nitroglycerin Tablets

DEFINITION

Glyceryl Trinitrate Tablets are *sublingual tablets* made with Mannitol as the basis and may be prepared by adding Glyceryl Trinitrate Solution of an appropriate concentration to dried granules of Mannitol, mixing intimately, drying at a temperature not exceeding 50° or without heating for not more than 4 hours and compressing.

CAUTION *Undiluted glyceryl trinitrate can be exploded by percussion or excessive heat. Appropriate precautions should be exercised and only exceedingly small amounts should be isolated.*

The tablets comply with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of glyceryl trinitrate, $C_3H_5N_3O_9$
85.0 to 115.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract a quantity of the powdered tablets containing 0.5 mg of glyceryl trinitrate with 1 mL of *acetone* and centrifuge.

(2) Dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient *water* to produce a solution containing 0.05% w/v of glyceryl trinitrate.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in a stream of air, spray with *diphenylamine solution R1* and irradiate for 15 minutes with *ultraviolet light (365 nm)*. Examine the plate in daylight.

MOBILE PHASE

toluene.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. Extract a quantity of the powdered tablets containing 3 mg of glyceryl trinitrate with 5 mL of *ether* and filter. Evaporate the ether and dissolve the residue in 0.2 mL of *sulfuric acid* containing a trace of *diphenylamine*. An intense blue colour is produced.

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a quantity of the powdered tablets containing 2.5 mg of glyceryl trinitrate with 10 mL of *acetonitrile* with the aid of ultrasound, filter through a 4-µm filter and dilute one volume of the filtrate with an equal volume of *water*.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) Dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient 1M *hydrochloric acid* to produce a solution containing 0.05% w/v of glyceryl trinitrate and heat in a reaction vial at 100° for 30 minutes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

(f) Inject 50 µL of each solution.

(g) For solution (1), allow the chromatography to proceed for three times the retention time of the principal peak.

MOBILE PHASE

40 volumes of *acetonitrile* and 60 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) resembles the reference chromatogram supplied

www.webofpharma.com

with *glyceryl trinitrate solution BPCRS* in that it shows a principal peak due to glyceryl trinitrate and two clearly separated peaks due to the dinitrate impurities with retention times relative to glyceryl trinitrate of approximately 0.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any such peaks is not greater than three times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of glyceryl trinitrate comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 2 mL of *acetonitrile* to one tablet, mix with the aid of ultrasound for 5 minutes, filter through a 4-µm filter and dilute 1 volume of the filtrate with an equal volume of *water*.

(2) Dilute *glyceryl trinitrate solution BPCRS* with the mobile phase to produce a solution containing the equivalent amount of glyceryl trinitrate as that expected for solution (1).

(3) Dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient 1M *hydrochloric acid* to produce a solution containing 0.05% w/v of glyceryl trinitrate and heat in a reaction vial at 100° for 30 minutes.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used, with the exception of the run time.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) resembles the reference chromatogram supplied with *glyceryl trinitrate solution BPCRS* in that it shows a principal peak due to glyceryl trinitrate and two clearly separated peaks due to the dinitrate impurities with retention times relative to glyceryl trinitrate of approximately 0.5.

DETERMINATION OF CONTENT

Calculate the content of $C_3H_5N_3O_9$ in each tablet from the chromatograms obtained and using the declared content of $C_3H_5N_3O_9$ in *glyceryl trinitrate solution BPCRS*.

ASSAY

Use the average of the 10 individual results obtained in the test for Uniformity of content.

STORAGE

Glyceryl Trinitrate Tablets should be protected from light and stored in a glass container closed by means of a screw closure lined with aluminium or tin foil; additional packing that absorbs glyceryl trinitrate should be avoided. Glyceryl Trinitrate Tablets should be issued for patients in containers of not more than 100 tablets.

Glyceryl Trinitrate Transdermal Patches

DEFINITION

Glyceryl Trinitrate Transdermal Patches contain glyceryl trinitrate in a suitable matrix or reservoir presentation. They are prepared from Glyceryl Trinitrate Solution.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of glyceryl trinitrate.

The transdermal patches comply with the requirements stated under Transdermal Patches and with the following requirements.

Content of glyceryl trinitrate, $C_3H_5N_3O_9$

90.0 to 115.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Clean the outer surface of a patch using a lint-free cloth moistened with *methanol*. Remove the release liner and score the exposed surface. Place the patch in a flask containing sufficient *methanol* to produce a solution containing 0.1% w/v of glyceryl trinitrate, mix with the aid of ultrasound in a water bath at 40° for 15 minutes and then shake mechanically at room temperature for 3 hours. Dilute the methanolic extract with sufficient *water* to produce a final concentration of 0.05% w/v of glyceryl trinitrate.

(2) Dilute a quantity of *glyceryl trinitrate solution BPCRS* with *methanol (50%)* to produce a solution containing 0.05% w/v of glyceryl trinitrate.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes and examine in daylight.

MOBILE PHASE

20 volumes of *ethyl acetate* and 80 volumes of *toluene*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the test for Uniformity of content, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Clean the outer surface of five patches using a lint-free cloth moistened with *methanol*. Remove the release liners and score the exposed surfaces. Place the patches in a flask containing sufficient *methanol* to produce a solution containing 0.1% w/v of glyceryl trinitrate, mix with the aid of ultrasound in a water bath at 40° for 15 minutes and then shake mechanically at room temperature for 3 hours. Dilute the methanolic extract with sufficient *water* to produce a final concentration of 0.05% w/v of glyceryl trinitrate.

www.webofpharma.com

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol (50%)*.

(3) Dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient 1M *hydrochloric acid* to produce a solution containing 0.05% w/v of glyceryl trinitrate and heat in a reaction vial at 100° for 30 minutes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Equal volumes of *acetonitrile* and *water*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the reference chromatogram supplied with *glyceryl trinitrate solution BPCRS* in that it shows a principal peak due to glyceryl trinitrate and two clearly separated peaks due to the dinitrate impurities with retention times relative to glyceryl trinitrate of approximately 0.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any *secondary peaks* is not greater than three times the area of the principal peak in the chromatogram obtained with solution (2) (3%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Uniformity of content

Comply with the requirements stated under *uniformity of content*, Appendix XII C3, Test C, with respect to the individual content of each dosage unit and using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Clean the outer surface of a patch using a lint-free cloth moistened with *methanol*. Remove the release liner and score the exposed surface. Place the patch in a flask containing sufficient *methanol* to produce a solution containing 0.1% w/v of glyceryl trinitrate, mix with the aid of ultrasound in a water bath at 40° for 15 minutes, shake mechanically at room temperature and dilute a volume of the solution with an equal volume of *water*.

(2) Dilute a quantity of *glyceryl trinitrate solution BPCRS* with sufficient *methanol (50%)* to produce a solution containing 0.05% w/v of glyceryl trinitrate.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_3H_5N_3O_9$ in the transdermal patch using the declared content of $C_3H_5N_3O_9$ in *glyceryl trinitrate solution BPCRS*.

ASSAY

Use the average of the 10 results obtained in the test for Uniformity of content.

IMPURITIES

A. Glyceryl-1,2-dinitrate,

B. Glyceryl-1,3-dinitrate.

Glycine Irrigation Solution

DEFINITION

Glycine Irrigation Solution is a sterile solution of Glycine in Water for Irrigation.

The irrigation solution complies with the requirements stated under Preparations for Irrigation and with the following requirements.

Content of glycine, $C_2H_5NO_2$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

A. Evaporate 5 mL to dryness on a water bath and dry at 105° for 1 hour. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of glycine *(RS 171)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the irrigation solution with *water* to contain 0.25% w/v of Glycine.

(2) 0.25% w/v of *glycine* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it at 100° to 105° for 10 minutes, spray with *ninhydrin solution* and heat at 100° to 105° for 2 minutes.

MOBILE PHASE

30 volumes of 13.5M *ammonia* and 70 volumes of *propan-1-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 4.5 to 6.5, Appendix V L.

Ammonium compounds

Dilute a volume containing 0.2 g of Glycine to 70 mL with *water* in an ammonia-distillation apparatus, add 25 mL of a solution prepared by boiling 25 mL of 5M *sodium hydroxide* with 50 mL of *water* and 50 mg of *aluminium* until the volume is reduced to 25 mL and distil into 2 mL of a saturated solution of *boric acid* until 50 mL is obtained. Add 2 mL of a solution prepared by boiling 25 mL of 5M *sodium hydroxide* with 50 mL of *water* until the volume is reduced to 25 mL and 2 mL of *alkaline potassium tetraiodomercurate solution*. Any colour produced is not more intense than that obtained by treating 70 mL of *water* containing 4 mL of *ammonia standard solution (10 ppm NH_4)*

www.webofpharma.com

in the same manner, beginning at the words 'add 25 mL of...' (200 ppm, calculated with reference to the content of glycine).

ASSAY

Dilute a volume containing 0.15 g of Glycine to 25 mL with *water* and add 10 mL of *formaldehyde solution* previously adjusted to pH 9.0 and 0.25 mL of a mixed indicator solution prepared by dissolving 75 mg of *phenolphthalein* and 25 mg of *thymol blue* in 100 mL of *ethanol (50%)*. Titrate with 0.1M *sodium hydroxide VS* until the yellow colour disappears and a faint violet colour is produced. Each mL of 0.1M *sodium hydroxide VS* is equivalent to 7.507 mg of $C_2H_5NO_2$.

Glycopyrronium Bromide Oral Solution

NOTE: Glycopyrronium Bromide Oral Solution is not currently licensed in the United Kingdom.

Action and use

Anticholinergic.

DEFINITION

Glycopyrronium Bromide Oral Solution is a solution of Glycopyrronium Bromide in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of glycopyrronium bromide, $C_{19}H_{28}BrNO_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *water*.

(1) Dilute a volume of the oral solution, if necessary, to produce a solution containing 0.01% w/v of Glycopyrronium Bromide.

(2) 0.01% w/v of *glycopyrronium bromide BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 30 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with a solution of 10 volumes of *potassium iodide solution*, 10 volumes of *potassium iodobismuthate solution*, 12 volumes of *glacial acetic acid* and 67 volumes of *water*.

MOBILE PHASE

20 volumes of *glacial acetic acid*, 20 volumes of *water* and 60 volumes of *butan-1-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute a weighed quantity of the oral solution, if necessary, to produce a solution containing 0.01% w/v of Glycopyrronium Bromide.

(2) 0.01% w/v of *glycopyrronium bromide BPCRS*.

(3) Dissolve 2 mg of *benzaldehyde EPCRS* in solution (2) and dilute to 100 mL with solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use either a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5 µm) (Phenomenex PhenoSphere CN is suitable) or a stainless steel column (25 cm × 4.6 mm) packed with spherical *base-deactivated, end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Restek Pinnacle DB C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 222 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

3 volumes of 0.5M *sulfuric acid*, 25 volumes of *acetonitrile*, 150 volumes of *methanol* and 615 volumes of a solution containing 0.16% w/v of *sodium pentanesulfonate* and 0.032% w/v of *sodium sulfate*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to benzaldehyde and glycopyrronium bromide is at least 3.0.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{19}H_{28}BrNO_3$, weight in volume, using the declared content of $C_{19}H_{28}BrNO_3$ in *glycopyrronium bromide BPCRS*.

STORAGE

Glycopyrronium Bromide Oral Solution should be protected from light.

Goserelin Implants

Action and use

Gonadotrophin-releasing hormone, gonadorelin analogue; treatment of prostate cancer.

DEFINITION

Goserelin Implants are biodegradable and biocompatible cylinders for subcutaneous injection containing Goserelin, as acetate, dispersed in a polymeric matrix. They are formulated so that the medicament is released over a period of weeks.

The implants comply with the requirements stated under Parenteral Preparations and with the following requirements.

Content of goserelin, $C_{59}H_{84}N_{18}O_{14}$

90.0 to 110.0% of the stated amount of the peptide.

IDENTIFICATION

In test B for Related substances, the retention time of the principal peak in the chromatogram obtained with

www.webofpharma.com

solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Drug release

NOTE: *Suitable procedures should be employed to minimise the presence of bacteria on glassware immediately prior to the dissolution tests.*

For 3.6 mg implants

PROCEDURE

Perform the test in a 120-mL flat-bottomed glass jar with a cap, incubated at 39° ± 0.5°. Use as the medium 50 mL of a pH 7.4 buffer solution prepared by dissolving 25.8 g of *anhydrous disodium hydrogen orthophosphate*, 1.92 g of *citric acid* and 0.2 g *sodium azide* in sufficient *distilled water* to produce 1000 mL. Adjust the pH of the resulting solution to 7.4 with *anhydrous disodium hydrogen orthophosphate* or *citric acid*, if necessary, and filter through a sterile filter with a nominal pore size not greater than 0.2 µm into a sterile container. Place 5 implants into the glass vessel, add 50 mL of the medium and place in the incubator. At the times specified in Table I remove the vessel from the incubator and allow to cool to room temperature. Swirl gently to ensure a uniform solution and withdraw a 5 mL sample. Dilute the sample with 5 mL of the medium, filter if necessary and measure the average *absorbance* of the resulting solution, Appendix II B, at 275 to 285 nm using the dissolution medium in the reference cell. Add 5 mL of the medium to the dissolution vessel to replace the volume removed and return the vessel to the incubator. At least three replicate analyses should be performed.

Table I

Test Duration Hours (days)	Amount dissolved (each replicate)
168 (7)	2 to 20%
336 (14)	25 to 55%
408 (17)	35 to 75%
504 (21)	65 to 90%
672 (28)	85 to 105%

DETERMINATION OF CONTENT

Calculate the content of $C_{59}H_{84}N_{18}O_{14}$ dissolved in the portions of the medium from the *absorbance* obtained from a solution prepared by diluting a suitable amount of *goserelin EPCRS* in the dissolution medium and using the declared content of $C_{59}H_{84}N_{18}O_{14}$ in *goserelin EPCRS*; at the times specified in Table I the cumulative percentages comply with the criteria given.

For 10.8 mg implants

PROCEDURE

Perform the test using the same apparatus as described for the 3.6 mg strength implant. Use as the medium 50 mL of a phosphate buffered saline pH 7.4 (PBS) solution prepared by mixing 8 g of *sodium chloride*, 0.19 g of *potassium dihydrogen orthophosphate*, 1.38 g of *anhydrous disodium hydrogen orthophosphate* and 0.2 g of *sodium azide* in 1000 mL of *distilled water*. Adjust the pH of the solution, if necessary to 7.4 with 2M *hydrochloric acid*. Filter the solution through a sterile filter with a nominal pore size not greater than 0.2 µm into a sterile container. Transfer 50 mL of medium to a vessel and heat at 39° ± 0.5°. Place a single implant into the vessel and withdraw 5-mL aliquots at 24, 72, 168 and 264 hours (1, 3, 7 and 11 days) and 20-mL aliquots at 336, 504, 672, 840, 1008, 1176, 1344, 1512, 1680, 1848 and 2016 hours (14, 21, 28, 35, 42, 49, 56, 63, 70, 77 and 84 days) following gentle swirling to ensure a uniform solution. Replace the volume removed with the equivalent amount of warmed medium. Filter the aliquot, if necessary, and measure the average *absorbance* of the solution, Appendix II B, at 275 to 285 nm using the dissolution medium in the reference cell. At least six replicate analyses should be performed.

Table II

Test Duration Hours (days)	Amount dissolved (each replicate)
72 (3)	5 to 30%
336 (14)	10 to 45%
840 (35)	15 to 60%
1,344 (56)	55 to 90%
2,016 (84)	Not less than 70%

DETERMINATION OF CONTENT

Calculate the content of $C_{59}H_{84}N_{18}O_{14}$ dissolved in the portions of the medium from the *absorbance* obtained from a solution prepared by diluting a suitable amount of *goserelin EPCRS* in the dissolution medium and using the declared content of $C_{59}H_{84}N_{18}O_{14}$ in *goserelin EPCRS*. At all time points calculate the cumulative percentage of the labelled amount of $C_{59}H_{84}N_{18}O_{14}$ dissolved; at the times specified in Table II the cumulative percentages comply with the criteria given.

Related substances

A. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Weigh and dissolve 10 implants, with the aid of ultrasound, in a mixture of 15 volumes of *water* and 85 volumes of *acetonitrile* to obtain a solution containing 0.2% w/v of Goserelin.

(2) 0.002% w/v of *goserelin EPCRS* in a mixture of 15 volumes of *water* and 85 volumes of *acetonitrile*.

(3) 0.002% w/v each of *4-D-Ser-goserelin EPCRS* and *goserelin EPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.8 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 5 µL of each solution.

www.webofpharma.com

MOBILE PHASE

0.272% w/v of *potassium dihydrogen orthophosphate* in a mixture of 27 volumes of *acetonitrile* and 73 volumes of *water*. Adjust the pH to 3.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution* between the peaks due to 4-D-Ser-goserelin and goserelin is at least 4.5;

the *symmetry factor* of the peak due to goserelin is less than 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any *secondary peaks* is not greater than four times the area of the principal peak in the chromatogram obtained with solution (2) (4%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

B. Carry out the method for *size-exclusion chromatography*, Appendix III C, using the following solutions.

(1) Weigh and dissolve 10 implants, with the aid of ultrasound, in a mixture of 15 volumes of *water* and 85 volumes of *acetonitrile* to obtain a solution containing 0.2% w/v of Goserelin.

(2) 0.002% w/v of *goserelin EPCRS* in a mixture of 15 volumes of *water* and 85 volumes of *acetonitrile*.

(3) 0.002% w/v each of *4-D-Ser-goserelin EPCRS* and *goserelin EPCRS* in a mixture of 20 volumes of *water* and 80 volumes of *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 7.8 mm) packed with *hydrophilic silica gel for chromatography* (5 µm) with a fractionation range for proteins with a relative molecular mass of approximately 4000 to 500 000 (TSK-GEL-G2000 SWXL is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

8 volumes of the solution prepared as described below and 92 volumes of *acetonitrile*.

To prepare the solution add 167.5 g of a 60% w/v solution of *perchloric acid* to a 1000 mL volumetric flask, cool in ice and dilute to volume with 1M *sodium hydroxide*. To 100 mL of this solution add sufficient *water* to produce 1000 mL and adjust the pH of the solution to 2.1 with 5M *sodium hydroxide*.

When the chromatograms are recorded using the prescribed conditions the retention times relative to goserelin (retention time about 40 minutes) are: impurity 11, about 0.93; impurity 7 (polymer envelope), about 0.1 to 0.6.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to 4-D-Ser-goserelin and goserelin is at least 4.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity 11 is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%);

the sum of the areas of any peaks corresponding to the polymer envelope is not greater than 5.5 times the area of the principal peak in the chromatogram obtained with solution (2) (5.5%).

C. Carry out the method for *size-exclusion chromatography*, Appendix III C, using the following solutions.

(1) Weigh and dissolve 10 implants, with the aid of ultrasound, in a mixture of 15 volumes of *water* and 85 volumes of *acetonitrile* to obtain a solution containing 0.2% w/v of Goserelin.

(2) 0.002% w/v of *goserelin EPCRS* in a mixture of 15 volumes of *water* and 85 volumes of *acetonitrile*.

(3) To 4 mg of *goserelin EPCRS* add 250 µL of *trifluoroacetic acid* and leave to stand for 24 hours. Dissolve the product in 20 mL of a mixture of 15 volumes of *water* and 85 volumes of *acetonitrile* to obtain a solution containing des-*t*-butyl-goserelin.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 7.8 mm) packed with *hydrophilic silica gel for chromatography* (5 µm) with a fractionation range for proteins with a relative molecular mass of approximately 4000 to 500 000 (TSK-GEL-G2000 SWXL is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

12.5 volumes of the solution prepared as described below and 87.5 volumes of *acetonitrile*.

Add 167.5 g of a 60% w/v solution of *perchloric acid* to a 1000 mL volumetric flask, cool in ice and dilute to volume with 1M *sodium hydroxide*. To 100 mL of this solution add sufficient *water* to produce 1000 mL and adjust the pH of the solution to 2.1 with 5M *sodium hydroxide*.

When the chromatograms are recorded using the prescribed conditions the retention time relative to des-*t*-butyl-goserelin (retention time about 20 minutes) of impurity 13 is about 1.1.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the retention time of des-*t*-butyl-goserelin is between 19 and 22 minutes.

LIMITS

In the chromatogram obtained with solution (1) the area of the peak corresponding to impurity 13 is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

The sum of impurities obtained in tests B and C is not more than 10%.

www.webofpharma.com

Acetic acid

Carry out the method for *gas chromatography*, Appendix III B, using a 2% v/v solution of n-*hexadecane* (internal standard) in *dimethylformamide* (solution B) and the following solutions.

(1) Dissolve a quantity of the implant and a quantity of solution B and dilute with sufficient *dimethylformamide* to obtain a solution containing about 2.8% w/v Goserelin Implant and 0.1% v/v n-*hexadecane*.

(2) Prepare a solution containing 0.625% w/v of *glacial acetic acid* in *dimethylformamide*. To 10 mL of this solution add 5 mL of solution B and dilute to 100 mL with *dimethylformamide*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a free fatty acid phase capillary column (10 m × 0.32 mm) with a nominal film thickness of 0.2 to 0.3 µm (FFAP CB is suitable).

(b) Use *helium* as the carrier gas at a flow rate of 1.3 mL per minute with a flow rate of the make up gas of 30 mL per minute.

(c) Use the gradient conditions described below.

(d) Use an injection temperature of 200°

(d) Use a flame ionisation detector at a temperature of 250°.

(e) Inject 1 µL of each solution.

(f) Use a split ratio of 100:30.

Time (Minutes)	Temperature	Comment
0→1	50°	isothermal
1→6	50°→200°	linear gradient
6→9	200°	isothermal
9→10	200°→50°	linear gradient
10-15	50°	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2):

the *resolution* between the peaks due to *acetic acid* and n-*hexadecane* is at least 15;

the *symmetry factor* of the peak due to acetic acid is less than 2.0.

LIMITS

In the chromatogram obtained with solution (1) the ratio of the area of any peak corresponding to acetic acid to the area of the peak due to the internal standard is not greater than the corresponding ratio in the chromatogram obtained with solution (2) (2.5%).

Water

Not more than 2.5% w/w, Appendix IX C. Use Method III. Prepare the sample by dissolving approximately 110 mg of the implant in 4 mL of dry *dimethylformamide*.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the copolymer using 2 mL of *acetonitrile* per implant and dilute to a suitable concentration with *water BET* (solution A). The endotoxin limit concentration of solution A is 350 IU of endotoxin per implant.

Uniformity of content

The implants comply with the limits described in test A for *uniformity of content*, Appendix XII C, using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve with the aid of ultrasound, 1 implant in a mixture of 15 volumes of *water* and 85 volumes of *acetonitrile* to obtain a solution containing 0.02% w/v Goserelin.

(2) 0.02% w/v of *goserelin EPCRS* in a mixture of 15 volumes of *water* and 85 volumes of *acetonitrile*.

(3) 0.02% w/v each of *goserelin hexapeptide BPCRS* and *goserelin EPCRS* in a mixture of 4 volumes of *water* and 1 volume of *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.8 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

0.272% w/v of *potassium dihydrogen orthophosphate* in a mixture of 45 volumes of *water* and 55 volumes of *methanol*. Adjust the pH to 3.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to goserelin hexapeptide and goserelin is not less than 4.0.

DETERMINATION OF CONTENT

Calculate the total content of goserelin, $C_{59}H_{84}N_{18}O_{14}$, from the chromatograms obtained and using the declared content of $C_{59}H_{84}N_{18}O_{14}$ in *goserelin EPCRS*.

ASSAY

Carry out the method for *size-exclusion chromatography*, Appendix III C, using the following solutions.

(1) Weigh and dissolve 10 implants, with the aid of ultrasound, in a mixture of 15 volumes of *water* and 85 volumes of *acetonitrile* to obtain a solution containing 0.2% w/v of Goserelin.

(2) 0.2% w/v of *goserelin EPCRS* in a mixture of 15 volumes of *water* and 85 volumes of *acetonitrile*.

(3) 0.002% w/v each of *4-D-Ser-goserelin EPCRS* and *goserelin EPCRS* in a mixture of 20 volumes of *water* and 80 volumes of *acetonitrile*.

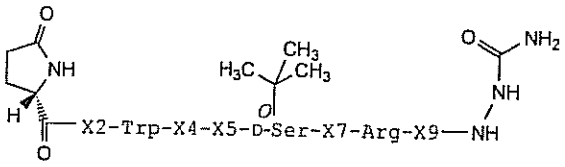
CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances test B, may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to 4-D-Ser-goserelin and goserelin is at least 4.0.

DETERMINATION OF CONTENT

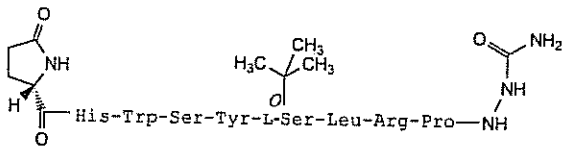


Calculate the content of goserelin, $C_{59}H_{84}N_{18}O_{14}$, from the chromatograms obtained and using the declared content of $C_{59}H_{84}N_{18}O_{14}$ in *goserelin EPCRS*.

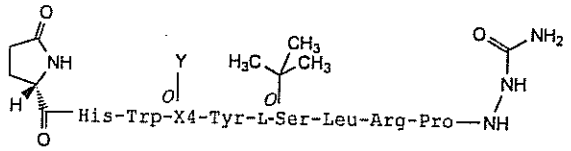
www.webofpharma.com

STORAGE
Goserelin Implants should be stored in a sealed container, protected from light and moisture, at a temperature not exceeding 25°.

LABELLING
The label states the equivalent amount of the peptide in mg in each implant.



IMPURITIES
The impurities controlled by this monograph include:

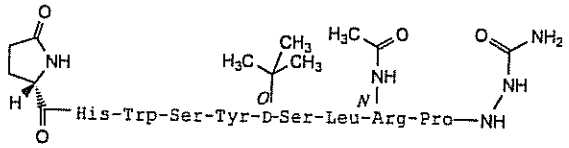


1. X2 = L-His, X4 = D-Ser, X5 = L-Tyr, X7 = L-Leu, X9 = L-Pro: 4(D-serine)-goserelin (equivalent to *Ph. Eur.* impurity A),

6. X2 = L-His, X4 = L-Ser, X5 = D-Tyr, X7 = L-Leu, X9 = L-Pro: 5(D-tyrosine)-goserelin (equivalent to *Ph. Eur.* impurity F),

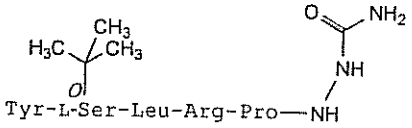
12. X2 = L-His, X4 = L-Ser, X5 = L-Tyr, X7 = D-Leu, X9 = L-Pro: 7(D-leucine)-goserelin (equivalent to *Ph. Eur.* impurity L),

2. 6-[*O*-(1,1-dimethylethyl)-L-serine]-goserelin (equivalent to *Ph. Eur.* impurity B),



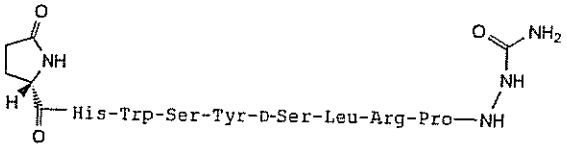
3. X4 = L-Ser, Y = Acetyl: 4-(acetyl-L-serine)-goserelin,

4. X4 = D-Ser, Y = Acetyl: 4-(acetyl-D-serine)-goserelin,



5. X4 = L-Ser, Y = Lactyl: 4-(lactyl-L-serine)-goserelin,

11. X4 = L-Ser, Y = Glycolyl: 4-(glycolyl-L-serine)-goserelin,



7. X4 = L-Ser, Y = Lactide/Glycolide copolymer chain: Polymer envelope,

8. 8-(N-acetylamino-L-arginine)-goserelin,

9. Hexapeptide,

10. 6-(des-t-butyl-D-serine)-goserelin,

13. The structure of this peak has not been identified.

Griseofulvin Tablets

Action and use
Antifungal.

DEFINITION
Griseofulvin Tablets contain Griseofulvin.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of griseofulvin, $C_{17}H_{17}ClO_6$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Extract a quantity of the powdered tablets containing 0.125 g of Griseofulvin with 20 mL of *chloroform*, add 1 g of *anhydrous sodium sulfate*, shake and filter. Evaporate the filtrate to dryness and dry at a pressure not exceeding 0.7 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of griseofulvin *(RS 172)*.

B. Shake a quantity of the powdered tablets containing 80 mg of Griseofulvin with 150 mL of *ethanol (96%)* for 20 minutes. Dilute to 200 mL with *ethanol (96%)* and filter. Dilute 2 mL of the filtrate to 100 mL with *ethanol (96%)*. The *light absorption* of the resulting solution, Appendix II B, in the range 240 to 400 nm, exhibits two maxima at 291 nm and 325 nm and a shoulder at 250 nm.

C. Dissolve 5 mg of the powdered tablets in 1 mL of *sulfuric acid* and add 5 mg of powdered *potassium dichromate*. A red colour is produced.

TESTS
Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 100 revolutions per minute.

(b) Use 1000 mL of a 1.5% w/v solution of *sodium dodecyl sulfate*, at a temperature of 37°, as the medium.

PROCEDURE

After 45 minutes withdraw a 10 ml sample of the medium and filter. Measure the *absorbance* of the filtrate, suitably diluted if necessary with *methanol (80%)*, at the maximum at

www.webofpharma.com

291 nm, Appendix II B, using a 1.5% w/v solution of *sodium dodecyl sulfate* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of griseofulvin, $C_{17}H_{17}ClO_6$, in the medium taking 725 as the value of A(1%, 1 cm) at the maximum at 291 nm.

Related substances

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions. Dissolve 50 mg of *9,10-diphenylanthracene* (internal standard) in sufficient *chloroform* to produce 50 mL (solution A).

(1) Add 60 mL of *chloroform* to a quantity of the powdered tablets containing 50 mg of Griseofulvin, heat at 60° with shaking for 20 minutes, cool and dilute to 100 mL with *chloroform*. Centrifuge and evaporate 20 mL of the clear supernatant liquid to about 1 mL.

(2) Prepare solution (2) in the same manner as solution (1) but adding 1 mL of solution A before diluting to 100 mL with *chloroform*.

(3) Dissolve 5 mg of *griseofulvin BPCRS* in *chloroform*, add 2 mL of solution A and sufficient *chloroform* to produce 200 mL. Evaporate 20 mL of the solution to about 1 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (1 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (100 to 120 mesh) coated with 1% w/w of cyanopropylmethyl phenylmethyl silicone fluid (OV 225 is suitable).

(b) Use *nitrogen* as the carrier gas at a flow rate of 50 to 60 mL per minute.

(c) Use isothermal conditions maintained at 250°.

(d) Use an inlet temperature of 270°.

(e) Use a flame ionisation detector at a temperature of 300°.

(f) Inject a suitable volume of each solution.

(g) For solution (1), allow the chromatography to proceed for 3 times the retention time of griseofulvin.

When the chromatograms are recorded under the prescribed conditions the retention time of griseofulvin is about 11 minutes. The retention times relative to griseofulvin are: dechlorogriseofulvin, about 0.6; dehydrogriseofulvin, about 1.4.

LIMITS

Using the chromatogram obtained with solution (3), calculate the ratio (*R*) of the area of the peak due to griseofulvin to the area of the peak due to the internal standard.

In the chromatogram obtained with solution (2):

the ratio of the area of any peak due to dechlorogriseofulvin to the area of the peak due to the internal standard is not greater than 0.6*R* (3%);

the ratio of the area of any peak due to dehydrogriseofulvin to the area of the peak due to the internal standard is not greater than 0.15*R* (0.75%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 35 mg of Griseofulvin add 60 mL of *ethyl acetate*, mix and heat to 60° with shaking for 20 minutes. Allow to cool and dilute to 100 mL with *ethyl acetate*. Centrifuge and transfer two 5 mL aliquots of the clear supernatant liquid into separate 100 mL graduated flasks. Add 5 mL of 2M *methanolic methanesulfonic acid* to the first flask, allow to stand at 20° for 30 minutes and dilute to 100 mL with *methanol* (solution A). Dilute the contents of the second flask to 100 mL with *methanol* (solution B). To a third flask add 5 mL of 2M *methanolic methanesulfonic acid* and dilute to 100 mL with *methanol* (solution C). Measure the *absorbance* of each solution at 266 nm, Appendix II B. Calculate the content of $C_{17}H_{17}ClO_6$ from the difference between the absorbance obtained with solution A and the sum of the absorbances obtained with solutions B and C and from the difference obtained by repeating the operation using 35 mg of *griseofulvin BPCRS* in place of the powdered tablets and from the declared content of $C_{17}H_{17}ClO_6$ in *griseofulvin BPCRS*.

Guanethidine Tablets

Action and use

Adrenergic neuron blocker.

DEFINITION

Guanethidine Tablets contain Guanethidine Monosulfate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of guanethidine monosulfate, $C_{10}H_{22}N_4,H_2SO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 50 mg of Guanethidine Monosulfate with a mixture of 5 mL of *hydrochloric acid* and 45 mL of *water*, filter, neutralise 25 mL of the filtrate with 5M *sodium hydroxide* and add 20 mL of *picric acid solution R1*. The *melting point* of the precipitate, after washing with *water*, is about 153°, Appendix V A.

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powder containing 30 mg of Guanethidine Monosulfate for 15 minutes with 50 mL of *water*, dilute to 100 mL with *water* and filter. To 5 mL of the filtrate add 10 mL of a solution prepared by dissolving 1 g of *sodium nitroprusside* and 1 g of *potassium hexacyanoferrate(II)* in 50 mL of a 0.5% w/v solution of *sodium hydroxide*, adding 5 mL of *hydrogen peroxide solution (100 vol)*, swirling gently and diluting to 100 mL with the solution of sodium hydroxide. Mix, allow to stand for 20 minutes, add sufficient *water* to produce 25 mL and measure the *absorbance* of the resulting solution at 520 nm, Appendix II B, using in the reference cell a solution prepared by treating 5 mL of *water* in the same manner, beginning at the words 'add 10 mL of a solution...'. Repeat the operation using 5 mL of a 0.03% w/v solution of *guanethidine monosulfate BPCRS* beginning at the words 'add 10 mL of a solution ...'. Calculate the content of $C_{10}H_{22}N_4,H_2SO_4$ in the tablets from the absorbances obtained using the declared content of $C_{10}H_{22}N_4,H_2SO_4$ in *guanethidine monosulfate BPCRS*.

STORAGE

Guanethidine Tablets should be protected from light.

www.webofpharma.com

Haemodialysis Solutions

(Solutions for Haemodialysis, Ph Eur monograph 0128)

Ph Eur

DEFINITION

Solutions of electrolytes with a concentration close to the electrolytic composition of plasma. Glucose may be included in the formulation.

Because of the large volumes used, haemodialysis solutions are usually prepared by diluting a concentrated solution with water of suitable quality (see the monograph *Haemodialysis solutions, concentrated, water for diluting (1167)*), using for example an automatic dosing device.

Concentrated solutions for haemodialysis

Concentrated haemodialysis solutions are prepared and stored using materials and methods designed to produce solutions having as low a degree of microbial contamination as possible. In certain circumstances, it may be necessary to use sterile solutions.

During dilution and use, precautions are taken to avoid microbial contamination. Diluted solutions are to be used immediately after preparation.

Concentrated solutions for haemodialysis are supplied in:
— rigid, semi-rigid or flexible plastic containers;
— glass containers.

Three types of concentrated solutions are used:

1. Concentrated solutions with acetate or lactate

Several formulations of concentrated solutions are used. The concentrations of the components in the solutions are such that after dilution to the stated volume the concentrations of the components per litre are usually in the following ranges (see Table 0128.-1):

Table 0128.-1.

	Concentration in mmol/L	Concentration in mEq/L
Sodium	130 - 145	130 - 145
Potassium	0 - 3.0	0 - 3.0
Calcium	0 - 2.0	0 - 4.0
Magnesium	0 - 1.2	0 - 2.4
Acetate or lactate	32 - 45	32 - 45
Chloride	90 - 120	90 - 120
Glucose	0 - 12.0	

Concentrated solutions with acetate or lactate are diluted before use.

2. Concentrated acid solutions

Several formulations of concentrated solutions are used. The concentrations of the components in the solutions are such that after dilution to the stated volume and before neutralisation with sodium hydrogen carbonate the concentrations of the components per litre are usually in the following ranges (see Table 0128.-2):

Table 0128.-2.

	Concentration in mmol/L	Concentration in mEq/L
Sodium	80 - 110	80 - 110
Potassium	0 - 3.0	0 - 3.0
Calcium	0 - 2.0	0 - 4.0
Magnesium	0 - 1.2	0 - 2.4
Acetic acid	2.5 - 10	2.5 - 10
Chloride	90 - 120	90 - 120
Glucose	0 - 12.0	

Sodium hydrogen carbonate must be added immediately before use to a final concentration of not more than 45 mmol/L. The concentrated solution of sodium hydrogen carbonate is supplied in a separate container.
The concentrated acid solutions and the concentrated solutions of sodium hydrogen carbonate are diluted and mixed immediately before use using a suitable device. Alternatively, solid sodium hydrogen carbonate may be used to prepare the solution.

3. Concentrated solutions without buffer

Several formulations of concentrated solutions without buffer are used. The concentrations of the components in the solutions are such that after dilution to the stated volume, the concentrations of the components per litre are usually in the following ranges (see Table 0128.-3):

Table 0128.-3.

	Concentration in mmol/L	Concentration in mEq/L
Sodium	130 - 145	130 - 145
Potassium	0 - 3.0	0 - 3.0
Calcium	0 - 2.0	0 - 4.0
Magnesium	0 - 1.2	0 - 2.4
Chloride	130 - 155	130 - 155
Glucose	0 - 12.0	

Concentrated solutions without buffer are used together with parenteral administration of suitable hydrogen carbonate solutions.

IDENTIFICATION

According to the stated composition, the solution to be examined gives the following identification reactions (*2.3.1*):
— potassium: reaction (b);
— calcium: reaction (a);
— sodium: reaction (b);
— chlorides: reaction (a);
— lactates;
— carbonates and hydrogen carbonates;
— acetates:
  — if the solution is free from glucose, use reaction (b);
  — if the solution contains glucose, use the following method: to 5 mL of the solution to be examined add 1 mL of *hydrochloric acid R* in a test-tube fitted with a stopper and a bent tube, heat and collect a few millilitres of distillate; carry out reaction (b) of acetates on the distillate;
— magnesium: to 0.1 mL of *titan yellow solution R* add 10 mL of *water R*, 2 mL of the solution to be examined and 1 mL of a 4.2 g/L solution of *sodium hydroxide R*; a pink colour is produced;

www.webofpharma.com

— glucose: to 5 mL of the solution to be examined, add 2 mL of *dilute sodium hydroxide solution R* and 0.05 mL of *copper sulfate solution R*; the solution is blue and clear; heat to boiling; an abundant red precipitate is formed.

TESTS

Appearance of solution

The solution to be examined is clear (*2.2.1*). If it does not contain glucose, it is colourless (*2.2.2, Method I*). If it contains glucose, it is not more intensely coloured than reference solution Y_7 (*2.2.2, Method I*).

Aluminium (*2.4.17*)

Maximum 0.1 mg/L.

Prescribed solution Take 20 mL of the solution to be examined, adjust to pH 6.0 using *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* and add 10 mL of *acetate buffer solution pH 6.0 R*.

Reference solution Mix 1 mL of *aluminium standard solution (2 ppm Al) R*, 10 mL of *acetate buffer solution pH 6.0 R* and 9 mL of *water R*.

Blank solution Mix 10 mL of *acetate buffer solution pH 6.0 R* and 10 mL of *water R*.

Extractable volume (*2.9.17*)

The volume measured is not less than the nominal volume stated on the label.

Sterility (*2.6.1*)

If the label states that the concentrated haemodialysis solution is sterile, it complies with the test for sterility.

Bacterial endotoxins (*2.6.14*)

Less than 0.5 IU/mL in the solution diluted for use.

Pyrogens (*2.6.8*)

Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Dilute the solution to be examined with *water for injections R* to the concentration prescribed for use. Inject 10 mL of the solution per kilogram of the rabbit's mass.

ASSAY

Determine the density (2.2.5) of the concentrated solution and calculate the content in grams per litre and in millimoles per litre.

Sodium

97.5 per cent to 102.5 per cent of the content of sodium (Na) stated on the label.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*.

Wavelengths 589.0 nm or 589.6 nm (sodium emits as a doublet).

Potassium

95.0 per cent to 105.0 per cent of the content of potassium (K) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution Dilute with *water R* an accurately weighed quantity of the solution to be examined to a concentration suitable for the instrument to be used. To 100 mL of this solution add 10 mL of a 22 g/L solution of *sodium chloride R*.

Reference solutions Prepare the reference solutions using *potassium standard solution (100 ppm K) R*. To 100 mL of each reference solution add 10 mL of a 22 g/L solution of *sodium chloride R*.

Source Potassium hollow-cathode lamp.

Wavelength 766.5 nm.

Atomisation device Air-acetylene flame.

Calcium

95.0 per cent to 105.0 per cent of the content of calcium (Ca) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution Dilute 5.0 mL of the solution to be examined to 100.0 mL with *water R*. To 3.0 mL of this solution add 5 mL of *lanthanum chloride solution R* and dilute to 50.0 mL with *water R*.

Reference solutions Into 4 identical volumetric flasks each containing 5 mL of *lanthanum chloride solution R*, introduce respectively 2.5 mL, 5.0 mL, 7.0 mL and 10.0 mL of *calcium standard solution (10 ppm Ca) R* and dilute to 50.0 mL with *water R*.

Source Calcium hollow-cathode lamp.

Wavelength 422.7 nm.

Atomisation device Air-acetylene flame.

Magnesium

95.0 per cent to 105.0 per cent of the content of magnesium (Mg) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution Dilute 5.0 mL of the solution to be examined to 100.0 mL with *water R*. To 2.0 mL of this solution add 5 mL of *lanthanum chloride solution R* and dilute to 50.0 mL with *water R*.

Reference solutions Into 4 identical volumetric flasks each containing 5 mL of *lanthanum chloride solution R*, introduce respectively 1.0 mL, 2.0 mL, 3.0 mL and 4.0 mL of *magnesium standard solution (10 ppm Mg) R* and dilute to 50.0 mL with *water R*.

Source Magnesium hollow-cathode lamp.

Wavelength 285.2 nm.

Atomisation device Air-acetylene flame.

Total chloride

95.0 per cent to 105.0 per cent of the content of chloride (Cl) stated on the label.

Dilute to 50 mL with *water R* an accurately measured volume of the solution to be examined containing the equivalent of about 60 mg of chloride. Add 5 mL of *dilute nitric acid R*, 25.0 mL of *0.1 M silver nitrate* and 2 mL of *dibutyl phthalate R*. Shake. Using 2 mL of *ferric ammonium sulfate solution R2* as indicator, titrate with *0.1 M ammonium thiocyanate* until a reddish-yellow colour is obtained.

1 mL of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

Acetate

95.0 per cent to 105.0 per cent of the content of acetate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of acetate, add 10.0 mL of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of acetate.

Lactate

95.0 per cent to 105.0 per cent of the content of lactate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of lactate, add 10.0 mL of *0.1 M*

www.webofpharma.com

hydrochloric acid. Then add 50 mL of *acetonitrile R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of lactate.

Sodium hydrogen carbonate

95.0 per cent to 105.0 per cent of the content of sodium hydrogen carbonate stated on the label.

Titrate with *0.1 M hydrochloric acid* a volume of the solution to be examined corresponding to about 0.1 g of sodium hydrogen carbonate, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M hydrochloric acid* is equivalent to 8.40 mg of $NaHCO_3$.

Reducing sugars

(expressed as anhydrous glucose): 95.0 per cent to 105.0 per cent of the content of glucose stated on the label.

Transfer a volume of the solution to be examined containing the equivalent of 25 mg of glucose to a 250 mL conical flask with a ground-glass neck and add 25.0 mL of *cupri-citric solution R*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 min and maintain boiling for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 mL of *water R*. Carefully add, in small amounts, 25 mL of a 25 per cent *m/m* solution of *sulfuric acid R*. Titrate with *0.1 M sodium thiosulfate* using *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration using 25.0 mL of *water R*.

Calculate the content of reducing sugars, expressed as anhydrous glucose ($C_6H_{12}O_6$), using Table 0128.-4.

STORAGE

At a temperature not lower than 4 °C.

LABELLING

The label states:

- the formula of the concentrated solution for haemodialysis expressed in grams per litre and in millimoles per litre;
- the nominal volume of the solution in the container;
- where applicable, that the concentrated solution is sterile;
- the storage conditions;
- that the concentrated solution is to be diluted immediately before use;
- the dilution to be made;
- that the volume taken for use is to be measured accurately;
- the ionic formula for the diluted solution ready for use in millimoles per litre;
- that any unused portion of solution is to be discarded;
- where applicable, that sodium hydrogen carbonate is to be added before use.

Ph Eur

Water for Diluting Concentrated Haemodialysis Solutions

(Haemodialysis Solutions, Concentrated, Water for Diluting, Ph Eur monograph 1167)

Ph Eur

The following monograph is given for information.

The analytical methods described and the limits proposed are intended to be used for validating the procedure for obtaining the water.

DEFINITION

Water for diluting concentrated haemodialysis solutions is obtained from potable water by distillation, by reverse osmosis, by ion exchange or by any other suitable method. The conditions of preparation, transfer and storage are designed to minimise the risk of chemical and microbial contamination.

When water obtained by one of the methods described above is not available, potable water may be used for home dialysis. Because the chemical composition of potable water varies considerably from one locality to another, consideration must be given to its chemical composition to enable adjustments to be made to the content of ions so that the concentrations in the diluted solution correspond to the intended use.

Attention has also to be paid to the possible presence of residues from water treatment (for example, chloramines) and volatile halogenated hydrocarbons.

For the surveillance of the quality of water for diluting concentrated haemodialysis solutions, the following methods may be used to determine the chemical composition and/or to detect the presence of possible contaminants together with suggested limits to be obtained.

CHARACTERS

Clear, colourless, liquid.

TESTS

Acidity or alkalinity

To 10 mL of the water to be examined, freshly boiled and cooled in a borosilicate glass flask, add 0.05 mL of *methyl red solution R*. The solution is not red. To 10 mL of the water to be examined add 0.1 mL of *bromothymol blue solution R1*. The solution is not blue.

Oxidisable substances

To 100 mL of the water to be examined add 10 mL of *dilute sulfuric acid R* and 0.1 mL of *0.02 M potassium permanganate* and boil for 5 min. The solution remains faintly pink.

Total available chlorine

Maximum 0.1 ppm.

In a 125 mL test-tube (A), place successively 5 mL of *buffer solution pH 6.5 R*, 5 mL of *diethylphenylenediamine sulfate solution R* and 1 g of *potassium iodide R*. In a second 125 mL test-tube (B), place successively 5 mL of *buffer solution pH 6.5 R* and 5 mL of *diethylphenylenediamine sulfate solution R*. Add as simultaneously as possible to tube A 100 mL of the water to be examined and to tube B a reference solution prepared as follows: to 1 mL of a 10 mg/L solution of *potassium iodate R*, add 1 g of *potassium iodide R* and 1 mL of *dilute sulfuric acid R*; allow to stand for 1 min, add 1 mL of *dilute sodium hydroxide solution R* and dilute to 100 mL with *water R*. Any colour in the mixture obtained with the water to be examined is not more intense than that in the mixture obtained with the reference solution.

www.webofpharma.com

Chlorides (*2.4.4*)
Maximum 50 ppm.

Dilute 1 mL of the water to be examined to 15 mL with *water R*.

Fluorides
Maximum 0.2 ppm.

Potentiometry (*2.2.36, Method I*): use as indicator electrode a fluoride-selective solid-membrane electrode and as reference electrode a silver-silver chloride electrode.

Test solution The water to be examined.

Reference solutions Dilute 2.0 mL, 4.0 mL and 10.0 mL of *fluoride standard solution (1 ppm F) R* respectively to 20.0 mL with *total-ionic-strength-adjustment buffer R1*.

Carry out the measurement of each solution.

Nitrates
Maximum 2 ppm.

Dilute 2 mL of the water to be examined to 100 mL with *nitrate-free water R*. Place 5 mL of the dilution in a test-tube immersed in iced water, add 0.4 mL of a 100 g/L solution of *potassium chloride R* and 0.1 mL of *diphenylamine solution R* and then, dropwise and with shaking, 5 mL of *sulfuric acid R*. Transfer the tube to a water-bath at 50 °C. Allow to stand for 15 min. Any blue colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using a mixture of 0.1 mL of *nitrate standard solution (2 ppm NO_3) R* and 4.9 mL of *nitrate-free water R*.

Sulfates (*2.4.13*)
Maximum 50 ppm.

Dilute 3 mL of the water to be examined to 15 mL with *distilled water R*.

Aluminium (*2.4.17*)
Maximum 10 µg/L.

Prescribed solution To 400 mL of the water to be examined add 10 mL of *acetate buffer solution pH 6.0 R* and 100 mL of *water R*.

Reference solution Mix 2 mL of *aluminium standard solution (2 ppm Al) R*, 10 mL of *acetate buffer solution pH 6.0 R* and 98 mL of *water R*.

Blank solution Mix 10 mL of *acetate buffer solution pH 6.0 R* and 100 mL of *water R*.

Ammonium
Maximum 0.2 ppm.

To 20 mL of the water to be examined in a flat-bottomed and transparent tube, add 1 mL of *alkaline potassium tetraiodomercurate solution R*. Allow to stand for 5 min. The solution is not more intensely coloured than a standard prepared at the same time and in the same manner using a mixture of 4 mL of *ammonium standard solution (1 ppm NH_4) R* and 16 mL of *ammonium-free water R*. Examine the solutions along the vertical axis of the tube.

Calcium
Maximum 2 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution The water to be examined.

Reference solutions Prepare reference solutions (1 ppm to 5 ppm) using *calcium standard solution (400 ppm Ca) R*.

Source Calcium hollow-cathode lamp.

Wavelength 422.7 nm.

Atomisation device Oxidising air-acetylene flame.

Magnesium
Maximum 2 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution Dilute 10 mL of the water to be examined to 100 mL with *distilled water R*.

Reference solutions Prepare reference solutions (0.1 ppm to 0.5 ppm) using *magnesium standard solution (100 ppm Mg) R*.

Source Magnesium hollow-cathode lamp.

Wavelength 285.2 nm.

Atomisation device Oxidising air-acetylene flame.

Mercury
Maximum 0.001 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution Add 5 mL of *nitric acid R* per litre of the water to be examined. In a 50 mL borosilicate glass flask with a ground-glass-stopper, place 20 mL of the water to be examined and add 1 mL of *dilute nitric acid R* and shake. Add 0.3 mL of *bromine water R1*. Stopper the flask, shake and heat the stoppered flask at 45 °C for 4 h. Allow to cool. If the solution does not become yellow, add 0.3 mL of *bromine water R1* and re-heat at 45 °C for 4 h. Add 0.5 mL of a freshly prepared 10 g/L solution of *hydroxylamine hydrochloride R*. Shake. Allow to stand for 20 min.

Reference solutions Use freshly prepared reference solutions (0.0005 ppm to 0.002 ppm) obtained by diluting *mercury standard solution (1000 ppm Hg) R* with a 5 per cent *V/V* solution of *dilute nitric acid R* and treat as described for the test solution.

To a volume of solution suitable for the instrument to be used, add *stannous chloride solution R2* equal to 1/5 of this volume. Fit immediately the device for the entrainment of the mercury vapour. Wait 20 s and pass through the device a stream of *nitrogen R* as the carrier gas.

Source Mercury hollow-cathode tube or a discharge lamp.

Wavelength 253.7 nm.

Atomisation device Flameless system whereby the mercury can be entrained in the form of cold vapour.

Potassium
Maximum 2 ppm.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution (a) Dilute 50.0 mL of the water to be examined to 100 mL with *distilled water R*. Carry out a determination using this solution. If the potassium content is more than 0.75 mg/L, further dilute the water to be examined with *distilled water R*.

Test solution (b) Take 50.0 mL of the water to be examined or, if necessary, the water to be examined diluted as described in the preparation of test solution (a). Add 1.25 mL of *potassium standard solution (20 ppm K) R* and dilute to 100.0 mL with *distilled water R*.

Reference solutions Prepare reference solutions (0 ppm; 0.25 ppm; 0.50 ppm; 0.75 ppm; 1 ppm) using *potassium standard solution (20 ppm K) R*.

Wavelength 766.5 nm.

Calculate the potassium content of the water to be examined in parts per million from the expression:

$$\frac{p \times n_1 \times 0.5}{n_2 - n_1}$$

p = dilution factor used for the preparation of test solution (a);

www.webofpharma.com

n_1 = measured value of test solution (a);
n_2 = measured value of test solution (b).

Sodium
Maximum 50 ppm.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution The water to be examined. If the sodium content is more than 10 mg/L, dilute with *distilled water R* to obtain a concentration suitable for the apparatus used.

Reference solutions Prepare reference solutions (0 ppm; 2.5 ppm; 5.0 ppm; 7.5 ppm; 10 ppm) using *sodium standard solution (200 ppm Na) R*.

Wavelength 589 nm.

Zinc
Maximum 0.1 ppm.

Atomic absorption spectrometry (*2.2.23, Method I*): use sampling and analytical equipment free from zinc or not liable to yield zinc under the conditions of use.

Test solution The water to be examined.

Reference solutions Prepare reference solutions (0.05 ppm to 0.15 ppm) using *zinc standard solution (100 ppm Zn) R*.

Source Zinc hollow-cathode lamp.

Wavelength 213.9 nm.

Atomisation device Oxidising air-acetylene flame.

Heavy metals (*2.4.8*)
Maximum 0.1 ppm.

Heat 200 mL of the water to be examined in a glass evaporating dish on a water-bath until the volume is reduced to 20 mL. 12 mL of the solution complies with test A. Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Microbial contamination
TAMC: acceptance criterion 10^2 CFU/g (*2.6.12*).

Bacterial endotoxins (*2.6.14*)
Less than 0.25 IU/mL.

Ph Eur

Haemofiltration and Haemodiafiltration Solutions

(Solutions for Haemofiltration and Haemodiafiltration, Ph Eur monograph 0861)

When the Solution is intended for haemofiltration only, the title Haemofiltration Solutions may be used

Ph Eur

DEFINITION

Preparations for parenteral administration containing electrolytes with a concentration close to the electrolytic composition of plasma. Glucose may be included in the formulation.

Solutions for haemofiltration and haemodiafiltration are supplied in:
— rigid or semi-rigid plastic containers;
— flexible plastic containers inside closed protective envelopes;
— glass containers.

The containers and closures comply with the requirements for containers for preparations for parenteral administration (*3.2*).

In haemofiltration and haemodiafiltration, the following formulations are used. The concentrations of the components per litre of solution are usually in the following range (see Table 0861.-1):

Table 0861.-1.

	Concentration in mmol/L	Concentration in mEq/L
Sodium	125 - 150	125 - 150
Potassium	0 - 4.5	0 - 4.5
Calcium	1.0 - 2.5	2.0 - 5.0
Magnesium	0.25 - 1.5	0.50 - 3.0
Acetate and/or lactate and/or hydrogen carbonate	30 - 60	30 - 60
Chloride	90 - 120	90 - 120
Glucose	0 - 25	

When hydrogen carbonate is present, the solution of sodium hydrogen carbonate is supplied in a container or a separate compartment and is added to the electrolyte solution immediately before use.

In haemofiltration and haemodiafiltration, the following formulations may also be used (see Table 0861.-2):

Table 0861.-2.

	Concentration in mmol/L	Concentration in mEq/L
Sodium	130 - 167	130 - 167
Potassium	0 - 4.0	0 - 4.0
Hydrogen carbonate	20 - 167	20 - 167
Chloride	0 - 147	0 - 147

Antioxidants are not added to the solutions.

IDENTIFICATION

According to the stated composition, the solution to be examined gives the following identification reactions (*2.3.1*):
— potassium: reaction (b);
— calcium: reaction (a);
— sodium: reaction (b);
— chlorides: reaction (a);
— acetates:
  — if the solution is free from glucose, use reaction (b);
  — if the solution contains glucose, use the following method: to 5 mL of the solution to be examined add 1 mL of *hydrochloric acid R* in a test-tube fitted with a stopper and a bent tube, heat and collect a few millilitres of distillate; carry out reaction (b) of acetates on the distillate;
— lactates;
— carbonates and hydrogen carbonates;
— magnesium: to 0.1 mL of *titan yellow solution R* add 10 mL of *water R*, 2 mL of the solution to be examined and 1 mL of *1 M sodium hydroxide*; a pink colour is produced;
— glucose: to 5 mL of the solution to be examined, add 2 mL of *dilute sodium hydroxide solution R* and 0.05 mL of *copper sulfate solution R*; the solution is blue and clear; heat to boiling; an abundant red precipitate is formed.

TESTS

Appearance of solution
The solution is clear (*2.2.1*). If it does not contain glucose, it is colourless (*2.2.2, Method I*). If it contains glucose, it is not

www.webofpharma.com

more intensely coloured than reference solution Y_7 (*2.2.2, Method I*).

pH (*2.2.3*)
5.0 to 7.5. If the solution contains glucose, the pH is 4.5 to 6.5. If the solution contains hydrogen carbonate, the pH is 7.0 to 8.5.

Hydroxymethylfurfural
Carry out the test only if glucose is added to the preparation. To a volume of the solution to be examined containing the equivalent of 25 mg of glucose, add 5.0 mL of a 100 g/L solution of *p-toluidine R* in *2-propanol R* containing 10 per cent *V/V* of *glacial acetic acid R*, then add 1.0 mL of a 5 g/L solution of *barbituric acid R*. The absorbance (*2.2.25*), determined at 550 nm after allowing the mixture to stand for 2-3 min, is not greater than that of a standard prepared at the same time and in the same manner using a solution containing 10 µg of *hydroxymethylfurfural R* in the same volume as the solution to be examined (400 ppm expressed with reference to the glucose concentration). If the solution contains hydrogen carbonate, use as the standard a solution containing 20 µg of *hydroxymethylfurfural R* (800 ppm expressed with reference to the glucose concentration).

Aluminium (*2.4.17*)
Maximum 10 µg/L.

Prescribed solution Take 200 mL of the solution to be examined, adjust to pH 6.0 using *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* and add 10 mL of *acetate buffer solution pH 6.0 R*.

Reference solution Mix 1 mL of *aluminium standard solution (2 ppm Al) R*, 10 mL of *acetate buffer solution pH 6.0 R* and 9 mL of *water R*.

Blank solution Mix 10 mL of *acetate buffer solution pH 6.0 R* and 10 mL of *water R*.

Particulate contamination (*2.9.19, Method I*)
Use 50 mL of the solution to be examined.

Extractable volume (*2.9.17*)
The solution complies with the test prescribed for parenteral infusions.

Sterility (*2.6.1*)
The solution complies with the test.

Bacterial endotoxins (*2.6.14*)
Less than 0.05 IU/mL.

Pyrogens (*2.6.8*)
Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 mL of the solution.

ASSAY

Sodium
97.5 per cent to 102.5 per cent of the content of sodium (Na) stated on the label.

Atomic emission spectrometry (*2.2.22, Method I*).

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*.

Wavelengths 589.0 nm or 589.6 nm (sodium emits as a doublet).

Potassium
95.0 per cent to 105.0 per cent of the content of potassium (K) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used. To 100 mL of the solution add 10 mL of a 22 g/L solution of *sodium chloride R*.

Reference solutions Prepare the reference solutions using *potassium standard solution (100 ppm K) R*. To 100 mL of each reference solution add 10 mL of a 22 g/L solution of *sodium chloride R*.

Source Potassium hollow-cathode lamp.

Wavelength 766.5 nm.

Atomisation device Air-propane or air-acetylene flame.

Calcium
95.0 per cent to 105.0 per cent of the content of calcium (Ca) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions Prepare the reference solutions using *calcium standard solution (400 ppm Ca) R*.

Source Calcium hollow-cathode lamp.

Wavelength 422.7 nm.

Atomisation device Air-propane or air-acetylene flame.

Magnesium
95.0 per cent to 105.0 per cent of the content of magnesium (Mg) stated on the label.

Atomic absorption spectrometry (*2.2.23, Method I*).

Test solution If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions Prepare the reference solutions using *magnesium standard solution (100 ppm Mg) R*.

Source Magnesium hollow-cathode lamp.

Wavelength 285.2 nm.

Atomisation device Air-propane or air-acetylene flame.

Total chloride
95.0 per cent to 105.0 per cent of the content of chloride (Cl) stated on the label.

Dilute to 50 mL with *water R* an accurately measured volume of the solution to be examined containing the equivalent of about 60 mg of chloride. Add 5 mL of *dilute nitric acid R*, 25.0 mL of *0.1 M silver nitrate* and 2 mL of *dibutyl phthalate R*. Shake. Using 2 mL of *ferric ammonium sulfate solution R2* as indicator, titrate with *0.1 M ammonium thiocyanate* until a reddish-yellow colour is obtained.

1 mL of *0.1 M silver nitrate* is equivalent to 3.545 mg of Cl.

Acetate
95.0 per cent to 105.0 per cent of the content of acetate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of acetate, add 10.0 mL of *0.1 M hydrochloric acid*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of acetate.

www.webofpharma.com

Lactate
95.0 per cent to 105.0 per cent of the content of lactate stated on the label.

To a volume of the solution to be examined, corresponding to about 0.7 mmol of lactate, add 10.0 mL of *0.1 M hydrochloric acid*. Add 50 mL of *acetonitrile R*. Carry out a potentiometric titration (*2.2.20*), using *0.1 M sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 mL of *0.1 M sodium hydroxide* is equivalent to 0.1 mmol of lactate.

Sodium hydrogen carbonate
95.0 per cent to 105.0 per cent of the content of sodium hydrogen carbonate stated on the label.

Titrate with *0.1 M hydrochloric acid*, a volume of the solution to be examined corresponding to about 0.1 g of sodium hydrogen carbonate, determining the end-point potentiometrically (*2.2.20*).

1 mL of *0.1 M hydrochloric acid* is equivalent to 8.40 mg of $NaHCO_3$.

Lactate and hydrogen carbonate
95.0 per cent to 105.0 per cent of the content of lactates and hydrogen carbonates stated on the label.

Liquid chromatography (*2.2.29*).

Test solution The solution to be examined.

Reference solution Dissolve in 100 mL of *water for chromatography R* quantities of lactates and hydrogen carbonates, accurately weighed, in order to obtain solutions having concentrations representing about 90 per cent, 100 per cent and 110 per cent of the concentrations stated on the label.

Column:
— *size*: *l* = 0.30 m, Ø = 7.8 mm;
— *stationary phase*: *cation-exchange resin R* (9 µm);
— *temperature*: 60 °C.

Mobile phase 0.005 M sulfuric acid previously degassed with *helium for chromatography R*.

Flow rate 0.6 mL/min.

Detection Differential refractometer.

Injection 20 µL, twice.

Order of elution Lactates, hydrogen carbonates.

Determine the concentration of lactates and hydrogen carbonates in the test solution by interpolating the peak area for lactate and the peak height for hydrogen carbonate from the linear regression curve obtained with the reference solutions.

Reducing sugars
(expressed as anhydrous glucose): 95.0 per cent to 105.0 per cent of the content of glucose stated on the label.

Transfer a volume of the solution to be examined containing the equivalent of 25 mg of glucose to a 250 mL conical flask with a ground-glass neck and add 25.0 mL of *cupri-citric solution R*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium iodide R* dissolved in 3 mL of *water R*. Carefully add, in small amounts, 25 mL of a 25 per cent *m/m* solution of *sulfuric acid R*. Titrate with *0.1 M sodium thiosulfate* using *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration using 25.0 mL of *water R*.

Calculate the content of reducing sugars expressed as anhydrous glucose ($C_6H_{12}O_6$), using Table 0861.-3.

Table 0861.-3.

Volume of *0.1 M sodium thiosulfate* in mL	Anhydrous glucose in mg
8	19.8
9	22.4
10	25.0
11	27.6
12	30.3
13	33.0
14	35.7
15	38.5
16	41.3

STORAGE
At a temperature not below 4 °C.

LABELLING
The label states:
— the formula of the solution for haemofiltration or haemodiafiltration, expressed in grams per litre and in millimoles per litre;
— the calculated osmolarity, expressed in milliosmoles per litre;
— the nominal volume of the solution for haemofiltration or haemodiafiltration in the container;
— that the solution is free from bacterial endotoxins, or where applicable, that it is apyrogenic;
— the storage conditions;
— that any unused portion of solution is to be discarded.

Ph Eur

Halibut-liver Oil Capsules

DEFINITION
Halibut-liver Oil Capsules are soft capsules containing Halibut-liver Oil diluted, if necessary, with a suitable fixed oil to a volume of 0.12 to 0.18 mL in each capsule.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of vitamin A
3500 to 4700 IU.

ASSAY
Weigh 10 capsules. Open the capsules carefully without loss of shell material, express as much of the contents as possible and reserve the expressed material. Wash the shells with *ether*, discard the washings, allow the shells to stand at room temperature to constant weight. The difference between the weights represents the weight of the total contents.
Determine the content of vitamin A in the reserved portion of the contents by the method described below and calculate the content in a capsule of average content weight.

Carry out the procedures as rapidly as possible, avoiding exposure to actinic light and air, oxidising agents, oxidation catalysts (e.g. copper and iron) and acids.

Carry out Method A (ultraviolet absorption spectrophotometry) but if method A is found not to be valid, carry out method B (liquid chromatography).

Method A
To 1 g of the oil being examined in a round-bottomed flask, add 3 mL of a freshly prepared 50% w/w solution of

www.webofpharma.com

potassium hydroxide and 30 mL of *ethanol*, boil under a reflux condenser in a current of *nitrogen* for 30 minutes and cool rapidly. Add 30 mL of *water* and extract with four 50 mL quantities of *ether* and discard the aqueous layer after complete separation of the final extract. Wash the combined ethereal layers with four 50 mL quantities of *water* and evaporate to dryness under a gentle current of *nitrogen* at a temperature not exceeding 30° or in a rotary evaporator at a temperature not exceeding 30° under reduced pressure. Dissolve the residue in sufficient *propan-2-ol R1* to give an expected concentration of vitamin A equivalent to 10 to 15 IU per mL. Measure the *absorbances* of the solution at 300 nm, 310 nm, 325 nm and 334 nm and at the wavelength of maximum absorption, Appendix II B, in a suitable spectrophotometer in 1-cm specially matched cells, using *propan-2-ol R1* in the reference cell.

Calculate the content of vitamin A, as all-*trans*-retinol, in IU per gram from the expression:

$$A_{325} \times \frac{1830}{100m} \times V$$

where A_{325} = absorbance at 325 nm,
m = weight of the oil being examined in grams,
V = total volume of solution containing 10 to 15 IU of vitamin A per mL,
1830 = conversion factor for the specific absorbance of all-*trans*-retinol in IU.

The above expression can be used only if A_{325} has a value of not greater than $A_{325,corr}/0.970$ where $A_{325,corr}$ is the corrected absorbance at 325 nm and is given by the equation:

$$A_{325,\,corr} = 6.815A_{325} - 2.555A_{310} - 4.260A_{324}$$

A designates the absorbance at the wavelength indicated by the subscript.

If A_{325} has a value greater than $A_{325,corr}/0.970$, calculate the content of vitamin A from the expression:

$$A_{325,corr} \times \frac{1830}{100m} \times V$$

The assay is not valid unless the wavelength of maximum absorption lies between 323 nm and 327 nm and the *absorbance* at 300 nm relative to that at 325 nm is at most 0.73.

Method B

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To 2 g of the oil being examined in a round-bottomed flask add 5 mL of a freshly prepared 10% w/v solution of *ascorbic acid*, 10 mL of a freshly prepared 80% w/v solution of *potassium hydroxide* and 100 mL of *ethanol*, boil under a reflux condenser on a water bath for 15 minutes. Add 100 mL of a 1% w/v solution of *sodium chloride* and cool. Transfer the solution to a 500 mL separating funnel rinsing the round-bottomed flask with about 75 mL of a 1% w/v solution of *sodium chloride* and then with 150 mL of a mixture of equal volumes of *light petroleum R3* and *ether R*. Shake for 1 minute and when the layers have separated completely, discard the lower layer and wash the upper layer with 50 mL of a 3% w/v solution of *potassium hydroxide* in a 10% v/v solution of *ethanol* and then with three 50-mL quantities of a 1% w/v solution of *sodium chloride*. Filter the upper layer through 5 g of *anhydrous sodium sulfate* on a fast filter paper into a 250 mL flask suitable for a rotary evaporator. Wash the funnel with 10 mL of fresh extraction mixture, filter and combine the upper layers. Distil them at a temperature not exceeding 30° under reduced pressure and fill with *nitrogen* when evaporation is completed. Alternatively evaporate the solvent under a gentle current of *nitrogen* at a temperature not exceeding 30°. Dissolve the residue in *propan-2-ol*, transfer to a 25-mL graduated flask and dilute to 25 mL with *propan-2-ol*. Gentle heating with the aid of ultrasound may be required (A large fraction of the white residue is cholesterol).

(2) A solution of *retinyl acetate EPCRS* in *2-propan-2-ol R1* containing about 1000 IU per mL of all-*trans*-retinol. The exact concentration of solution (2) is assessed by *ultraviolet absorption spectrophotometry*, Appendix II B. Dilute the solution with *propan-2-ol R1* to a presumed concentration of 10 to 15 IU per mL and measure the *absorbance* at 326 nm in matched 1-cm cells using *propan-2-ol R1* in the reference cell. Calculate the content of vitamin A in IU per mL of solution (2) from the following expression, taking into account the assigned content of *retinyl acetate EPCRS*:

$$A_{326} \times \frac{1900 \times V_2}{100 \times V_1}$$

where A_{326} = absorbance at 326 nm,
V_2 = volume of the diluted solution,
V_1 = volume of reference solution (a) used,
1900 = conversion factor for the specific absorbance of *retinyl acetate EPCRS* in IU.

(3) Prepared in the same manner as solution (1) but using 2 mL of solution (2) in place of the oil being examined. The exact concentration of solution (3) is assessed by *ultraviolet absorption spectrophotometry*, Appendix II B. Dilute solution (3) with *propan-2-ol R1* to a presumed concentration of 10 to 15 IU per mL of all-*trans*-retinol and measure the *absorbance* at 325 nm in matched 1-cm cells using *propan-2-ol R1* in the reference cell. Calculate the content of all-*trans*-retinol in IU per mL of solution (3) from the expression:

$$A_{325} \times \frac{1830 \times V_4}{100 \times V_3}$$

where A_{325} = absorbance at 325 nm,
V_3 = volume of the diluted solution,
V_4 = volume of reference solution (b) used,
1830 = conversion factor for the specific absorbance of all-*trans*-retinol in IU.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm to 10 µm).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 325 nm.

(f) Inject in triplicate 10 µL of solutions (1) and (3). The retention time of all-*trans*-retinol is 4 to 6 minutes.

MOBILE PHASE

3 volumes of *water* and 97 volumes of *methanol*.

www.webofpharma.com

SYSTEM SUITABILITY

The Assay is not valid unless:

the chromatogram obtained with solution (1) shows a peak corresponding to that of all-*trans*-retinol in the chromatogram obtained with solution (3);

when using the method of standard additions to solution (1) there is greater than 95% recovery of the added *retinyl acetate EPCRS;*

the recovery of all-*trans*-retinol in solution (3) as assessed by direct absorption spectrophotometry is greater than 95%.

DETERMINATION OF CONTENT

Calculate the content of vitamin A using the following expression:

$$A_1 \times \frac{C \times V}{A_2} \times \frac{1}{m}$$

where A_1 = area of the peak corresponding to all-*trans*-retinol in the chromatogram obtained with solution (1),

A_2 = area of the peak corresponding to all-*trans*-retinol in the chromatogram obtained with solution (3),

C = concentration of *retinyl acetate EPCRS* in solution (2) as assessed before the saponification in International Units per millilitre (1000 IU per mL),

V = volume of solution (2) treated (2 mL),

m = weight of the oil being examined in solution (1) (2 g).

STORAGE

Halibut-liver Oil Capsules should be protected from light and stored at a temperature not exceeding 20°. When stored under these conditions, they may be expected to retain their potency for at least 3 years after the date of preparation.

LABELLING

The label states that each capsule contains 4000 IU (Units) of vitamin A activity.

Haloperidol Capsules

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Haloperidol Capsules contain Haloperidol.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of haloperidol, $C_{21}H_{23}ClFNO_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the contents of the capsules containing 10 mg of Haloperidol add 10 mL of *water* and 1 mL of 1M *sodium hydroxide* and extract with 10 mL of *ether*. Filter the ether extract through absorbent cotton, evaporate the filtrate to dryness and dry the residue at 60° at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of haloperidol *(RS 173)*.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 10 mg of Haloperidol with 30 mL of *chloroform*, disperse with the aid of ultrasound for 15 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 1 mL of *chloroform*.

(2) Dilute 1 volume of solution (1) to 200 volumes with *chloroform*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating a suitable silanised silica gel containing a fluorescent indicator with an optimal intensity at 254 nm (Merck silanised silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in a current of warm air for 15 minutes and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

0.5 volume of 13.5M *ammonia*, 20 volumes of *ammonium acetate solution*, 20 volumes of *water* and 60 volumes of *1,4-dioxan*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows a distinct and clearly visible spot.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

Uniformity of content

Capsules containing less than 2 mg and/or less than 2% w/w of Haloperidol comply with the requirements stated under Capsules using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add sufficient of the mobile phase to the contents of one capsule to produce a solution containing 0.005% w/v of Haloperidol, disperse with the aid of ultrasound for 2 minutes, centrifuge and use the supernatant solution.

(2) 0.005% w/v of *haloperidol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 5 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 247 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

45 volumes of *acetonitrile* and 55 volumes of a 1% w/v solution of *ammonium acetate*.

www.webofpharma.com

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{23}ClFNO_2$ in each capsule using the declared content of $C_{21}H_{23}ClFNO_2$ in *haloperidol BPCRS*.

ASSAY

Use the average of the 10 individual results obtained in the test for Uniformity of content.

Haloperidol Injection

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Haloperidol Injection is a sterile solution of Haloperidol in Lactic Acid diluted with Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of haloperidol, $C_{21}H_{23}ClFNO_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a volume containing 20 mg of Haloperidol add 5 mL of *water* and 1 mL of 1M *sodium hydroxide* and extract with 10 mL of *chloroform*. Filter the chloroform extract through absorbent cotton, evaporate the filtrate to dryness and dry the residue at 60° at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of haloperidol *(RS 173)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits a maximum only at 245 nm.

TESTS

Acidity

pH, 2.8 to 3.6, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 92 volumes of *chloroform*, 8 volumes of *methanol* and 1 volume of 13.5M *ammonia* as the mobile phase. Apply separately to the plate (1) a volume of the injection containing 0.1 mg of Haloperidol, (2) the same volume of a solution prepared by diluting 1 volume of the injection to 100 volumes with *methanol* and (3) the same volume of a solution prepared by diluting 1 volume of the injection to 200 volumes with *methanol*. After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3).

ASSAY

To a quantity containing 10 mg of Haloperidol add 8 mL of *water* and 10 mL of 1M *hydrochloric acid*. Extract with successive quantities of 25, 25, 10 and 10 mL of *ether*. Wash the combined ether extracts with 10 mL of *water*, combine the aqueous layers and remove the ether using a rotary evaporator. Add sufficient *water* to produce 100 mL and dilute 10 mL to 100 mL with *methanol*. Measure the *absorbance* of the resulting solution at the maximum at 245 nm, Appendix II B. Calculate the content of $C_{21}H_{23}ClFNO_2$ taking 346 as the value of A(1%, 1 cm) at the maximum at 245 nm.

STORAGE

Haloperidol Injection should be protected from light.

Haloperidol Oral Solution

Haloperidol Oral Drops

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Haloperidol Oral Solution is an aqueous solution containing not more than 0.2% w/v of Haloperidol.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of haloperidol, $C_{21}H_{23}ClFNO_2$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A clear, colourless solution.

IDENTIFICATION

A. To a volume containing 20 mg of Haloperidol add 1 mL of 1M *sodium hydroxide*, extract with 10 mL of *chloroform*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of haloperidol *(RS 173)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits a maximum only at 245 nm.

TESTS

Acidity

pH, 2.5 to 3.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

(1) Dilute the oral solution, if necessary, to contain 0.1% w/v of Haloperidol.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) Dilute 1 volume of solution (1) to 200 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 50 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

1 volume of 13.5M *ammonia*, 8 volumes of *methanol* and 92 volumes of *dichloromethane*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) and not more than

www.webofpharma.com

one such spot is more intense than the spot in the chromatogram obtained with solution (3).

ASSAY

To a volume containing 10 mg of Haloperidol add 8 mL of *water* and 10 mL of 1M *hydrochloric acid* and extract with two 10 mL quantities of *ether*. Wash the combined ether extracts with 10 mL of *water*, combine the aqueous solutions and remove the ether using a rotary evaporator. Add sufficient *water* to produce 100 mL and dilute 10 mL to 100 mL with *methanol*. Measure the *absorbance* of the resulting solution at the maximum at 245 nm, Appendix II B. Calculate the content of $C_{21}H_{23}ClFNO_2$ taking 346 as the value of A(1%, 1 cm) at the maximum at 245 nm.

STORAGE

Haloperidol Oral Solution should be protected from light. It should not be refrigerated.

When Haloperidol Oral Solution or Haloperidol Oral Drops is prescribed or demanded and no strength is stated, an Oral Solution containing 0.2% w/v of Haloperidol shall be dispensed or supplied.

Strong Haloperidol Oral Solution

Strong Haloperidol Oral Drops

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Strong Haloperidol Oral Solution is an aqueous solution containing 1% w/v of Haloperidol. It is intended to be diluted before use.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of haloperidol, $C_{21}H_{23}ClFNO_2$

0.95 to 1.05% w/v.

CHARACTERISTICS

A clear, colourless solution.

IDENTIFICATION

A. To 2 mL add 10 mL of *water* and 1 mL of 1M *sodium hydroxide*, extract with 10 mL of *chloroform*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of haloperidol *(RS 173)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the final solution obtained in the Assay exhibits a maximum only at 245 nm.

TESTS

Acidity

pH, 3.5 to 4.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and a mixture of 92 volumes of *dichloromethane*, 8 volumes of *methanol* and 1 volume of 13.5M *ammonia* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. Solution (1) is the preparation being examined. For solution (2) dilute 1 volume of solution (1) to 100 volumes with *water*. For solution (3) dilute 1 volume of solution (1) to 200 volumes with *water*. After removal of the plate, allow it to dry in air and spray with *dilute potassium iodobismuthate solution*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3).

ASSAY

To 1 mL add 10 mL of *water* and 10 mL of 1M *hydrochloric acid* and extract with two 10 mL quantities of *ether*. Wash the combined ether extracts with 10 mL of *water*, combine the aqueous solutions and remove the ether using a rotary evaporator. Add sufficient *water* to produce 100 mL and dilute 10 mL to 100 mL with *methanol*. Measure the *absorbance* of the resulting solution at the maximum at 245 nm, Appendix II B. Calculate the content of $C_{21}H_{23}ClFNO_2$ taking 346 as the value of A(1%, 1 cm) at the maximum at 245 nm.

STORAGE

Strong Haloperidol Oral Solution should be protected from light. It should not be refrigerated.

Haloperidol Tablets

Action and use

Dopamine receptor antagonist; neuroleptic.

DEFINITION

Haloperidol Tablets contain Haloperidol.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of haloperidol, $C_{21}H_{23}ClFNO_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

To a quantity of the powdered tablets containing 10 mg of Haloperidol add 10 mL of *water* and 1 mL of 1M *sodium hydroxide* and extract with 10 mL of *ether*. Filter the ether extract through absorbent cotton, evaporate the filtrate to dryness and dry the residue at 60° at a pressure not exceeding 0.7 kPa. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of haloperidol *(RS 173)*.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 10 mg of Haloperidol with 10 mL of *chloroform*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 mL of *chloroform*.

(2) Dilute 1 volume of solution (1) to 200 volumes with *chloroform*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating a suitable silanised silica gel containing a fluorescent indicator with an optimal intensity at 254 nm (Merck silanised silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in a current of warm air for 15 minutes and examine under *ultraviolet light (254 nm)*.

www.webofpharma.com

MOBILE PHASE

0.5 volume of 13.5M *ammonia*, 20 volumes of *ammonium acetate solution*, 20 volumes of *water* and 60 volumes of *1,4-dioxan*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (2) shows a distinct and clearly visible spot.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Haloperidol comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Place one tablet in 10 mL of the mobile phase, disperse with the aid of ultrasound for 2 minutes and centrifuge. If necessary, dilute the supernatant liquid with the mobile phase to produce a solution containing 0.005% w/v of Haloperidol.

(2) 0.005% w/v of *haloperidol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 5 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 247 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

45 volumes of *acetonitrile* and 55 volumes of a 1% w/v solution of *ammonium acetate*.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{23}ClFNO_2$ using the declared content of $C_{21}H_{23}ClFNO_2$ in *haloperidol BPCRS*.

ASSAY

For tablets containing less than 2 mg and/or less than 2% w/w of Haloperidol

Use the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing 2 mg or more and 2% w/w or more of Haloperidol

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 60 mL of the mobile phase to a quantity of the powdered tablets containing 20 mg of Haloperidol, disperse with the aid of ultrasound for 2 minutes, add sufficient mobile phase to produce 100 mL, mix and filter.

(2) 0.020% w/v of *haloperidol BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{23}ClFNO_2$ using the declared content of $C_{21}H_{23}ClFNO_2$ in *haloperidol BPCRS*.

Heparin Injection

Action and use

Anticoagulant.

DEFINITION

Heparin Injection is a sterile solution of Heparin Calcium or Heparin Sodium in Water for Injections. The pH of the solution may be adjusted by the addition of a suitable alkali.

PRODUCTION

The final product is produced from the drug substance where the methods of manufacturing are designed to ensure freedom from contamination by over-sulfated glycosaminoglycans.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Potency

The estimated potency is not less than 90% and not more than 111% of the stated potency.

CHARACTERISTICS

A colourless or straw-coloured liquid, free from turbidity and from matter that deposits on standing.

IDENTIFICATION

A. Under the conditions of the Assay, the clotting time is not less than 1.5 times the blank recalcification time.

B. Carry out the method for *zone electrophoresis*, Appendix III F, using *agarose for electrophoresis* as the supporting medium. To equilibrate the agarose and as electrolyte solution use a mixture of 50 mL of *glacial acetic acid* and 800 mL of *water* adjusted to pH 3 by the addition of *lithium hydroxide* and diluted to 1000 mL with *water*. Apply separately to the strip 2 µL to 3 µL of each of the following solutions. For solution (1) dilute a volume of the injection with *water* to give a solution containing 375 IU per mL. For solution (2), dilute *heparin sodium EPBRP* with an equal volume of *water*. Pass a current of 1 mA to 2 mA per centimetre of strip width at a potential difference of 300 volts for about 10 minutes. Stain the strips using a 0.1% w/v solution of *toluidine blue* and remove the excess by washing. The ratio of the distance migrated by the principal band or bands in the gel obtained with solution (1) to the distance migrated by the principal band in the gel obtained with solution (2) is 0.9 to 1.1.

C. When the injection contains Heparin Calcium, it yields reactions A and B characteristic of *calcium salts*, Appendix VI. When the injection contains Heparin Sodium, it yields reaction A characteristic of *sodium salts*, Appendix VI.

TESTS

Acidity or alkalinity

pH, 5.5 to 8.0, Appendix V L.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C.

For a preparation supplied in a container with a nominal content of less than 100 mL, dilute the injection if necessary with *water BET* to give a solution containing 1000 IU of heparin activity per mL (solution A). The endotoxin limit concentration of solution A is 10 IU of endotoxin per mL. Carry out the test using a lysate with a declared sensitivity not less sensitive than 0.0625 IU of endotoxin per mL.

For a preparation supplied in a container with a nominal content of 100 mL or more, the endotoxin limit concentration is 0.25 IU of endotoxin per mL.

www.webofpharma.com

For Heparin Injection prepared from Heparin Calcium it may be necessary to add divalent cations in order to achieve the validation criteria.

ASSAY

Carry out the *assay of heparin*, Appendix XIV J B2.
The fiducial limits of error are not less than 80% and not more than 125% of the stated potency.

STORAGE

Heparin Injection should preferably be kept in a container sealed by fusion of the glass.

LABELLING

The strength is stated as the number of IU (Units) in a suitable dose-volume except that for multi-dose containers the strength is stated as the number of IU (Units) per mL.

The label states (1) whether the material is the calcium or sodium salt; (2) when no antimicrobial preservative is present that the preparation contains no antimicrobial preservative and that any portion of the contents not used at once should be discarded.

Hexachlorophene Dusting Powder

Hexachlorophene Cutaneous Powder; Zinc and Hexachlorophene Dusting Powder

Action and use
Antiseptic.

DEFINITION

Hexachlorophene Dusting Powder is a *cutaneous powder*. It is a mixture of Hexachlorophene and Zinc Oxide with a suitable inert diluent.

The dusting powder complies with the requirements stated under Topical Powders and with the following requirements.

Content of hexachlorophene, $C_{13}H_6Cl_6O_2$
90.0 to 110.0% of the stated amount.

Content of zinc oxide, ZnO
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powder containing 30 mg of Hexachlorophene with 25 mL of *ether* for 15 minutes, filter, wash the filtrate with 10 mL of *water*, dry the ether layer over *anhydrous sodium sulfate*, filter and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of hexachlorophene *(RS 174)*.

B. Shake a quantity of the powder containing 30 mg of Zinc Oxide with 10 mL of 2M *hydrochloric acid* for 15 minutes and filter. 5 mL of the filtrate yields the reaction characteristic *zinc salts*, Appendix VI.

ASSAY

For hexachlorophene

Shake a quantity of the powder containing 15 mg of Hexachlorophene with 50 mL of *methanolic tris(hydroxymethyl)methylamine solution* for 10 minutes, filter through a sintered-glass crucible (ISO 4793, porosity grade 3, is suitable), wash the filter with two 10 mL quantities of the tris(hydroxymethyl)methylamine solution and dilute the combined filtrate and washings to 100 mL with the same solution. Dilute 10 mL of the resulting solution to 50 mL with *methanolic tris(hydroxymethyl)methylamine solution* and measure the *absorbance* at the maximum at 312 nm, Appendix II B, using in the reference cell a solution prepared by diluting a further 10 mL of the solution to 50 mL with *acidified methanol*. An absorbance of 0.432 is equivalent to 15 mg of $C_{13}H_6Cl_6O_2$ in the weight of powder taken.

For zinc oxide

To a quantity of the powder containing 90 mg of Zinc Oxide add 10 mL of 2M *nitric acid* and 20 mL of *water*, boil for 2 minutes, cool, filter and wash the filter with two 25 mL quantities of *water*. To the combined filtrate and washings add 3 g of *hexamine* and titrate with 0.05M *disodium edetate VS* using 2 mL of *xylenol orange solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 4.068 mg of ZnO.

LABELLING

The label states that the preparation should not be applied to infants or to large areas of skin except in accordance with medical advice.

Homatropine Eye Drops

Action and use
Anticholinergic.

DEFINITION

Homatropine Eye Drops are a sterile solution of Homatropine Hydrobromide in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of homatropine hydrobromide, $C_{16}H_{21}NO_3,HBr$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a volume containing 60 mg of Homatropine Hydrobromide add 3 mL of 5M *ammonia*, extract with 15 mL of *chloroform*, dry the chloroform over *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of homatropine *(RS 175)*.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak derived from homatropine hydrobromide in the chromatogram obtained with solution (3).

C. To 1 mL of the eye drops, diluted with *water* if necessary to give a solution containing 1% w/v of Homatropine Hydrobromide, add 1 mL of 5M *ammonia*, shake with *chloroform* and evaporate the chloroform solution to dryness on a water bath. To the residue add 1.5 mL of a 2% w/v solution of *mercury(II) chloride* in *ethanol (60%)*. A yellow colour is produced which becomes red on gentle warming (distinction from most other alkaloids except atropine and hyoscyamine).

TESTS

Tropine

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Use the eye drops diluted, if necessary, with *water* to contain 1% w/v of Homatropine Hydrobromide.

(2) 0.0050% w/v of *tropine*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 40 µL of each solution.

www.webofpharma.com

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it at 100° to 105° until the solvent has evaporated, allow to cool and spray with *dilute potassium iodobismuthate solution* until spots appear.

MOBILE PHASE

33 volumes of *anhydrous formic acid*, 33 volumes of *water* and 134 volumes of *ethyl acetate*.

LIMITS

Any spot corresponding to tropine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the method for *gas chromatography*, Appendix III B. Prepare a 2% w/v solution of *atropine sulfate BPCRS* (internal standard) in *methanol* (solution A).

(1) Add 1 mL of solution A and 1 mL of 5M *ammonia* to a volume of the eye drops containing 20 mg of Homatropine Hydrobromide, diluted if necessary to 5 mL with *water*. Extract with two 5-mL quantities of *chloroform*, shake the combined extracts with 1 g of *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 mL of *dichloromethane*. To 1 mL of this solution add 0.2 mL of a mixture of 4 volumes of N,O-*bis(trimethylsilyl) acetamide* and 1 volume of *trimethylchlorosilane*, mix and allow to stand for 30 minutes.

(2) Prepare in the same manner as solution (1) but omitting the addition of solution A.

(3) Add 1 mL of solution A and 1 mL of 5M *ammonia* to 5 mL of a 0.4% w/v solution of *homatropine hydrobromide BPCRS*. Complete the procedure described under solution (1), beginning at the words 'Extract with two 5-mL quantities of *chloroform*...'.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (80 to 100 mesh) coated with 3% w/w of phenyl methyl silicone fluid (50% phenyl) (OV-17 is suitable).

(b) Use *helium* as the carrier gas at 1.7 mL per minute.

(c) Use isothermal conditions maintained at 220°.

(d) Use an inlet temperature of 220°.

(e) Use a flame ionisation detector at a temperature of 220°.

(f) Inject 1 µL of each solution.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{21}NO_3$,HBr using the ratios of the peaks and the declared content of $C_{16}H_{21}NO_3$,HBr in *homatropine hydrobromide BPCRS*.

Hyaluronidase Injection

Action and use

Used to promote absorption of fluid into tissues.

DEFINITION

Hyaluronidase Injection is a sterile solution of Hyaluronidase in Water for Injections. It is prepared by dissolving Hyaluronidase for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Hyaluronidase Injection should be used immediately after preparation.

HYALURONIDASE FOR INJECTION

DEFINITION

Hyaluronidase for Injection is a sterile material consisting of Hyaluronidase with or without excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Potency

The estimated potency is not less than 90% and not more than 115% of the stated potency.

IDENTIFICATION

A solution containing 100 IU in 1 mL of a 0.9% w/v solution of *sodium chloride* depolymerises an equal volume of a 1% w/v solution of *sodium hyaluronate EPBRP* at 20° in 1 minute, as shown by a pronounced decrease in viscosity. This action is destroyed by heating the initial solution at 100° for 30 minutes.

TESTS

Acidity or alkalinity

pH of a 0.3% w/v solution in *carbon dioxide-free water*, 4.5 to 7.5, Appendix V L.

Clarity and colour of solution

A 1.0% w/v solution in *carbon dioxide-free water* is *clear*, Appendix IV A, and not more than faintly yellow.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dissolve the contents of the sealed container in *water BET* to give a solution containing 150 IU of Hyaluronidase per mL (solution A). The endotoxin limit concentration of solution A is 30 IU per mL.

ASSAY

Carry out the Assay described under Hyaluronidase.

LABELLING

The label of the sealed container states the total number of IU (Units) contained in it.

Hydralazine Injection

Action and use

Vasodilator; treatment of hypertension.

DEFINITION

Hydralazine Injection is a sterile solution of Hydralazine Hydrochloride in Water for Injections. It is prepared by dissolving Hydralazine Hydrochloride for Injection in the requisite amount of Water for Injections immediately before use. For intravenous infusion, the Hydralazine Hydrochloride for Injection should be dissolved in, and then diluted with, an appropriate volume of a suitable diluent.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Hydralazine Injection deteriorates on storage and should be used immediately after preparation.

HYDRALAZINE HYDROCHLORIDE FOR INJECTION

DEFINITION

Hydralazine Hydrochloride for Injection is a sterile material consisting of Hydralazine Hydrochloride with or without excipients. It is supplied in a sealed container.

www.webofpharma.com

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of hydralazine hydrochloride, $C_8H_8N_4,HCl$
98.0 to 114.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of hydralazine hydrochloride *(RS 177)*.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of a 0.002% w/v solution exhibits four maxima, at 240, 260, 305 and 315 nm.

C. Yield the reactions characteristic of *chlorides*, Appendix VI.

TESTS

Acidity
pH of a 2% w/v solution, 3.5 to 4.2, Appendix V L.

Clarity of solution
A 2.0% w/v solution is not more opalescent than *reference suspension II*, Appendix IV A.

Colour of solution
A 2.0% w/v solution in 0.01M *hydrochloric acid* is not more intensely coloured than *reference solution GY_6*, Appendix IV B, Method II.

Hydrazine
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve the contents of a sealed container in sufficient 0.1M *methanolic hydrochloric acid* to produce a solution containing 0.5% w/v of Hydralazine Hydrochloride. To 2 mL add 1 mL of a 2% w/v solution of *salicylaldehyde* in *methanol* and 0.1 mL of *hydrochloric acid*, centrifuge and decant the supernatant liquid.

(2) Prepare in the same manner as solution (1), but use 2 mL of a 0.00025% w/v solution of *hydrazine sulfate* in 0.1M *methanolic hydrochloric acid* in place of the solution of the material being examined.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 40 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and spray with *dimethylaminobenzaldehyde solution R1*.

MOBILE PHASE

The upper layer of the mixture obtained by shaking together 20 volumes of 13.5M *ammonia*, 20 volumes of *ethyl acetate* and 80 volumes of *hexane* and allow to stand.

LIMITS

Any spot corresponding to hydrazine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Uniformity of content
Sealed containers each containing 20 mg or less of Hydralazine Hydrochloride comply with the requirements stated under Parenteral Preparations, Powders for Injections or Infusions using the following method of analysis. Dissolve the contents of a sealed container in sufficient *water* to produce 100 mL and dilute a volume containing 1 mg of Hydralazine Hydrochloride to 100 mL with *water*. Measure the *absorbance* of the resulting solution at the maximum at 260 nm, Appendix II B. Calculate the content of $C_8H_8N_4,HCl$ taking 535 as the value of A(1%, 1 cm) at the maximum at 260 nm.

ASSAY

Determine the weight of the contents of 10 containers described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Use.

Dissolve 0.1 g of the mixed contents of the 10 containers in a mixture of 25 mL of *water* and 35 mL of *hydrochloric acid* and titrate with 0.025M *potassium iodate VS* determining the end point potentiometrically using a platinum indicator electrode and a calomel reference electrode. Each mL of 0.025M *potassium iodate VS* is equivalent to 4.916 mg of $C_8H_8N_4,HCl$. Calculate the content of $C_8H_8N_4,HCl$ in a container of average content weight.

STORAGE

The sealed container should be protected from light.

Hydralazine Tablets

Action and use
Vasodilator; treatment of hypertension.

DEFINITION

Hydralazine Tablets contain Hydralazine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hydralazine hydrochloride, $C_8H_8N_4,HCl$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the powdered tablets containing 0.1 g of Hydralazine Hydrochloride in 10 mL of *water*, make alkaline with 2 mL of 5M *ammonia* and extract with two 10-mL quantities of *chloroform*. Combine the chloroform extracts and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of hydralazine *(RS 176)*.

B. Shake a quantity of the powdered tablets containing 25 mg of Hydralazine Hydrochloride with 30 mL of *methanol* for 15 minutes, add sufficient *methanol* to produce 50 mL and filter. Dilute 1 volume of the filtrate to 50 volumes with *water*. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits four maxima, at 240, 260, 305 and 315 nm.

C. Extract a quantity of the powdered tablets containing 0.1 g of Hydralazine Hydrochloride with two 25-mL quantities of *methanol*, filter the combined extracts and evaporate to dryness. To 5 mL of a 1% w/v solution of the residue in *methanol* add 5 mL of a 2% w/v solution of *2-nitrobenzaldehyde* in *ethanol (96%)*. An orange precipitate is produced.

TEST

Hydrazine
Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and as the mobile phase the upper layer obtained by shaking together 20 volumes of 13.5M *ammonia*, 20 volumes of *ethyl acetate* and 80 volumes of *hexane* and allowing to separate. Apply separately to the plate 40 µL of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 50 mg of Hydralazine Hydrochloride with 10 mL

www.webofpharma.com

of 0.1M *methanolic hydrochloric acid*; to 2 mL add 1 mL of a 2% w/v solution of *salicylaldehyde* in *methanol* and 0.1 mL of *hydrochloric acid*, centrifuge and use the supernatant liquid. Prepare solution (2) in the same manner, but using 2 mL of a 0.00025% w/v solution of *hydrazine sulfate* in 0.1M *methanolic hydrochloric acid* in place of the solution of the substance being examined. After removal of the plate, allow it to dry in air and spray with *dimethylaminobenzaldehyde solution R1*. Any spot corresponding to hydrazine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 50 mg of Hydralazine Hydrochloride add 50 mL of *water* and shake for 20 minutes. Add 60 mL of *hydrochloric acid* and titrate with 0.025M *potassium iodate VS* determining the end point potentiometrically using platinum and calomel electrodes. Each mL of 0.025M *potassium iodate VS* is equivalent to 4.916 mg of $C_8H_8N_4,HCl$.

STORAGE

Hydralazine Tablets should be protected from light.

Hydrochlorothiazide Tablets

Action and use

Thiazide diuretic.

DEFINITION

Hydrochlorothiazide Tablets contain Hydrochlorothiazide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Triturate a quantity of the powdered tablets containing 10 mg of Hydrochlorothiazide with 10 mL of *acetone* and filter.

(2) 0.1% w/v of *hydrochlorothiazide BPCRS* in *acetone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in a current of air, examine under *ultraviolet light (254 nm)* and then treat the plate by *Method I* and examine again.

MOBILE PHASE

ethyl acetate.

CONFIRMATION

By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds in colour and intensity to that in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 50 mg of Hydrochlorothiazide with 25 mL of a mixture of equal volumes of *acetonitrile* and *methanol* and dilute to 100 mL with *phosphate buffer solution pH 3.2 R1*. Filter through a glass-fibre filter (Whatman 0.45µ GD/X is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with a mixture containing 1 volume of *methanol*, 1 volume of *acetonitrile* and 2 volumes of *phosphate buffer solution pH 3.2 R1*.

(3) Dissolve, with the aid of ultrasound, 15 mg each of *hydrochlorothiazide BPCRS* and *chlorothiazide BPCRS* in 25 mL of a mixture of equal volumes of *acetonitrile* and *methanol* and dilute to 100 mL with *phosphate buffer solution pH 3.2 R1*. Dilute 5 volumes of this solution to 100 volumes with the same solvent mixture.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Phenosphere ODS 3µ or Microsorb ODS 3µ is suitable).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 0.8 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 224 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE A

A mixture of 10 volumes of *tetrahydrofuran*, 60 volumes of *methanol* and 940 volumes of *phosphate buffer solution pH 3.2 R1*.

MOBILE PHASE B

A mixture of 50 volumes of *tetrahydrofuran*, 500 volumes of *methanol* and 500 volumes of *phosphate buffer solution pH 3.2 R1*.

Equilibrate the column for at least 20 minutes with mobile phase A. Inject 20 µL. Carry out a linear gradient elution using the following gradient programme.

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)	Comment
0–17	100→55	0→45	Linear gradient
17–30	55	45	Isocratic
30–35	55→100	45→0	Linear gradient
35–50	100	0	Isocratic
50=0	100	0	Return to initial eluent composition

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to chlorothiazide and hydrochlorothiazide is at least 2.5. If necessary, adjust the composition of the mobile phase or the time programme of the linear gradient.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

www.webofpharma.com

the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (2.5%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powder containing 30 mg of Hydrochlorothiazide add 50 mL of 0.1M *sodium hydroxide*, shake for 20 minutes and dilute to 100 mL with 0.1M *sodium hydroxide*. Mix, filter, dilute 5 mL of the filtrate to 100 mL with *water* and measure the *absorbance* of the resulting solution at the maximum at 273 nm, Appendix II B. Calculate the content of $C_7H_8ClN_3O_4S_2$ taking 520 as the value of A(1%, 1 cm) at the maximum at 273 nm.

Hydrocortisone Cream

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Cream contains Hydrocortisone in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

For creams containing more than 0.5% w/w of Hydrocortisone:

(1) Mix a quantity containing 25 mg of Hydrocortisone with 10 mL of *methanol (90%)*, add 50 mL of hot *hexane* and shake. Separate the lower layer, add 5 g of *anhydrous sodium sulfate*, mix and filter through a glass microfibre filter (Whatman GF/C is suitable).

(2) 0.25% w/v of *hydrocortisone BPCRS* in *methanol*.

(3) A mixture of equal volumes of solutions (1) and (2).

For creams containing 0.5% w/w or less of Hydrocortisone:

(1) Prepare in the same manner as solution (1) above but use a quantity containing 5 mg of Hydrocortisone.

(2) 0.05% w/v of *hydrocortisone BPCRS* in *methanol*.

(3) A mixture of equal volumes of solutions (1) and (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *alkaline tetrazolium blue solution* and examine in white light.

MOBILE PHASE

1.2 volumes of *water*, 8 volumes of *methanol*, 15 volumes of *ether* and 77 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2); if it does not, the principal spot in the chromatogram obtained with solution (3) appears as a single, compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to hydrocortisone in the chromatogram obtained with solution (3).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For creams containing more than 0.5% w/w of Hydrocortisone:

Prepare a 0.5% w/v solution of *betamethasone* (internal standard) in *methanol* (solution A).

(1) Disperse, by shaking, a quantity of the cream containing 25 mg of Hydrocortisone in 40 mL of a mixture of 3 volumes of *methanol* and 1 volume of a 15% w/v solution of *sodium chloride*. Add 50 mL of hot *hexane*, shake and separate the lower layer. Repeat the extraction using a further two 10-mL quantities of the methanolic sodium chloride solution. To the combined extracts add 5 mL of solution A and sufficient *water* to produce 100 mL, mix and filter through a glass microfibre paper (Whatman GF/C is suitable).

(2) Prepare in the same manner as solution (1), but add 5 mL of *methanol* in place of the 5 mL of solution A.

(3) Dissolve 25 mg of *hydrocortisone BPCRS* in 45 mL of *methanol*, add 5 mL of solution A and add sufficient *water* to produce 100 mL.

For creams containing 0.5% w/w or less of Hydrocortisone:

Prepare a 0.110% w/v solution of *betamethasone* (internal standard) in *methanol* (solution B).

(1) Disperse, by shaking, a quantity of the cream containing 5 mg of Hydrocortisone in 40 mL of a mixture of 3 volumes of *methanol* and 1 volume of a 15% w/v solution of *sodium chloride*. Add 50 mL of hot *hexane*, shake and separate the lower layer. Repeat the extraction using a further two 10-mL quantities of the methanolic sodium chloride solution. To the combined extracts add 5 mL of solution B and sufficient *water* to produce 100 mL, mix and filter through a glass microfibre paper (Whatman GF/C is suitable).

(2) Prepare in the same manner as solution (1), but add 5 mL of *methanol* in place of the 5 mL of solution B.

(3) Dissolve 5 mg of *hydrocortisone BPCRS* in 45 mL of *methanol* and add 5 mL of solution B and sufficient *water* to produce 100 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

methanol (50%).

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{30}O_5$ in the cream using the ratios of the peaks and the declared content of $C_{21}H_{30}O_5$ in *hydrocortisone BPCRS*.

www.webofpharma.com

Hydrocortisone Ointment

Action and use
Corticosteroid.

DEFINITION
Hydrocortisone Ointment contains Hydrocortisone in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Complies with test A for Identification described under Hydrocortisone Cream but preparing solution (1) in the following manner. For ointments containing more than 0.5% w/w of Hydrocortisone, disperse a quantity containing 25 mg of Hydrocortisone in 5 mL of hot *hexane*, cool, extract with 10 mL of *methanol (90%)* and filter. For ointments containing 0.5% w/w or less of Hydrocortisone, disperse a quantity containing 5 mg of Hydrocortisone in 50 mL of hot *hexane*, cool, extract with 10 mL of *methanol (90%)* and filter.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to hydrocortisone in the chromatogram obtained with solution (1).

ASSAY
Carry out the Assay described under Hydrocortisone Cream but prepare solution (2) in the following manner.
For ointments containing more than 0.5% w/w of Hydrocortisone, disperse a quantity containing 25 mg of Hydrocortisone in 100 mL of hot *hexane*, cool and extract with 20 mL of a solution prepared by mixing 3 volumes of *methanol* with 1 volume of a 15% w/v solution of *sodium chloride*. Repeat the extraction using a further two 10 mL quantities of the methanolic sodium chloride solution. To the combined extracts add 5 mL of *methanol* and sufficient *water* to produce 100 mL, mix and filter through a glass microfibre filter (Whatman GF/C is suitable). For ointments containing 0.5% w/w or less of Hydrocortisone, prepare solution (2) in the same manner as solution (2) above but use a quantity containing 5 mg of Hydrocortisone.

STORAGE
Hydrocortisone Ointment should be protected from light.

Hydrocortisone Oromucosal Tablets

Action and use
Corticosteroid.

DEFINITION
Hydrocortisone Oromucosal Tablets are mucoadhesive buccal tablets containing hydrocortisone sodium succinate prepared by buffering Hydrocortisone Hydrogen Succinate.

The tablets comply with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel plate* (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 20 volumes of *acetic anhydride*, 20 volumes of *water* and 60 volumes of *butan-1-ol* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) shake a quantity of the tablets containing the equivalent of 25 mg of hydrocortisone with 10 mL of *methanol*, filter and use the filtrate. For solution (2) dissolve 50 mg of *hydrocortisone acetate BPCRS* in sufficient *methanol* to produce 20 mL. Solution (3) contains equal volumes of solutions (1) and (2). After removal of the plate, allow it to dry in air, spray with *ethanolic sulfuric acid (20%)*, heat at 120° for 10 minutes, allow to cool and examine under *ultraviolet light (365 nm)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The test is not valid unless the chromatogram obtained with solution (3) shows a single compact spot.

TESTS

Disintegration
The tablets disintegrate in not less than 10 minutes when examined by the *disintegration test for tablets and capsules*, Appendix XII A1, but using *water* at 24° to 26°.

Free hydrocortisone
Not more than 15% of the stated amount when determined by the following method. Weigh and powder 20 tablets. For solution (1) disperse a quantity of the powdered tablets containing the equivalent of 7.5 mg of hydrocortisone in 15 mL of a phosphate buffer prepared by dissolving 5.8 g of *anhydrous disodium hydrogen orthophosphate* and 1.6 g of *sodium dihydrogen orthophosphate* in 1000 mL of *water* and adjusting the pH to 7.4, if necessary, by adding 10 mg quantities of either *anhydrous disodium hydrogen orthophosphate* or *sodium dihydrogen orthophosphate*. Shake and extract with three 25-mL quantities of *chloroform*, combine the extracts in a second separating funnel, wash the combined extracts with 2 mL of *water*, filter the chloroform layer through a plug of absorbent cotton, previously moistened with *chloroform*, into a 250-mL round-bottomed flask, wash the funnel and absorbent cotton plug with two 10-mL quantities of *chloroform* and add the washings to the flask; evaporate to dryness using a rotary evaporator, allow to cool and dissolve the residue in 50 mL of *aldehyde-free ethanol (96%)*. Solution (2) contains 0.00225% w/v of *hydrocortisone BPCRS* in *aldehyde-free ethanol (96%)*.

Protect all the solutions from light. Transfer 10 mL of solution (1) into a stoppered test-tube and repeat for solution (2). Place in a water bath at 35° for 10 minutes, add 1 mL of *triphenyltetrazolium chloride solution* and 1 mL of *dilute tetramethylammonium hydroxide solution* to each tube, stopper and mix well; allow the tubes to stand in the water bath at 35° for a further 25 minutes, remove from the water bath and allow to stand in water for 5 minutes at room temperature. Measure the *absorbance* of the resulting solutions in a stoppered cell at the maximum at 485 nm, Appendix II B, using in the reference cell a solution prepared at the same time and in the same manner using 10 mL of *aldehyde-free ethanol (96%)*.

Calculate the content of free hydrocortisone.

ASSAY
Weigh and powder 20 tablets. Shake a quantity of the powdered tablets containing the equivalent of 25 mg of hydrocortisone with 50 mL of *water* for 10 minutes, dilute to 100 mL with *water*, filter and discard the first 20 mL of the filtrate; dilute 4 mL of the remaining filtrate to 100 mL with *water* and measure the *absorbance*, Appendix II B, at the

www.webofpharma.com

maximum at 248 nm using *water* in the reference cell. Calculate the content of hydrocortisone, $C_{21}H_{30}O_5$, in the tablets using 449 as the value of A(1%, 1 cm) at the maximum at 248 nm.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of hydrocortisone.

Hydrocortisone Acetate Cream

Action and use
Corticosteroid.

DEFINITION
Hydrocortisone Acetate Cream contains Hydrocortisone Acetate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions.

For creams containing more than 0.5% w/w of Hydrocortisone Acetate, prepare two solutions in the following manner. For solution (1) mix a quantity of the cream containing 25 mg of Hydrocortisone Acetate with 10 mL of *methanol (90%)*, add 50 mL of hot *hexane* and shake. Discard the upper layer, add 5 g of *anhydrous sodium sulfate* to the lower layer, mix and filter through a glass microfibre filter (Whatman GF/C is suitable). Solution (2) is a mixture of equal volumes of solution (1) and a 0.25% w/v solution of *hydrocortisone acetate BPCRS* in *methanol*.

For creams containing 0.5% w/w or less of Hydrocortisone Acetate, prepare solution (1) in the same manner as solution (1) described above but using a quantity of the cream containing 5 mg of Hydrocortisone Acetate. Solution (2) is a mixture of equal volumes of solution (1) and a 0.05% w/v solution of *hydrocortisone acetate BPCRS* in *methanol*.

After removal of the plate, allow it to dry in air and spray with *alkaline tetrazolium blue solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2), which appears as a single, compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to hydrocortisone acetate in the chromatogram obtained with solution (1).

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

For creams containing more than 0.5% w/w of Hydrocortisone Acetate, prepare solutions (1) and (2) in the following manner. For solution (1) dissolve 25 mg of *hydrocortisone acetate BPCRS* in 45 mL of *methanol*, add 5 mL of a 0.5% w/v solution of *betamethasone* (internal standard) in *methanol* and add sufficient *water* to produce 100 mL. For solution (2) disperse, by shaking, a quantity containing 25 mg of Hydrocortisone Acetate in 40 mL of a solution prepared by mixing 75 mL of *methanol* with 25 mL of a 15% w/v solution of *sodium chloride*. Add 50 mL of hot *hexane*, shake and separate the lower layer. Repeat the extraction using two 10 mL quantities of the methanolic sodium chloride solution. Add 5 mL of *methanol* to the combined extracts and sufficient *water* to produce 100 mL, mix and filter through a glass microfibre filter paper (Whatman GF/C is suitable).

For creams containing 0.5% w/w or less of Hydrocortisone Acetate, prepare solutions (1) and (2) in the following manner. For solution (1) dissolve 5 mg of *hydrocortisone acetate BPCRS* in 45 mL of *methanol* and add 5 mL of a 0.110% w/v solution of *betamethasone* (internal standard) in *methanol* and sufficient *water* to produce 100 mL. Prepare solution (2) in the same manner as solution (2) above but use a quantity containing 5 mg of Hydrocortisone Acetate.

For all creams prepare solution (3) in the same manner as solution (2) but adding 5 mL of the appropriate internal standard solution in place of the 5 mL of methanol before diluting to volume.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) *methanol (50%)* as the mobile phase with a flow rate of 2 mL per minute and (c) a detection wavelength of 240 nm.

Calculate the content of $C_{23}H_{32}O_6$ in the preparation being examined using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

Hydrocortisone Acetate Injection

Action and use
Corticosteroid.

DEFINITION
Hydrocortisone Acetate Injection is a sterile suspension of Hydrocortisone Acetate in Water for Injections. It is prepared using aseptic technique.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$
95.0 to 105.0% of the stated amount.

CHARACTERISTICS
A white suspension that settles on standing but readily disperses on shaking. On examination under a microscope, the particles are seen to be crystalline and rarely exceed 30 µm in diameter.

IDENTIFICATION
Filter a volume containing 50 mg of Hydrocortisone Acetate through a sintered-glass filter, wash the residue with four 5-mL quantities of *water*, dissolve in 20 mL of *chloroform*, wash the chloroform solution with four 10-mL quantities of *water*, discard the washings, filter the chloroform solution through absorbent cotton and evaporate the filtrate to dryness. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of hydrocortisone acetate *(RS 179)*.

B. Complies with the test for *identification of steroids*, Appendix III A, using *impregnating solvent I* and *mobile phase B*.

www.webofpharma.com

C. Yields the reaction characteristic of *acetyl groups*, Appendix VI.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve 25 mg of *hydrocortisone acetate BPCRS* in 50 mL of *methanol* and add sufficient *water* to produce 100 mL. For solution (2) add 70 mL of *methanol* to a volume of the injection containing 50 mg of Hydrocortisone Acetate, shake to produce a clear solution and dilute to 100 mL with *methanol*. Dilute 10 mL of the resulting solution to 20 mL with *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) *methanol (50%)* as the mobile phase with a flow rate of 2 mL per minute and (c) a detection wavelength of 240 nm.

Calculate the content of $C_{23}H_{32}O_6$ in the preparation being examined using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

STORAGE

Hydrocortisone Acetate Injection should be protected from light.

LABELLING

The label states (1) that it is intended for local action; (2) that the container should be gently shaken before a dose is withdrawn.

Hydrocortisone Acetate Ointment

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Acetate Ointment contains Hydrocortisone Acetate in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A using the following solutions.

For ointments containing more than 0.5% w/w of Hydrocortisone Acetate

(1) Disperse a quantity containing 25 mg of Hydrocortisone Acetate in 5 mL of hot *hexane*, cool, extract with 10 mL of *methanol (90%)* and filter.

(2) Equal volumes of solution (1) and a 0.25% w/v solution of *hydrocortisone acetate BPCRS* in *methanol*.

For ointments containing 0.5% w/w or less of Hydrocortisone Acetate

(1) Disperse a quantity containing 5 mg of Hydrocortisone Acetate in 5 mL of hot *hexane*, cool, extract with 10 mL of *methanol (90%)* and filter.

(2) Equal volumes of solution (1) and a 0.05% w/v solution of *hydrocortisone acetate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) After removal of the plate, dry in air and spray with *alkaline tetrazolium blue solution*.

MOBILE PHASE

1.2 volumes of *water*, 8 volumes of *methanol*, 15 volumes of *ether* and 77 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2) which appears as a single, compact spot.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to hydrocortisone acetate in the chromatogram obtained with solution (1).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D using the following solutions.

For ointments containing more than 0.5% w/w of Hydrocortisone Acetate

(1) Disperse a quantity of the ointment containing 25 mg of Hydrocortisone Acetate in 100 mL of hot *hexane*, cool and extract with 20 mL of a solution prepared by mixing 3 volumes of *methanol* and 1 volume of a 15% w/v solution of *sodium chloride*. Repeat the extraction using two 10-mL quantities of the methanolic sodium chloride solution. Add 5 mL of *methanol* to the combined extracts and sufficient *water* to produce 100 mL, mix and filter through a glass microfibre filter (Whatman GF/C is suitable).

(2) Dissolve 25 mg of *hydrocortisone acetate BPCRS* in 45 mL of *methanol*, add 5 mL of a 0.5% w/v solution of *betamethasone* (internal standard) in *methanol* and sufficient *water* to produce 100 mL.

(3) Prepare in the same manner as solution (1) but add 5 mL of the internal standard solution in place of the 5 mL of methanol before diluting to volume.

For ointments containing 0.5% w/w or less of Hydrocortisone Acetate

(1) Disperse a quantity of the ointment containing 5 mg of Hydrocortisone Acetate in 100 mL of hot *hexane*, cool and extract with 20 mL of a solution prepared by mixing 3 volumes of *methanol* and 1 volume of a 15% w/v solution of *sodium chloride*. Repeat the extraction using two 10-mL quantities of the methanolic sodium chloride solution. Add 5 mL of *methanol* to the combined extracts and sufficient *water* to produce 100 mL, mix and filter through a glass microfibre filter (Whatman GF/C is suitable).

(2) Dissolve 5 mg of *hydrocortisone acetate BPCRS* in 45 mL of *methanol*, add 5 mL of a 0.110% w/v solution of *betamethasone* (internal standard) in *methanol* and add sufficient *water* to produce 100 mL.

(3) Prepare in the same manner as solution (1) but add 5 mL of the internal standard solution in place of the 5 mL of methanol before diluting to volume.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column 10 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

www.webofpharma.com

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

50 volumes of *methanol* and 50 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{23}H_{32}O_6$ in the ointment using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

STORAGE

Hydrocortisone Acetate Ointment should be protected from light.

Hydrocortisone Acetate Oral Suspension

NOTE: Hydrocortisone Acetate Oral Suspension is not currently licensed in the United Kingdom.

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Acetate Oral Suspension is a suspension of Hydrocortisone Acetate in a suitable flavoured aqueous vehicle.

The oral suspension complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

95.0 to 105.0% of the stated amount.

The oral suspension should be shaken vigorously before carrying out the following tests.

IDENTIFICATION

A. Filter a volume of the oral suspension containing the equivalent of 50 mg of hydrocortisone through a sintered-glass filter, wash the residue with four 5-mL quantities of *water*, dissolve in 20 mL of *dichloromethane*, wash the dichloromethane solution with four 10-mL quantities of *water*, discard the washings, filter the dichloromethane solution through absorbent cotton and evaporate the filtrate to dryness. The residue complies with the test for *identification of steroids*, Appendix III A, using *impregnating solvent I* and *mobile phase B*.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

C. The residue obtained in test A yields the reaction characteristic of *acetyl groups*, Appendix VI.

TESTS

Dissolution

Complies with the requirements stated under Unlicensed Medicines, Oral Suspensions. Use a volume of the oral suspension containing one dose.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a weighed quantity of the oral suspension containing the equivalent of 10 mg of hydrocortisone add 50 mL of *methanol*, mix with the aid of ultrasound, dilute to 100 mL with *methanol* and filter (Whatman No. 1 paper is suitable).

(2) 0.01% w/v of *hydrocortisone BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

4 volumes of a 1% w/v solution of *acetic acid* in *water* and 6 volumes of *methanol*.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{21}H_{30}O_5$, weight in volume, using the declared content of $C_{21}H_{30}O_5$ in *hydrocortisone BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of hydrocortisone.

Hydrocortisone and Clioquinol Cream

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone and Clioquinol Cream contains Hydrocortisone and Clioquinol, the latter in *very fine powder*, in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

92.5 to 107.5% of the stated amount.

Content of clioquinol, C_9H_5ClINO

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse, by warming and shaking, a quantity of the cream containing 2.5 g of Hydrocortisone in 10 mL of *ethanol (96%)*, cool, allow to stand at 0° for 30 minutes, filter and use the filtrate.

(2) 0.25% w/v of *hydrocortisone BPCRS* in *ethanol (96%)*.

(3) Dissolve 12.5 mg of *hydrocortisone BPCRS* in 5 mL of solution (1).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and spray with *alkaline tetrazolium blue solution*.

MOBILE PHASE

1.2 volumes of *water*, 8 volumes of *methanol*, 15 volumes of *ether* and 77 volumes of *dichloromethane*.

www.webofpharma.com

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2). The principal spot in the chromatogram obtained with solution (3) appears as a single, compact spot.

B. In the Assay for hydrocortisone, the chromatogram obtained with solution (3) shows a peak with the same retention time as the peak due to hydrocortisone in the chromatogram obtained with solution (1).

C. Fuse a quantity of the cream containing 0.1 g of Clioquinol with *anhydrous sodium carbonate*, dissolve the fused mass in *water* and acidify with 2M *nitric acid*. Add *silver nitrate solution*; a pale yellow precipitate is produced which is insoluble in 5M *ammonia*. Add 5M *ammonia* until the solution becomes alkaline, boil gently, filter and acidify the filtrate with 2M *nitric acid*; a white precipitate is produced which darkens on exposure to light.

ASSAY

For hydrocortisone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 30 mL of *2,2,4-trimethylpentane* to a quantity of the cream containing 10 mg of Hydrocortisone and warm on a water bath until the preparation has melted. Extract the warm mixture with successive quantities of 30, 20 and 20 mL of *methanol (80%)*, combine the aqueous methanolic layers, cool to about 20° and dilute to 100 mL with the same solvent.

(2) Dissolve 5 mg of *hydrocortisone BPCRS* in 5 mL of a 4% v/v solution of *bromobenzene* (internal standard) in *methanol* and dilute to 50 mL with *methanol (80%)*.

(3) Prepare in the same manner as solution (1) but adding 10 mL of a 4% v/v solution of *bromobenzene* in *methanol* to the cooled methanolic extract.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 242 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

methanol (65%).

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{30}O_5$ in the cream using the declared content of $C_{21}H_{30}O_5$ in *hydrocortisone BPCRS*.

For clioquinol

To a quantity of the cream containing 25 mg of Clioquinol add 80 mL of a hot mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* and heat on a water bath for 5 minutes. Cool in ice for 10 minutes, allow to warm to room temperature, dilute to 100 mL with the aqueous methoxyethanol, mix and filter. To 10 mL of the filtrate add 10 mL of *2-methoxyethanol* and 2 mL of a solution prepared by dissolving 0.5 g of *iron(III) chloride hexahydrate* in 80 mL of *2-methoxyethanol* and adding 0.1 mL of *hydrochloric acid* and sufficient *2-methoxyethanol* to produce 100 mL. Dilute the solution to 25 mL with *2-methoxyethanol* and measure the *absorbance* of the resulting solution at the maximum at 650 nm, Appendix II B, using in the reference cell a solution prepared by treating 10 mL of the aqueous methoxyethanol in the same manner beginning at the words 'add 10 mL of *2-methoxyethanol*...'.

Repeat the operation beginning at the words 'add 10 mL of *2-methoxyethanol* ...' using 10 mL of a solution prepared in the following manner. Dissolve 0.125 g of *clioquinol BPCRS* in sufficient *2-methoxyethanol* to produce 50 mL, warming to effect solution; add 1 mL of *water* to 5 mL of the solution and add sufficient of a mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* to produce 50 mL. Calculate the content of C_9H_5ClINO from the *absorbances* obtained and using the declared content of C_9H_5ClINO in *clioquinol BPCRS*.

STORAGE

Hydrocortisone and Clioquinol Cream should be protected from light.

Hydrocortisone and Clioquinol Ointment

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone and Clioquinol Ointment contains Hydrocortisone and Clioquinol, the latter in *very fine powder*, in a suitable basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

92.5 to 107.5% of the stated amount.

Content of clioquinol, C_9H_5ClINO

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water* as the mobile phase. Apply separately to the plate 5 µl of each of the following solutions. For solution (1) disperse, by warming and shaking, a quantity of the ointment containing 2.5 g of Hydrocortisone in 10 ml of *ethanol (96%)*, cool, allow to stand at 0° for 30 minutes, filter and use the filtrate. Solution (2) contains 0.25% w/v of *hydrocortisone BPCRS* in *ethanol (96%)*. For solution (3) dissolve 12.5 mg of *hydrocortisone BPCRS* in 5 ml of solution (1). After removal of the plate, allow it to dry in air and spray with *alkaline tetrazolium blue solution*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).
The principal spot in the chromatogram obtained with solution (3) appears as a single, compact spot.

B. In the Assay for hydrocortisone the chromatogram obtained with solution (3) shows a peak with the same retention time as the peak due to hydrocortisone in the chromatogram obtained with solution (1).

C. Fuse a quantity of the ointment containing 0.1 g of Clioquinol with *anhydrous sodium carbonate*, dissolve the fused mass in *water* and acidify with 2M *nitric acid*. Add *silver nitrate solution*; a pale yellow precipitate is produced which is insoluble in 5M *ammonia*. Add 5M *ammonia* until the solution

www.webofpharma.com

becomes alkaline, boil gently, filter and acidify the filtrate with 2M *nitric acid*; a white precipitate is produced which darkens on exposure to light.

ASSAY

For hydrocortisone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve 5 mg of *hydrocortisone BPCRS* in 5 ml of a 4% v/v solution of *bromobenzene* (internal standard) in *methanol* and dilute to 50 ml with *methanol (80%)*. For solution (2) add 30 ml of *2,2,4-trimethylpentane* to a quantity of the ointment containing 10 mg of Hydrocortisone and warm on a water bath until the preparation has melted. Extract the warm mixture with successive quantities of 30, 20 and 20 ml of *methanol (80%)*, combine the aqueous methanolic layers, cool to about 20° and dilute to 100 ml with the same solvent. Prepare solution (3) in the same manner as solution (2) but adding 10 ml of a 4% v/v solution of *bromobenzene* in *methanol* to the cooled methanolic extract.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 5 mm) packed with *octadecylsilyl silica gel for chromatography* (Spherisorb ODS 1 is suitable), (b) *methanol (65%)* as the mobile phase with a flow rate of 1 ml per minute and (c) a detection wavelength of 242 nm.

Calculate the content of $C_{21}H_{30}O_5$ in the ointment using the declared content of $C_{21}H_{30}O_5$ in *hydrocortisone BPCRS*.

For clioquinol

To a quantity containing 25 mg of Clioquinol add 80 ml of a hot mixture of 24 volumes of *2-methoxy-ethanol* and 6 volumes of *water* and heat on a water bath for 5 minutes. Cool in ice for 10 minutes, allow to warm to room temperature, dilute to 100 ml with the aqueous methoxyethanol, mix and filter. To 10 ml of the filtrate add 10 ml of *2-methoxyethanol* and 2 ml of a solution prepared by dissolving 0.5 g of *iron(III) chloride hexahydrate* in 80 ml of *2-methoxyethanol* and adding 0.1 ml of *hydrochloric acid* and sufficient *2-methoxyethanol* to produce 100 ml. Dilute the solution to 25 ml with *2-methoxyethanol* and measure the *absorbance* of the resulting solution at the maximum at 650 nm, Appendix II B, using in the reference cell a solution prepared by treating 10 ml of the aqueous methoxyethanol in the same manner beginning at the words 'add 10 ml of *2-methoxyethanol*...'.

Repeat the operation beginning at the words 'add 10 ml of *2-methoxyethanol* ...' using 10 ml of a solution prepared in the following manner. Dissolve 0.125 g of *clioquinol BPCRS* in sufficient *2-methoxyethanol* to produce 50 ml, warming to effect solution; add 1 ml of *water* to 5 ml of the solution and add sufficient of a mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* to produce 50 ml. Calculate the content of C_9H_5ClINO from the *absorbances* obtained using the declared content of C_9H_5ClINO in *clioquinol BPCRS*.

STORAGE

Hydrocortisone and Clioquinol Ointment should be protected from light.

Hydrocortisone and Neomycin Cream

Action and use

Corticosteroid + Aminoglycoside antibacterial.

DEFINITION

Hydrocortisone and Neomycin Cream contains Hydrocortisone and Neomycin Sulfate in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Add 10 mL of *hexane* saturated with *acetonitrile* to a quantity of the preparation being examined containing 5 mg of Hydrocortisone and shake for 2 to 3 minutes. Add 10 mL of *acetonitrile* saturated with *hexane*, shake for 10 minutes and allow the layers to separate. Centrifuge, filter the acetonitrile layer if necessary, evaporate 5 mL to dryness and dissolve the residue in 5 mL of a mixture of equal volumes of *chloroform* and *ethanol (96%)*.

(2) 0.05% w/v of *hydrocortisone BPCRS* in a mixture of equal volumes of *chloroform* and *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and spray with *alkaline tetrazolium blue solution*.

MOBILE PHASE

8 volumes of *methanol* and 90 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay for hydrocortisone the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to hydrocortisone in the chromatogram obtained with solution (2).

C. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Disperse a quantity containing 7000 IU of Neomycin Sulfate with 10 mL of *chloroform*, add 5 mL of *water*, shake, centrifuge and use the clear, upper layer.

(2) 0.2% w/v of *neomycin sulfate EPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with a 1% w/v solution of *ninhydrin* in *butan-1-ol* and heat at 105° for 2 minutes.

MOBILE PHASE

20 volumes of *chloroform*, 40 volumes of 13.5M *ammonia* and 60 volumes of *methanol*.

www.webofpharma.com

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

TESTS

Neamine

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a quantity containing 7000 IU of Neomycin Sulfate in 10 mL of *chloroform*, shake gently with 5 mL of *water*, centrifuge and use the aqueous layer.

(2) 0.004% w/v of *neamine EPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel H*.

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate dry it in a current of warm air, heat at 110° for 10 minutes and spray the hot plate with a solution prepared immediately before use by diluting *sodium hypochlorite solution* with *water* to contain 0.5% of available chlorine. Dry in a current of cold air until a sprayed area of the plate below the line of application gives at most a very faint blue colour with a drop of a 0.5% w/v solution of *potassium iodide* in *starch mucilage*; avoid prolonged exposure to the cold air. Spray the plate with a 0.5% w/v solution of *potassium iodide* in *starch mucilage*.

MOBILE PHASE

Freshly prepared 3.85% w/v solution of *ammonium acetate*.

CONFIRMATION

Any spot corresponding to neamine in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

Neomycin C

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity containing 3500 IU of Neomycin Sulfate with 10 mL of *chloroform*, add 5 mL of 0.02M *sodium tetraborate*, mix, allow to separate and centrifuge the upper layer. Proceed as for solution (2) but using 0.5 mL of the clear supernatant liquid in place of 0.5 mL of the neomycin sulfate solution.

(2) Add 1.5 mL of a freshly prepared 2% w/v solution of *1-fluoro-2,4-dinitrobenzene* in *methanol* to 0.5 mL of a 0.10% w/v solution of *neomycin sulfate EPCRS* in 0.02M *sodium tetraborate*, heat in a water bath at 60° for 1 hour and cool; dilute the solution to 25 mL with the mobile phase, allow to stand and use the clear lower layer.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Nucleosil 100-5 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.6 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 350 nm.

(f) Inject 10 µL of each solution.

(g) Pass the mobile phase through the column for several hours before starting the analysis. Record the chromatogram for 1.4 times the retention time of the peak due to neomycin B.

MOBILE PHASE

0.5 mL of *glacial acetic acid*, 1.0 mL of *water* and 97 mL of *tetrahydrofuran*, with sufficient of a 2.0% v/v solution of *absolute ethanol* in *ethanol-free chloroform* to produce 250 mL.

SYSTEM SUITABILITY

The chromatogram obtained with solution (2) shows a principal peak due to neomycin B and a major *secondary peak* due to neomycin C with a retention time relative to neomycin B of about 0.6.

The *column efficiency*, determined using the peak due to neomycin B in the chromatogram obtained with solution (2), should be at least 13,000 *theoretical plates* per metre.

LIMITS

In the chromatogram obtained with solution (1):

the area of the peak corresponding to neomycin C is 3 to 15% of the sum of the areas of the peaks corresponding to neomycin B and neomycin C.

ASSAY

For hydrocortisone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *chloroform*.

(1) Shake together a quantity of the preparation being examined containing 25 mg of Hydrocortisone, several small glass beads and 25 mL of a 0.036% w/v solution of *fluoxymesterone BPCRS in chloroform* for 15 minutes, add sufficient *chloroform* to produce 50 mL, mix and centrifuge. Remove any excipient material present at the interface and use the clear supernatant liquid.

(2) 0.010% w/v of *hydrocortisone BPCRS* and 0.018% w/v of *fluoxymesterone BPCRS* (internal standard).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *silica gel for chromatography* (10 µm) (µPorasil is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

30 volumes of *glacial acetic acid*, 35 volumes of *methanol*, 70 volumes of *tetrahydrofuran*, 425 volumes of *butyl chloride* and 425 volumes of *butyl chloride* saturated with *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{30}O_5$ in the cream using the declared content of $C_{21}H_{30}O_5$ in *hydrocortisone BPCRS*.

For neomycin sulfate

Stir a quantity containing 4200 IU with 15 mL of *chloroform* until the emulsion is completely broken. Transfer to a separating funnel with 25 mL of *phosphate buffer pH 8.0* and 5 mL of *chloroform*, shake vigorously, allow to separate and reserve the aqueous phase. Extract the chloroform layer with two 25-mL quantities of *phosphate buffer pH 8.0* and discard the chloroform layer. Pass *nitrogen* through the combined aqueous solutions to remove dissolved chloroform and dilute to 100 mL with sterile *phosphate buffer pH 8.0*. Dilute 10 mL of the resulting solution to 50 mL with the same solvent and carry out the *microbiological assay of antibiotics*,

www.webofpharma.com

Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated amount.

LABELLING
The strength with respect to Neomycin Sulfate is stated as the number of IU (Units) per g.

Hydrocortisone Acetate and Neomycin Ear Drops

Hydrocortisone and Neomycin Ear Drops

Action and use
Corticosteroid + Aminoglycoside antibacterial.

DEFINITION
Hydrocortisone Acetate and Neomycin Ear Drops are a suspension of Hydrocortisone Acetate in a solution of Neomycin Sulfate in Purified Water.

The ear drops comply with the requirements stated under Ear Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$
90.0 to 110.0% w/v of the stated amount.

IDENTIFICATION
A. Comply with test A for Identification described under Hydrocortisone and Neomycin Cream using the following solutions. For solution (1) add 10 mL of *chloroform* to a quantity of the ear drops containing 5 mg of Hydrocortisone Acetate in a separating funnel, shake for 2 to 3 minutes and allow the layers to separate. Filter if necessary and use the chloroform layer. Solution (2) contains 0.05% w/v of *hydrocortisone acetate BPCRS* in *chloroform*.

B. In the Assay for hydrocortisone acetate the chromatogram obtained with solution (3) shows a peak with the same retention time as the peak due to hydrocortisone acetate in the chromatogram obtained with solution (1).

C. Comply with test C for Identification described under Hydrocortisone and Neomycin Cream. For solution (1) dilute a volume containing 3500 IU of Neomycin Sulfate with *water* to 2.5 mL, shake with 3 mL of *chloroform*, centrifuge and use the clear, upper layer.

TESTS

Acidity or alkalinity
pH, 6.5 to 8.0, Appendix V L.

Neamine
Comply with the test described under Hydrocortisone and Neomycin Cream. For solution (1) dilute a volume containing 3500 IU of Neomycin Sulfate with 2.5 mL of *water*, shake gently with 3 mL of *chloroform*, centrifuge and use the aqueous layer.

Neomycin C
Comply with the test described under Hydrocortisone and Neomycin Cream but using as solution (2) a solution prepared in the following manner. Dilute the ear drops with 0.02M *sodium tetraborate* to contain 700 IU per mL.
To 0.5 mL of the resulting solution add 1.5 mL of a freshly prepared 2% w/v solution of *1-fluoro-2,4-dinitrobenzene* in *methanol*, heat in a water bath at 60° for 1 hour, cool and dilute the solution to 25 mL with the mobile phase; allow to stand and use the clear, lower layer.

ASSAY

For hydrocortisone acetate
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.020% w/v of *hydrocortisone acetate BPCRS* and 0.016% w/v of *fluoxymesterone BPCRS* (internal standard) in *chloroform*. For solution (2) shake a quantity of the ear drops containing 10 mg of Hydrocortisone Acetate with 25 mL of a 0.032% w/v solution of *fluoxymesterone BPCRS* in *chloroform*, add 25 mL of *chloroform*, mix and filter through *anhydrous sodium sulfate*.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *silica gel for chromatography* (10 µm) (µPorasil is suitable), (b) a mixture of 425 volumes of *butyl chloride*, 425 volumes of *butyl chloride* saturated with *water*, 70 volumes of *tetrahydrofuran*, 35 volumes of *methanol* and 30 volumes of *glacial acetic acid* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{23}H_{32}O_6$ in the ear drops using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

For neomycin sulfate
Dilute a volume containing 3500 IU to 50 mL with sterile *phosphate buffer pH 8.0*, dilute 10 mL of the resulting solution to 100 mL with the same solvent and carry out the *microbiological assay of antibiotics*, Appendix XIV A.
The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated number of IU per mL.

LABELLING
The strength with respect to Neomycin Sulfate is stated as the number of IU (Units) per mL.

Hydrocortisone Acetate and Neomycin Eye Drops

Hydrocortisone and Neomycin Eye Drops

Action and use
Corticosteroid + Aminoglycoside antibacterial.

DEFINITION
Hydrocortisone Acetate and Neomycin Eye Drops are a sterile suspension of Hydrocortisone Acetate in a solution of Neomycin Sulfate in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$
90.0 to 110.0% w/v of the stated amount.

IDENTIFICATION
A. Comply with test A for Identification described under Hydrocortisone and Neomycin Cream using the following solutions. For solution (1) add 10 mL of *chloroform* to a quantity of the eye drops containing 5 mg of Hydrocortisone Acetate in a separating funnel, shake for 2 to 3 minutes and allow the layers to separate. Filter if necessary and use the chloroform layer. Solution (2) contains 0.05% w/v of *hydrocortisone acetate BPCRS* in *chloroform*.

www.webofpharma.com

B. In the Assay for hydrocortisone acetate the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to hydrocortisone acetate in the chromatogram obtained with solution (1).

C. Comply with test C for Identification described under Hydrocortisone and Neomycin Cream. For solution (1) dilute a volume containing 3500 IU of Neomycin Sulfate with *water* to 2.5 mL, shake with 3 mL of *chloroform*, centrifuge and use the clear, upper layer.

TESTS

Acidity or alkalinity
pH, 6.5 to 8.0, Appendix V L.

Neamine
Comply with the test described under Hydrocortisone and Neomycin Cream. For solution (1) dilute a volume containing 3500 IU of Neomycin Sulfate with 2.5 mL of *water*, shake gently with 3 mL of *chloroform*, centrifuge and use the aqueous layer.

Neomycin C
Comply with the test described under Hydrocortisone and Neomycin Cream but using as solution (2) a solution prepared in the following manner. Dilute the eye drops with 0.02M *sodium tetraborate* to contain 700 IU per mL.
To 0.5 mL of the resulting solution add 1.5 mL of a freshly prepared 2% w/v solution of *1-fluoro-2,4-dinitrobenzene* in *methanol*, heat in a water bath at 60° for 1 hour, cool and dilute the solution to 25 mL with the mobile phase; allow to stand and use the clear, lower layer.

ASSAY

For hydrocortisone acetate
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.020% w/v of *hydrocortisone acetate BPCRS* and 0.016% w/v of *fluoxymesterone BPCRS* (internal standard) in *chloroform*. For solution (2) shake a quantity of the eye drops containing 10 mg of Hydrocortisone Acetate with 25 mL of a 0.032% w/v solution of *fluoxymesterone BPCRS* in *chloroform*, add 25 mL of *chloroform*, mix and filter through *anhydrous sodium sulfate*.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *silica gel for chromatography* (10 µm) (µPorasil is suitable), (b) a mixture of 425 volumes of *butyl chloride*, 425 volumes of *butyl chloride* saturated with *water*, 70 volumes of *tetrahydrofuran*, 35 volumes of *methanol* and 30 volumes of *glacial acetic acid* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{23}H_{32}O_6$ in the eye drops using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

For neomycin sulfate
Dilute a volume containing 3500 IU to 50 mL with sterile *phosphate buffer pH 8.0*, dilute 10 mL of the resulting solution to 100 mL with the same solvent and carry out the *microbiological assay of antibiotics*, Appendix XIV A.
The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated number of IU per mL.

LABELLING

The strength with respect to Neomycin Sulfate is stated as the number of IU (Units) per mL.

Hydrocortisone Acetate and Neomycin Eye Ointment

Action and use
Corticosteroid + Aminoglycoside antibacterial.

DEFINITION

Hydrocortisone Acetate and Neomycin Eye Ointment is a sterile preparation containing Hydrocortisone Acetate and Neomycin Sulfate in a suitable basis.

The eye ointment complies with the requirements stated under Eye Preparations and with the following requirements.

Content of hydrocortisone acetate, $C_{23}H_{32}O_6$
92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Complies with test A for Identification described under Hydrocortisone and Neomycin Cream using the following solutions. For solution (1) add 10 mL of *hexane* saturated with *acetonitrile* to a quantity of the ointment containing 5 mg of Hydrocortisone Acetate and shake for 2 to 3 minutes. Add 10 mL of *acetonitrile* saturated with *hexane*, shake for 10 minutes and allow the layers to separate. Centrifuge, filter the acetonitrile layer if necessary, evaporate 5 mL to dryness and dissolve the residue in 5 mL of a mixture of equal volumes of *chloroform* and *ethanol (96%)*. Solution (2) contains 0.05% w/v of *hydrocortisone acetate BPCRS* in a mixture of equal volumes of *chloroform* and *ethanol (96%)*.

B. In the Assay for hydrocortisone acetate the chromatogram obtained with solution (3) shows a peak with the same retention time as the peak due to hydrocortisone acetate in the chromatogram obtained with solution (1).

C. Complies with test C for Identification described under Hydrocortisone and Neomycin Cream. For solution (1) shake a quantity containing 7000 IU of Neomycin Sulfate with 10 mL of *chloroform*, add 5 mL of *water*, shake, centrifuge and use the clear, upper layer.

TESTS

Neamine
Complies with the test described under Hydrocortisone and Neomycin Cream. For solution (1) disperse a quantity containing 7000 IU of Neomycin Sulfate in 10 mL of *chloroform*, shake gently with 5 mL of *water*, centrifuge and use the aqueous layer.

Neomycin C
Complies with the test described under Hydrocortisone and Neomycin Cream.

ASSAY

For hydrocortisone acetate
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.025% w/v of *hydrocortisone acetate BPCRS* and 0.050% w/v of *fluoxymesterone BPCRS* (internal standard) in *chloroform*. For solution (2) shake a quantity of the ointment containing 25 mg of Hydrocortisone Acetate with 20 mL of a 0.25% w/v solution of *fluoxymesterone BPCRS* in *chloroform* and several glass beads for 30 minutes. Centrifuge; to 10 mL of the clear, supernatant layer add sufficient *chloroform* to produce 50 mL.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *silica gel for chromatography* (10 µm) (µPorasil is suitable), (b) a mixture of 425 volumes of *butyl chloride*, 425 volumes of *butyl chloride* saturated with *water*, 70 volumes of

www.webofpharma.com

tetrahydrofuran, 35 volumes of *methanol* and 30 volumes of *glacial acetic acid* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{23}H_{32}O_6$ in the ointment using the declared content of $C_{23}H_{32}O_6$ in *hydrocortisone acetate BPCRS*.

For neomycin sulfate

Dissolve a quantity containing 3500 IU in 50 mL of *ether*, extract the solution with three 30-mL quantities of sterile *phosphate buffer pH 8.0* and discard the ether phase. Pass *nitrogen* through the combined aqueous extracts to remove dissolved ether, dilute to 100 mL with sterile *phosphate buffer pH 8.0* and carry out the *microbiological assay of antibiotics*, Appendix XIV A. The precision of the assay is such that the fiducial limits of error are not less than 95% and not more than 105% of the estimated potency. The upper fiducial limit of error is not less than 90.0% and the lower fiducial limit of error is not more than 115.0% of the stated number of IU per g.

LABELLING

The strength with respect to Neomycin Sulfate is stated as the number of IU (Units) per g.

Hydrocortisone Sodium Phosphate Injection

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Sodium Phosphate Injection is a sterile solution of Hydrocortisone Sodium Phosphate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

92.5 to 107.5% of the stated amount.

CHARACTERISTICS

A colourless or very pale yellow solution.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the injection containing the equivalent of 0.25 g of hydrocortisone to 100 mL with *water*.

(2) 0.34% w/v of *hydrocortisone sodium phosphate BPCRS* in *methanol*.

(3) A mixture of equal volumes of solutions (1) and (2).

(4) A mixture of equal volumes of solution (1) and a 0.25% w/v solution of *betamethasone sodium phosphate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow to dry in air until the solvent has evaporated, spray with *ethanolic sulfuric acid (20%)*, heat at 120° for 10 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

A freshly prepared mixture of 20 volumes of *acetic anhydride*, 20 volumes of *water and* 60 volumes of *butan-1-ol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

The principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

The chromatogram obtained with solution (4) exhibits two principal spots with almost identical Rf values.

B. Evaporate 0.1 mL to dryness on a water bath and dissolve the residue in 2 mL of *sulfuric acid*. A yellowish green fluorescence is produced immediately (distinction from betamethasone sodium phosphate, dexamethasone sodium phosphate and prednisolone sodium phosphate).

TESTS

Alkalinity

pH, 7.5 to 8.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the injection with *water* to contain the equivalent of 0.75% w/v of hydrocortisone.

(2) 1.0% w/v of *hydrocortisone sodium phosphate BPCRS* in *methanol*.

(3) 0.020% w/v of *hydrocortisone BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow to dry in air for 5 minutes and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1.2 volumes of *water*, 8 volumes of *methanol*, 15 volumes of *ether and* 77 volumes of *dichloromethane*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3).

ASSAY

Dilute a volume containing the equivalent of 0.2 g of hydrocortisone to 1000 mL with *water*. To 5 mL add 15 mL of *water*, 2.5 g of *sodium chloride* and 0.5 mL of *hydrochloric acid* and extract with three 25-mL quantities of *chloroform*. Wash each chloroform layer with the same 1 mL quantity of 0.1M *hydrochloric acid*, add the washings to the aqueous solution and discard the chloroform. Extract the aqueous solution with two 10-mL quantities of *tributyl orthophosphate*, discard the aqueous phase and extract the combined tributyl phosphate solutions with two 25-mL quantities of a solution containing 10% w/v of *sodium chloride* and 1% w/v of *anhydrous disodium hydrogen orthophosphate*. Filter the extracts successively through absorbent cotton and wash the filter with 10 mL of the chloride–phosphate solution. Dilute the combined filtrates to 100 mL with the chloride–phosphate solution and measure the *absorbance* of the resulting solution at the maximum at 248 nm, Appendix II B, using in the reference cell a solution prepared in the same manner but using 20 mL of a solution containing 2.5 g of *sodium chloride*

www.webofpharma.com

and 0.5 mL of *hydrochloric acid* and beginning at the words 'Extract the aqueous solution...'. Calculate the content of hydrocortisone sodium phosphate as $C_{21}H_{30}O_5$ taking 447 as the value of A(1%, 1 cm) at the maximum at 248 nm.

STORAGE

Hydrocortisone Sodium Phosphate Injection should be protected from light. The injection should not be allowed to freeze.

LABELLING

The strength is stated in terms of the equivalent amount of hydrocortisone in a suitable dose-volume.

Hydrocortisone Sodium Phosphate Oral Solution

NOTE: *Hydrocortisone Sodium Phosphate Oral Solution is not currently licensed in the United Kingdom.*

Action and use

Corticosteroid.

DEFINITION

Hydrocortisone Sodium Phosphate Oral Solution is a solution containing Hydrocortisone Sodium Phosphate in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the oral solution containing the equivalent of 0.25 g of hydrocortisone to 100 mL with *water*.

(2) 0.34% w/v of *hydrocortisone sodium phosphate BPCRS* in *methanol*.

(3) A mixture of equal volumes of solutions (1) and (2).

(4) A mixture of equal volumes of solution (1) and a 0.25% w/v solution of *betamethasone sodium phosphate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air until the solvent has evaporated, spray with *ethanolic sulfuric acid (20%)*, heat at 120° for 10 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

A freshly prepared mixture of 20 volumes of *acetic anhydride*, 20 volumes of *water* and 60 volumes of *butan-1-ol*.

SYSTEM SUITABILITY

The test is not valid unless the principal spot in the chromatogram obtained with solution (3) appears as a single compact spot and the chromatogram obtained with solution (4) exhibits two principal spots with almost identical Rf values.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Evaporate 0.1 mL to dryness on a water bath and dissolve the residue in 2 mL of *sulfuric acid*. A yellowish green fluorescence is produced immediately (distinction from betamethasone sodium phosphate, dexamethasone sodium phosphate and prednisolone sodium phosphate).

TESTS

Alkalinity

pH, 7.5 to 8.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a suitable volume of the oral solution with *water* to contain the equivalent of 0.75% w/v of hydrocortisone.

(2) 1.0% w/v of *hydrocortisone sodium phosphate BPCRS* in *methanol*.

(3) Equal volumes of solutions (1) and (2).

(4) 0.020% w/v of *hydrocortisone BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air for 5 minutes and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1.2 volumes of *water*, 8 volumes of *methanol*, 15 volumes of *ether* and 77 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the principal spot in the chromatogram obtained with solution (3) appears as a single compact spot.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (4) (3%).

ASSAY

Dilute a volume of the oral solution containing the equivalent of 20 mg of hydrocortisone to 100 mL with *water*. To 5 mL add 15 mL of *water*, 2.5 g of *sodium chloride* and 0.5 mL of *hydrochloric acid* and extract with three 25 mL quantities of *chloroform*. Wash each chloroform layer with the same 1 mL quantity of 0.1M *hydrochloric acid*, add the washings to the aqueous solution and discard the chloroform. Extract the aqueous solution with two 10 mL quantities of *tributyl orthophosphate*, discard the aqueous phase and extract the combined tributyl phosphate solutions with two 25 mL quantities of a solution containing 10% w/v of *sodium chloride* and 1% w/v of *anhydrous disodium hydrogen orthophosphate*. Filter the extracts successively through absorbent cotton and wash the filter with 10 mL of the chloride–phosphate solution. Dilute the combined filtrates to 100 mL with the chloride–phosphate solution and measure the *absorbance* of the resulting solution at the maximum at 248 nm, Appendix II B, using in the reference cell a solution prepared in the same manner but using 20 mL of a solution containing 2.5 g of *sodium chloride* and 0.5 mL of *hydrochloric acid* and beginning at the words 'Extract the aqueous

www.webofpharma.com

solution ...'. Calculate the content of hydrocortisone sodium phosphate as $C_{21}H_{30}O_5$ taking 447 as the value of A(1%, 1 cm) at the maximum at 248 nm.

STORAGE

Hydrocortisone Sodium Phosphate Oral Solution should be protected from light. The oral solution should not be allowed to freeze.

LABELLING

The strength is stated in terms of the equivalent amount of hydrocortisone in a suitable dose-volume.

Hydrocortisone Sodium Succinate Injection

Action and use
Corticosteroid.

DEFINITION

Hydrocortisone Sodium Succinate Injection is a sterile solution of Hydrocortisone Sodium Succinate in Water for Injections. It is prepared by dissolving Hydrocortisone Sodium Succinate for Injection in the requisite amount of Water for Injections immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Hydrocortisone Sodium Succinate Injection deteriorates on storage and should be used immediately after preparation.

HYDROCORTISONE SODIUM SUCCINATE FOR INJECTION

DEFINITION

Hydrocortisone Sodium Succinate for Injection is a sterile material prepared from Hydrocortisone Hydrogen Succinate with the aid of a suitable alkali. It may contain excipients. It is supplied in a sealed container.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of hydrocortisone, $C_{21}H_{30}O_5$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of hydrocortisone sodium succinate *(RS 180)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in 1 volume of *methanol* and 9 volumes of *dichloromethane*.

(1) 0.1% w/v solution of the contents of the sealed container.

(2) 0.1% w/v of *hydrocortisone hydrogen succinate BPCRS*.

(3) 0.1% w/v each of *hydrocortisone hydrogen succinate BPCRS* and *methylprednisolone hydrogen succinate EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow to dry in air and examine in daylight and under *ultraviolet light (365 nm)*.

MOBILE PHASE

1 volume of *anhydrous formic acid*, 10 volumes of *absolute ethanol* and 150 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless, by each method of visualisation, the chromatogram obtained with solution (3) shows two spots which may not be completely separated.

CONFIRMATION

By each method of visualisation, the principal spot in the chromatogram obtained with solution (1) corresponds in position to that in the chromatogram obtained with solution (2).

TESTS

Acidity or alkalinity
pH of a solution containing the equivalent of 5% w/v of hydrocortisone, 6.5 to 8.0, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a sufficient quantity of the contents of the sealed container in a mixture of equal volumes of *acetonitrile* and *water* to produce a solution containing the equivalent of 0.25% w/v of hydrocortisone.

(2) Dilute 2 volumes of solution (1) to 100 volumes with a mixture of equal volumes of *acetonitrile* and *water*.

(3) Dilute a 0.035% w/v solution of *hydrocortisone BPCRS* in *acetonitrile* with an equal volume of *water*.

(4) Dilute a solution containing 0.04% w/v each of *hydrocortisone hydrogen succinate BPCRS* and *dexamethasone BPCRS* in *acetonitrile* with an equal volume of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

(g) For solution (1) allow the chromatography to proceed for twice the retention time of the principal peak.

MOBILE PHASE

330 volumes of *acetonitrile*, 600 volumes of *water* and 1 volume of *orthophosphoric acid* which is allowed to equilibrate and then diluted to 1000 volumes with *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to dexamethasone and hydrocortisone hydrogen succinate is at least 5.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to hydrocortisone is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (7%);

www.webofpharma.com

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Uniformity of content
The content of hydrocortisone in each of 10 individual containers as determined in the Assay is not less than 92.5% and not more than 107.5% of the content of hydrocortisone stated on the label, except that in one container the weight may be not less than 85.0% and not more than 115.0% of the stated content.

ASSAY
Dissolve the contents of a sealed container in sufficient *water* to produce a solution containing the equivalent of 0.001% w/v of hydrocortisone. Measure the *absorbance* of the resulting solution at the maximum at 248 nm, Appendix II B, and calculate the content of $C_{21}H_{30}O_5$ taking 449 as the value of A(1%, 1 cm) at the maximum at 248 nm. Repeat the procedure with a further nine sealed containers and calculate the average content of $C_{21}H_{30}O_5$ per container from the ten individual results thus obtained.

LABELLING
The label of the sealed container states the quantity of hydrocortisone sodium succinate contained in it in terms of the equivalent amount of hydrocortisone.

Hydroflumethiazide Tablets

Action and use
Thiazide diuretic.

DEFINITION
Hydroflumethiazide Tablets contain Hydroflumethiazide.
The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hydroflumethiazide, $C_8H_8F_3N_3O_4S_2$
92.5 to 107.5% of the stated amount.

IDENTIFICATION
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *acetone*.
(1) Shake a quantity of the powdered tablets containing 10 mg of Hydroflumethiazide with 10 mL of solvent for 10 minutes and filter.
(2) 0.1% w/v of *hydroflumethiazide BPCRS*.

CHROMATOGRAPHIC CONDITIONS
(a) Use as the coating *silica gel* GF_{254}.
(b) Use the mobile phase as described below.
(c) Apply 5 µL of each solution.
(d) Develop the plate to 15 cm.
(e) After removal of the plate, dry in a current of air and examine under *ultraviolet light (254 nm)* and then treat the plate by *Method I* and examine again.

MOBILE PHASE
ethyl acetate.

CONFIRMATION
By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds in colour and intensity to that in the chromatogram obtained with solution (2).

TEST
Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *acetone*.
(1) Shake a quantity of the powdered tablets containing 25 mg of Hydroflumethiazide with 25 mL of solvent for 10 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 2.5 mL of solvent.
(2) Dilute 1 volume of solution (1) to 100 volumes.

CHROMATOGRAPHIC CONDITIONS
(a) Use as the coating *silica gel G*.
(b) Use the mobile phase as described below.
(c) Apply 10 µL of each solution.
(d) Develop the plate to 15 cm.
(e) After removal of the plate, dry in a current of air and reveal the spots by *Method I*.

MOBILE PHASE
ethyl acetate.

LIMITS
Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%).

ASSAY
Weigh and powder 20 tablets. Shake a quantity of the powder containing 15 mg of Hydroflumethiazide with 50 mL of *methanol* for 10 minutes and dilute to 100 mL with *methanol*. Mix, filter, dilute 10 mL of the filtrate to 100 mL with *methanol* and measure the *absorbance* of the resulting solution at the maximum at 273 nm, Appendix II B. Calculate the content of $C_8H_8F_3N_3O_4S_2$ taking 595 as the value of A(1%, 1 cm) at the maximum at 273 nm.

Hydrogen Peroxide Mouthwash

DEFINITION
Hydrogen Peroxide Mouthwash is Hydrogen Peroxide Solution (6 per cent).
The mouthwash complies with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of hydrogen peroxide, H_2O_2
5.0 to 7.0% w/v.

IDENTIFICATION;
Acidity; Non-volatile matter; Organic stabilisers
Complies with the requirements stated under Hydrogen Peroxide Solution (6 per cent).

ASSAY
Dilute 10 mL to 100 mL with *water*. To 10 mL of the resulting solution add 20 mL of 1M *sulfuric acid* and titrate with 0.02M *potassium permanganate VS*. Each mL of 0.02M *potassium permanganate VS* is equivalent to 1.701 mg of H_2O_2.

STORAGE
Hydrogen Peroxide Mouthwash should be protected from light.

www.webofpharma.com

Hydrotalcite Tablets

Action and use
Antacid.

DEFINITION
Hydrotalcite Tablets contain Hydrotalcite.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hydrotalcite, $Al_2Mg_6(OH)_{16}CO_3,4H_2O$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
Add 20 mL of 2M *hydrochloric acid* to a quantity of the powdered tablets containing 1.0 g of Hydrotalcite, shake and filter. Add 30 mL of *water* to the filtrate and boil. Add 2M *ammonia* until just alkaline to *methyl red*, continue boiling for 2 minutes and filter. Wash the precipitate with 50 mL of a hot 2% w/v solution of *ammonium chloride* and dissolve in 15 mL of 2M *hydrochloric acid*. The resulting solution yields the reaction characteristic of *aluminium salts*, Appendix VI.

Neutralising capacity
Weigh and powder 20 tablets, pass the powder as completely as possible through a sieve of nominal mesh aperture about 225 µm and remix the sifted powder. Mix a quantity equivalent to one tablet with a small quantity of *water*, added slowly with stirring, to give a smooth paste and add gradually sufficient further quantities of *water* to produce 100 mL. Warm to 37°, add 100 mL of 0.1M *hydrochloric acid VS* previously heated to 37° and stir continuously using a paddle stirrer at a rate of about 200 revolutions per minute, maintaining the temperature at 37°. The pH of the solution at 37°, after 10 minutes and after 20 minutes, is 3.0 to 4.2, Appendix V L. Add 12 mL of 0.5M *hydrochloric acid VS* at 37°, stir continuously for 1 hour, maintaining the temperature at 37°, and titrate with 0.1M *sodium hydroxide VS* to pH 3.5. Subtract the number of mL of 0.1M *sodium hydroxide VS* from 160 mL to obtain the number of mL of 0.1M *hydrochloric acid VS* required for neutralisation. Not less than 130 mL of 0.1M *hydrochloric acid VS* is required to neutralise one tablet.

ASSAY
Weigh and powder 20 tablets. To a quantity of the powder containing 0.3 g of Hydrotalcite add 2 mL of 7M *hydrochloric acid* and heat on a water bath for 15 minutes. Allow to cool, add 250 mL of *water* and 50 mL of 0.05M *disodium edetate VS* and neutralise with 1M *sodium hydroxide* using *methyl red solution* as indicator. Heat the solution on a water bath for 30 minutes and allow to cool. Add 3 g of *hexamine* and titrate the excess of disodium edetate with 0.05M *lead nitrate VS* using *xylenol orange solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 15.09 mg of $Al_2Mg_6(OH)_{16}CO_3,4H_2O$.

Hydrous Ointment

Oily Cream

DEFINITION

Wool Alcohols Ointment	500 g
Phenoxyethanol	10 g
Dried Magnesium Sulfate	5 g
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 g

In preparing Hydrous Ointment the proportions of Hard Paraffin, Soft Paraffin and Liquid Paraffin used to make the Wool Alcohols Ointment may be varied to produce Hydrous Ointment having suitable properties.

When Hydrous Ointment is used in a white ointment, it should be prepared from Wool Alcohols Ointment made with White Soft Paraffin; when used in a coloured ointment, it should be prepared from Wool Alcohols Ointment made with Yellow Soft Paraffin.

Extemporaneous preparation
The following directions apply.

Dissolve the Phenoxyethanol and the Dried Magnesium Sulfate in sufficient warm Purified Water to produce about 500 g. Melt the Wool Alcohols Ointment and heat to about 60°; gradually add the aqueous solution at about 60° with vigorous stirring until a smooth cream is obtained. Stir until cool, add sufficient Purified Water to produce 1000 g and mix.

The ointment complies with the requirements stated under Topical Semi-solid Preparations.

STORAGE
Hydrous Ointment should be kept in a container made from non-absorbent material. If, on storage, some aqueous liquid separates, it is readily reincorporated by stirring.

Hydroxocobalamin Injection

Action and use
Vitamin B_{12} analogue.

DEFINITION
Hydroxocobalamin Injection is a sterile solution of Hydroxocobalamin Acetate, Hydroxocobalamin Chloride or Hydroxocobalamin Sulfate in Water for Injections containing sufficient Acetic Acid, Hydrochloric Acid or Sulfuric Acid respectively to adjust the pH to about 4.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of hydroxocobalamin, $C_{62}H_{89}CoN_{13}O_{15}P$
95.0 to 110.0% of the stated amount of anhydrous hydroxocobalamin.

IDENTIFICATION
Measure the *absorbance* at 351 nm and at 361 nm, Appendix II B. The ratio of the absorbance at 361 nm to that at 351 nm is about 0.65.

TESTS
Acidity
pH, 3.8 to 5.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. *Solutions (1) to (3) are freshly prepared; protect all the solutions from bright light.*

(1) Dilute a volume of the injection, if necessary, to produce a solution containing 0.10% w/v of hydroxocobalamin in the mobile phase.

(2) Dilute a volume of the injection, if necessary, to produce a solution containing 0.005% w/v of hydroxocobalamin in the mobile phase.

(3) Dilute a volume of the injection, if necessary, to produce a solution containing 0.00010% w/v of hydroxocobalamin in the mobile phase.

(4) Add 0.2 mL of a freshly prepared 2% w/v solution of *chloramine T* and 0.1 mL of 0.05M *hydrochloric acid* to a

www.webofpharma.com

volume of the injection containing the equivalent of 5 mg of hydroxocobalamin, dilute to 10 mL with *water*, shake, allow to stand for 5 minutes and inject immediately.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Lichrosorb 100 CH8/11 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 351 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

19.5 volumes of *methanol* and 80.5 volumes of a solution containing 1.5% w/v of *citric acid* and 0.81% w/v of *disodium hydrogen orthophosphate*.

SYSTEM SUITABILITY

The test is not valid unless:

the chromatogram obtained with solution (4) shows three principal peaks and the *resolution factor* between each pair of adjacent peaks is not less than 3.0;

the chromatogram obtained with solution (3) shows one principal peak with a *signal-to-noise ratio* of not less than 5.

LIMITS

In the chromatogram obtained with solution (1):

the sum of the areas of any *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (10%).

Disregard any peak the area of which is less than that of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Carry out the following procedure protected from light. Dilute a quantity containing the equivalent of 2.5 mg of anhydrous hydroxocobalamin to 100 mL with a solution containing 0.8% v/v of *glacial acetic acid* and 1.09% w/v of *sodium acetate* and measure the *absorbance* of the resulting solution at the maximum at 351 nm, Appendix II B. Calculate the content of $C_{62}H_{89}CoN_{13}O_{15}P$ taking 195 as the value of A(1%, 1 cm) at the maximum at 351 nm.

STORAGE

Hydroxocobalamin Injection should be protected from light.

LABELLING

The strength is stated in terms of the equivalent amount of anhydrous hydroxocobalamin in a suitable dose-volume.

When vitamin B_{12} injection is prescribed or demanded, Hydroxocobalamin Injection shall be dispensed or supplied.

Hydroxycarbamide Capsules

Action and use

Cytotoxic alkylating drug.

DEFINITION

Hydroxycarbamide Capsules contain Hydroxycarbamide.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of hydroxycarbamide, $CH_4N_2O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing 30 mg of Hydroxycarbamide with 10 mL of *methanol* and filter. Evaporate the filtrate to dryness and dry the residue at 60° at a pressure of 2 kPa for 3 hours. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of hydroxycarbamide *(RS 184)*.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

TEST

Urea

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *water*.

(1) Shake a quantity of the contents of the capsules containing 0.5 g of Hydroxycarbamide with 10 mL of *water* for 15 minutes and filter through a glass-fibre filter (Whatman GF/C is suitable).

(2) 0.025% w/v of *urea*.

(3) 5.0% w/v of *hydroxycarbamide BPCRS* and 0.025% w/v of *urea*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with a 1% w/v solution of *4-dimethylaminobenzaldehyde* in 1M *hydrochloric acid*.

MOBILE PHASE

1 volume of *pyridine*, 1 volume of *water* and 5 volumes of *ethyl acetate*. Shake, allow to separate and use the upper layer.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

LIMITS

Any spot corresponding to urea in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%)

Hydroxylamine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Shake a quantity of the contents of the capsules containing 0.1 g of Hydroxycarbamide with 8 mL of *water* for 5 minutes, add sufficient water to produce 10 mL and filter through a glass-fibre filter (Whatman GF/C is suitable).

(2) 1.0% w/v of *hydroxycarbamide BPCRS* and 0.01% w/v of *hydroxylamine hydrochloride*.

(3) 0.1% w/v of *hydroxycarbamide BPCRS* and 1.0% w/v of *hydroxylamine hydrochloride*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.5 mL per minute.

(d) Use an ambient column temperature.

www.webofpharma.com

(c) Use a detection wavelength of 214 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 volumes of *methanol* and 95 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to hydroxycarbamide and hydroxylamine is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to hydroxylamine is not greater than the area of the corresponding peak in the chromatogram obtained with solution (2) (1%).

ASSAY

Weigh and powder the contents of 20 capsules. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*.

(1) Shake a quantity of the capsule contents containing 1 g of Hydroxycarbamide with 450 mL of *water* for 5 minutes, mix for 30 minutes with the aid of ultrasound, add sufficient *water* to produce 500 mL and mix well. Filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 1 volume of the filtrate with 1 volume of *water*.

(2) 0.10% w/v of *hydroxycarbamide BPCRS*

(3) 0.10% w/v of *hydroxycarbamide BPCRS* and 0.4% w/v of *hydroxylamine hydrochloride*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 214 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

water.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between hydroxycarbamide and hydroxylamine hydrochloride is at least 1.0.

DETERMINATION OF CONTENT

Calculate the content of $CH_4N_2O_2$ in the capsules using the declared content of $CH_4N_2O_2$ in *hydroxycarbamide BPCRS*.

STORAGE

Hydroxycarbamide Capsules should be protected from moisture.

Hydroxychloroquine Tablets

Action and use

Used in the treatment of rheumatoid arthritis.

DEFINITION

Hydroxychloroquine Tablets contain Hydroxychloroquine Sulfate. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hydroxychloroquine sulfate, $C_{18}H_{26}ClN_3O,H_2SO_4$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the powdered tablets containing 0.1 g of Hydroxychloroquine Sulfate in a mixture of 10 mL of *water* and 2 mL of 2M *sodium hydroxide* and extract with two 20 mL quantities of *chloroform*. Wash the chloroform extracts with *water*, dry with *anhydrous sodium sulfate*, evaporate to dryness and dissolve the residue in 2 mL of *chloroform IR*. The *infrared absorption spectrum* of the resulting solution, Appendix II A, is concordant with the *reference spectrum* of hydroxychloroquine *(RS 182)*.

B. Shake a quantity of the powdered tablets containing 0.1 g of Hydroxychloroquine Sulfate with 10 mL of *water* and filter. To the filtrate add 1 mL of 2M *hydrochloric acid* and 1 mL of *barium chloride solution*. A white precipitate is produced.

TEST

Disintegration

Maximum time, 15 minutes, Appendix XII A1.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions of the substance being examined in mobile phase A.

(1) Shake a quantity of the powdered tablets containing 200 mg of Hydroxychloroquine Sulfate in 150 mL of mobile phase A, dilute to 200 mL with mobile phase A and filter. Dilute 1 volume of the resulting solution with 10 volumes of mobile phase A.

(2) Dilute 1 volume of solution (1) to 200 volumes.

(3) Dilute 1 volume of solution (2) to 10 volumes.

(4) 0.00005% w/v of *2-[4-[(7-chloro-4-quinolinyl)amino]pentyl] amino ethanol BPCRS*.

(5) 0.0001% w/v of *hydroxychloroquine sulfate BPCRS* and 0.0001% w/v of *2-[4-[(7-chloro-4-quinolinyl)amino]pentyl] amino ethanol BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5µm) (Inertsil ODS3 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 0.2 volumes of *orthophosphoric acid*, 10 volumes of *acetonitrile* and 90 volumes of *water*.

Mobile phase B 0.1 volumes of *orthophosphoric acid*, 20 volumes of *water* and 80 volumes of *acetonitrile*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-2	100	0	isocratic
2-10	100→85	0→15	linear gradient
10-18	85→100	15→0	linear gradient
18-25	100	0	isocratic

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between 2-[4-[(7-chloro-4-quinolinyl)amino]pentyl] amino ethanol and hydroxychloroquine is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 2-[4-[(7-chloro-4-quinolinyl)amino]pentyl]aminoethanol is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.5%);

the area of any other *secondary peak* is not greater than the principal peak in the chromatogram obtained with solution (2) (0.5%).

the sum of the areas of any other *secondary peaks* is not greater than twice the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (3) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions of the substance being examined in mobile phase A.

(1) Weigh and powder 20 tablets. Shake a quantity of the powdered tablets containing 0.20 g of Hydroxychloroquine Sulfate with 150 mL of mobile phase A, dilute to 200 mL and filter. Dilute 1 volume of the filtrate to 10 volumes with mobile phase A.

(2) 0.01% w/v *hydroxychloroquine sulfate BPCRS*.

(3) 0.0001% w/v of *hydroxychloroquine sulfate BPCRS* and 0.0001% w/v of *2-[4-[(7-chloro-4-quinolinyl)amino]pentyl]aminoethanol BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure may be carried out using the conditions described under the Related substances test.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between 2-[4-[(7-chloro-4-quinolinyl)amino]pentyl] amino ethanol and hydroxychloroquine is at least 1.5.

DETERMINATION OF CONTENT

Calculate the total content of hydroxychloroquine sulfate, $C_{18}H_{26}ClN_3O,H_2SO_4$, in the tablets using the declared content of $C_{18}H_{26}ClN_3O,H_2SO_4$ in *hydroxychloroquine sulfate BPCRS*.

Hydroxyzine Oral Solution

Action and use

Histamine H_1 receptor antagonist.

DEFINITION

Hydroxyzine Oral Solution contains Hydroxyzine Hydrochloride in a suitable vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of hydroxyzine hydrochloride, $C_{21}H_{27}ClN_2O_2,2HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak due to hydroxyzine hydrochloride in the chromatogram obtained with solution (2).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions, prepared in a solution containing 1 volume of *dichloromethane* and 1 volume of *methanol* (solution A).

(1) Shake a quantity of the oral solution containing 50 mg of Hydroxyzine Hydrochloride with 5 mL of solution A, add sufficient solution A to produce 10 mL, centrifuge and use the supernatant liquid.

(2) 1% w/v of *hydroxyzine hydrochloride BPCRS*.

(3) 0.5% w/v each of *hydroxyzine hydrochloride BPCRS* and *meclozine hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 30 µL of solution (1) and 2 µL of each of solutions (2) and (3).

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *potassium iodobismuthate solution R2*, heat at 110° for 5 minutes and allow to cool.

MOBILE PHASE

1 volume of 13.5M *ammonia*, 24 volumes of *ethanol* and 75 volumes of *toluene*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 2.7 to 3.0, Appendix V L.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Shake a quantity of the oral solution containing 50 mg of Hydroxyzine Hydrochloride with 10 mL of mobile phase, add sufficient mobile phase to produce 50 mL and filter.

(2) Dilute 2 volumes of solution (1) to 100 volumes. Further dilute 1 volume of the resulting solution to 10 volumes.

(3) 0.01% w/v of *hydroxyzine hydrochloride BPCRS*.

(4) Dilute 1 volume of solution (1) to 100 volumes. Further dilute 1 volume of the resulting solution to 20 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Luna C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

www.webofpharma.com

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 3 times the retention time of hydroxyzine.

MOBILE PHASE

14 volumes of *triethylamine*, 300 volumes of *acetonitrile* and 686 volumes of a 0.075% w/v solution of *sodium methanesulfonate*, adjust the mobile phase to pH 2.7 with *sulfuric acid*.

When the chromatograms are recorded under the prescribed conditions the retention time of hydroxyzine is about 9 min.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* is at least 10, where H_p is the height above the baseline of the peak immediately before the peak due to hydroxyzine and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to hydroxyzine.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the oral solution containing 50 mg of Hydroxyzine Hydrochloride with 10 mL of *water* for 20 minutes, add 125 mL of *methanol* and shake for a further 30 minutes. Add a sufficient quantity of a 30% v/v solution of *acetonitrile* to produce 250 mL and filter, dilute 5 mL of the filtrate to 10 mL with a 30% v/v solution of *acetonitrile*.

(2) 0.01% w/v of *hydroxyzine hydrochloride BPCRS* in a 30% v/v solution of *acetonitrile*.

(3) 0.01% w/v of *hydroxyzine hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* is at least 10, where H_p is the height above the baseline of the peak immediately before the peak due to hydroxyzine and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to Hydroxyzine.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{27}ClN_2O_2,2HCl$ in the oral solution using the declared content of $C_{21}H_{27}ClN_2O_2,2HCl$ in *hydroxyzine hydrochloride BPCRS*.

Hydroxyzine Tablets

Action and use

Histamine H_1 receptor antagonist.

DEFINITION

Hydroxyzine Tablets contain Hydroxyzine Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hydroxyzine hydrochloride, $C_{21}H_{27}ClN_2O_2,2HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak due to hydroxyzine hydrochloride in the chromatogram obtained with solution (2).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions, prepared in a solution containing 1 volume of *methanol* and 1 volume of *dichloromethane* (solution A).

(1) Shake a quantity of the powdered tablets containing 100 mg of Hydroxyzine Hydrochloride with 5 mL of solution A, add sufficient solution A to produce 10 mL, centrifuge and use the supernatant liquid.

(2) 1% w/v of *hydroxyzine hydrochloride BPCRS*.

(3) 0.5% w/v each of *hydroxyzine hydrochloride BPCRS* and *meclozine hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel G plate*.

(b) Use the mobile phase described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *potassium iodobismuthate solution R2*, heat at 110° for 5 minutes and allow to cool.

MOBILE PHASE

1 volume of 13.5M *ammonia*, 24 volumes of *ethanol* and 75 volumes of *toluene*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

TESTS

Dissolution

Carry out the procedure protected from light. Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary to produce a solution expected to contain 0.0011% w/v of Hydroxyzine

www.webofpharma.com

Hydrochloride, at the maximum at 230 nm, Appendix II B using *water* in the reference cell.

(2) Measure the *absorbance* of a 0.0011% w/v solution of *hydroxyzine hydrochloride BPCRS* using *water* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of hydroxyzine hydrochloride, $C_{21}H_{27}ClN_2O_2,2HCl$, in the medium from the absorbances obtained and using the declared content of $C_{21}H_{27}ClN_2O_2,2HCl$ in *hydroxyzine hydrochloride BPCRS*.

LIMITS

The amount of hydroxyzine hydrochloride released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Shake a quantity of the powdered tablets containing 50 mg of Hydroxyzine Hydrochloride with 10 mL of the mobile phase, add sufficient mobile phase to produce 50 mL and filter.

(2) Dilute 2 volumes of solution (1) to 100 volumes. Further dilute 1 volume of this solution to 10 volumes.

(3) 0.01% w/v of *hydroxyzine hydrochloride BPCRS*.

(4) Dilute 1 volume of solution (1) to 100 volumes. Further dilute 1 volume of the resulting solution to 20 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Luna C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for 3 times the retention time of hydroxyzine.

MOBILE PHASE

14 volumes of *triethylamine*, 300 volumes of *acetonitrile* and 686 volumes of a 0.075% w/v solution of *sodium methanesulfonate*, adjust the mobile phase to pH 2.7 with *sulfuric acid*.

When the chromatograms are recorded under the prescribed conditions the retention time of hydroxyzine is about 9 min.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* is at least 10, where H_p is the height above the baseline of the peak immediately before the peak due to hydroxyzine and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to hydroxyzine.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 50 mg of Hydroxyzine Hydrochloride with 10 mL of *water* for 20 minutes, add 125 mL of *methanol* and shake for a further 30 minutes. Add a sufficient quantity of a 30% v/v solution of *acetonitrile* to produce 250 mL, filter and dilute 5 volumes of the filtrate to 10 volumes with a 30% v/v solution of *acetonitrile*.

(2) 0.01% w/v of *hydroxyzine hydrochloride BPCRS* in a 30% v/v solution of *acetonitrile*.

(3) 0.01% w/v of *hydroxyzine hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3);

the *peak-to-valley ratio* is at least 10, where H_p is the height above the baseline of the peak immediately before the peak due to hydroxyzine and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to hydroxyzine.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{27}ClN_2O_2,2HCl$ in the tablets using the declared content of $C_{21}H_{27}ClN_2O_2,2HCl$ in *hydroxyzine hydrochloride BPCRS*.

Hyoscine Eye Drops

Action and use

Anticholinergic.

DEFINITION

Hyoscine Eye Drops are a sterile solution of Hyoscine Hydrobromide in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of hyoscine hydrobromide, $C_{17}H_{23}NO_4,HBr,3H_2O$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck plates are suitable) and a mixture of 10 volumes of *diethylamine*, 40 volumes of *acetone* and 50 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) evaporate a volume of the eye drops containing 5 mg of Hyoscine Hydrobromide to dryness on a water bath, triturate the residue with 1 mL of *ethanol (96%)*, allow to stand and use the supernatant liquid. Solution (2) contains 0.5% w/v of *hyoscine hydrobromide BPCRS* in *ethanol (96%)*. After removal of the plate, heat it at 105° for 20 minutes, allow to cool and spray with *potassium iodobismuthate solution R1*. The principal

www.webofpharma.com

spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak of similar size and with the same retention time as the principal peak in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *water*. For solution (1) dilute the eye drops, if necessary, to produce a solution containing 0.125% w/v of Hyoscine Hydrobromide. Solution (2) contains 0.125% w/v of *hyoscine hydrobromide BPCRS*.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) and a stainless steel pre-column (1.0 cm × 4.6 mm) both packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP18 is suitable), (b) as the mobile phase with a flow rate of 2 mL per minute a mixture of 1 volume of a 60% w/v solution of *perchloric acid*, 31 volumes of *methanol* and 68 volumes of *water*, adjusted to pH 2.5 with 13.5M *ammonia* and (c) a detection wavelength of 240 nm. When chlorhexidine is used as a preservative allow the chromatography for solution (1) to proceed until the chlorhexidine has eluted (this may be up to 20 times the retention time of the peak due to hyoscine hydrobromide).

Calculate the content of $C_{17}H_{21}NO_4,HBr,3H_2O$ using the declared content of $C_{17}H_{21}NO_4,HBr$ in *hyoscine hydrobromide BPCRS*. Each mg of $C_{17}H_{21}NO_4,HBr$ is equivalent to 1.141 mg of $C_{17}H_{21}NO_4,HBr,3H_2O$.

Hyoscine Injection

Action and use
Anticholinergic.

DEFINITION

Hyoscine Injection is a sterile solution of Hyoscine Hydrobromide in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of hyoscine hydrobromide, $C_{17}H_{21}NO_4,HBr,3H_2O$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck plates are suitable) and a mixture of 10 volumes of *diethylamine*, 40 volumes of *acetone* and 50 volumes of *dichloromethane* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) evaporate a volume of the injection containing 5 mg of Hyoscine Hydrobromide to dryness on a water bath, triturate the residue with 1 mL of *ethanol (96%)*, allow to stand and use the supernatant liquid. Solution (2) contains 0.5% w/v of *hyoscine hydrobromide BPCRS* in *ethanol (96%)*. After removal of the plate, heat it at 105° for 20 minutes, allow to cool and spray with *potassium iodobismuthate solution R1*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention as the principal peak in the chromatogram obtained with solution (2).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute the injection, if necessary, to produce a solution containing 0.04% w/v of Hyoscine Hydrobromide. Solution (2) contains 0.04% w/v of *hyoscine hydrobromide BPCRS*.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) and a stainless steel pre-column (1.0 cm × 4.6 mm) both packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP18 is suitable), (b) as the mobile phase with a flow rate of 2 mL per minute a mixture of 1 volume of a 60% w/v solution of *perchloric acid*, 31 volumes of *methanol* and 68 volumes of *water*, adjusted to pH 2.5 with 13.5M *ammonia* and (c) a detection wavelength of 240 nm.

Calculate the content of $C_{17}H_{21}NO_4,HBr,3H_2O$ using the declared content of $C_{17}H_{21}NO_4,HBr$ in *hyoscine hydrobromide BPCRS*. Each mg of $C_{17}H_{21}NO_4,HBr$ is equivalent to 1.141 mg of $C_{17}H_{21}NO_4,HBr,3H_2O$.

STORAGE

Hyoscine Injection should be protected from light.

Hyoscine Tablets

Action and use
Anticholinergic.

DEFINITION

Hyoscine Tablets contain Hyoscine Hydrobromide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hyoscine hydrobromide, $C_{17}H_{21}NO_4,HBr,3H_2O$
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of powdered tablets containing 0.5 mg of Hyoscine Hydrobromide with 5 mL of 0.1M *hydrochloric acid*. Mix, with gentle swirling, with three 5-mL quantities of *dichloromethane* discarding the dichloromethane layers. Add 1 mL of 5M *ammonia* to the aqueous phase and extract with two 5-mL quantities of *dichloromethane* and retain the dichloromethane extracts. Dry the combined dichloromethane extracts over *anhydrous sodium sulfate*, filter, evaporate the filtrate to dryness and dissolve the residue in 0.5 mL of *ethanol (96%)*.

(2) 0.1% w/v of *hyoscine hydrobromide BPCRS* in *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel for chromatography* (Merck plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

www.webofpharma.com

(e) After removal of the plate, heat it at 105° for 20 minutes, allow to cool and spray with *potassium iodobismuthate solution R1*.

MOBILE PHASE

10 volumes of *diethylamine*, 40 volumes of *acetone* and 50 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the test for Uniformity of content, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Hyoscine Hydrobromide comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution A is a 0.02% w/v solution of *atropine sulfate BPCRS* (internal standard) in a mixture of 25 volumes of *acetonitrile* and 75 volumes of *water*.

(1) Add 1 mL of solution A to one tablet and disintegrate with the aid of ultrasound. Shake the mixture for 2 minutes, centrifuge and filter the supernatant liquid using a suitable 0.45-µm filter.

(2) 0.015% w/v of *hyoscine hydrobromide BPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.05M *sodium octanesulfonate* in a mixture of 1 volume of a 60% w/v solution of *perchloric acid*, 3 volumes of *methanol*, 21 volumes of *acetonitrile* and 75 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{21}NO_4,HBr,3H_2O$ in each tablet using the declared content of $C_{17}H_{21}NO_4,HBr$ in *hyoscine hydrobromide BPCRS*. Each mg of $C_{17}H_{21}NO_4,HBr$ is equivalent to 1.141 mg of $C_{17}H_{21}NO_4,HBr,3H_2O$.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution A is a 0.02% w/v solution of *atropine sulfate BPCRS* (internal standard) in a mixture of 25 volumes of *acetonitrile* and 75 volumes of *water*.

(1) Add to 10 whole tablets 7 mL of *acetonitrile (25%)*, disintegrate with the aid of ultrasound and shake the mixture for 2 minutes. Add sufficient of a mixture of 25 volumes of *acetonitrile* and 75 volumes of *water* to produce a final solution containing 0.015% w/v of Hyoscine Hydrobromide, centrifuge and filter the supernatant liquid using a suitable 0.45-µm filter.

(2) Prepare solution (2) in the same manner as solution (1) but using solution A in place of a mixture of 25 volumes of *acetonitrile* and 75 volumes of *water*.

(3) 0.015% w/v of *hyoscine hydrobromide BPCRS* in solution A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{17}H_{21}NO_4,HBr,3H_2O$ in the tablets using the declared content of $C_{17}H_{21}NO_4,HBr$ in *hyoscine hydrobromide BPCRS*. Each mg of $C_{17}H_{21}NO_4,HBr$ is equivalent to 1.141 mg of $C_{17}H_{21}NO_4,HBr,3H_2O$.

Hyoscine Butylbromide Injection

Action and use

Anticholinergic.

DEFINITION

Hyoscine Butylbromide Injection is a sterile solution of Hyoscine Butylbromide in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of hyoscine butylbromide, $C_{21}H_{30}BrNO_4$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Evaporate to dryness a volume containing 0.1 g of Hyoscine Butylbromide, shake the residue with *chloroform*, filter, evaporate the filtrate to dryness and triturate the residue with 5 mL of *acetonitrile*. Evaporate to dryness and dry the residue at 50° at a pressure not exceeding 0.7 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of hyoscine butylbromide *(RS 185)*. Retain the residue for use in test C.

B. The *light absorption*, Appendix II B, in the range 230 to 350 nm of the solution obtained in the Assay exhibits maxima at 252, 257 and 264 nm and a less well-defined maximum at 247 nm.

C. To 1 mg of the residue obtained in test A add 0.2 mL of *fuming nitric acid* and evaporate to dryness on a water bath. Dissolve the residue in 2 mL of *acetone* and add 0.1 mL of a 3% w/v solution of *potassium hydroxide* in *methanol*. A violet colour is produced.

TESTS

Acidity

pH, 3.7 to 5.5, Appendix V L.

Hyoscine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 0.001M *hydrochloric acid*.

(1) Use the injection diluted, if necessary, to contain 1.0% w/v of Hyoscine Butylbromide.

(2) 0.0010% w/v of *hyoscine hydrobromide BPCRS*.

(3) Add 10 µL of solution (1) to 10 mL of solution (2).

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (10 µm) (Lichrosorb 10µ C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2.0 g of *sodium dodecyl sulfate* in a mixture of 370 mL of 0.001M *hydrochloric acid* and 680 mL of *methanol.*

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3), the *resolution factor* between hyoscine and butylhyoscine is at least 5.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to hyoscine is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Related substances

Carry out the method for *thin-layer chromatography,* Appendix III A, using the following solutions in. 0.01M *hydrochloric acid.*

(1) Dilute the injection, if necessary, to contain 2% w/v of Hyoscine Butylbromide.

(2) Dilute 3 volumes of solution (1) to 100 volumes.

(3) Dilute 1 volume of solution (1) to 50 volumes.

(4) Dilute 1 volume of solution (1) to 400 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel F_{254} high-performance precoated plate (Merck silica gel 60 F_{254} HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 4 cm.

(e) After removal of the plate, dry it at 60° for 15 minutes, spray with a solution prepared by mixing equal volumes of a 40% w/v solution of *potassium iodide* in *water* and a solution prepared by dissolving 0.85 g of *bismuth oxynitrate* in a mixture of 10 mL of *glacial acetic acid* and 40 mL of *water* and diluting 1 volume of the mixture with 2 volumes of *glacial acetic acid* and 10 volumes of *water* immediately before use. Allow the plate to dry in air, spray well with a 5% w/v solution of *sodium nitrite* and examine immediately.

MOBILE PHASE

0.5 volume of *anhydrous formic acid,* 1.5 volumes of *water,* 9 volumes of *absolute ethanol* and 9 volumes of *dichloromethane.*

SYSTEM SUITABILITY

In the chromatogram obtained with solution (1) the principal spot has an Rf value of about 0.45.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* with an Rf value less than that of the principal spot is not more intense than the spot in the chromatogram obtained with solution (2) (3%);

not more than two *secondary spots* with an Rf value less than that of the principal spot are more intense than the spot in the chromatogram obtained with solution (4) (0.25%);

any *secondary spot* with an Rf value greater than that of the principal spot is not more intense than the spot in the chromatogram obtained with solution (3) (2%);

not more than one *secondary spot* with an Rf value greater than that of the principal spot is more intense than the spot in the chromatogram obtained with solution (4) (0.25%).

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions in 0.001M *hydrochloric acid.*

(1) Dilute the injection to contain 0.04% w/v of Hyoscine Butylbromide.

(2) 0.04% w/v of *hyoscine butylbromide BPCRS.*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under the test for Hyoscine may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{30}BrNO_4$ using the declared content of $C_{21}H_{30}BrNO_4$ in *hyoscine butylbromide BPCRS.*

STORAGE

Hyoscine Butylbromide Injection should be protected from light.

Hyoscine Butylbromide Tablets

Action and use

Anticholinergic.

DEFINITION

Hyoscine Butylbromide Tablets contain Hyoscine Butylbromide.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of hyoscine butylbromide, $C_{21}H_{30}BrNO_4$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 50 mg of Hyoscine Butylbromide with 20 mL of *chloroform,* filter, evaporate the filtrate to dryness and triturate the residue with 5 mL of *acetonitrile.* Evaporate to dryness and dry the residue at 50° at a pressure not exceeding 0.7 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of hyoscine butylbromide *(RS 185).*

B. To 1 mg of the residue obtained in test A add 0.2 mL of *fuming nitric acid* and evaporate to dryness on a water bath. Dissolve the residue in 2 mL of *acetone* and add 0.1 mL of a 3% w/v solution of *potassium hydroxide* in *methanol.* A violet colour is produced.

C. Shake a quantity of the powdered tablets containing 50 mg of Hyoscine Butylbromide with 20 mL of *chloroform,* filter, evaporate the filtrate to dryness, shake the residue with 50 mL of *water* and filter. The *light absorption* of the filtrate, Appendix II B, in the range 230 to 350 nm exhibits maxima at 252, 257 and 264 nm and a less well-defined maximum at 247 nm.

www.webofpharma.com

TESTS

Hyoscine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 g of Hyoscine Butylbromide with 10 mL of 0.001M *hydrochloric acid* with the aid of ultrasound for 15 minutes, centrifuge and filter.

(2) 0.0010% w/v of *hyoscine hydrobromide BPCRS* in 0.001M *hydrochloric acid*.

(3) Add 10 µL of solution (1) to 10 mL of solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (10 µm) (Lichrosorb 10µ C8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

2.0 g of *sodium dodecyl sulfate* in a mixture of 370 mL of 0.001M *hydrochloric acid* and 680 mL of *methanol*.

SYSTEM SUITABILITY

The test is not valid unless the *resolution factor* between the peaks corresponding to hyoscine and butylhyoscine is at least 5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to hyoscine is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in 0.01M *hydrochloric acid*.

(1) Shake a quantity of the powdered tablets containing 20 mg of Hyoscine Butylbromide with 5 mL of 0.01M *hydrochloric acid* and centrifuge.

(2) Dilute 3 volumes of solution (1) to 100 volumes.

(3) Dilute 1 volume of solution (1) to 50 volumes.

(4) Dilute 1 volume of solution (1) to 400 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel F_{254} high-performance precoated plate (Merck silica gel 60 F_{254} HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 2 µL of each solution.

(d) Develop the plate to 4 cm.

(e) After removal of the plate, dry it at 60° for 15 minutes, spray with a solution prepared by mixing equal volumes of a 40% w/v solution of *potassium iodide* in *water* and a solution prepared by dissolving 0.85 g of *bismuth oxynitrate* in a mixture of 10 mL of *glacial acetic acid* and 40 mL of *water* and diluting 1 volume of the mixture with 2 volumes of *glacial acetic acid* and 10 volumes of *water* immediately before use. Allow the plate to dry in air, spray well with a 5% w/v solution of *sodium nitrite* and examine immediately.

MOBILE PHASE

0.5 volumes of *anhydrous formic acid*, 1.5 volumes of *water*, 9 volumes of *absolute ethanol* and 9 volumes of *dichloromethane*.

SYSTEM SUITABILITY

In the chromatogram obtained with solution (1) the principal spot has an Rf value of about 0.45.

LIMITS

In the chromatogram obtained with solution (1):

any *secondary spot* with an Rf value less than that of the principal spot is not more intense than the spot in the chromatogram obtained with solution (2) (3%);

not more than two such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.25%);

any *secondary spot* with an Rf value greater than that of the principal spot is not more intense than the spot in the chromatogram obtained with solution (3) (2%);

not more than one such spot is more intense than the spot in the chromatogram obtained with solution (4) (0.25%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 0.001M *hydrochloric acid*.

(1) Shake a quantity of the powdered tablets containing 40 mg of Hyoscine Butylbromide with 60 mL of the solvent with the aid of ultrasound for 15 minutes, dilute to 100 mL with the same solvent, centrifuge and filter to obtain a clear filtrate.

(2) 0.04% w/v of *hyoscine butylbromide BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under the test for Hyoscine may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{30}BrNO_4$ in the tablets using the declared content of $C_{21}H_{30}BrNO_4$ in *hyoscine butylbromide BPCRS*.

Hypromellose Eye Drops

Alkaline Eye Drops; Artificial Tears

Action and use

Artificial tears.

DEFINITION

Hypromellose Eye Drops are a sterile solution of Hypromellose in Purified Water. They are isotonic with tear secretions.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

IDENTIFICATION

A. Heat 5 mL in a water bath, with stirring. Above 50° the solution becomes cloudy or a flocculent precipitate is produced. The solution becomes clear on cooling.

B. To 5 mL add 0.15 mL of 2M *acetic acid* and 1.2 mL of a 10% w/v solution of *tannic acid*. A yellowish white, flocculent precipitate is produced which dissolves in 6M *ammonia*.

www.webofpharma.com

TESTS

Clarity of solution
The eye drops are not more opalescent than *reference suspension IV*, Appendix IV A.

Alkalinity
pH, 8.2 to 8.6, Appendix V L.

Viscosity
70 to 130% of the declared value when determined by Appendix V H, Method I, at 20° and using a viscometer of a size appropriate to the nominal viscosity.

LABELLING

The label states the nominal viscosity in millipascal seconds.

When methylcellulose eye drops are prescribed or demanded, Hypromellose Eye Drops shall be dispensed or supplied.

Prolonged-release Ibuprofen Capsules

Prolonged-release Ibuprofen Capsules from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use
Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Prolonged-release Ibuprofen Capsules contain Ibuprofen. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of Ibuprofen. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of ibuprofen, $C_{13}H_{18}O_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

Extract a quantity of the capsule contents containing 0.5 g of Ibuprofen with 20 mL of *acetone*, filter and evaporate the filtrate to dryness in a current of air without heating. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ibuprofen *(RS 186)*.

TESTS

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the capsule contents containing 20 mg of Ibuprofen in 2 mL of *acetonitrile for chromatography* and add sufficient mobile phase A to produce 10 mL.

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A.

(3) Dissolve 20 mg of *ibuprofen BPCRS* in 2 mL of *acetonitrile for chromatography*, add 1 mL of a 0.006% w/v solution of *ibuprofen impurity B BPCRS* in *acetonitrile for chromatography* (prepared by diluting 1 volume of *ibuprofen impurity B BPCRS* to 10 volumes with *acetonitrile for chromatography*) and sufficient mobile phase A to produce 10 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 214 nm.

(f) Inject 20 µL of each solution.

(g) Equilibrate the column with mobile phase A for about 45 minutes.

MOBILE PHASE

Mobile phase A 0.5 volume of *orthophosphoric acid*, 340 volumes of *acetonitrile for chromatography* and 600 volumes of *water*. Allow to equilibrate and add sufficient *water* to produce 1000 mL.

Mobile phase B *acetonitrile.*

Time (Minutes)	Mobile phase A (%v/v)	Mobile phase B (%v/v)	Comment
0-25	100	0	isocratic
25-55	100→15	0→85	linear gradient
55-70	15	85	isocratic
70-75	15→100	85→0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* between the peaks due to ibuprofen and ibuprofen impurity B is not less than 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to ibuprofen impurity B is not greater than the area of the peak corresponding to impurity B in the chromatogram obtained with solution (3) (0.3%);

the area of any other *secondary peak* is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the sum of the areas of any other *secondary peaks* is not greater than 0.7 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%).

Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the mixed contents of 20 capsules containing 0.2 g of Ibuprofen in 30 mL of mobile phase for 30 minutes. Add sufficient mobile phase to produce 100 mL and mix. Centrifuge an aliquot of the suspension at 2500 *g* for 5 minutes and use the supernatant liquid.

(2) 0.2% w/v of *ibuprofen BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

www.webofpharma.com

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 264 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

3 volumes of *orthophosphoric acid*, 247 volumes of *water* and 750 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{13}H_{18}O_2$ in the capsules using the declared content of $C_{13}H_{18}O_2$ in *ibuprofen BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include:

(2*RS*)-2-(4-butylphenyl)propanoic acid (Ibuprofen Impurity B).

Ibuprofen Cream

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Ibuprofen Cream contains Ibuprofen in a suitable basis.

The cream complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of ibuprofen, $C_{13}H_{18}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake vigorously a quantity of the cream containing 50 mg of Ibuprofen with 10 mL of *dichloromethane* for 5 minutes and filter (Whatman GF/C paper is suitable).

(2) 0.5% w/v of *ibuprofen BPCRS* in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel H*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 10 cm.

(e) After removal of the plate, dry it at 120° for 30 minutes, lightly spray the plate with a 1% w/v solution of *potassium permanganate* in 1M *sulfuric acid*, heat at 120° for 20 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

5 volumes of *anhydrous acetic acid*, 25 volumes of *ethyl acetate* and 75 volumes of n-*hexane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position, colour and size to that in the chromatogram obtained with solution (2).

B. In the Assay the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake vigorously a quantity of the cream containing 0.1 g of Ibuprofen with 25 mL of *methanol* for 10 minutes, decant the solution into a 50 mL graduated flask, rinse the original flask with two 10-mL quantities of *methanol*, dilute the combined solution and rinsings to 50 mL with *methanol* and filter (Whatman GF/C paper is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol*.

(3) Dissolve 50 mg of *ibuprofen BPCRS* in 2.5 mL of a 0.006% w/v solution of *ibuprofen impurity B BPCRS* in *methanol* (prepared by diluting 1 volume of *ibuprofen impurity B BPCRS* to 10 volumes with *methanol*) and add sufficient *methanol* to produce 25 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 214 nm.

(f) Equilibrate the column with the mobile phase for about 45 minutes before starting the chromatography.

(g) Inject 20 µL of each solution.

(h) Allow the chromatography to proceed for 1.5 times the retention time of the principal peak. When the chromatograms are recorded under the conditions described above, the retention time of ibuprofen is about 20 minutes.

MOBILE PHASE

0.5 volume of *orthophosphoric acid*, 340 volumes of *acetonitrile* and 600 volumes of *water* diluted to 1000 volumes with *water* after equilibration.

SYSTEM SUITABILITY

In the chromatogram obtained with solution (3) measure the height (*a*) of the peak due to (2*RS*)-2-(4-butylphenyl)-propanoic acid and the height (*b*) of the lowest point of the curve separating this peak from that due to ibuprofen.
The test is not valid unless *a* is greater than 1.5*b*.
If necessary, adjust the concentration of acetonitrile in the mobile phase to obtain the required resolution.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to ibuprofen impurity B is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.3%);

the area of any other *secondary peak* is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the sum of the area of any *secondary peaks*, other than the peak due to impurity B, is not greater than 0.7 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%).

Disregard any peak the area of which is less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

www.webofpharma.com

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake vigorously a quantity of the cream containing 50 mg of Ibuprofen with 25 mL of the mobile phase for 10 minutes, decant the solution into a 50 mL graduated flask, rinse the original flask with two 10-mL quantities of the mobile phase, dilute the combined solution and rinsings to 50 mL with the mobile phase and filter (Whatman GF/C paper is suitable).

(2) 0.1% w/v of *ibuprofen BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 264 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

3 volumes of *orthophosphoric acid*, 247 volumes of *water* and 750 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{13}H_{18}O_2$ in the cream using the declared content of $C_{13}H_{18}O_2$ in *ibuprofen BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include:

1. (2*RS*)-2-(4-butylphenyl)propanoic acid (Ibuprofen Impurity B).

Ibuprofen Gel

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Ibuprofen Gel is a solution of Ibuprofen in a suitable water-miscible basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of ibuprofen, $C_{13}H_{18}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake vigorously a quantity of the gel containing 0.125 g of Ibuprofen with 25 mL of *dichloromethane* for 5 minutes and use the upper layer.

(2) 0.5% w/v of *ibuprofen BPCRS* in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel H*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 10 cm.

(e) After removal of the plate, dry it at 120° for 30 minutes, lightly spray the plate with a 1% w/v solution of *potassium permanganate* in 1M *sulfuric acid*, heat at 120° for 20 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

5 volumes of *anhydrous acetic acid*, 25 volumes of *ethyl acetate* and 75 volumes of n-*hexane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the gel containing 0.1 g of Ibuprofen in 25 mL of warm *methanol*, cool and dilute to 50 mL with *methanol*.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol*.

(3) Dissolve 50 mg of *ibuprofen BPCRS* in 2.5 mL of a 0.006% w/v solution of *ibuprofen impurity B BPCRS* in *methanol* (prepared by diluting 1 volume of *ibuprofen impurity B BPCRS* to 10 volumes with *methanol*) and add sufficient *methanol* to produce 25 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 214 nm.

(f) Inject 20 µL of each solution.

(g) Equilibrate the column with the mobile phase for about 45 minutes before starting the chromatography.

(h) Allow the chromatography to proceed for 1.5 times the retention time of the principal peak. When the chromatograms are recorded under the conditions described above, the retention time of ibuprofen is about 20 minutes.

MOBILE PHASE

0.5 volume of *orthophosphoric acid*, 340 volumes of *acetonitrile* and 600 volumes of *water* diluted to 1000 volumes with *water*. Equilibrate the column with the mobile phase for about 45 minutes before starting the chromatography.

SYSTEM SUITABILITY

In the chromatogram obtained with solution (3) measure the height (*a*) of the peak due to 2-(4-butylphenyl)-propionic acid and the height (*b*) of the lowest point of the curve separating this peak from that due to ibuprofen. The test is not valid unless *a* is greater than 1.5*b*. If necessary, adjust the concentration of acetonitrile in the mobile phase to obtain the required resolution.

LIMITS

In the chromatogram obtained with solution (1):

www.webofpharma.com

the area of any peak corresponding to ibuprofen impurity B is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.3%);

the area of any other *secondary peak* is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the sum of the area of any *secondary peaks*, other than the peak due to impurity B, is not greater than 0.7 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%).

Disregard any peak the area of which is less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the gel containing 50 mg of Ibuprofen with 50 mL of warm *methanol* for 10 minutes, cool and add sufficient *methanol* to produce 100 mL. Dilute 10 volumes of this solution to 20 volumes with the mobile phase.

(2) Dilute 10 volumes of a solution containing 0.05% w/v of *ibuprofen BPCRS* in *methanol* to 20 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 264 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

3 volumes of *orthophosphoric acid*, 247 volumes of *water* and 750 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{13}H_{18}O_2$ using the declared content of $C_{13}H_{18}O_2$ in *ibuprofen BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include:

1. (2*RS*)-2-(4-butylphenyl)propanoic acid (Ibuprofen Impurity B).

Ibuprofen Oral Suspension

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Ibuprofen Oral Suspension is a suspension of Ibuprofen in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of ibuprofen, $C_{13}H_{18}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the oral suspension containing 0.5 g of Ibuprofen with 20 mL of *chloroform*, allow to stand until the layers have separated, filter and evaporate the filtrate to dryness in a current of air without heating. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ibuprofen *(RS 186)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a quantity of the oral suspension containing 0.1 g of Ibuprofen to 100 mL with *absolute ethanol*, shake vigorously for 5 minutes, filter (Whatman GF/C paper is suitable) and use the filtrate.

(2) 0.1% w/v of *ibuprofen BPCRS* in *absolute ethanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel H*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 10 cm.

(e) After removal of the plate dry it at 120° for 30 minutes, lightly spray the plate with a 1% w/v solution of *potassium permanganate* in 1M *sulfuric acid*, heat at 120° for 20 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

1 volume of *anhydrous acetic acid*, 5 volumes of *ethyl acetate* and 15 volumes of n-*hexane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position, size and colour to that in the chromatogram obtained with solution (2). Disregard any spot remaining on the line of application.

TEST

4′-Isobutylacetophenone

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions immediately after preparation.

(1) Mix a quantity of the oral suspension containing 0.2 g of Ibuprofen with 30 mL of *acetonitrile*, add a further 10 mL of acetonitrile and 10 mL of 0.01M *orthophosphoric acid*, shake vigorously, dilute to 100 mL with 0.01M *orthophosphoric acid* and filter (Whatman GF/C paper is suitable).

(2) 0.0006% w/v of *4′-isobutylacetophenone BPCRS* in *acetonitrile*.

(3) 0.0006% w/v of *4′-isobutylacetophenone BPCRS* and 0.2% w/v of *ibuprofen BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to ibuprofen and 4′-isobutylacetophenone is at least 1.0.

LIMITS

In the chromatogram obtained with solution (1) the area of any peak corresponding to 4′-isobutylacetophenone is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.3%).

www.webofpharma.com

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions immediately after preparation.

(1) Mix a quantity of the oral suspension containing 0.1 g of Ibuprofen with 30 mL of *acetonitrile*, add a further 10 mL of *acetonitrile* and 10 mL of 0.01M *orthophosphoric acid*, shake vigorously, dilute to 100 mL with 0.01M *orthophosphoric acid* and filter (Whatman GF/C paper is suitable).

(2) 0.1% w/v of *ibuprofen BPCRS* prepared by dissolving a suitable quantity in 40 volumes of *acetonitrile* and adding 60 volumes of 0.01M *orthophosphoric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

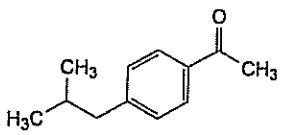
(e) Use a detection wavelength of 220 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

400 volumes of *acetonitrile* and 600 volumes of 0.01M *orthophosphoric acid*.

DETERMINATION OF CONTENT



Determine the *weight per mL* of the oral suspension, Appendix V G, and calculate the content of $C_{13}H_{18}O_2$, weight in volume, from the declared content of $C_{13}H_{18}O_2$ in *ibuprofen BPCRS*.

STORAGE

Ibuprofen Oral Suspension should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include:

1. 4′-isobutylacetophenone; 1-[4-(2-methylpropyl)phenyl]ethanone) (Ibuprofen Impurity E).

Ibuprofen Tablets

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Ibuprofen Tablets contain Ibuprofen. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ibuprofen, $C_{13}H_{18}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the powdered tablets containing 0.5 g of Ibuprofen with 20 mL of *acetone*, filter and evaporate the filtrate to dryness in a current of air without heating. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ibuprofen *(RS 186)*.

B. *Melting point* of the residue obtained in test A, after recrystallisation from *petroleum spirit (boiling range, 40° to 60°)*, about 75°, Appendix V A.

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 30 mL of *methanol* to a quantity of the powdered tablets containing 0.2 g of Ibuprofen, shake for 30 minutes, add 30 mL of *methanol* and sufficient *water* to produce 100 mL, mix and filter through a glass microfibre filter paper (Whatman GF/C is suitable).

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) Dissolve 50 mg of *ibuprofen BPCRS* in 2.5 mL of a 0.006% w/v solution of *ibuprofen impurity B BPCRS* in *methanol* (prepared by diluting 1 volume of *ibuprofen impurity B BPCRS* to 10 volumes with *methanol*) and add sufficient *methanol* to produce 25 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 214 nm.

(f) Inject 20 µL of each solution.

(g) Equilibrate the column with the mobile phase for about 45 minutes before starting the chromatography.

(h) Allow the chromatography to proceed for 1.5 times the retention time of the principal peak. When the chromatograms are recorded under the conditions described above, the retention time of ibuprofen is about 20 minutes.

MOBILE PHASE

0.5 volume of *orthophosphoric acid*, 340 volumes of *acetonitrile* and 600 volumes of *water* diluted to 1000 volumes with *water* after equilibration.

SYSTEM SUITABILITY

In the chromatogram obtained with solution (3) measure the height (*a*) of the peak due to 2-(4-butylphenyl)-propionic acid and the height (*b*) of the lowest point of the curve separating this peak from that due to ibuprofen. The test is not valid unless *a* is greater than 1.5*b*. If necessary, adjust the concentration of acetonitrile in the mobile phase to obtain the required resolution.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to ibuprofen impurity B is not greater than the area of the corresponding peak in the chromatogram obtained with solution (3) (0.3%);

the area of any other *secondary peak* is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the sum of the area of any *secondary peaks*, other than the peak due to impurity B, is not greater than 0.7 times the area

www.webofpharma.com

of the principal peak in the chromatogram obtained with solution (2) (0.7%).

Disregard any peak the area of which is less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.2 g of Ibuprofen with 30 mL of the mobile phase for 30 minutes, add sufficient of the mobile phase to produce 100 mL and mix thoroughly. Centrifuge 25 mL of the solution at 2500 *g* for 5 minutes and use the supernatant liquid.

(2) 0.2% w/v of *ibuprofen BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 264 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

3 volumes of *orthophosphoric acid*, 247 volumes of *water* and 750 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{13}H_{18}O_2$ using the declared content of $C_{13}H_{18}O_2$ in *ibuprofen BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include:

1. (2*RS*)-2-(4-butylphenyl)propanoic acid (Ibuprofen Impurity B).

Prolonged-release Ibuprofen Tablets

Prolonged-release Ibuprofen Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Prolonged-release Ibuprofen Tablets contain Ibuprofen. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of Ibuprofen. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of ibuprofen, $C_{13}H_{18}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 0.5 g of Ibuprofen with 20 mL of *acetone*, filter and evaporate the filtrate to dryness in a current of air without heating. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of ibuprofen *(RS 186)*.

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the powdered tablets containing 20 mg of Ibuprofen in 2 mL of *acetonitrile for chromatography* and add sufficient mobile phase A to produce 10 mL.

(2) Dilute 1 volume of solution (1) to 100 volumes with mobile phase A.

(3) Dissolve 20 mg of *ibuprofen BPCRS* in 2 mL of *acetonitrile for chromatography*, add 1 mL of a 0.006% w/v solution of *ibuprofen impurity B BPCRS* in *acetonitrile for chromatography* (prepared by diluting 1 volume of *ibuprofen impurity B BPCRS* to 10 volumes with *acetonitrile for chromatography*) and sufficient mobile phase A to produce 10 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 214 nm.

(f) Inject 20 µL of each solution.

(g) Equilibrate the column with mobile phase A for about 45 minutes.

MOBILE PHASE

Mobile phase A 0.5 volume of *orthophosphoric acid*, 340 volumes of *acetonitrile for chromatography* and 600 volumes of *water*. Allow to equilibrate and add sufficient *water* to produce 1000 mL.

Mobile phase B *acetonitrile*.

Time (Minutes)	Mobile phase A (%v/v)	Mobile phase B (%v/v)	Comment
0-25	100	0	isocratic
25-55	100→15	0→85	linear gradient
55-70	15	85	isocratic
70-75	15→100	85→0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *peak-to-valley ratio* between the peaks due to ibuprofen and ibuprofen impurity B is not less than 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of the peak corresponding to ibuprofen impurity B is not greater than the area of the peak corresponding to impurity B in the chromatogram obtained with solution (3) (0.3%);

www.webofpharma.com

the area of any other *secondary peak* is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the sum of the areas of any other *secondary peaks* is not greater than 0.7 times the area of the principal peak in the chromatogram obtained with solution (2) (0.7%).

Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.2 g of Ibuprofen in 30 mL of mobile phase for 30 minutes. Add sufficient mobile phase to produce 100 mL and mix. Centrifuge an aliquot of the suspension at 2500 *g* for 5 minutes and use the supernatant liquid.

(2) 0.2% w/v of *ibuprofen BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 264 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

3 volumes of *orthophosphoric acid*, 247 volumes of *water* and 750 volumes of *methanol*.

DETERMINATION OF CONTENT

Calculate the content of $C_{13}H_{18}O_2$ in the tablets using the declared content of $C_{13}H_{18}O_2$ in *ibuprofen BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include:

(2*RS*)-2-(4-butylphenyl)propanoic acid (Ibuprofen Impurity B).

Idoxuridine Eye Drops

Action and use

Pyrimidine nucleoside analogue; antiviral (herpesviruses).

DEFINITION

Idoxuridine Eye Drops are a sterile solution of Idoxuridine in Purified Water.

Except that they may be supplied in containers not exceeding 15 mL capacity, the eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of idoxuridine, $C_9H_{11}IN_2O_5$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Dilute a suitable volume of the eye drops with 0.01M *sodium hydroxide* to produce a solution containing 0.004% w/v of Idoxuridine. The *light absorption* of the resulting solution, Appendix II B, in the range 230 to 350 nm exhibits a maximum only at 279 nm.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak having the same retention time as the peak due to Idoxuridine in the chromatogram obtained with solution (1).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a suitable volume of the eye drops with sufficient of a suitable solution of *sulfanilamide* (internal standard) to give a final concentration of 0.080% w/v of Idoxuridine and 0.0001% w/v of the internal standard.

(2) Dilute a suitable volume of the eye drops with *water* to give a final concentration of 0.080% w/v of Idoxuridine.

(3) 0.0004% w/v of *2′-deoxyuridine*, 0.0008% w/v of *5-iodouracil*, 0.0004% w/v of *5-bromo-2′-deoxyuridine* and 0.0001% w/v of *sulfanilamide* (internal standard).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.7 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

4 volumes of *methanol* and 96 volumes of *water*.

The order of elution of the peaks following the internal standard is deoxyuridine, iodouracil, bromodeoxyuridine and idoxuridine. Several peaks due to excipients may appear in the chromatogram obtained with solution (1) before the peak due to the internal standard.

LIMITS

In the chromatogram obtained with solution (1):

the ratio of the area of any peak due to 2′-deoxyuridine to the area of the peak due to sulfanilamide is not greater than the ratio of the areas of the corresponding peaks in the chromatogram obtained with solution (3) (0.5%);

the ratio of the area of any peak due to 5-iodouracil to the area of the peak due to sulfanilamide is not greater than the ratio of the areas of the corresponding peaks in the chromatogram obtained with solution (3) (1%);

the ratio of the area of any peak due to 5-bromo-2′-deoxyuridine to the area of the peak due to sulfanilamide is not greater than the ratio of the areas of the corresponding peaks in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

Solution A Prepare a solution containing 0.12 g of *sulfathiazole* (internal standard) in 10 mL of *ethanol (96%)*, warming if necessary, and dilute to 100 mL with *water*.

Solution B Prepare a solution by diluting a suitable volume of the eye drops with *water* if necessary to give a final concentration of 0.10% w/v of Idoxuridine.

(1) Add 2 mL of solution A to 15 mL of solution B and dilute to 20 mL with *water*.

www.webofpharma.com

(2) Add 2 mL of a 10% v/v solution of *ethanol (96%)* to 15 mL of solution B and dilute to 20 mL with *water*.

(3) Shake 0.1 g of *idoxuridine BPCRS* with 50 mL of *water* until dissolved and then dilute to 100 mL with *water*; to 15 mL of this solution add 2 mL of solution A and dilute to 20 mL with *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.7 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

13 volumes of *methanol* and 87 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_{11}IN_2O_5$ using the ratios of the peaks and the declared content of $C_9H_{11}IN_2O_5$ in *idoxuridine BPCRS*.

STORAGE

Idoxuridine Eye Drops should be stored at a temperature not exceeding 8° but should not be allowed to freeze.

Ifosfamide Injection

Action and use

Cytotoxic alkylating agent.

DEFINITION

Ifosfamide Injection is a sterile solution of Ifosfamide in Water for Injections or a suitable liquid. It is prepared by dissolving Ifosfamide for Injection in the requisite amount of a suitable liquid immediately before use.

The injection complies with the requirements stated under Parenteral Preparations.

STORAGE

Ifosfamide Injection should be used immediately after preparation but, in any case, within the period recommended by the manufacturer when prepared and stored strictly in accordance with the manufacturer's instructions.

IFOSFAMIDE FOR INJECTION

Ifosfamide for Injection is a sterile material consisting of Ifosfamide with or without excipients. It is supplied in a sealed container.

CAUTION *Ifosfamide is Cytotoxic. Carry out the procedures described below exercising appropriate precautions.*

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of ifosfamide, $C_7H_{15}Cl_2N_2O_2P$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of ifosfamide (*RS 428*).

TESTS

Solution A

Dissolve 5.0 g in *carbon dioxide-free water* and dilute to 50.0 mL with the same solvent.

Appearance of solution

Solution A is clear, Appendix IV A, and not more intensely coloured than *reference solution* Y_7, Appendix IV B.

Acidity or alkalinity

pH of an 8% w/v solution, 4.0 to 7.0, Appendix V L.

Related substances

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a sufficient quantity of the contents of the sealed container in a mixture of equal volumes of *methanol* and *water* to produce a solution containing 10.0% w/v of Ifosfamide.

(2) 0.025% w/v of *ifosfamide impurity A EPCRS* and 0.025% w/v of *chloroethylamine hydrochloride* (impurity C) in a mixture of equal volumes of *methanol* and *water*.

(3) 0.015% w/v of *ifosfamide impurity B EPCRS* in a mixture of equal volumes of *methanol* and *water*.

(4) 0.005% w/v of *ethanolamine*, 0.02% w/v of *ifosfamide impurity A EPCRS* and 0.08% w/v of *chloroethylamine hydrochloride* (impurity C) in a mixture of equal volumes of *methanol* and *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry at 115° for 45 minutes. At the bottom of a chromatography tank, place an evaporating dish containing a 0.32% w/v solution of *potassium permanganate* and add an equal volume of *dilute hydrochloric acid*, close the tank and allow to stand for 10 minutes. Place the plate whilst still hot in the tank, avoiding contact of the stationary phase with the solution, and close the tank. Leave the plate in contact with the chlorine vapour for 20 minutes. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed (about 20 minutes) and an area of coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution*. Avoid prolonged exposure to cold air. Immerse the plate in a 0.1% w/v solution of *tetramethylbenzidine* in *ethanol (96%)* for 5 seconds. Allow the plate to dry and examine.

MOBILE PHASE

10 volumes of *water*, 15 volumes of *methanol*, 25 volumes of *acetic acid* and 50 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows three clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1) any spot corresponding to impurity A or impurity C is not more intense than the corresponding spot in the chromatogram obtained with solution (2) (0.25%); any spot corresponding to impurity B is not more intense than the corresponding spot in the chromatogram obtained with solution (3) (0.15 %); any other spot is not more intense than the principal spot in the chromatogram obtained with solution (3) (0.15%).

www.webofpharma.com

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dissolve a sufficient quantity of the contents of the sealed container in a mixture of equal volumes of *methanol* and *water* to produce a solution containing 2.0% w/v of Ifosfamide.

(2) 0.005% w/v of *ifosfamide impurity E EPCRS* and 0.005% w/v of *ifosfamide impurity F EPCRS* in a mixture of equal volumes of *methanol* and *water*.

(3) 0.01% w/v of *ifosfamide impurity E EPCRS* and 0.01% w/v of *ifosfamide impurity F EPCRS* in a mixture of equal volumes of *methanol* and *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate dry at 115° for 45 minutes. At the bottom of a chromatography tank, place an evaporating dish containing a 0.32% w/v solution of *potassium permanganate* and add an equal volume of *dilute hydrochloric acid*, close the tank and allow to stand for 10 minutes. Place the plate whilst still hot in the tank, avoiding contact of the stationary phase with the solution, and close the tank. Leave the plate in contact with the chlorine vapour for 20 minutes. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed (about 20 minutes) and an area of coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution*. Avoid prolonged exposure to cold air. Immerse the plate in a 0.1% w/v solution of *tetramethylbenzidine* in *ethanol (96%)* for 5 seconds. Allow the plate to dry and examine.

MOBILE PHASE

1 volume of *dichloromethane* and 10 volumes of *acetone*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

LIMITS

In the chromatogram obtained with solution (1) any spot corresponding to impurity E or impurity F is not more intense than the corresponding spot in the chromatogram obtained with solution (2) (0.25%).

Water

Not more than 0.5% w/w, Appendix IX C. Use 1g.

ASSAY

Determine the weight of the contents of 10 containers as described in the test for *uniformity of weight*, Appendix XII C1, Powders for Parenteral Use.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dissolve a sufficient quantity of the contents of the sealed container to produce a solution containing 0.060% w/v of Ifosfamide.

(2) 0.060% w/v of *ifosfamide BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Zorbax SB-C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 195 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A mixture of 30 volumes of *acetonitrile R1* and 70 volumes of *carbon dioxide-free water*.

DETERMINATION OF CONTENT

Calculate the content of $C_7H_{15}Cl_2N_2O_2P$ in a container of average content weight using the declared content of $C_7H_{15}Cl_2N_2O_2P$ in *ifosfamide BPCRS*.

STORAGE

The sealed container should be kept protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Ifosfamide. Related substances test A is intended to control degradation impurities and Related substances test B is intended to control synthetic impurities.

Imipramine Tablets

Action and use

Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

Imipramine Tablets contain Imipramine Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of imipramine hydrochloride, $C_{19}H_{24}N_2,HCl$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

Triturate a quantity of the powdered tablets containing 0.25 g of Imipramine Hydrochloride with 10 mL of *chloroform*, filter, evaporate the filtrate to low volume, add *ether* until a turbidity is produced and allow to stand. The precipitate complies with the following tests.

A. *Melting point*, after recrystallisation from *acetone*, about 172°, Appendix V A.

B. Dissolve 5 mg in 2 mL of *nitric acid*. An intense blue colour is produced.

C. Yields the reactions characteristic of *chlorides*, Appendix VI.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 5 volumes of *hydrochloric acid*, 5 volumes of *water*, 35 volumes of *glacial acetic acid* and 55 volumes of *ethyl acetate* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 10 µL of each of the following solutions prepared immediately before use. For solution (1) shake a quantity of the powdered tablets containing 0.20 g of Imipramine Hydrochloride with three 10 mL quantities of *chloroform*, filter the combined chloroform extracts, evaporate to dryness and dissolve the residue in 10 mL of *methanol*. For solution (2) dilute 3 volumes of solution (1) to 100 volumes with *methanol* and dilute 1 volume of the

www.webofpharma.com

resulting solution to 10 volumes with *methanol*. Solution (3) contains 0.0060% w/v of *iminodibenzyl* in *methanol*. After removal of the plate, allow it to dry for 5 minutes, spray with a 0.5% w/v solution of *potassium dichromate* in *sulfuric acid (20%)* and examine immediately. In the chromatogram obtained with solution (1) any spot corresponding to iminodibenzyl is not more intense than the spot in the chromatogram obtained with solution (3) (0.3%) and any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.3%).

ASSAY

Powder 10 tablets and transfer quantitatively without loss into 300 mL of 0.1M *hydrochloric acid*. Shake for 30 minutes, add sufficient 0.1M *hydrochloric acid* to produce 500 mL and filter through a fine glass microfibre filter (GF/C paper is suitable). Dilute a suitable volume of the filtrate with 0.1M *hydrochloric acid* to produce a solution containing 0.0025% w/v of Imipramine Hydrochloride and measure the *absorbance* of the resulting solution at the maximum at 250 nm, Appendix II B. Calculate the content of $C_{19}H_{24}N_2,HCl$ taking 264 as the value of A (1%, 1 cm) at the maximum at 250 nm.

Indapamide Tablets

Action and use

Thiazide-like diuretic.

Preparation

Prolonged-release Indapamide Tablets

DEFINITION

Indapamide Tablets contain Indapamide. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of indapamide hemihydrate, $C_{16}H_{16}ClN_3O_3S,½H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a *TLC silica gel F_{254} plate* (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 20 volumes of *acetone* and 80 volumes of *toluene* as the mobile phase but allowing the solvent front to ascend 12 cm above the line of application. Apply separately to the plate 20 µL of each of the following solutions. For solution (1) grind a quantity of the powdered tablets containing 50 mg of Indapamide with 10 mL of *acetone*, mix for 15 minutes, filter through a fine filter paper (Whatman 42 is suitable) and use the filtrate. Solution (2) contains 0.5% w/v of *indapamide BPCRS* in *acetone*. After removal of the plate, allow it to dry until the solvent has evaporated and examine under *ultraviolet light (254 nm)*. Spray the plate with a solution prepared by mixing 10 volumes of *potassium iodobismuthate solution* and 20 volumes of *glacial acetic acid* and diluting to 100 volumes with *water* and examine again. Finally, spray the plate with a 5% w/v solution of *sodium nitrite* in a mixture of equal volumes of *water* and *ethanol (96%)* and examine again. By each method of visualisation, the principal spot in the chromatogram obtained with solution (1) is similar in position, colour and intensity to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 500 mL of 0.1M *hydrochloric acid* and rotate the paddle at 100 revolutions per minute. After 60 minutes, withdraw a sample of 10 mL of the medium and filter. Measure the *absorbance* of the filtrate, Appendix II B, suitably diluted with 0.1M *hydrochloric acid* if necessary, at 240 nm and at 275 nm using 0.1M *hydrochloric acid* in the reference cell. Prepare a reference solution by diluting 1 volume of a 0.10% w/v solution of *indapamide BPCRS* in *methanol* to 200 volumes with 0.1M *hydrochloric acid* and measure the *absorbance* of this solution at 240 nm and at 275 nm using 0.1M *hydrochloric acid* in the reference cell. Calculate the total content of indapamide hemihydrate, $C_{16}H_{16}ClN_3O_3S,½H_2O$, in the medium using the differences in absorbance at 240 nm and at 275 nm and using the declared content of $C_{16}H_{16}ClN_3O_3S$ in *indapamide BPCRS*. Each mg of $C_{16}H_{16}ClN_3O_3S$ is equivalent to 1.0246 mg of $C_{16}H_{16}ClN_3O_3S,½H_2O$. The amount of indapamide hemihydrate released is not less than 75% of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions. For solution (1) mix 10 whole tablets with 70 mL of *ethanol (96%)*, mix mechanically until the tablets have disintegrated and continue mixing for 2 hours. Add sufficient *ethanol (96%)* to produce 100 mL, mix and centrifuge. Dilute the supernatant liquid with the mobile phase to produce a solution containing 0.005% w/v of Indapamide. For solution (2) dilute 1 volume of solution (1) to 10 volumes with the mobile phase and further dilute 1 volume of this solution to 100 volumes with the mobile phase. For solution (3) dilute 1 volume of a 0.00025% w/v solution of *indapamide impurity B BPCRS* in *ethanol (96%)* to 10 volumes with the mobile phase. For solution (4) dilute 1 volume of a 0.00025% w/v solution of *4-chloro-3-sulfamoylbenzoic acid* in *ethanol (96%)* to 10 volumes with the mobile phase. For solution (5) mix one volume of solution (1), one volume of a 0.00025% w/v solution of *indapamide impurity B BPCRS* in *ethanol (96%)* and 1 volume of a 0.00025% w/v solution of *4-chloro-3-sulfamoylbenzoic acid* in *ethanol (96%)* and add 7 volumes of the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) as the mobile phase with a flow rate of 1.6 mL per minute a mixture of 6 volumes of a solution containing 5% w/v of *sodium dodecyl sulfate* and 3% v/v of *glacial acetic acid*, 10 volumes of *triethylamine*, 20 volumes of *butan-2-ol*, 310 volumes of *acetonitrile* and 690 volumes of *water*, the mixture being adjusted to pH 3.0 with *orthophosphoric acid* and (c) a detection wavelength of 240 nm.

The test is not valid unless, in the chromatogram obtained with solution (5), the retention time of impurity B relative to indapamide is about 1.7 and the retention time of 4-chloro-3-sulfamoylbenzoic acid relative to indapamide is about 0.3.

www.webofpharma.com

In the chromatogram obtained with solution (1), the area of any peak corresponding to indapamide impurity B is not greater than the area of the peak in the chromatogram obtained with solution (3) (0.5%), the area of any peak corresponding to 4-chloro-3-sulfamoylbenzoic acid is not greater than 0.4 times the area of the peak in the chromatogram obtained with solution (4) (0.2%) and the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.1%). The sum of the content of impurities, excluding indapamide impurity B, is not greater than 0.3%.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions. For solution (1) mix 10 whole tablets with 70 mL of *ethanol (96%)*, mix mechanically until the tablets have disintegrated and continue mixing for 2 hours. Add sufficient *ethanol (96%)* to produce 100 mL, mix and centrifuge. Dilute the supernatant liquid with the mobile phase to produce a solution containing 0.005% w/v of Indapamide. For solution (2) dilute 1 volume of a 0.025% w/v solution of *indapamide BPCRS* in *ethanol (96%)* to 5 volumes with the mobile phase.

The chromatographic procedure described under Related substances may be used.

Calculate the content of $C_{16}H_{16}ClN_3O_3S,½H_2O$ in the tablets from the chromatogram obtained and using the declared content of $C_{16}H_{16}ClN_3O_3S$ in *indapamide BPCRS*. Each mg of $C_{16}H_{16}ClN_3O_3S$ is equivalent to 1.0246 mg of $C_{16}H_{16}ClN_3O_3S,½H_2O$.

STORAGE

Indapamide Tablets should be protected from light.

Prolonged-release Indapamide Tablets

Prolonged-release Indapamide Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Thiazide-like diuretic.

DEFINITION

Prolonged-release Indapamide Tablets contain Indapamide. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of Indapamide. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of indapamide, $C_{16}H_{16}ClN_3O_3S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Grind a quantity of the powdered tablets containing 50 mg of Indapamide with 10 mL of *acetone*, mix for 15 minutes, filter (Whatman 42 is suitable) and use the filtrate.

(2) 0.5% w/v of *indapamide BPCRS* in *acetone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *TLC silica gel* F_{254} (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 12 cm.

(e) After removal of the plate, allow it to dry until the solvent has evaporated and examine under *ultraviolet light (254 nm)*. Spray the plate with a solution prepared by mixing 10 volumes of *potassium iodobismuthate solution* and 20 volumes of *glacial acetic acid* and diluting to 100 volumes with *water* and examine again. Finally, spray the plate with a 5% w/v solution of *sodium nitrite* in a mixture of equal volumes of *water* and *ethanol (96%)* and examine again.

MOBILE PHASE

20 volumes of *acetone* and 80 volumes of *toluene*.

CONFIRMATION

By each method of visualisation, the principal spot in the chromatogram obtained with solution (1) is similar in position, colour and intensity to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions prepared immediately before use.

(1) To a quantity of the powdered tablets containing 25 mg of Indapamide add 70 mL of *ethanol (96%)* and mix mechanically for 2 hours. Add sufficient *ethanol (96%)* to produce 100 mL, mix and centrifuge. Dilute the supernatant liquid with the mobile phase to produce a solution containing 0.005% w/v of Indapamide.

(2) Dilute 1 volume of solution (1) to 10 volumes with the mobile phase and further dilute 1 volume of this solution to 100 volumes with the mobile phase.

(3) Dilute 1 volume of a 0.00025% w/v solution of *indapamide impurity B BPCRS* in *ethanol (96%)* to 10 volumes with the mobile phase.

(4) Dilute 1 volume of a 0.00025% w/v solution of *4-chloro-3-sulfamoylbenzoic acid* in *ethanol (96%)* to 10 volumes with the mobile phase.

(5) Mix 1 volume of solution (1), 1 volume of a 0.00025% w/v solution of *indapamide impurity B BPCRS* in *ethanol (96%)* and 1 volume of a 0.00025% w/v solution of *4-chloro-3-sulfamoylbenzoic acid* in *ethanol (96%)* and add 7 volumes of the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.6 mL per minute.

(d) Use an ambient column temperature.

www.webofpharma.com

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

6 volumes of a solution containing 5% w/v of *sodium dodecyl sulphate* and 3% v/v of *glacial acetic acid*, 10 volumes of *triethylamine*, 20 volumes of *butan-2-ol*, 310 volumes of *acetonitrile* and 690 volumes of *water*, the mixture being adjusted to pH 3.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the retention time of impurity B relative to indapamide is about 1.7 and the retention time of 4-chloro-3-sulfamoylbenzoic acid relative to indapamide is about 0.3.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to indapamide impurity B is not greater than twice the area of the peak in the chromatogram obtained with solution (3) (1.0%),

the area of any peak corresponding to 4-chloro-3-sulfamoylbenzoic acid is not greater than the area of the peak in the chromatogram obtained with solution (4) (0.5%),

the area of any other *secondary peak* is not greater than 5 times the area of the peak in the chromatogram obtained with solution (2) (0.5%),

The total impurity content is not greater than 1.5%.

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, protected from light, using the following solutions.

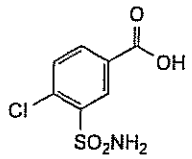
(1) To a quantity of the powdered tablets containing 25 mg of Indapamide add 70 mL of *ethanol (96%)* and mix mechanically for 2 hours. Add sufficient *ethanol (96%)* to produce 100 mL, mix and centrifuge. Dilute the supernatant liquid with the mobile phase to produce a solution containing 0.005% w/v of Indapamide.

(2) Dilute 1 volume of a 0.025% w/v solution of *indapamide BPCRS* in *ethanol (96%)* to 5 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT



Calculate the content of $C_{16}H_{16}ClN_3O_3S$ in the tablets using the declared content of $C_{16}H_{16}ClN_3O_3S$ in *indapamide BPCRS*.

STORAGE

Prolonged-release Indapamide Tablets should be protected from light.

IMPURITIES

The impurities limited by the requirements of his monograph include impurity B listed under Indapamide and:

1. 4-chloro-3-sulfamoylbenzoic acid.

Indometacin Capsules

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Indometacin Capsules contain Indometacin.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of indometacin, $C_{19}H_{16}ClNO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the contents of the capsules containing 0.1 g of Indometacin with 5 mL of *chloroform*, filter and evaporate the filtrate to dryness. Dry the residue at 60° at a pressure not exceeding 0.7 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of indometacin *(RS 187)*.

B. The *light absorption*, Appendix II B, in the range 300 to 350 nm of the solution obtained in the Assay exhibits a maximum only at 320 nm.

C. Mix a quantity of the contents of the capsules containing 25 mg of Indometacin with 2 mL of *water* and add 2 mL of 2M *sodium hydroxide*. A bright yellow colour is produced which fades rapidly.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of *phosphate buffer pH 7.2*, at a temperature of 37°, as the medium.

PROCEDURE

(1) Withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 320 nm, Appendix II B using *phosphate buffer pH 7.2* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of indometacin, $C_{19}H_{16}ClNO_4$, in the medium taking 196 as the value of A(1%, 1 cm) at the maximum at 320 nm.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

www.webofpharma.com

(1) Shake a quantity of the contents of the capsules containing 0.10 g of Indometacin with 5 mL of *chloroform*, filter and use the filtrate.

(2) Dilute 1 volume of solution (1) to 200 volumes with *chloroform*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a suspension of *silica gel HF_{254}* in a 4.68% w/v solution of *sodium dihydrogen orthophosphate* to coat the plate.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

30 volumes of *petroleum spirit (boiling range, 60° to 80°)* and 70 volumes of *ether*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2).

ASSAY

To a quantity of the mixed contents of 20 capsules containing 50 mg of Indometacin add 10 mL of *water* and allow to stand for 10 minutes, swirling occasionally. Add 75 mL of *methanol*, shake well, add sufficient *methanol* to produce 100 mL and filter if necessary. To 5 mL of the filtrate add sufficient of a mixture of equal volumes of *methanol* and *phosphate buffer pH 7.2* to produce 100 mL. Measure the *absorbance* of the resulting solution at the maximum at 320 nm, Appendix II B. Calculate the content of $C_{19}H_{16}ClNO_4$ taking 193 as the value of A(1%, 1 cm) at the maximum at 320 nm.

Indometacin Suppositories

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Indometacin Suppositories contain Indometacin in a suitable suppository basis.

The suppositories comply with the requirements stated under Rectal Preparations and with the following requirements.

Content of indometacin, $C_{19}H_{16}ClNO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Dissolve a quantity of the suppositories containing 0.1 g of Indometacin as completely as possible in 50 mL of hot *water*, filter, wash the residue with hot *water* and allow to dry in air. Dissolve the residue in 5 mL of *chloroform* and evaporate to dryness. The *infrared absorption spectrum* of the final residue, Appendix II A, is concordant with the *reference spectrum* of indometacin *(RS 187)*.

B. Shake a quantity of the suppositories containing 25 mg of Indometacin with 5 mL of *water* until the basis dissolves; a white suspension is produced. Add 2 mL of 2M *sodium hydroxide*; a bright yellow colour is produced which fades rapidly.

TESTS

Disintegration

Carry out the *disintegration test for suppositories and pessaries*, Appendix XII A2, using a weighed suppository and *phosphate buffer pH 6.8* in place of *water* and operating the apparatus for 90 minutes. At the end of this period remove the suppository, dry with filter paper and weigh. Repeat the operation with two further weighed suppositories. Not less than 75% of each suppository is dissolved.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following freshly prepared solutions. For solution (1) dilute 3 volumes of solution (2) to 100 volumes with the mobile phase. For solution (2) powder or cut into small pieces a suitable number of the suppositories, dissolve a quantity containing 0.1 g of Indometacin in sufficient *methanol* to produce 50 mL.

The chromatographic procedure may be carried out using (a) a stainless steel column (30 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable), (b) a mixture of 40 volumes of 0.2% v/v solution of *orthophosphoric acid* and 60 volumes of *methanol* as the mobile phase with a flow rate of 2 mL per minute and (c) a detection wavelength of 320 nm.

The *column efficiency*, determined using the principal peak in the chromatogram obtained with solution (1), should be not less than 7500 theoretical plates per metre.

The sum of the areas of any *secondary peaks* that elute before the principal peak in the chromatogram obtained with solution (2) is not greater than the area of the peak in the chromatogram obtained with solution (1).

Repeat the procedure but using the following freshly prepared solutions and a detection wavelength of 240 nm. For solution (3) dilute 10 volumes of solution (2) to 20 volumes with the mobile phase. Solution (4) contains 0.001% w/v of *4-chlorobenzoic acid* in the mobile phase. In the chromatogram obtained with solution (3) the sum of the areas of any *secondary peaks* that elute before the principal peak, other than those determined in solution (2), is not greater than the area of the peak in the chromatogram obtained with solution (4).

ASSAY

Weigh 10 suppositories and powder or cut into small pieces. To a quantity containing 0.1 g of Indometacin add 50 mL of *methanol*, shake until dispersion is complete and, if necessary, filter. To 2 mL add sufficient of a mixture of equal volumes of *methanol* and *phosphate buffer pH 7.2* to produce 100 mL. Measure the *absorbance* of the resulting solution at the maximum at 318 nm, Appendix II B. Calculate the content of $C_{19}H_{16}ClNO_4$ taking 193 as the value of A(1%, 1 cm) at the maximum at 318 nm.

Indoramin Tablets

Action and use

Alpha$_1$-adrenoceptor antagonist.

DEFINITION

Indoramin Tablets contain Indoramin Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of indoramin, $C_{22}H_{25}N_3O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing the equivalent of 0.1 g of indoramin with 25 mL of *water* for

www.webofpharma.com

5 minutes, filter (Whatman GF/C paper is suitable), make the filtrate alkaline with 2M *sodium hydroxide* and extract with 20 mL of *dichloromethane*. Wash the extracts with two 10 mL quantities of *water*, dry by shaking with *anhydrous sodium sulfate* and evaporate to dryness using a rotary evaporator. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of indoramin *(RS 188)*.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 1 volume of 18M *ammonia*, 20 volumes of *absolute ethanol* and 79 volumes of *toluene* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) add 10 mL of *ethanol (96%)* to a quantity of the powdered tablets containing the equivalent of 0.1 g of indoramin, shake for 30 minutes and filter. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *ethanol (96%)*. For solution (3) dilute 1 volume of solution (2) to 5 volumes with *ethanol (96%)*. After removal of the plate, allow it to dry in a current of warm air and examine it under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.1%). Disregard any spot remaining on the line of application.

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use 900 mL of 0.1M *hydrochloric acid* as the medium and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 mL of the medium. Measure the *absorbance* of a layer of suitable thickness of the filtered sample, suitably diluted if necessary, at the maximum at 280 nm, Appendix II B. Calculate the total content of indoramin, $C_{22}H_{25}N_3O$, in the medium taking 186 as the value of A(1%, 1 cm) at the maximum at 280 nm.

ASSAY

Shake 10 whole tablets with 50 mL of 0.1M *hydrochloric acid* until the tablets have disintegrated, add 300 mL of *ethanol (96%)* and mix with the aid of ultrasound for 10 minutes, shaking occasionally. Add sufficient *ethanol (96%)* to produce 500 mL, filter (Whatman GF/C paper is suitable), dilute the filtrate with *ethanol (96%)* to contain 0.005% w/v of indoramin and measure the *absorbance* of the resulting solution at the maximum at 280 nm, Appendix II B. Calculate the content of $C_{22}H_{25}N_3O$ taking 186 as the value of A(1%, 1 cm) at the maximum at 280 nm.

STORAGE

Indoramin Tablets should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of indoramin.

Inositol Nicotinate Tablets

Action and use

Vasodilator.

DEFINITION

Inositol Nicotinate Tablets contain Inositol Nicotinate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of inositol nicotinate, $C_{42}H_{30}N_6O_{12}$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 1 g of Inositol Nicotinate with 30 mL of a mixture of 9 volumes of *chloroform* and 1 volume of *methanol*, filter and evaporate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of inositol nicotinate *(RS 190)*. Retain the remainder of the residue for use in the Related substances test.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 20 mL sample of the medium and filter.

(2) Measure the *absorbance* of the filtrate, Appendix II B, diluted with 1M *hydrochloric acid* if necessary, at the maximum at 262 nm using 1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of inositol nicotinate, $C_{42}H_{30}N_6O_{12}$, in the medium taking 398 as the value of A(1%, 1 cm) at the maximum at 262 nm.

Free nicotinic acid

To a quantity of the powdered tablets containing 1 g of Inositol Nicotinate add 75 mL of *water*, shake for 15 minutes and titrate with 0.02M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Not more than 1.0 mL of 0.02M *sodium hydroxide VS* is required to produce the first pink colour.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) 5.0% w/v of the residue obtained in test A for Identification in a mixture of 1 volume of *methanol* and 9 volumes of *chloroform*.

(2) 0.075% w/v of the residue obtained in test A for Identification in a mixture of 1 volume of *methanol* and 9 volumes of *chloroform*.

(3) 0.050% w/v of the residue obtained in test A for Identification in a mixture of 1 volume of *methanol* and 9 volumes of *chloroform*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use as a plate 200 mm × 200 mm in size and *silica gel GF_{254}* as the coating substance.

(b) Use the mobile phase as described below for the first development.

(c) Apply to the bottom right-hand corner of the plate 5 µL of solution (1).

(d) Develop the plate to 12 cm.

(e) After removal of the plate, allow it to dry in air and turn the plate through 90° in a clockwise direction.

(f) Use the mobile phase as described below for the second development.

(g) Apply separately to the bottom right-hand corner of the plate, and to the right of the solvent front, 5 µL of solutions (2) and (3).

(h) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

For the first development: 10 volumes of *methanol* and 90 volumes of *chloroform*.

For the second development: 5 volumes each of *glacial acetic acid*, *ethanol (96%)* and *water* and 50 volumes of *ethyl acetate*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1.5%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (1%).

ASSAY

Weigh and powder 20 tablets. To a quantity of the powdered tablets containing 0.25 g of Inositol Nicotinate add 50 mL of *anhydrous acetic acid*, heat to boiling and allow to cool. Carry out Method I for *non-aqueous titration*, Appendix VIII A, using *1-naphtholbenzein solution* as indicator. Each mL of 0.1M *perchloric acid VS* is equivalent to 13.51 mg of $C_{42}H_{30}N_6O_{12}$.

Injectable Insulin Preparations

Insulin Preparations

(Ph. Eur. monograph 0854)

For preparations of Human Insulin, the label states the approved code in lower case letters indicative of the method of production.

The provisions of this monograph apply to sterile preparations of Human Insulin and its analogues, Bovine Insulin and Porcine Insulin.

The provisions of this monograph apply to the Injectable Insulin Preparations listed below.

Preparations

Biphasic Insulin Injection

Biphasic Isophane Insulin Injection

Insulin Injection

Insulin Aspart Injection

Insulin Lispro Injection

Insulin Zinc Suspension

Insulin Zinc Suspension (Amorphous)

Insulin Zinc Suspension (Crystalline)

Isophane Insulin Injection

Protamine Zinc Insulin Injection

Ph Eur

Injectable insulin preparations comply with the requirements for Injections prescribed in the monograph on Parental preparations (0520).

DEFINITION

Injectable insulin preparations are sterile preparations of *Insulin, human (0838)*, *Insulin, bovine (1637)* or *Insulin, porcine (1638)*. They contain not less than 90.0 per cent and not more than the equivalent of 110.0 per cent of the amount of insulin stated on the label. They are either solutions or suspensions or they are prepared by combining solutions and suspensions.

PRODUCTION

The methods of preparation are designed to confer suitable properties with respect to the onset and duration of therapeutic action.

The following procedures are carried out in a suitable sequence, depending on the method of preparation:

— addition of suitable antimicrobial preservatives;
— addition of a suitable substance or substances to render the preparation isotonic with blood;
— addition of a suitable substance or substances to adjust the pH to the appropriate value;
— determination of the strength of the insulin-containing component or components followed, where necessary, by adjustment so that the final preparation contains the requisite number of International Units per millilitre;
— sterilisation by filtration of the insulin-containing component or components; once this procedure has been carried out all subsequent procedures are carried out aseptically using materials that have been sterilised by a suitable method.

In addition, where appropriate, suitable excipients are added and suitable procedures carried out to confer the appropriate physical form on the insulin-containing component or components. The final preparation is distributed aseptically into sterile containers which are closed so as to exclude microbial contamination.

TESTS

pH *(2.2.3)*

The pH of the solution or suspension is 6.9 to 7.8, unless otherwise prescribed in the specific monograph.

Insulin in the supernatant

For injectable insulin preparations that are suspensions, not more than 2.5 per cent of the total insulin content, unless otherwise stated. Centrifuge 10 mL of the suspension at 1500 *g* for 10 min and carefully separate the supernatant and the residue. Determine the insulin content of the supernatant (*S*) by a suitable method, for example using the chromatographic conditions described under Assay. Calculate the percentage of the insulin in solution from the expression:

$$\frac{100S}{T}$$

where *T* is the total insulin content determined as described under the Assay.

Impurities with molecular masses greater than that of insulin

Examine by size-exclusion chromatography *(2.2.30)*.

Test solution Add 4 µL of *6 M hydrochloric acid R* per millilitre of the preparation to be examined, whether a suspension or a solution, to obtain a clear acid insulin solution. When

www.webofpharma.com

sampling a suspension, agitate the material prior to sampling in order to obtain a homogeneous sample. If a suspension does not turn clear within 5 min of the initial addition of hydrochloric acid, add small aliquots of acid (less than 4 µL per millilitre) until a solution is obtained. Preparations with concentrations higher than 100 IU/mL need to be diluted with *0.01 M hydrochloric acid* to avoid overloading the column with insulin monomer.

Resolution solution Use a solution of insulin (approximately 4 mg/mL), containing more than 0.4 per cent of high molecular mass proteins. An injectable insulin preparation, whether a solution or a suspension, that has been clarified with a sufficient amount of *6 M hydrochloric acid R*, containing the indicated percentage of high molecular mass proteins, or a solution prepared from insulin, dissolved in *0.01 M hydrochloric acid*, may be used. Insulin containing the indicated percentage of high molecular mass proteins may be prepared by allowing insulin powder to stand at room temperature for about ten days.

Maintain the solutions at 2 °C to 10 °C and use within 30 h (soluble insulin injection) or 7 days (other insulin preparations). If an automatic injector is used, maintain the temperature at 2 °C to 10 °C.

The chromatographic procedure may be carried out using:
— a column 0.3 m long and at least 7.5 mm in internal diameter packed with *hydrophilic silica gel for chromatography R* (5 µm to 10 µm), of a grade suitable for the separation of insulin monomer from dimers and polymers;
— as mobile phase at a flow rate of 0.5 mL/min a mixture consisting of 15 volumes of *glacial acetic acid R*, 20 volumes of *acetonitrile R* and 65 volumes of a 1.0 g/L solution of *arginine R*; filter and degas;
— as detector a spectrophotometer set at 276 nm.

Equilibration of the column Before using a new column for chromatographic analysis, equilibrate by repeated injections of an insulin solution containing high molecular mass proteins. This can be done by at least three injections of the resolution solution. The column is equilibrated when repeatable results are obtained from two subsequent injections. If protamine-containing samples are to be analysed, the equilibration of the column is performed using a solution containing protamine.

Inject 100 µL of the resolution solution. When the chromatograms are recorded under the prescribed conditions, the retention times are: polymeric insulin complexes or covalent insulin-protamine complex: about 13 min to 17 min, covalent insulin dimer: about 17.5 min, insulin monomer: about 20 min, salts: about 22 min. If the sample solution contains preservatives, for example methyl paraben, *m*-cresol or phenol, these compounds elute later. The test is not valid unless the resolution, defined by the ratio of the height of the dimer peak to the height above the baseline of the valley separating the monomer and dimer peaks, is at least 2.0.

Inject 100 µL of the test solution. Record the chromatogram for approximately 35 min. In the chromatogram obtained, the sum of the areas of any peak with a retention time less than that of the insulin peak is not greater than 3.0 per cent (protamine containing preparations) or 2.0 per cent (non-protamine containing preparations) of the total area of the peaks. Disregard any peak with a retention time greater than that of the insulin peak.

Related proteins

Examine by liquid chromatography (*2.2.29*) as described under Assay, following the elution conditions as described in the table below:

Time (min)	Mobile phase A (per cent *V/V*)	Mobile phase B (per cent *V/V*)	Comment
0 - 30	42	58	isocratic
30 - 44	42 → 11	58 → 89	linear gradient
44 - 50	11	89	isocratic

Maintain the solutions at 2 °C to 10 °C and use within 24 h. Perform a system suitability check (resolution, linearity) as described under Assay. If necessary, the relative proportions of the mobile phases may be adjusted to ensure complete elution of A21 desamido porcine insulin before commencement of the gradient. The profile of the gradient may also be adjusted to ensure complete elution of all insulin related impurities.

Inject 20 µL of the test solution and 20 µL of either reference solution (a), for insulin preparations containing 100 IU/mL, or reference solution (b), for insulin preparations containing 40 IU/mL. If necessary, adjust the injection volume to a volume between 10 µL and 20 µL in accordance with the results obtained in the test for linearity as described under Assay. Record the chromatograms for approximately 50 min. If necessary, make further adjustments to the mobile phase in order to ensure that the antimicrobial preservatives present in the test solution are well separated from the insulin and show a shorter retention time. A small reduction in the concentration of acetonitrile increases the retention time of the insulin peaks relatively more than those of the preservatives. In the chromatogram obtained with either reference solution (a), or reference solution (b), as appropriate, A21 desamido insulin appears as a small peak after the principal peak and has a retention time of about 1.3 relative to the principal peak, due to insulin. In the chromatogram obtained with the test solution the area of the peak due to A21 desamido insulin is not greater than 5.0 per cent of the total area of the peaks; the sum of the areas of any other peaks, apart from those due to insulin and A21 desamido insulin is not greater than 6.0 per cent of the total area of the peaks. Disregard the peaks due to the preservatives and protamine (early eluting peaks).

Total zinc

Not more than the amount stated in the individual monograph, determined by atomic absorption spectrometry (*2.2.23, Method I*).

Use the following method, unless otherwise prescribed in the specific monograph.

Test solution Shake the preparation gently and dilute a volume containing 200 IU of insulin to 25.0 mL with *0.01 M hydrochloric acid*. Dilute if necessary to a suitable concentration of zinc (for example 0.4 µg to 1.6 µg of Zn per millilitre) with *0.01 M hydrochloric acid*.

Reference solutions Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/mL Zn) R* with *0.01 M hydrochloric acid*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 L of air and 2 L of acetylene per minute).

www.webofpharma.com

Zinc in solution
Where applicable, not more than the amount stated in the individual monograph, determined by atomic absorption spectrometry (*2.2.23, Method I*).

Test solution Centrifuge the preparation to be examined and dilute 1 mL of the clear supernatant obtained to 25.0 mL with *water R*. Dilute if necessary to a suitable concentration of zinc (for example 0.4 µg to 1.6 µg of Zn per millilitre) with *water R*.

Reference solutions Use solutions containing 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/mL Zn) R* with *0.01 M hydrochloric acid*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 L of air and 2 L of acetylene per minute).

Bacterial endotoxins (*2.6.14*)
Less than 80 IU per 100 IU of insulin.

ASSAY

Examine by liquid chromatography (*2.2.29*).

Test solution Add 4 µL of *6 M hydrochloric acid R* per millilitre of the preparation to be examined, whether a suspension or a solution, to obtain a clear solution. When sampling a suspension, shake the material prior to sampling in order to obtain a homogeneous sample. If a suspension does not turn clear within 5 min of the initial addition of acid, add small aliquots of acid (less than 4 µL per millilitre) until a solution is obtained. For a preparation containing more than 100 IU mL, an additional dilution with *0.01 M hydrochloric acid* is necessary to avoid overloading the column.

Reference solution (a) For a preparation containing a single species of insulin, dissolve in *0.01 M hydrochloric acid*, as appropriate, the contents of a vial of *human insulin CRS*, *porcine insulin CRS* or *bovine insulin CRS* to obtain a concentration of 4.0 mg/mL. For a preparation containing both bovine and porcine insulins, mix 1.0 mL of a solution containing 4.0 mg of *bovine insulin CRS* per millilitre of *0.01 M hydrochloric acid* and 1.0 mL of a solution containing 4.0 mg of *porcine insulin CRS* per millilitre of *0.01 M hydrochloric acid. Reference solution (a) is used for the assay of insulin preparations containing 100 IU/mL.*

Reference solution (b) Dilute 4.0 mL of reference solution (a) to 10.0 mL with *0.01 M hydrochloric acid. Reference solution (b) is used for the assay of insulin preparations containing 40 IU/mL.*

Reference solution (c) Dissolve the contents of a vial of *human insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/mL.

Reference solution (d) Dissolve the contents of a vial of *porcine insulin CRS* in *0.01 M hydrochloric acid* to obtain a concentration of 4.0 mg/mL.

Reference solution (e) Dilute 1.0 mL of reference solution (a) to 10.0 mL with *0.01 M hydrochloric acid.*

Reference solution (f) Dilute 1.0 mL of reference solution (b) to 10.0 mL with *0.01 M hydrochloric acid.*

Resolution solution Mix 1.0 mL of reference solution (c) and 1.0 mL of reference solution (d).

Maintain the solutions at 2 °C to 10 °C and use within 48 h. If an automatic injector is used, maintain the temperature at 2 °C to 10 °C.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm);
- as mobile phase at a flow rate of 1 mL/min the following solutions prepared and maintained at a temperature not lower than 20 °C:

Mobile phase A Dissolve 28.4 g of *anhydrous sodium sulfate R* in *water R* and dilute to 1000 mL with the same solvent; add 2.7 mL of *phosphoric acid R*; adjust the pH to 2.3, if necessary, with *ethanolamine R*; filter and degas;

Mobile phase B Mix 550 mL of mobile phase A with 450 mL of *acetonitrile R*. Warm the solution to a temperature not lower than 20 °C in order to avoid precipitation (mixing of mobile phase A with acetonitrile is endothermic); filter and degas;

- as detector a spectrophotometer set at 214 nm;

maintaining the temperature of the column at 40 °C.

Elute with a mixture of 42 volumes of mobile phase A and 58 volumes of mobile phase B, adjusted if necessary.

Inject 20 µL of the resolution solution and 20 µL of reference solution (d). Record the chromatogram of the resolution solution until the peak corresponding to the principal peak in the chromatogram obtained with reference solution (d) is clearly visible. In the chromatogram obtained with the resolution solution, identify the peaks due to porcine insulin and human insulin. The test is not valid unless the resolution between the peaks due to human insulin and porcine insulin is at least 1.2. If necessary, adjust the concentration of acetonitrile in the mobile phase until this resolution is achieved.

Inject 20 µL of the test solution and 20 µL of either reference solutions (a) and (e), for insulin preparations containing 100 IU/mL, or 20 µL of reference solutions (b) and (f), for insulin preparations containing 40 IU/mL. If necessary, make further adjustments of the mobile phase in order to ensure that the antimicrobial preservatives present in the test solution are well separated from the insulin and show shorter retention times. A small reduction in the concentration of acetonitrile increases the retention time of the insulin peaks relatively more than those of the preservatives. If necessary, after having carried out the chromatography of a solution wash the column with a mixture of equal volumes of *acetonitrile R* and *water R* for a sufficient time to ensure elution of any interfering substances before injecting the next solution. The test is not valid unless the area of the principal peak in the chromatogram obtained with reference solution (a) or (b) is 10 ± 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) or (f). If this test fails, adjust the injection volume between 10 µL and 20 µL, in order to be in the linearity range of the detector.

Calculate the content of insulin plus A21 desamido insulin from the area of the peak due to the bovine, porcine or human insulin and that of any peak due to the A21 desamido insulin, using the declared content of insulin plus A21 desamido insulin in *bovine insulin CRS*, *porcine insulin CRS* or *human insulin CRS*, as appropriate. For preparations containing both bovine and porcine insulin use the sum of the areas of both the bovine and porcine insulin peaks and of the peaks due to the A21 desamido insulin derivatives.

STORAGE

Unless otherwise prescribed, store in a sterile, airtight, tamper-proof container, protected from light, at a temperature of 2 °C to 8 °C. Insulin preparations are not to be frozen.

www.webofpharma.com

LABELLING

The label states:
- the potency in International Units per millilitre;
- the concentration in terms of the number of milligrams of insulin per millilitre (for preparations containing both bovine insulin and porcine insulin the concentration is stated as the combined amount of both insulins);
- where applicable, that the substance is produced by enzymatic modification of porcine insulin;
- where applicable, that the substance is produced by recombinant DNA technology;
- where applicable, the animal species of origin;
- that the preparation must not be frozen;
- where applicable, that the preparation must be resuspended before use.

Ph Eur

Insulin Injection

Neutral Insulin; Neutral Insulin Injection; Soluble Insulin

(Soluble Insulin Injection, Ph Eur monograph 0834)

Action and use
Hormone; treatment of diabetes mellitus.

Ph Eur

Soluble insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.

DEFINITION

Soluble insulin injection is a neutral, sterile solution of bovine, porcine or human insulin.

CHARACTERS

A colourless liquid, free from turbidity and foreign matter; during storage, traces of a very fine sediment may be deposited.

IDENTIFICATION

Examine the chromatograms obtained in the assay.
The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak obtained with the appropriate reference solution.

TESTS

Total zinc
Not more than 40.0 µg per 100 IU of insulin.

Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.

Use the following test solution.

Test solution Dilute a volume of the gently shaken preparation containing 200 IU to 25.0 mL with *water R*. Dilute if necessary to a suitable concentration (for example, 0.4 µg to 1.6 µg of Zn per millilitre) with *water R*.

Ph Eur

Insulin Aspart Injection

Action and use
Hormone; treatment of diabetes mellitus.

DEFINITION

Insulin Aspart Injection is a sterile, neutral, aqueous solution of Insulin Aspart.

The injection complies with the requirements stated under Insulin Preparations with the modifications described below.

Content of insulin aspart, $C_{256}H_{381}N_{65}O_{79}S_6$
90.0 to 110.0% of the stated amount.

CHARACTERISTICS

A colourless liquid, free from turbidity and foreign matter; during storage traces of a very fine sediment may be deposited.

IDENTIFICATION

In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Related proteins
Carry out the method for *liquid chromatography*, Appendix III D, as described under Assay using the *normalisation procedure*.

LIMITS

In the chromatogram obtained with solution (1), the area of the peak corresponding to B28isoAsp insulin aspart is not more than 2.5%, the total area of the peaks corresponding to A21Asp insulin aspart, B3Asp insulin aspart and B3isoAsp insulin aspart is not more than 5%, and the total area of other peaks corresponding to impurities is not more than 3.5%.

Total zinc
Not more than 40 µg per 100 units of insulin aspart, determined by *atomic absorption spectrometry*, Appendix II D Method I.

Test solution Shake the preparation gently and dilute a volume containing 100 units of insulin aspart to 25.0 mL with 0.01M *hydrochloric acid*. Dilute, if necessary, to a suitable concentration of zinc (for example 0.1 µg to 1.0 µg of Zn per millilitre) with 0.01M *hydrochloric acid*.

Reference solutions Use solutions containing a suitable range of concentrations, for example 0.20 µg, 0.40 µg, 0.60 µg, 0.80 µg and 1.00 µg of Zn per millilitre, freshly prepared by diluting *zinc standard solution (5 mg/mL Zn)* with 0.01M *hydrochloric acid*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 litres of air and 2 litres of acetylene per minute).

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is less than 80 IU of endotoxin per 100 units of insulin aspart.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute, if necessary, the preparation being examined with 0.01M *hydrochloric acid* to produce a solution containing 100 units/mL of insulin aspart (equivalent to approximately 0.35% w/v insulin aspart). Add 4 µL of 6M *hydrochloric acid*

www.webofpharma.com

per mL to this solution to obtain a clear acid solution. Maintain the solution at 2° to 8° and use within 48 hours.

(2) Dissolve the contents of a vial of *insulin aspart EPCRS* in 0.01M *hydrochloric acid* to produce a solution containing 0.4% w/v insulin aspart. Maintain the solution at 2° to 8° and use within 48 hours.

(3) Use an appropriate solution with a content of B3Asp insulin aspart and A21Asp insulin aspart of not less than 1%. This may be achieved by storing solution (2) at room temperature for 1 to 3 days. Maintain the solution at 2° to 8° and use within 72 hours.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (25 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrosorb RP18 is suitable).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 214 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Mobile phase A Dissolve 70 g of *anhydrous sodium sulfate* in approximately 4500 mL of *water*; add 6.5 mL of *orthophosphoric acid* and adjust to pH 3.4, if necessary, with *dilute sodium hydroxide solution*. Dilute to 5000 mL with *water*; filter and degas. Mix 9 volumes of the solution with 1 volume of *acetonitrile R1*.

Mobile phase B Mix equal volumes of *water* and *acetonitrile R1*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comments
0-35	58	42	Isocratic
35-40	58 → 20	42 → 80	Linear gradient
40-45	20	80	Isocratic
45-46	20 → 58	80 → 42	Linear gradient
46-60	58	42	Re-equilibration

When the chromatograms are recorded under the prescribed conditions the relative retention times with reference to insulin aspart (retention time, 20 to 26 minutes) are: B28isoAsp insulin aspart, approximately 0.9; B3Asp insulin aspart plus A21Asp insulin aspart (generally co eluted), approximately 1.3; B3isoAsp insulin aspart, approximately 1.5.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peak due to insulin aspart and the peak due to A21Asp insulin aspart plus B3Asp insulin aspart is greater than 1.6.

The test is not valid unless the *symmetry factor* of the principal peak in the chromatogram obtained with solution (2) is less than 1.8.

DETERMINATION OF CONTENT

Calculate the content of insulin aspart $C_{256}H_{381}N_{65}O_{79}S_6$, together with the content of B28isoAsp insulin aspart, A21Asp insulin aspart, B3Asp insulin aspart and B3isoAsp insulin aspart using the areas of the corresponding peaks in the chromatograms obtained with solution (1) and solution (2) and the declared content of insulin aspart together with the content of B28isoAsp insulin aspart, A21Asp insulin aspart, B3Asp insulin aspart and B3isoAsp insulin aspart[1] in *insulin aspart EPCRS*.

LABELLING

The label states the potency in units per mL.

[1] *100 units are equivalent to 3.50 mg of insulin aspart.*

Biphasic Insulin Injection

Biphasic Insulin

(Ph. Eur. monograph 0831)

Action and use

Hormone; treatment of diabetes mellitus.

Ph Eur

Biphasic insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the amendments prescribed below.

DEFINITION

Biphasic insulin injection is a sterile suspension of crystals containing bovine insulin in a solution of porcine insulin.

CHARACTERS

A white or almost white suspension. When examined under a microscope, the majority of the particles are seen to be rhombohedral crystals, with a maximum dimension measured from corner to corner through the crystal greater than 10 µm but rarely exceeding 40 µm.

IDENTIFICATION

Examine the chromatograms obtained in the assay.
The position of the peaks due to the two insulins in the chromatogram obtained with the test solution correspond to those of the principal peaks in the chromatogram obtained with the appropriate reference solution.

TESTS

pH *(2.2.3)*

The pH of the suspension to be examined is 6.6 to 7.2.

Insulin in the supernatant

22.0 per cent to 28.0 per cent of insulin in solution. Determine by the method described in the test for insulin in the supernatant in the monograph on *Insulin preparations, injectable (0854)*.

Total zinc

26.0 µg to 37.5 µg per 100 IU of insulin. Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.

Ph Eur

www.webofpharma.com

Biphasic Isophane Insulin Injection

Biphasic Isophane Insulin
(Ph Eur monograph 0832)

Action and use
Hormone; treatment of diabetes mellitus.

Ph Eur

Biphasic isophane insulin injection complies with the monograph on Insulin preparations, injectable (0854) with the exception of the test for Insulin in the supernatant and with the amendments prescribed below for the other tests.

DEFINITION
Biphasic isophane insulin injection is a sterile buffered suspension of either porcine or human insulin, complexed with protamine sulfate or another suitable protamine, in a solution of insulin of the same species.

PRODUCTION
Biphasic isophane insulin injection is prepared by carrying out the procedures described in the monograph on *Insulin preparations, injectable (0854)*.

Biphasic isophane insulin injection is produced by mixing, in defined ratios, soluble insulin injection and isophane insulin injection. The defined ratios shall be demonstrated by a test method which has been approved by the competent authority to comply with the label claim.

CHARACTERS
A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to be rod-shaped crystals, the majority with a maximum dimension greater than 1 µm but rarely exceeding 60 µm, free from large aggregates.

IDENTIFICATION
Examine the chromatograms obtained in the Assay.
The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak obtained with the appropriate reference solution.

TESTS
Total zinc
Not more than 40.0 µg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

LABELLING
The label states in addition to the indications mentioned in the monograph on *Insulin preparations, injectable (0854)* the ratio of soluble insulin injection to isophane insulin injection used in the manufacturing process of biphasic isophane insulin injection.

Ph Eur

Isophane Insulin Injection

Isophane Insulin; Isophane Insulin (NPH)
(Ph. Eur. monograph 0833)

Action and use
Hormone; treatment of diabetes mellitus.

Ph Eur

DEFINITION
Isophane insulin injection is a sterile suspension of bovine, porcine or human insulin, complexed with protamine sulfate or another suitable protamine.

PRODUCTION
Isophane insulin injection is prepared by carrying out the procedures described in the monograph on *Insulin preparations, injectable (0854)*.

The amount of protamine is based on the known isophane ratio and is not less than the equivalent of 0.3 mg and not more than the equivalent of 0.6 mg of protamine sulfate for each 100 IU of insulin in the insulin-protamine complex.

CHARACTERS
A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant; the sediment is readily resuspended by gently shaking. When examined under a microscope, the particles are seen to be rod-shaped crystals, the majority with a maximum dimension greater than 1 µm but rarely exceeding 60 µm, free from large aggregates.

IDENTIFICATION
Examine the chromatograms obtained in the Assay.
The position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution.

TESTS
Total zinc
Not more than 40.0 µg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

Ph Eur

Insulin Glargine Injection

Action and use
Hormone; treatment of diabetes mellitus.

DEFINITION
Insulin Glargine Injection is a sterile, acidic, aqueous solution of Insulin Glargine.

The injection complies with the requirements stated under Insulin Preparations with the modifications described below.

Content of insulin glargine, $C_{267}H_{404}N_{72}O_{78}S_6$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS
Acidity
pH, 3.5 to 4.5, Appendix V L.

www.webofpharma.com

Impurities with molecular masses greater than that of insulin glargine

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the injection, if necessary, with sufficient *water* to produce a solution containing 0.15% w/v of Insulin Glargine.

(2) Dry 1 vial of *insulin glargine EPCRS* in an oven at 100° for 1.5 to 3 hours. Dissolve the contents of the vial in 1.5 mL of 0.01M *hydrochloric acid* and dilute to 10.0 mL with *water*.

(3) Dilute 1 volume of solution (1) to 100 volumes with *water*, dilute 3 volumes of this solution to 20 volumes with *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use two stainless steel columns (30 cm × 8.0 mm) coupled in series and packed with *hydrophilic silica gel for chromatography* (5 µm) with a pore size of 15 nm of a grade suitable for the fractionation of globular proteins in the relative molecular mass range of 2000 to 80,000 (Shodex PROTEIN KW-802.5 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 276 nm.

(f) Inject 100 µL of each solution. If splitting of the principal peak is observed, the injection volume may be decreased according to the provisions given in Appendix III.

(g) Allow the chromatography to proceed for 1.8 times the retention time of insulin glargine.

MOBILE PHASE

Mix 200 volumes of *anhydrous acetic acid*, 300 volumes of *acetonitrile for chromatography* and 400 volumes of *water*, adjust to pH 3.0 with *concentrated ammonia* and dilute to 1000 volumes with *water*.

When the chromatograms are recorded under the prescribed conditions the retention time of insulin glargine is about 35 minutes.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to insulin glargine is not more than 2.0;

in the chromatogram obtained with solution (2), the *peak-to-valley ratio* is at least 2, where H_p = height above the baseline due to high molecular mass proteins and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to insulin glargine;

in the chromatogram obtained with solution (3), the *signal-to-noise ratio* of the principal peak is at least 10.

LIMITS

In the chromatogram obtained with solution (1) the sum of the areas of any *secondary peaks* with a retention time less than that of the peak due to insulin glargine is not greater than 0.3% by normalisation.

Disregard any peaks with a retention time greater than that of the peak due to insulin glargine.

Related proteins

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Store the solutions at a temperature of 2° to 8°.

(1) Dilute the injection, if necessary, with sufficient *water* to produce a solution containing 0.15% w/v of Insulin Glargine.

(2) Dissolve the contents of a vial of *insulin glargine for peak identification EPCRS* (containing 0^A-Arg-insulin glargine) in 0.3 mL of 0.01M *hydrochloric acid* and add 1.7 mL of *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 3.0 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (4 µm) (Merck Superspher 100-RP-18e is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 0.6 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 214 nm.

(f) Inject 5 µL of each solution.

MOBILE PHASE

Mobile phase A Dissolve 18.4 g of *sodium chloride* in 250 mL of buffer solution prepared as described below; add 250 mL of *acetonitrile R1* and mix; dilute to 1000 mL with *water*.

To prepare the buffer solution, dissolve 20.7 g of *anhydrous sodium dihydrogen phosphate* in 900 mL of *water*, adjust to pH 2.5 with *orthophosphoric acid* and dilute to 1000 mL with *water*.

Mobile phase B Dissolve 3.2 g of *sodium chloride* in 250 mL of the buffer solution prepared as described above; add 650 mL of *acetonitrile R1* and mix; dilute to 1000 mL with *water for chromatography*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-20	96→83	4→17	linear gradient
20-30	83→63	17→37	linear gradient
30-40	63→96	37→4	linear gradient
40-48	96	4	re-equilibration

When the chromatograms are recorded under the prescribed conditions the relative retention time of insulin glargine is about 20 minutes.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *peak-to-valley ratio* is at least 2, where H_p = height above the baseline due to 0^A-Arg-insulin glargine and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to insulin glargine.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 0.5% by *normalisation*;

the sum of the areas of all *secondary peaks* is not greater than 2.0% by *normalisation*.

Total zinc

27 to 33 µg per 100 units of insulin glargine, determined by *atomic absorption spectrometry*, Appendix II D, Method I.

Test solution Dilute, if necessary, to a suitable concentration of zinc (for example 0.2 µg to 0.6 µg of Zn per mL) with 0.01M *hydrochloric acid*.

Reference solutions Use solutions containing a suitable range of concentrations, for example 0.20 µg, 0.40 µg and 0.60 µg of Zn per mL, freshly prepared by diluting *zinc standard solution (10 ppm Zn)* with 0.01M *hydrochloric acid*.

www.webofpharma.com

Measure the *absorbance* at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 litres of air and 2 litres of acetylene per minute).

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is less than 80 IU of endoxtoxin per 100 units of insulin glargine.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Store the solutions at a temperature of 2° to 8°.

(1) Dilute the injection, if necessary, with sufficient *water* to produce a solution containing 0.15% w/v of Insulin Glargine.

(2) Dissolve the contents of a vial of *insulin glargine EPCRS* in 1.5 mL of 0.01M *hydrochloric acid* and dilute to 10.0 mL with *water*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related proteins may be used.

DETERMINATION OF CONTENT

Calculate the content of insulin glargine, $C_{267}H_{404}N_{72}O_{78}S_6$, in the injection from the chromatograms obtained and the declared content of $C_{267}H_{404}N_{72}O_{78}S_6$[1] in *insulin glargine EPCRS*.

LABELLING
The label states the potency in units per mL.

[1] *100 IU are equivalent to 3.64 mg of insulin glargine.*

Insulin Lispro Injection

Action and use
Hormone; treatment of diabetes mellitus.

DEFINITION
Insulin Lispro Injection is a sterile, aqueous solution of Insulin Lispro.

The injection complies with the requirements stated under Insulin Preparations, with the exception of the test for Insulin in the supernatant, and with the modifications described below.

Content of insulin lispro, $C_{257}H_{383}N_{65}O_{77}S_6$
90.0 to 105.0% of the stated amount.

CHARACTERISTICS
A clear and colourless solution, free from turbidity and foreign matter.

IDENTIFICATION
In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Impurities with molecular masses greater than that of insulin lispro
The sum of the areas of the peaks in the chromatogram obtained with the test solution with a retention time less than that of the principal peak is not more than 1.5% of the total area of the peaks. Disregard any peak with a retention time greater than that of the peak due to insulin lispro monomer.

Related proteins
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute, if necessary, the preparation being examined with 0.01M *hydrochloric acid* to produce a solution containing 0.35% w/v of Insulin Lispro. Add 4 µL of 6M *hydrochloric acid* per mL of this solution. Maintain the solution at 2° to 8° and use within 56 hours.

(2) Prepare a 0.35% w/v solution of Insulin Lispro in 0.01M *hydrochloric acid* and add 4 µL of 6M *hydrochloric acid* per mL. Allow to stand at room temperature to obtain a solution containing between 0.8% and 11% of A21 desamido insulin lispro.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (25 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) with a pore size of 30 nm (Vydac Protein and Peptide C18 is suitable).

(b) Gradient system using the mobile phases described below.

(c) Flow rate of 1 mL per minute.

(d) Column temperature of 40°.

(e) Detection wavelength of 214 nm.

(f) Injection volume of 20 µL for each solution.

MOBILE PHASE

Mobile phase A Mix 82 volumes of a 2.84% w/v solution of *anhydrous sodium sulfate* adjusted to pH 2.3 with *orthophosphoric acid* and 18 volumes of *acetonitrile for chromatography*.

Mobile phase B Mix equal volumes of a 2.84% w/v solution of *anhydrous sodium sulfate*, adjusted to pH 2.3 with *orthophosphoric acid*, and *acetonitrile for chromatography*.

Use the following gradient.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comments
0-60	81	19	Isocratic
60-83	81 → 51	19 → 49	Linear gradient
83-84	51 → 81	49 → 19	Linear gradient
84-94	81	19	Re-equilibration

SYSTEM SUITABILITY

Adjust the mobile phase composition to obtain a retention time of about 41 minutes for insulin lispro; A21 desamido insulin lispro elutes near the start of the gradient elution. The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the first peak (insulin lispro) and the second peak (A21 desamido insulin lispro) is at least 1.5 and the *symmetry factor* for the peak due to insulin lispro is less than 2.0.

LIMITS

In the chromatogram obtained with solution (1), the amount of A21 desamido insulin lispro is not more than 1.5%, and that of any other impurity is not greater than 0.5% by *normalisation*. The total amount of related proteins (excluding A21) is not greater than 4.0%.

Total zinc
14 to 35 µg per 100 units of insulin lispro, determined by *atomic absorption spectrometry*, Appendix II D, Method I.

Test solution Shake the preparation gently and dilute a volume containing 200 units of insulin lispro to 25.0 mL with 0.01M *hydrochloric acid*. Dilute if necessary to a suitable concentration of zinc (for example 0.4 µg to 1.6 µg of Zn per mL) with 0.01M *hydrochloric acid*.

www.webofpharma.com

Reference solutions Use solutions containing a suitable range of concentrations, for example 0.40 µg, 0.80 µg, 1.00 µg, 1.20 µg and 1.60 µg of Zn per mL, freshly prepared by diluting *zinc standard solution (5 mg per mL Zn)* with 0.01M *hydrochloric acid.*

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame of suitable composition (for example 11 litres of air and 2 litres of acetylene per minute).

Bacterial endotoxins
Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is less than 80 IU of endotoxin per 100 units of insulin lispro.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute, if necessary, the preparation being examined with 0.01M *hydrochloric acid* to obtain a 0.08% w/v solution. Add 4 µL of 6M *hydrochloric acid* per mL of this solution. Maintain the solution at 2 to 8° and use within 48 hours.

(2) Dissolve the contents of a vial of *insulin lispro EPCRS* in 0.01M *hydrochloric acid* to obtain a 0.08% w/v solution. Maintain the solution at 2° to 8° and use within 48 hours.

(3) Prepare a 0.1% w/v solution of the preparation being examined in 0.01M *hydrochloric acid* and add 4 µL of 6M *hydrochloric acid* per mL. Allow to stand at room temperature to obtain a solution containing between 0.8% and 11% of A21 desamido insulin lispro. Maintain the solution at 2° to 8° and use within 14 days.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (10 cm x 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Spherisorb ODS 2 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 0.8 mL per minute.

(d) Column temperature of 40°.

(e) Detection wavelength of 214 nm.

(f) Injection volume of 20 µL for each solution.

MOBILE PHASE

Mix 255 volumes of *acetonitrile for chromatography* and 745 volumes of a 2.84% w/v solution of *anhydrous sodium sulfate* adjusted to pH 2.3 with *orthophosphoric acid.*

SYSTEM SUITABILITY

When the chromatograms are recorded in the prescribed conditions, the retention time of insulin lispro is approximately 24 minutes. The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the first peak (insulin lispro) and the second peak (A21 desamido insulin lispro), is greater than 1.8, and the maximum relative standard deviation for replicate injections is 1.1% after 3 injections.

DETERMINATION OF CONTENT

Calculate the content of insulin lispro $C_{257}H_{383}N_{65}O_{77}S_6$ from the chromatograms obtained and the declared content of $C_{257}H_{383}N_{65}O_{77}S_6$[1] in *insulin lispro EPCRS.*

LABELLING
The label states the potency in units per mL.

[1] *100 IU are equivalent to 3.47 mg of insulin lispro.*

Protamine Zinc Insulin Injection

Protamine Zinc Insulin

Action and use
Antidote to heparin.

DEFINITION
Protamine Zinc Insulin Injection is a sterile buffered suspension of bovine, porcine or human insulin complexed with Protamine Sulfate or another suitable protamine and Zinc Chloride or another suitable zinc salt.

The injection complies with the requirements stated under Insulin Preparations and with the following requirements.

PRODUCTION
Protamine Zinc Insulin Injection is prepared by carrying out the procedures described under Insulin Preparations.
A suitable protamine is added in the proportion of 1.0 to 1.7 mg of protamine sulfate per 100 IU of insulin.

DESCRIPTION
A white suspension which on standing deposits a white sediment and leaves a colourless or almost colourless supernatant liquid; the sediment is readily resuspended by shaking. When examined under a microscope, approximately 50% of the particles are seen to have no uniform shape, with a maximum diameter rarely exceeding 2 µm. The remaining particles are seen to be rod-shaped crystals, the majority with a maximum dimension greater than 10 µm but rarely exceeding 100 µm.

IDENTIFICATION
In the Assay the position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the appropriate reference solution.

Total zinc
20 to 25 mg per 100 IU of insulin, determined as described under Insulin Preparations.

Insulin Zinc Suspension

Insulin Zinc Suspension, Mixed

(Insulin Zinc Injectable Suspension, Ph Eur monograph 0837)

Action and use
Hormone; treatment of diabetes mellitus.

Ph Eur

Insulin zinc injectable suspension (crystalline) complies with the monograph on insulin preparations, injectable (0854) with amendments prescribed below.

DEFINITION
Insulin zinc injectable suspension is a sterile neutral suspension of bovine insulin and/or porcine insulin or of human insulin with a suitable zinc salt; the insulin is in a form which is practically insoluble in water.

PRODUCTION
Insulin zinc injectable suspension is prepared by carrying out the procedures described in the monograph on *Insulin preparations, injectable (0854).*

Insulin zinc injectable suspension is produced by mixing insulin zinc injectable suspension (crystalline) and insulin zinc injectable suspension (amorphous) in a ratio of 7 to 3.

www.webofpharma.com

CHARACTERS
A white or almost white suspension which on standing deposits a white or almost white sediment and leaves a colourless or almost colourless supernatant; the sediment is readily resuspended by gently shaking. When examined under a microscope, the majority of the particles are seen to be rhombohedral crystals with a maximum dimension when measured from corner to corner through the crystal greater than 10 µm but rarely exceeding 40 µm; a considerable proportion of the particles are seen to have no uniform shape and a maximum dimension rarely exceeding 2 µm.

IDENTIFICATION
Examine the chromatograms obtained in the Assay.

For preparations made from a single species of insulin (bovine, porcine or human), the position of the peak due to insulin in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the appropriate reference solution. For preparations made from a mixture of bovine and porcine insulin, the positions of the peaks due to the two insulins in the chromatogram obtained with the test solution correspond to those of the principal peaks in the chromatogram obtained with the appropriate reference solution.

TESTS
Insulin not extractable with buffered acetone solution
63 per cent to 77 per cent of the total insulin content. Centrifuge a volume of the substance to be examined containing 200 IU of insulin and discard the supernatant. Suspend the residue in 1.65 mL of *water R*, add 3.3 mL of *buffered acetone solution R*, stir for 3 min, again centrifuge, discard the supernatant and repeat all the operations with the residue. Dissolve the residue using a suitable procedure, for example dissolve in *0.1 M hydrochloric acid* to give a final volume of 2.0 mL. Determine the insulin content of the residue (R) and determine the total insulin content (T) of an equal volume of the suspension by a suitable method. Calculate the percentage of insulin not extractable with buffered acetone solution from the expression:

$$\frac{100R}{T}$$

Total zinc
0.12 mg to 0.25 mg per 100 IU of insulin, determined as described in the monograph on *Insulin preparations, injectable (0854)*.

Zinc in solution
20 per cent to 65 per cent of the total zinc is in the form of zinc in solution. Determine by the method described in the monograph on *Insulin preparations, injectable (0854)*.

Ph Eur

Insulin Zinc Suspension (Amorphous)

(Insulin Zinc Injectable Suspension (Amorphous), Ph Eur monograph 0835)

Action and use
Hormone; treatment of diabetes mellitus.

Ph Eur

Ph Eur

Interferon Alfa-2a Injection

Action and use
Cytokine.

DEFINITION
Interferon Alfa-2a Injection is a dilution of Interferon Alfa-2a Concentrated Solution in a suitable liquid. It is supplied as a ready-to-use solution.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Potency
The estimated potency is not less than 80% and not more than 125% of the stated potency.

CHARACTERISTICS
A clear, colourless or slightly yellowish solution virtually free from particles.

IDENTIFICATION
A. It gives the appropriate response when examined using the conditions under the Assay.

B. In the test for Related proteins, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

C. In the test for Impurities of molecular weights differing from that of Interferon Alfa-2a, the principal band in the gel obtained with solution (1) corresponds to that in the gel obtained with solution (3).

TESTS

Acidity
pH 4.7 to 5.3, Appendix V L.

Impurities of molecular weights differing from that of Interferon Alfa-2a
Carry out the method for *polyacrylamide gel electrophoresis*, Appendix III F, under reducing and non-reducing conditions, using slab gels 1.0 mm thick and 14% *acrylamide* as the resolving gel.

For the test under non-reducing conditions, the sample buffer consists of equal volumes of *water* and *SDS PAGE sample buffer (concentrated)*. For the test under reducing conditions, the sample buffer consists of equal volumes of *water* and *SDS PAGE sample buffer solution for reducing conditions (concentrated)* containing *2-mercaptoethanol* as the reducing agent.

For solution (1) dilute, if necessary, the injection being examined in sample buffer to a concentration of 5.5 MIU of interferon alfa-2a per mL. For solution (2) dilute 0.20 mL of solution (1) to 1 mL with sample buffer. For solution (3) prepare a 25 µg per mL solution of the *interferon alfa-2a EPCRS* in sample buffer. For solution (4) dilute 0.2 mL of solution (3) to 1 mL with sample buffer. For solution (5) dilute 0.2 mL of solution (4) to 1 mL with sample buffer. For solution (6) dilute 0.2 mL of solution (5) to 1 mL with sample buffer. For solution (7) dilute 0.4 mL of solution (6) to 1 mL with sample buffer. Solution (8) is a solution of molecular weight markers suitable for calibrating SDS-polyacrylamide gels in the range of 15 kDa to 67 kDa.

Place solutions (1) to (8), contained in covered test-tubes, on a water-bath for 2 minutes prior to application. Apply 10 µL of solution (8) and 50 µL of each of the other solutions to the stacking gel wells. Perform the electrophoresis under the conditions recommended by the manufacturer of the equipment. Proteins in the gel are visualised by silver staining.

The test is not valid unless:

there is compliance with the validation criteria for solution (8);

a band is seen in the electrophoretogram obtained with solution (7);

a gradation of intensity of staining is seen in the electrophoretograms obtained, respectively, with solutions (1) and (2) and with solutions (3) to (7).

The electrophoretogram obtained with solution (1) under reducing conditions may show, in addition to the principal band, less intense bands with molecular weights lower than the principal band. No such band is more intense than the principal band in the electrophoretogram obtained with solution (6) (1%) and not more than three such bands are more intense than the principal band in the electrophoretogram obtained with solution (7) (0.4%).

The electrophoretogram obtained with solution (1) under non-reducing conditions may show, in addition to the principal band, less intense bands with molecular weights higher than the principal band. No such band is more intense than the principal band in the electrophoretogram obtained with solution (6) (1%) and not more than three such bands are more intense than the principal band in the electrophoretogram obtained with solution (7) (0.4%).

Related proteins
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions and the

www.webofpharma.com

normalisation procedure. Store the solutions for not longer than 24 hours at a temperature of 2° to 8°.

(1) Dilute the injection, if necessary, with *water* to give a solution containing 5.5 MIU of interferon alfa-2a per mL.

(2) Add a suitable volume of 0.25% w/w *hydrogen peroxide solution* to a volume of the solution (1) to give a final hydrogen peroxide concentration of 0.005% w/w and allow to stand at room temperature for 1 hour or for the length of time that will generate about 5% oxidised interferon. Add 12.5 mg of L-*methionine* per mL of solution. Allow to stand at room temperature for 1 hour.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Bakerbond C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

(f) Inject 100 µL of each solution.

MOBILE PHASE

Mobile phase A 0.2 volumes of *trifluoroacetic acid*, 30 volumes of *acetonitrile* and 70 volumes of *water*.

Mobile phase B 0.2 volumes of *trifluoroacetic acid*, 20 volumes of *water* and 80 volumes of *acetonitrile*.

Equilibrate the column with the mobile phases in the initial gradient ratio for at least 15 minutes.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-1	72	28	isocratic
1-5	72→67	28→33	linear gradient
5-20	67→63	33→37	linear gradient
20-30	63→57	37→43	linear gradient
30-40	57→40	43→60	linear gradient
40-42	40	60	isocratic
42-50	40→72	60→28	linear gradient
50-60	72	28	re-equilibration

When the chromatograms are recorded using the prescribed conditions the retention time of the peak due to interferon alfa-2a is about 20 minutes. The relative retention times with reference to Interferon Alfa-2a are: impurity A (oxidised interferon alfa-2a), about 0.7; impurity B (*N*-acetyl interferon), about 1.1; impurity C (interferon with broken disulfide bridge), about 1.3.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *resolution factor* between the peaks corresponding to oxidised interferon (impurity A) and interferon is at least 1.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than 5.0%;

the area of any peak corresponding to impurity B is not greater than 3.0%;

the sum of the areas of any other *secondary peaks* is not greater than 5.0%;

the sum of the areas of any *secondary peaks* is not greater than 12.0%.

Disregard any peak with a retention time less than 0.7 times, or greater than 1.4 times, of that of the principal peak in the chromatogram obtained with solution (2).

Bacterial endotoxins

Carry out the *test for Bacterial endotoxins*, Appendix XIV C. The endotoxin limit is not more than 2 IU in a volume containing 1 MIU of interferon alfa-2a.

ASSAY

The potency of interferon alfa-2a is calculated by comparing its effect to protect cells against a viral cytopathic effect with the same effect of the appropriate International Standard of human recombinant interferon alfa-2a or of a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the appropriate International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organization.

Carry out the assay by a suitable method, based on the following design.

Use, in standard culture conditions, an established cell line sensitive to the cytopathic effect of a suitable virus (a human diploid fibroblast cell line, free of microbial contamination, responsive to interferon and sensitive to encephalomyocarditis virus, is suitable).

The following cell cultures and virus have shown to be suitable: MDBK cells (ATCC No. CCL22), or Mouse L cells (NCTC clone 929; ATCC No. CCL 1) as the cell culture and vesicular stomatitis virus VSV, Indiana strain (ATCC No. VR-158) as the infective agent; or human diploid fibroblast FS-71 cells responsive to interferon as the cell culture, and encephalomyocarditis virus (ATCC No. VR-129B) as the infective agent.

Incubate in at least four series, cells with three or more different concentrations of the preparation being examined and the reference preparation in a microtitre plate and include in each series appropriate controls of untreated cells. Choose the concentrations of the preparations such that the lowest concentration produces some protection and the largest concentration produces less than maximal protection against the viral cytopathic effect. Add at a suitable time the cytopathic virus to all wells with the exception of a sufficient number of wells in all series, which are left with uninfected control cells. Determine the cytopathic effect of virus quantitatively with a suitable method. Calculate the potency of the preparation being examined by the standard statistical methods for a parallel line assay.

The fiducial limits of error are not less than 64% and not more than 156% of the stated potency.

STORAGE

Interferon Alfa-2a Injection should be stored at a temperature of 2° to 8°. It should not be allowed to freeze.

LABELLING

The label of the sealed container states the number of MIU (Million Units) contained in it.

www.webofpharma.com

Aqueous Iodine Oral Solution

DEFINITION

Iodine	50 g
Potassium Iodide	100 g
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 mL

Extemporaneous preparation
The following directions apply.

Dissolve the Potassium Iodide and the Iodine in 100 mL of the Purified Water and add sufficient of the Purified Water to produce 1000 mL.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of iodine, I
4.75 to 5.25% w/v.

Content of potassium iodide, KI
9.5 to 10.5% w/v.

ASSAY
Dilute 25 mL to 100 mL with *water*.

For iodine
To 20 mL of the diluted solution add 10 mL of *water* and titrate with 0.1M *sodium thiosulfate VS*. Each mL of 0.1M *sodium thiosulfate VS* is equivalent to 12.69 mg of I.

For potassium iodide
To 10 mL of the diluted solution add 20 mL of *water* and 40 mL of *hydrochloric acid* and titrate with 0.05M *potassium iodate VS* until the dark brown solution which is produced becomes pale brown. Add 1 mL of *amaranth solution* and continue the titration until the red colour just changes to pale yellow. From the number of mL of 0.05M *potassium iodate VS* required subtract one quarter of the number of mL of 0.1M *sodium thiosulfate VS* required in the Assay for iodine. Each mL of the remainder is equivalent to 16.60 mg of KI.

STORAGE
Aqueous Iodine Oral Solution should be kept in a well-closed container, the materials of which are resistant to iodine.

Aqueous Iodine Oral Solution contains in 1 mL 50 mg of Iodine and about 130 mg of total iodine, free and combined.

Aqueous Iodine Oral Solution is intended to be diluted before use.

When aqueous iodine solution is prescribed or demanded, Aqueous Iodine Oral Solution shall be dispensed or supplied.

Alcoholic Iodine Solution

Alcoholic Iodine Cutaneous Solution

DEFINITION
Alcoholic Iodine Solution is a *cutaneous solution*.

Iodine	25 g
Potassium Iodide	25 g
Purified Water	25 mL
Ethanol (90 per cent)	Sufficient to produce 1000 mL

Extemporaneous preparation
The following directions apply.

Dissolve the Potassium Iodide and the Iodine in the Purified Water and add sufficient Ethanol (90 per cent) to produce 1000 mL.

The solution complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of iodine, I
2.4 to 2.7% w/v.

Content of potassium iodide, KI
2.4 to 2.7% w/v.

Ethanol content
83 to 88% v/v, Appendix VIII F.

ASSAY
For iodine
Dilute 10 mL with 20 mL of *water* and titrate with 0.1M *sodium thiosulfate VS*. Each mL of 0.1M *sodium thiosulfate VS* is equivalent to 12.69 mg of I.

For potassium iodide
To 10 mL add 30 mL of *water* and 50 mL of *hydrochloric acid* and titrate with 0.05M *potassium iodate VS* until the dark brown solution which is produced becomes pale brown. Add 1 mL of *amaranth solution* and continue the titration until the red colour just changes to pale yellow. From the number of mL of 0.05M *potassium iodate VS* required subtract half the number of mL of 0.1M *sodium thiosulfate VS* required in the Assay for iodine. Each mL of the remainder is equivalent to 16.60 mg of KI.

STORAGE
Alcoholic Iodine Solution should be kept in a well-closed container, the materials of which are resistant to iodine.

When iodine tincture is prescribed or demanded Alcoholic Iodine Solution shall be dispensed or supplied.

Iodised Oil Fluid Injection

Action and use
Radio-opaque injection.

DEFINITION
Iodised Oil Fluid Injection is a sterile iodine addition product of the ethyl esters of the fatty acids obtained from poppy-seed oil.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of combined iodine
37.0 to 39.0% w/w.

CHARACTERISTICS
A straw-coloured or yellow, oily liquid.

Practically insoluble in *water*; soluble in *chloroform*, in *ether* and in *petroleum spirit (boiling range, 40° to 60°)*.

IDENTIFICATION
Boil 0.05 mL with 2 mL of *glacial acetic acid* and 0.1 g of *zinc powder* for 2 minutes, add 5 mL of *water*, shake, decant from any undissolved zinc and add 1 mL of *hydrogen peroxide solution (20 vol)*. Iodine vapour is evolved.

TESTS
Acidity
To 5 mL of *chloroform* add 5 mL of *ethanol (96%)* previously neutralised to *phenolphthalein solution R1* with 0.1M *ethanolic sodium hydroxide VS*, add 5 g of the injection, shake and titrate with 0.1M *ethanolic sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Not more than 1.0 mL is required to change the colour of the solution.

www.webofpharma.com

Weight per mL
1.28 to 1.30 g, Appendix V G.

Free iodine
Shake 1 g with 1 mL of *starch mucilage* and 1 mL of *cadmium iodide solution*. Any blue colour disappears on the addition of 0.4 mL of 0.01M *sodium thiosulfate*.

ASSAY
Boil 1 g with 10 mL of *glacial acetic acid* and 1 g of *zinc powder* under a reflux condenser for 1 hour. Add through the condenser 30 mL of hot *water*, filter through absorbent cotton, wash the flask with two 20 mL quantities of hot *water* and pass the washings through the filter. Cool the filtrate, add 25 mL of *hydrochloric acid* and 8 mL of *potassium cyanide solution* and titrate with 0.05M *potassium iodate VS* until the dark brown solution which is produced becomes light brown; add 5 mL of *starch mucilage* and continue the titration until the blue colour disappears. Each mL of 0.05M *potassium iodate VS* is equivalent to 12.69 mg of combined iodine.

STORAGE
Iodised Oil Fluid Injection should be kept in an atmosphere of carbon dioxide or nitrogen and protected from light.

Iofendylate Injection

Action and use
Iodinated contrast medium.

DEFINITION
Iofendylate Injection is a sterile mixture of stereoisomers of ethyl 10-(4-iodophenyl)undecanoate ($C_{19}H_{29}IO_2$).
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of iofendylate, $C_{19}H_{29}IO_2$
98.0 to 101.0% w/w.

CHARACTERISTICS
Almost colourless to pale yellow, viscous liquid.
Very slightly soluble in *water*; freely soluble in *ethanol (96%)*; miscible with *chloroform* and with *ether*.

IDENTIFICATION
A. When heated with *sulfuric acid*, violet vapours of iodine are evolved.
B. To 1 mL add 15 mL of *water* and 7 g of *potassium dichromate*, cool and carefully add 10 mL of *sulfuric acid*. Allow to stand until the reaction ceases, heat under a reflux condenser for 2 hours, cool, pour into 25 mL of *water* and filter. Wash the residue with a little *water*, recrystallise from 10 mL of aqueous ethanol and sublime the crystals. The *melting point* of the sublimate is about 270°, Appendix V A.

TESTS
Acid value
Not more than 1.5, Appendix X B.

Refractive index
1.525 to 1.527, Appendix V E.

Saponification value
132 to 142, Appendix X G. Use 1 g.

Weight per mL
1.245 to 1.260 g, Appendix V G.

Aliphatic iodine
Mix 0.5 g with 10 mL of 1M *ethanolic potassium hydroxide* and boil vigorously under a reflux condenser in a water bath for 1 hour. Add 40 mL of *water* and 15 mL of *hydrochloric acid*, cool, filter and wash the residue with 10 mL of *water*. To the combined filtrate and washings add 10 mL of *potassium cyanide solution*, 5 mL of *starch mucilage* and 0.2 mL of 0.05M *potassium iodate*. A blue colour is not produced.

Free iodine
Absorbance of a 4-cm layer at 485 nm, not more than 0.20, Appendix II B.

ASSAY
Carry out the method for *oxygen-flask combustion for iodine*, Appendix VIII C, using 20 mg absorbed on filter paper surrounded by greaseproof paper. Each mL of 0.02M *sodium thiosulfate VS* is equivalent to 1.388 mg of $C_{19}H_{29}IO_2$.

STORAGE
Iophendylate Injection should be protected from light.

Iopamidol Injection

Action and use
Iodinated contrast medium.

DEFINITION
Iopamidol Injection is a solution of Iopamidol in Water for Injections with or without excipients.
The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of iopamidol, $C_{17}H_{22}I_3N_3O_8$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Dry 1 mL of the injection over *phosphorus pentoxide* at a pressure of 2 kPa for 16 hours. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of iopamidol (*RS 441*).
B. In the test for Related substances, the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (5).

TESTS
Acidity or alkalinity
pH, 6.5 to 7.5, Appendix V L.

Light absorption
The *light absorption* of a 4-cm layer of the injection, Appendix II B at 450 nm is not more than 0.120.

Free aromatic amines
The following solutions and reagents are stored in ice-water and protected from bright light.
Mix a volume of the injection containing 0.5 g of Iopamidol with *water* and add sufficient *water* to produce 20 mL. Place the solution in ice-water, protected from light, for 5 minutes. Add 1.0 mL of *hydrochloric acid*, mix and allow to stand for 5 minutes. Add 1.0 mL of a 2% w/v solution of *sodium nitrite* prepared immediately before use, mix and allow to stand for 5 minutes. Add 1.0 mL of a 12% w/v solution of *ammonium sulfamate*, swirl gently until gas liberation has ceased and allow to stand for 5 minutes. Add 1.0 mL of a freshly prepared 0.1% w/v solution of *naphthylethylenediamine dihydrochloride* and mix. Remove from the ice-water and allow to stand for 10 minutes. Add sufficient *water* to produce 25 mL and mix. Immediately measure the *absorbance* at 500 nm, Appendix II B, using in the reference cell a solution prepared by treating 20 mL of *water* in the same manner.

www.webofpharma.com

The *absorbance* is not greater than that obtained by treating 20 mL of a 0.00125% w/v solution of *iopamidol impurity A EPCRS* in *water* in the same manner and beginning at the words "Place the solution...".(500 ppm).

Free iodine

Mix a volume of the injection containing 2.0 g of Iopamidol with *water* and add sufficient *water* to produce 25 mL. Add 5 mL of *toluene* and 5 mL of *dilute sulfuric acid*, shake and centrifuge. Any red colour in the upper phase is not more intense than that of the upper phase obtained in the same manner from a mixture of 22 mL of *water*, 2 mL of *iodide standard solution (10 ppm I)*, 5 mL of *dilute sulfuric acid*, 1 mL of *hydrogen peroxide solution (100 vol)* and 5 mL of *toluene* (10 ppm).

Iodide

To 10 mL of the injection add sufficient *water* to produce 50 mL. Add 2.0 mL of 0.001M *potassium iodide*. Carry out the method for *potentiometric titration*, Appendix VIII B, using 0.001M *silver nitrate VS*, a silver indicator electrode and an appropriate reference electrode. Subtract the volume of titrant corresponding to the 2.0 mL of 0.001M *potassium iodide*, determined by titrating a blank to which is added 2.0 mL of 0.001M *potassium iodide*, and use the residual value to calculate the iodide content.

1 mL of 0.001M *silver nitrate VS* is equivalent to 126.9 µg of iodide.

Not more than 2.0 mL of 0.001M *silver nitrate VS* is required (40 ppm).

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a volume of the injection containing 0.5 g of Iopamidol with *water* and add sufficient *water* to produce 50 mL.

(2) 0.005% w/v of *iopamidol impurity H EPCRS* in *water*.

(3) Dilute 1 volume of solution (1) to 500 volumes with *water*.

(4) To 200 volumes of solution (2) add 1 volume of solution (1) and add sufficient *water* to produce 500 volumes.

(5) 1.0% w/v of *iopamidol EPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use two stainless steel columns (25 cm × 4.6 mm) coupled in series and packed with *phenylsilyl silica gel for chromatography* (5 µm) (Zorbax SB-Phenyl 80 Å is suitable).

(b) Use gradient elution and the mobile phase program described below.

(c) Use a flow rate of 2.0 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

The retention time of iopamidol is about 15 minutes and the retention time of the peak due to impurity H is about 13 minutes. Impurity H and impurity I have identical retention times.

MOBILE PHASE

Mobile phase A *water*.

Mobile phase B Equal volumes of *acetonitrile* and *water*.

Equilibrate the column for at least 20 minutes with mobile phase A.

Time (Minutes)	Mobile phase A (%v/v)	Mobile phase B (%v/v)	Comment
0-18	100	0	isocratic
18-40	100→62	0→38	linear gradient
40-45	62→50	38→50	linear gradient
45-50	50→100	50→0	linear gradient
50-60	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to iopamidol and iopamidol impurity H is at least 2.0. If necessary, adjust the composition of the mobile phase or the time programme of the gradient.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity H or impurity I is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (3) (0.5%);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (3) (0.1%);

the sum of the areas of any *secondary peaks* other than impurites H and I is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (3) (0.05%).

Sterility

Complies with the *test for sterility*, Appendix XVI A.

Bacterial endotoxins

The endotoxin limit concentration is 0.7 IU per mL, Appendix XIV C.

ASSAY

Mix a volume of the injection containing 0.220 g of Iopamidol with *water* and add sufficient *water* to produce 20 mL. Add 5 mL of *strong sodium hydroxide solution*, 1 g of *zinc powder* and a few glass beads. Boil under a reflux condenser for 30 minutes. Allow to cool and rinse the condenser with 20 mL of *water*, adding the rinsings to the flask. Filter through a sintered-glass filter and wash the filter with several quantities of *water*. Collect the filtrate and washings. Add 5 mL of *glacial acetic acid* and titrate immediately with 0.1M *silver nitrate VS*. Carry out the method for *potentiometric titration*, Appendix VIII B, using a suitable electrode system such as silver-silver chloride.

Each mL of 0.1M *silver nitrate VS* is equivalent to 25.90 mg of $C_{17}H_{22}I_3N_3O_8$.

STORAGE

Iopamidol Injection should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of Iopamidol and as the equivalent amount of iodine.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Iopamidol.

www.webofpharma.com

Iopamidol Oral Solution

Action and use
Iodinated contrast medium.

DEFINITION
Iopamidol Oral Solution is a solution of Iopamidol in a suitable aqueous vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of iopamidol, $C_{17}H_{22}I_3N_3O_8$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Dry 1 mL of the oral solution over *phosphorus pentoxide* at a pressure of 2 kPa for 16 hours. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of iopamidol (*RS 441*).

B. In the test for Related substances, the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (5).

TESTS
Acidity
pH, 4.0 to 5.5, Appendix V L.

Free aromatic amines
The following solutions and reagents are stored in ice-water and protected from bright light.

Mix a volume of the oral solution containing 0.5 g of Iopamidol with *water* and add sufficient *water* to produce 20 mL. Place the solution in ice-water, protected from light, for 5 minutes. Add 1.0 mL of *hydrochloric acid*, mix and allow to stand for 5 minutes. Add 1.0 mL of a 2% w/v solution of *sodium nitrite* prepared immediately before use, mix and allow to stand for 5 minutes. Add 1.0 mL of a 12% w/v solution of *ammonium sulfamate*, swirl gently until gas liberation has ceased and allow to stand for 5 minutes. Add 1.0 mL of a freshly prepared 0.1% w/v solution of *naphthylethylenediamine dihydrochloride* and mix. Remove from the ice-water and allow to stand for 10 minutes.
Add sufficient *water* to produce 25 mL and mix. Immediately measure the *absorbance* at 500 nm, Appendix II B, using in the reference cell a solution prepared by treating 20 mL of *water* in the same manner.

The *absorbance* is not greater than that obtained by treating 20 mL of a 0.00125% w/v solution of *iopamidol impurity A EPCRS* in *water* in the same manner and beginning at the words "Place the solution...".(500 ppm).

Free iodine
Mix a volume of the oral solution containing 2.0 g of Iopamidol with *water* and add sufficient *water* to produce 25 mL. Add 5 mL of *toluene* and 5 mL of *dilute sulfuric acid*. Shake and centrifuge. Any red colour in the upper phase is not more intense than that of the upper phase obtained in the same manner from a mixture of 22 mL of *water*, 2 mL of *iodide standard solution (10 ppm I)*, 5 mL of *dilute sulfuric acid*, 1 mL of *hydrogen peroxide solution (100 vol)* and 5 mL of *toluene* (10 ppm).

Iodide
Mix a volume of the oral solution containing 6.0 g of Iopamidol with *water* and add sufficient *water* to produce 20 mL. Add 2.0 mL of 0.001M *potassium iodide*. Carry out the method for *potentiometric titration*, Appendix VIII B, using 0.001M *silver nitrate VS*, a silver indicator electrode and an appropriate reference electrode. Subtract the volume of titrant corresponding to the 2.0 mL of 0.001M *potassium iodide*, determined by titrating a blank to which is added 2.0 mL of 0.001M *potassium iodide* and use the residual value to calculate the iodide content.

Not more than 2.0 mL of 0.001M *silver nitrate VS* is required (65 ppm).

Each mL of 0.001M *silver nitrate VS* is equivalent to 126.9 µg of iodide.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a volume of the oral solution containing 0.5 g of Iopamidol with *water* and add sufficient *water* to produce 50 mL.

(2) 0.005% w/v of *iopamidol impurity H EPCRS* in *water*.

(3) Dilute 1 volume of solution (1) to 500 volumes with *water*.

(4) To 200 volumes of solution (2) add 1 volume of solution (1) and add sufficient *water* to produce 500 volumes.

(5) 1.0% w/v of *iopamidol EPCRS* in *water*.

CHROMATOGRAPHIC CONDITIONS

(a) Use two stainless steel columns (25 cm × 4.6 mm) coupled in series and packed with *phenylsilyl silica gel for chromatography* (5 µm) (Zorbax SB-Phenyl 80 Å is suitable).

(b) Use gradient elution and the mobile phases described below.

(c) Use a flow rate of 2.0 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

The retention time of iopamidol is about 15 minutes and the retention time of the peak due to impurity H is about 13 minutes. Impurity H and impurity I have identical retention times.

MOBILE PHASE

Mobile phase A *water*.

Mobile phase B Equal volumes of *acetonitrile* and *water*.

Equilibrate the column for at least 20 minutes with mobile phase A.

Time (Minutes)	Mobile phase A (%v/v)	Mobile phase B (%v/v)	Comment
0-18	100	0	isocratic
18-40	100→62	0→38	linear gradient
40-45	62→50	38→50	linear gradient
45-50	50→100	50→0	linear gradient
50-60	100	0	re-equilibration

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to iopamidol and iopamidol impurity H is at least 2.0. If necessary, adjust the composition of the mobile phase or the time programme of the gradient.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity H or impurity I is not greater than 2.5 times the area of the

www.webofpharma.com

principal peak in the chromatogram obtained with solution (3) (0.5%);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (3) (0.1%);

the sum of the areas of any *secondary peaks* other than impurities H and I is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (3) (0.05%).

ASSAY

Mix a volume of the oral solution containing 0.220 g of Iopamidol with *water* and add sufficient *water* to produce 20 mL. Add 5 mL of *strong sodium hydroxide solution*, 1 g of *zinc powder* and a few glass beads. Boil under a reflux condenser for 30 minutes. Allow to cool and rinse the condenser with 20 mL of *water*, adding the rinsings to the flask. Filter through a sintered-glass filter and wash the filter with several quantities of *water*. Collect the filtrate and washings. Add 5 mL of *glacial acetic acid* and titrate immediately with 0.1M *silver nitrate VS*. Carry out the method for *potentiometric titration*, Appendix VIII B, using a suitable electrode system such as silver-silver chloride.

Each mL of 0.1M *silver nitrate VS* is equivalent to 25.90 mg of $C_{17}H_{22}I_3N_3O_8$.

STORAGE

Iopamidol Oral Solution should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of Iopamidol and as the equivalent amount of iodine.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Iopamidol.

Iopanoic Acid Tablets

Action and use
Iodinated contrast medium.

DEFINITION

Iopanoic Acid Tablets contain Iopanoic Acid.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of iopanoic acid, $C_{11}H_{12}I_3NO_2$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 30 mg of Iopanoic Acid with 10 mL of *ethanol (96%)*, filter, evaporate the filtrate to dryness and dry the residue at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of iopanoic acid *(RS 192)*.

B. Spray the chromatograms obtained in the test for Related substances with a 0.1% w/v solution of *dimethylamino-cinnamaldehyde* in a mixture of 1 volume of *hydrochloric acid* and 99 volumes of *ethanol (96%)*. The principal spot in the chromatogram obtained with solution (2) is similar in position, colour and size to that in the chromatogram obtained with solution (4).

TESTS

Halide
To a quantity of the powdered tablets containing 0.8 g of Iopanoic Acid add just sufficient 0.2M *sodium hydroxide* to dissolve the iopanoic acid, dilute to 10 mL with *water*, add sufficient 2M *nitric acid* dropwise to ensure complete precipitation of the iodinated acid and add 3 mL in excess. Filter (Whatman GF/C filter paper is suitable), wash the precipitate with 5 mL of *water* and combine the solutions. 15 mL of the resulting solution complies with the *limit test for chlorides*, Appendix VII (180 ppm, calculated as chloride).

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel* GF_{254} as the coating substance and a mixture of 10 volumes of 13.5M *ammonia*, 20 volumes of *methanol*, 20 volumes of *toluene* and 50 volumes of *1,4-dioxan* as the mobile phase but allowing the solvent front to ascend 10 cm above the line of application. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) extract a quantity of the powdered tablets containing 1.0 g of Iopanoic Acid with five 10 mL quantities of *ethanol (96%)*, filter, evaporate the combined filtrates to dryness using a rotary evaporator and dissolve the residue in 10 mL of a mixture of 3 volumes of 10M *ammonia* and 97 volumes of *methanol*. For solution (2) dilute 1 volume of solution (1) to 10 volumes with a mixture of 3 volumes of 10M *ammonia* and 97 volumes of *methanol*. For solution (3) dilute 1 volume of solution (1) to 500 volumes with a mixture of 3 volumes of 10M *ammonia* and 97 volumes of *methanol*. Solution (4) contains 1.0% w/v of *iopanoic acid EPCRS* in a mixture of 3 volumes of 10M *ammonia* and 97 volumes of *methanol*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense that the spot in the chromatogram obtained with solution (3) (0.2%).

ASSAY

Weigh and powder 20 tablets. Triturate a quantity of the powder containing 0.4 g of Iopanoic Acid with five 10-mL quantities of *ethanol (96%)*, decanting and filtering each extract through the same filter. Evaporate the combined filtrates almost to dryness on a water bath, cool, add 20 mL of *water*, 12 mL of 5M *sodium hydroxide* and 1 g of *zinc powder* and boil under a reflux condenser for 30 minutes. Cool, rinse the condenser with 30 mL of *water*, filter through absorbent cotton and wash the flask and filter with two 20 mL quantities of *water*. To the combined filtrate and washings add 80 mL of *hydrochloric acid*, cool and titrate with 0.05M *potassium iodate VS* until the dark brown solution becomes light brown. Add 5 mL of *chloroform* and continue the titration, shaking well after each addition, until the chloroform becomes colourless. Each mL of 0.05M *potassium iodate VS* is equivalent to 19.03 mg of $C_{11}H_{12}I_3NO_2$.

STORAGE

Iopanoic Acid Tablets should be protected from light.

www.webofpharma.com

Ipratropium Nebuliser Solution

Action and use
Anticholinergic (antimuscarinic) bronchodilator.

DEFINITION
Ipratropium Nebuliser Solution is a solution of Ipratropium Bromide in Water for Injections and may contain sodium chloride.

The nebuliser solution complies with the requirements stated under Preparations for Inhalation and with the following requirements.

PRODUCTION
The active substance delivery rate and the total active substance delivered are determined using the methods described in Appendix XII C. 8. Preparations for Nebulisation: Characterisation. Where justified and authorised, a different apparatus and procedure may be used.

The particle-size distribution is determined using an apparatus and procedure described in Appendix XII C. 8. Preparations for Nebulisation: Characterisation. Where justified and authorised, a different apparatus and procedure may be used.

Content of ipratropium bromide, $C_{20}H_{30}NO_3Br,H_2O$
95.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Evaporate a volume of the nebuliser solution containing 1.5 mg of Ipratropium Bromide to dryness on a water bath. Shake the residue with 5 mL of *methanol* and filter (Whatman GF/C is suitable). Evaporate the filtrate to dryness on a water bath and dry the residue at room temperature at a pressure of 1 kPa for 15 minutes. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with a spectrum prepared from a mixture of 5 mg of *ipratropium bromide BPCRS* and 45 mg of *sodium chloride* dissolved in the minimum quantity of *water*, evaporated to dryness on a water bath and treated in a similar manner to the substance being examined beginning at the words "Shake the residue with 5 mL of *methanol*, ... ".

B. To a quantity of the nebuliser solution containing 0.5 mg of Ipratropium Bromide add 75 mg of *lead dioxide* and 0.25 mL of *acetic acid*, shake gently and allow to stand for 5 minutes. Add one drop to a strip of filter paper previously impregnated with *decolorised fuchsin solution*, a characteristic violet colour develops.

TESTS
Acidity
pH, 3.0 to 4.0, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the nebuliser solution, if necessary, with sufficient 0.001M *hydrochloric acid* to produce a solution containing 0.02% w/v of Ipratropium Bromide.

(2) Dilute 1 volume of solution (1) to 200 volumes with 0.001M *hydrochloric acid*.

(3) 0.005% w/v of *ipratropium bromide impurity B EPCRS* and 0.005% w/v of *ipratropium bromide BPCRS* in 0.001M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Stainless steel column (12.5 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (5 µm)(Columbus C8 is suitable).

(b) Isocratic elution using the mobile phase described below.

(c) Flow rate of 0.5 mL per minute.

(d) Ambient column temperature.

(e) Detection wavelength of 210 nm.

(f) Injection volume of 20 µL for each solution.

For solution (1) allow the chromatography to proceed for 6 times the retention time of ipratropium (retention time of ipratropium, about 11 minutes).

MOBILE PHASE

A mixture of 4 volumes of freshly distilled *triethylamine*, 50 volumes of *propan-2-ol R1*, 100 volumes of *acetonitrile R1* and 850 volumes of a 0.1% w/v solution of *sodium methanesulfonate* adjusted to pH 3.0 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 1.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any such peaks is not greater than 3 times the area of the principal peak in the chromatogram obtained with solution (2) (1.5%).

Disregard any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Osmolality
The osmolality of the solution is 245 mosmol/kg to 299 mosmol/kg, Appendix V N.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a quantity of the nebuliser solution, if necessary, with sufficient 0.001M *hydrochloric acid* to produce a solution containing 0.02% w/v of Ipratropium Bromide.

(2) 0.02% w/v of *ipratropium bromide BPCRS* in 0.001M *hydrochloric acid*.

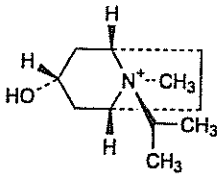
(3) 0.005% w/v of *ipratropium bromide impurity B EPCRS* and 0.005% w/v of *ipratropium bromide BPCRS* in 0.001M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Related substances may be used.

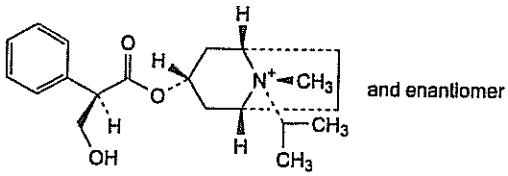
SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 1.0.



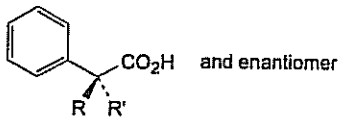
DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{30}NO_3Br,H_2O$ in the solution using the declared content of $C_{20}H_{30}NO_3Br,H_2O$ in *ipratropium bromide BPCRS*.



www.webofpharma.com

STORAGE
Ipratropium Nebuliser Solution should be stored protected from light in a sealed container.



IMPURITIES
The impurities limited by the requirements of this monograph include.

A. (1*R*,3*r*,5*S*,8*r*)-3-hydroxy-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane,

B. (1*R*,3*r*,5*S*,8*s*)-3-[[(2*RS*)-3-hydroxy-2-phenylpropanoyl]oxy]-8-methyl-8-(1-methylethyl)-8-azoniabicyclo[3.2.1]octane,

C. R = CH_2-OH, R′ = H: (2*RS*)-3-hydroxy-2-phenylpropanoic acid (DL-tropic acid),
D. R + R′ = CH_2: 2-phenylpropenoic acid (atropic acid).

Ipratropium Inhalation Powder, hard capsule

Ipratropium Powder for Inhalation

Action and use
Anticholinergic (antimuscarinic) bronchodilator.

DEFINITION
Ipratropium Inhalation Powder, hard capsule consists of hard gelatin capsules containing Ipratropium Bromide admixed with Glucose. The contents of the capsules are in powder of a suitable fineness.

The powder for inhalation complies with the requirements stated under Preparations for Inhalation and the contents of the capsules comply with the following requirements.

PRODUCTION
The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lung. The fine-particle characteristics of powders for inhalation are determined using the method described in Appendix XII C. 7. Preparations for Inhalation: Aerodynamic Assessment of Fine Particles.

Content of ipratropium bromide, $C_{20}H_{30}NO_3Br,H_2O$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Vigorously shake for 2 minutes a quantity of the contents of the capsules containing 1.84 mg of Ipratropium Bromide with 1 mL of *methanol*, centrifuge and use the supernatant.

(2) 0.184% w/v of *ipratropium bromide BPCRS* in a saturated solution of *glucose*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254} (Merck HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 5 cm.

(e) After removal of the plate, dry at 60° for 15 minutes, spray with *potassium iodobismuthate solution*, dry briefly in a current of air and spray with a 5% w/v solution of *sodium nitrite*.

MOBILE PHASE

1 volume of *formic acid*, 3 volumes of *water*, 18 volumes of *ethanol* and 18 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position, size and intensity to that in the chromatogram obtained with solution (2).

B. Disperse a quantity of the contents of the capsules containing the equivalent of 0.3 mg of bromide ion in 0.5 mL of *water* add 75 mg of *lead dioxide* and 0.25 mL of *acetic acid*, shake gently and allow to stand for 5 minutes. Add one drop to a strip of filter paper previously impregnated with *decolorised fuchsin solution*, a characteristic violet colour develops.

C. In the Assay, the principal peak in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS
Related substances
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Vigorously shake for 2 minutes a quantity of the contents of the capsules containing 1.84 mg of Ipratropium Bromide with 1 mL of *methanol*, centrifuge and use the supernatant.

(2) Dilute 1 volume of solution (1) to 200 volumes with a saturated solution of *glucose*.

(3) 0.0005% w/v of *tropic acid* in a saturated solution of *glucose*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating substance *silica gel* GF_{254} (Merck HPTLC plates are suitable).

(b) The mobile phase is a mixture of 1 volume of *formic acid*, 3 volumes of *water*, 18 volumes of *ethanol* and 18 volumes of *dichloromethane*.

(c) Develop to 5 cm.

(d) Application volume of 10 µL for each solution.

(e) Remove the plate, dry for 15 minutes at 60°, spray with *potassium iodobismuthate solution*, dry briefly in a current of air and spray with a 5% w/v solution of *sodium nitrite*.

www.webofpharma.com

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to tropic acid is not more intense than the spot in the chromatogram obtained with solution (2)(0.5%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2)(0.5%).

B. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the contents of the capsules solution with sufficient mobile phase to produce a solution containing 0.02% w/v of Ipratropium Bromide.

(2) Dilute 1 volume of solution (1) to 200 volumes with mobile phase.

(3) 0.005% w/v of *ipratropium bromide impurity B EPCRS* and 0.005% w/v of *ipratropium bromide BPCRS* in 0.001M *hydrochloric acid.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm), (Lichrospher 60 RP-select B is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for three times the retention time of ipratropium.

MOBILE PHASE

3 volumes of *acetonitrile for chromatography and* 25 volumes of a 0.1% w/v solution of *sodium methanesulfonate* in 0.05M *orthophosphoric acid.*

When the chromatograms are recorded under the prescribed conditions, the relative retention with reference to ipratropium (retention time = about 7.5 minutes) for impurity B is about 1.2.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 1.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the contents of the capsules with sufficient 0.01M *hydrochloric acid* to produce a solution containing 0.0040% w/v of Ipratropium Bromide, filter and use the filtrate.

(2) 0.004% w/v of *ipratropium bromide BPCRS* in 0.01M *hydrochloric acid.*

(3) 0.005% w/v of *ipratropium bromide impurity B EPCRS* and 0.005% w/v of *ipratropium bromide BPCRS* in 0.001M *hydrochloric acid.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm), (Lichrospher 60 RP-select B is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

27 volumes of *acetonitrile for chromatography* and 100 volumes of a 0.25% w/v solution of *sodium heptanesulfonate monohydrate* in *water* adjusted to pH 3.2 with 0.05M *orthophosphoric acid.*

SYSTEM SUITABILITY

The Assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 1.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{20}H_{30}NO_3Br,H_2O$ in the powder for inhalation using the declared content of $C_{20}H_{30}BrNO_3,H_2O$ in *ipratropium bromide BPCRS.*

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A, B, C and D listed under Ipratropium Bromide.

Ipratropium Pressurised Inhalation

Action and use

Anticholinergic (antimuscarinic) bronchodilator.

DEFINITION

Ipratropium Pressurised Inhalation is a solution or suspension of Ipratropium Bromide in a suitable liquid in a pressurised container fitted with a metering dose valve.

The pressurised inhalation complies with the requirements stated under Preparations for Inhalations and with the following requirements.

PRODUCTION

The size of aerosol particles to be inhaled is controlled so that a consistent portion is deposited in the lung. The fine-particle characteristics of pressurised metered-dose preparations for inhalation are determined using the method described in Appendix XII C. 7. Preparations for Inhalation: Aerodynamic Assessment of Fine Particles.

Content of ipratropium bromide, $C_{20}H_{30}NO_3Br,H_2O$

85.0 to 115.0% of the amount stated to be delivered by actuation of the valve.

IDENTIFICATION

A. In the test for Related substances, the principal spot in the chromatogram obtained with solution (2) corresponds to that in the chromatogram obtained with solution (6).

www.webofpharma.com

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the peak due to ipratropium bromide in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Punch a small hole in the ferrule of each of three cooled containers, allow the propellant to evaporate for about 1 minute and transfer the contents of the containers, through the punched holes, to a beaker. Stir, using a magnetic stirrer, for about 10 minutes, add 3.5 mL of 0.01M *hydrochloric acid* and continue stirring for about 1 hour, until the propellant has completely evaporated, filter, add 10 mL of *chloroform* to the filtrate and shake vigorously for 1 minute. Allow the phases to separate and use the upper layer.

(2) Dilute 1 volume of solution (1) to 50 volumes with 0.01M *hydrochloric acid.*

(3) Dilute 1 volume of solution (2) to 4 volumes with 0.01M *hydrochloric acid.*

(4) Dilute 2 volumes of solution (3) to 5 volumes with 0.01M *hydrochloric acid.*

(5) 0.008% w/v of *8s-isopropyl-3β-hydroxytropanium bromide BPCRS* in 0.01M *hydrochloric acid.*

(6) 0.008% w/v of *ipratropium bromide BPCRS* in 0.01M *hydrochloric acid.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a high performance silica gel precoated plate (Merck silica gel 60 HPTLC plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 6 cm above the line of application.

(e) After removal of the plate, dry it in a current of warm air for about 30 minutes. Spray the plate with a mixture of 1 volume of *potassium iodobismuthate solution*, 2 volumes of *glacial acetic acid* and 10 volumes of *water*, allow to dry briefly, spray with a 5% w/v solution of *sodium nitrite* and immediately examine the plate.

MOBILE PHASE

5 volumes of *water*, 8 volumes of *anhydrous formic acid*, 28 volumes of *methanol* and 70 volumes of *dichloromethane.*

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to 8*s*-isopropyl-3β-hydroxytropanium bromide is not more intense than the spot in the chromatogram obtained with solution (2) (2%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%);

not more than two such spots are more intense than the spot in the chromatogram obtained with solution (4) (0.2%).

ASSAY

Determine the content of active ingredient delivered by the first 10 successive combined actuations of the valve after priming. Carry out the procedure for content of active ingredient delivered by actuation of the valve described under Pressurised Inhalations, Preparations for Inhalation, beginning at the words 'Remove the pressurised container from the actuator...' and ending at the words '... to the volume specified in the monograph' using 20 mL of a mixture of equal volumes of 0.001M *hydrochloric acid* and *methanol* in the vessel. Use the same solvent mixture to wash the pressurised container and to dilute the combined solution and washings obtained from the set of 10 combined actuations to 50 mL (solution A). Determine the amount of active ingredient in the 10 combined actuations using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use solution A.

(2) 0.00040% w/v of *ipratropium bromide BPCRS* in a mixture of equal volumes of 0.001M *hydrochloric acid* and *methanol.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm x 4 mm) packed with *octylsilyl silica gel for chromatography* (Lichrospher RP8 select B is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 210 nm.

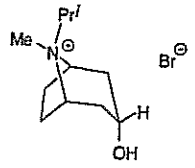
(f) Inject 20 µL of each solution.

MOBILE PHASE

345 volumes of *acetonitrile* and 750 volumes of 0.012M *sodium heptanesulfonate* previously adjusted to pH 3.2 with 0.05M *orthophosphoric acid.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (1), the *symmetry factor* for the peak due to ipratropium bromide is less than 3.0.



DETERMINATION OF CONTENT

Calculate the average content of $C_{20}H_{30}BrNO_3,H_2O$ delivered by a single actuation of the valve using the declared content of $C_{20}H_{30}BrNO_3,H_2O$ in *ipratropium bromide BPCRS.*

Determine the content of active ingredient a second and a third time by repeating the procedure on the middle 10 and the last 10 successive combined actuations of the valve, as estimated from the number of deliveries available from the container as stated on the label. For each of the three determinations the average content of $C_{20}H_{30}BrNO_3,H_2O$ delivered by a single actuation of the valve is within the limits stated under Content of ipratropium bromide.

IMPURITIES

In addition to the impurities shown in the monograph for Ipratropium Bromide the degradation impurities limited by the requirements of this monograph include:

A. 8*s*-isopropyl-3β-hydroxytropanium bromide.

www.webofpharma.com

Irbesartan Tablets

Action and use
Angiotensin II (AT_1) receptor antagonist.

DEFINITION
Irbesartan Tablets contain Irbesartan.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of irbesartan, $C_{25}H_{28}N_6O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Dissolve a quantity of the powdered tablets containing 0.3 g of Irbesartan in 10 mL of *methanol* with the aid of ultrasound. Filter through a Whatman GF/C filter and then through a 0.45-µm filter. Evaporate the filtrate to dryness under a stream of nitrogen and dry the residue at 60° for 1 hour. The *infrared absorption spectrum* of the residue, Appendix IIA, is concordant with the *reference spectrum* of Irbesartan (*RS 467*). Disregard any bands occurring between 1125 and 1000 cm^{-1}.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution
Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary to produce a solution containing 0.0083% w/v of Irbesartan, at the maximum at 254 nm, Appendix II B using 0.1M *hydrochloric acid* in the reference cell.

(2) Measure the *absorbance* of a 0.0083% w/v solution of *irbesartan BPCRS* using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of irbesartan, $C_{25}H_{28}N_6O$ in the medium from the absorbances obtained and using the declared content of $C_{25}H_{28}N_6O$ in *irbesartan BPCRS*.

LIMITS

The amount of irbesartan released is not less than 75% (Q) of the stated amount.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare a 0.025M solution of *sodium dihydrogen orthophosphate monohydrate*, adjusted to pH 3.2 with *orthophosphoric acid* (solvent A).

(1) To a quantity of the powdered tablets containing 62.5 mg of Irbesartan, add 125 mL of *methanol* and mix with the aid of ultrasound. Add 100 mL of solvent A and shake. Dilute to 250 mL with solvent A, mix and filter (a 0.45-µm filter is suitable).

(2) Dilute 1 volume of solution (1) to 50 volumes with equal volumes of *methanol* and solvent A. Dilute 1 volume of this solution to 10 volumes with solvent A.

(3) 0.025% w/v of *irbesartan impurity A BPCRS* in *methanol*.

(4) To 25 mg of *irbesartan BPCRS*, add 50 mL of *methanol* and mix with the aid of ultrasound, add sufficient solvent A to produce 100 mL.

(5) Dilute 1 volume of solution (3) to 200 volumes with solution (4).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.0 mm) packed with *octadecylsilyl silica gel for chromatography* (3.5 µm) (Waters SunFire C18 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 0.6 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 10 µL of solutions 1, 2 and 5.

MOBILE PHASE

Mobile phase A 42 volumes of *acetonitrile R1* and 58 volumes of solvent A.

Mobile phase B 20 volumes of solvent A and 80 volumes of *acetonitrile R1*.

Time (Minutes)	Mobile phase A%	Mobile phase B%	Comment
0-6	100	0	isocratic
6-11	100→0	0→100	linear gradient
11-12	0	100	isocratic
12-13	0→100	100→0	linear gradient
13-15	100	0	Re-equilibration

When the chromatograms are recorded under the prescribed conditions the relative retention, with reference to Irbesartan (retention time = about 5 minutes), of impurity A is about 0.8.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between the peaks due to irbesartan and irbesartan impurity A is at least 4.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to irbesartan impurity A is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of any other *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY
Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Prepare a 0.025M solution of *sodium dihydrogen*

www.webofpharma.com

orthophosphate monohydrate, adjusted to pH 3.2 with *orthophosphoric acid* (solvent B).

(1) To a quantity of the powdered tablets containing 62.5 mg of irbesartan, add 125 mL of *methanol* and mix with the aid of ultrasound. Add 100 mL of solvent B and shake. Dilute to 250 mL with solvent B, mix and filter (a 0.45-µm filter is suitable).

(2) To 25 mg of *irbesartan BPCRS*, add 50 mL of *methanol* and mix with the aid of ultrasound. Dilute to 100 mL with solvent B.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used with a detection wavelength of 250 nm.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *symmetry factor* of the peak due to irbesartan is between 0.8 and 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{25}H_{28}N_6O$ in the tablets using the declared content of $C_{25}H_{28}N_6O$ in *irbesartan BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurity A listed under Irbesartan.

Iron Dextran Injection

Action and use

Used in prevention and treatment of anaemia.

DEFINITION

Iron Dextran Injection is a sterile colloidal solution containing a complex of iron(III) hydroxide with dextrans of weight average molecular weight between 5000 and 7500.

PRODUCTION

Iron Dextran Injection is produced by a method of manufacture designed to provide an iron-dextran complex with appropriate iron absorption characteristics. This may be confirmed for routine control purposes by the use of an appropriate combination of physico-chemical tests, subject to the agreement of the competent authority.

The method of manufacture is validated to demonstrate that, if tested, the injection would comply with the following test.

Undue toxicity

Inject 0.10 mL into a tail vein of each of 10 mice; not more than three mice die within 5 days of injection. If more than three mice die within 5 days, repeat the test on another group of 20 mice. Not more than 10 of the 30 mice used in the combined tests die within 5 days of injection.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of iron, Fe

4.75 to 5.25% w/v.

Content of dextrans

17.0 to 23.0% w/v.

CHARACTERISTICS

A dark brown solution.

IDENTIFICATION

A. Add 5M *ammonia* to 0.2 mL of the injection previously diluted to 5 mL with *water*. No precipitate is produced.

B. Mix 1 mL with 100 mL of *water*. To 10 mL of this solution add 0.2 mL of *hydrochloric acid*, boil for 30 seconds, cool rapidly, add 4 mL of 13.5M *ammonia* and 10 mL of *hydrogen sulfide solution*, boil for at least 4 minutes to remove hydrogen sulfide, cool and filter. Boil 5 mL of the filtrate with 5 mL of *cupri-tartaric solution R1*; the solution remains greenish in colour and no precipitate is produced. Boil a further 5 mL of the filtrate with 0.5 mL of *hydrochloric acid* for 5 minutes, cool, add 2.5 mL of 5M *sodium hydroxide* and 5 mL of *cupri-tartaric solution R1* and boil again; a reddish precipitate is produced.

C. To 1 mL add 20 mL of *water* and 5 mL of *hydrochloric acid* and boil for 5 minutes. Cool, add an excess of 13.5M *ammonia* and filter. Wash the precipitate with *water*, dissolve in the minimum volume of 2M *hydrochloric acid* and add sufficient *water* to produce 20 mL. The resulting solution yields reaction B characteristic of *iron salts*, Appendix VI.

TESTS

Acidity

pH, 5.2 to 6.5, Appendix V L.

Arsenic

To 5.0 mL in a Kjeldahl flask add 10 mL of *water* and 10 mL of *nitric acid* and heat until the vigorous evolution of brown fumes ceases. Cool, add 10 mL of *sulfuric acid* and heat again until fumes are evolved, adding *nitric acid* dropwise at intervals until oxidation is complete. Cool, add 30 mL of *water*, bring to the boil and continue boiling until the volume of liquid is reduced to about 20 mL. Cool and dilute to 50 mL with *water*. Reserve a portion of the solution for the test for Lead. To 5 mL of the solution add 10 mL of *water*, 15 mL of *stannated hydrochloric acid* and 3 mL of *tin(II) chloride solution AsT*. Connect to a condenser and distil 15 mL into 10 mL of *water*. To the distillate add 0.2 mL of *bromine water* and remove the excess of bromine with *tin(II) chloride solution AsT*. The solution complies with the *limit test for arsenic*, Appendix VII (2 µg per mL).

Copper

To 5.0 mL add 5 mL of *nitric acid* and heat until the vigorous evolution of brown fumes ceases. Cool, add 2 mL of *sulfuric acid* and heat again until fumes are evolved, adding *nitric acid* dropwise at intervals until oxidation is complete. Cool, add 25 mL of *hydrochloric acid*, warm to dissolve, cool and extract with four 25 mL quantities of *isobutyl acetate*, discarding the extracts. Evaporate the acid solution to dryness, adding *nitric acid* dropwise if charring occurs. Dissolve the residue in 10 mL of 1M *hydrochloric acid*, reserving a portion of the solution for the test for Zinc. To 1 mL add 25 mL of *water* and 1 g of *citric acid*, make alkaline to *litmus paper* with 5M *ammonia*, dilute to 50 mL with *water*, add 1 mL of *sodium diethyldithiocarbamate solution* and allow to stand for 5 minutes. Any colour produced is not more intense than that produced by treating in the same manner a mixture of 3 mL of *copper standard solution (10 ppm Cu)* and 1 mL of 1M *hydrochloric acid* beginning at the words 'add 25 mL of *water*...' (60 µg per mL).

Lead

To 16.0 mL of the solution reserved in the test for Arsenic add 50 mL of *hydrochloric acid* and extract with four 20 mL quantities of *isobutyl acetate*, discarding the extracts. Evaporate the acid solution to dryness and dissolve the residue in 20 mL of *water*. 12 mL of the solution complies with *limit test A for heavy metals*, Appendix VII. Use *lead standard solution (2 ppm Pb)* to prepare the standard (25 µg per mL).

www.webofpharma.com

Zinc
To 5.0 mL of the solution reserved in the test for Copper add 15 mL of 1M *sodium hydroxide*, boil, filter, wash the residue with *water* and dilute the combined filtrate and washings to 25 mL with *water*. To 5 mL add 5 mL of 1M *hydrochloric acid* and 2 g of *ammonium chloride*, dilute to 50 mL with *water*, add 1 mL of freshly prepared *dilute potassium hexacyanoferrate(II) solution* and allow to stand for 20 minutes. Any opalescence produced is not more than that produced when 1 mL of freshly prepared *dilute potassium hexacyanoferrate(II) solution* is added to a solution prepared from 3 mL of *zinc standard solution (25 ppm Zn)*, 3 mL of 1M *sodium hydroxide*, 6 mL of 1M *hydrochloric acid* and 2 g of *ammonium chloride* diluted to 50 mL with *water* and allowed to stand for 20 minutes (150 µg per mL).

Chloride
To 5 mL add 75 mL of *water* and 0.05 mL of *nitric acid* and titrate immediately with 0.1M *silver nitrate VS* determining the end point potentiometrically. 6.8 to 9.6 mL of 0.1M *silver nitrate VS* is required.

Iron absorption
Using at least two rabbits, each weighing between 1.5 and 2.5 kg, clip the right hind leg free from hair over the injection site and swab the area with a bactericidal solution. Inject into each rabbit 0.4 mL of the injection per kg of the rabbit's weight using a 2 mL syringe fitted with a No. 12 hypodermic needle [22 gauge × 1.25 inch (0.7 × 32 mm approx.)]. Insert the needle at the distal end of the semitendinosus muscle, passing through the sartorius and entering the vastus medialis; the angle of the needle must be such that the full length is used. After 7 days, kill the rabbits and remove the legs into which the injections were made. Carefully cut open the muscles and examine the site of injection; it should be only very lightly stained and should show no dark brown deposits and no evidence of leakage along fascial planes. Skin the leg, dissect the flesh from the bone and cut into small pieces. Transfer the pieces to a 1000 mL beaker, add 75 mL of 2M *sodium hydroxide* and sufficient *water* to cover the flesh, cover the beaker with a watch glass and boil until most of the solid matter has disintegrated. Cool, cautiously add 50 mL of *sulfuric acid*, heat the mixture almost to boiling and add carefully ten 1 mL quantities of *fuming nitric acid* until no charring occurs when the excess of nitric acid has been boiled off. Cool, add 170 mL of *water*, boil until solution is complete, cool and dilute to 250 mL with *water*. To 5 mL of this solution add 3 mL of *sulfuric acid*, heat to fuming and complete the oxidation by the addition of small quantities of *nitric acid* until the solution is colourless. Cool, add 20 mL of *water*, boil for 3 minutes and add 10 mL of *ammonium citrate solution*, 10 mL of *ammonium mercaptoacetate solution*, 5M *ammonia* dropwise until the iron colour is fully developed, 1 mL of 5M *ammonia* in excess and sufficient *water* to produce 100 mL. Measure the *absorbance* of the resulting solution at 530 nm, Appendix II B.

Prepare a reference solution by adding 20 mL of *water* the same quantities of *ammonium citrate solution*, *ammonium mercaptoacetate solution* and 5M *ammonia* as used above, dilute to 100 mL with *water* and measure the *absorbance* at 530 nm. From the difference between the absorbances, calculate the amount of Fe present in the legs from a reference curve prepared by treating suitable aliquots of a solution of *ammonium iron(III) sulfate* containing 0.01% w/v of Fe by the procedure described above beginning at the words 'add 10 mL of *ammonium citrate solution*...'. Repeat the determination of Fe on the corresponding legs into which no injection was made, beginning at the words 'Carefully cut open the muscles...'. From the difference between the two amounts of iron, calculate the proportion of injected iron, as Fe, remaining in the leg tissues. Not more than 20% of the injected iron remains.

Bacterial endotoxins
The endotoxin limit concentration is 0.50 IU per mg of iron, Appendix XIV C.

ASSAY
For iron
To 2 g add 10 mL of *water* and 5 mL of *sulfuric acid* and stir for several minutes. Allow to stand for 5 minutes, cool and dilute to 50 mL with *water*. Prepare a suitable zinc amalgam by covering 300 g of *zinc shot* with a 2% w/v solution of *mercury(II) chloride* and stir for 10 minutes. Decant the solution, wash the residue three times with *water* and transfer it to a column (30 cm × 18 mm) fitted with a sintered-glass disc (ISO 4793, porosity grade 0, is suitable). Activate the zinc amalgam by passing through the column 200 mL of *sulfuric acid (5%)*. Pass the prepared solution slowly through the column and wash successively with 50 mL of *water*, four 25 mL quantities of *sulfuric acid (5%)* and 50 mL of *water*. Titrate the combined eluates with 0.1M *ammonium cerium(IV) sulfate VS* using *ferroin solution* as indicator. Each mL of 0.1M *ammonium cerium(IV) sulfate VS* is equivalent to 5.585 mg of Fe. Determine the *weight per mL* of the injection, Appendix V G, and calculate the percentage w/v of Fe.

For dextrans
Dilute 1 g to 500 mL with *water*, dilute 10 mL of the solution to 100 mL with *water*, transfer 3 mL of the resulting solution to a test tube and cool to 0°. Add, to form a lower layer, 6 mL of a solution prepared and maintained at 0° containing 0.2% w/v of *anthrone* in a mixture of 19 volumes of *sulfuric acid* and 1 volume of *water*, mix and immediately heat on a water bath for 5 minutes. Cool and measure the *absorbance* of the resulting solution at the maximum at 625 nm, Appendix II B. Repeat the operation using 3 mL of *water* in place of the dilution of the injection. From the difference between the absorbances calculate the content of glucose present using a calibration curve prepared by treating suitable amounts of D-*glucose* in the same manner. Each g of D-*glucose* is equivalent to 0.94 g of dextrans. Determine the *weight per mL* of the injection, Appendix V G, and calculate the percentage w/v of dextrans.

LABELLING
The strength is stated as the equivalent amount of iron, Fe, in a suitable dose-volume.

Iron Sucrose Injection

Action and use
Treatment of iron-deficiency anaemia.

DEFINITION
Iron Sucrose Injection is a sterile colloidal solution containing a complex of iron(III) hydroxide with sucrose of average molecular weight between 34000 and 60000.

PRODUCTION
Iron Sucrose Injection is produced by a method of manufacture designed to provide an iron-sucrose complex with appropriate iron absorption characteristics. This may be confirmed for routine control purposes by the use of an appropriate combination of physico-chemical tests, subject to the agreement of the competent authority.

www.webofpharma.com

A suitable test is carried out to demonstrate (1) the amount of iron(II) present in the injection is not more than 0.4% w/v of the total iron content and (2) there are no low molecular weight complexes in the injection.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of iron, Fe
95.0 to 105.0% of the stated amount.

Content of sucrose
90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. To a quantity of the injection containing the equivalent of 20 mg of iron, add 20 mL of *water* and 5 mL of *hydrochloric acid* and boil for 5 minutes. Cool, add an excess of 13.5M *ammonia* and filter. Wash the precipitate with *water*, dissolve in the minimum volume of 2M *hydrochloric acid* and add sufficient *water* to produce 20 mL. The resulting solution yields reaction B characteristic of *iron salts*, Appendix VI.

B. In the Assay for Sucrose, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

C. Complies with the test for Molecular weight determination.

TESTS

Alkalinity
pH, 10.5 to 11.0, Appendix V L.

Osmolality
The osmolality, Appendix V N, of the injection is 1150 mosmol/kg to 1350 mosmol/kg.

Clarity of solution
Appendix IV A. To a quantity of the injection containing 10 mg of iron, add 100 mL of water and adjust to pH 6.0 with 0.1M *hydrochloric acid*. The solution must not have any turbidity. Add 0.1M *hydrochloric acid* dropwise until a faint turbidity develops, the pH of the solution is between 4.4 and 5.3.

Molecular weight determination
Carry out the method for *size-exclusion chromatography*, Appendix III C, using the following solutions in the mobile phase.

(1) Dilute a quantity of the injection with a sufficient volume of the mobile phase to produce a solution expected to contain 1% w/v of iron.

(2) 0.4% w/v of *polysaccharide molecular weight standard 5000 Da*. Allow to stand for a minimum of 12 hours and gently swirl to dissolve any agglomerated particles.

(3) 0.4% w/v of *polysaccharide molecular weight standard 25000 Da*. Allow to stand for a minimum of 12 hours and gently swirl to dissolve any agglomerated particles.

(4) 0.4% w/v of *polysaccharide molecular weight standard 50000 Da*. Allow to stand for a minimum of 12 hours and gently swirl to dissolve any agglomerated particles.

(5) 0.4% w/v of *polysaccharide molecular weight standard 150000 Da*. Allow to stand for a minimum of 12 hours and gently swirl to dissolve any agglomerated particles.

(6) 0.4% w/v of *polysaccharide molecular weight standard 270000 Da*. Allow to stand for a minimum of 12 hours and gently swirl to dissolve any agglomerated particles.

(7) 0.4% w/v of *polysaccharide molecular weight standard 410000 Da*. Allow to stand for a minimum of 12 hours and gently swirl to dissolve any agglomerated particles.

(8) 0.4% w/v of *polysaccharide molecular weight standards 12000 Da*. Allow to stand for a minimum of 12 hours and gently swirl to dissolve any agglomerated particles.

CHROMATOGRAPHIC CONDITIONS

(a) Use two columns (30 cm × 7.8 mm) packed with *hydrophilic polyhydroxymethacrylate gel of totally porous spherical resin for chromatography*, connected in series with pore sizes of 1000Å and 120Å respectively.

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.5 mL per minute.

(d) Use a column temperature of 45°.

(e) Use a refractive index detector, maintained at 45°.

(f) Inject 25 µL of each solution.

MOBILE PHASE

A solution containing 0.02% w/v of *sodium azide*, 0.276% w/v of *sodium dihydrogen orthophosphate monohydrate* and 0.356% w/v of *disodium hydrogen orthophosphate dihydrate in water*. Adjust the pH to 6.8 with *orthophosphoric acid*.

SYSTEM SUITABILITY

The test is not valid unless:

the correlation coefficient of the calculated calibration curve is at least 0.98;

in the chromatogram obtained with solution (8), the calculated molecular weight is concordant with the value supplied with *polysaccharide molecular weight standard 12000 Da*.

DETERMINATION OF MOLECULAR WEIGHT

Determine the peak areas and retention times of the principal peaks in solutions (2), (3), (4), (5) (6) and (7). Plot the peak area for each solution as a function of concentration and peak area to create a cubic calibration curve.

From the calibration curve obtained with solutions (2) to (7), calculate the molecular weight of the complex in the injection.

The molecular weight distribution curve of solution (1) is split into fractions correlating to the molecular weight of solutions (2) to (7). Calculate:

the weight-average molecular weight (M_W):

$$M_w = \Sigma(A_T M_T)/\Sigma A_T$$

and the number-average molecular weight (M_N):

$$M_N = \Sigma(A_T)/\Sigma(A_T/M_T)$$

where
A_T = the area of each fraction of the sample distribution
M_T = the corresponding mean molecular weight of each fraction as determined from its retention time on the calibration curve.

The molecular weight distribution curve obtained for the Injection conforms to the following parameters:
M_W = 34,000 to 60,000 Da
M_N = Not less than 24,000 Da
M_W/M_N = Not more than 1.7.

ASSAY

For iron

To a quantity of the injection containing the equivalent of 100 mg of iron add 100 mL of 0.5M *hydrochloric acid* and 10 mL of *acetic acid*. Adjust the pH to 2.4 using *dilute sodium hydroxide*, add 0.5 mL of *hydrogen peroxide solution (20 vol)* and 2.5 mL of *tiron indicator solution*. Titrate with

www.webofpharma.com

0.1M *sodium edetate VS* until the dark green colour changes to yellow and remains yellow for at least one minute. Each mL of 0.1M *sodium edetate VS* is equivalent to 5.585 mg of iron.

For sucrose

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a volume of the injection containing 40mg of Iron Sucrose add 2.5 mL of a 3.0% w/v solution of *sodium dihydrogen orthophosphate monohydrate*, mix and allow to stand for 10 minutes, add sufficient *water* to produce 25 mL, centrifuge and filter discarding the first 2 mL of filtrate.

(2) 1.30% w/v of *sucrose BPCRS* in mobile phase.

(3) 1.60% w/v of *sucrose BPCRS* in mobile phase.

(4) 1.80% w/v of *sucrose BPCRS* in mobile phase.

(5) 2.10% w/v of *sucrose BPCRS* in mobile phase.

(6) 2.30% w/v of *sucrose BPCRS* in mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *aminopropylsilyl silica gel for chromatography* (3-10 µm).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a refractive index detector.

(f) Inject 20 µL of each solution.

MOBILE PHASE

21 volumes of *water* and 79 volumes of *acetonitrile*.

DETERMINATION OF CONTENT

Determine the peak areas of the principal peak in solutions (2), (3), (4), (5) and (6), plot the peak area for each solution as a function of concentration of sucrose and draw a straight line best fitting the five plotted points. From the graph obtained calculate the content of sucrose in the injection using the declared content of sucrose in *sucrose BPCRS*.

LABELLING

The strength is stated as the equivalent amount of iron, Fe, in a suitable dose-volume.

Isoconazole Pessaries

Isoconazole Vaginal Tablets

Action and use

Antifungal.

DEFINITION

Isoconazole Pessaries are *vaginal tablets* containing Isoconazole Nitrate in a suitable basis.

The pessaries comply with the requirements stated under Vaginal Preparations and with the following requirements.

Content of isoconazole nitrate, $C_{18}H_{14}Cl_4N_2O,HNO_3$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of powdered pessaries containing 10 mg of Isoconazole Nitrate with 10 mL of *dichloromethane* for 5 minutes and filter.

(2) 0.10% w/v of *isoconazole nitrate BPCRS* in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and spray with *potassium iodobismuthate solution*.

MOBILE PHASE

10 volumes of *methanol*, 30 volumes of *dichloromethane* and 60 volumes of *hexane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TEST

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of powdered pessaries containing 0.10 g of Isoconazole Nitrate with 10 mL of the mobile phase for 30 minutes and filter.

(2) Dilute 1 volume of solution (1) to 400 volumes with the mobile phase.

(3) 0.0025% w/v each of *isoconazole nitrate BPCRS* and of *econazole nitrate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 µm) (Hypersil ODS 3 µm is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 235 nm.

(f) Inject 20 µL of each solution.

(g) In the chromatogram obtained with solution (3) the approximate retention times of econazole and isoconazole are 10 minutes and 14 minutes respectively.

MOBILE PHASE

6.0 g of *ammonium acetate* in a mixture of 300 mL of *acetonitrile*, 320 mL of *methanol* and 380 mL of *water*.

SYSTEM SUITABILITY

The test is not valid unless the *resolution factor* between the peaks due to econazole and isoconazole in solution (3) is at least 5.0. If necessary adjust the composition of the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.25%);

the sum of the areas of any *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

www.webofpharma.com

Disregard any peaks due to the solvent and to the nitrate ion and any peak with an area less than 0.4 times that of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered pessaries containing 0.10 g of Isoconazole Nitrate with 100 mL of the mobile phase, mix and filter.

(2) 0.10% w/v of *isoconazole nitrate BPCRS* in the mobile phase.

(3) 0.10% w/v each of *isoconazole nitrate BPCRS* and of *econazole nitrate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The assay is not valid unless the *resolution factor* between the peaks due to econazole and isoconazole in solution (3) is at least 5.0. If necessary adjust the composition of the mobile phase.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{14}Cl_4N_2O,HNO_3$ in the pessaries using the declared content of $C_{18}H_{14}Cl_4N_2O,HNO_3$ in *isoconazole nitrate BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Isoconazole Nitrate.

Isoniazid Injection

Action and use

Antituberculosis drug.

DEFINITION

Isoniazid Injection is a sterile solution of Isoniazid in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of isoniazid, $C_6H_7N_3O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Using a rotary evaporator, evaporate a volume of the injection containing 50 mg of Isoniazid to dryness, extract the residue with two 10 mL quantities of *ethanol (96%)*, filter and evaporate the combined ethanol extracts to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of isoniazid *(RS 196)*.

B. To a volume containing 25 mg of Isoniazid add 5 mL of *ethanol (96%)*, 0.1 g of *sodium tetraborate* and 5 mL of a 5.0% w/v solution of *1-chloro-2,4-dinitrobenzene* in *ethanol (96%)*, evaporate to dryness on a water bath, heat for a further 10 minutes and dissolve the residue in 10 mL of *methanol*. A reddish purple colour is produced.

TEST

Acidity

pH, 5.6 to 6.0, Appendix V L.

ASSAY

Dilute a quantity containing 0.4 g of Isoniazid to 250 mL with *water*. To 25 mL of the solution in a glass-stoppered flask add 25 mL of 0.05M *bromine VS* and 5 mL of *hydrochloric acid*, shake for 1 minute, allow to stand for 15 minutes, add 1 g of *potassium iodide* and titrate with 0.1M *sodium thiosulfate VS* using *starch mucilage* as indicator. Repeat the operation without the injection. The difference between the titrations represents the amount of bromine required. Each mL of 0.05M *bromine VS* is equivalent to 3.429 mg of $C_6H_7N_3O$.

STORAGE

Isoniazid Injection should be protected from light.

Isoniazid Oral Solution

NOTE: *Isoniazid Oral Solution is not currently licensed in the United Kingdom.*

Action and use

Antituberculosis drug.

DEFINITION

Isoniazid Oral Solution is a solution of Isoniazid in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of isoniazid, $C_6H_7N_3O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in a mixture of equal volumes of *acetone* and *water*.

(1) Dilute a volume of the oral solution, if necessary, to contain 0.01% w/v of Isoniazid.

(2) 0.01% w/v of *isoniazid BPCRS*.

(3) 0.01% w/v of each of *isoniazid BPCRS* and *pyrazinamide BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 50 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

10 volumes of *water*, 20 volumes of *acetone*, 20 volumes of *methanol* and 50 volumes of *ethyl acetate*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. To a volume of the oral solution containing 25 mg of Isoniazid add 5 mL of *ethanol (96%)*, 0.1 g of *sodium tetraborate* and 5 mL of a 5.0% w/v solution of *1-chloro-2,4-dinitrobenzene* in *ethanol (96%)*. Evaporate to dryness on a

www.webofpharma.com

water bath, heat for a further 10 minutes and dissolve the residue in 10 mL of *methanol;* a reddish purple colour is produced.

C. In the Assay, the retention time of the peak due to isoniazid in the chromatogram obtained with solution (1) corresponds to the retention time of the principal peak in the chromatogram obtained with solution (2).

TESTS

Acidity

pH, 5.4 to 5.9, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the oral solution with sufficient of the mobile phase to produce a solution containing 0.032% w/v of Isoniazid and filter through a 0.45-µm nylon filter.

(2) 0.032% w/v of *isoniazid BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 260 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

Dissolve about 8.8 g of *sodium dodecyl sulfate* in a mixture of 840 volumes of *water* and 1160 volumes of *methanol*, mix with the aid of ultrasound and adjust the pH of the resulting solution to 2.5 using 1M *sulfuric acid.*

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_6H_7N_3O$, weight in volume, using the declared content of $C_6H_7N_3O$ in *isoniazid BPCRS.*

STORAGE

Isoniazid Oral Solution should be protected from light.

Isoniazid Tablets

Action and use

Antituberculosis drug.

DEFINITION

Isoniazid Tablets contain Isoniazid.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of isoniazid, $C_6H_7N_3O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Shake a quantity of the powdered tablets containing 0.1 g of Isoniazid with 10 mL of *ethanol (96%)* for 15 minutes, centrifuge and decant the supernatant liquid. Extract the residue with two further 10-mL quantities of *ethanol (96%)* and evaporate the combined extracts to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of isoniazid *(RS 196).*

TEST

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

After 45 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted if necessary, at the maximum at 263 nm, Appendix II B.

DETERMINATION OF CONTENT

Calculate the total content of isoniazid, $C_6H_7N_3O$, in the medium taking 307 as the value of A(1%, 1 cm) at the maximum at 263 nm.

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing 150 mg of Isoniazid as completely as possible in *water*, filter and wash the residue with sufficient *water* to produce 250 mL. To 50 mL of the resulting solution add 50 mL of *water*, 20 mL of *hydrochloric acid* and 0.2 g of *potassium bromide* and titrate with 0.0167M *potassium bromate VS* determining the end point electrometrically. Each mL of 0.0167M *potassium bromate VS* is equivalent to 3.429 mg of $C_6H_7N_3O$.

STORAGE

Isoniazid Tablets should be protected from light.

Isoprenaline Injection

Action and use

Adrenoceptor agonist.

DEFINITION

Isoprenaline Injection is a sterile solution of Isoprenaline Hydrochloride in Water for Injections. It is supplied either as a ready-to-use solution or prepared immediately before use in accordance with the manufacturer's instructions from Sterile Isoprenaline Concentrate.

The injection complies with the requirements stated under Parenteral Preparations.

When supplied as a ready-to-use solution, the injection complies with the following requirements.

Content of isoprenaline hydrochloride, $C_{11}H_{17}NO_3,HCl$

90.0 to 115.0% of the stated amount.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

A. Record *second-derivative ultraviolet absorption spectra* of the following solutions, Appendix II B, in the range 250 to 330 nm. For solution (1) dilute the injection, if necessary, with *methanol* to contain 0.002% w/v of Isoprenaline Hydrochloride. Solution (2) is a 0.002% w/v solution of *isoprenaline hydrochloride BPCRS* in *methanol.* The spectrum

www.webofpharma.com

obtained with solution (1) exhibits a maximum at 294 nm and a trough at 289 nm and is similar to the spectrum obtained with solution (2) in the range 280 to 298 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Evaporate a suitable volume of the solution just to dryness and dissolve the residue in sufficient *methanol* to produce a solution containing 0.01% w/v of Isoprenaline Hydrochloride.

(2) 0.01% w/v of *isoprenaline hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *TLC octadecylsilyl silica gel* F_{254} (Merck HPTLC RP18 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, heat at 105° for 15 minutes and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

0.1 volume of *glacial acetic acid*, 40 volumes of *water* and 60 volumes of *methanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. To 2 mL add 0.1 mL of *iron(III) chloride solution R1*. An emerald green colour is produced which, on the gradual addition of *sodium hydrogen carbonate solution*, changes first to blue and then to red.

TEST

Acidity

pH, 2.5 to 3.0, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use the solution diluted, if necessary, with sufficient of a 0.1% w/v solution of *sodium metabisulfite* to produce a solution containing 0.002% w/v of Isoprenaline Hydrochloride.

(2) 0.002% w/v of *isoprenaline hydrochloride BPCRS* in a 0.1% w/v solution of *sodium metabisulfite*.

(3) A mixture of 1 volume of a 0.02% w/v solution of *adrenaline acid tartrate* in the mobile phase containing 1.0% w/v of *sodium metabisulfite* and 18 volumes of solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 to 10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A solution prepared by dissolving 1.76 g of *sodium heptanesulfonate* in 800 mL of *water*, adding 200 mL of *methanol* and adjusting the pH to 3.0 with 1M *orthophosphoric acid*.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{11}H_{17}NO_3$,HCl in the injection using the declared content of $C_{11}H_{17}NO_3$,HCl in *isoprenaline hydrochloride BPCRS*.

STERILE ISOPRENALINE CONCENTRATE

DEFINITION

Sterile Isoprenaline Concentrate is a sterile solution of Isoprenaline Hydrochloride in Water for Injections.

The concentrate complies with the requirements for Concentrates for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of isoprenaline hydrochloride, $C_{11}H_{17}NO_3$,HCl 95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A colourless or very pale yellow solution.

IDENTIFICATION

A. Record *second-derivative ultraviolet absorption spectra* of the following solutions, Appendix II B, in the range 250 to 330 nm. For solution (1) dilute the concentrate with *methanol* to contain 0.002% w/v of Isoprenaline Hydrochloride. Solution (2) is a 0.002% w/v solution of *isoprenaline hydrochloride BPCRS* in *methanol*. The spectrum obtained with solution (1) exhibits a maximum at 294 nm and a trough at 289 nm and is similar to the spectrum obtained with solution (2) in the range 280 to 298 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute the concentrate with *methanol* to produce a solution containing 0.01% w/v of Isoprenaline Hydrochloride.

(2) 0.01% w/v of *isoprenaline hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *TLC octadecylsilyl silica gel* F_{254} (Merck HPTLC RP18 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, heat at 105° for 15 minutes and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

0.1 volume of *glacial acetic acid*, 40 volumes of *water* and 60 volumes of *methanol*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. To 2 mL add 0.1 mL of *iron(III) chloride solution R1*. An emerald green colour is produced which, on the gradual addition of *sodium hydrogen carbonate solution*, changes first to blue and then to red.

www.webofpharma.com

TEST

Acidity

pH, 2.5 to 3.0, Appendix V L.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use the concentrate diluted with sufficient of a 0.1% w/v solution of *sodium metabisulfite* to produce a solution containing 0.002% w/v of Isoprenaline Hydrochloride.

(2) 0.002% w/v of *isoprenaline hydrochloride BPCRS* in a 0.1% w/v solution of *sodium metabisulfite*.

(3) A mixture of 1 volume of a 0.02% w/v solution of *adrenaline acid tartrate* in the mobile phase containing 1.0% w/v of *sodium metabisulfite* and 18 volumes of solution (2).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (3 to 10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 280 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A solution prepared by dissolving 1.76 g of *sodium heptanesulfonate* in 800 mL of *water*, adding 200 mL of *methanol* and adjusting the pH to 3.0 with 1M *orthophosphoric acid*.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 3.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{11}H_{17}NO_3,HCl$ in the concentrate using the declared content of $C_{11}H_{17}NO_3,HCl$ in *isoprenaline hydrochloride BPCRS*.

STORAGE

Sterile Isoprenaline Concentrate should be protected from light.

Isosorbide Dinitrate Injection

Action and use

Nitric oxide analogue; treatment of angina pectoris.

DEFINITION

Isosorbide Dinitrate Injection is a sterile solution of isosorbide dinitrate made isotonic with Sodium Chloride in Water for Injections. It is supplied as a ready-to-use solution.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of isosorbide dinitrate, $C_6H_8N_2O_8$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Evaporate a suitable volume of the injection under reduced pressure and below 40° to dryness. Shake a quantity of the residue containing 25 mg of isosorbide dinitrate with 10 mL of *dichloromethane* for 5 minutes, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of isosorbide dinitrate (*RS 412*).

B. Yields the reactions characteristic of *sodium salts* and reaction A characteristic of *chlorides*, Appendix VI.

Acidity or alkalinity

pH, 3.5 to 7.0, Appendix V L.

Nitrite

To 40 mL of the injection add 2 mL of *sulfanilic acid solution*, 2 mL of *aminonaphthalenesulfonic acid solution* and sufficient *water* to produce 50 mL. Allow to stand at room temperature for 1 hour. Measure the *absorbance* of the resulting solution at the maximum at 524 nm, Appendix II B, using in the reference cell a solution prepared by treating 40 mL of *water* in the same manner, beginning at the words "add 2 mL of *sulfanilic acid solution* ...". The *absorbance* is not greater than that obtained by repeating the procedure using 2 mL of *nitrite standard solution (20 ppm)* diluted to 40 mL with *water* and treated at the same time and in the same manner, beginning at the words "add 2 mL of *sulfanilic acid solution* ..." (1 ppm, calculated with reference to the injection).

Isosorbide 5-nitrate and isosorbide 2-nitrate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) evaporate a volume of the injection containing 50 mg of isosorbide dinitrate, under reduced pressure and below 40°, to dryness, triturate the residue with 50 mL of mobile phase, shake, filter through a glass-fibre filter (Whatman GF/C is suitable) and use the filtrate. Solution (2) contains 0.0005% w/v of *isosorbide 2-nitrate BPCRS* in the mobile phase. Solution (3) contains 0.0005% w/v of *isosorbide mononitrate BPCRS* in the mobile phase. Solution (4) contains 0.005% w/v each of *isosorbide mononitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable), (b) as the mobile phase with a flow rate of 1.0 mL per minute a mixture of 30 volumes of *methanol* and 70 volumes of *water* and (c) a detection wavelength of 220 nm.

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

In the chromatogram obtained with solution (1) the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%) and the area of any peak corresponding to isosorbide 5-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%).

Bacterial endotoxins

The endotoxin limit concentration is 5.0 IU per mL, Appendix XIV C.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) use the injection, diluted, if necessary, with sufficient of a mixture of 25 volumes of *methanol* and 75 volumes of *water* to produce a solution containing 0.002% w/v of isosorbide dinitrate. For solution (2) prepare a 0.01% w/v solution of *isosorbide dinitrate BPCRS* in methanol.

www.webofpharma.com

Filter and dilute 1 volume to 50 volumes with a mixture of 25 volumes of *methanol* and 75 volumes of *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *trimethylsilyl silica gel for chromatography* (3 µm) (Hypersil SAS is suitable), (b) as the mobile phase with a flow rate of 1.3 mL per minute a mixture containing 0.039% w/v of *ammonium acetate* in 25 volumes of *methanol R2* and 75 volumes of *water* and (c) a detection wavelength of 214 nm.

Calculate the content of $C_6H_8N_2O_8$ in the injection using the declared content of $C_6H_8N_2O_8$ in *isosorbide dinitrate BPCRS*.

Isosorbide Dinitrate Tablets

Action and use
Nitric oxide analogue; treatment of angina pectoris.

DEFINITION
Isosorbide Dinitrate Tablets contain Diluted Isosorbide Dinitrate.

CAUTION Undiluted isosorbide dinitrate can be exploded by percussion or excessive heat. Appropriate precautions should be exercised and only exceedingly small amounts should be isolated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of isosorbide dinitrate, $C_6H_8N_2O_8$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract a quantity of the powdered tablets containing 2 mg of isosorbide dinitrate with 1 mL of *ether* and centrifuge.

(2) Prepare solution (2) in the same manner but use *isosorbide dinitrate BPCRS* in place of the powdered tablets.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel*.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in a current of air, spray with *diphenylamine solution R1* and irradiate for 15 minutes with *ultraviolet light (254* and *365 nm)*.

MOBILE PHASE

toluene.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Shake a quantity of the powdered tablets containing 50 mg of isosorbide dinitrate with warm *sulfuric acid (50%)* containing a trace of *diphenylamine*. An intense blue colour is produced.

TESTS
Dissolution
Tablets intended to be swallowed whole comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of 0.1M *hydrochloric acid* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 mL of the medium and filter through a membrane filter with a nominal pore size not greater than 0.45 µm. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) is a solution of *isosorbide dinitrate BPCRS* in the dissolution medium containing the same concentration of isosorbide dinitrate as that expected in the dissolution vessel. Solution (2) is the filtrate from the dissolution vessel.

The chromatographic procedure may be carried out using (a) a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) as the mobile phase with a flow rate of 1 mL per minute, a mixture of equal volumes of *methanol* and *water* and (c) a detection wavelength of 222 nm. Inject 100 µL of each solution.

Calculate the total content of isosorbide dinitrate, $C_6H_8N_2O_8$, in the medium using the declared content of $C_6H_8N_2O_8$ in *isosorbide dinitrate BPCRS*.

Inorganic nitrates
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 g of Isosorbide Dinitrate with 5 mL of *ethanol (96%)* and filter.

(2) Dissolve 10 mg of *potassium nitrate* in 1 mL of *water* and dilute to 100 mL with *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Analtech silica gel H plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate thoroughly dry it in a current of air until the acetic acid is completely removed. Spray copiously with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes. Examine in daylight.

MOBILE PHASE

15 volumes of *glacial acetic acid*, 30 volumes of *acetone* and 60 volumes of *toluene*.

LIMITS

In the chromatogram obtained with solution (1) any spot corresponding to potassium nitrate is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%, calculated as potassium nitrate).

Isosorbide 5-nitrate and isosorbide 2-nitrate
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 20 mL of the mobile phase to a quantity of the powdered tablets containing 25 mg of Isosorbide Dinitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 mL with the same solvent. Filter through a glass-fibre filter (Whatman GF/C is suitable) and use the filtrate.

(2) 0.0005% w/v *of isosorbide 2-nitrate BPCRS* in the mobile phase.

(3) 0.0005% w/v of *isosorbide mononitrate BPCRS* in the mobile phase.

(4) 0.005% w/v each of *isosorbide dinitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *aminopropylsilyl silica gel for chromatography* (10 µm) (Lichrosorb NH_2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 215 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

15 volumes of *absolute ethanol* and 85 volumes of *2,2,4-trimethylpentane.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks corresponding to isosorbide dinitrate and isosorbide 2-nitrate is at least 6.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to isosorbide 5-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%).

Disintegration

The requirement for Disintegration does not apply to Isosorbide Dinitrate Tablets.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the powdered tablets containing 25 mg of Isosorbide Dinitrate add 20 mL of the mobile phase mix with the aid of ultrasound for 15 minutes and dilute to 25 mL with the same solvent. Filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 1 volume to 10 volumes with the mobile phase.

(2) To a quantity of *isosorbide dinitrate BPCRS* containing 25 mg of Isosorbide Dinitrate add 20 mL of the mobile phase mix with the aid of ultrasound for 15 minutes and dilute to 25 mL with the mobile phase. Filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 1 volume to 10 volumes with the mobile phase.

(3) 0.005% w/v each *of isosorbide dinitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Isosorbide 5-nitrate and isosorbide 2-nitrate may be used but using a detection wavelength of 230 nm.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to isosorbide dinitrate and isosorbide 2-nitrate is at least 6.0.

DETERMINATION OF CONTENT

Calculate the content of $C_6H_8N_2O_8$ in the tablets from the chromatograms obtained and using the declared content of $C_6H_8N_2O_8$ in *isosorbide dinitrate BPCRS.*

LABELLING

The label states whether the tablets are to be swallowed whole or chewed before being swallowed.

When Isosorbide Dinitrate Tablets are prescribed or demanded, either Isosorbide Dinitrate Tablets or Isosorbide Dinitrate Sublingual Tablets may be dispensed or supplied, as appropriate.

Isosorbide Dinitrate Sublingual Tablets

Action and use

Nitric oxide analogue; treatment of angina pectoris.

DEFINITION

Isosorbide Dinitrate Sublingual Tablets contain Diluted Isosorbide Dinitrate.

CAUTION Undiluted isosorbide dinitrate can be exploded by percussion or excessive heat. Appropriate precautions should be exercised and only exceedingly small amounts should be isolated.

The sublingual tablets comply with the requirements stated under Oromucosal Preparations and with the following requirements.

Content of isosorbide dinitrate, $C_6H_8N_2O_8$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract a quantity of the powdered tablets containing 2 mg of isosorbide dinitrate with 1 mL of *ether* and centrifuge.

(2) Prepare solution (2) in the same manner but use *isosorbide dinitrate BPCRS* in place of the powdered tablets.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel.*

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in a current of air, spray with *diphenylamine solution R1* and irradiate for 15 minutes with *ultraviolet light (254* and *365 nm).*

MOBILE PHASE

toluene.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. Shake a quantity of the powdered tablets containing 50 mg of Isosorbide Dinitrate with warm *sulfuric acid (50%)* containing a trace of *diphenylamine.* An intense blue colour is produced.

TESTS

Inorganic nitrates

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 g of Isosorbide Dinitrate with 5 mL of *ethanol (96%)* and filter.

(2) Dissolve 10 mg of *potassium nitrate* in 1 mL of *water* and dilute to 100 mL with *ethanol (96%).*

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel H.*

www.webofpharma.com

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate thoroughly dry it in a current of air until the acetic acid is completely removed. Spray copiously with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes. Examine in daylight.

MOBILE PHASE

15 volumes of *glacial acetic acid*, 30 volumes of *acetone* and 60 volumes of *toluene*.

LIMITS

In the chromatogram obtained with solution (1) any spot corresponding to potassium nitrate is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%, calculated as potassium nitrate).

Isosorbide 5-nitrate and isosorbide 2-nitrate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 20 mL of the mobile phase to a quantity of the powdered tablets containing 25 mg of Isosorbide Dinitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 mL with the same solvent. Filter through a glass-fibre filter (Whatman GF/C is suitable) and use the filtrate.

(2) 0.0005% w/v *of isosorbide 2-nitrate BPCRS* in the mobile phase.

(3) 0.0005% w/v of *isosorbide mononitrate BPCRS* in the mobile phase.

(4) 0.005% w/v each of *isosorbide dinitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *aminopropylsilyl silica gel for chromatography* (10 µm) (Lichrosorb NH_2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 215 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

15 volumes of *absolute ethanol* and 85 volumes of *2,2,4-trimethylpentane*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks corresponding to isosorbide dinitrate and isosorbide 2-nitrate is at least 6.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to isosorbide 5-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the powdered tablets containing 25 mg of Isosorbide Dinitrate add 20 mL of the mobile phase mix with the aid of ultrasound for 15 minutes and dilute to 25 mL with the same solvent. Filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 1 volume to 10 volumes with the mobile phase.

(2) To a quantity of *isosorbide dinitrate BPCRS* containing 25 mg of Isosorbide Dinitrate add 20 mL of the mobile phase mix with the aid of ultrasound for 15 minutes and dilute to 25 mL with the mobile phase. Filter through a glass-fibre filter (Whatman GF/C is suitable) and dilute 1 volume to 10 volumes with the mobile phase.

(3) 0.005% w/v each *of isosorbide dinitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic procedure described under Isosorbide 5-nitrate and isosorbide 2-nitrate may be used but using a detection wavelength of 230 nm.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to isosorbide dinitrate and isosorbide 2-nitrate is at least 6.0.

DETERMINATION OF CONTENT

Calculate the content of $C_6H_8N_2O_8$ in the tablets from the chromatograms obtained and using the declared content of $C_6H_8N_2O_8$ in *isosorbide dinitrate BPCRS*.

LABELLING

The label states that the tablets should be placed under the tongue and allowed to dissolve slowly.

When Isosorbide Dinitrate Tablets are prescribed or demanded, either Isosorbide Dinitrate Tablets or Isosorbide Dinitrate Sublingual Tablets may be dispensed or supplied, as appropriate.

Prolonged-release Isosorbide Mononitrate Capsules

Prolonged-release Isosorbide Mononitrate Capsules from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Nitric oxide analogue; treatment of angina pectoris.

DEFINITION

Prolonged-release Isosorbide Mononitrate Capsules contain Diluted Isosorbide Mononitrate. They are formulated so that the medicament is released over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of isosorbide mononitrate.

The dissolution profile reflects the *in vivo* performance, which in turn is compatible with the dosage schedule recommended by the manufacturer.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of isosorbide mononitrate, $C_6H_9NO_6$

95.0 to 105.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the capsule contents containing the equivalent of 10 mg of isosorbide mononitrate with 10 mL of *ethanol (96%)* and filter.

(2) 0.1% w/v solution of *isosorbide mononitrate BPCRS* in *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel plate* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with *diphenylamine solution R1* and irradiate for 15 minutes with *ultraviolet light (254* and *365 nm)*.

MOBILE PHASE

5 volumes of *methanol* and 95 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Inorganic nitrates

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the capsule contents containing the equivalent of 0.1 g of isosorbide mononitrate with 5 mL of *ethanol (96%)* and filter.

(2) Dissolve 10 mg of *potassium nitrate* in 1 mL of *water* and dilute to 100 mL with *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel plate* (Analtech silica gel H plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, thoroughly dry it in a current of air until the acetic acid is completely removed. Spray copiously with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes and examine in daylight.

MOBILE PHASE

15 volumes of *glacial acetic acid*, 30 volumes of *acetone* and 60 volumes of *toluene*.

CONFIRMATION

In the chromatogram obtained with solution (1) any spot corresponding to potassium nitrate is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%, calculated as potassium nitrate).

Isosorbide dinitrate and isosorbide 2-nitrate

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase.

(1) Add 15 mL of mobile phase to a quantity of the capsule contents containing the equivalent of 50 mg of isosorbide mononitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 mL. Filter through a membrane filter with a nominal pore size not greater than 0.45-µm and use the filtrate.

(2) 0.001% w/v of *isosorbide 2-nitrate BPCRS*.

(3) 0.001% w/v of *isosorbide dinitrate BPCRS*.

(4) 0.001% w/v each of *isosorbide mononitrate BPCRS* and *isosorbide 2-nitrate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

(g) Allow the chromatography to proceed for five times the retention time of isosorbide mononitrate.

MOBILE PHASE

30 volumes of *methanol* and 70 volumes of *water*.

When the chromatograms are recorded under the prescribed conditions the retention time relative to isosorbide mononitrate (retention time = about 6 minutes) are: isosorbide 2-nitrate = about 0.9; isosorbide dinitrate = about 4.0.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to isosorbide dinitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Shake a quantity of the mixed contents of 20 capsules containing the equivalent of 50 mg of isosorbide mononitrate with 70 mL of the mobile phase, mix with the aid of ultrasound for 15 minutes, dilute to 100 mL with the same solvent and centrifuge. Dilute 1 volume of the supernatant liquid to 5 volumes with the mobile phase and filter through a membrane filter with a nominal pore size not greater than 0.45-µm.

(2) 0.01% w/v of *isosorbide mononitrate BPCRS*.

(3) 0.001% w/v each of *isosorbide mononitrate BPCRS* and *isosorbide 2-nitrate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Isosorbide dinitrate and isosorbide 2-nitrate may be used.

www.webofpharma.com

MOBILE PHASE

30 volumes of *methanol* and 70 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

DETERMINATION OF CONTENT

Calculate the content of $C_6H_9NO_6$ in the capsules from the chromatograms obtained and using the declared content of $C_6H_9NO_6$ in *isosorbide mononitrate BPCRS*.

Isosorbide Mononitrate Tablets

Action and use
Nitric oxide analogue; angina pectoris.

DEFINITION
Isosorbide Mononitrate Tablets contain Diluted Isosorbide Mononitrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of isosorbide mononitrate, $C_6H_9NO_6$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract a quantity of the powdered tablets containing 10 mg of isosorbide mononitrate with 10 mL of *ethanol (96%)* and filter.

(2) 0.1% w/v solution of *isosorbide mononitrate BPCRS* in *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel plate* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in a current of air, spray with *diphenylamine solution R1* and irradiate for 15 minutes with *ultraviolet light (254* and *365 nm)*.

MOBILE PHASE

5 volumes of *methanol* and 95 volumes of *dichloromethane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Inorganic nitrates
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.1 g of isosorbide mononitrate with 5 mL of *ethanol (96%)* and filter.

(2) Dissolve 10 mg of *potassium nitrate* in 1 mL of *water* and dilute to 100 mL with *ethanol (96%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel plate* (Analtech silica gel H plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate thoroughly dry it in a current of air until the acetic acid is completely removed. Spray copiously with freshly prepared *potassium iodide and starch solution*. Expose the plate to *ultraviolet light (254 nm)* for 15 minutes and examine in daylight.

MOBILE PHASE

15 volumes of *glacial acetic acid*, 30 volumes of *acetone* and 60 volumes of *toluene*.

LIMITS

In the chromatogram obtained with solution (1) any spot corresponding to potassium nitrate is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%, calculated as potassium nitrate).

Isosorbide dinitrate and isosorbide 2-nitrate
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 15 mL of mobile phase to a quantity of the powdered tablets containing 50 mg of isosorbide mononitrate, mix with the aid of ultrasound for 15 minutes and dilute to 25 mL with the same solvent. Filter through a membrane filter with a nominal pore size not greater than 0.45 µm and use the filtrate.

(2) 0.001% w/v of *isosorbide 2-nitrate BPCRS* in the mobile phase.

(3) 0.001% w/v of *isosorbide dinitrate BPCRS* in the mobile phase.

(4) 0.001% w/v each of *isosorbide mononitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octyldecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

30 volumes of *methanol* and 70 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

www.webofpharma.com

the area of any peak corresponding to isosorbide dinitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 70 mL of mobile phase to a quantity of the powdered tablets containing 50 mg of isosorbide mononitrate, mix with the aid of ultrasound for 15 minutes, dilute to 100 mL with the same solvent and centrifuge. Dilute 1 volume of the supernatant liquid to 5 volumes with mobile phase and filter through a membrane filter with a nominal pore size not greater than 0.45 µm.

(2) Add 20 mL of mobile phase to a quantity of *isosorbide mononitrate BPCRS* containing 25 mg of isosorbide mononitrate, mix with the aid of ultrasound for 15 minutes, dilute to 25 mL with the same solvent and centrifuge. Dilute 1 volume of the supernatant liquid to 10 volumes with the mobile phase and filter through a membrane filter with a nominal pore size not greater than 0.45 µm.

(3) 0.001% w/v each of *isosorbide mononitrate BPCRS* and *isosorbide 2-nitrate BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Isosorbide dinitrate and isosorbide 2-nitrate may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

DETERMINATION OF CONTENT

Calculate the content of $C_6H_9NO_6$ in the tablets from the chromatograms obtained and using the declared content of $C_6H_9NO_6$ in *isosorbide mononitrate BPCRS*.

Prolonged-release Isosorbide Mononitrate Tablets

Prolonged-release Isosorbide Mononitrate Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

Action and use

Nitric oxide analogue; treatment of angina pectoris.

DEFINITION

Prolonged-release Isosorbide Mononitrate Tablets contain Diluted Isosorbide Mononitrate. They are formulated so that the medicament is released over a period of several hours. They are coated.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of isosorbide mononitrate.
The dissolution profile reflects the *in vivo* performance, which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of isosorbide mononitrate, $C_6H_9NO_6$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Filtered solution prepared from powdered tablets containing the equivalent of 0.1% w/v of isosorbide mononitrate in *ethanol (96%)*.

(2) 0.1% w/v solution of *isosorbide mononitrate BPCRS* in *ethanol (96%)*.

30 volumes of *methanol* and 70 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

LIMIT

In the chromatogram obtained with solution (1):

the area of any peak corresponding to isosorbide 2-nitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to isosorbide dinitrate is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Add 70 mL of mobile phase to a quantity of the powdered tablets containing the equivalent of 50 mg of isosorbide mononitrate, mix with the aid of ultrasound for 15 minutes and dilute to 100 mL with the same solvent and centrifuge. Dilute 1 volume of the supernatant liquid to 5 volumes with the mobile phase and filter through a membrane filter with a nominal pore size not greater than 0.45 µm.

(2) 0.01% w/v of *isosorbide mononitrate BPCRS*.

(3) 0.001% w/v each of *isosorbide mononitrate BPCRS* and *isosorbide 2-nitrate BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

30 volumes of *methanol* and 70 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks corresponding to isosorbide mononitrate and isosorbide 2-nitrate is at least 2.4.

DETERMINATION OF CONTENT

Calculate the content of $C_6H_9NO_6$ in the tablets from the chromatograms obtained and using the declared content of $C_6H_9NO_6$ in *isosorbide mononitrate BPCRS*.

Isotretinoin Capsules

Action and use

Vitamin A analogue (retinoid); treatment of acne.

DEFINITION

Isotretinoin Capsules contain Isotretinoin.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of isotretinoin, $C_{20}H_{28}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the test for Related substances, the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (4).

B. The *light absorption* of the final solution obtained in the Assay, Appendix II B, in the range 300 to 400 nm, exhibits a maximum at 356 nm.

TESTS

Dissolution

Protect the apparatus from light throughout the determination and flush the apparatus with nitrogen before use.

TEST CONDITIONS

(a) Carry out the test using the apparatus for the *disintegration test for tablets and capsules*, Appendix XII A1.

(b) Use 900 mL of 0.1M *sodium hydroxide* at a temperature of 37°, as the medium.

PROCEDURE

After 60 minutes withdraw a 20 mL sample of the medium, filter immediately through a 0.2-µm filter, discarding the first 5 mL of filtrate, and dilute the filtrate with 0.1M *sodium hydroxide* to give a solution expected to contain about 0.00025% w/v of Isotretinoin. Measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 343 nm, Appendix II B, using 0.1M *sodium hydroxide* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of isotretinoin, $C_{20}H_{28}O_2$, in the medium taking 1490 as the value of A(1%, 1 cm) at 343 nm and divide the result by 6 to obtain the amount per capsule.

LIMITS

Not less than 85% of the stated amount per capsule is released after 60 minutes.

Related substances

Protect the solutions from light throughout the procedure. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

www.webofpharma.com

(1) Shake a quantity of the contents of the capsules containing 10 mg of Isotretinoin with 10 mL of a mixture of 20 volumes of 0.1M *sodium hydroxide* and 80 volumes of *absolute ethanol* for 10 minutes, treat with ultrasound for 15 minutes and centrifuge for 5 minutes. Mix 5 mL of the supernatant liquid with 7.5 mL of 0.1M *hydrochloric acid* and extract with two 20-mL quantities of *dichloromethane*. Filter the combined extracts through phase separating paper (Whatman 1PS is suitable) and wash the filter with 5 mL of *dichloromethane*. Evaporate the combined filtrate and washing to dryness at 30° under reduced pressure and dissolve the residue in 5 mL of *methanol*.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol*.

(3) 0.002% w/v of *tretinoin EPCRS* in *methanol*.

(4) 0.001% w/v of *isotretinoin EPCRS* in *methanol*.

(5) 0.001% w/v of each of *tretinoin EPCRS* and *isotretinoin EPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.4 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 353 nm.

(f) Inject 10 µL of each solution.

MOBILE PHASE

A 0.5% w/v solution of *glacial acetic acid* in a mixture of *methanol* and *water*, the proportions adjusted to give a retention time for tretinoin of about 15 minutes (a mixture of 23 volumes of *water* and 77 volumes of *methanol* is usually suitable).

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between the peaks due to tretinoin and isotretinoin is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to tretinoin is not greater than twice the area of the peak in the chromatogram obtained with solution (3) (4%);

the area of any other *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any such peaks is not greater than 1.5 times the area of the peak in the chromatogram obtained with solution (2) (1.5%).

ASSAY

Carry out the following procedure in subdued light. Slit 10 capsules with a scalpel avoiding loss of the capsule contents, place the capsules in a 500-mL graduated flask washing any material adhering to the scalpel into the flask with 25 mL of *dichloromethane* per capsule and mix with the aid of ultrasound for 15 minutes. Add sufficient *dichloromethane* to produce 500 mL, shake for 2 minutes and dilute with a solution prepared by diluting 5 mL of 0.1M *hydrochloric acid* to 250 mL with *ethanol (96%)* to produce a solution containing 0.0008% w/v of Isotretinoin. Measure the *absorbance* of this solution at the maximum at 356 nm, Appendix II B, using the ethanolic hydrochloric acid solution in the reference cell. Calculate the content of $C_{20}H_{28}O_2$ in the capsules taking 1350 as the value of A(1%, 1 cm) at the maximum at 356 nm.

STORAGE

Isotretinoin Capsules should be protected from light.

Isotretinoin Gel

Action and use

Vitamin A analogue (retinoid); treatment of acne.

DEFINITION

Isotretinoin Gel is a solution of Isotretinoin in a suitable alcoholic basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of isotretinoin, $C_{20}H_{28}O_2$

90.0 to 110.0% of the stated amount.

Carry out all the operations as rapidly as possible protected from light.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake to disperse a quantity of the gel containing 1 mg of Isotretinoin as completely as possible in 5 mL of *dichloromethane reagent* and 10 mL of *dichloromethane*, add 80 mL of n-*hexane* and shake the mixture vigorously; filter, evaporate the filtrate to dryness using a rotary evaporator at a temperature not exceeding 60° and dissolve the residue in 1 mL of *dichloromethane*.

(2) 0.1% w/v of *isotretinoin EPCRS* in *dichloromethane*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

2 volumes of *glacial acetic acid*, 4 volumes of *acetone*, 40 volumes of *peroxide-free ether* and 54 volumes of *cyclohexane*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. The *light absorption* of the final solution obtained in the Assay, Appendix II B, in the range 300 to 400 nm, exhibits a maximum at 356 nm.

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in n-*hexane*, protected from light.

(1) Shake to disperse a quantity of the gel containing 2.5 mg of Isotretinoin as completely as possible in a mixture of 5 mL of *dichloromethane reagent* and 10 mL of *dichloromethane*, dilute to 50 mL with n-*hexane*, shake and filter.

www.webofpharma.com

(2) 0.0002% w/v of *tretinoin EPCRS*.

(3) Dilute 1 volume of solution (1) to 100 volumes.

(4) 0.0002% w/v each of *isotretinoin EPCRS* and *tretinoin EPCRS*.

(5) Dilute 1 volume of solution (3) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *silica gel for chromatography* (5 µm) (Lichrosorb Si60 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 365 nm.

(f) Inject 50 µL of each solution.

MOBILE PHASE

1 volume of *glacial acetic acid*, 30 volumes of *ethyl acetate* and 970 volumes of n-*hexane*.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to isotretinoin and tretinoin is at least 3.0;

in the chromatogram obtained with solution (5), *the signal-to-noise ratio* of the peak due to isotretinoin is at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to tretinoin is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (4%);

the sum of the areas of any other *secondary peaks* is not greater than the area of the peak in the chromatogram obtained with solution (3) (1%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.1%).

ASSAY

Carry out the following procedure in subdued light. To a quantity of the gel containing 0.5 mg of Isotretinoin, add 10 mL of *dichloromethane*, shake until all the gel has dispersed and dilute the solution to 100 mL with a solution prepared by diluting 5 mL of 0.1M *hydrochloric acid* to 250 mL with *ethanol (96%)*. Measure the *absorbance* of this solution at the maximum at 356 nm, Appendix II B, using the ethanolic hydrochloric acid solution in the reference cell. Calculate the content of $C_{20}H_{28}O_2$ in the gel taking 1350 as the value of A(1%, 1 cm) at the maximum at 356 nm.

Isradipine Tablets

Action and use

Calcium channel blocker.

DEFINITION

Isradipine Tablets contain Isradipine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of isradipine, $C_{19}H_{21}N_3O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

B. Shake a quantity of the powdered tablets containing 3 mg of Isradipine with 70 mL of *methanol (80%)* for 10 minutes, dilute to 100 mL with the same solvent and filter. The *light absorption* of the filtrate, Appendix II B, in the range 250 to 450 nm exhibits a maximum at 326 nm.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 500 mL of a 0.1% w/v solution of N,N-*dimethyldodecylamine N-oxide* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 mL of the medium and filter. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dilute 5 volumes of a 0.01% w/v solution *of isradipine BPCRS* in *methanol (80%)* to 100 volumes with a 0.1% w/v solution of N,N-*dimethyldodecylamine* N-*oxide*. Use the filtered dissolution medium as solution (2).

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography R* (5 µm) (Brownlee Spheri ODS 5µ is suitable), (b) *methanol (80%)* as the mobile phase with a flow rate of 2 mL per minute and (c) a detection wavelength of 326 nm. Inject 50 µL of each solution.

Calculate the content of $C_{19}H_{21}N_3O_5$ in the medium using the declared content of $C_{19}H_{21}N_3O_5$ in *isradipine BPCRS*.

Related substances

Carry out the test protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 50 mL of *methanol (80%)* to a number of whole tablets containing 50 mg of Isradipine, shake for 1 hour, centrifuge the resulting mixture and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 400 volumes with *methanol (80%)*. Solution (3) contains 0.0009% w/v *of isradipine impurity B BPCRS* in the mobile phase. Solution (4) contains 0.0005% w/v of *isradipine impurity D* in the mobile phase. Solution (5) contains 0.010% w/v each of *isradipine impurity D BPCRS* and *isradipine BPCRS* in *methanol (80%)*. For solution (1) allow the chromatography to proceed for 5 times the retention time of the principal peak.

The chromatographic procedure may be carried out using (a) a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Brownlee Spheri ODS 5µ is suitable), (b) as the mobile phase a mixture of 125 volumes of *acetonitrile*, 270 volumes of *tetrahydrofuran* and 625 volumes of *water* with a flow rate of 1.2 mL per minute and (c) a detection wavelength of 230 nm.

The test is not valid unless, in the chromatogram obtained with solution (5), the *resolution factor* between the two principal peaks is at least 1.5.

In the chromatogram obtained with solution (1) the area of any *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (0.25%), the area of any peak corresponding to isradipine impurity B is not greater than the area of the corresponding peak in the

www.webofpharma.com

chromatogram obtained with solution (3) (0.9%), and the area of any peak corresponding to isradipine impurity D is not greater than the area of the corresponding peak in the chromatogram obtained with solution (4) (0.5%). Calculate the percentage content of isradipine impurity B and isradipine impurity D using the respective reference solutions and the content of any unnamed impurities using solution (2). The total nominal content of impurities is not greater than 2%.

ASSAY

Carry out the assay protected from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) add 50 mL of *methanol (80%)* to a number of whole tablets containing 50 mg of Isradipine, shake for 1 hour, centrifuge the resulting mixture and dilute a volume of the clear supernatant liquid with *methanol (80%)* to produce a solution containing 0.010% w/v of Isradipine. Solution (2) is a 0.010% w/v solution of *isradipine BPCRS* in *methanol (80%)*. Solution (3) is a 0.010% w/v solution of *isradipine impurity D BPCRS* in solution (2).

The chromatographic procedure described under Related substances may be used.

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 1.5.

Calculate the content of $C_{19}H_{21}N_3O_5$ in the tablets using the declared content of $C_{19}H_{21}N_3O_5$ in *isradipine BPCRS*.

STORAGE

Isradipine Tablets should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Isradipine.

Kaolin Mixture

Kaolin Oral Suspension

DEFINITION

Kaolin Mixture is an *oral suspension* containing 20% w/v of Light Kaolin or Light Kaolin (Natural) and 5% w/v each of Light Magnesium Carbonate and Sodium Bicarbonate in a suitable vehicle with a peppermint flavour.

It should be recently prepared unless the kaolin has been sterilised.

Extemporaneous preparation

The following formula applies.

Light Kaolin or Light Kaolin (Natural)	200 g
Light Magnesium Carbonate	50 g
Sodium Bicarbonate	50 g
Concentrated Peppermint Emulsion	25 mL
Double-strength Chloroform Water	500 mL
Water	Sufficient to produce 1000 mL

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of magnesium, Mg

1.04 to 1.25% w/w.

Content of sodium bicarbonate, $NaHCO_3$

4.05 to 4.65% w/w.

TESTS

Acid-insoluble matter

13.8 to 18.4% w/w when determined by the following method. Dry and ignite the residue reserved in the Assay for magnesium to constant weight at red heat.

ASSAY

For magnesium

To 3 g add 15 mL of *water*, make acidic to *litmus paper* by the cautious addition of 2M *hydrochloric acid*, boil for 5 minutes, replacing the water lost by evaporation, cool and filter the supernatant liquid. Boil the residue with 20 mL of *water* and 10 mL of 2M *hydrochloric acid*, cool, filter through the same filter and wash the residue with *water* until the washings are free from chloride. Reserve the residue for the test for Acid-insoluble matter. Dilute the combined filtrate and washings to 100 mL with *water*. To 20 mL add 0.1 g of *L-ascorbic acid*, make slightly alkaline to *litmus paper* with 5M *ammonia* and add 10 mL of *triethanolamine*, 10 mL of *ammonia buffer pH 10.9* and 1 mL of a 10% w/v solution of *potassium cyanide*. Titrate with 0.05M *disodium edetate VS*, using *mordant black 11 solution* as indicator, to a full blue colour. Each mL of 0.05M *disodium edetate VS* is equivalent to 1.215 mg of Mg.

For sodium bicarbonate

Boil 10 g with 100 mL of *water* for 5 minutes, filter, boil the residue with 100 mL of *water* for 5 minutes and filter. Combine the filtrates, cool and titrate with 0.5M *hydrochloric acid VS* using *methyl orange-xylene cyanol FF solution* as indicator. Add 10 mL of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. After subtracting one-fifth of the volume of 0.05M *disodium edetate VS*, each mL of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of $NaHCO_3$.

Kaolin and Morphine Mixture

Kaolin and Morphine Oral Suspension

DEFINITION

Kaolin and Morphine Mixture is an *oral suspension* containing 20% w/v of Light Kaolin or Light Kaolin (Natural), 5% w/v of Sodium Bicarbonate and 4% v/v of Chloroform and Morphine Tincture in a suitable vehicle.

It should be recently prepared unless the kaolin has been sterilised.

Extemporaneous preparation

The following formula applies.

Light Kaolin or Light Kaolin (Natural)	200 g
Sodium Bicarbonate	50 g
Chloroform and Morphine Tincture	40 mL
Water	Sufficient to produce 1000 mL

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of sodium bicarbonate, $NaHCO_3$

4.65 to 5.35% w/v.

Content of anhydrous morphine, $C_{17}H_{19}NO_3$

0.0055 to 0.0080% w/v.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

www.webofpharma.com

(1) Centrifuge 10 mL of the preparation, reserving the supernatant liquid. Extract the residue with four 10-mL quantities of a mixture of 38 mL of *acetone* and 2 mL of 5M *ammonia*, centrifuging between each extraction, and evaporate the combined extracts on a water bath to about 5 mL. Mix with the reserved supernatant liquid, add 10 mL of 1M *sulfuric acid*, shake with two 10-mL quantities of *chloroform* and discard the chloroform. Add sufficient 5M *ammonia* to make the aqueous solution alkaline to *litmus paper*, extract with three 10-mL quantities of a mixture of equal volumes of *chloroform* and *ethanol (96%)*, evaporate to dryness and dissolve the residue in 0.5 mL of *ethanol (96%)*.

(2) 0.10% w/v of *morphine hydrochloride*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel G*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, heat at 105° to 110° for 30 minutes, allow to cool and spray with *dilute potassium iodobismuthate solution*.

MOBILE PHASE

10 volumes of *diethylamine*, 20 volumes of *ethyl acetate* and 70 volumes of *toluene*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

TESTS

Acid-insoluble matter

13.8 to 18.4% w/w when determined by the following method. To 3 g add 15 mL of *water*, cautiously add sufficient 2M *hydrochloric acid* to make the suspension acidic to *litmus paper*, boil for 5 minutes, replacing the water lost by evaporation, cool and filter the supernatant liquid. Boil the residue with 20 mL of *water* and 10 mL of 2M *hydrochloric acid*, cool, filter through the same filter and wash the residue with *water* until the washings are free from chloride. Dry and ignite the residue to constant weight at red heat.

ASSAY

For sodium bicarbonate

Boil 20 mL with 40 mL of *water* for 5 minutes, replacing the water lost by evaporation, add 50 mL of *ethanol (96%)* previously neutralised to *methyl red solution* and allow to stand for 1 hour. Filter and wash the residue with 100 mL of a mixture of equal volumes of the neutralised ethanol and *water*. Add 50 mL of 0.5M *hydrochloric acid VS* to the combined filtrate and washings, boil, cool and titrate the excess of hydrochloric acid with 0.5M *sodium hydroxide VS* using *methyl red solution* as indicator. Each mL of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of $NaHCO_3$.

For anhydrous morphine

Centrifuge 25 mL, reserving the supernatant liquid, and extract the residue with three 25-mL quantities of *ethanol (96%)*, centrifuging between each extraction and reserving each supernatant liquid. Add 40 mL of *water* and 7 mL of 5M *ammonia* to the combined supernatant liquids and extract the mixture with three 30-mL quantities of *chloroform*. Gently shake each extract with the same 15 mL of a mixture of 2 volumes of *water* and 1 volume of *ethanol (96%)* and discard the aqueous ethanol. Evaporate the combined chloroform solutions just to dryness, warm the residue with 10 mL of 1M *hydrochloric acid*, cool the solution, which may be slightly cloudy, add sufficient *water* to produce 50 mL and filter (Whatman No. 42 paper is suitable). To 20 mL of the filtrate add 8 mL of a freshly prepared 1% w/v solution of *sodium nitrite*, allow to stand in the dark for 15 minutes, add 12 mL of 5M *ammonia* and sufficient *water* to produce 50 mL and measure the *absorbance* of a 4-cm layer at 442 nm without delay, Appendix II B. Use in the reference cell a solution prepared in the same manner but using *water* in place of the sodium nitrite solution. Calculate the content of anhydrous morphine taking 124 as the value of A(1%, 1 cm) at the maximum at 442 nm.

STORAGE

Kaolin and Morphine Mixture should be kept in well-filled glass containers.

Kaolin Poultice

DEFINITION

Heavy Kaolin[1], finely sifted	527 g
Boric Acid, finely sifted	45 g
Methyl Salicylate	2 mL
Thymol	500 mg
Peppermint Oil	0.5 mL
Glycerol	425 g

Extemporaneous preparation

The following directions apply.

Mix the Heavy Kaolin, previously dried at 100°, and the Boric Acid with the Glycerol, heat at 120° for 1 hour, stirring occasionally, and allow to cool. Separately, dissolve the Thymol in the Methyl Salicylate, add to the cooled mixture, add the Peppermint Oil and mix thoroughly.

The heating step may be omitted if some other satisfactory means of mixing the solid ingredients with the Glycerol is used but in this case Heavy Kaolin that has been sterilised is used.

The poultice complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of boric acid, H_3BO_3

4.25 to 4.75% w/w.

ASSAY

Mix 20 g with a solution containing 10 g of D-*mannitol* in 40 mL of *water*, warm and stir until completely dispersed and titrate with 1M *sodium hydroxide VS* using *phenolphthalein solution R1* as indicator. Each mL of 1M *sodium hydroxide VS* is equivalent to 61.83 mg of H_3BO_3.

STORAGE

Kaolin Poultice should be kept in suitable containers that minimise absorption, diffusion or evaporation of the ingredients.

[1] *If an appropriate heating step, such as that described under Extemporaneous preparation, is not included in the manufacturing process, Heavy Kaolin that has been sterilised is used.*

www.webofpharma.com

Ketamine Injection

Action and use
Intravenous general anaesthetic.

DEFINITION
Ketamine Injection is a sterile solution of Ketamine Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of ketamine, $C_{13}H_{16}ClNO$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Dilute a volume of the injection with a mixture of 1 volume of 1M *sodium hydroxide* and 49 volumes of *methanol* to produce a solution containing the equivalent of 0.07% w/v of ketamine. The *light absorption*, Appendix II B, in the range 230 to 350 nm of this solution exhibits a maximum at 301 nm and shoulders at 274, 268 and 261 nm.

B. Dilute a volume of the injection with 0.1M *hydrochloric acid* to produce a solution containing the equivalent of 0.025% w/v of ketamine. The *light absorption*, Appendix II B, in the range 230 to 350 nm of this solution exhibits two maxima at 276 nm and at 269 nm and a shoulder at 260 nm.

TESTS
Acidity
pH, 3.5 to 5.5, Appendix V L.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Dilute the injection, if necessary, to produce a solution containing the equivalent of 0.1% w/v of ketamine.

(2) Dilute 1 volume of solution (1) to 200 volumes.

(3) Dilute 1 volume of solution (2) to 2 volumes.

(4) Add 2 volumes of a 0.05% w/v solution of *ketamine impurity A EPCRS* in the mobile phase to 1 volume of solution (1) and dilute the resulting solution to 100 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.0 mm) and a stainless steel pre-column (4 mm × 4.0 mm), both packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Lichrosorb RP18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 215 nm.

(f) Inject 20 µL of each solution.

(g) For solutions (1), (2) and (3), continue the chromatography for 10 times the retention time of ketamine.

MOBILE PHASE

Dissolve 0.95 g of *sodium hexanesulfonate* in 1 litre of a mixture of 25 volumes of *acetonitrile R1* and 75 volumes of *water*. To the resulting solution add 4 mL of 6M *acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks due to ketamine and ketamine impurity A is at least 1.5 and the retention time for ketamine is about 3 to 4.5 minutes.

If necessary, adjust the concentrations of water and acetonitrile in the mobile phase.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of not more than one such peak is greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.25%);

the sum of the areas of all *secondary peaks* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (1.0%).

Disregard any peak with an area less than 0.4 times the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY
Dilute a volume of the injection containing the equivalent of 20 mg of ketamine to 100 mL with 0.05M *hydrochloric acid* and mix. Measure the *absorbance* of the resulting solution at the maximum at 269 nm, Appendix II B. Measure the *absorbance* of a 0.023% w/v solution of *ketamine hydrochloride BPCRS* in 0.05M *hydrochloric acid* at the same wavelength.
Calculate the content of $C_{13}H_{16}ClNO$, using the declared content of $C_{13}H_{16}ClNO$, in *ketamine hydrochloride BPCRS*.

IMPURITIES
The impurities limited by the requirements of this monograph include impurity A, listed under Ketamine Hydrochloride.

STORAGE
Ketamine Injection should be protected from light and stored at a temperature not exceeding 30°.

LABELLING
The quantity of active ingredient is stated in terms of the equivalent amount of ketamine.

Ketoprofen Capsules

Action and use
Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION
Ketoprofen Capsules contain Ketoprofen.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of ketoprofen, $C_{16}H_{14}O_3$
92.5 to 107.5% of the stated amount.

IDENTIFICATION
Shake a quantity of the contents of the capsules containing 0.5 g of Ketoprofen with 50 mL of *chloroform* for 5 minutes, filter, evaporate to dryness using a rotary evaporator and induce crystallisation by prolonged scratching of the side of the container with a glass rod. The *infrared absorption spectrum* of the crystals, Appendix II A, is concordant with the *reference spectrum* of ketoprofen *(RS 198)*.

TESTS
Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*,

www.webofpharma.com

Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of a phosphate buffer prepared by dissolving 1.46 g of *potassium dihydrogen orthophosphate* and 20.06 g of *disodium hydrogen orthophosphate* in sufficient *water* to produce 1000 mL, adjusting the pH to 7.5 if necessary with *orthophosphoric acid*, and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 mL of the medium, filter and dilute the filtrate with sufficient of the dissolution medium to give a solution expected to contain about 0.001% w/v of Ketoprofen. Measure the *absorbance* of this solution, Appendix II B, at the maximum at 260 nm using dissolution medium in the reference cell. Calculate the total content of ketoprofen, $C_{16}H_{14}O_3$, in the medium taking 662 as the value of A(1%, 1 cm) at the maximum at 260 nm.

Related substances

Protect the solutions from light. Carry out the method for *liquid chromatography*, Appendix III D, using the following freshly prepared solutions. For solution (1) shake a quantity of the contents of the capsules containing 0.1 g of Ketoprofen with 100 mL of a mixture of 40 volumes of *acetonitrile* and 60 volumes of *water* (solvent A), filter and use the filtrate. For solution (2) dilute 1 volume of solution (1) to 50 volumes with solvent A and further dilute 1 volume to 10 volumes with solvent A. Solution (3) contains 0.0002% w/v of *impurity C EPCRS* (2-(3-carboxyphenyl)propionic acid) in solvent A. Solution (4) contains 0.0003% w/v of *impurity A EPCRS* (3-acetylbenzophenone) in solvent A. For solution (5) dilute 1 volume of solution (1) to 100 volumes with solvent A; to 1 mL add 1 mL of solution (4).

The chromatographic procedure may be carried out using (a) a stainless steel column (15 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable), (b) a mixture of 2 volumes of freshly prepared *phosphate buffer pH 3.5*, 43 volumes of *acetonitrile* and 55 volumes of *water* as the mobile phase with a flow rate of 1 mL per minute and (c) a detection wavelength of 233 nm.

Inject 20 µL of solution (5). The test is not valid unless the *resolution factor* between the peaks due to ketoprofen and 3-acetylbenzophenone is at least 7.

Inject separately 20 µL of solutions (1) to (4). Allow the chromatography to proceed for seven times the retention time of ketoprofen. In the chromatogram obtained with solution (1) the area of any peak corresponding to 2-(3-carboxyphenyl)propionic acid is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%), the area of any peak corresponding to 3-acetylbenzophenone is not greater than the area of the principal peak in the chromatogram obtained with solution (4) (0.3%), the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%) and the sum of the areas of all the *secondary peaks* other than those due to the two named impurities is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with solution (2) (0.02%).

ASSAY

Shake a quantity of the mixed contents of 20 capsules containing 50 mg of Ketoprofen for 10 minutes with 300 mL of *methanol (75%)*, mix and dilute to 500 mL with *methanol (75%)*. Allow to stand, dilute 5 mL of the supernatant liquid to 100 mL with *methanol (75%)* and measure the *absorbance* of the resulting solution at the maximum at 258 nm, Appendix II B. Calculate the content of $C_{16}H_{14}O_3$ taking 662 as the value of A(1%, 1 cm) at the maximum at 258 nm.

Ketoprofen Gel

Action and use

Cyclo-oxygenase inhibitor; analgesic; anti-inflammatory.

DEFINITION

Ketoprofen Gel is a solution of Ketoprofen in a suitable water-miscible basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of ketoprofen, $C_{16}H_{14}O_3$

92.5 to 107.5% of the stated amount.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

B. In the test for Related substances, the principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (3).

TESTS

Acidity or alkalinity

pH of a 1% w/v dispersion of the gel in *carbon dioxide-free water*, 5.0 to 7.5, Appendix V L.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel F_{254} precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 1 volume of *formic acid*, 25 volumes of *toluene* and 75 volumes of *di-isopropyl ether* as the mobile phase. Apply separately to the plate 25 µL of each of the following solutions. For solution (1) shake a quantity of the gel containing 40 mg of Ketoprofen with 5 mL of *methanol* for 15 minutes, centrifuge the mixture for 5 minutes and use the supernatant liquid. Solution (2) contains 0.032% w/v of *ketoprofen ethyl ester BPCRS* in *methanol*. Solution (3) contains 0.8 % w/v of *ketoprofen BPCRS* in *methanol*. Solution (4) contains 0.004% w/v of *ketoprofen BPCRS* in *methanol*. Solution (5) contains 0.0016% w/v of *ketoprofen BPCRS* in *methanol*. After removal of the plate, dry it at 105° for 1 hour and examine under *ultraviolet light (254 nm)*. Spray the plate with a 0.4% w/v solution of *2,4-dinitrophenylhydrazine* in *methanol* containing 5% v/v of *hydrochloric acid* and dry the plate at 105° for 30 minutes. Spray the plate with a mixture of 10 volumes of *tetraethylammonium hydroxide solution* and 10 volumes of *methanol*, dry the plate at 105° for 5 minutes and examine in daylight. By each method of visualisation any spot corresponding to ketoprofen ethyl ester in the chromatogram obtained with solution (1) is not more intense than the principal spot in the chromatogram obtained with solution (2) (4%), any other *secondary spot* is not more intense than the principal spot in the chromatogram obtained with solution (4) (0.5%) and not more than three such spots are more intense than the principal spot in the chromatogram obtained with solution (5) (0.2%).

www.webofpharma.com

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of the gel containing 10 mg of Ketoprofen with 50 mL of *methanol* for 15 minutes, centrifuge the mixture for 5 minutes, dilute 25 mL of the supernatant liquid with sufficient of a mixture of 270 mL of *acetonitrile* and 550 mL of a 0.5% w/v solution of *ammonium acetate* to produce 100 mL and mix. For solution (2) add 19 mL of *methanol* to 5 mL of a 0.1% w/v solution of *ketoprofen BPCRS* in *methanol*, add sufficient of a mixture of 270 mL of *acetonitrile* and 550 mL of a 0.5% w/v solution of *ammonium acetate* to produce 100 mL and mix.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 1 is suitable), (b) as the mobile phase with a flow rate of 2 mL per minute a mixture of 450 volumes of a solution containing 40% v/v of *methanol* and 60% v/v of *acetonitrile* and 550 volumes of a 0.5% w/v solution of *ammonium acetate*, adjusted to pH 5.9 by the addition of 10% w/w *nitric acid* and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{16}H_{14}O_3$ in the gel using the declared content of $C_{16}H_{14}O_3$ in *ketoprofen BPCRS*.

IMPURITIES
The impurities limited by the requirements of this monograph include ketoprofen ethyl ester and impurities A, B, E and F listed under Ketoprofen.

Labetalol Injection

Action and use
Alpha- and beta-adrenoceptor antagonist.

DEFINITION
Labetalol Injection is a sterile solution of Labetalol Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of labetalol hydrochloride, $C_{19}H_{24}N_2O_3$,HCl
90.0 to 110.0% of the stated amount.

CHARACTERISTICS
A colourless or very pale yellow solution.

IDENTIFICATION
A. Mix a volume containing 50 mg of Labetalol Hydrochloride with 50 mL of 0.1M *hydrochloric acid* and heat on a water bath for 30 minutes. Cool, filter, add 10 mL of *ammonia buffer pH 10.0* and extract with three 15-mL quantities of *dichloromethane*. Shake the combined extracts with 5 g of *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of labetalol *(RS 199)*.

B. The *light absorption*, Appendix II B, in the range 250 to 400 nm, of a 0.004% w/v solution of the residue obtained in test A in 0.1M *sodium hydroxide* exhibits a maximum only at 333 nm.

TESTS
Acidity
pH, 3.5 to 4.5, Appendix V L.

Free carboxylic acid and other related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Dilute a volume of the injection containing 80 mg of Labetalol Hydrochloride to about 50 mL with *ethanol (96%)*, evaporate to dryness using a rotary evaporator and dissolve the residue in 1 mL of *methanol*.

(2) Dilute 1 volume of solution (1) to 200 volumes with *methanol*.

(3) 0.160% w/v of *5-[1-hydroxy-2-(1-methyl-3-phenylpropylamino)ethyl]salicylic acid hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in a current of warm air, heat at 105° for 30 minutes, cool and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of 13.5M *ammonia*, 25 volumes of *methanol* and 75 volumes of *dichloromethane*.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to 5-[1-hydroxy-2-(1-methyl-3-phenylpropylamino)ethyl]salicylic acid is not more intense that the spot in the chromatogram obtained with solution (3) (2%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY
Dilute a volume containing 50 mg of Labetalol Hydrochloride to 100 mL with *water*. To 10 mL of the solution add 10 mL of 0.05M *sulfuric acid* and dilute to 100 mL with *water*. Measure the *absorbance* of the resulting solution at the maximum at 302 nm, Appendix II B. Calculate the content of $C_{19}H_{24}N_2O_3$,HCl in the injection taking 86 as the value of A(1%, 1 cm) at the maximum at 302 nm.

STORAGE
Labetalol Injection should be protected from light.

Labetalol Tablets

Action and use
Alpha- and beta-adrenoceptor antagonist.

DEFINITION
Labetalol Tablets contain Labetalol Hydrochloride.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of labetalol hydrochloride, $C_{19}H_{24}N_2O_3$,HCl
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. To a quantity of the powdered tablets containing 50 mg of Labetalol Hydrochloride add 50 mL of 0.1M *hydrochloric acid* and heat on a water bath for 30 minutes. Cool, filter, add 10 mL of *ammonia buffer pH 10.0* and extract with three

www.webofpharma.com

15-mL quantities of *dichloromethane*. Shake the combined extracts with 5 g of *anhydrous sodium sulfate*, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of labetalol *(RS 199)*.

B. The *light absorption*, Appendix II B, in the range 250 to 400 nm of a 0.004% w/v solution in 0.1M *sodium hydroxide* of the residue obtained in test A exhibits a maximum only at 333 nm.

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.5 g of Labetalol Hydrochloride with 10 mL of *methanol*, filter and use the filtrate.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol*.

(3) Dilute 1 volume of solution (2) to 2 volumes with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in a current of warm air, heat at 105° for 30 minutes, cool and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of 13.5M *ammonia*, 25 volumes of *methanol* and 75 volumes of *dichloromethane*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (1%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.5%).

ASSAY

Weigh and powder 20 tablets. Shake a quantity of the powdered tablets containing 1 g of Labetalol Hydrochloride with 250 mL of 0.05M *sulfuric acid* for 30 minutes. Dilute the mixture to 500 mL with 0.05M *sulfuric acid*, mix, filter and dilute 10 mL of the filtrate to 250 mL with 0.05M *sulfuric acid*. Measure the *absorbance* of the resulting solution at the maximum at 302 nm, Appendix II B. Calculate the content of $C_{19}H_{24}N_2O_3$,HCl taking 86 as the value of A(1%, 1 cm) at the maximum at 302 nm.

Lacidipine Tablets

Action and use

Calcium channel blocker.

DEFINITION

Lacidipine Tablets contain Lacidipine. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lacidipine, $C_{26}H_{33}NO_6$

95.0 to 105.0% of the stated amount.

Carry out all of the following procedures protected from light and prepare solutions immediately before use.

IDENTIFICATION

A. Shake a quantity of whole tablets containing 4 mg of Lacidipine with 50 mL of *absolute ethanol* with the aid of ultrasound for 30 minutes. Dilute to 100 mL with *absolute ethanol* and filter through a 0.45-µm membrane filter (Millipore Millex is suitable). The *light absorption* of the filtrate, Appendix II B, in the range 250 to 400 nm exhibits maxima only at 284 nm and 368 nm.

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use as the medium 500 mL of a solution prepared by mixing 100 mL of *water* with 10 mL of *polysorbate 20*, shaking gently and diluting to 1000 mL with *water* at a temperature of 37°.

PROCEDURE

(1) After 45 minutes, withdraw a sample of 10 mL of the medium and filter immediately through a 0.45-µm membrane filter (Millipore Millex is suitable), having first activated the filter with 3 mL of *methanol* followed by 5 mL of a 1% w/v solution of *polysorbate 20*. Measure the *absorbance* of the filtrate in a 2-cm cell, suitably diluted with the dissolution medium if necessary, at the maximum at 284 nm, Appendix II B, using the dissolution medium in the reference cell.

(2) Measure the *absorbance*, in a 2 cm cell, of a solution of *lacidipine BPCRS* prepared by diluting a 0.02% w/v solution in *absolute ethanol* to a suitable volume with the dissolution medium at the maximum at 284 nm, Appendix II B, using the dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of lacidipine, $C_{26}H_{33}NO_6$, in the medium using the declared content of $C_{26}H_{33}NO_6$ in *lacidipine BPCRS*.

Related substances

Carry out method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 20 mg of Lacidipine with 50 mL of *absolute ethanol* with the aid of ultrasound for 15 minutes. Cool, dilute to 100 mL with *absolute ethanol*, filter through a 0.45-µm membrane filter (Millipore Millex is suitable) and dilute 5 volumes of the filtrate to 20 volumes with *hexane*.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) Dilute 1 volume of a 0.1% w/v solution of *lacidipine impurity standard BPCRS* in *absolute ethanol* to 5 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm x 4.6 mm) packed with *cyanosilyl silica gel for chromatography* (5 µm) (Spherisorb CN is suitable).

www.webofpharma.com

(b) Use isocratic elution using the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use ambient column temperature.

(e) Use a detection wavelength of 240 nm.

(f) Inject 20 µL of each solution.

(g) If necessary adjust the composition of the mobile phase so that, in the chromatogram obtained with solution (3), the retention time of the peak due to lacidipine is about 10 minutes.

(h) For solution (1) allow the chromatography to proceed for 2 times the retention time of the principal peak.

MOBILE PHASE

3 volumes of *absolute ethanol* and 97 volumes of n-*hexane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *lacidipine impurity standard BPCRS*.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak due to lacidipine impurity B is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%, taking into account the correction factor of 0.5);

the area of any other *secondary peak* is not greater than half the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the total nominal content of impurities is not greater than 2.5%;

disregard any peak with a relative retention time of 1.5 with respect to the peak due to lacidipine impurity B.

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Lacidipine comply with the requirements stated under Tablets using the following method of analysis. Place one tablet in 50 mL of *absolute ethanol*, disperse the tablet completely with the aid of ultrasound for 30 minutes crushing with a glass rod if it does not disintegrate, and mix. Cool and filter through a 0.45-µm membrane filter (Millipore Millex is suitable). If necessary further dilute with *absolute ethanol* to produce a solution containing 0.004% w/v of Lacidipine. Measure the *absorbance* of the resulting solution at the maximum at 368 nm, Appendix II B, using *absolute ethanol* in the reference cell. Calculate the content of $C_{26}H_{33}NO_6$ in each tablet from the *absorbance* obtained from a 0.004% w/v solution of *lacidipine BPCRS* in *absolute ethanol* and using the declared content of $C_{26}H_{33}NO_6$ in *lacidipine BPCRS*.

ASSAY

Carry out method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse with the aid of ultrasound 10 whole tablets in 50 mL of *absolute ethanol* for 10 minutes, cool and filter through a 0.45-µm membrane filter (Millipore Millex is suitable). Dilute a quantity of the filtrate with sufficient mobile phase to produce a solution containing 0.01% w/v of Lacidipine.

(2) Dilute 5 volumes of a 0.04% w/v solution of *lacidipine BPCRS* in *absolute ethanol* to 20 volumes with the mobile phase.

(3) Dilute 1 volume of a 0.1% w/v solution of *lacidipine impurity standard BPCRS* in *absolute ethanol* to 5 volumes with the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *lacidipine impurity standard BPCRS*.

DETERMINATION OF CONTENT

Calculate the content of $C_{26}H_{33}NO_6$ in the tablets using the declared content of $C_{26}H_{33}NO_6$ in *lacidipine BPCRS*.

STORAGE

Lacidipine Tablets should be protected from light.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Lacidipine.

Lactic Acid Pessaries

DEFINITION

Lactic Acid Pessaries are moulded pessaries containing Lactic Acid in a suitable basis.

The pessaries comply with the requirements stated under Vaginal Preparations and with the following requirements.

Content of lactic acid, $C_3H_6O_3$

95.0 to 105.0% of the stated amount.

ASSAY

Weigh five pessaries, melt together by warming and allow to cool, stirring continuously. Dissolve a quantity of the mass containing 1 g of Lactic Acid in 50 mL of *water*, add 50 mL of 0.5M *sodium hydroxide VS*, boil gently for 5 minutes, cool and titrate the excess of alkali with 0.5M *hydrochloric acid VS* using *phenolphthalein solution R1* as indicator. Each mL of 0.5M *sodium hydroxide VS* is equivalent to 45.04 mg of $C_3H_6O_3$.

Lactulose Oral Powder

Action and use

Osmotic laxative.

DEFINITION

Lactulose Oral Powder consists of Lactulose with or without lesser amounts of other sugars including lactose and galactose.

The oral powder complies with the requirements stated under Oral Powders and with the following requirements.

Content of lactulose, $C_{12}H_{22}O_{11}$

95.0 to 102.0%.

Dissolve 3 g in carbon dioxide-free water and dilute to 50 mL with the same solvent (solution S).

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using *silica gel G* as the coating substance and a mixture of 10 volumes of *glacial acetic acid*, 15 volumes of a 5% w/v solution of *boric acid*, 20 volumes of *methanol*

www.webofpharma.com

and 55 volumes of *ethyl acetate* as the mobile phase. Apply separately to the plate 2 µL of each of the following solutions. For solution (1) dissolve 50 mg of the oral powder in *water* and dilute to 10 mL with the same solvent. For solution (2) dissolve 50 mg of *lactulose BPCRS* in *water* and dilute to 10 mL with the same solvent. After removal of the plate, dry it at 100° to 105° for 5 minutes and allow to cool. Spray the plate with a 0.1% w/v solution of *1,3-dihydroxynaphthalene* in a mixture of 10 volumes of *sulfuric acid* and 90 volumes of *methanol*. Heat the plate at 110° for 5 minutes. The principal spot in the chromatogram obtained with solution (1) is similar in position, colour and size to the principal spot in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) is similar in position and size to the principal peak in the chromatogram obtained with solution (3).

C. Dissolve 0.05 g in 10 mL of *water*. Add 3 mL of *cupri-tartaric solution* and heat. A red precipitate is formed.

D. Dissolve 0.125 g in 5 mL of *water*. Add 5 mL of *ammonia*. Heat on a water bath at 80° for 10 minutes. A red colour develops.

E. Complies with the test for Specific optical rotation.

TESTS

Clarity and colour of solution

Solution S is *clear*, Appendix IV A, and not more intensely coloured than *reference solution* BY_5, Appendix IV B, Method II.

pH

To 10 mL of solution S add 0.1 mL of a saturated solution of *potassium chloride*. The pH of the solution is 3.0 to 7.0, Appendix V L.

Specific optical rotation

Dissolve 1.25 g in *water*, add 0.2 mL of 13. 5M *ammonia* and dilute to 25 mL with *water*. The *specific optical rotation* is –46.0° to –50.0°, Appendix V G.

Related substances

In the Assay, in the chromatogram obtained with solution (1), the sum of the areas of any peaks corresponding to the principal peaks in the chromatograms obtained with solutions 5, 6, 7, 8 and 9 respectively (galactose, lactose, epilactose, tagatose and fructose) is not greater than the area of the peak corresponding to lactulose in the chromatogram obtained with solution (2) (3%).

Methanol

Carry out the method for *head-space gas chromatography*, Appendix III B, Method II. Mix 0.5 mL of *propan-1-ol* with 100 mL of *water*. Dilute 1 mL to 100 mL with *water*. Dilute 5 mL to 50 mL with *water* (internal standard solution). For solution (1) add 1 mL of the internal standard solution and 5 µL of a 0.1% v/v solution of *methanol* to 79 mg of the oral powder in a 20 mL vial. For solution (2) add 5 µL of a 0.1% v/v solution of *methanol* to 1 mL of the internal standard solution in a 20 mL vial.

The chromatographic procedure may be carried out using (a) a column (2 m × 2 mm) packed with *ethylvinylbenzene–divinylbenzene co-polymer* (180 µm), (b) *helium for chromatography* as the carrier gas at a flow rate of 30 mL per minute and (c) a flame-ionisation detector, maintaining the temperature of the column at 140°, that of the injection port at 200° and that of the detector at 220°. Maintain each solution at 60° for 1 hour, pressurise for 1 minute and transfer onto the column 1 mL of the gaseous phase.

In the chromatogram obtained with solution (1), the ratio of the area of the methanol peak to that of the internal standard peak is not greater than twice the corresponding ratio for the chromatogram obtained with solution (2) (50 ppm, calculated assuming the density of methanol to be 0.79 g/mL at 20°).

Boron

Avoid where possible the use of glassware. Prepare a reference solution as follows. Dissolve 50 mg of *boric acid* in *water* and dilute to 100 mL with the same solvent. Dilute 5 mL of this solution to 100 mL with *water*. Keep in a well-closed polyethylene container. In four polyethylene 25 mL flasks, place 0.50 g of the oral powder dissolved in 2 mL of *water* (solution A), 0.50 g of the oral powder dissolved in 1 mL of the reference solution and 1 mL of *water* (solution B), 1 mL of the reference solution and 1 mL of *water* (solution C) and 2 mL of *water* (solution D). To each flask, add 4 mL of *acetate-edetate buffer solution pH 5.5*. Mix and add 4 mL of freshly prepared *azomethine H solution*. Mix and allow to stand for 1 hour. Measure the *absorbance*, Appendix II B, of solutions A, B and C at 420 nm, using solution D as the compensation liquid. The test is not valid unless the absorbance of solution C is at least 0.25. The absorbance of solution B is not less than twice that of solution A (9 ppm of boron).

Lead

Complies with the *limit test for lead in sugars*, Appendix VII (0.5 ppm).

Water

Not more than 2.5%, Appendix IX C, Method I. Use 0.5 g.

Sulfated ash

Not more than 0.1%, Appendix IX A, Method II. Use 1 g.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) dissolve 1 g of the oral powder in 10 mL of *water*, add 12.5 mL of *acetonitrile* with gentle heating and dilute to 25 mL with *water*. For solution (2) add 47.5 mL of *acetonitrile* to 3 mL of solution (1) with gentle heating and dilute to 100 mL with *water*. For solution (3) dissolve 1 g of *lactulose BPCRS* in 10 mL of *water*, add 12.5 mL of *acetonitrile* with gentle heating and dilute to 25 mL with *water*. For solution (4) dissolve 20 mg of *lactulose BPCRS* and 20 mg of *epilactose EPCRS* in 2 mL of *water*, add 2.5 mL of *acetonitrile* with gentle heating and dilute to 5 mL with *water*. For solution (5) dissolve 0.2 g of *galactose* in 20 mL of *water*, add 25 mL of *acetonitrile* with gentle heating and dilute to 50 mL with *water*. For solution (6) dissolve 0.2 g of *lactose* in 20 mL of *water*, add 25 mL of *acetonitrile* with gentle heating and dilute to 50 mL with *water*. For solution (7) dissolve 20 mg of *epilactose EPCRS* in 2 mL of *water*, add 2.5 mL of *acetonitrile* with gentle heating and dilute to 5 mL with *water*. For solution (8) dissolve 0.2 g of *tagatose* in 20 mL of *water*, add 25 mL of *acetonitrile* with gentle heating and dilute to 50 mL with *water*. For solution (9) dissolve 0.2 g of *fructose* in 20 mL of *water*, add 25 mL of *acetonitrile* with gentle heating and dilute to 50 mL with *water*.

The chromatographic procedure may be carried out using (a) a stainless steel column (5 cm × 4.6 mm) followed by a stainless steel column (15 cm × 4.6 mm), both packed with *aminopropylsilyl silica gel for chromatography* (3 µm) and maintained at 37° to 39°, (b) as mobile phase with a flow

www.webofpharma.com

rate of 1.0 mL per minute a mixture prepared as follows: dissolve 0.253 g of *sodium dihydrogen orthophosphate* in 220 mL of *water* and add 780 mL of *acetonitrile*, and (c) as detector a refractometer maintained at a constant temperature.

When the chromatograms are recorded in the prescribed conditions, the retention time of lactulose is about 18.3 minutes and retention times relative to lactulose are about 0.38 for tagatose, 0.42 for fructose, 0.57 for galactose, 0.90 for epilactose and 1.17 for lactose.

Inject 20 µL of solution (4). The test is not valid unless the *resolution factor* between the peaks corresponding to lactulose and epilactose is at least 1.3. If necessary, adjust the concentration of *acetonitrile* in the mobile phase to between 75.0% and 82.0% v/v to achieve the prescribed resolution.

Inject separately 20 µL of solution (1) and 20 µL of solution (3) and continue the chromatography for 2.5 times the retention time of lactulose. Calculate the percentage content of $C_{12}H_{22}O_{11}$ (lactulose) from the areas of the peaks and from the declared content of $C_{12}H_{22}O_{11}$ in *lactulose BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed in the monograph for Lactulose.

Lamivudine Tablets

Action and use

Nucleoside reverse transcriptase inhibitor; antiviral (HIV).

DEFINITION

Lamivudine Tablets contain Anhydrous Lamivudine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lamivudine, $C_8H_{11}N_3O_3S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a quantity of the powdered tablets containing 50 mg of Anhydrous Lamivudine add 20 mL of *methanol*, shake, filter and evaporate the filtrate to dryness. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of lamivudine (*RS 451*).

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2 and rotate the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 280 nm, Appendix II B, using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *lamivudine BPCRS* using dissolution medium in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of lamivudine, $C_8H_{11}N_3O_3S$, in the medium from the absorbances obtained and using the declared content of $C_8H_{11}N_3O_3S$ in *lamivudine BPCRS*.

LIMIT

The amount of lamivudine released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.3 g of Anhydrous Lamivudine in 60 mL of *water* with the aid of ultrasound for 30 minutes, dilute to 100 mL and filter. Dilute 1 volume of the filtrate to 10 volumes with the mobile phase.

(2) Dilute 1 volume of solution (1) to 50 volumes with the mobile phase and further dilute 1 volume to 10 volumes with the mobile phase.

(3) Dilute 1 volume of solution (2) to 2 volumes with the mobile phase.

(4) 0.03% w/v of *lamivudine impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil BDS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 277 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 volumes of *methanol* and 95 volumes of 0.025M *ammonium acetate*, the pH of the aqueous component having previously been adjusted to 4.0 with *glacial acetic acid*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4):

the chromatogram closely resembles the reference chromatogram supplied with *lamivudine impurity standard BPCRS;*

the *resolution factor* between the peaks due to lamivudine impurity B and lamivudine is at least 2.0.

LIMITS

Using the chromatogram obtained with solution (4) and the reference chromatogram supplied with *lamivudine impurity standard BPCRS* identify any peaks in solution (1) corresponding to impurity A and impurity B.

In the chromatogram obtained with solution (1):

the area of any peak corresponding to lamivudine impurity A is not greater than 1.5 times the area of the peak due to lamivudine in the chromatogram obtained with solution (2) (0.3%);

the area of any peak corresponding to lamivudine impurity B is not greater than the area of the peak due to lamivudine in the chromatogram obtained with solution (2) (0.2%);

the area of any other *secondary peak* is not greater than the area of the peak due to lamivudine in the chromatogram obtained with solution (2) (0.2%);

www.webofpharma.com

the sum of the areas of all the *secondary peaks* is not greater than 3 times the area of the peak due to lamivudine in the chromatogram obtained with solution (2) (0.6%).

Disregard any peak with an area less than the area of the peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 0.3 g of Anhydrous Lamivudine in 60 mL of *water* with the aid of ultrasound for 30 minutes, dilute to 100 mL with the mobile phase and filter. Dilute 1 volume of the filtrate to 10 volumes with the mobile phase.

(2) 0.03% w/v of *lamivudine BPCRS* in the mobile phase.

(3) 0.03% w/v of *lamivudine impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3):

the *resolution factor* between the peaks due to lamivudine impurity B and lamivudine is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_8H_{11}N_3O_3S$ in the tablets using the declared content of $C_8H_{11}N_3O_3S$ in *lamivudine BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A, B, C, E, F, G, H, I and J listed under Anhydrous Lamivudine.

Lamotrigine Tablets

Action and use

Antiepileptic.

DEFINITION

Lamotrigine Tablets contain Lamotrigine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lamotrigine, $C_9H_7Cl_2N_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

(1) To a quantity of the powdered tablets containing 0.1 g of Lamotrigine add 20 mL of *methanol*, shake well, dilute to 100 mL with *methanol*, filter and use the filtrate.

(2) 0.1% w/v of *lamotrigine BPCRS*.

(3) 0.1% w/v each of *lamotrigine BPCRS* and *carbamazepine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and immediately examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of *concentrated ammonia*, 10 volumes of *methanol* and 85 volumes of *ethyl acetate*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the chromatogram obtained with solution (1) shows a principal peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2 and rotate the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium and filter. Measure the *absorbance* of the filtrate, Appendix II B, diluted with the dissolution medium if necessary, at the maximum at 267 nm using dissolution medium in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *lamotrigine BPCRS* in the dissolution medium.

DETERMINATION OF CONTENT

Calculate the total content of lamotrigine, $C_9H_7Cl_2N_5$, in the medium from the absorbances obtained and using the declared content of $C_9H_7Cl_2N_5$ in *lamotrigine BPCRS*.

LIMITS

The amount of Lamotrigine released is not less than 75% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 20 volumes of *methanol* and 80 volumes of 0.1M *hydrochloric acid* (solution A).

(1) Shake a quantity of the powdered tablets containing 0.20 g of Lamotrigine with 20 mL of *methanol*, dilute to 100 mL with 0.1M *hydrochloric acid*, filter and use the filtrate.

(2) Dilute 1 volume of solution (1) to 100 volumes with 0.1M *hydrochloric acid* and dilute 2 volumes of the resulting solution to 10 volumes with solution A.

(3) 0.2% w/v of *lamotrigine impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2.0 mL per minute.

(d) Use an ambient column temperature.

www.webofpharma.com

(e) Use a detection wavelength of 275 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.5 volumes of *octylamine*, 20 volumes of *glacial acetic acid*, 100 volumes of *acetonitrile*, 100 volumes of *methanol* and 700 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *lamotrigine impurity standard BPCRS* and the *resolution factor* between the peaks due to lamotrigine and saccharin sodium is at least 5.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of the peak corresponding to impurity A is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than 0.5 of the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in solution A described under Related substances.

(1) Shake a quantity of the powdered tablets containing 0.2 g of Lamotrigine with 20 mL of *methanol*, add sufficient 0.1M *hydrochloric acid* to produce 100 mL and filter. Dilute 1 volume of the filtrate to 10 volumes with solution A.

(2) Shake 50 mg of *lamotrigine BPCRS* with 20 mL of *methanol* and add sufficient 0.1M *hydrochloric acid* to produce 100 mL. Dilute 2 volumes to 5 volumes with solution A.

(3) 0.2% w/v of *lamotrigine impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *lamotrigine impurity standard BPCRS* and the *resolution factor* between the peaks due to lamotrigine and saccharin sodium is at least 5.0.

DETERMINATION OF CONTENT

Calculate the total content of $C_9H_7Cl_2N_5$ in the tablets using the declared content of $C_9H_7Cl_2N_5$ in *lamotrigine BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurity A listed under Lamotrigine.

Dispersible Lamotrigine Tablets

Action and use
Antiepileptic.

DEFINITION

Dispersible Lamotrigine Tablets contain Lamotrigine in a suitable dispersible basis.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lamotrigine, $C_9H_7Cl_2N_5$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

(1) Shake a quantity of the powdered tablets containing 20 mg of Lamotrigine in 20 mL, dilute to 100 mL, filter and use the filtrate.

(2) 0.02% w/v of *lamotrigine BPCRS*.

(3) 0.02% w/v each of *lamotrigine BPCRS* and *carbamazepine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}*.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and immediately examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of *concentrated ammonia*, 10 volumes of *methanol* and 85 volumes of *ethyl acetate*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Disintegration
Comply with the requirements for Dispersible Tablets.

Dissolution
Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a sample of the medium, filter and dilute 5 mL of the filtrate to 10 mL with 0.3M *sodium hydroxide*. Measure the *absorbance* of the solution at 307 nm, Appendix II B, using 0.1M *sodium hydroxide* in the reference cell. Adjust the concentration with *water* if necessary.

www.webofpharma.com

(2) Prepare a suitable solution of *lamotrigine BPCRS* in the dissolution medium, using 0.3M *sodium hydroxide* to produce a solution of the strength expected in solution (1). Measure the *absorbance* of the solution at 307 nm, Appendix II B, using 0.1M *sodium hydroxide* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of lamotrigine, $C_9H_7Cl_2N_5$, in the medium using the declared content of $C_9H_7Cl_2N_5$ in *lamotrigine BPCRS*.

LIMITS

The amount of lamotrigine released is not less than 80% (Q) of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 20 mg of Lamotrigine with 40 mL of *water* and add 40 mL of *methanol*. Dilute to 100 mL with *methanol (40%)*, filter and use the filtrate.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol (40%)* and dilute 1 volume of the resulting solution to 5 volumes with *methanol (40%)*.

(3) 0.02% w/v of *lamotrigine impurity standard BPCRS* (containing lamotrigine, saccharin sodium and impurity A) in *methanol (40%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS1 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 275 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.5 volumes of *octylamine*, 20 volumes of *glacial acetic acid*, 100 volumes of *acetonitrile*, 100 volumes of *methanol* and 700 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *lamotrigine impurity standard BPCRS* and the *resolution factor* between the peaks due to lamotrigine and saccharin sodium is at least 5.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all such peaks is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Lamotrigine comply with the requirement stated under Tablets using the following method of analysis.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake one tablet with 10 mL of *water*, add sufficient *methanol* to produce 25 mL and filter.

(2) 0.008% w/v of *lamotrigine BPCRS* in *methanol (40%)*.

(3) 0.02% w/v of *lamotrigine impurity standard BPCRS* (containing lamotrigine, saccharin sodium and impurity A) in *methanol (40%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *lamotrigine impurity standard BPCRS* and the *resolution factor* between the peaks due to lamotrigine and saccharin sodium is at least 5.0.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_7Cl_2N_5$ in each tablet using the declared content of $C_9H_7Cl_2N_5$ in *lamotrigine BPCRS*.

ASSAY

For tablets containing less than 2 mg and/or less than 2% w/w of lamotrigine.

Use the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing 2 mg or more than 2% w/w of lamotrigine.

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 20 mg of Lamotrigine with 60 mL of *water*, add sufficient *methanol* to produce 100 mL and filter.

(2) 0.02% w/v of *lamotrigine BPCRS* in *methanol (40%)*.

(3) 0.02% w/v of *lamotrigine impurity standard BPCRS* (containing lamotrigine, saccharin sodium and impurity A) in *methanol (40%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) closely resembles the chromatogram supplied with *lamotrigine impurity standard BPCRS* and the *resolution factor* between the peaks due to lamotrigine and saccharin sodium is at least 5.0.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_7Cl_2N_5$ in the tablets using the declared content of $C_9H_7Cl_2N_5$ in *lamotrigine BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurity A listed under Lamotrigine.

www.webofpharma.com

Gastro-resistant Lansoprazole Capsules

Action and use
Proton pump inhibitor; treatment of peptic ulcer disease.

DEFINITION
Gastro-resistant Lansoprazole Capsules contain Lansoprazole. They are covered with a gastro-resistant coating or prepared from granules or particles covered with a gastro-resistant coating.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of lansoprazole, $C_{16}H_{14}F_3N_3O_2S$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Shake a quantity of the finely powdered contents of the capsules containing 30 mg of Lansoprazole with 50 mL of *methanol*, filter and dilute 1 volume to 50 volumes. The *light absorption*, Appendix II B, in the range 220 nm to 350 nm exhibits a maximum at 284 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution
Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

Mix 11 volumes of 0.25M *trisodium orthophosphate* and 22 volumes of 0.5M *anhydrous disodium hydrogen orthophosphate*, dilute to 100 volumes with *water* and adjust the pH, if necessary, to 11.0 with *orthophosphoric acid* or 10M *sodium hydroxide*, as appropriate (solution A).

Mix 1 volume of 10M *sodium hydroxide* with 99 volumes of *0.05M phosphate buffer solution pH 4.5* (solution B).

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 150 revolutions per minute.

(b) Use as the media the solutions described sequentially below.

First stage (pH 4.5)
Use as the medium 700 mL of *0.05M phosphate buffer solution pH 4.5*. After 45 minutes, withdraw 5 mL of the medium, filter, dilute to 25 mL with solution A and retain the samples for analysis as described below. Proceed immediately to the final stage.

Final stage (pH 6.8)
Within 5 minutes, add 200 mL of solution B at 37° to the vessel. Maintain the rotation speed at 150 revolutions per minute and continue to operate the apparatus for 45 minutes. Withdraw 5 mL of the medium, filter, dilute to 25 mL with solution A and retain the samples for analysis as described below.

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Use the sample solutions taken above.

(2) Dissolve a sufficient quantity of *lansoprazole BPCRS* in solution A and dilute with sufficient *water* to produce a final solution of the same concentration as that expected for solution (1).

CHROMATOGRAPHIC CONDITIONS
The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT
Calculate the total content of $C_{16}H_{14}F_3N_3O_2S$ in the medium using the declared content of $C_{16}H_{14}F_3N_3O_2S$ in *lansoprazole BPCRS*.

LIMITS
The amount of lansoprazole released after the first stage is not more than 10% of the stated amount. The amount of lansoprazole released after the final stage is not less than 75% (Q) of the stated amount.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions protected from light.

Mix 1 volume of *triethylamine* with 60 volumes of *water*, adjust the pH to 10.5 using *orthophosphoric acid*, add 40 volumes of *acetonitrile* and mix (solvent A).

(1) Shake a quantity of the finely powdered contents of the capsules containing 50 mg of Lansoprazole with 50 mL of solvent A and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent A and dilute a further 1 volume to 5 volumes with solvent A.

(3) Dilute 1 volume of solution (2) to 4 volumes with solvent A.

(4) 0.1% w/v of *lansoprazole impurity standard BPCRS* in solvent A.

(5) 0.0004% w/v of *2-mercaptobenzimidazole* (impurity E) in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *amidohexadecylsilyl silica gel for chromatography* (5 µm). (Supelcosil LC-ABZ is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 285 nm.

(f) Inject 10 µL of each solution.

(g) Identify any peaks in the chromatogram obtained with solution (1) corresponding to lansoprazole impurities A and B using solution (3).

MOBILE PHASE

1 volume of *triethylamine*, 60 volumes of *water*, adjusted to pH 6.2 using *orthophosphoric acid* and 40 volumes of *acetonitrile*.

SYSTEM SUITABILITY
The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to lansoprazole and impurity B is at least 3.0.

LIMITS
In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any peak corresponding to impurity B is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

www.webofpharma.com

the area of any peak corresponding to impurity E is not greater than the area of the principal peak in the chromatogram obtained with solution (5) (0.4%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all the *secondary peaks* is not more than 2.0%.

Disregard any peak with an area less the area of the principal peak in the chromatogram obtained with solution (3) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions and protect from light.

Mix 1 volume of *triethylamine* with 60 volumes of *water*, adjust the pH to 10.5 using *orthophosphoric acid*, add 40 volumes of *acetonitrile* and mix (solvent A).

(1) Add a quantity of the finely powdered mixed contents of 20 capsules containing 20 mg of Lansoprazole to 100 mL of solvent A, shake for 30 minutes and filter.

(2) 0.02% w/v of *lansoprazole BPCRS*.

(3) 0.01% w/v of *lansoprazole impurity standard BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to lansoprazole and impurity B is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{14}F_3N_3O_2S$ in the capsules using the declared content of $C_{16}H_{14}F_3N_3O_2S$ in *lansoprazole BPCRS*.

Gastro-resistant Lansoprazole Tablets

Action and use

Proton pump inhibitor; treatment of peptic ulcer disease.

DEFINITION

Gastro-resistant Lansoprazole Tablets contain Lansoprazole. They are covered with a gastro-resistant coating or prepared from granules or particles covered with a gastro-resistant coating.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lansoprazole, $C_{16}H_{14}F_3N_3O_2S$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A Shake a quantity of the powdered tablets containing 30 mg of Lansoprazole with 50 mL of *methanol*, filter and dilute 1 volume to 50 volumes. The *light absorption*, Appendix II B, in the range 220 nm to 350 nm exhibits a maximum at 285 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

Mix 11 volumes of 0.25M *trisodium orthophosphate* and 22 volumes of 0.5M *anhydrous disodium hydrogen orthophosphate*, dilute to 100 volumes with *water* and adjust the pH, if necessary, to 11.0 with *orthophosphoric acid* or 10M *sodium hydroxide*, as appropriate (solution A).

Mix 1 volume of *triethylamine* with 60 volumes of *water*, adjust the pH to 10.5 using *orthophosphoric acid*, add 40 volumes of *acetonitrile* and mix (solvent A).

(1) Shake a quantity of the powdered tablets containing 50 mg of Lansoprazole with 50 mL of solvent A and filter.

(2) Dilute 1 volume of solution (1) to 100 volumes with solvent A and dilute a further 1 volume to 5 volumes with solvent A.

www.webofpharma.com

(3) Dilute 1 volume of solution (2) to 4 volumes with solvent A.

(4) 0.1% w/v of *lansoprazole impurity standard BPCRS* in solvent A.

(5) 0.0003% w/v of *2-mercaptobenzimidazole* (impurity E) in solvent A.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *amidohexadecylsilyl silica gel for chromatography* (5 µm) (Supelcosil LC-ABZ is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 285 nm.

(f) Inject 10 µL of each solution.

(g) Identify any peaks in the chromatogram obtained with solution (1) corresponding to lansoprazole impurities A and B using solution (3).

MOBILE PHASE

1 volume of *triethylamine,* 60 volumes of *water,* adjusted to pH 6.2 using *orthophosphoric acid* and mix the solution with 40 volumes of *acetonitrile.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution* between the peaks due to lansoprazole and impurity B is at least 3.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the area of any peak corresponding to impurity B is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.4%);

the area of any peak corresponding to impurity E is not greater than the area of the principal peak in the chromatogram obtained with solution (5) (0.3%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all the *secondary peaks* is not more than 2.0%.

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (3) (0.05%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions in solvent A, protected from light.

Mix 1 volume of *triethylamine* with 60 volumes of *water,* adjust the pH to 10.5 using *orthophosphoric acid,* add 40 volumes of *acetonitrile* and mix (solvent A).

(1) To a quantity of the powdered tablets containing 50 mg of Lansoprazole add 50 mL of solvent A, shake for 30 minutes and filter. Dilute 1 volume to 5 volumes with solvent A.

(2) 0.02% w/v of *lansoprazole BPCRS.*

(3) 0.01% w/v of *lansoprazole impurity standard BPCRS.*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to lansoprazole and impurity B is at least 3.0.

DETERMINATION OF CONTENT

Calculate the content of lansoprazole, $C_{16}H_{14}F_3N_3O_2S$, in the tablets using the declared content of $C_{16}H_{14}F_3N_3O_2S$ in *lansoprazole BPCRS.*

Leuprorelin Injection

Action and use

Gonadotropin releasing hormone (gonadorelin) analogue; treatment of prostate cancer.

DEFINITION

Leuprorelin Injection is a sterile suspension of Leuprorelin in a suitable liquid. It is prepared by suspending Leuprorelin for Injection in the requisite amount of the liquid stated on the label immediately before use.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Acidity

pH of the injection when constituted in accordance with the manufacturer's instructions, 5.0 to 7.0, Appendix V L.

STORAGE

Leuprorelin Injection should be used immediately after preparation.

LEUPRORELIN FOR INJECTION

DEFINITION

Leuprorelin for Injection is a sterile powder consisting of Leuprorelin with or without excipients. It is supplied in a sealed container. Leuprorelin for Injection is formulated so that the medicament is released over a period of weeks.

The contents of the sealed container comply with the requirements for Powders for Injections or Infusions stated under Parenteral Preparations and with the following requirements.

Content of leuprorelin, $C_{59}H_{84}N_{16}O_{12}$

95.0 to 105.0% of the stated amount of the peptide.

IDENTIFICATION

A. To a quantity of the powder containing the equivalent of 4.5 mg of the peptide in a separating funnel add 15 mL of *dichloromethane* and 35 mL of a 1.15% w/v solution of *ammonium dihydrogen orthophosphate,* previously adjusted to pH 6.0 with *dilute ammonia R1.* Shake for 1 minute and extract the aqueous layer. Dilute the aqueous extract to 50 mL with a 1.15% w/v solution of *ammonium dihydrogen orthophosphate,* previously adjusted to pH 6.0 with 6M *ammonia.* The *light absorption* of the resulting solution, Appendix II B, exhibits a maximum between 277 and 282 nm.

B In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) corresponds to that of the principal peak in the chromatogram obtained with solution (2).

www.webofpharma.com

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions and the *normalisation procedure*.

(1) To a quantity of the powder containing the equivalent of 4.5 mg of the peptide in a separating funnel add 15 mL of *dichloromethane* and 35 mL of a 1.15% w/v solution of *ammonium dihydrogen orthophosphate*, previously adjusted to pH 6.0 with *dilute ammonia R1*. Shake for 1 minute and extract the aqueous layer. Dilute the aqueous extract to 50 mL with a 1.15% w/v solution of *ammonium dihydrogen orthophosphate*, previously adjusted to pH 6.0 with 6M *ammonia*.

(2) 0.1% w/v of *leuprorelin EPCRS* in the mobile phase.

(3) Dilute 5 volumes of solution (2) to 50 volumes with *water*. To 5 mL of the solution add 100 µL of 1M *sodium hydroxide* and shake vigorously. Heat in an oven at 100° for 60 minutes, cool immediately and add 50 µL of 2M *orthophosphoric acid*. Shake vigorously (generation of impurity B).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Wakosil-II 3C18 HG is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 to 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL each of solutions (1) and (3).

MOBILE PHASE

150 volumes of a mixture of 2 volumes of *propan-1-ol* and 3 volumes of *acetonitrile* and 850 volumes of the buffer solution prepared as described below.

To prepare the buffer solution, dissolve about 15.2 g of *triethylamine* in 800 mL of *water*, adjust to pH 3.0 with *orthophosphoric acid* and add sufficient *water* to produce 1000 mL.

When the chromatograms are recorded under the prescribed conditions the relative retentions with reference to leuprorelin (retention time = 41 to 49 minutes) are: impurity E = about 0.7; impurity F = about 0.7; impurity H = about 0.78; impurity A = about 0.8; impurity B = about 0.9; impurity I = about 0.94; impurity J = about 1.09; impurity C = about 1.2; impurity G = about 1.3; impurity K = about 1.31; impurity D = about 1.5.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks corresponding to impurity B and leuprorelin is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity D is not greater than 1.0%;

the areas of any peaks corresponding to impurities A, B and C are not greater than 0.5%;

the area of any other *secondary peak* is not greater than 0.5%;

the sum of the areas of any *secondary peaks* is not greater than 2.5%.

Disregard any peak with an area less than 0.1%.

Water

Not more than 5.0 % w/w, Appendix IX C, Method III.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. The endotoxin limit concentration is 11.6 IU per mg of leuprorelin.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the powder containing the equivalent of 9 mg of the peptide in 100 mL of *dimethyl sulfoxide*.

(2) 0.01% w/v of *leuprorelin EPCRS* dissolved in the mobile phase.

(3) 0.1% w/v of *leuprorelin EPCRS* dissolved in the mobile phase.

(4) Dilute 5 volumes of solution (3) to 50 volumes with *water*. To 5 mL of the solution add 100 µL of 1M *sodium hydroxide* and shake vigorously. Heat in an oven at 100° for 60 minutes, cool immediately and add 50 µL of 2M *orthophosphoric acid*. Shake vigorously (generation of impurity B).

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (3 µm) (Wakosil-II 3C18 AR is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.8 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of solutions (1), (2) and (4).

MOBILE PHASE

150 volumes of a mixture of 2 volumes of *propan-1-ol* and 3 volumes of *acetonitrile* and 850 volumes of the buffer solution as described below.

To prepare the buffer solution, add 15.2 g of *triethylamine* to 800 mL of *water*, adjust to pH 3.0 with *orthophosphoric acid* and add sufficient *water* to produce 1000 mL.

When the chromatograms are recorded under the prescribed conditions the relative retention time of impurity B with reference to leuprorelin (retention time is approximately 22 minutes) is approximately 0.9.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (4), the *resolution factor* between the peaks corresponding to impurity B and that of leuprorelin is at least 1.2.

DETERMINATION OF CONTENT

Calculate the content of $C_{59}H_{84}N_{16}O_{12}$ using the declared content of $C_{59}H_{84}N_{16}O_{12}$ in *leuprorelin EPCRS*.

STORAGE

The sealed container should be stored at a temperature not exceeding 30°.

LABELLING

The label of the sealed container states the amount of the peptide in milligrams.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Leuprorelin.

www.webofpharma.com

Levobunolol Eye Drops

Action and use
Beta-adrenoceptor antagonist.

DEFINITION
Levobunolol Eye Drops are a sterile solution of Levobunolol Hydrochloride in Purified Water.

The eye drops comply with the requirements stated under Eye Preparations and with the following requirements.

Content of levobunolol hydrochloride, $C_{17}H_{25}NO_3$,HCl
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. The *light absorption*, Appendix II B, in the range 210 to 350 nm of a solution prepared by diluting the eye drops with *ethanol (96%)* to contain 0.001% w/v of Levobunolol Hydrochloride exhibits two maxima, at 223 nm and at 255 nm and a broad peak at 315 nm.

B. In the Assay, the chromatogram obtained with solution (1) shows a peak with the same retention time as that of the principal peak in the chromatogram obtained with solution (2).

TESTS
Acidity or alkalinity
pH, 5.5 to 7.5, Appendix V L.

Related substances
The nominal total amount of related substances determined by tests A and B below is not more than 2.5% of the stated content of Levobunolol Hydrochloride.

A. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a suitable volume of the eye drops with the mobile phase to produce a solution containing 0.10% w/v of Levobunolol Hydrochloride.

(2) Dilute 1 volume of solution (1) to 100 volumes with the mobile phase.

(3) 0.0010% w/v of *disodium edetate* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Determine the sum of the areas of any *secondary peaks*.

Disregard any peak corresponding to the principal peak in the chromatogram obtained with solution (3).

B. Carry out test A as described above but using a detection wavelength of 400 nm and injecting solution (1).

LIMITS

The area of any peak with a retention time corresponding to that of the principal peak in the chromatogram obtained with solution (2) in test A is not greater than one-fifth of the area of that peak (1%, assuming a response factor of 5).

Calculate the nominal percentage content of this impurity from the area of the peak in the chromatogram obtained with solution (1) taking one-fifth of the area of the peak in the chromatogram obtained with solution (2) in test A to be equivalent to 1%.

ASSAY
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a suitable volume of the eye drops with the mobile phase to produce a solution containing 0.005% w/v of Levobunolol Hydrochloride.

(2) 0.005% w/v of *levobunolol hydrochloride BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (30 cm × 3.9 mm) packed with *octadecylsilyl silica gel for chromatography* (10 µm) (µBondapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

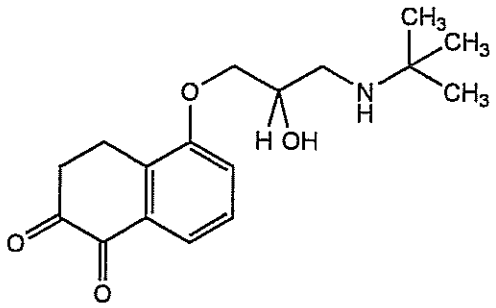
(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

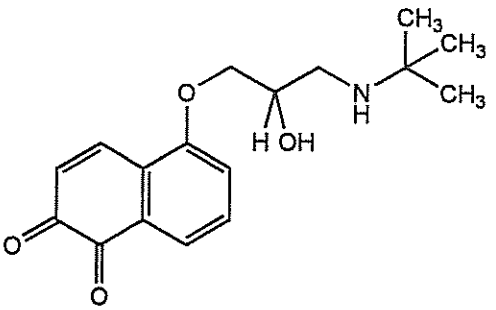
(f) Inject 20 µL of each solution.

MOBILE PHASE



5 volumes of *glacial acetic acid*, 450 volumes of 0.005M *sodium heptanesulfonate* and 550 volumes of *methanol*.

DETERMINATION OF CONTENT



Calculate the content of $C_{17}H_{25}NO_3$,HCl in the eye drops from the declared content of $C_{17}H_{25}NO_3$,HCl in *levobunolol hydrochloride BPCRS*.

STORAGE
Levobunolol Eye Drops should be protected from light.

IMPURITIES
The impurities limited by the requirements of this monograph include:

A. 5-(3-*tert*-butylamino-2-hydroxypropoxy)-3,4-dihydro-1,2-naphthalene dione,

B. 5-(3-*tert*-butylamino-2-hydroxypropoxy)-1,2-naphthoquinone.

www.webofpharma.com

Levodopa Capsules

Action and use
Dopamine precursor; treatment of Parkinson's disease.

DEFINITION
Levodopa Capsules contain Levodopa.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of levodopa, $C_9H_{11}NO_4$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Dissolve as completely as possible a quantity of the contents of the capsules containing 0.5 g of Levodopa in 25 mL of 1M *hydrochloric acid* and filter. Adjust to pH 3 with 5M *ammonia*, added dropwise with stirring, and allow to stand for several hours, protected from light. Filter, wash the precipitate and dry it at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of levodopa *(RS 201)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using *microcrystalline cellulose* as the coating substance and a mixture of 25 volumes of *glacial acetic acid*, 25 volumes of *water* and 50 volumes of *butan-1-ol* as the mobile phase. Apply separately to the plate 5 µL of each of the following solutions. For solution (1) shake a quantity of the contents of the capsules containing 0.1 g of Levodopa with 10 mL of 1M *hydrochloric acid* and filter. Solution (2) contains 1% w/v of *levodopa BPCRS* in 1M *hydrochloric acid*. After removal of the plate, dry it in a current of warm air and spray with a freshly prepared mixture of equal volumes of a 10% w/v solution of *iron(III) chloride hexahydrate* and a 5% w/v solution of *potassium hexacyanoferrate(III)*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

C. Shake a quantity of the contents of the capsules containing 20 mg of Levodopa with 5 mL of 0.1M *hydrochloric acid*. Add 0.1 mL of *iron(III) chloride solution R1*; a green colour is produced. To half of the solution add an excess of 5M *ammonia*; a purple colour is produced. To the remainder of the solution add an excess of 5M *sodium hydroxide*; a red colour is produced.

TESTS
Dissolution
Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using Apparatus 2. Use as the medium 900 mL of 0.1M *hydrochloric acid* and rotate the paddle at 50 revolutions per minute. Withdraw a sample of 10 mL of the medium. For capsules containing 0.25 g of Levodopa or less, filter and dilute 2 mL of the filtrate to 10 mL with 0.1M *hydrochloric acid*. For capsules containing more than 0.25 g of Levodopa, filter and dilute 1 mL of the filtrate to 10 mL with 0.1M *hydrochloric acid*. Measure the *absorbance* of the solution, Appendix II B, at 280 nm using 0.1M *hydrochloric acid* in the reference cell. Calculate the total content of $C_9H_{11}NO_4$ in the medium taking 142 as the value of A(1%, 1 cm) at the maximum at 280 nm.

Specific optical rotation
–38.5 to –41.5, Appendix V F, when determined in the following manner. Shake a quantity of the contents of the capsules containing 1.25 g of Levodopa with 25 mL of 0.5M *hydrochloric acid* for 30 minutes, centrifuge and filter the supernatant liquid (Whatman No. 42 filter paper is suitable). To 10 mL of the filtrate add 10 mL of a 21.5% w/v solution of *aluminium sulfate*, 20 mL of a 21.8% w/v solution of *sodium acetate* and sufficient *water* to produce 50 mL and measure the *optical rotation*. Separately dilute 5 mL of the filtrate to 200 mL with 0.1M *hydrochloric acid*, mix well and dilute 10 mL to 200 mL with 0.1M *hydrochloric acid*. Measure the *absorbance* of the resulting solution at the maximum at 280 nm, Appendix II B. Calculate the content of levodopa, $C_9H_{11}NO_4$, in the filtrate taking 142 as the value of A(1%, 1 cm) at the maximum at 280 nm and hence calculate the *specific optical rotation*.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using a precoated cellulose plate (Merck plates are suitable) and a mixture of 25 volumes of *glacial acetic acid*, 25 volumes of *water* and 50 volumes of *butan-1-ol* as the mobile phase. Apply separately to the plate, as bands 20 mm long, 10 µL of each of solutions (1) and (2) and 20 µL of solution (3) and dry in a current of air. For solution (1) shake a quantity of the contents of the capsules containing 0.1 g of Levodopa with 10 mL of a mixture of equal volumes of *anhydrous formic acid* and *methanol*; prepare immediately before use. For solution (2) dilute 1 volume of solution (1) to 200 volumes with *methanol*. Solution (3) is a mixture of equal volumes of solution (1) and a solution prepared by dissolving 30 mg of L-*tyrosine* in 1 mL of *anhydrous formic acid* and diluting to 100 mL with *methanol*. After removal of the plate, dry it in a current of warm air, spray with a freshly prepared mixture of equal volumes of a 10% w/v solution of *iron(III) chloride hexahydrate* and a 5% w/v solution of *potassium hexacyanoferrate(III)* and examine the plate immediately. Any *secondary band* in the chromatogram obtained with solution (1) is not more intense than the band in the chromatogram obtained with solution (2) (0.5%). The test is not valid unless the chromatogram obtained with solution (3) shows a distinct band, at a higher Rf value than the principal band, which is more intense than the band in the chromatogram obtained with solution (2).

ASSAY
Dissolve as completely as possible a quantity of the mixed contents of 20 capsules containing 0.6 g of Levodopa in 10 mL of *anhydrous formic acid*, add 80 mL of *glacial acetic acid*, mix and carry out Method I for *non-aqueous titration*, Appendix VIII A, using *oracet blue 2R solution* as indicator. Each mL of 0.1M *perchloric acid VS* is equivalent to 19.72 mg of $C_9H_{11}NO_4$.

When L-dopa capsules are prescribed or demanded, Levodopa Capsules shall be dispensed or supplied.

Levodopa Tablets

Action and use
Dopamine precursor; treatment of Parkinson's disease.

DEFINITION
Levodopa Tablets contain Levodopa.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of levodopa, $C_9H_{11}NO_4$
95.0 to 105.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

A. Dissolve as completely as possible a quantity of the powdered tablets containing 0.5 g of Levodopa in 25 mL of 1M *hydrochloric acid* and filter. Adjust to pH 3 with 5M *ammonia*, added dropwise with stirring, and allow to stand for several hours, protected from light. Filter, wash the precipitate with *water* and dry it at 105°. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of levodopa *(RS 201)*.

B. Comply with test B for Identification described under Levodopa Capsules, but using as solution (1) a solution obtained by shaking a quantity of the powdered tablets containing 0.1 g of Levodopa with 10 mL of 1M *hydrochloric acid* and filtering.

C. Shake a quantity of the powdered tablets containing 20 mg of Levodopa with 5 mL of 0.1M *hydrochloric acid*. Add 0.1 mL of *iron(III) chloride solution R1*; a green colour is produced. To half of the solution add an excess of 5M *ammonia*; a purple colour is produced. To the remainder of the solution add an excess of 5M *sodium hydroxide*; a red colour is produced.

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1, using as the medium 900 mL of 0.1M *hydrochloric acid* and rotating the basket at 100 revolutions per minute. Withdraw a sample of 10 mL of the medium and filter. For tablets containing 0.25 g of Levodopa or less, filter and dilute 2 mL of the filtrate to 10 mL with 0.1M *hydrochloric acid*. For tablets containing more than 0.25 g of Levodopa, filter and dilute 1 mL of the filtrate to 10 mL with 0.1M *hydrochloric acid*. Measure the *absorbance* of the solution, Appendix II B, at 280 nm using 0.1M *hydrochloric acid* in the reference cell. Calculate the total content of $C_9H_{11}NO_4$ in the medium taking 142 as the value of A(1%, 1 cm) at the maximum at 280 nm.

Specific optical rotation

–38.5 to –41.5, Appendix V F, when determined in the following manner. Shake a quantity of the finely powdered tablets containing 1.25 g of Levodopa with 25 mL of 0.5M *hydrochloric acid* for 30 minutes, centrifuge and filter the supernatant liquid (Whatman No. 42 filter paper is suitable). To 10 mL of the filtrate add 10 mL of a 21.5% w/v solution of *aluminium sulfate*, 20 mL of a 21.8% w/v solution of *sodium acetate* and sufficient *water* to produce 50 mL and measure the *optical rotation*. Further dilute 5 mL of the filtrate to 200 mL with 0.1M *hydrochloric acid*, mix well and dilute 10 mL to 200 mL with 0.1M *hydrochloric acid*. Measure the *absorbance* of the resulting solution at the maximum at 280 nm, Appendix II B. Calculate the concentration of levodopa, $C_9H_{11}NO_4$, in the filtrate taking 142 as the value of A(1%, 1 cm) at the maximum at 280 nm and hence calculate the *specific optical rotation*.

Related substances

Comply with the test described under Levodopa Capsules using as solution (1) a solution prepared immediately before use by shaking a quantity of the powdered tablets containing 0.1 g of Levodopa with 10 mL of a mixture of equal volumes of *anhydrous formic acid* and *methanol*.

ASSAY

Weigh and powder 20 tablets. Dissolve as completely as possible a quantity of the powder containing 0.6 g of Levodopa in 10 mL of *anhydrous formic acid*, add 80 mL of *anhydrous acetic acid*, mix and carry out Method I for *non-aqueous titration*, Appendix VIII A, using *oracet blue 2R solution* as indicator. Each mL of 0.1M *perchloric acid VS* is equivalent to 19.72 mg of $C_9H_{11}NO_4$.

When L-dopa tablets are prescribed or demanded, Levodopa Tablets shall be dispensed or supplied.

Levomenthol Cream

Menthol in Aqueous Cream

NOTE: *Levomenthol Cream is not currently licensed in the United Kingdom.*

DEFINITION

Levomenthol Cream contains Levomenthol in Aqueous Cream.

The cream complies with the requirements stated under Topical Semi-solid Preparations, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of levomenthol, $C_{10}H_{20}O$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to levomenthol in the chromatogram obtained with solution (3).

ASSAY

Carry out the method for *gas chromatography*, Appendix III B, using the following freshly prepared solutions.

(1) 0.1% w/v of *camphor* (internal standard) in *industrial methylated spirit (95%)*.

(2) Disperse a quantity of the well-mixed cream containing 50 mg of Levomenthol in 20 mL of *industrial methylated spirit (95%)* and mix with the aid of ultrasound for 15 minutes. Transfer the liquid contents to a 50 mL graduated flask, rinse the original flask with two 10-mL quantities of *industrial methylated spirit (95%)*, transfer the washings to the graduated flask and add sufficient *industrial methylated spirit (95%)* to produce 50 mL; mix well and filter (Whatman No. 1 paper is suitable) discarding the first 5 mL of filtrate. Add 10 mL of solution (1) to 10 mL of the filtrate and add sufficient *industrial methylated spirit (95%)* to produce 25 mL; mix well.

(3) Mix 5 mL of a 0.2% w/v solution of *levomenthol BPCRS* in *industrial methylated spirit (95%)* with 10 mL of solution (1) and dilute to 25 mL with *industrial methylated spirit (95%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a fused silica column (10 m × 0.53 mm) bonded with a 0.25-µm layer of dimethylpolysiloxane.

(b) Use *helium* as the carrier gas.

(c) Use the gradient conditions described below.

(d) Use an inlet temperature of 250°.

(e) Use a flame ionisation detector at a temperature of 250°.

(f) Inject 1 µL of each solution.

www.webofpharma.com

Time (Minutes)	Temperature	Comment
0 → 1	90°	isothermal
1 → 5	90° → 230°	linear gradient
5 → 9	230°	isothermal

When the chromatograms are recorded under the prescribed conditions the retention times are: levomenthol, about 2.1 minutes; camphor, about 2 minutes.

DETERMINATION OF CONTENT

Calculate the content of $C_{10}H_{20}O$ in the cream using the declared content of $C_{10}H_{20}O$ in *levomenthol BPCRS*.

Levomepromazine Injection

Action and use
Dopamine receptor antagonist; neuroleptic.

DEFINITION
Levomepromazine Injection is a solution of Levomepromazine Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of levomepromazine hydrochloride, $C_{19}H_{24}N_2OS,HCl$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
To a volume of the injection containing 50 mg of Levomepromazine Hydrochloride add 2 mL of 1M *sodium hydroxide*, shake, extract with 15 mL of *ether* and allow to separate. Wash the ethereal layer with 5 mL of *water*, filter through phase-separating paper (Whatman 1 PS is suitable) containing *anhydrous sodium sulfate*, evaporate the ether to dryness and dry the residue at 100° for 3 hours. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of levomepromazine (*RS 404*).

TESTS

Acidity
pH, 4.0 to 5.0, Appendix V L.

Related substances
Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions protected from light.

(1) Dilute a volume of the injection, if necessary, with sufficient of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* to produce a solution containing 0.5% w/v of Levomepromazine Hydrochloride.

(2) Dilute 1 volume of solution (1) to 100 volumes with a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* and further dilute 1 volume to 2 volumes with the same solvent mixture.

(3) 0.005% w/v of *levomepromazine sulfoxide BPCRS* in a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *TLC silica gel GF_{254} plate*.

(b) Use the mobile phase, maintained at 35°, as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of *diethylamine*, 10 volumes of *acetone* and 85 volumes of *toluene*.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to levomepromazine sulfoxide is not more intense than the spot in the chromatogram obtained with solution (3) (1%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

Disregard any spot remaining on the line of application.

ASSAY
Carry out the following procedure protected from light. Dilute a volume of the injection containing 0.1 g of Levomepromazine Hydrochloride to 100 mL with *water* and dilute 1 volume of this solution to 25 volumes with *water*. Immediately measure the *absorbance* of the solution at the maximum at 302 nm, Appendix II B, using *water* in the reference cell. Measure the absorbance of a 0.004% w/v solution of *levomepromazine maleate BPCRS* in *water* and calculate the content of $C_{19}H_{24}N_2OS,HCl$ from the absorbances obtained using the declared content of $C_{19}H_{24}N_2OS,C_4H_4O_4$ in *levomepromazine maleate BPCRS*. Each mg of $C_{19}H_{24}N_2OS,C_4H_4O_4$ is equivalent to 0.8207 mg of $C_{19}H_{24}N_2OS,HCl$.

STORAGE
Levomepromazine Injection should be protected from light.

Levomepromazine Tablets

Action and use
Dopamine receptor antagonist; neuroleptic.

DEFINITION
Levomepromazine Tablets contain Levomepromazine Maleate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of levomepromazine maleate, $C_{19}H_{24}N_2OS,C_4H_4O_4$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. To a quantity of the powdered tablets containing 50 mg of Levomepromazine Maleate add 10 mL of *water* and 2 mL of 1M *sodium hydroxide*, shake, extract with 15 mL of *ether* and allow to separate. Wash the ethereal layer with 5 mL of *water*, filter through phase-separating paper (Whatman 1 PS is suitable) containing *anhydrous sodium sulfate*, evaporate the ether to dryness and dry the residue at 100° for 3 hours. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of levomepromazine (*RS 404*).

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

www.webofpharma.com

(1) Mix a quantity of the powdered tablets containing 0.2 g of Levomepromazine Maleate with 10 mL of a mixture of 1 volume of *water* and 9 volumes of *acetone*, shake with the aid of ultrasound for 5 minutes, allow to stand and use the clear supernatant liquid.

(2) 0.6% w/v of *maleic acid* in *anhydrous formic acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *TLC silica gel* F_{254} (Macherey-Nagel plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry at 120° for 10 minutes and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

3 volumes of *water*, 7 volumes of *anhydrous formic acid* and 90 volumes of *di-isopropyl ether*.

CONFIRMATION

The chromatogram obtained with solution (1) shows a spot remaining on the line of application and a spot which is similar in position to the principal spot in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 500 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 30 minutes withdraw a 10 mL sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 311 nm, Appendix II B using 0.1M *hydrochloric acid* in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *levomepromazine maleate BPCRS* at the maximum at 311 nm, Appendix II B, using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of levomepromazine maleate, $C_{19}H_{24}N_2OS,C_4H_4O_4$, in the medium from the absorbances obtained and using the declared content of $C_{19}H_{24}N_2OS,C_4H_4O_4$ in *levomepromazine maleate BPCRS*. The amount of levomepromazine maleate released is not less than 60% of the stated amount.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, protected from light using the following solutions.

(1) Mix a quantity of the powdered tablets containing 0.1 g of Levomepromazine Maleate with 10 mL of a mixture of 1 volume of 18M *ammonia* and 99 volumes of *methanol*, shake with the aid of ultrasound for 5 minutes, mix, filter (Whatman No. 40 paper is suitable), discarding the first portion of filtrate, and use the filtrate.

(2) Dilute 1 volume of solution (1) to 200 volumes with the same solvent.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *TLC silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

5 volumes of *diethylamine*, 10 volumes of *acetone* and 85 volumes of *toluene*.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.5%).

ASSAY

Carry out the following procedure protected from light. Weigh and powder 20 tablets. To a quantity of the powdered tablets containing 50 mg of Levomepromazine Maleate add 15 mL of 0.2M *methanolic ammonia*, stir for 2 minutes, filter and collect the filtrate. Repeat the extraction with a further 3 successive 15-mL quantities of 0.2M *methanolic ammonia*, grinding the residue with a glass rod before extraction. Dilute the combined filtrates to 100 mL with 0.2M *methanolic ammonia*, mix and dilute 10 volumes of the solution to 100 volumes with *methanol* and further dilute 10 volumes of this solution to 100 volumes with the same solvent. Measure the *absorbance* of this solution at the maximum at 254 nm, Appendix II B, using *methanol* in the reference cell. Measure the *absorbance* of a 0.0005% w/v solution of *levomepromazine maleate BPCRS* in 0.002M *methanolic ammonia* at the same wavelength using *methanol* in the reference cell and calculate the content of $C_{19}H_{24}N_2OS,C_4H_4O_4$ in the tablets using the declared content of $C_{19}H_{24}N_2OS,C_4H_4O_4$ in *levomepromazine maleate BPCRS*.

STORAGE

Levomepromazine Tablets should be protected from light.

Levonorgestrel Tablets

Action and use

Progestogen.

DEFINITION

Levonorgestrel Tablets contain Levonorgestrel.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of levonorgestrel, $C_{21}H_{28}O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol (80%)*.

(1) To a quantity of the powdered tablets containing 0.15 mg of Levonorgestrel add 25 mL of *methanol (80%)*, heat in a water bath at 60° for 10 minutes, allow to cool and filter through a 0.45-µm filter.

(2) 0.0006% w/v of *levonorgestrel BPCRS*.

(3) 0.0012% w/v of *norgestrel BPCRS*.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (12.5 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 242 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

50 volumes of *methanol* and 50 volumes of a 1% w/v solution of *gamma-cyclodextrin*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to dextronorgestrel and levonorgestrel and is at least 1.0.

CONFIRMATION

The principal peak in the chromatogram obtained with solution (1) has the same retention time as the peak due to levonorgestrel in the chromatogram obtained with solution (2).

B. In the test for Uniformity of content, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

For tablets containing less than 100 µg of levonorgestrel

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 500 mL of 0.01M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 30 minutes withdraw a sample of the medium and filter. Dilute the filtrate, with a 0.1% w/v solution of *sodium dodecylsulfate* in 0.01M *hydrochloric acid* if necessary, to produce a solution expected to contain 0.000006% w/v of Levonorgestrel.

(2) 0.000006% w/v of *levonorgestrel BPCRS* in dissolution medium.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.3 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 220 nm.

(f) Inject 500 µL of each solution.

MOBILE PHASE

50 volumes of *acetonitrile* and 50 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *column efficiency*, determined on the peak due to levonorgestrel is at least 5000 theoretical plates per metre.

DETERMINATION OF CONTENT

Calculate the total content of $C_{21}H_{28}O_2$ in the medium from the chromatograms obtained and using the declared content of $C_{21}H_{28}O_2$ in *levonorgestrel BPCRS*.

For tablets containing 100 µg or more of levonorgestrel

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 500 mL of a 0.1% w/v solution of *sodium dodecylsulfate* in 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 30 minutes withdraw a sample of the medium and filter. Dilute the filtrate, with a 0.1% w/v solution of *sodium dodecylsulfate* in 0.1M *hydrochloric acid* if necessary, to produce a solution expected to contain 0.00015% w/v of Levonorgestrel.

(2) 0.00015% w/v of *levonorgestrel BPCRS* in dissolution medium.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution (For tablets containing less than 100 µg of levonorgestrel) may be used with an injection volume of 25 µL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *column efficiency*, determined on the peak due to levonorgestrel is at least 5000 theoretical plates per metre.

DETERMINATION OF CONTENT

Calculate the total content of $C_{21}H_{28}O_2$ in the medium from the chromatograms obtained and using the declared content of $C_{21}H_{28}O_2$ in *levonorgestrel BPCRS*.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol (50%)*.

(1) Add 5 mL of *methanol (50%)* to a quantity of the powdered tablets containing 0.18 mg of Levonorgestrel, mix with the aid of ultrasound for 30 minutes, stir vigorously for 15 minutes, centrifuge and use the supernatant liquid.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) 0.004% w/v each of *ethinylestradiol BPCRS* and *levonorgestrel BPCRS*.

(4) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Spherisorb ODS 2 is suitable).

www.webofpharma.com

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.2 mL per minute.

(d) Use a column temperature of 30°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 200 µL of each solution.

(g) Allow the chromatography to proceed for twice the retention time of levonorgestrel.

MOBILE PHASE

100 volumes of *methanol*, 240 volumes of *acetonitrile* and 500 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution* between the peaks due to ethinylestradiol and levonorgestrel is at least 12.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Levonorgestrel comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To 1 tablet add 5 mL of the mobile phase, disperse with the aid of ultrasound for 45 minutes, shaking every 15 minutes, centrifuge and dilute the clear supernatant liquid with the mobile phase, if necessary, to produce a solution expected to contain 0.0006% w/v of levonorgestrel.

(2) 0.0006% w/v of *levonorgestrel BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Dissolution (For tablets containing less than 100 µg of levonorgestrel) may be used with an injection volume of 25 µL.

MOBILE PHASE

50 volumes of *acetonitrile* and 50 volumes of *water*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *column efficiency*, determined on the peak due to levonorgestrel is at least 5000 theoretical plates per metre.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{28}O_2$ in each tablet using the declared content of $C_{21}H_{28}O_2$ in *levonorgestrel BPCRS*.

ASSAY

Use the average of the 10 individual results obtained in the test for Uniformity of content.

Levonorgestrel and Ethinylestradiol Tablets

Action and use

Progestogen.

DEFINITION

Levonorgestrel and Ethinylestradiol Tablets contain Levonorgestrel and Ethinylestradiol.

The tablets comply with the requirements stated under Tablets and with the following requirements. For Levonorgestrel and Ethinylestradiol Tablets presented in 21-day or 28-day calendar packs, apply the requirements separately to tablets of each combination of different proportions, by weight, of the active ingredients. Where applicable, disregard any tablets that contain no active ingredient (placebo tablets).

Content of levonorgestrel, $C_{21}H_{28}O_2$

90.0 to 110.0% of the stated amount.

Content of ethinylestradiol, $C_{20}H_{24}O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Extract 15 powdered tablets with 30 mL of *acetone*, filter, evaporate to dryness and dissolve the residue in 1 mL of *chloroform*.

(2) 0.075% w/v of *levonorgestrel BPCRS* in *chloroform*.

(3) 0.045% w/v of *ethinylestradiol BPCRS* in *chloroform*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 20 µL of each solution.

(d) Develop the plate to 15 cm. Develop the chromatograms twice, drying the plates between developments.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

(f) Spray the plate with a 2% w/v solution of *toluene-p-sulfonic acid* in *water* and heat at 105° for 10 minutes and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

1 volume of *methanol* and 99 volumes of *chloroform*.

CONFIRMATION

By the first method of visualisation:

one of the principal spots in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2) and the other principal spot corresponds to that in the chromatogram obtained with solution (3).

By the second method of visualisation:

the spots corresponding to levonorgestrel and ethinylestradiol appear as blue spots.

Uniformity of content

Prepare the following stock solutions using a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*.

Solution A 0.0625% w/v of *levonorgestrel* BPCRS.

Solution B 0.025% of *ethinylestradiol* BPCRS.

Solution C 0.020% w/v of *2-hydroxybiphenyl* (internal standard).

Solution D Dilute 1 mL of solution C to 20 mL with the solvent mixture.

www.webofpharma.com

Tablets containing less than 2 mg and/or less than 2% w/w of Levonorgestrel or less than 2 mg and/or less than 2% w/w of Ethinylestradiol comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 4 mL of solution D to one tablet, heat at 60° in an ultrasonic bath for 25 minutes, shake and repeat the ultrasound treatment. Cool, centrifuge and use the clear supernatant liquid.

(2) Mix the volumes of solutions A and B specified in the table with 5 mL of solution C and dilute to 100 mL with a mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*.

Content of		Volume of	
Levonorgestrel µg	Ethinyloestradiol µg	Solution A ml	Solution B ml
250	50	10.0	5.0
250	30	10.0	3.0
150	30	6.0	3.0
125	30	5.0	3.0
75	40	3.0	4.0
50	30	2.0	3.0

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 215 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

49 volumes of *acetonitrile* and 51 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{28}O_2$ and of $C_{20}H_{24}O_2$ in each tablet using the declared content of $C_{21}H_{28}O_2$ in *levonorgestrel BPCRS* and the declared content of $C_{20}H_{24}O_2$ in *ethinylestradiol BPCRS*.

ASSAY

For both levonorgestrel and ethinylestradiol use the average of the 10 individual results obtained in the test for Uniformity of content.

Levothyroxine Oral Solution

Action and use

Thyroid hormone replacement.

DEFINITION

Levothyroxine Oral Solution is a solution of Levothyroxine Sodium in a suitable aqueous vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of anhydrous levothyroxine sodium, $C_{15}H_{10}I_4NNaO_4$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

B. To a volume of the oral solution containing the equivalent of 0.5 mg of anhydrous levothyroxine sodium add a mixture of 3 mL of *ethanol (50%)* and 0.2 mL of *hydrochloric acid*, boil gently for 30 seconds, cool, filter, add 0.1 mL of a 10% w/v solution of *sodium nitrite* and boil; a yellow colour is produced. Cool and make alkaline with 5M *ammonia*; the solution becomes orange.

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in mobile phase. Carry out the test protected from light.

(1) Dilute, if necessary, a weighed quantity of the oral solution with sufficient mobile phase to produce a solution containing the equivalent of 0.0005% w/v of anhydrous levothyroxine sodium.

(2) Dilute 1 volume of solution (1) to 100 volumes.

(3) 0.000005% w/v of *liothyronine sodium EPCRS*.

(4) 0.0005% w/v of *liothyronine sodium EPCRS* and 0.0005% w/v of *levothyroxine sodium EPCRS*.

(5) Dilute 1 volume of solution (2) to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5 µm) (Microsorb CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 225 nm.

(f) Inject 100 µL of each solution.

(g) Allow the chromatography to proceed for 5 times the retention time of levothyroxine.

MOBILE PHASE

5 volumes of *orthophosphoric acid*, 300 volumes of *acetonitrile* and 700 volumes of *water*.

When the chromatograms are recorded under the prescribed conditions, the relative retention with reference to levothryoxine (retention time = about 5.5 minutes) for liothyronine is about 2.5.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 4.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to liothyronine is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (1%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1%);

the total impurities are not greater than 1.0%.

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (5) (0.1%).

www.webofpharma.com

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D using the following solutions in a mixture of equal volumes of *methanol* and 0.1M *sodium hydroxide* (solvent A). Carry out the test protected from light.

(1) Dilute, if necessary, a weighed quantity of the oral solution with sufficient solvent A to produce a solution containing the equivalent of 0.0005% w/v of anhydrous levothyroxine sodium.

(2) 0.0005% w/v of *levothyroxine sodium EPCRS*.

(3) 0.0005% w/v of *liothyronine sodium EPCRS* and 0.0005% w/v of *levothyroxine sodium EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5 µm) (Spherisorb S5 CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 225 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 volumes of *orthophosphoric acid*, 300 volumes of *acetonitrile* and 700 volumes of *water*.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 4.0.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{15}H_{10}I_4NNaO_4$, weight in volume, using the declared content of $C_{15}H_{10}I_4NNaO_4$ in *levothyroxine sodium EPCRS*.

STORAGE

Levothyroxine Oral Solution should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous levothyroxine sodium.

IMPURITIES

The impurities limited by the requirements of this monograph include impurity A listed under Levothyroxine Sodium.

Levothyroxine Tablets

Action and use

Thyroid hormone replacement.

DEFINITION

Levothyroxine Tablets contain Levothyroxine Sodium.

The tablets comply with the requirements stated under Tablets and with the following requirements.

PRODUCTION

Levothyroxine Sodium used in the formulation of Levothyroxine Tablets exists primarily in its most stable form, a crystalline pentahydrate.

Care should be taken during manufacture to avoid exposure to higher temperatures (> 50°) or very low humidities.

Content of anhydrous levothyroxine sodium, $C_{15}H_{10}I_4NNaO_4$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the peak in the chromatogram obtained with solution (2).

B. To a quantity of the powdered tablets containing the equivalent of 0.5 mg of anhydrous levothyroxine sodium add a mixture of 3 ml of *ethanol (50%)* and 0.2 mL of *hydrochloric acid*, boil gently for 30 seconds, cool, filter, add 0.1 mL of a 10% w/v solution of *sodium nitrite* and boil; a yellow colour is produced. Cool and make alkaline with 5M *ammonia*; the solution becomes orange.

TESTS

Dissolution

Comply with the *dissolution test for tablets and capsules*, Appendix XII B1.

Plastic containers must not be used to prepare and store solutions.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 100 revolutions per minute.

(b) Use 500 mL of *water*, at a temperature of 37°, as the medium.

(c) For tablets containing the equivalent of 25 µg or less of anhydrous levothyroxine sodium, place two tablets in the dissolution vessel; for tablets containing more than the equivalent of 25 µg of anhydrous levothyroxine sodium, place one tablet in the dissolution vessel.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a 5 mL sample of the medium and centrifuge, dilute with sufficient of the dissolution medium, if necessary, to produce a solution expected to contain 0.00001% w/v of Levothyroxine Sodium. To a 5 mL aliquot add 200 µL of 0.1M *sodium hydroxide* and 125 µL of a 2% v/v solution of *diethylamine*.

(2) To 5 mL of 0.00001% w/v *levothyroxine sodium EPCRS* in 0.001M *sodium hydroxide* add 200 µL of 0.1m *sodium hydroxide* and 125 µL of a 2% v/v solution of *diethylamine* and mix.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15.0 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5 µm) (Spherisorb S5 CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 225 nm.

(f) Inject 150 µL of each solution.

MOBILE PHASE

5 volumes of *orthophosphoric acid*, 300 volumes of *acetonitrile R1* and 700 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the total content of levothyroxine sodium, $C_{15}H_{10}I_4NNaO_4$, in the medium from the chromatograms obtained and using the declared content of $C_{15}H_{10}I_4NNaO_4$ in *levothyroxine sodium EPCRS*.

www.webofpharma.com

LIMITS

The amount of levothyroxine released is not less than 75% (Q) of the stated amount.

Uniformity of content

Comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add sufficient 0.05M *sodium hydroxide* to one tablet to produce a solution containing the equivalent of about 6 µg per mL of anhydrous levothyroxine sodium, mix with the aid of ultrasound until the tablet is fully dispersed, cool and shake for 2 minutes. Add sufficient 0.05M *sodium hydroxide* to produce a solution containing the equivalent of 0.0004% w/v of anhydrous levothyroxine sodium, filter through glass microfibre filter (Whatman GF/C is suitable) and use the filtrate.

(2) 0.0004% w/v of *levothyroxine sodium EPCRS* in 0.05M *sodium hydroxide*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5 µm) (Nucleosil 5 CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 225 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 volumes of *orthophosphoric acid*, 300 volumes of *acetonitrile* and 700 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{10}I_4NNaO_4$ in each tablet using the declared content of $C_{15}H_{10}I_4NNaO_4$ in *levothyroxine sodium EPCRS*.

ASSAY

For tablets containing the equivalent of less than 2 mg and/or less than 2% w/w of anhydrous levothyroxine sodium

Use the average of the 10 individual results obtained in the test for Uniformity of content.

For tablets containing the equivalent of 2 mg or more and 2% w/w or more of anhydrous levothyroxine sodium

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D. Prepare a mixture of equal volumes of *methanol* and 0.1M *sodium hydroxide* (solvent A).

(1) Disperse with the aid of ultrasound for 10 minutes a quantity of the powdered tablets containing the equivalent of 0.1 mg of anhydrous levothyroxine sodium with 8 mL of solvent A. Shake for 2 minutes, cool, add sufficient solvent A to produce 10 mL, mix, filter through glass microfibre filter paper (Whatman GF/C is suitable) and use the filtrate.

(2) 0.001% w/v of *levothyroxine sodium EPCRS* in solvent A.

(3) 0.0005% w/v of *liothyronine sodium EPCRS* and 0.0005% w/v of *levothyroxine sodium EPCRS* in solvent A

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

SYSTEM SUITABILITY

The assay is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 4.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{10}I_4NNaO_4$ in the tablets using the declared content of $C_{15}H_{10}I_4NNaO_4$ in *levothyroxine sodium EPCRS*.

STORAGE

Levothyroxine Tablets should be protected from light.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous levothyroxine sodium.

Lidocaine Gel

Action and use

Local anaesthetic; Class I antiarrhythmic.

DEFINITION

Lidocaine Gel is a sterile solution of Lidocaine Hydrochloride in a suitable water-miscible basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of anhydrous lidocaine hydrochloride, $C_{14}H_{22}N_2O,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

To a quantity of the gel containing the equivalent of 80 mg of anhydrous lidocaine hydrochloride add 4 mL of *hydrochloric acid* and heat on a water bath for 10 minutes. Allow to cool, transfer to a separating funnel with the aid of 20 mL of *water*, add 5M *sodium hydroxide* until precipitation is complete and extract with two 20-mL quantities of *chloroform*. Filter the chloroform extracts through *anhydrous sodium sulfate* and evaporate the filtrate to dryness on a water bath using a current of nitrogen. The residue complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of lidocaine *(RS 202)*.

B. Dissolve 20 mg in 1 mL of *ethanol (96%)*, add 0.5 mL of a 10% w/v solution of *cobalt(II) chloride* and 0.5 mL of 5M *sodium hydroxide* and shake for 2 minutes. A bluish-green precipitate is produced.

C. Dissolve 40 mg in 5 mL of a 1% w/v solution of *cetrimide* and add 1 mL of 5M *sodium hydroxide* and 1 mL of *bromine water*. A yellow colour is produced.

TESTS

2,6-Dimethylaniline

Mix a quantity of the gel containing the equivalent of 15 mg of anhydrous lidocaine hydrochloride with sufficient *water* to produce 3 mL using a rotary vortex mixer. To 2 mL of the resulting solution add 1 mL of a freshly prepared 1% w/v solution of *4-dimethyl-aminobenzaldehyde* in *methanol*, mix thoroughly using a rotary vortex mixer, add 2 mL of *glacial acetic acid* and allow to stand for 10 minutes. The yellow colour produced is not more intense than that obtained using a mixture of 2 mL of a solution of *2,6-dimethylaniline* in *methanol* containing 2 µg per mL in place of the solution of the gel.

www.webofpharma.com

Sterility
Complies with the *test for sterility*, Appendix XVI A.

ASSAY
Disperse a quantity containing the equivalent of 10 mg of anhydrous lidocaine hydrochloride in 20 mL of *water*. Add 5 mL of *acetate buffer pH 2.8*, 120 mL of *chloroform* and 5 mL of *dimethyl yellow and oracet blue 2R solution* and titrate with 0.005M *dioctyl sodium sulfosuccinate VS*, swirling vigorously. Near the end point add the titrant dropwise and, after each addition, swirl vigorously, allow to separate and swirl gently for 5 seconds. The end point is indicated when the colour of the chloroform layer changes from green to pinkish-grey. Repeat the operation without the preparation being examined. The difference between the titrations represents the amount of dioctyl sodium sulfosuccinate required. Each mL of 0.005M *dioctyl sodium sulfosuccinate VS* is equivalent to 1.354 mg of $C_{14}H_{22}N_2O,HCl$. Determine the *weight per mL* of the gel, Appendix V G, and calculate the percentage of $C_{14}H_{22}N_2O,HCl$, weight in volume.

STORAGE
Lidocaine Gel should be stored in accordance with the manufacturer's instructions.

LABELLING
The quantity of active ingredent is stated in terms of the equivalent amount of anhydrous lidocaine hydrochloride.

Lidocaine Injection

Action and use
Local anaesthetic; Class I antiarrhythmic.

DEFINITION
Lidocaine Injection is a sterile solution of Lidocaine Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of lidocaine hydrochloride, $C_{14}H_{22}N_2O,HCl,H_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Make a volume containing 0.1 g of Lidocaine Hydrochloride alkaline with 5M *sodium hydroxide*, filter, wash the residue with *water*, dissolve it in 1 mL of *ethanol (96%)*, add 0.5 mL of a 10% w/v solution of *cobalt(II) chloride* and shake for 2 minutes. A bluish-green precipitate is produced.

B. To a volume containing 0.1 g of Lidocaine Hydrochloride add 10 mL of *picric acid solution R1*. The *melting point* of the precipitate, after washing with *water* and drying at 105°, is about 229°, Appendix V A.

C. Yields the reactions characteristic of *chlorides*, Appendix VI.

2,6-Dimethylaniline
To a volume of the injection containing 25 mg of Lidocaine Hydrochloride add *water* if necessary to produce 10 mL, add 2M *sodium hydroxide* until the solution is just alkaline and extract with three 5 mL quantities of *chloroform*. Dry the combined chloroform extracts over *anhydrous sodium sulfate*, filter, wash with a further 5 mL of *chloroform* and evaporate the filtrate to dryness at a pressure of 2 kPa. Dissolve the residue in 2 mL of *methanol*, add 1 mL of a 1% w/v solution of *4-dimethylaminobenzaldehyde* in *methanol* and 2 mL of *glacial acetic acid* and allow to stand at room temperature for 10 minutes. Any yellow colour produced is not more intense than the colour obtained by repeating the operation using 10 mL of a solution of *2,6-dimethylaniline* in *water* containing 1 µg per mL in place of the injection (400 ppm).

ASSAY
Make a quantity containing 0.1 g of Lidocaine Hydrochloride alkaline with 2M *sodium hydroxide* and extract with three 20 mL quantities of *chloroform*, washing each extract with the same 10 mL of *water*. Filter the washed extracts through a filter paper moistened with *chloroform* and wash the filter with 10 mL of *chloroform*. Add the washings to the filtrate and carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.02M *perchloric acid VS* as titrant and *crystal violet solution* as indicator. Each mL of 0.02M *perchloric acid VS* is equivalent to 5.776 mg of $C_{14}H_{22}N_2O,HCl,H_2O$.

Lidocaine Intraocular Injection

NOTE: Lidocaine Intraocular Injection is not currently licensed in the United Kingdom.

Action and use
Intraocular anaesthetic.

DEFINITION
Lidocaine Intraocular Injection is a sterile, isotonic solution of Lidocaine Hydrochloride in a suitable diluent. It is supplied as a ready-to-use solution.

The injection complies with the requirements stated under Parenteral Preparations, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of lidocaine hydrochloride, $C_{14}H_{22}N_2O,HCl,H_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Make a volume of the injection containing 10 mg of Lidocaine Hydrochloride alkaline with 5M *sodium hydroxide*, filter, wash the residue with *water*, dissolve it in 1 mL of *ethanol (96%)*, add 0.5 mL of a 10% w/v solution of *cobalt (II) chloride* and shake for 2 minutes. A bluish-green precipitate is produced.

B. To a volume of the injection containing 10 mg of Lidocaine Hydrochloride add 10 mL of *picric acid solution R1*. The *melting point* of the precipitate, after washing with *water* and drying at 105°, is about 229°, Appendix V A.

TESTS
Acidity or alkalinity
pH, 6.0 to 7.0, Appendix V L.

Osmolality
The osmolality of the injection is 270 to 330 mosmol/kg, Appendix V N.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a buffer prepared by dissolving 2.72 g of *potassium dihydrogen orthophosphate* and 1.01 g of *heptanesulfonic acid* in 1000 mL of *water* and adjusting the pH to 3.0 with *orthophosphoric acid* (solution A).

(1) Dilute a volume of the injection to contain 0.2% w/v of Lidocaine Hydrochloride.

www.webofpharma.com

(2) 0.0004% w/v of *2,6-dimethylaniline*.

(3) Dilute 1 volume of solution (1) to 100 volumes and further dilute 1 volume to 5 volumes.

(4) Mix 1 volume of a 0.2% w/v solution of *lidocaine hydrochloride BPCRS* with 5 volumes of solution (2) and dilute to 10 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Luna C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 263 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

30 volumes of *acetonitrile* and 70 volumes of solution A.

The chromatogram obtained with solution (4) shows a peak due to lidocaine and a peak due to 2,6-dimethylaniline with a retention time relative to lidocaine of about 0.42.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 2,6-dimethylaniline is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the area of any other *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (3) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (3) (2.0%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (3) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in solution A described under Related substances.

(1) Dilute a volume of the injection to contain 0.2% w/v of Lidocaine Hydrochloride.

(2) 0.2% w/v of *lidocaine hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (2), the *column efficiency*, determined on the peak due to lidocaine is at least 2000 *theoretical plates*.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{22}N_2O,HCl,H_2O$ in the injection using the declared content of $C_{14}H_{22}N_2O,HCl,H_2O$ in *lidocaine hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include 2,6-dimethylaniline.

Lidocaine Ointment

Action and use

Local anaesthetic; Class I antiarrhythmic.

DEFINITION

Lidocaine Ointment contains Lidocaine in a suitable hydrophilic basis.

The ointment complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of lidocaine, $C_{14}H_{22}N_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Warm a quantity of the ointment containing about 25 mg of Lidocaine until the basis has melted, add 1 mL of *saturated sodium chloride solution* and 0.2 mL of 1M *sodium hydroxide* and cool. Add 5 mL of *ether*, shake vigorously for 1 minute and allow the layers to separate. Filter the ether layer through *anhydrous sodium sulfate* and evaporate the *ether* to dryness. Dissolve the residue in the minimum volume of *chloroform IR*, apply the solution directly to a *sodium chloride* disc and allow the solvent to evaporate. The *infrared absorption spectrum* of the resulting thin film, Appendix II A, is concordant with the *reference spectrum* of lidocaine *(RS 405)*.

2,6-Dimethylaniline

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the ointment containing 50 mg of Lidocaine in the mobile phase, dilute to 50 mL with the mobile phase and dilute 1 volume of this solution to 10 volumes with the mobile phase.

(2) Dilute a 0.1% w/v solution of *2,6-dimethylaniline* in *methanol* with the mobile phase to produce a solution containing 0.04 µg per mL of 2,6-dimethylaniline.

(3) Mix equal volumes of a 0.01% w/v solution of *lidocaine BPCRS* in the mobile phase with a 0.005% w/v solution of *2,6-dimethylaniline* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Apex ODS 2 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 0.8 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

35 volumes of a phosphate buffer pH 8.0 prepared by adding a 0.408% w/v solution of *potassium dihydrogen orthophosphate* to a suitable volume of a 0.685% w/v solution of *dipotassium hydrogen orthophosphate* until pH 8.0 is attained and 65 volumes of *methanol*.

The chromatogram obtained with solution (3) shows a peak due to lidocaine and a peak due to 2,6-dimethylaniline with a retention time relative to lidocaine of about 0.5.

LIMIT

In the chromatogram obtained with solution (1), the area of any peak corresponding to 2,6-dimethylaniline is not greater than the area of the peak in the chromatogram obtained with solution (2) (400 ppm).

www.webofpharma.com

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the ointment containing 50 mg of Lidocaine in the mobile phase, dilute to 50 mL with the mobile phase and dilute 1 volume of this solution to 10 volumes with the mobile phase.

(2) 0.010% w/v of *lidocaine BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under 2,6-Dimethylaniline may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{14}H_{22}N_2O$ in the ointment using the declared content of $C_{14}H_{22}N_2O$ in *lidocaine BPCRS*.

Sterile Lidocaine Solution

Sterile Lidocaine Cutaneous Solution

Action and use

Local anaesthetic; Class I antiarrhythmic.

DEFINITION

Sterile Lidocaine Solution is a sterile *cutaneous solution*. It contains Lidocaine Hydrochloride in Purified Water.

The solution complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of lidocaine hydrochloride, $C_{14}H_{22}N_2O,HCl,H_2O$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Make a volume containing 0.1 g of Lidocaine Hydrochloride alkaline with 5M *sodium hydroxide*, filter, wash the residue with *water*, dissolve it in 1 mL of *ethanol (96%)*, add 0.5 mL of a 10% w/v solution of *cobalt(II) chloride* and shake for 2 minutes. A bluish-green precipitate is produced.

B. To a volume containing 0.1 g of Lidocaine Hydrochloride add 10 mL of *picric acid solution R1*. The *melting point* of the precipitate, after washing with *water* and drying at 105°, is about 229°, Appendix V A.

C. Yields the reactions characteristic of *chlorides*, Appendix VI.

2,6-Dimethylaniline

Dilute the solution to contain 0.25% w/v of Lidocaine Hydrochloride. To 10 mL of this solution add 2M *sodium hydroxide* until the solution is just alkaline and extract with three 5 mL quantities of *chloroform*, dry the combined chloroform extracts over *anhydrous sodium sulfate*, filter, wash with a further 5 mL of *chloroform* and evaporate the filtrate to dryness at a pressure of 2 kPa. Dissolve the residue in 2 mL of *methanol*, add 1 mL of a 1% w/v solution of *4-dimethylaminobenzaldehyde* in *methanol* and 2 mL of *glacial acetic acid* and allow to stand at room temperature for 10 minutes. Any yellow colour produced is not more intense than the colour obtained by repeating the operation using 10 mL of a solution of *2,6-dimethylaniline* in *water* containing 1 µg per mL in place of the solution being examined (400 ppm).

TESTS

Sterility

Complies with the *test for sterility*, Appendix XVI A.

ASSAY

Make a quantity containing 0.1 g of Lidocaine Hydrochloride alkaline with 2M *sodium hydroxide* and extract with three 20 mL quantities of *chloroform*, washing each extract with the same 10 mL of *water*. Filter the washed extracts through a filter paper moistened with *chloroform* and wash the filter with 10 mL of *chloroform*. Add the washings to the filtrate and carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.02M *perchloric acid VS* as titrant and *crystal violet solution* as indicator. Each mL of 0.02M *perchloric acid VS* is equivalent to 5.776 mg of $C_{14}H_{22}N_2O,HCl,H_2O$.

Lidocaine and Adrenaline Injection
Lidocaine and Epinephrine Injection

Action and use

Local anaesthetic + class I antiarrhythmic; adrenoceptor agonist.

DEFINITION

Lidocaine and Adrenaline Injection is a sterile solution of Lidocaine Hydrochloride and Adrenaline Acid Tartrate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of lidocaine hydrochloride, $C_{14}H_{22}N_2O,HCl,H_2O$

95.0 to 105.0% of the stated amount.

Content of adrenaline, $C_9H_{13}NO_3$

87.5 to 112.5% of the stated amount.

CHARACTERISTICS

A colourless solution.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *water*.

(1) Dilute a quantity of the injection, if necessary, to produce a solution containing 0.2% w/v of Lidocaine Hydrochloride.

(2) 0.2% w/v of *lidocaine hydrochloride BPCRS*.

(3) 0.2% w/v of each of *lidocaine hydrochloride BPCRS* and *bupivacaine hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a silica gel precoated plate (Merck silica gel 60G plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in a current of cold air, heat at 110° for 1 hour, place the hot plate in a tank of chlorine gas prepared by the addition of *hydrochloric acid* to a 5% w/v solution of *potassium permanganate* contained in a beaker placed in the tank and allow to stand for 2 minutes. Dry the plate in a current of cold air until an area of the plate below the line of application gives at most a very faint blue colour with a 0.5% w/v solution of *potassium iodide* in *starch mucilage*; avoid prolonged exposure to cold air. Spray the plate with a 0.5% w/v solution of *potassium iodide* in *starch mucilage*.

MOBILE PHASE

5 volumes of *methanol* and 95 volumes of *dichloromethane*.

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows two clearly separated principal spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay for adrenaline, the chromatogram obtained with solution (1) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (2).

Acidity

pH, 3.0 to 4.5, Appendix V L.

ASSAY

For lidocaine hydrochloride

Make a quantity containing 0.1 g of Lidocaine Hydrochloride alkaline with 2M *sodium hydroxide* and extract with three 20-mL quantities of *chloroform*, washing each extract with the same 10 mL of *water*. Filter the washed extracts through a filter paper moistened with *chloroform* and wash the filter with 10 mL of *chloroform*. Add the washings to the filtrate and carry out Method I for *non-aqueous titration*, Appendix VIII A, using 0.02M *perchloric acid VS* as titrant and *crystal violet solution* as indicator. Each mL of 0.02M *perchloric acid VS* is equivalent to 5.776 mg of $C_{14}H_{22}N_2O,HCl,H_2O$.

For adrenaline

Prepare a solution by adding 8.0 g of *tetramethylammonium hydrogen sulfate*, 2.2 g of *sodium heptanesulfonate* and 2 mL of 0.1M *disodium edetate* to a mixture of 900 mL of *water* and 100 mL of *methanol*, adjust the pH to 3.5 using 1M *sodium hydroxide* and filter through glass microfibre paper under reduced pressure (solution A).

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute the injection with solution A, if necessary, to contain 0.0005% w/v of adrenaline and dilute 5 mL of the resulting solution to 10 mL with solution A.

(2) Dilute 5 mL of a 0.001% w/v solution of *adrenaline acid tartrate BPCRS* to 10 mL with solution A.

(3) Mix 5 mL of solution (2) with 5 mL of a 0.001% w/v solution of *noradrenaline acid tartrate* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (10 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 ml per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 205 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

A solution prepared by adding 4.0 g of *tetramethylammonium hydrogen sulfate*, 1.1 g of *sodium heptanesulfonate* and 2 mL of 0.1M *disodium edetate* to a mixture of 950 mL of *water* and 50 mL of *methanol* and adjusting the pH to 3.5 with 1M *sodium hydroxide*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 2.0.

DETERMINATION OF CONTENT

Calculate the content of $C_9H_{13}NO_3$ in the injection using the declared content of $C_9H_{13}NO_3$ in *adrenaline acid tartrate BPCRS*.

STORAGE

Lidocaine and Adrenaline Injection should be protected from light.

LABELLING

The quantity of Adrenaline Acid Tartrate is stated in terms of the equivalent amount of adrenaline (epinephrine).

Lidocaine and Chlorhexidine Gel

Action and use

Local anaesthetic; class I antiarrhythmic and antiseptic.

DEFINITION

Lidocaine and Chlorhexidine Gel is a sterile solution of Lidocaine Hydrochloride containing 0.25% v/v of Chlorhexidine Gluconate Solution in a suitable water-miscible basis.

The gel complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of anhydrous lidocaine hydrochloride, $C_{14}H_{22}N_2O,HCl$

95.0 to 105.0% of the stated amount.

Content of chlorhexidine gluconate solution

0.225 to 0.275% v/v.

IDENTIFICATION

To a quantity of the gel containing the equivalent of 80 mg of anhydrous lidocaine hydrochloride add 4 mL of *hydrochloric acid* and heat on a water bath for 10 minutes. Allow to cool, transfer to a separating funnel with the aid of 20 mL of *water*, add 5M *sodium hydroxide* until precipitation is complete and extract with two 20-mL quantities of *chloroform*. Filter the chloroform extracts through *anhydrous sodium sulfate* and evaporate the filtrate to dryness on a water bath using a current of nitrogen. The residue complies with tests A, B and C.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of lidocaine *(RS 202)*.

B. Dissolve 20 mg in 1 mL of *ethanol (96%)*, add 0.5 mL of a 10% w/v solution of *cobalt(II) chloride* and 0.5 mL of 5M *sodium hydroxide* and shake for 2 minutes. A bluish-green precipitate is produced.

C. Dissolve 40 mg in 5 mL of a 1% w/v solution of *cetrimide* and add 1 mL of 5M *sodium hydroxide* and 1 mL of *bromine water*. An orange colour is produced.

D. In the Assay for chlorhexidine gluconate solution, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to chlorhexidine acetate in the chromatogram obtained with solution (1).

TESTS

Aromatic amines

Not more than 8 ppm of 2,6-dimethylaniline and not more than 1.5 ppm of 4-chloroaniline when determined in the

www.webofpharma.com

following manner. Carry out the method for *gas chromatography*, Appendix III B, using the following solutions.

(1) Shake 0.2 g of the gel with 20 mL of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 mL of a buffer solution prepared by adjusting the pH of 0.1M *sodium citrate* to 5.0 with 0.2M *sodium hydroxide*, allow to separate and discard the aqueous layer. Shake the organic layer with *anhydrous sodium sulfate* and filter through silica-treated filter paper (Whatman 1PS is suitable), add 100 µL of *heptafluorobutyric anhydride* and shake for 30 seconds. Allow the solution to stand for 2 minutes, add 5 mL of 0.6M *sodium hydrogen carbonate solution*, shake, allow to separate and use the upper layer

(2) Dissolve 80 mg of *2,6-dimethylaniline* in 1 mL of 1M *hydrochloric acid* with the aid of ultrasound, add sufficient *water* to produce 100 mL, dilute 1 volume of this solution to 50 volumes with 0.01M *hydrochloric acid* and further dilute 1 volume to 20 volumes with the same solvent. Shake 2 mL of this solution with 20 mL of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 mL of 0.6M *sodium hydrogen carbonate solution* and continue in the same manner as for solution (1) beginning at the words 'allow to separate ...'.

(3) Dissolve 30 mg of *4-chloroaniline* in 1 mL of 1M *hydrochloric acid* with the aid of ultrasound, add sufficient *water* to produce 200 mL and dilute 1 volume to 50 volumes with the same solvent; further dilute 1 volume to 20 volumes with the same solvent. Shake 2 mL of this solution with 20 mL of a mixture of 20 volumes of *ether* and 80 volumes of *hexane* and 5 mL of 0.6M *sodium hydrogen carbonate solution* and continue in the same manner as for solution (1) beginning at the words 'allow to separate ...'.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (1.5 m × 4 mm) packed with *acid-washed, silanised diatomaceous support* (100 to 120 mesh) coated with 15% w/w of cyanopropylmethylphenyl methyl silicone fluid (OV-225 is suitable).

(b) Use *nitrogen* as the carrier gas at a flow rate of 50 mL per minute.

(c) Use isothermal conditions maintained at 190°.

(d) Use an inlet temperature of 200°.

(e) Use an electron capture detector at a temperature of 270°.

(f) Inject 1 µL of each solution.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to 2,6-dimethylaniline is not greater than the area of the principal peak in the chromatogram obtained with solution (2);

the area of any peak corresponding to 4-chloroaniline is not greater than the area of the principal peak in the chromatogram obtained with solution (3).

Sterility

Complies with the *test for sterility*, Appendix XVI A.

ASSAY

For lidocaine hydrochloride

Carry out the Assay described under Lidocaine Gel.

For chlorhexidine gluconate solution

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 5 mL of a 0.080% w/v solution of *diphenylamine* (internal standard) in the mobile phase to 5 mL of a 0.070% w/v solution of *chlorhexidine acetate BPCRS* in the mobile phase and dilute to 100 mL with the mobile phase.

(2) Mix 10 g of the gel with sufficient of the mobile phase to produce 100 mL.

(3) Prepare solution (3) in the same manner as solution (2) but adding 5 mL of the internal standard solution before diluting to 100 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (10 µm) (Nucleosil C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

0.01M *sodium octanesulfonate* in *methanol (73%)* adjusted to pH 3.0 with *glacial acetic acid*

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$ from the declared content of $C_{22}H_{30}Cl_2N_{10}$ in *chlorhexidine acetate BPCRS*. Each mg of $C_{22}H_{30}Cl_2N_{10}$ is equivalent to 1.775 mg of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$. Determine the *weight per mL* of the gel, Appendix V G, and express the result as the percentage volume in volume of Chlorhexidine Gluconate Solution, which contains 20% w/v of $C_{22}H_{30}Cl_2N_{10},2C_6H_{12}O_7$.

LABELLING

The quantity of Lidocaine Hydrochloride is stated in terms of the equivalent amount of anhydrous lidocaine hydrochloride.

Lincomycin Capsules

Action and use

Lincosamide antibacterial.

DEFINITION

Lincomycin Capsules contain Lincomycin Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of lincomycin, $C_{18}H_{34}N_2O_6S$

90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Extract a quantity of the capsules contents containing the equivalent of 0.2 g of lincomycin with 5 mL of a mixture of 4 volumes of *chloroform* and 1 volume of *methanol*, filter and evaporate the filtrate. Dissolve the oily residue in 1 mL of *water*, add *acetone* until precipitation begins and add a further 20 mL of *acetone*. Filter the precipitate, wash with two 10-mL quantities of *acetone*, dissolve the residue in a little of the chloroform–methanol mixture, evaporate to dryness and dry at 60° at a pressure not exceeding 2 kPa for 4 hours. The *infrared absorption spectrum* of the dried precipitate, Appendix II A, is concordant with the *reference spectrum* of lincomycin hydrochloride *(RS 203)*.

www.webofpharma.com

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to the trimethylsilyl derivative of lincomycin in the chromatogram obtained with solution (1).

TESTS

Lincomycin B

Examine solution (3) as described under the Assay but increasing the sensitivity by 8 to 10 times while recording the peak derived from lincomycin B, which is eluted immediately before that derived from lincomycin.

LIMITS

The area of the peak derived from lincomycin B, when corrected for the sensitivity factor, is not more than 5% of the area of the peak derived from lincomycin.

Water

The contents of the capsules contain not more than 7.0% w/w of water, Appendix IX C. Use 0.3 g.

ASSAY

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions.

(1) Add 10 mL of a 0.8% w/w solution of *dotriacontane* (internal standard) in *chloroform* to 0.1 g of *lincomycin hydrochloride BPCRS*, dilute to 100 mL with a 2% w/v solution of *imidazole* in *chloroform* and shake to dissolve. Place 4 mL of the resulting solution in a 15-mL ground-glass-stoppered centrifuge tube, add 1 mL of a mixture of 99 volumes of *N,O-bis(trimethylsilyl)acetamide* and 1 volume of *trimethylchlorosilane* and swirl gently. Loosen the glass stopper and heat at 65° for 30 minutes.

(2) Prepare in the same manner as solution (1) but omitting the internal standard and using a quantity of the mixed contents of 20 capsules containing the equivalent of 90 mg of lincomycin in place of the *lincomycin hydrochloride BPCRS*.

(3) Prepare in the same manner as solution (1) but using a quantity of the mixed contents of 20 capsules containing the equivalent of 90 mg of lincomycin in place of the *lincomycin hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (1.5 m × 3 mm) packed with *acid-washed silanised diatomaceous support* impregnated with 3% w/w of phenyl methyl silicone fluid (50% phenyl) (OV-17 is suitable) and maintained at 260°.

(b) Use *helium* as the carrier gas at a flow rate of about 45 mL per minute.

(c) Use an inlet temperature of 260° to 290°.

(d) Use a flame ionisation detector at a temperature of 260° to 290°.

(e) Inject 1 µL of each solution.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{34}N_2O_6S$ in the capsules using the declared content of $C_{18}H_{34}N_2O_6S$ in *lincomycin hydrochloride BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of lincomycin.

Lincomycin Injection

Action and use

Lincosamide antibacterial.

DEFINITION

Lincomycin Injection is a sterile solution of Lincomycin Hydrochloride in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of lincomycin, $C_{18}H_{34}N_2O_6S$

92.5 to 107.5% of the stated amount.

CHARACTERISTICS

A colourless or almost colourless solution.

IDENTIFICATION

A. Add *acetone* to a volume of the injection containing the equivalent of 0.2 g of lincomycin until precipitation begins and add a further 20 mL of *acetone*. Filter the precipitate, wash with two 10-mL quantities of *acetone*, dissolve the residue in the minimum of a mixture of 4 volumes of *chloroform* and 1 volume of *methanol*, evaporate to dryness and dry at 60° at a pressure not exceeding 2 kPa for 4 hours. The *infrared absorption spectrum* of the dried precipitate, Appendix II A, is concordant with the *reference spectrum* of lincomycin hydrochloride *(RS 203)*.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the peak due to the trimethylsilyl derivative of lincomycin in the chromatogram obtained with solution (1).

TESTS

Acidity

pH, 3.0 to 5.5, Appendix V L.

Lincomycin B

Examine solution (3) as described under the Assay but increase the sensitivity by 8 to 10 times while recording the peak derived from lincomycin B, which is eluted immediately before that derived from lincomycin.

LIMITS

The area of the peak derived from lincomycin B, when corrected for the sensitivity factor, is not more than 5% of the area of the peak derived from lincomycin.

Bacterial endotoxins

Carry out the *test for bacterial endotoxins*, Appendix XIV C. Dilute the injection if necessary with *water BET* to give a solution containing the equivalent of 10 mg of lincomycin per mL (solution A). The endotoxin limit concentration of solution A is 5.0 IU per mL.

ASSAY

Carry out the method for *gas chromatography*, Appendix III B, using the following solutions.

(1) Add 10 mL of a 0.8% w/w solution of *dotriacontane* (internal standard) in *chloroform* to 0.1 g of *lincomycin hydrochloride BPCRS*, dilute to 100 mL with a 2% w/v solution of *imidazole* in *chloroform* and shake to dissolve. Place 4 mL of the resulting solution in a 15-mL ground-glass-stoppered centrifuge tube, add 1 mL of a mixture of 99 volumes of *N,O-bis(trimethylsilyl)acetamide* and 1 volume of *trimethylchlorosilane* and swirl gently. Loosen the glass stopper and heat at 65° for 30 minutes.

(2) Prepare in the same manner as solution (1) but omitting the internal standard and using the residue obtained by evaporating to dryness 1 mL of a solution prepared by

www.webofpharma.com

diluting a volume of the injection containing the equivalent of 0.9 g of lincomycin to 10 mL with *methanol* in place of the *lincomycin hydrochloride BPCRS*.

(3) Prepare in the same manner as solution (1) but using the residue obtained by evaporating to dryness 1 mL of a solution prepared by diluting a volume of the injection containing the equivalent of 0.9 g of lincomycin to 10 mL with *methanol* in place of the *lincomycin hydrochloride BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a glass column (1.5 m × 3 mm) packed with *acid-washed silanised diatomaceous support* impregnated with 3% w/w of phenyl methyl silicone fluid (50% phenyl) (OV-17 is suitable) and maintained at 260°.

(b) Use *helium* as the carrier gas at a flow rate of about 45 mL per minute.

(c) Use an inlet temperature of 260° to 290°.

(d) Use a flame ionisation detector at a temperature of 260° to 290°.

(e) Inject 1 µL of each solution.

DETERMINATION OF CONTENT

Calculate the content of $C_{18}H_{34}N_2O_6S$ in the injection using the declared content of $C_{18}H_{34}N_2O_6S$ in *lincomycin hydrochloride BPCRS*.

STORAGE

Lincomycin Injection should be protected from light and stored at a temperature not exceeding 30°.

LABELLING

The strength is stated as the equivalent amount of lincomycin in a suitable dose-volume.

White Liniment

White Cutaneous Emulsion

White Embrocation

DEFINITION

White Liniment is a *cutaneous emulsion*.

Oleic Acid	85 mL
Turpentine Oil	250 mL
Dilute Ammonia Solution	45 mL
Ammonium Chloride	12.5 g
Purified Water	625 mL

Extemporaneous preparation

The following directions apply.

Mix the Oleic Acid with the Turpentine Oil. Dilute the Dilute Ammonia Solution with 45 mL of the Purified Water, previously warmed, add to the oily solution and shake to form an emulsion. Separately dissolve the Ammonium Chloride in the remainder of the Purified Water, add to the emulsion and mix.

The liniment complies with the requirements stated under Liquids for Cutaneous Application and with the following requirements.

Content of volatile oil

24.5 to 27.5% v/w.

Refractive index

Of the oily liquid obtained in the Assay, 1.465 to 1.477, Appendix V E.

ASSAY

Acidify 100 g with 1M *sulfuric acid* using *methyl orange solution* as indicator, distil in steam and collect the distillate in a separating funnel; occasionally separate the aqueous portion of the distillate and return it to the flask. When all the volatile matter has been distilled, remove the aqueous portion of the distillate and measure the volume of the oily liquid.

Liothyronine Tablets

Action and use

Thyroid hormone replacement.

DEFINITION

Liothyronine Tablets contain Liothyronine Sodium.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of liothyronine sodium, $C_{15}H_{11}I_3NNaO_4$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the peak in the chromatogram obtained with solution (2).

TEST

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Liothyronine comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in 0.05M *sodium hydroxide*.

(1) Add sufficient 0.05M *sodium hydroxide* to one tablet to produce a solution containing about 6 µg per mL of Liothyronine Sodium, mix with the aid of ultrasound until the tablet is fully dispersed, cool and shake for 2 minutes. Add sufficient 0.05M *sodium hydroxide* to produce a solution containing 0.0004% w/v of Liothryonine Sodium, filter through glass microfibre filter paper (Whatman GF/C is suitable) and use the filtrate.

(2) 0.0004% w/v of *liothyronine sodium EPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *nitrile silica gel for chromatography* (5 µm) (Nucleosil 5 CN is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 225 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

5 volumes of *orthophosphoric acid*, 300 volumes of *acetonitrile* and 700 volumes of *water*.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{11}I_3NNaO_4$ in each tablet using the declared content of $C_{15}H_{11}I_3NNaO_4$ in *liothyronine sodium EPCRS*.

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in equal volumes of *methanol* and 0.1M *sodium hydroxide* (solvent A).

www.webofpharma.com

(1) Disperse with the aid of ultrasound for 10 minutes a quantity of the powdered tablets containing 0.1 mg of Liothyronine Sodium with 8 mL of solvent A. Shake for 2 minutes, cool, add sufficient solvent A to produce 10 mL, mix, filter through glass microfibre filter paper (Whatman GF/C is suitable) and use the filtrate.

(2) 0.001% w/v of *liothyronine sodium EPCRS*.

(3) 0.0005% w/v of *liothyronine sodium EPCRS* and 0.0005% w/v of *levothyroxine sodium BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Uniformity of content may be used.

SYSTEM SUITABILITY

The Assay is not valid unless the *resolution factor* between the two principal peaks in the chromatogram obtained with solution (3) is at least 4.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{15}H_{11}I_3NNaO_4$ in the tablets using peak areas and the declared content of $C_{15}H_{11}I_3NNaO_4$ in *liothyronine sodium EPCRS*.

STORAGE

Liothyronine Tablets should be protected from light.

Lisinopril Oral Solution

NOTE: Lisinopril Oral Solution is not currently licensed in the United Kingdom.

Action and use

Angiotensin converting enzyme inhibitor.

DEFINITION

Lisinopril Oral Solution is a solution of Lisinopril Dihydrate in a suitable aqueous vehicle.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of anhydrous lisinopril, $C_{21}H_{31}N_3O_5$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a volume of the oral solution with sufficient of a mixture of 20 volumes of *water* and 80 volumes of *methanol* to produce a solution containing the equivalent of 0.05% w/v of anhydrous lisinopril.

(2) 0.055% w/v of *lisinopril dihydrate BPCRS* in a mixture of 20 volumes of *water* and 80 volumes of *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254}.

(b) Pre-wash the plate with *methanol* and allow to dry in air before use.

(c) Use the mobile phase as described below.

(d) Apply 20 µL of each solution.

(e) Develop the plate to 15 cm.

(f) After removal of the plate, dry in air, spray with a 0.2% w/v solution of *ninhydrin* in *absolute ethanol*, heat at 105° for 10 minutes and examine in daylight.

MOBILE PHASE

Equal volumes of *glacial acetic acid*, *butan-1-ol*, *ethyl acetate* and *water*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is the same as that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a volume of the oral solution containing the equivalent of 5 mg of anhydrous lisinopril to 20 mL with mobile phase A.

(2) Dilute 3 volumes of solution (1) to 100 volumes with mobile phase A and dilute 1 volume of the resulting solution to 10 volumes with mobile phase A.

(3) Dilute 1 volume of solution (2) to 3 volumes with mobile phase A.

(4) Boil 20 mL of a 0.1% w/v solution of *lisinopril dihydrate BPCRS* in *water* under a reflux condenser for 2 hours. Allow to cool to room temperature, dilute 5 mL of the resulting solution to 20 mL with mobile phase A and mix thoroughly.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *ether linked phenyl groups* (4 µm) (Phenomenex Synergi Hydro-RP is suitable) fitted with a guard column (4 mm × 3 mm) packed with the same material.

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 35°.

(e) Use a detection wavelength of 210 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

Mobile phase A 25 volumes of *methanol* and 75 volumes of a solution prepared by dissolving 13.7 g of *sodium dihydrogen orthophosphate*, 2.1 g of *disodium hydrogen orthophosphate dihydrate* and 6.8 g of *tetrabutylammonium hydrogen sulfate* in 2000 mL of *water* and adjusting the pH to 5.7 with either 5M *sodium hydroxide* or *orthophosphoric acid*.

Mobile phase B *acetonitrile R1*.

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-30	100	0	Isocratic
30-31	100→50	0→50	linear gradient
31-39	50	50	Isocratic
39-40	50→100	50→0	linear gradient
40-60	100	0	re-equilibration

www.webofpharma.com

SYSTEM SUITABILITY

The test is not valid unless:

the retention time of lisinopril is about 10 minutes;

in the chromatogram obtained with solution (3), the *signal to noise ratio* of the peak due to lisinopril is at least 10;

in the chromatogram obtained with solution (4), a peak on the tail of the lisinopril peak is visible.

If necessary, adjust the pH or the methanol content of mobile phase A.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.3%);

the sum of the areas of any such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.6%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (3) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dilute a weighed quantity of the oral solution containing the equivalent of 5 mg of anhydrous lisinopril to 20 mL with mobile phase A.

(2) 0.027% w/v of *lisinopril dihydrate BPCRS* in mobile phase A.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used but using isocratic elution and mobile phase A.

DETERMINATION OF CONTENT

Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of $C_{21}H_{31}N_3O_5$, weight in volume, using the declared content of $C_{21}H_{31}N_3O_5$ in *lisinopril dihydrate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous lisinopril.

Lisinopril Tablets

Action and use

Angiotensin converting enzyme inhibitor.

DEFINITION

Lisinopril Tablets contain Lisinopril Dihydrate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of anhydrous lisinopril, $C_{21}H_{31}N_3O_5$

92.5 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing the equivalent of 10 mg of anhydrous lisinopril with 2 mL of *water* and add 8 mL of *methanol*.

(2) 0.11% w/v of *lisinopril dihydrate BPCRS* in a mixture of 20 volumes of *water* and 80 volumes of *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Pre-wash the plate with *methanol* and allow to dry in air before use.

(c) Use the mobile phase as described below.

(d) Apply 20 µL of each solution.

(e) Develop the plate to 15 cm.

(f) After removal of the plate, dry in air, spray with a 0.2% w/v solution of *ninhydrin* in *absolute ethanol*, heat at 105° for 10 minutes and examine in daylight.

MOBILE PHASE

Equal volumes of *glacial acetic acid*, *butan-1-ol*, *ethyl acetate* and *water*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (1) has the same retention time as the peak due to lisinopril in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 30 minutes withdraw a 10 mL sample of the medium and filter. Use the filtered medium, diluted with 0.1M *hydrochloric acid*, if necessary.

(2) Dissolve a quantity of *lisinopril dihydrate BPCRS* in sufficient of the dissolution medium to produce a solution of the same concentration as that expected for solution (1).

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the total content of lisinopril, $C_{21}H_{31}N_3O_5$, in the medium from the chromatograms obtained and using the declared content of $C_{21}H_{31}N_3O_5$, in *lisinopril dihydrate BPCRS*.

LIMITS

The amount of anhydrous lisinopril released is not less than 85% of the stated amount.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in a mixture of 1 volume of *methanol* and 4 volumes *water* (solvent A).

(1) Shake a quantity of the powdered tablets containing the equivalent of 20 mg of anhydrous lisinopril with solvent A

www.webofpharma.com

with the aid of ultrasound for 5 minutes, dilute to 100 mL with solvent A, mix with the aid of ultrasound again for about 10 minutes ensuring that the temperature of the solution does not rise above room temperature, and filter through a 0.45-µm membrane filter.

(2) 0.0003% w/v of *lisinopril diketopiperazine BPCRS*.

(3) Dilute 1 volume of solution (1) to 100 volumes.

(4) Dilute 1 volume of solution (3) to 10 volumes.

(5) 0.022% w/v of *lisinopril dihydrate BPCRS* and 0.0002% w/v of *lisinopril diketopiperazine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *octylsilyl silica gel for chromatography* (10 µm) (Lichrosorb RP-8 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 215 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

200 volumes of *acetonitrile R1* and 800 volumes of a 0.408% w/v solution of *anhydrous potassium dihydrogen orthophosphate* adjusted to pH 2.0 with *orthophosphoric acid* containing 0.125% w/v of *sodium hexanesulfonate*.

SYSTEM SUITABILITY

The test is not valid unless:

in the chromatogram obtained with solution (5), the *resolution factor* between the peaks due to lisinopril and lisinopril diketopiperazine is at least 5.0;

in the chromatogram obtained with solution (4), the *signal to noise ratio* of the peak due to lisinopril is at least 10.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to lisinopril diketopiperazine is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (1.5%);

the area of any other *secondary peak* is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with solution (3) (0.3%);

the sum of the areas of any other *secondary peaks* is not greater than 0.6 times the area of the principal peak in the chromatogram obtained with solution (3) (0.6%);

the sum of the content of lisinopril diketopiperazine and the nominal total content of any other impurities is not more than 2%.

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (4) (0.1%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D. Using the following solutions in solvent A described under Related Substances.

(1) Shake 10 whole tablets with solvent A with the aid of ultrasound for 5 minutes, dilute to a suitable volume with solvent A, mix with the aid of ultrasound again for about 10 minutes ensuring that the temperature of the solution does not rise above room temperature, and filter through a 0.45-µm membrane filter. Dilute a volume of the filtrate with solvent A to produce a solution containing the equivalent of 0.02% w/v of anhydrous lisinopril.

(2) 0.022% w/v of *lisinopril dihydrate BPCRS*.

(3) 0.022% w/v of *lisinopril dihydrate BPCRS* and 0.0002% w/v of *lisinopril diketopiperazine BPCRS*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to lisinopril and lisinopril diketopiperazine is at least 5.0.

DETERMINATION OF CONTENT

Calculate the content of $C_{21}H_{31}N_3O_5$ in the tablets using the declared content of $C_{21}H_{31}N_3O_5$ in *lisinopril dihydrate BPCRS*.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of anhydrous lisinopril.

IMPURITIES

The impurities limited by the requirements of this monograph include:

1. (2*S*)-2-[(3*S*,8a*S*)-3-(4-aminobutyl)-1,4-dioxohexahydropyrrolo[1,2-a]pyrazin-2(1*H*)-yl]-4-phenylbutanoic acid (*S*,*S*,*S*-diketopiperazine) (Lisinopril Dihydrate impurity C),

2. (2*S*)-2-[(3*S*,8a*R*)-3-(4-aminobutyl)-1,4-dioxohexahydropyrrolo[1,2-a]pyrazin-2(1*H*)-yl]-4-phenylbutanoic acid (*R*,*S*,*S*-diketopiperazine) (Lisinopril Dihydrate impurity D).

Lithium Carbonate Tablets

DEFINITION

Lithium Carbonate Tablets contain Lithium Carbonate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lithium carbonate, Li_2CO_3

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A small quantity of the powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, imparts a carmine red colour to the flame.

ASSAY

Weigh and powder 20 tablets. Add a quantity of the powder containing 1 g of Lithium Carbonate to 100 mL of *water*, add 50 mL of 1M *hydrochloric acid VS* and boil for 1 minute to remove the carbon dioxide. Cool and titrate the excess of acid with 1M *sodium hydroxide VS* using *methyl orange solution* as indicator. Each mL of 1M *hydrochloric acid VS* is equivalent to 36.95 mg of Li_2CO_3.

www.webofpharma.com

Prolonged-release Lithium Carbonate Tablets

Prolonged-release Lithium Carbonate Tablets from different manufacturers, whilst complying with the requirements of the monograph, are not interchangeable unless otherwise justified and authorised.

DEFINITION

Prolonged-release Lithium Carbonate Tablets contain Lithium Carbonate and are formulated so as to release the medicament over a period of several hours.

PRODUCTION

A suitable dissolution test is carried out to demonstrate the appropriate release of lithium carbonate. The dissolution profile reflects the *in vivo* performance which in turn is compatible with the dosage schedule recommended by the manufacturer.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lithium carbonate, Li_2CO_3
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A small quantity of the powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, imparts a carmine red colour to the flame.

ASSAY

Weigh and powder 20 tablets. Add a quantity of the powder containing 1 g of Lithium Carbonate to 100 mL of *water*, add 50 mL of 1M *hydrochloric acid VS* and boil for 1 minute to remove the carbon dioxide. Cool and titrate the excess of acid with 1M *sodium hydroxide VS* using *methyl orange solution* as indicator. Each mL of 1M *hydrochloric acid VS* is equivalent to 36.95 mg of Li_2CO_3.

Lithium Citrate Oral Solution

DEFINITION

Lithium Citrate Oral Solution is a solution of Lithium Citrate in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids and with the following requirements.

Content of lithium citrate, $C_6H_5Li_3O_7,4H_2O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. The oral solution, when diluted with an equal volume of 3M *hydrochloric acid* and introduced on a platinum wire into a flame, imparts a carmine red colour to the flame.

B. Boil 5 mL of the oral solution with 5 mL of *mercury(II) sulfate solution* and add a few drops of *dilute potassium permanganate solution*. The solution is decolorised and an off-white precipitate is produced.

TESTS

Acidity
pH, 4.0 to 5.5, Appendix V L.

ASSAY

Dilute a weighed quantity of the oral solution containing 0.4 g of Lithium Citrate to 1000 mL with *water* and add 0.05 mL of *polysorbate 80*. Determine the content of lithium by Method I for *atomic emission spectrophotometry*, Appendix II D, measuring at 671 nm and using *lithium standard solution (100 ppm Li)*, suitably diluted with *water* and 0.05 mL of *polysorbate 80*, to prepare the standard solutions. Determine the *weight per mL* of the oral solution, Appendix V G, and calculate the content of lithium citrate, weight in volume, taking each mg of Li to be equivalent to 13.54 mg of $C_6H_5Li_3O_7,4H_2O$.

STORAGE

Lithium Citrate Oral Solution should be protected from light and stored at a temperature not exceeding 30°.

LABELLING

The quantity of the active ingredient in a suitable dose-volume is stated (1) as the amount of Lithium Citrate; (2) as the concentration of lithium ions in millimoles; (3) in terms of the equivalent amount of Lithium Carbonate.

Lofepramine Tablets

Action and use
Monoamine reuptake inhibitor; tricyclic antidepressant.

DEFINITION

LofepramineTablets contain Lofepramine Hydrochloride. They are coated.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lofepramine, $C_{26}H_{27}ClN_2O$
90.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Remove the majority of the coating. Wash the tablet with *dichloromethane* to remove the remaining coating. Place the tablet core in an ultrasound bath for 30 minutes with 10 mL of *dichloromethane*, filter the resulting suspension through a 0.45-µm PTFE filter; evaporate the filtrate to dryness using a rotary evaporator and a water bath at 30° and dry the residue at 50° at a pressure not exceeding 2 kPa for 1 hour. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of lofepramine hydrochloride (form B) *(RS 399B)*.

B. In the Assay, the chromatogram obtained with solution (2) shows a peak with the same retention time as the principal peak in the chromatogram obtained with solution (1).

TEST

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake a quantity of tablets containing the equivalent of 0.35 g of lofepramine for 1 hour with 50 mL of a mixture of 250 volumes of *acetonitrile*, 250 volumes of *water* and 1 volume of *orthophosphoric acid (85%)*, dilute the resulting solution to 200 mL with the same solvent mixture, centrifuge and use the supernatant liquid. For solution (2) dilute 1 volume of solution (1) to 100 volumes with the same solvent mixture. Solution (3) contains 0.0002% w/v each of *desipramine hydrochloride BPCRS* and *imipramine hydrochloride BPCRS* in the mobile phase.

The chromatographic procedure may be carried out using (a) a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octylsilyl silica gel for chromatography* (5 µm) (Lichrospher 60 RP-select B is suitable) and maintained at 50°, (b) as the mobile phase with a flow rate of 1.5 mL per minute a 0.09% w/v solution of *sodium dodecyl sulfate* in a

www.webofpharma.com

mixture of 550 volumes of *acetonitrile*, 325 volumes of *water* and 125 volumes of a buffer solution of pH 1.0 containing 0.015% w/v of *glycine*, 0.018% w/v of *sodium chloride* and 0.44% w/v of *hydrochloric acid* and (c) a detection wavelength of 254 nm.

Inject 20 µL of each solution. For solution (1) allow the chromatography to continue for 4 times the retention time of the principal peak.

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 0.9.

In the chromatogram obtained with solution (1), the area of any *secondary peak* is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%) and the sum of the areas of any *secondary peaks* is not greater than twice the area of the peak in the chromatogram obtained with solution (2) (2%). Disregard any peak with a retention time of less than 3 minutes.

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. For solution (1) shake 10 tablets for 1 hour with 300 mL of a mixture of 250 volumes of *acetonitrile*, 250 volumes of *water* and 1 volume of *orthophosphoric acid (85%)* and dilute to 500 mL with the same solvent mixture, mix and centrifuge; dilute the supernatant liquid with the same solvent mixture to produce a solution containing the equivalent of 0.028% w/v of lofepramine. Solution (2) contains 0.030% w/v of *lofepramine hydrochloride BPCRS* in the solvent mixture. Solution (3) contains 0.0002% w/v each of *desipramine hydrochloride BPCRS* and *imipramine hydrochloride BPCRS* in the mobile phase.

The chromatographic procedure described under Related substances may be used.

Inject 20 µL of each solution. The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 0.9.

Calculate the content of $C_{26}H_{27}ClN_2O$ in the tablets using the declared content of $C_{26}H_{27}ClN_2O$ in *lofepramine hydrochloride BPCRS*.

STORAGE

Lofepramine Tablets should be protected from light and moisture.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of lofepramine.

Lomustine Capsules

Action and use

Cytotoxic alkylating agent.

DEFINITION

Lomustine Capsules contain Lomustine.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of lomustine, $C_9H_{16}ClN_3O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

Carry out the following procedure in subdued light. Shake a quantity of the contents of the capsules containing 0.2 g of Lomustine with 10 mL of *methanol*, filter and evaporate the filtrate to dryness using a rotary evaporator on a water bath maintained at not more than 60°. The residue, after drying at 60° at a pressure not exceeding 0.7 kPa for 30 minutes, complies with the following tests.

A. The *infrared absorption spectrum*, Appendix II A, is concordant with the *reference spectrum* of lomustine *(RS 204)*.

B. *Melting point*, about 88°, Appendix V A.

TEST

Related substances

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *methanol*.

(1) Shake a quantity of the contents of the capsules containing 0.20 g of Lomustine with 10 mL of *methanol* and filter.

(2) Dilute 1 volume of solution (1) to 25 volumes and further dilute 1 volume of this solution to 10 volumes.

(3) Dilute 1 volume of solution (2) to 2 volumes.

(4) Dissolve 10 mg of *lomustine EPCRS* and 10 mg of *1,3-dicyclohexylurea* and dilute to 10 mL.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel*.

(b) Use the mobile phase as described below.

(c) Apply 5 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it at 110° for 1 hour. At the bottom of a chromatography tank, place an evaporating dish containing a mixture of 1 volume of 7M *hydrochloric acid*, 1 volume of *water* and 2 volumes of a 1.5% w/v solution of *potassium permanganate*, close the tank and allow to stand for 15 minutes. Place the dried plate in the tank and close the tank. Leave the plate in contact with the chlorine vapour for 5 minutes. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed and an area of coating below the line of application does not give a blue colour with a drop of *potassium iodide and starch solution*. Spray with *potassium iodide and starch solution*.

MOBILE PHASE

20 volumes of *glacial acetic acid* and 80 volumes of *toluene*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (4) shows two clearly separated principal spots.

LIMITS

Any *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2) (0.4%) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (3) (0.2%).

B. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in *methanol*.

(1) Shake a quantity of the contents of the capsules containing 0.20 g of Lomustine with 10 mL of *methanol* and filter.

(2) Dilute 2 volumes of solution (1) to 100 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 to 10 µm) (Nucleosil C18 is suitable).

www.webofpharma.com

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

50 volumes of *methanol* and 50 volumes of *water*.

When the chromatograms are recorded in the prescribed conditions, the retention time of lomustine is about 25 minutes.

LIMITS

In the chromatogram obtained with solution (1) the sum of the areas of any *secondary peaks* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (2%).

Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Carry out the following procedure in subdued light. Shake a quantity of the mixed contents of 20 capsules containing 40 mg of Lomustine with 70 mL of *ethanol (96%)* for 20 minutes, dilute to 100 mL with the same solvent and filter. Dilute 5 mL of the filtrate to 100 mL with *ethanol (96%)* and measure the *absorbance* of the resulting solution at the maximum at 230 nm, Appendix II B. Calculate the content of $C_9H_{16}ClN_3O_2$ taking 260 as the value of A(1%, 1 cm) at the maximum at 230 nm.

Loperamide Capsules

Action and use

Opioid receptor agonist; antidiarrhoeal.

DEFINITION

Loperamide Capsules contain Loperamide Hydrochloride.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of loperamide hydrochloride, $C_{29}H_{33}ClN_2O_2,HCl$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 10 mg of Loperamide Hydrochloride with 10 mL of *methanol* for 5 minutes and filter.

(2) 0.10% w/v of *loperamide hydrochloride BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel F_{254}* (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*. Expose the plate to iodine vapour and examine again.

MOBILE PHASE

2.5 volumes of *acetate buffer pH 4.7*, 17.5 volumes of *methanol*, 27 volumes of *ethyl acetate* and 53 volumes of *dichloromethane*.

CONFIRMATION

By each method of visualisation the principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with solution (1) is similar to that of the principal peak in the chromatogram obtained with solution (2).

TESTS

Dissolution

Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 50 revolutions per minute.

(b) Use 500 mL of a buffer solution prepared by mixing 20 mL of 1M *acetic acid* with 60 mL of *water*, adjusting the pH to 4.7 with 1M *sodium hydroxide* and diluting to 100 mL with *water*, at a temperature of 37°, as the medium.

PROCEDURE

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) After 45 minutes withdraw a 10 mL sample of the medium and filter. Use the filtered medium.

(2) 0.00040% w/v of *loperamide hydrochloride BPCRS* in the dissolution medium.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

DETERMINATION OF CONTENT

Calculate the total content of loperamide hydrochloride, $C_{29}H_{33}ClN_2O_2,HCl$, in the medium from the chromatograms obtained and using the declared content of $C_{29}H_{33}ClN_2O_2,HCl$ in *loperamide hydrochloride BPCRS*.

Loperamide *N*-oxide

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 20 mg of Loperamide Hydrochloride with 40 mL of *methanol* for 15 minutes, filter and evaporate the filtrate to dryness using a rotary evaporator and a water bath at 30°; to the residue add 2 mL of *methanol*, mix with the aid of ultrasound, centrifuge and use the supernatant liquid.

(2) 0.020% w/v of *loperamide N-oxide BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating silica gel the surface of which has been modified with chemically-bonded octadecylsilyl groups (Whatman KC 18 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 25 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and expose to iodine vapour for 16 hours.

www.webofpharma.com

MOBILE PHASE

30 volumes of *water*, adjusted to pH 3.0 by the addition of *orthophosphoric acid*, and 70 volumes of *methanol*.

LIMITS

Any spot corresponding to loperamide *N*-oxide in the chromatogram obtained with solution (1) is not more intense than the principal spot in the chromatogram obtained with solution (2) (2%).

Uniformity of content

Capsules containing less than 2 mg and/or less than 2% w/w of Loperamide Hydrochloride comply with the requirements stated under Capsules using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 150 mL of *water* to one whole capsule and mix with the aid of ultrasound for 30 minutes, shake mechanically for 30 minutes and dilute to 200 mL with *acetonitrile*, filter and use the filtrate.

(2) 0.0010% w/v of *loperamide hydrochloride BPCRS* in a mixture of 45 volumes of *water* and 55 volumes of *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Assay may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{29}H_{33}ClN_2O_2$,HCl in each capsule using the declared content of $C_{29}H_{33}ClN_2O_2$,HCl in *loperamide hydrochloride BPCRS*.

ASSAY

Prepare 0.005M *sodium octanesulfonate* containing, per 1000 mL, 1 mL of 13.5M *ammonia* and 0.5 mL of *triethylamine* and adjust the pH to 3.2 with *orthophosphoric acid* (solvent A). Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Mix a quantity of the mixed contents of 20 capsules containing 20 mg of Loperamide Hydrochloride with 90 mL of *water* with the aid of ultrasound for 10 minutes, shake for 30 minutes, dilute to 200 mL with *acetonitrile* and filter.

(2) 0.010% w/v of *loperamide hydrochloride BPCRS* in a mixture of 45 volumes of *water* and 55 volumes of *acetonitrile*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 4 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (4 µm) (Novapak C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

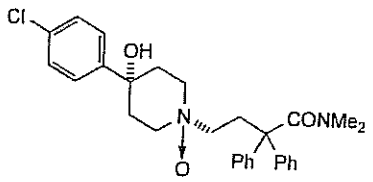
(c) Use a flow rate of 1.5 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 226 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE



45 volumes of solvent A and 55 volumes of *acetonitrile*.

DETERMINATION OF CONTENT

Calculate the content of $C_{29}H_{33}ClN_2O_2$,HCl in the capsules using the declared content of $C_{29}H_{33}ClN_2O_2$,HCl in *loperamide hydrochloride BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurity F listed under Loperamide Hydrochloride.

F. Loperamide *N*-oxide

Loprazolam Tablets

Action and use

Benzodiazepine.

DEFINITION

Loprazolam Tablets contain Loprazolam Mesilate.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of loprazolam, $C_{23}H_{21}ClN_6O_3$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 210 to 370 nm of the filtrate obtained in the Assay exhibits a maximum at 330 nm and a shoulder at 240 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing the equivalent of 2 mg of loprazolam with 10 mL of a mixture of 46 volumes of *chloroform*, 46 volumes of *methanol* and 8 volumes of *water*, centrifuge and use the clear supernatant liquid.

(2) 0.02% w/v of *loprazolam mesilate BPCRS* in the same solvent mixture.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* F_{254} (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

20 volumes of *methanol* and 80 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in a mixture of 46 volumes of *chloroform*, 46 volumes of *methanol* and 8 volumes of *water*.

(1) Shake a quantity of the powdered tablets containing the equivalent of 10 mg of loprazolam with 4 mL of the solvent mixture, mix the suspension with the aid of ultrasound for 5 minutes, centrifuge and use the clear supernatant liquid.

(2) 0.00025% w/v of *loprazolam mesilate BPCRS*.

www.webofpharma.com

(3) 0.00125% w/v of *6-(2-chlorophenyl)-2,4-dihydro-2-[(dimethylamino)methylene]-8-nitroimidazo-[1,2-a][1,4]benzodiazepin-1-one BPCRS* (dimethylamino analogue).

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* (Merck silica gel 60 plates are suitable). Before use, stand the plate in *methanol,* allowing the solvent front to ascend 17 cm, allow to dry in air, heat the plate at 100° to 105° for 1 hour and use with the flow of mobile phase in the same direction as that used for the pretreatment.

(b) Use the mobile phase as described below.

(c) Apply 40 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, allow it to dry in air, spray the plate with a 5% w/v solution of *titanium(III) chloride* in a solution of hydrochloric acid containing 10% w/v of HCl and then spray with a solution containing 0.4 g of *4-dimethylaminocinnamaldehyde* in a mixture of 20 mL of 6M *hydrochloric acid* and 100 mL of *ethanol (96%)*. Heat at 100° until spots appear (about 10 minutes).

MOBILE PHASE

20 volumes of *methanol* and 80 volumes of *chloroform.*

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to the dimethylamino analogue is not more intense than the spot in the chromatogram obtained with solution (3) (0.5%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (2) (0.1%).

Uniformity of content

Tablets containing less than the equivalent of 2 mg and/or less than 2% w/w of loprazolam comply with the requirements stated under Tablets using the following method of analysis. Shake one tablet with 8 mL of *water,* add 80 mL of *absolute ethanol,* mix with the aid of ultrasound for 10 minutes, cool and dilute to 200 mL with *absolute ethanol.* Mix, filter, discarding the first 20 mL of filtrate, and measure the *absorbance* of the resulting solution at the maximum at 330 nm, Appendix II B. Calculate the content of $C_{23}H_{21}ClN_6O_3$ taking 890 as the value of A(1%, 1 cm) at the maximum at 330 nm.

ASSAY

Use the average of the 10 individual results obtained in the test for Uniformity of content.

LABELLING

The quantity of active ingredient is stated in terms of the equivalent amount of loprazolam.

Loratadine Tablets

Action and use

Histamine H_1 receptor antagonist; antihistamine.

DEFINITION

Loratadine Tablets contain Loratadine.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of loratadine, $C_{22}H_{23}ClN_2O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

Extract a quantity of the powdered tablets containing 50 mg of Loratadine with 20 mL of *acetone,* filter and evaporate the filtrate to dryness. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of loratadine *(RS 435).*

TESTS

Impurity H

Carry out the method for *gas chromatography,* Appendix III B. Use a 0.002% w/v solution of *isoamyl benzoate* in *dichloromethane* as the internal standard solution.

(1) Shake a quantity of powdered tablets containing 20 mg of Loratadine with 5 mL of *dichloromethane* and filter. To the filtrate add 1 mL of the internal standard solution and 1 mL of solution (2) and dilute to 10 mL with *dichloromethane.*

(2) 0.002% w/v of *loratadine impurity H EPCRS.*

(3) Add 1 mL of the internal standard solution to 1 mL of solution (2) and dilute to 5 mL with *dichloromethane.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a *poly(dimethyl)siloxane* column (25 m × 0.32 mm) bonded with a film (0.52 µm) (HP 1 is suitable).

(b) Use *helium* as the carrier gas at 1.0 mL per minute.

(c) Use the gradient conditions described below.

(d) Use an inlet temperature of 260°.

(e) Use a flame ionisation detector at a temperature of 300°.

(f) Inject 1 µL of each solution.

(g) Use a split ratio of 1:30.

Temperature	Rate (min)	Comment
80°	maintain for 1 minute	isocratic
80°→300°	10° per minute	linear gradient
300°	maintain for 10 minutes	isocratic

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity H and isoamyl benzoate is at least 2.0.

LIMITS

Calculate the ratio of the area of the peak due to impurity H to the area of the peak due to isoamyl benzoate from the chromatogram obtained with solution (3).

In the chromatogram obtained with solution (1): the ratio of the area of the peak due to impurity H to the area of the peak due to isoamyl benzoate is not greater than twice the ratio of the peaks obtained with solution (3) (0.1%).

Related substances

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions.

(1) Shake a quantity of powdered tablets containing 20 mg of Loratadine with 10 mL of *methanol* and filter. Dilute 1 volume of the filtrate to 2 volumes with the mobile phase.

(2) Dilute 1 volume of solution (1) to 100 volumes and further dilute 1 volume to 5 volumes with the mobile phase.

(3) 0.1% w/v of *loratadine impurity standard BPCRS* in the mobile phase.

www.webofpharma.com

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (Inertsil ODS-3V is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

(d) Use a column temperature of 40°.

(e) Use a detection wavelength of 220 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

30 volumes of *methanol*, 35 volumes of 0.05M *potassium dihydrogen orthophosphate*, previously adjusted to pH 2.8 with *orthophosphoric acid*, and 40 volumes of *acetonitrile*.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity E and loratadine is at least 1.5.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than the area of the principal peak in the chromatogram obtained with solution (2) (0.2%) assuming correction factors of 1.7 for impurity A, 1.9 for impurity E and 1.6 for impurity F;

the sum of the areas of the *secondary peaks* is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%).

Disregard any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with solution (2) (0.05%).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 20 mg of Loratadine with 20 mL of *methanol* and filter. Dilute 1 volume of the filtrate to 10 volumes with the mobile phase.

(2) 0.01% w/v of *loratadine BPCRS* in the mobile phase.

(3) 0.1% w/v of *loratadine impurity standard BPCRS* in the mobile phase.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to loratadine and impurity E is at least 1.5.

DETERMINATION OF CONTENT

Calculate the content of $C_{22}H_{23}ClN_2O_2$ in the tablets using the declared content of $C_{22}H_{23}ClN_2O_2$ in *loratadine BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include those listed under Loratadine.

Lorazepam Injection

Action and use

Benzodiazepine.

DEFINITION

Lorazepam Injection is a sterile solution of Lorazepam in a suitable solvent.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of lorazepam, $C_{15}H_{10}Cl_2N_2O_2$

92.5 to 105.0% of the stated amount.

IDENTIFICATION

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 plates are suitable) and *toluene* as the mobile phase. Apply separately to the plate 10 µL of each of the following solutions. For solution (1) add 5 mL of *hydrochloric acid* to a volume of the injection containing 10 mg of Lorazepam, heat in a water bath for 20 minutes and cool. Transfer the cooled solution to a separating funnel, add 8 mL of 10M *sodium hydroxide*, extract with two 25 mL quantities of *ether* and filter the combined extracts through absorbent cotton. Evaporate the filtrate to about 2 mL and dilute to 10 mL with *methanol*. For solution (2) add 5 mL of *hydrochloric acid* to 10 mL of a 0.1% w/v solution of *lorazepam BPCRS* in *absolute ethanol* and treat in the same manner as for solution (1) beginning at the words 'heat in a water bath . . .'. After removal of the plate, allow it to dry and spray with a freshly prepared 1.25% w/v solution of *sodium nitrite* in 0.5M *hydrochloric acid*. Heat the plate at 100° for 5 minutes, allow to cool and spray with a 0.1% w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride* in *absolute ethanol*. The principal spot in the chromatogram obtained with solution (1) corresponds to that in the chromatogram obtained with solution (2).

B. In the Assay, the principal peak in the chromatogram obtained with solution (2) has the same retention time as the principal peak in the chromatogram obtained with solution (1).

TESTS

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using a silica gel precoated plate (Merck silica gel 60 F_{254} plates are suitable) and a mixture of 100 volumes of *chloroform* and 10 volumes of *methanol* as the mobile phase. Before use, stand the plate in *methanol* and allow the solvent front to ascend 17 cm. Allow the plate to dry in air, heat it at 100° to 105° for 1 hour and use with the flow of mobile phase in the same direction as that used for the pretreatment. Apply separately to the plate 40 µL of each of the following solutions. For solution (1) add 10 mL of *water* to a volume of the injection containing 4 mg of Lorazepam, extract with two 10 mL quantities of *dichloromethane*, wash the combined extracts with 10 mL of *water* and evaporate the washed extract to dryness at 20° in a current of nitrogen. Dissolve the residue in 2 mL of *acetone*. Solution (2) contains 0.010% w/v of *6-chloro-4-(2-chlorophenyl)quinazoline-2-carboxaldehyde BPCRS* in *acetone*. For solution (3) dilute 1 volume of solution (1) to 100 volumes with *acetone*. For solution (4) dilute 1 volume of solution (1) to 200 volumes with *acetone*. Solution (5) contains 0.1% v/v of *benzyl alcohol* in *acetone*. After removal of the plate, allow it to dry in air and examine under *ultraviolet light (254 nm)*. Any spot corresponding to

www.webofpharma.com

6-chloro-4-(2-chlorophenyl)quinazoline-2-carboxaldehyde in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (2). Any other *secondary spot* in the chromatogram obtained with solution (1) is not more intense than the spot in the chromatogram obtained with solution (3) and not more than one such spot is more intense than the spot in the chromatogram obtained with solution (4). Disregard any spot with an Rf value similar to that of the spot in the chromatogram obtained with solution (5).

ASSAY

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions. Solution (1) contains 0.008% w/v of *lorazepam BPCRS* in the mobile phase. For solution (2) dilute a suitable volume of the injection with sufficient mobile phase to produce a solution containing 0.008% w/v of Lorazepam.

The chromatographic procedure may be carried out using (a) a stainless steel column (12.5 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable), (b) a mixture of 70 volumes of *methanol* and 30 volumes of *water* as the mobile phase with a flow rate of 1.5 mL per minute and (c) a detection wavelength of 254 nm.

Calculate the content of $C_{15}H_{10}Cl_2N_2O_2$ from the declared content of $C_{15}H_{10}Cl_2N_2O_2$ in *lorazepam BPCRS*.

STORAGE

Lorazepam Injection should be protected from light and stored at a temperature of 2° to 8°.

Lorazepam Tablets

Action and use

Benzodiazepine.

DEFINITION

Lorazepam Tablets contain Lorazepam.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lorazepam, $C_{15}H_{10}Cl_2N_2O_2$

90.0 to 110.0% of the stated amount.

IDENTIFICATION

A. The *light absorption*, Appendix II B, in the range 210 to 350 nm of the solution obtained in the Assay exhibits two maxima, at 230 nm and 316 nm.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 10 mg of Lorazepam with 10 mL of *acetone* for 20 minutes, filter and evaporate the filtrate to dryness. Dissolve the residue in 10 mL of *absolute ethanol*, add 5 mL of *hydrochloric acid*, heat on a water bath for 20 minutes and cool. Transfer the cooled solution to a separating funnel, add 8 mL of 10M *sodium hydroxide*, extract with two 25-mL quantities of *ether* and filter the combined extracts through absorbent cotton. Evaporate the filtrate to about 2 mL and dilute to 10 mL with *methanol*.

(2) Treat 10 mL of a 0.1% w/v solution of *lorazepam BPCRS* in *absolute ethanol*, add 5 mL of *hydrochloric acid*, heat on a water bath for 20 minutes and cool. Transfer the cooled solution to a separating funnel, add 8 mL of 10M *sodium hydroxide*, extract with two 25-mL quantities of *ether* and filter the combined extracts through absorbent cotton. Evaporate the filtrate to about 2 mL and dilute to 10 mL with *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel GF_{254}* (Merck silica gel 60 plates are suitable).

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air, spray with a freshly prepared 1.25% w/v solution of *sodium nitrite* in 0.5M *hydrochloric acid*. Heat the plate at 100° for 5 minutes, allow to cool and spray with a 0.1% w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride* in *absolute ethanol*.

MOBILE PHASE

toluene

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

TESTS

Dissolution

Carry out the procedure protected from light. Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 1, rotating the basket at 100 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 45 minutes withdraw a 10 mL sample of the medium. Using 2 cm cells measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, to produce a solution expected to contain about 0.00011% w/v of Lorazepam, at the maximum at 232 nm, Appendix II B using 0.1M *hydrochloric acid* in the reference cell.

DETERMINATION OF CONTENT

Calculate the content of Lorazepam, $C_{15}H_{10}Cl_2N_2O_2$, in the medium taking 1115 as the value of A(1%, 1cm) at the maximum at 232 nm.

Related substances

Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions in *acetone*.

(1) Shake a quantity of powdered tablets containing 10 mg of Lorazepam with 4 mL of *acetone*, centrifuge and use the supernatant liquid.

(2) 0.0025% w/v of *6-chloro-4-(2-chlorophenyl)quinazoline-2-carboxaldehyde BPCRS*.

(3) Dilute 1 volume of solution (1) to 100 volumes.

(4) Dilute 1 volume of solution (1) to 200 volumes.

CHROMATOGRAPHIC CONDITIONS

(a) Use a *silica gel GF_{254}* precoated plate (Merck silica gel 60 F_{254} plates are suitable).

(b) Use the mobile phase as described below.

(c) Before use, stand the plate in *methanol*, allowing the solvent front to ascend 17 cm, heat the plate at 100° to 105° for 1 hour. Use with the flow of mobile phase in the same direction as that used for the prewash.

www.webofpharma.com

(d) Apply 40 µL of each solution.

(e) Develop the plate to 17 cm.

(f) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

10 volumes of *methanol* and 100 volumes of *chloroform*.

LIMITS

In the chromatogram obtained with solution (1):

any spot corresponding to 6-chloro-4-(2-chlorophenyl)quinazoline-2-carboxaldehyde is not more intense than the spot in the chromatogram obtained with solution (2) (1%);

any other *secondary spot* is not more intense than the spot in the chromatogram obtained with solution (3) (1%);

not more than one such spot is more intense than the spot in the chromatogram obtained with solution (4) (0.5%).

Uniformity of content

Tablets containing less than 2 mg and/or less than 2% w/w of Lorazepam comply with the requirements stated under Tablets using the following method of analysis. Crush one tablet to a fine powder, add 40 mL of *ethanol (96%)* and shake for 1 hour. Add sufficient *ethanol (96%)* to produce 50 mL, centrifuge and dilute the supernatant liquid with sufficient *ethanol (96%)* to produce a solution containing 0.0005% w/v of Lorazepam. Measure the *absorbance* of the resulting solution at the maximum at 230 nm, Appendix II B, and calculate the content of $C_{15}H_{10}Cl_2N_2O_2$ taking 1150 as the value of A(1%, 1 cm) at the maximum at 230 nm.

ASSAY

Weigh and powder 20 tablets. To a quantity of the powdered tablets containing 5 mg of Lorazepam add 40 mL of *ethanol (96%)* and shake for 1 hour. Add sufficient *ethanol (96%)* to produce 50 mL, centrifuge, dilute 5 mL to 100 mL with the same solvent and measure the *absorbance* of the resulting solution at the maximum at 230 nm, Appendix II B. Calculate the content of $C_{15}H_{10}Cl_2N_2O_2$ taking 1150 as the value of A(1%, 1 cm) at the maximum at 230 nm.

STORAGE

Lorazepam Tablets should be protected from light.

Lormetazepam Tablets

Action and use

Benzodiazepine.

DEFINITION

Lormetazepam Tablets contain Lormetazepam.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of lormetazepam, $C_{16}H_{12}Cl_2N_2O_2$

95.0 to 105.0% of the stated amount.

IDENTIFICATION

A. Shake a quantity of the powdered tablets containing 10 mg of Lormetazepam with 5 mL of *acetone*, filter, wash the residue with a further 5 mL of *acetone*, combine the acetone extracts and evaporate to dryness on a water bath using a current of *nitrogen*. The *infrared absorption spectrum* of the dried residue, Appendix II A, is concordant with the *reference spectrum* of lormetazepam *(RS 207)*.

B. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the powdered tablets containing 10 mg of Lormetazepam with 5 mL of *acetone* for 15 minutes and filter.

(2) 0.2% w/v of *lormetazepam BPCRS* in *acetone*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel* GF_{254}.

(b) Use the mobile phase as described below.

(c) Apply 10 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry in air and examine under *ultraviolet light (254 nm)*.

MOBILE PHASE

1 volume of *methanol* and 10 volumes of *chloroform*.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position and colour to that in the chromatogram obtained with solution (2).

TESTS

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Dissolve a quantity of the powdered tablets containing 10 mg of Lormetazepam in 100 mL of *methanol (60%)*, centrifuge and use the clear supernatant liquid.

(2) Dilute 1 volume of solution (1) to 100 volumes with *methanol (60%)*.

(3) 0.0010% w/v each of *lormetazepam BPCRS* and *lorazepam BPCRS* in *methanol (60%)*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (20 cm × 4.6 mm) packed with *end-capped octadecylsilyl silica gel for chromatography* (5 µm) (Hypersil ODS is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 2 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 230 nm.

(f) Inject 20 µL of each solution.

MOBILE PHASE

48 volumes of *methanol* and 52 volumes of a phosphate buffer prepared by dissolving 4.91 g of *sodium dihydrogen orthophosphate* and 0.633 g of *disodium hydrogen orthophosphate* in sufficient *water* to produce 1000 mL.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the two principal peaks is at least 4.

LIMITS

In the chromatogram obtained with solution (1):

the area of any *secondary peak* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the sum of the areas of any *secondary peaks* is not greater than the area of the peak in the chromatogram obtained with solution (2) (1%).

Disregard any peaks with a retention time of less than half that of lormetazepam.

www.webofpharma.com

Uniformity of content
Tablets containing less than 2 mg and/or less than 2% w/w of Lormetazepam comply with the requirements stated under Tablets using the following method of analysis. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Add 3 mL of *water* to one tablet, allow to stand for 20 minutes with occasional shaking, mix with the aid of ultrasound for 2 minutes, add 35 mL of *methanol*, mix with the aid of ultrasound for 5 minutes, shake for a further 15 minutes and cool. For tablets containing 0.5 mg of Lormetazepam, dilute the resulting solution to 50 mL with *water* and for tablets containing 1 mg of Lormetazepam, dilute to 100 mL with *methanol (60%)*, centrifuge for 10 minutes and use the clear supernatant liquid.

(2) 0.001% w/v of *lormetazepam BPCRS* in *methanol (70%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{12}Cl_2N_2O_2$ in the tablets from the declared content of $C_{16}H_{12}Cl_2N_2O_2$ in *lormetazepam BPCRS*.

ASSAY
Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) Disperse a quantity of the powdered tablets containing 10 mg of Lormetazepam in 500 mL of *methanol (60%)*, centrifuge for 15 minutes and use the clear supernatant liquid.

(2) 0.002% w/v of *lormetazepam BPCRS* in *methanol (60%)*.

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

DETERMINATION OF CONTENT

Calculate the content of $C_{16}H_{12}Cl_2N_2O_2$ in the tablets from the declared content of $C_{16}H_{12}Cl_2N_2O_2$ in *lormetazepam BPCRS*.

Losartan Potassium Tablets

Action and use
Angiotensin II (AT_1) receptor antagonist.

DEFINITION
Losartan Tablets contain Losartan Potassium.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of losartan potassium, $C_{22}H_{22}ClKN_6O$
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. Shake a quantity of the powdered tablets containing 0.1 g of Losartan Potassium with 25 mL of *acetone* for 15 minutes, filter (Whatman GF/C is suitable) and evaporate to dryness under a stream of nitrogen. The *infrared absorption spectrum* of the residue, Appendix II A, is concordant with the *reference spectrum* of losartan *(RS 453)*.

B. Shake a quantity of the powdered tablets containing 0.2 g of Losartan Potassium with 5 mL of *water*, filter (Whatman GF/C is suitable) and pass the filtrate through a 0.45-µm membrane filter. 1 mL of the filtrate yields reaction B characteristic of *potassium salts*, Appendix VI.

TESTS
Dissolution
Comply with the requirements in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 900 mL of *water*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 30 minutes withdraw a sample of the medium and measure the *absorbance* of the filtered sample, suitably diluted with the dissolution medium if necessary, at the maximum at 250 nm, Appendix II B, using *water* in the reference cell.

(2) Measure the *absorbance* of a suitable solution of *losartan potassium BPCRS* using *water* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of losartan potassium, $C_{22}H_{22}ClKN_6O$, in the medium from the absorbances obtained and using the declared content of $C_{22}H_{22}ClKN_6O$ in *losartan potassium BPCRS*.

LIMITS

The amount of losartan potassium released after 30 minutes is not less than 70% (Q) of the stated amount.

Related substances
Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions.

(1) To a quantity of the powdered tablets containing 62.5 mg of Losartan Potassium add 125 mL of mobile phase A and mix with the aid of ultrasound for 15 minutes, shaking the samples intermittently. Mix for a further 10 minutes with the aid of ultrasound. Add sufficient mobile phase A to produce a solution containing 0.025% w/v of Losartan Potassium.

(2) Dilute 1 volume of solution (1) to 100 volumes and further dilute 1 volume to 10 volumes with mobile phase A.

(3) Dissolve 12 mg of *losartan potassium BPCRS* in 5 mL of *water*, add 5 mL of 0.1M *hydrochloric acid* and heat at 105° for 4 hours. Cool to ambient temperature. Add 5 mL of 0.1M *sodium hydroxide* and dilute to 50 mL with *water*. Adjust the pH of the solution to 6.0 with 0.1M *hydrochloric acid*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (15 cm × 3.9 mm) packed with *octylsilyl silica gel for chromatography* (5 µm) (Waters Symmetry C8 is suitable).

(b) Use gradient elution and the mobile phase described below.

(c) Use a flow rate of 1 mL per minute.

(d) Use an ambient column temperature.

(e) Use a detection wavelength of 250 nm.

(f) Inject 10 µl of each solution.

MOBILE PHASE

Mobile phase A 3 volumes of *acetonitrile* and 17 volumes of *mixed phosphate buffer pH 7.0*.

Mobile phase B *acetonitrile*.

www.webofpharma.com

Time (Minutes)	Mobile phase A (% v/v)	Mobile phase B (% v/v)	Comment
0-10	80→40	20→60	linear gradient
10-11	40→80	60→20	linear gradient
11-15	80	20	re-equilibration

Use the chromatogram obtained with solution (3) to identify the peaks due to impurities L and M. When the chromatograms are recorded under the prescribed conditions, the relative retentions with reference to losartan (retention time = about 2.6 minutes) are: impurity L = about 2.4; impurity M = about 2.9.

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (3), the *resolution factor* between the peaks due to impurity L and impurity M is at least 2.0.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity M is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any peak corresponding to impurity L is not greater than 5 times the area of the principal peak in the chromatogram obtained with solution (2) (0.5%);

the area of any other *secondary peak* is not greater than twice the area of the principal peak in the chromatogram obtained with solution (2) (0.2%);

the sum of the areas of all the *secondary peaks* is not greater than 10 times the area of the principal peak in the chromatogram obtained with solution (2) (1%).

Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with solution (2) (0.1%).

ASSAY

Weigh and powder 20 tablets. Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions in the mobile phase.

(1) Mix with the aid of ultrasound for 15 minutes a quantity of the powdered tablets containing 25 mg of Losartan Potassium with 30 mL of mobile phase and allow to cool. Add sufficient mobile phase to produce 50 mL and filter through a 0.45-µm PTFE filter.

(2) 0.05% w/v of *losartan potassium BPCRS*.

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *octadecylsilyl silica gel for chromatography* (5 µm) (Prodigy C18 is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.5 mL per minute.

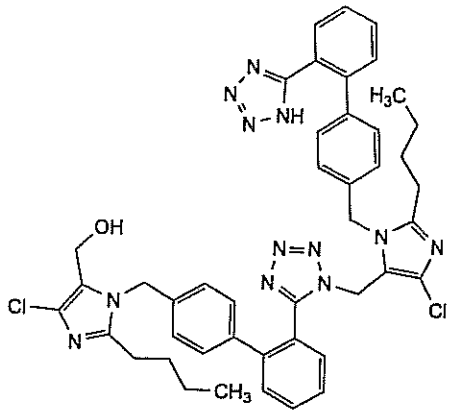
(d) Use an ambient column temperature.

(e) Use a detection wavelength of 250 nm.

(f) Inject 10 µL of each solution.

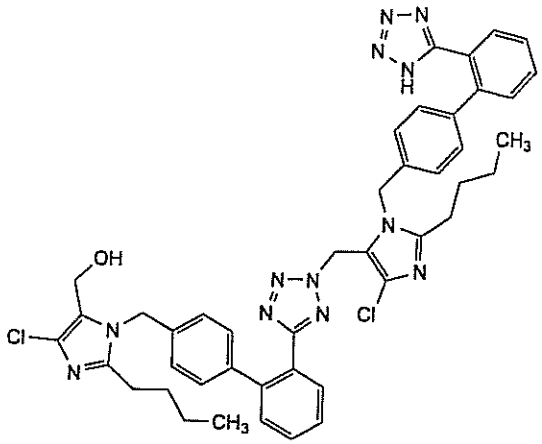
MOBILE PHASE

3 volumes of *acetonitrile* and 7 volumes of a solution containing 0.39% w/v of *sodium dihydrogen orthophosphate* and 0.35% v/v of *triethylamine* adjusted to pH 7.0 with *orthophosphoric acid*.



When the chromatograms are recorded under the prescribed conditions the retention time of Losartan is about 7 minutes.

DETERMINATION OF CONTENT



Calculate the content of $C_{22}H_{22}ClKN_6O$ in the tablets using the declared content of $C_{22}H_{22}ClKN_6O$ in *losartan potassium BPCRS*.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities L and M listed under Losartan Potassium.

L. [2-butyl-1-[[2′-[1-[[2-butyl-4-chloro-1-[[2′-(1*H*-tetrazol-5-yl)biphenyl-4-yl]methyl]-1*H*-imidazol-5-yl]methyl]-1*H*-tetrazol-5-yl]biphenyl-4-yl]methyl]-4-chloro-1*H*-imidazol-5-yl]methanol (European Pharmacopoeia Impurity L).

M. [2-butyl-1-[[2′-[2-[[2-butyl-4-chloro-1-[[2′-(1*H*-tetrazol-5-yl)biphenyl-4-yl]methyl]-1*H*-imidazol-5-yl]methyl]-2*H*-tetrazol-5-yl]biphenyl-4-yl]methyl]-4-chloro-1*H*-imidazol-5-yl]methanol (European Pharmacopoeia Impurity M).

Lymecycline Capsules

Action and use

Tetracycline antibacterial.

DEFINITION

Lymecycline Capsules contain Lymecycline.

The capsules comply with the requirements stated under Capsules and with the following requirements.

Content of lymecycline, $C_{29}H_{38}N_4O_{10}$

90.0 to 110.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

The contents of the capsules comply with the following tests.

A. Carry out the method for *thin-layer chromatography*, Appendix III A, using the following solutions.

(1) Shake a quantity of the contents of the capsules containing 5 mg of Lymecycline with 10 mL of *methanol*, centrifuge and use the supernatant liquid.

(2) 0.05% w/v of *lymecycline BPCRS* in *methanol*.

(3) 0.05% w/v of each of *tetracycline hydrochloride BPCRS*, *chlortetracycline hydrochloride BPCRS* and *doxycycline hyclate BPCRS* in *methanol*.

CHROMATOGRAPHIC CONDITIONS

(a) Use as the coating *silica gel H*. Adjust the pH of a 10% w/v solution of *disodium edetate* to 8.0 with 10M *sodium hydroxide* and spray the solution evenly onto the plate (about 10 mL for a plate 100 mm × 200 mm). Allow the plate to dry in a horizontal position for at least 1 hour. Before use, dry the plate in an oven at 110° for 1 hour.

(b) Use the mobile phase as described below.

(c) Apply 1 µL of each solution.

(d) Develop the plate to 15 cm.

(e) After removal of the plate, dry it in air and examine under *ultraviolet light (365 nm)*.

MOBILE PHASE

6 volumes of *water*, 35 volumes of *methanol* and 59 volumes of *dichloromethane*.

SYSTEM SUITABILITY

The test is not valid unless the chromatogram obtained with solution (3) shows three clearly separated spots.

CONFIRMATION

The principal spot in the chromatogram obtained with solution (1) corresponds in position, colour and size to that in the chromatogram obtained with solution (2).

B. To 0.5 mg add 2 mL of *sulfuric acid*. A purplish-red colour is produced.

C. Dissolve 50 mg in 5 mL of *water*, add 50 mg of *ninhydrin*, boil and add 15 mL of *water*. A bluish-violet colour is produced.

D. Dissolve 0.2 g in 5 mL of *water*, add 0.3 mL of *orthophosphoric acid* and distil. To 1 mL of the distillate add 10 mL of *chromotropic acid–sulfuric acid solution*. A violet colour is produced.

TESTS

Dissolution

Carry out the procedure protected from light. Comply with the requirements for Monographs of the British Pharmacopoeia in the *dissolution test for tablets and capsules*, Appendix XII B1.

TEST CONDITIONS

(a) Use Apparatus 2, rotating the paddle at 75 revolutions per minute.

(b) Use 900 mL of 0.1M *hydrochloric acid*, at a temperature of 37°, as the medium.

PROCEDURE

(1) After 60 minutes withdraw a 20 mL sample of the medium and filter. To 5 mL of this solution add 50 mL of *water* and 5 mL of 5M *sodium hydroxide*, mix with shaking and add sufficient *water* to produce 100 mL. Exactly 6 minutes after adding the sodium hydroxide measure the *absorbance* of the resulting solution at the maximum at 380 nm, Appendix II B using a solution prepared by diluting 5 mL of 5M *sodium hydroxide* to 100 mL with *water* in the reference cell.

(2) Add 50 mL of *water* and 5 mL of 5M *sodium hydroxide* to 2 mL of a 0.09% w/v solution of *tetracycline hydrochloride BPCRS* in 0.1M *hydrochloric acid*, mix with shaking and add sufficient *water* to produce 100 mL. Exactly 6 minutes after adding the sodium hydroxide measure the *absorbance* of the resulting solution using a solution prepared by diluting 5 mL of 5M *sodium hydroxide* to 100 mL with *water* in the reference cell.

DETERMINATION OF CONTENT

Calculate the total content of lymecycline, $C_{29}H_{38}N_4O_{10}$, in the medium from the absorbances obtained and using the declared content of $C_{22}H_{24}N_2O_8$,HCl in *tetracycline hydrochloride BPCRS*. Each mg of $C_{22}H_{24}N_2O_8$,HCl is equivalent to 0.9241 mg of $C_{22}H_{24}N_2O_8$ (tetracycline). Multiply the content of tetracycline by 1.356 to obtain the content of lymecycline.

LIMITS

The amount of lymecycline released is not less than 70% of the stated amount.

Free tetracycline

Not more than 2.5%, when determined by the following method. To a quantity of the contents of the capsules containing 0.5 g of Lymecycline add 50 mL of *butyl acetate* and allow to stand at 25° for 1 hour. Filter (Whatman GF/C is suitable) and extract the filtrate with two 25-mL quantities of 0.1M *hydrochloric acid*. Combine the extracts, add sufficient 0.1M *hydrochloric acid* to produce 50 mL and dilute 10 mL of this solution to 100 mL with 0.1M *hydrochloric acid*.
The *absorbance* of the resulting solution at the maximum at 355 nm, Appendix II B, is not greater than 0.64.

Light-absorbing impurities

Dissolve the contents of five capsules as completely as possible in sufficient 0.1M *hydrochloric acid* to produce a solution containing 0.15% w/v of Lymecycline and filter. The *absorbance* of the filtrate at 430 nm, when measured within 1 hour of preparing the solution, is not more than 0.60, calculated with reference to the anhydrous capsule contents, Appendix II B.

Related substances

Carry out the method for *liquid chromatography*, Appendix III D, using the following solutions prepared immediately before use.

(1) Dissolve a quantity of the mixed contents of 20 capsules containing 0.125 g of Lymecycline in 5 mL of *water*. Add 1 mL of a 4% w/v solution of *sodium metabisulfite* and allow to stand in the dark at 20 to 25° for 16 to 24 hours, without stirring. Add 50 mL of 0.05M *hydrochloric acid*, shake to dissolve the precipitate and dilute to 100 mL with *water* (contains approximately 0.1% w/v of tetracycline).

(2) 0.1% w/v of *tetracycline hydrochloride BPCRS* in 0.01M *hydrochloric acid*.

(3) 0.025% w/v of *4-epitetracycline hydrochloride EPCRS* (impurity A) in 0.01M *hydrochloric acid*.

(4) 0.01% w/v of *anhydrotetracycline hydrochloride EPCRS* (impurity C) in 0.01M *hydrochloric acid*.

(5) 0.02% w/v of *4-epianhydrotetracycline hydrochloride EPCRS* (impurity D) in 0.01M *hydrochloric acid*.

(6) Mix 1 volume of solution (2), 2 volumes of solution (3) and 5 volumes of solution (5) and dilute to 25 volumes with 0.01M *hydrochloric acid*.

www.webofpharma.com

(7) Mix 40 volumes of solution (3), 20 volumes of solution (4) and 5 volumes of solution (5) and dilute to 200 volumes with 0.01M *hydrochloric acid.*

CHROMATOGRAPHIC CONDITIONS

(a) Use a stainless steel column (25 cm × 4.6 mm) packed with *styrene-divinylbenzene copolymer* (8 µm) with a pore size of 10 nm (PLRP-S 100A is suitable).

(b) Use isocratic elution and the mobile phase described below.

(c) Use a flow rate of 1.0 mL per minute.

(d) Use a column temperature of 60°.

(e) Use a detection wavelength of 254 nm.

(f) Inject 20 µL of solutions (1), (6) and (7).

(g) Allow the chromatography to proceed for 5 times the retention time of the principal peak in the chromatogram obtained with solution (1).

When the chromatograms are recorded under the prescribed conditions, the retention time of tetracycline is about 8 minutes. The retention times relative to tetracycline are: impurity E, about 0.50; impurity A, about 0.6; impurity F, about 0.68; impurity B (eluting on the tail of the principal peak), about 1.2; impurity D, about 1.45; impurity G, about 1.45; impurity C, about 2.95.

MOBILE PHASE

Weigh 80.0 g of *2-methyl-2-propanol* and transfer to a 1000 mL volumetric flask with the aid of 200 mL of *water.* Add 100 mL of a 3.5% w/v solution of *dipotassium hydrogen orthophosphate* adjusted to pH 8.0 with *dilute orthophosphoric acid,* 200 mL of a 1% w/v solution of *tetrabutylammonium hydrogen sulfate* adjusted to pH 8.0 with *dilute sodium hydroxide solution* and 10 mL of a 4% w/v solution of *sodium edetate* adjusted to pH 8.0 with *dilute sodium hydroxide solution;* dilute to 1000 mL with *water.*

SYSTEM SUITABILITY

The test is not valid unless, in the chromatogram obtained with solution (6):

the *resolution factor* between the peaks due to impurity A (first peak) and tetracycline (second peak) is at least 3.0;

the *resolution factor* between the peaks due to tetracycline and impurity D (third peak) is at least 5.0;

the *symmetry factor* of the peak due to tetracycline is not more than 1.25.

LIMITS

In the chromatogram obtained with solution (1):

the area of any peak corresponding to impurity A is not greater than 1.6 times the area of the corresponding peak in the chromatogram obtained with solution (7) (8%);

the area of any peak corresponding to impurity C is not greater than twice the area of the corresponding peak in the chromatogram obtained with solution (7) (2%);

the area of any peaks corresponding to impurities E and F are not greater than 0.4 times the area of the peak corresponding to impurity A in the chromatogram obtained with solution (7) (2% each);

the area of any peak with a retention time relative to tetracycline of about 1.6 is not greater than 0.14 times the area of the peak corresponding to impurity A in the chromatogram obtained with solution (7) (0.7%);

the area of any peak corresponding to impurity B is not greater than 0.1 times the area of the peak corresponding to impurity A in the chromatogram obtained with solution (7) (0.5%);

the sum of the areas of any peaks corresponding to impurities D and G is not greater than the area of the peak corresponding to impurity D in the chromatogram obtained with solution (7) (0.5%);

the area of any other *secondary peak* is not greater than 0.1 times the area of the peak corresponding to impurity A in the chromatogram obtained with solution (7) (0.5%);

the sum of the areas of all the *secondary peaks* is not greater than 2.2 times the area of the peak corresponding to impurity A in the chromatogram obtained with solution (7) (11%).

Disregard any peak with an area less than 0.02 times the area of the peak corresponding to impurity A in the chromatogram obtained with solution (7) (0.1%).

Water

The contents of the capsules contain not more than 7.0% w/w of water, Appendix IX C. Use 0.3 g.

ASSAY

Carry out the method for *liquid chromatography,* Appendix III D, using the following solutions prepared immediately before use.

(1) Dissolve a quantity of the mixed contents of 20 capsules containing 0.125 g of Lymecycline in 5 mL of *water.* Add 1 mL of a 4% w/v solution of *sodium metabisulfite* and allow to stand in the dark at 20 to 25° for 16 to 24 hours, without stirring. Add 50 mL of 0.05M *hydrochloric acid,* shake to dissolve the precipitate and dilute to 100 mL with *water* (contains approximately 0.1% w/v of tetracycline).

(2) 0.1% w/v of *tetracycline hydrochloride BPCRS* in 0.01M *hydrochloric acid.*

CHROMATOGRAPHIC CONDITIONS

The chromatographic conditions described under Related substances may be used.

SYSTEM SUITABILITY

Inject solution (2) six times. The Assay is not valid unless the relative standard deviation of the area of the principal peak is at most 1.0%.

DETERMINATION OF CONTENT

Calculate the content of $C_{29}H_{38}N_4O_{10}$ in the capsules using the declared content of $C_{22}H_{24}N_2O_8$,HCl in *tetracycline hydrochloride BPCRS.* Each mg of $C_{22}H_{24}N_2O_8$,HCl is equivalent to 0.9241 mg of $C_{22}H_{24}N_2O_8$ (tetracycline). Multiply the content of tetracycline by 1.356 to obtain the content of lymecycline.

IMPURITIES

The impurities limited by the requirements of this monograph include impurities A to G listed under Lymecycline.

204 mg of Lymecycline is equivalent to approximately 150 mg of tetracycline.

www.webofpharma.com

Magaldrate Oral Suspension

Action and use
Antacid.

DEFINITION
Magaldrate Oral Suspension contains Magaldrate in a suitable flavoured vehicle.

The oral suspension complies with the requirements stated under Oral Liquids and with the following requirements.

Content of anhydrous magaldrate, $Al_5Mg_{10}(OH)_{31}(SO_4)_2$
90.0 to 110.0% of the stated amount.

IDENTIFICATION
A. Dissolve a quantity of the oral suspension containing the equivalent of 0.8 g of anhydrous magaldrate in 20 mL of 3M *hydrochloric acid*, add 30 mL of *water* and heat to boiling. Add 6M *ammonia* until a pH of 6.2 is obtained, continue boiling for a further 2 minutes, filter and retain the precipitate and the filtrate. To 2 mL of the filtrate add 2 mL of *ammonium chloride solution* and neutralise with a solution prepared by dissolving 2 g of *ammonium carbonate* and 2 mL of 6M *ammonia* in sufficient *water* to produce 20 mL; no precipitate is produced. Add *disodium hydrogen phosphate solution*; a white, crystalline precipitate is produced which is insoluble in 6M *ammonia*.

B. The precipitate retained in test A yields the reaction characteristic of *aluminium salts*, Appendix VI.

C. The filtrate obtained in test A yields the reactions characteristic of *sulfates*, Appendix VI.

TESTS
Neutralising capacity
Disperse a quantity containing the equivalent of 0.8 g of anhydrous magaldrate in 70 mL of water, heat to 37° and mix for 1 minute. Maintain the temperature at 37° and, while stirring continuously, add from a pipette 30 mL of 1M *hydrochloric acid VS*. Stir for 15 minutes and, over a period not exceeding 5 minutes, titrate the excess acid with 1M *sodium hydroxide VS* to a pH of 3.5 which is stable for a period of 10 to 15 seconds. Not more than 12 mL of 1M *sodium hydroxide VS* is required.

Magnesium hydroxide
Not less than 49.2% and not more than 66.6% of the content of anhydrous magaldrate when determined by the following method. Mix a quantity of the oral suspension containing the equivalent of 1 g of magaldrate in 30 mL of 2M *hydrochloric acid* and add sufficient *water* to produce 100 mL (solution A). Dilute 10 mL of this solution to 200 mL with *water*. Add, while stirring, 1 g of *ammonium chloride*, 20 mL of *triethanolamine*, 10 mL of *ammonia buffer pH 10.9* and 0.4 mL of *mordant black 11 solution*. Titrate with 0.05M *disodium edetate VS* until a blue colour is obtained. Repeat the procedure without the substance being examined. The difference between the titrations represents the amount of disodium edetate required. Each mL of 0.05M *disodium edetate VS* is equivalent to 2.916 g of $Mg(OH)_2$.

Aluminium hydroxide
Not less than 32.1% and not more than 45.9% of the stated content of anhydrous magaldrate when determined by the following method. Dilute 10 mL of solution A obtained in the test for Magnesium hydroxide with 20 mL of *water*. Add 25 mL of 0.05M *disodium edetate VS*, mix, allow to stand for 5 minutes and add 20 mL of *acetate buffer pH 4.4*, 60 mL of *ethanol (96%)* and 2 mL of a 0.026% w/v solution of *dithizone* in *ethanol (96%)*. Titrate with 0.05M *zinc sulfate VS* until a bright pink colour is obtained. Repeat the procedure without the substance being examined. The difference between the titrations represents the amount of disodium edetate required. Each mL of 0.05M *disodium edetate VS* is equivalent to 3.90 g of $Al(OH)_3$.

Microbial contamination
Carry out a quantitative evaluation for Enterobacteria and certain other Gram-negative bacteria, Appendix XVI B1. 0.01 mL of the preparation gives a negative result, Table 1 (most probable number of bacteria per gram fewer than 10^2).

ASSAY
To a quantity of the oral suspension containing the equivalent of 3 g of anhydrous magaldrate add 100 mL of 1M *hydrochloric acid VS* and mix using a magnetic stirrer to achieve dissolution. Titrate the excess acid with 1M *sodium hydroxide VS* to pH 3, determined potentiometrically. Repeat the procedure without the preparation being examined. The difference between the titrations represents the amount of hydrochloric acid required. Each mL of 1M *hydrochloric acid VS* is equivalent to 35.40 mg of $Al_5Mg_{10}(OH)_{31}(SO_4)_2$.

LABELLING
The quantity of the active ingredient is stated in terms of the equivalent amount of anhydrous magaldrate.

Aromatic Magnesium Carbonate Mixture

Aromatic Magnesium Carbonate Oral Suspension

DEFINITION
Aromatic Magnesium Carbonate Mixture is an *oral suspension* containing 3% w/v of Light Magnesium Carbonate and 5% w/v of Sodium Bicarbonate in a suitable vehicle containing Aromatic Cardamom Tincture.

Extemporaneous preparation
It is recently prepared according to the following formula.

Light Magnesium Carbonate	30 g
Sodium Bicarbonate	50 g
Aromatic Cardamom Tincture	30 mL
Double-strength Chloroform Water	500 mL
Water	Sufficient to produce 1000 mL

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of sodium bicarbonate, $NaHCO_3$
4.7 to 5.3% w/v.

Content of magnesium, Mg
0.70 to 0.86% w/v.

ASSAY
For sodium bicarbonate
Boil 10 g with 100 mL of *water* for 5 minutes, filter, boil the residue with 100 mL of *water* for 5 minutes and filter. Combine the filtrates, cool and titrate with 0.5M *hydrochloric acid VS* using *methyl orange–xylene cyanol FF solution* as indicator. Add 10 mL of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. After subtracting one-fifth of the volume of 0.05M *disodium edetate VS*, each mL of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of $NaHCO_3$. Determine the *weight per mL* of the mixture, Appendix V G, and calculate the percentage of $NaHCO_3$, weight in volume.

www.webofpharma.com

For magnesium
Dissolve 30 g in the minimum quantity of 2M *hydrochloric acid* and dilute to 200 mL with *water*. To 20 mL of this solution add 200 mL of *water* and 10 mL of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 1.215 mg of Mg. Use the *weight per mL* of the mixture to calculate the percentage of Mg, weight in volume.

Magnesium Chloride Injection

DEFINITION
Magnesium Chloride Injection is a sterile solution of Magnesium Chloride Hexahydrate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of magnesium chloride hexahydrate, $MgCl_2,6H_2O$
95.0 to 105.0% of the stated amount.

CHARACTERISTICS
A clear, colourless solution.

IDENTIFICATION
Yields the reactions characteristic of *magnesium salts* and of *chlorides*, Appendix VI.

Acidity or alkalinity
pH, 5.0 to 8.0, Appendix V L.

ASSAY
Dilute a volume containing 2.5 g of Magnesium Chloride Hexahydrate to 100 mL with *water*. To 20 mL of this solution add 10 mL of *ammonia buffer pH 10.9* and titrate with 0.1M *disodium edetate VS* using 0.1 g of *mordant black 11 triturate* as indicator, until the pink tint is discharged from the blue colour. Each mL of 0.1M *disodium edetate VS* is equivalent to 20.33 mg of $MgCl_2,6H_2O$.

LABELLING
The strength is stated as the percentage w/v of Magnesium Chloride Hexahydrate and as the approximate concentration of magnesium ions (Mg^{2+}) in millimoles per mL.

For a preparation containing 10% w/v of Magnesium Chloride Hexahydrate, the concentration of magnesium ions is approximately 0.5 millimoles per millilitre (0.5 mmol Mg^{2+}/mL).

Magnesium Glycerophosphate Oral Solution

NOTE: *Magnesium Glycerophosphate Oral Solution is not currently licensed in the United Kingdom.*

Action and use
Used in the treatment of magnesium deficiency.

DEFINITION
Magnesium Glycerophosphate Oral Solution is a solution of Magnesium Glycerophosphate in a suitable flavoured vehicle.

The oral solution complies with the requirements stated under Oral Liquids, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of magnesium, Mg
95.0 to 105.0% of the stated amount.

IDENTIFICATION
A. To a quantity of the oral solution containing the equivalent of about 25 mg of magnesium in a test tube fitted with a glass tube add 1 g of *potassium hydrogen sulfate*. Heat strongly and direct the white vapour towards a piece of filter paper impregnated with a freshly prepared 1% w/v solution of *sodium nitroprusside*. The filter paper develops a blue colour in contact with *piperidine*.

B. Reduce a quantity of the oral solution containing the equivalent of about 25 mg of magnesium in a crucible and ignite. Add 5 mL of *nitric acid* to the residue, heat on a water-bath for 1 minute and filter. The filtrate yields reaction B characteristic of *phosphates*, Appendix VI.

C. Yields reaction A characteristic of *magnesium salts*, Appendix VI.

TESTS
Acidity
Dilute a quantity of the oral solution containing the equivalent of about 25 mg of magnesium to 100 mL with *carbon dioxide-free water*. Add 0.1 mL of *phenolphthalein solution*. Not more than 2.0 mL of 0.1M *sodium hydroxide* is required to change the colour of the solution.

Phosphate
Dilute a quantity of the oral solution containing the equivalent of about 25 mg of magnesium to 100 mL with *water* and dilute 1 mL of the solution to 100 mL with *water*. The resulting solution complies with the *limit test for phosphates*, Appendix VII (0.5%).

ASSAY
To a quantity of the oral solution containing the equivalent of about 120 mg of magnesium add 25 mL of *water*. Transfer 10 mL of the solution into a 500 mL conical flask and carry out the *complexometric titration of magnesium*, Appendix VIII D, beginning at the words 'and dilute to 300 mL with *water*...'. Each mL of 0.1M *disodium edetate VS* is equivalent to 2.431 mg of Mg.

LABELLING
The quantity of the active ingredient is stated both as the amount of Magnesium Glycerophosphate and in terms of the equivalent amount of magnesium or magnesium ions (Mg^{2+}).

For a preparation containing 250 milligrams per mL of Magnesium Glycerophosphate, the concentration of magnesium is approximately 24.25 milligrams per mL and the concentration of magnesium ions is approximately 1 millimole per millilitre (1 mmol Mg^{2+} / mL).

Chewable Magnesium Glycerophosphate Tablets

NOTE: *Chewable Magnesium Glycerophosphate Tablets are not currently licensed in the United Kingdom.*

Action and use
Used in the treatment of magnesium deficiency.

DEFINITION
Chewable Magnesium Glycerophosphate Tablets contain Magnesium Glycerophosphate

The tablets comply with the requirements stated under Tablets, the requirements stated under Unlicensed Medicines and with the following requirements.

Content of magnesium, Mg
95.0 to 105.0% of the stated amount.

www.webofpharma.com

IDENTIFICATION

A. To a quantity of the powdered tablets containing the equivalent of about 25 mg of magnesium in a test tube fitted with a glass tube add 1 g of *potassium hydrogen sulfate*. Heat strongly and direct the white vapour towards a piece of filter paper impregnated with a freshly prepared 1% w/v solution of *sodium nitroprusside*. The filter paper develops a blue colour in contact with *piperidine*.

B. Place a quantity of the powdered tablets containing the equivalent of about 25 mg of magnesium in a crucible and ignite. Take up the residue with 5 mL of *nitric acid*, heat on a water-bath for 1 minute and filter. The filtrate yields reaction B characteristic of *phosphates*, Appendix VI.

C. Dissolve a quantity of the powdered tablets containing the equivalent of about 25 mg of magnesium in 10 mL of *water* and filter. The filtrate yields reaction A characteristic of *magnesium salts*, Appendix VI.

TESTS

Disintegration

The requirement for Disintegration does not apply to Chewable Magnesium Glycerophosphate Tablets.

Phosphate

Dissolve a quantity of the powdered tablets containing the equivalent of about 25 mg of magnesium in 100 mL of *water* and dilute 1 mL of the solution to 100 mL with *water*. The resulting solution complies with the *limit test for phosphates*, Appendix VII (0.5%).

ASSAY

Weigh and powder 20 tablets. Dissolve a quantity of the powder containing the equivalent of about 120 mg of magnesium in 25 mL of *water*. Transfer 10 mL of the solution into a 500 mL conical flask and carry out the *complexometric titration of magnesium*, Appendix VIII D, beginning at the words '... and dilute to 300 mL with *water*.'. Each mL of 0.1M *disodium edetate VS* is equivalent to 2.431 mg of Mg.

LABELLING

The label states the quantity of active ingredient both in terms of the amount of Magnesium Glycerophosphate and in terms of the equivalent amount of magnesium or magnesium ions (Mg^{2+}).

Tablets containing 1 gram of Magnesium Glycerophosphate contain approximately 97 mg of magnesium and approximately 4 millimoles of magnesium ions (4 mmol Mg^{2+}) per tablet.

Magnesium Hydroxide Mixture

Magnesium Hydroxide Oral Suspension

DEFINITION

Magnesium Hydroxide Mixture is an aqueous *oral suspension* of hydrated magnesium oxide. It may be prepared from a suitable grade of Light Magnesium Oxide.

Extemporaneous preparation

The following formula and directions apply.

Magnesium Sulfate	47.5 g
Sodium Hydroxide	15 g
Light Magnesium Oxide	52.5 g
Chloroform	2.5 mL
Purified Water, freshly boiled and cooled	Sufficient to produce 1000 mL

Dissolve the Sodium Hydroxide in 150 mL of Purified Water, add the Light Magnesium Oxide, mix to form a smooth cream and then add sufficient Purified Water to produce 2500 mL. Pour this suspension in a thin stream into a solution of the Magnesium Sulfate in 2500 mL of Purified Water, stirring continuously during the mixing. Allow the precipitate to subside, remove the clear liquid, transfer the residue to a calico strainer, allow to drain and wash the precipitate with Purified Water until the washings give only a slight reaction for *sulfates*, Appendix VI. Mix the washed precipitate with Purified Water, dissolve the Chloroform in the mixture and add sufficient Purified Water to produce 1000 mL.

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of hydrated magnesium oxide, calculated as $Mg(OH)_2$

7.45 to 8.35% w/w.

CHARACTERISTICS

A white, uniform suspension which does not separate readily on standing.

TESTS

Heavy metals

Dissolve 12.5 g in 10 mL of *hydrochloric acid* and 20 mL of *water*, add 0.5 mL of *nitric acid*, boil to remove any carbon dioxide and filter. To the cooled filtrate add 2 g of *ammonium chloride* and 2 g of *ammonium thiocyanate* and extract with two successive 10 mL quantities of a mixture of equal volumes of *isoamyl alcohol* and *ether*. To the aqueous layer add 2 g of *citric acid* and sufficient *water* to produce 50 mL. 12 mL of the resulting solution complies with *limit test A for heavy metals*, Appendix VII. Use *lead standard solution (1 ppm Pb)* to prepare the standard (4 ppm).

Sulfate

Dissolve 2.5 mL in 20 mL of *hydrochloric acid* and dilute to 500 mL with *water*. 15 mL of the solution, filtered if necessary, complies with the *limit test for sulfates*, Appendix VII (0.2%).

ASSAY

Mix 10 g with 50 mL of *water*, add 50 mL of 0.5M *sulfuric acid VS* and titrate the excess of acid with 1M *sodium hydroxide VS* using *methyl orange solution* as indicator. Each mL of 0.5M *sulfuric acid VS* is equivalent to 29.16 mg of hydrated magnesium oxide calculated as $Mg(OH)_2$.

STORAGE

Magnesium Hydroxide Mixture should not be kept in a cold place.

Magnesium Sulphate Injection

Magnesium Sulfate Injection

DEFINITION

Magnesium Sulfate Injection is a sterile solution of Magnesium Sulfate Heptahydrate in Water for Injections.

The injection complies with the requirements stated under Parenteral Preparations and with the following requirements.

Content of magnesium sulfate heptahydrate, $MgSO_4,7H_2O$

95.0 to 105.0% of the stated amount.

CHARACTERISTICS

A clear, colourless solution.

www.webofpharma.com

IDENTIFICATION
Yields the reactions characteristic of *magnesium salts* and of *sulfates*, Appendix VI.

TESTS
Acidity or alkalinity
pH of the injection diluted, if necessary, to contain 5% w/v of Magnesium Sulfate Heptahydrate, 5.5 to 7.0, Appendix V L.

ASSAY
Dilute a volume containing 1.25 g of Magnesium Sulfate Heptahydrate to 100 mL with *water*. To 20 mL of this solution add 10 mL of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using 0.1 g of *mordant black 11 triturate* as indicator, until the pink tint is discharged from the blue colour. Each mL of 0.05M *disodium edetate VS* is equivalent to 12.32 mg of $MgSO_4,7H_2O$.

LABELLING
The strength is stated as the percentage w/v of Magnesium Sulfate Heptahydrate and as the approximate concentration of magnesium ions (Mg^{2+}) in millimoles per mL.

For a preparation containing 50% w/v of Magnesium Sulfate Heptahydrate ($MgSO_4,7H_2O$) the concentration of magnesium ions is approximately 2 millimoles per millilitre (2 mmol Mg^{2+}/mL).

Magnesium Sulfate Mixture
Magnesium Sulphate Mixture

Magnesium Sulfate Oral Suspension

DEFINITION
Magnesium Sulfate Mixture is an *oral suspension* containing 40% w/v of Magnesium Sulfate Heptahydrate and 5% w/v of Light Magnesium Carbonate in a suitable vehicle with a peppermint flavour.

Extemporaneous preparation
It is recently prepared according to the following formula.

Magnesium Sulfate Heptahydrate	400 g
Light Magnesium Carbonate	50 g
Concentrated Peppermint Emulsion	25 mL
Double-strength Chloroform Water	300 mL
Water	Sufficient to produce 1000 mL

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of magnesium sulfate heptahydrate, $MgSO_4,7H_2O$
36.0 to 44.0% w/v.

Content of magnesium carbonate, calculated as Mg
1.14 to 1.49% w/v.

IDENTIFICATION
A. Filter 10 mL of the mixture and reserve the residue. The filtrate yields reaction A characteristic of *magnesium salts*, Appendix VI. Wash the residue with 10 mL of *water*, dissolve 25 mg in 1 mL of 1M *hydrochloric acid* and adjust the pH to 6 to 7 with 1M *sodium hydroxide*. The resulting solution yields reaction A characteristic of *magnesium salts*, Appendix VI.

B. The residue obtained in test A yields reaction A characteristic of *carbonates*, Appendix VI.

C. The filtrate obtained in test A yields reaction A characteristic of *sulfates*, Appendix VI.

ASSAY
For magnesium sulfate heptahydrate
Boil 0.7 g with 50 mL of a mixture of equal volumes of *ethanol (96%)* and *water*, cool, filter and wash the residue with successive small quantities of the diluted ethanol until the washings are free from sulfate. Reserve the residue for the Assay for magnesium carbonate. To the combined filtrate and washings add 10 mL of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 12.32 mg of $MgSO_4,7H_2O$. Determine the *weight per mL* of the mixture, Appendix V G, and calculate the percentage of $MgSO_4,7H_2O$, weight in volume.

For magnesium carbonate
Dissolve the residue obtained in the Assay for magnesium sulfate in 10 mL of 1M *hydrochloric acid* and wash the filter with successive small quantities of *water* until the washings are free from chloride. To the combined filtrate and washings add 10 mL of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 1.215 mg of Mg. Using the *weight per mL*, calculate the percentage of Mg, weight in volume.

Magnesium Sulfate Paste
Magnesium Sulphate Paste

Morison's Paste

DEFINITION

Dried Magnesium Sulfate	A sufficient quantity
Phenol	0.5 g
Glycerol, previously heated at 120° for 1 hour and cooled	55 g

Extemporaneous preparation
The following directions apply.

Dry about 70 g of Dried Magnesium Sulfate at 150° for 1.5 hours or at 130° for 4 hours and allow to cool in a desiccator. Mix 45 g of the dried material in a warm mortar with the Phenol dissolved in the Glycerol.

In preparing larger quantities of the paste the period of heating the Dried Magnesium Sulfate should be increased, if necessary, to ensure that the dried material contains not less than 85% of magnesium sulfate, calculated as $MgSO_4$.

The paste complies with the requirements stated under Topical Semi-solid Preparations and with the following requirements.

Content of magnesium sulfate, $MgSO_4$
36.0 to 41.0% w/w.

Content of phenol, C_6H_6O
0.45 to 0.55% w/w.

ASSAY
For magnesium sulfate
Dissolve 5 g in sufficient *water* to produce 100 mL. To 10 mL of the resulting solution add 150 mL of *water* and 10 mL of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS*, using *mordant black 11 solution* as indicator, to a full blue colour. Each mL of 0.05M *disodium edetate VS* is equivalent to 6.018 mg of $MgSO_4$.

www.webofpharma.com

For phenol
Dissolve 5 g in 25 mL of *water*, add 25 mL of 0.05M *bromine VS* and 5 mL of *hydrochloric acid*, stopper the flask, allow to stand for 30 minutes with occasional swirling and then allow to stand for a further 15 minutes. Add 5 mL of a 20% w/v solution of *potassium iodide*, shake thoroughly, titrate with 0.1M *sodium thiosulfate VS* until only a faint yellow colour remains, add 0.25 mL of *starch mucilage* and 10 mL of *chloroform* and complete the titration with vigorous shaking. Repeat the operation without the substance being examined. The difference between the titrations represents the amount of bromine required. Each mL of 0.05M *bromine VS* is equivalent to 1.569 mg of C_6H_6O.

Magnesium Trisilicate Mixture

Magnesium Trisilicate Oral Suspension; Compound Magnesium Trisilicate Mixture

DEFINITION

Magnesium Trisilicate Mixture is an *oral suspension* containing 5% w/v each of Magnesium Trisilicate, Light Magnesium Carbonate and Sodium Bicarbonate in a suitable vehicle with a peppermint flavour.

Extemporaneous preparation
It is recently prepared according to the following formula.

Magnesium Trisilicate	50 g
Light Magnesium Carbonate	50 g
Sodium Bicarbonate	50 g
Concentrated Peppermint Emulsion	25 mL
Double-strength Chloroform Water	500 mL
Water	Sufficient to produce 1000 mL

The mixture complies with the requirements stated under Oral Liquids and with the following requirements.

Content of magnesium, Mg
1.70 to 2.20% w/v.

Content of sodium bicarbonate, $NaHCO_3$
4.60 to 5.40% w/v.

IDENTIFICATION

A. Filter 50 mL of the mixture using a Buchner funnel, reserving the filtrate, wash the filter with 50 mL of *water* and dry the residue at 100° to 105° for 1 hour. The filtrate yields reaction B characteristic of *sodium salts* and reaction A characteristic of *bicarbonates*, Appendix VI.

B. Shake 0.5 g of the residue obtained in test A with 5 mL of 1M *hydrochloric acid* for 5 minutes, add 5 mL of 1M *sodium hydroxide* and centrifuge. The supernatant liquid yields reaction B characteristic of *magnesium salts*, Appendix VI.

C. The residue obtained in test A yields reaction A characteristic of *carbonates*, Appendix VI.

D. 30 mg of the residue obtained in test A yields the reaction characteristic of *silicates*, Appendix VI.

Neutralising capacity
To 5 g add 100 mL of *water* and heat to 37°. Add 100 mL of 0.1M *hydrochloric acid VS* previously heated to 37° and stir continuously using a suitable paddle stirrer rotating at a rate of about 200 revolutions per minute, maintaining the temperature at 37°. The pH of the suspension at 37° after 10 and 20 minutes is not less than 2.0 and not less than 2.4 respectively and at no time is it more than 4.0. Add 10 mL of 0.5M *hydrochloric acid VS* previously heated to 37°, stir continuously for 1 hour, maintaining the temperature at 37°, and titrate with 0.1M *sodium hydroxide VS* to pH 3.5. Subtract the volume of 0.1M *sodium hydroxide VS* from 150 to obtain the number of mL of 0.1M *hydrochloric acid VS* required for the neutralisation. Determine the *weight per mL* of the mixture, Appendix V G, and hence the volume of 0.1M *hydrochloric acid VS* required to neutralise 5 mL of the mixture. Not less than 100 mL of 0.1M *hydrochloric acid VS* is required.

ASSAY

For magnesium
To 5 g add 7 mL of *hydrochloric acid* and 7 mL of *water*, stir and heat on a water bath for 15 minutes. Add 30 mL of hot *water*, mix, filter while still hot and wash the filter with hot *water*. Cool the combined filtrate and washings and dilute to 100 mL with *water*. To 25 mL of the resulting solution add 150 mL of *water* and 5 mL of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. Each mL of 0.05M *disodium edetate VS* is equivalent to 1.215 mg of Mg. Using the *weight per mL* of the mixture calculate the percentage of Mg, weight in volume.

For sodium bicarbonate
Boil 20 g with 100 mL of *water* for 5 minutes, filter, boil the residue with 100 mL of *water* for 5 minutes and filter. Combine the filtrates, cool and titrate with 0.5M *hydrochloric acid VS* using *methyl orange–xylene cyanol FF solution* as indicator. Add 10 mL of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. After subtracting one-fifth of the volume of 0.05M *disodium edetate VS*, each mL of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of $NaHCO_3$. Using the *weight per mL* of the mixture calculate the percentage of $NaHCO_3$, weight in volume.

Compound Magnesium Trisilicate Oral Powder

DEFINITION

Magnesium Trisilicate	250 g
Chalk in powder	250 g
Sodium Bicarbonate	250 g
Heavy Magnesium Carbonate	250 g

The oral powder complies with the requirements stated under Oral Powders and with the following requirements.

Content of magnesium trisilicate, calculated as silica, SiO_2
11.0 to 15.2% w/w.

Content of sodium bicarbonate, $NaHCO_3$
23.7 to 26.9% w/w.

IDENTIFICATION

Shake 0.5 g with 5 mL of 2M *hydrochloric acid* and filter. The filtrate complies with the following tests.

A. To 0.05 mL add 0.2 mL of a 1% w/v solution of *glyoxal bis(2-hydroxyanil)* in *ethanol (96%)* and 0.05 mL of a 10% w/v solution of *sodium hydroxide*; a reddish brown precipitate is produced. Add *chloroform*; the precipitate dissolves to produce a red solution.

B. Add to the filtrate an excess of a 2.5% w/v solution of *ammonium oxalate*, filter and to the filtrate add 5M *sodium*

www.webofpharma.com

hydroxide followed by *diphenylcarbazide solution*. A violet-red precipitate is produced.

ASSAY

For silica

Mix 1.5 g with 5 mL of *water* and 10 mL of 9M *perchloric acid* in a beaker, heat until dense white fumes are evolved, cover the beaker with a watch glass, continue heating for a further 3 hours and allow to cool. Add 30 mL of *water*, filter, wash the filter with 200 mL of hot *water*, discard the filtrate and washings, dry the filter paper and its contents, ignite at 1000°, cool and weigh. To the residue add 0.25 mL of *sulfuric acid* followed by 15 mL of *hydrofluoric acid*, heat cautiously on a sand bath until all the acid has evaporated, ignite at 1000°, cool and weigh. Subtract the weight of any residue so obtained from the weight of the residue obtained above and calculate the content of SiO_2 from the corrected weight of residue.

For sodium bicarbonate

Boil 2.5 g with 100 mL of *water* for 5 minutes, filter, boil the residue with 100 mL of *water* for 5 minutes and filter. Combine the filtrates, cool and titrate with 0.5M *hydrochloric acid VS* using *methyl orange–xylene cyanol FF solution* as indicator. Add 10 mL of *ammonia buffer pH 10.9* and titrate with 0.05M *disodium edetate VS* using *mordant black 11 solution* as indicator. After subtracting one-fifth of the volume of 0.05M *disodium edetate VS*, each mL of 0.5M *hydrochloric acid VS* is equivalent to 42.00 mg of $NaHCO_3$.

Chewable Compound Magnesium Trisilicate Tablets

Aluminium Hydroxide and Magnesium Trisilicate Tablets

DEFINITION

Chewable Compound Magnesium Trisilicate Tablets contain, in each, 250 mg of Magnesium Trisilicate and 120 mg of Dried Aluminium Hydroxide. They have a peppermint flavour.

The tablets comply with the requirements stated under Tablets and with the following requirements.

Content of aluminium, Al

28 to 40 mg.

Content of magnesium, Mg

30 to 41 mg.

TESTS

Disintegration

The requirement for Disintegration does not apply to Chewable Compound Magnesium Trisilicate Tablets.

Neutralising capacity
