In suitable cases, acarbose, nateglinide p. 660 and repaglinide p. 660 can be continued with just the dose omitted on the morning of surgery if fasting (the morning dose may be given if the patient is not fasting and surgery is in the afternoon).

Pioglitazone, dipeptidylpeptidase-4 inhibitors (gliptins) and glucagon-like peptide-1 receptor agonists can be taken as normal during the whole peri-operative period.

**Sodium glucose co-transporter 2 inhibitors** should be omitted on the day of surgery and not restarted until the patient is stable; their use during periods of dehydration and acute illness is associated with an increased risk of developing diabetic ketoacidosis.

**Sulfonylureas** are associated with hypoglycaemia in the fasted state and therefore should always be omitted on the day of surgery until the patient is eating and drinking again. Capillary blood glucose should be checked hourly. If hyperglycaemia occurs, an appropriate dose of subcutaneous rapid-acting insulin may be given. A second dose may be given 2 hours later, and a variable rate intravenous insulin infusion considered if hyperglycaemia persists.

Metformin hydrochloride p. 652 is renally excreted; renal impairment may lead to accumulation and lactic acidosis during surgery. If only one meal will be missed during surgery, and the patient has an eGFR greater than 60 mL/minute/1.73m<sup>2</sup> and a low risk of acute kidney injury (and the procedure does not involve administration of contrast media), it may be possible to continue metformin

hydrochloride throughout the peri-operative period—just the lunchtime dose should be omitted if the usual dose is prescribed three times a day.

If the patient will miss more than one meal or there is significant risk of the patient developing acute kidney injury, metformin hydrochloride should be stopped when the pre-operative fast begins. A variable rate intravenous insulin infusion should be started if the metformin hydrochloride dose is more than once daily. Otherwise insulin should only be started if blood glucose concentration is greater than 12 mmol/litre on two consecutive occasions. Metformin should not be recommenced until the patient is eating and drinking again, and normal renal function has been assured.

There is no need to stop metformin hydrochloride after contrast medium in patients missing only one meal or who have an eGFR greater than 60 mL/minute/1.73m<sup>2</sup>. If contrast medium is to be used, and eGFR is less than 60 mL/minute/1.73m<sup>2</sup>, metformin should be omitted on the day of the procedure and for the following 48 hours. 

### Use of antidiabetic drugs during medical illness

Manufacturers of some antidiabetic drugs recommend that they may need to be replaced temporarily with insulin during undercurrent illness when the drug is unlikely to control hyperglycaemia (such as myocardial infarction, coma, severe infection, trauma and other medical emergencies). Consult individual product literature.

Sodium glucose co-transporter 2 inhibitors are associated with increased risk of developing diabetic ketoacidosis during periods of dehydration, stress, surgery, trauma, acute medical illness or any other catabolic state, and should be used with caution during these times. The MHRA has advised (2016) that these drugs should be temporarily stopped in patients who are hospitalised for acute serious illness until the patient is medically stable.

## Diabetic ketoacidosis

### Management

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis in Adults, published by the Joint British Diabetes Societies Inpatient Care Group (available at [www.diabetes.org.uk/About\\_us/What-we-say/Specialist-care-for-children-and-adults-and-complications/The-Management-of-Diabetic-Ketoacidosis-in-Adults](http://www.diabetes.org.uk/About_us/What-we-say/Specialist-care-for-children-and-adults-and-complications/The-Management-of-Diabetic-Ketoacidosis-in-Adults)), should be followed.

- To restore circulating volume if systolic blood pressure is below 90 mmHg (adjusted for age, sex, and medication as appropriate), give 500 mL **sodium chloride 0.9%** by intravenous infusion over 10–15 minutes; repeat if blood pressure remains below 90 mmHg and seek senior medical advice.
- When blood pressure is over 90 mmHg, **sodium chloride 0.9%** should be given by intravenous infusion at a rate that replaces deficit and provides maintenance; see guideline or suggested regimen.
- Include **potassium chloride** in the fluids unless anuria is suspected; adjust according to plasma-potassium concentration (measure at 60 minutes, 2 hours, and 2 hourly thereafter; measure hourly if outside the normal range).
- Start an intravenous insulin infusion: **soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride 0.9%** intravenous infusion to a concentration of 1 unit/mL; infuse at a fixed rate of 0.1 units/kg/hour.
- Established subcutaneous therapy with long-acting insulin analogues (insulin detemir p. 671 or insulin glargine p. 672) should be continued during treatment of diabetic ketoacidosis.

- Monitor blood-ketone and blood-glucose concentrations hourly and adjust the insulin infusion rate accordingly. Blood-ketone concentration should fall by at least 0.5 mmol/litre/hour and blood-glucose concentration should fall by at least 3 mmol/litre/hour.
- Once blood-glucose concentration falls below 14 mmol/litre, **glucose 10%** should be given by intravenous infusion (into a large vein through a large-gauge needle) at a rate of 125 mL/hour, in addition to the **sodium chloride 0.9% infusion**.
- Continue insulin infusion until blood-ketone concentration is below 0.3 mmol/litre, blood pH is above 7.3 and the patient is able to eat and drink; ideally give subcutaneous fast-acting insulin and a meal, and stop the insulin infusion 1 hour later.

The management of hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion are usually necessary and slower rehydration may be required.

### BLOOD GLUCOSE LOWERING DRUGS > ALPHA GLUCOSIDASE INHIBITORS

#### Acarbose

- **DRUG ACTION** Acarbose, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose.

#### • INDICATIONS AND DOSE

**Diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs**

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 50 mg daily, then increased to 50 mg 3 times a day for 6–8 weeks, then increased if necessary to 100 mg 3 times a day (max. per dose 200 mg 3 times a day)

- **CONTRA-INDICATIONS** Hernia · inflammatory bowel disease · predisposition to partial intestinal obstruction · previous abdominal surgery
- **CAUTIONS** May enhance hypoglycaemic effects of insulin and sulfonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose)
- **INTERACTIONS** → Appendix 1: acarbose
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal distention and pain · diarrhoea (may need to reduce dose or withdraw) · flatulence · soft stools
  - ▶ **Rare** Abnormal liver function tests · nausea · skin reactions
  - ▶ **Very rare** Hepatitis · ileus · jaundice · oedema
- **SIDE-EFFECTS, FURTHER INFORMATION** Antacids unlikely to be beneficial for treating side effects.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 25 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Monitor liver function.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food.
- **PATIENT AND CARER ADVICE** Antacids unlikely to be beneficial for treating side-effects. To counteract possible hypoglycaemia, patients receiving insulin or a sulfonylurea as well as acarbose need to carry glucose (not

sucrose—acarbose interferes with sucrose absorption). Patients should be given advice on how to administer acarbose tablets.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ■ Acarbose (Non-proprietary)

**Acarbose 50 mg** Acarbose 50mg tablets | 90 tablet [PoM] £11.51 DT price = £11.51

**Acarbose 100 mg** Acarbose 100mg tablets | 90 tablet [PoM] £19.03 DT price = £19.03

##### ■ Glucobay (Bayer Plc)

**Acarbose 50 mg** Glucobay 50mg tablets | 90 tablet [PoM] £7.35 DT price = £11.51

**Acarbose 100 mg** Glucobay 100mg tablets | 90 tablet [PoM] £13.50 DT price = £19.03

## BLOOD GLUCOSE LOWERING DRUGS >

### BIGUANIDES

## Metformin hydrochloride

06-Jun-2017

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

### ● INDICATIONS AND DOSE

#### Diabetes mellitus

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 10–17 years (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day
- Adult: Initially 500 mg once daily for at least 1 week, dose to be taken with breakfast, then 500 mg twice daily for at least 1 week, dose to be taken with breakfast and evening meal, then 500 mg 3 times a day, dose to be taken with breakfast, lunch and evening meal; maximum 2 g per day

##### ► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 500 mg once daily, then increased if necessary up to 2 g once daily, dose increased gradually, every 10–15 days, dose to be taken with evening meal, alternatively increased to 1 g twice daily, dose to be taken with meals, alternative dose only to be used if control not achieved with once daily dose regimen. If control still not achieved then change to standard release tablets

#### Polycystic ovary syndrome

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 500 mg once daily for 1 week, dose to be taken with breakfast, then 500 mg twice daily for 1 week, dose to be taken with breakfast and evening meal, then 1.5–1.7 g daily in 2–3 divided doses

### ● UNLICENSED USE

- In adults Doses in the BNF may differ from those in the product literature. Not licensed for polycystic ovary syndrome.
- In children Not licensed for use in children under 10 years.
- **CONTRA-INDICATIONS** Acute metabolic acidosis (including lactic acidosis and diabetic ketoacidosis)

### ● CAUTIONS Risk factors for lactic acidosis

#### CAUTIONS, FURTHER INFORMATION

- Risk factors for lactic acidosis Manufacturer advises caution in chronic stable heart failure (monitor cardiac function), and concomitant use of drugs that can acutely impair renal function; interrupt treatment if dehydration occurs, and

avoid in conditions that can acutely worsen renal function, or cause tissue hypoxia.

### ● INTERACTIONS → Appendix 1: metformin

### ● SIDE-EFFECTS

- **Common or very common** Abdominal pain · anorexia · diarrhoea (usually transient) · nausea · taste disturbance · vomiting
- **Rare** Decreased vitamin-B<sub>12</sub> absorption · erythema · lactic acidosis (withdraw treatment) · pruritus · urticaria
- **Frequency not known** Hepatitis

### SIDE-EFFECTS, FURTHER INFORMATION

- **Gastro-intestinal effects** Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

- **PREGNANCY** Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.

- **BREAST FEEDING** May be used during breast-feeding in women with pre-existing diabetes.

- **HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.

### ● RENAL IMPAIRMENT

- In children Manufacturer advises consider dose reduction in moderate impairment. Manufacturer advises avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m<sup>2</sup>.

- In adults Manufacturer advises reduce dose in moderate impairment—consult product literature. Manufacturer advises avoid if eGFR is less than 30 mL/minute/1.73 m<sup>2</sup>.

- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).

### ● PRESCRIBING AND DISPENSING INFORMATION

- In adults Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of metformin modified release; not suitable if dose of standard-release tablets more than 2 g daily.

- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and their carers should be informed of the risk of lactic acidosis and told to seek immediate medical attention if symptoms such as dyspnoea, muscle cramps, abdominal pain, hypothermia, or asthenia occur.

Medicines for Children leaflet: Metformin for diabetes [www.medicinesforchildren.org.uk/metformin-diabetes](http://www.medicinesforchildren.org.uk/metformin-diabetes)

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### GLUCOPHAGE® SR

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2009) that *Glucophage® SR* is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in adult patients who are intolerant of standard-release metformin, and in whom the prolonged-release tablet allows the use of a dose of metformin not previously tolerated, or in patients for whom a once daily preparation offers a clinically significant benefit.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

## BLOOD GLUCOSE LOWERING DRUGS >

### DIPEPTIDYLPEPTIDASE-4 INHIBITORS (GLIPTINS)

## Alogliptin

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as dual therapy in combination with either metformin, pioglitazone, a sulfonylurea, or insulin (when treatment with these drugs alone fails to achieve adequate glycaemic control), or as triple therapy in combination with metformin and either pioglitazone or insulin**

- ▶ BY MOUTH
- ▶ Adult: 25 mg once daily

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant sulfonylurea or insulin may need to be reduced.

Caution with use in combination with both metformin and pioglitazone—risk of hypoglycaemia (dose of metformin or pioglitazone may need to be reduced).

- **CONTRA-INDICATIONS** Ketoacidosis
- **CAUTIONS** History of pancreatitis · not recommended in moderate to severe heart failure (limited experience)
- **INTERACTIONS** → Appendix 1: alogliptin
- **SIDE-EFFECTS**
  - ▶ Common or very common Abdominal pain · gastro-oesophageal reflux · headache · nasopharyngitis · pruritus · rash · upper respiratory-tract infection
  - ▶ Frequency not known Angiodema · hepatic impairment · pancreatitis · Stevens-Johnson syndrome · urticaria
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Pancreatitis Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of serious hypersensitivity to dipeptidylpeptidase-4 inhibitors.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Reduce dose to 12.5 mg once daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Reduce dose to 6.25 mg once daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. Use with caution if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Determine renal function before treatment and periodically thereafter.

### ● MEDICINAL FORMS

tablets | 28 tablet [PoM] £31.60 DT price = £31.60

Saxagliptin (as Saxagliptin hydrochloride) 5 mg Onglyza 5mg

tablets | 28 tablet [PoM] £31.60 DT price = £31.60

## Saxagliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, saxagliptin p. 654, metformin hydrochloride p. 652.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin**

- ▶ BY MOUTH

- ▶ Adult: 1 tablet twice daily, based on patient's current metformin dose

### ● INTERACTIONS → Appendix 1: metformin, saxagliptin

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (May 2013) that *Komboglyze*® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone and when the addition of a sulfonylurea is inappropriate.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Komboglyze** (AstraZeneca UK Ltd)

Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg, Metformin hydrochloride 850 mg Komboglyze 2.5mg/850mg tablets | 56 tablet [PoM] £31.60 DT price = £31.60

Saxagliptin (as Saxagliptin hydrochloride) 2.5 mg, Metformin hydrochloride 1 gram Komboglyze 2.5mg/1000mg tablets | 56 tablet [PoM] £31.60 DT price = £31.60

## Sitagliptin

- **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate), or in combination with metformin or a sulfonylurea (if metformin inappropriate), or pioglitazone (when treatment with either metformin or a sulfonylurea or pioglitazone fails to achieve adequate glycaemic control), and also in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control, and may also be used in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control**

- ▶ BY MOUTH

- ▶ Adult: 100 mg once daily

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant sulfonylurea or insulin may need to be reduced.

- **CONTRA-INDICATIONS** Ketoacidosis

- **INTERACTIONS** → Appendix 1: sitagliptin

### ● SIDE-EFFECTS

- ▶ **Common or very common** Gastro-intestinal disturbances · nasopharyngitis · pain · peripheral oedema · upper respiratory tract infection
- ▶ **Uncommon** Anorexia · dizziness · drowsiness · dry mouth · headache · hypoglycaemia · osteoarthritis
- ▶ **Frequency not known** Cutaneous vasculitis · pancreatitis · rash · Stevens-Johnson syndrome

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Pancreatitis** Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **RENAL IMPAIRMENT** Reduce dose to 50 mg once daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Reduce dose to 25 mg once daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2010) that *Januvia*® is accepted for restricted use within NHS Scotland as monotherapy, to improve glycaemic control in patients with type 2 diabetes mellitus, for whom both metformin and sulfonylureas are not appropriate.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- ▶ **Januvia** (Merck Sharp & Dohme Ltd)

Sitagliptin (as Sitagliptin phosphate) 25 mg Januvia 25mg tablets | 28 tablet [PoM] £33.26 DT price = £33.26

**Sitagliptin (as Sitagliptin phosphate) 50 mg** Januvia 50mg tablets | 28 tablet [PoM] £33.26 DT price = £33.26

**Sitagliptin (as Sitagliptin phosphate) 100 mg** Januvia 100mg tablets | 28 tablet [PoM] £33.26 DT price = £33.26

## Sitagliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, sitagliptin p. 655, metformin hydrochloride p. 652.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or pioglitazone or insulin**

- BY MOUTH
- Adult: 1 tablet twice daily

● **INTERACTIONS** → Appendix 1: metformin, sitagliptin

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2008) that *Janumet*® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus when the addition of a sulfonylurea to metformin is not appropriate; it is also accepted for use in NHS Scotland in combination with a sulfonylurea in patients inadequately controlled on maximum tolerated doses of metformin and a sulfonylurea.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

► **Janumet** (Merck Sharp & Dohme Ltd)

**Sitagliptin (as Sitagliptin phosphate) 50 mg, Metformin hydrochloride 1 gram** Janumet 50mg/1000mg tablets | 56 tablet [PoM] £33.26 DT price = £33.26

## Vildagliptin

● **DRUG ACTION** Inhibits dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with metformin or pioglitazone (when treatment with either metformin or pioglitazone fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with both metformin and a sulfonylurea (when dual therapy with these drugs fails to achieve adequate glycaemic control) | Type 2 diabetes mellitus in combination with insulin (with or without metformin) when a stable dose of insulin has not provided adequate glycaemic control**

- BY MOUTH
- Adult: 50 mg twice daily

**Type 2 diabetes mellitus in combination with sulfonylurea (if metformin inappropriate)**

- BY MOUTH
- Adult: 50 mg daily, dose to be taken in the morning

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant sulfonylurea or insulin may need to be reduced.

● **CONTRA-INDICATIONS** Ketoacidosis

● **CAUTIONS** Manufacturer advises avoid in severe heart failure—no information available

● **INTERACTIONS** → Appendix 1: vildagliptin

### ● SIDE-EFFECTS

- **Common or very common** Asthenia · dizziness · headache · nausea · peripheral oedema · tremor
- **Uncommon** Arthralgia · constipation · hypoglycaemia
- **Rare** Hepatic dysfunction
- **Very rare** Nasopharyngitis · upper respiratory tract infection
- **Frequency not known** Bullous skin reactions · exfoliative skin reactions · pancreatitis

### SIDE-EFFECTS, FURTHER INFORMATION

- **Pancreatitis** Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **Liver toxicity** Rare reports of liver dysfunction; discontinue if jaundice or other signs of liver dysfunction occur.

● **PREGNANCY** Avoid—toxicity in *animal* studies.

● **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Avoid.

● **RENAL IMPAIRMENT** Reduce dose to 50 mg once daily if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.

● **MONITORING REQUIREMENTS** Monitor liver function before treatment and every 3 months for first year and periodically thereafter.

### ● PATIENT AND CARER ADVICE

**Liver toxicity** Patients should be advised to seek prompt medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, and dark urine develop.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that vildagliptin (*Galvus*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus as monotherapy when treatment with metformin or a sulfonylurea is inappropriate (December 2012), and in combination with metformin when addition of a sulfonylurea is inappropriate (March 2008), and in combination with a sulfonylurea if metformin is inappropriate (September 2009), and also as triple therapy in combination with metformin and a sulfonylurea, as an alternative to existing dipeptidyl peptidase-4 inhibitors, when treatment with metformin and a sulfonylurea is inadequate (November 2013).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

► **Galvus** (Novartis Pharmaceuticals UK Ltd)

**Vildagliptin 50 mg** Galvus 50mg tablets | 56 tablet [PoM] £33.35 DT price = £33.35

## Vildagliptin with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, vildagliptin above, metformin hydrochloride p. 652.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus not controlled by metformin alone or by metformin in combination with either a sulfonylurea or insulin**

- BY MOUTH
- Adult: 1 tablet twice daily, based on patient's current metformin dose

● **INTERACTIONS** → Appendix 1: metformin, vildagliptin

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2008) that *Eucreas*® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in

patients unable to achieve adequate glycaemic control with metformin alone or those already treated with vildagliptin and metformin as separate tablets.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

50mg/1000mg tablets | 60 tablet [POM] £35.68 DT price = £35.68

## BLOOD GLUCOSE LOWERING DRUGS > GLUCAGON-LIKE PEPTIDE-1 RECEPTOR AGONISTS

### Albiglutide

01-Jun-2016

- **DRUG ACTION** Albiglutide is a GLP-1 (glucagon-like peptide-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

#### • INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy when treatment with metformin is considered inappropriate | Type 2 diabetes mellitus in combination with basal insulin and other oral glucose lowering agents**

► BY SUBCUTANEOUS INJECTION

► Adult: 30 mg once weekly, increased if necessary up to 50 mg once weekly, to be administered on the same day each week

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

- **CONTRA-INDICATIONS** Severe gastrointestinal disease—no information available

- **CAUTIONS** History of pancreatitis · moderate to severe heart failure—no information available

- **INTERACTIONS** → Appendix 1: albiglutide

#### • SIDE-EFFECTS

- **Common or very common** Atrial fibrillation · constipation · diarrhoea · dyspepsia · gastro-oesophageal reflux disease · hypoglycaemia · injection site reactions · nausea · vomiting
- **Uncommon** Intestinal obstruction · pancreatitis (discontinue treatment)

- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in women of childbearing potential. Discontinue treatment at least one month before a planned pregnancy.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- **HANDLING AND STORAGE** Store at 2–8°C. May be stored at temperatures up to 30°C for up to 4 weeks.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer albiglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

#### Missed doses

If a dose is missed it should be administered as soon as possible within 3 days; if more than 3 days have passed, the missed dose should not be taken and the next dose should be taken at the normal time.

### • NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2016) that albiglutide (*Eperzan*®) is accepted for restricted use for treating adults with type 2 diabetes to improve glycaemic control in combination with other glucose-lowering medicines when these, together with diet and exercise, do not provide adequate glycaemic control. It is restricted to use as an alternative once weekly GLP-1 mimetic for use in combination with oral anti-diabetic agents as a third-line pre-insulin treatment option.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for solution for injection

► **Eperzan** (GlaxoSmithKline UK Ltd) ▼

**Albiglutide 30 mg** Eperzan 30mg powder and solvent for solution for injection pre-filled pen | 4 pre-filled disposable injection [POM] £71.00

**Albiglutide 50 mg** Eperzan 50mg powder and solvent for solution for injection pre-filled pen | 4 pre-filled disposable injection [POM] £71.00

### Dulaglutide

14-Jun-2016

- **DRUG ACTION** Dulaglutide is a long-acting glucagon-like peptide 1 (GLP-1) receptor agonist that augments glucose-dependent insulin secretion, and slows gastric emptying.

#### • INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy if metformin inappropriate**

► BY SUBCUTANEOUS INJECTION

► Adult: 0.75 mg once weekly

**Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**

► BY SUBCUTANEOUS INJECTION

► Adult: 1.5 mg once weekly

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant insulin or drugs that stimulate insulin secretion may need to be reduced.

- **CONTRA-INDICATIONS** Severe gastro-intestinal disease—no information available

- **CAUTIONS** Congestive heart failure—no information available

- **INTERACTIONS** → Appendix 1: dulaglutide

#### • SIDE-EFFECTS

- **Common or very common** Abdominal distention, · abdominal pain · atrioventricular block · constipation · decreased appetite · diarrhoea · dyspepsia · fatigue · flatulence · gastro-oesophageal reflux disease · nausea · sinus tachycardia · vomiting
- **Rare** Acute pancreatitis (discontinue treatment)

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment and end stage renal disease—no information available.

- **HANDLING AND STORAGE** Refrigerated storage is usually necessary (2°C – 8°C). Once in use, may be stored unrefrigerated for up to 14 days at a temperature not above 30°C.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer dulaglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

**Missed doses**

If a dose is missed, it should be administered as soon as possible only if there are at least 3 days until the next scheduled dose; if less than 3 days remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.

**• NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (January 2016) that dulaglutide (*Trulicity*®) is accepted for restricted use for treating adults with type 2 diabetes to improve glycaemic control as add-on therapy in combination with other glucose-lowering medicines, when these, together with diet and exercise, do not provide adequate glycaemic control. It is restricted to use as part of a triple therapy in people with inadequate glycaemic control on 2 oral anti-diabetic medicines, as an alternative GLP-1 mimetic option.

**• MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection****• Trulicity (Eli Lilly and Company Ltd) ▼**

**Dulaglutide 1.5 mg per 1 ml** Trulicity 0.75mg/0.5ml solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £73.25

**Dulaglutide 3 mg per 1 ml** Trulicity 1.5mg/0.5ml solution for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £73.25

**Exenatide**

- DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

**• INDICATIONS AND DOSE**

**Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, or with pioglitazone, or with both metformin and pioglitazone, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination**

**► BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES**

- Adult:** Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

**► BY SUBCUTANEOUS INJECTION USING MODIFIED-RELEASE MEDICINES**

- Adult:** 2 mg once weekly

**Type 2 diabetes mellitus in combination with basal insulin alone or with metformin or pioglitazone (or both)**

**► BY SUBCUTANEOUS INJECTION USING IMMEDIATE-RELEASE MEDICINES**

- Adult:** Initially 5 micrograms twice daily for at least 1 month, then increased if necessary up to 10 micrograms twice daily, dose to be taken within 1 hour before 2 main meals (at least 6 hours apart)

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Dose of concomitant sulfonylurea may need to be reduced.

**PHARMACOKINETICS**

Effect of modified-release exenatide injection (*Bydureon*®) may persist for 10 weeks after discontinuation.

- CONTRA-INDICATIONS** Ketoacidosis · severe gastrointestinal disease
- CAUTIONS** Elderly · may cause weight loss greater than 1.5 kg weekly · pancreatitis
- INTERACTIONS** → Appendix 1: exenatide

**• SIDE-EFFECTS**

- Common or very common** Abdominal pain and distension · agitation · antibody formation · asthenia · decreased appetite · diarrhoea · dizziness · dyspepsia · gastrointestinal disturbances · gastro-oesophageal reflux disease · headache · hypoglycaemia · increased sweating · injection-site reactions · nausea · vomiting · weight loss
- Uncommon** Pancreatitis
- Rare** Alopecia
- Very rare** Anaphylactic reactions
- Frequency not known** Angioedema · constipation · dehydration · drowsiness · eructation · flatulence · pruritus · rash · renal impairment · taste disturbance · urticaria

**SIDE-EFFECTS, FURTHER INFORMATION**

- Pancreatitis** Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely; discontinue permanently if pancreatitis is diagnosed.
- CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception during treatment with modified-release exenatide and for 12 weeks after discontinuation.
- PREGNANCY** Avoid—toxicity in *animal* studies.
- BREAST FEEDING** Avoid—no information available.
- RENAL IMPAIRMENT** For *standard-release* injection, use with caution if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. For *standard-release* injection, avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. For *modified-release* injection, avoid if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.
- PATIENT AND CARER ADVICE** Patients changing from standard-release to modified-release exenatide formulation may experience initial transient increase in blood glucose.

Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details.

Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop.

**Missed doses**

If a dose of the immediate-release medicine is missed, continue with the next scheduled dose—do not administer after a meal.

**• NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (June 2007) that standard-release exenatide (*Byetta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulfonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulfonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

The *Scottish Medicines Consortium* has also advised (February 2011) that standard-release exenatide (*Byetta*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin and pioglitazone as a third-line pre-insulin treatment option.

The *Scottish Medicines Consortium* has advised (December 2011) that modified-release exenatide (*Bydureon*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes as a third-line treatment option.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

#### ► Byetta (AstraZeneca UK Ltd)

**Exenatide 250 microgram per 1 ml** Byetta 10micrograms/0.04ml solution for injection 2.4ml pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £68.24 DT price = £68.24  
Byetta 5micrograms/0.02ml solution for injection 1.2ml pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £68.24 DT price = £68.24

### Powder and Solvent for suspension for injection

CAUTIONARY AND ADVISORY LABELS 10

#### ► Bydureon (AstraZeneca UK Ltd)

**Exenatide 2 mg** Bydureon 2 mg powder and solvent for prolonged-release suspension for injection pre-filled pen | 4 pre-filled disposable injection [PoM] £73.36

## Liraglutide

01-Jun-2016

- **DRUG ACTION** Liraglutide binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus in combination with metformin or a sulfonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination | Type 2 diabetes mellitus in combination with basal insulin or both metformin and pioglitazone when dual therapy with these drugs fails to achieve adequate glycaemic control**

#### ► BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 0.6 mg once daily for at least 1 week, then increased to 1.2 mg once daily for at least 1 week, then increased if necessary up to 1.8 mg once daily

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant insulin or sulfonylurea may need to be reduced.

- **CONTRA-INDICATIONS** Diabetic gastroparesis · inflammatory bowel disease · ketoacidosis · moderate to severe congestive heart failure—no information available

- **CAUTIONS** History of pancreatitis · mild congestive heart failure—limited experience · thyroid disease

- **INTERACTIONS** → Appendix 1: liraglutide

### ● SIDE-EFFECTS

- **Common or very common** Abdominal pain and distension · bronchitis · constipation · decreased appetite · diarrhoea · dizziness · dyspepsia · flatulence · gastritis · gastro-intestinal disturbances · gastro-oesophageal reflux disease · headache · hypoglycaemia · injection site reactions · malaise · nasopharyngitis · nausea · tachycardia · vomiting
- **Uncommon** Acute renal failure · dehydration · renal impairment
- **Very rare** Acute pancreatitis
- **Frequency not known** Goitre · increased blood calcitonin · thyroid neoplasm

### SIDE-EFFECTS, FURTHER INFORMATION

- **Pancreatitis** Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies (recommendation also supported by primary literature).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—limited experience.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—limited experience.

- **HANDLING AND STORAGE** Store in a refrigerator (2°C–8°C); after first use can be stored below 30°C, discard 1 month after first use.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer liraglutide injection. Acute pancreatitis Patients should be told how to recognise signs and symptoms of acute pancreatitis and advised to seek immediate medical attention if symptoms such as persistent, severe abdominal pain develop.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

#### ► Liraglutide (Non-patented)

**Liraglutide 6 mg per 1 ml** Liraglutide 6mg/ml solution for injection 3ml pre-filled disposable devices | 2 pre-filled disposable injection [PoM] no price available DT price = £78.48 | 3 pre-filled disposable injection [PoM] no price available

#### ► Saxenda (Novo Nordisk Ltd) ▼

**Liraglutide 6 mg per 1 ml** Saxenda 6mg/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £196.20

#### ► Victoza (Novo Nordisk Ltd)

**Liraglutide 6 mg per 1 ml** Victoza 6mg/ml solution for injection 3ml pre-filled pen | 2 pre-filled disposable injection [PoM] £78.48 DT price = £78.48 | 3 pre-filled disposable injection [PoM] £117.72

Combinations available: *Insulin degludec with liraglutide*, p. 671

## Lixisenatide

- **DRUG ACTION** Binds to, and activates, the GLP-1 (glucagon-like peptide-1) receptor to increase insulin secretion, suppresses glucagon secretion, and slows gastric emptying.

### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus in combination with oral antidiabetic drugs (e.g. metformin, pioglitazone, or a sulfonylurea) or basal insulin, or both, when adequate glycaemic control has not been achieved with these drugs**

#### ► BY SUBCUTANEOUS INJECTION

- **Adult:** Initially 10 micrograms once daily for 14 days, then increased to 20 micrograms once daily, dose to be taken within 1 hour before the first meal of the day or the evening meal

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant sulfonylurea or insulin may need to be reduced.

- **CONTRA-INDICATIONS** Ketoacidosis · severe gastro-intestinal disease

- **INTERACTIONS** → Appendix 1: lixisenatide

### ● SIDE-EFFECTS

- **Common or very common** Diarrhoea · dizziness · drowsiness · dyspepsia · headache · hypoglycaemia · injection-site reactions · nausea · palpitation · vomiting
- **Uncommon** Tachycardia · urticaria

### SIDE-EFFECTS, FURTHER INFORMATION

- **Pancreatitis** Discontinue if symptoms of acute pancreatitis (persistent, severe abdominal pain).
- **CONCEPTION AND CONTRACEPTION** Women of child-bearing age should use effective contraception.
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Use with caution if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—no information available.

### ● PATIENT AND CARER ADVICE

Some oral medications should be taken at least 1 hour before or 4 hours after lixisenatide injection—consult product literature for details.

#### Missed doses

If a dose is missed, inject within 1 hour before the next meal—do not administer **after** a meal.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2013) that lixisenatide (*Lyxumia*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with oral antidiabetic drugs or basal insulin (or both), when adequate glycaemic control has not been achieved with these drugs; use is restricted to patients in whom a GLP-1 agonist is appropriate, as an alternative to an existing GLP-1 agonist (exenatide or liraglutide).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

##### ► *Lyxumia* (Sanofi) ▼

**Lixisenatide 50 microgram per 1 ml** *Lyxumia* 10micrograms/0.2ml solution for injection 3ml pre-filled pen | 1 pre-filled disposable injection [PoM] £31.67 DT price = £31.67

**Lixisenatide 100 microgram per 1 ml** *Lyxumia* 20micrograms/0.2ml solution for injection 3ml pre-filled pen | 1 pre-filled disposable injection [PoM] no price available | 2 pre-filled disposable injection [PoM] £57.93 DT price = £57.93

## BLOOD GLUCOSE LOWERING DRUGS >

### MEGLITINIDES

## Nateglinide

### ● DRUG ACTION Nateglinide stimulates insulin secretion.

#### ● INDICATIONS AND DOSE

##### Type 2 diabetes mellitus in combination with metformin when metformin alone inadequate

###### ► BY MOUTH

► Adult: Initially 60 mg 3 times a day (max. per dose 180 mg), adjusted according to response, to be taken within 30 minutes before main meals

### ● CONTRA-INDICATIONS Ketoacidosis

### ● CAUTIONS Debilitated patients · elderly · malnourished patients

#### CAUTIONS, FURTHER INFORMATION

Substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit nateglinide on morning of surgery and recommence when eating and drinking normally).

### ● INTERACTIONS → Appendix 1: nateglinide

### ● SIDE-EFFECTS Hypersensitivity reactions · hypoglycaemia · pruritus · rashes · urticaria

### ● PREGNANCY Avoid—toxicity in *animal* studies.

### ● BREAST FEEDING Avoid—present in milk in *animal* studies.

### ● HEPATIC IMPAIRMENT Caution in moderate hepatic impairment. Avoid in severe impairment—no information available.

### ● PATIENT AND CARER ADVICE

#### Driving and skilled tasks

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ► *Starlix* (Novartis Pharmaceuticals UK Ltd)

**Nateglinide 60 mg** *Starlix* 60mg tablets | 84 tablet [PoM] £26.12 DT price = £26.12

**Nateglinide 120 mg** *Starlix* 120mg tablets | 84 tablet [PoM] £29.76 DT price = £29.76

**Nateglinide 180 mg** *Starlix* 180mg tablets | 84 tablet [PoM] £29.76 DT price = £29.76

## Repaglinide

### ● DRUG ACTION Repaglinide stimulates insulin secretion.

#### ● INDICATIONS AND DOSE

##### Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)

###### ► BY MOUTH

► Adult 18–74 years: Initially 500 micrograms (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day

► Adult 75 years and over: Not recommended

##### Type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate), if transferring from another oral antidiabetic drug

###### ► BY MOUTH

► Adult 18–74 years: Initially 1 mg (max. per dose 4 mg), adjusted according to response, dose to be taken within 30 minutes before main meals and adjusted at intervals of 1–2 weeks; maximum 16 mg per day

► Adult 75 years and over: Not recommended

### ● CONTRA-INDICATIONS Ketoacidosis

### ● CAUTIONS Debilitated patients · malnourished patients

#### CAUTIONS, FURTHER INFORMATION

Substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery.

### ● INTERACTIONS → Appendix 1: repaglinide

#### ● SIDE-EFFECTS

► **Common or very common** Abdominal pain · constipation · diarrhoea · nausea · vomiting

► **Rare** Hypersensitivity reactions · hypoglycaemia · pruritus · rashes · urticaria · vasculitis · visual disturbances

### ● PREGNANCY Avoid.

### ● BREAST FEEDING Avoid—present in milk in *animal* studies.

### ● HEPATIC IMPAIRMENT Avoid in severe liver disease.

### ● RENAL IMPAIRMENT Use with caution.

### ● PATIENT AND CARER ADVICE

#### Driving and skilled tasks

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ► *Repaglinide* (Non-proprietary)

**Repaglinide 500 microgram** *Repaglinide* 500microgram tablets | 30 tablet [PoM] £3.92 | 90 tablet [PoM] £11.76 DT price = £9.03

**Repaglinide 1 mg** *Repaglinide* 1mg tablets | 30 tablet [PoM] £3.92 | 90 tablet [PoM] £11.76 DT price = £10.48

Repaglinide 2 mg Prandin 2mg tablets | 90 tablet [PoM] £11.76 DT price = £5.88

## BLOOD GLUCOSE LOWERING DRUGS > SODIUM GLUCOSE CO-TRANSPORTER 2 INHIBITORS

### Canagliflozin

11-Apr-2017

- **DRUG ACTION** Reversibly inhibits sodium-glucose co-transporter 2 (SGLT2) in the renal proximal convoluted tubule to reduce glucose reabsorption and increase urinary glucose excretion.

#### ● INDICATIONS AND DOSE

**Type 2 diabetes mellitus as monotherapy (if metformin inappropriate) | Type 2 diabetes mellitus in combination with insulin or other antidiabetic drugs (if existing treatment fails to achieve adequate glycaemic control)**

##### ▶ BY MOUTH

- ▶ **Adult:** 100 mg once daily; increased if tolerated to 300 mg once daily if required, dose to be taken preferably before breakfast

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises increase dose if tolerated to 300 mg once daily with concurrent use of rifampicin.

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE (UPDATED MARCH 2017): INCREASED RISK OF LOWER-LIMB AMPUTATION (MAINLY TOES)**

Canagliflozin may increase the risk of lower-limb amputation (mainly toes) in patients with type 2 diabetes. Preventive foot care is important for all patients with diabetes. The MHRA has issued the following advice while clinical trials are ongoing:

- consider stopping canagliflozin if a patient develops a significant lower limb complication (e.g. skin ulcer, osteomyelitis, or gangrene)
- carefully monitor patients who have risk factors for amputation (e.g. previous amputations, existing peripheral vascular disease, or neuropathy)
- monitor all patients for signs and symptoms of water or salt loss; ensure patients stay sufficiently hydrated to prevent volume depletion in line with the manufacturer's recommendations
- advise patients to stay well hydrated, carry out routine preventive foot care, and seek medical advice promptly if they develop skin ulceration, discolouration, or new pain or tenderness
- start treatment for foot problems (e.g. ulceration, infection, or new pain or tenderness) as early as possible
- continue to follow standard treatment guidelines for routine preventive foot care for people with diabetes.

**MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)**

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients

having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use canagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 treatment in patients who are hospitalised for major surgery or acute serious illnesses; treatment may be restarted once the patient's condition has stabilised

#### ● CONTRA-INDICATIONS Ketoacidosis

- **CAUTIONS** Cardiovascular disease (risk of hypotension) · elderly (risk of hypotension) · elevated haematocrit · history of hypotension

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Volume depletion** Correct hypovolaemia before starting treatment.

#### ● INTERACTIONS → Appendix 1: canagliflozin

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Constipation · dyslipidaemia · genital infection · hypoglycaemia (in combination with insulin or sulfonylurea) · nausea · polyuria · raised haematocrit · thirst · urinary frequency · urinary-tract infection

- ▶ **Uncommon** Dehydration · dizziness · hypovolaemia · lower-limb amputation · postural hypotension · raised serum creatinine · raised serum urea · rash · syncope

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Volume depletion** Consider interrupting treatment if volume depletion occurs.

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

- **RENAL IMPAIRMENT** Reduce dose to 100 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m<sup>2</sup> and existing canagliflozin treatment tolerated. Avoid initiation if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 45 mL/minute/1.73 m<sup>2</sup>. Monitor renal function at least twice a year in moderate impairment.

- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually thereafter, and before initiation of concomitant drugs that reduce renal function and periodically thereafter.

- **PATIENT AND CARER ADVICE** Patients should be advised to report symptoms of volume depletion including postural hypotension and dizziness. Patients should be informed of

the signs and symptoms of diabetic ketoacidosis, see MHRA advice.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016) NICE TA390

Canagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed **and** a sulfonylurea or pioglitazone is not appropriate.

Patients currently receiving canagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA390](http://www.nice.org.uk/TA390)

- ▶ Canagliflozin in combination therapy for treating type 2 diabetes (June 2014) NICE TA315

Canagliflozin in a dual therapy regimen in combination with metformin is recommended for the treatment of type 2 diabetes, only if a sulfonylurea is contra-indicated or not tolerated or the patient has a significant risk of hypoglycaemia.

Canagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with metformin and a sulfonylurea or metformin and a thiazolidinedione.

Canagliflozin in combination with insulin (alone or with other antidiabetic drugs) is an option for the treatment of type 2 diabetes.

Patients currently receiving canagliflozin in a dual or triple therapy regimen that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA315](http://www.nice.org.uk/TA315)

**IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE (UPDATED APRIL 2016): RISK OF DIABETIC KETOACIDOSIS WITH SODIUM-GLUCOSE CO-TRANSPORTER 2 (SGLT2) INHIBITORS (CANAGLIFLOZIN, DAPAGLIFLOZIN OR EMPAGLIFLOZIN)**

A review by the European Medicines Agency has concluded that serious, life-threatening, and fatal cases of diabetic ketoacidosis (DKA) have been reported rarely in patients taking an SGLT2 inhibitor. In several cases, the presentation of DKA was atypical with patients having only moderately elevated blood glucose levels, and some of them occurred during off-label use.

To minimise the risk of such effects when treating patients with a SGLT2 inhibitor, the European Medicines Agency has issued the following advice:

- inform patients of the signs and symptoms of DKA, (including rapid weight loss, nausea or vomiting, abdominal pain, fast and deep breathing, sleepiness, a sweet smell to the breath, a sweet or metallic taste in the mouth, or a different odour to urine or sweat), and advise them to seek immediate medical advice if they develop any of these
- test for raised ketones in patients with signs and symptoms of DKA, even if plasma glucose levels are near-normal
- use empagliflozin with caution in patients with risk factors for DKA, (including a low beta cell reserve, conditions leading to restricted food intake or severe dehydration, sudden reduction in insulin, increased insulin requirements due to acute illness, surgery or alcohol abuse), and discuss these risk factors with patients
- discontinue treatment if DKA is suspected or diagnosed
- do not restart treatment with any SGLT2 inhibitor in patients who experienced DKA during use, unless another cause for DKA was identified and resolved
- interrupt SGLT2 treatment in patients who are hospitalised for major surgery or acute serious

illnesses; treatment may be restarted once the patient's condition has stabilised

- **CONTRA-INDICATIONS** Diabetic ketoacidosis
  - **CAUTIONS** Cardiovascular disease (increased risk of volume depletion) · complicated urinary tract infections—consider temporarily interrupting treatment · concomitant antihypertensive therapy (increased risk of volume depletion) · elderly patients aged over 75 years (increased risk of volume depletion) · heart failure · history of hypotension (increased risk of volume depletion) · patients at increased risk of volume depletion · predisposition to fluid disturbances e.g. gastro-intestinal illness, concomitant use of diuretics (increased risk of volume depletion)
  - **CAUTIONS, FURTHER INFORMATION**
    - Volume depletion Correct hypovolaemia before starting treatment. Consider interrupting treatment if volume depletion occurs.
  - **INTERACTIONS** → Appendix 1: empagliflozin
  - **SIDE-EFFECTS**
    - Common or very common Genital infection · hypoglycaemia (in combination with insulin or sulfonylurea) · polyuria · pruritus · urinary tract infection
    - Uncommon Dysuria · volume depletion
  - **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
  - **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
  - **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.
  - **RENAL IMPAIRMENT** Reduce dose to 10 mg once daily if eGFR falls persistently below 60 mL/minute/1.73 m<sup>2</sup>. Avoid initiation if eGFR below 60 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR is persistently below 45 mL/minute/1.73 m<sup>2</sup>.
  - **MONITORING REQUIREMENTS** Determine renal function before treatment and before initiation of concomitant drugs that may reduce renal function, then at least annually thereafter.
  - **PATIENT AND CARER ADVICE** Patients should be informed of the signs and symptoms of diabetic ketoacidosis, see MHRA advice.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - NICE technology appraisals (TAs)**
      - Canagliflozin, dapagliflozin and empagliflozin as monotherapies for treating type 2 diabetes (May 2016) NICE TA390
- Empagliflozin as monotherapy is recommended as an option for treating type 2 diabetes in adults for whom metformin is contra-indicated or not tolerated, only if a dipeptidyl peptidase-4 (DPP-4) inhibitor would otherwise be prescribed and a sulfonylurea or pioglitazone is not appropriate.
- Patients currently receiving empagliflozin whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.
- [www.nice.org.uk/TA390](http://www.nice.org.uk/TA390)
- **Empagliflozin in combination therapy for treating type 2 diabetes (March 2015) NICE TA336**
- Empagliflozin in a dual therapy regimen in combination with metformin is an option for the treatment of type 2 diabetes, only if:
- a sulfonylurea is contra-indicated or not tolerated, or
  - the patient is at significant risk of hypoglycaemia or its consequences.
- Empagliflozin in a triple therapy regimen is an option for the treatment of type 2 diabetes in combination with:
- metformin and a sulfonylurea or
  - metformin and a thiazolidinedione.

Empagliflozin in combination with insulin with or without other antidiabetic drugs is an option for the treatment of type 2 diabetes.

Patients currently receiving empagliflozin whose disease does not meet the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

## BLOOD GLUCOSE LOWERING DRUGS > SULFONYLUREAS

### Sulfonylureas

- **DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.

- **CONTRA-INDICATIONS** Presence of ketoacidosis

- **CAUTIONS** Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) • elderly • G6PD deficiency

#### • SIDE-EFFECTS

- ▶ **Uncommon** Hypoglycaemia
- ▶ **Rare** Agranulocytosis • aplastic anaemia • blood disorders • cholestatic jaundice • haemolytic anaemia • hepatic failure • hepatitis • leucopenia • pancytopenia • thrombocytopenia
- ▶ **Frequency not known** Allergic skin reactions (usually in the first 6–8 weeks of therapy) • constipation • diarrhoea • disturbance in liver function • erythema multiforme (usually in the first 6–8 weeks of therapy) • exfoliative dermatitis (usually in the first 6–8 weeks of therapy) • fever (usually in the first 6–8 weeks of therapy) • gastro-intestinal disturbances • hypersensitivity reactions (usually in the first 6–8 weeks of therapy) • jaundice (usually in the first 6–8 weeks of therapy) • nausea • vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hypoglycaemia** This is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.
- **HEPATIC IMPAIRMENT** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.
- **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.
- **PATIENT AND CARER ADVICE** The risk of hypoglycaemia associated with sulfonylureas should be discussed with the patient, especially when concomitant glucose-lowering drugs are prescribed.

#### Driving and skilled tasks

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

► above

## Glibenclamide

#### • INDICATIONS AND DOSE

##### Type 2 diabetes mellitus

##### ▶ BY MOUTH

- ▶ Adult: Initially 5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

- **UNLICENSED USE** Not licensed for use in breast feeding women with pre-existing diabetes. Not licensed for use in gestational diabetes.
- **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 969
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used

during the second and third trimesters of pregnancy in women with gestational diabetes.

- **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

##### ► Glibenclamide (Non-proprietary)

**Glibenclamide 2.5 mg** Glibenclamide 2.5mg tablets | 28 tablet **[PoM]** £11.46 DT price = £8.91

**Glibenclamide 5 mg** Glibenclamide 5mg tablets | 28 tablet **[PoM]** £14.72 DT price = £1.39

F 665

## Gliclazide

#### • INDICATIONS AND DOSE

##### Type 2 diabetes mellitus

###### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

Adult: Initially 40–80 mg daily, adjusted according to response, increased if necessary up to 160 mg once daily, dose to be taken with breakfast, doses higher than 160 mg to be given in divided doses; maximum 320 mg per day

###### ► BY MOUTH USING MODIFIED-RELEASE MEDICINES

Adult: Initially 30 mg daily, dose to be taken with breakfast, adjust dose according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); maximum 120 mg per day

#### DOSE EQUIVALENCE AND CONVERSION

► Gliclazide modified release 30 mg may be considered to be approximately equivalent in therapeutic effect to standard formulation gliclazide 80 mg.

- **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 969
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **RENAL IMPAIRMENT** If necessary, gliclazide which is principally metabolised in the liver, can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

##### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 25

F 665

## Glimepiride

#### • INDICATIONS AND DOSE

##### Type 2 diabetes mellitus

###### ► BY MOUTH

Adult: Initially 1 mg daily, adjusted according to response, then increased in steps of 1 mg every 1–2 weeks, increased to 4 mg daily, dose to be taken shortly before or with first main meal, the daily dose may be increased further, in exceptional circumstances; maximum 6 mg per day

#### • CAUTIONS

##### CAUTIONS, FURTHER INFORMATION

- **Porphyria** Sulfonylureas should be avoided where possible in acute porphyrias p. 969 but glimepiride is thought to be safe.
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS** Hyponatraemia
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **MONITORING REQUIREMENTS** Manufacturer recommends regular hepatic and haematological monitoring but limited evidence of clinical value.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

##### ► Glimepiride (Non-proprietary)

**Glimepiride 1 mg** Glimepiride 1mg tablets | 30 tablet **[PoM]** £4.33 DT price = £0.80

**Glimepiride 2 mg** Glimepiride 2mg tablets | 30 tablet **[PoM]** £7.13 DT price = £0.89

**Glimepiride 3 mg** Glimepiride 3mg tablets | 30 tablet **[PoM]** £10.75 DT price = £0.87

**Glimepiride 4 mg** Glimepiride 4mg tablets | 30 tablet **[PoM]** £14.24 DT price = £1.07

##### ► Amaryl (Zentiva)

**Glimepiride 3 mg** Amaryl 3mg tablets | 30 tablet **[PoM]** £10.75 DT price = £0.87

## Glipizide

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus

##### ► BY MOUTH

- Adult: Initially 2.5–5 mg daily, adjusted according to response, dose to be taken shortly before breakfast or lunch, doses up to 15 mg may be given as a single dose, higher doses to be given in divided doses; maximum 20 mg per day

### ● CAUTIONS

#### CAUTIONS, FURTHER INFORMATION

- **Porphyrria** Sulfonylureas should be avoided where possible in acute porphyrias p. 969 but glipizide is thought to be safe.
- **INTERACTIONS** → Appendix 1: sulfonylureas
- **SIDE-EFFECTS**
  - **Rare** Photosensitivity
  - **Frequency not known** Dizziness · drowsiness · hyponatraemia
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.
- **BREAST FEEDING** Avoid—theoretical possibility of hypoglycaemia in the infant.
- **HEPATIC IMPAIRMENT** Avoid if the patient has both renal and hepatic impairment.
- **RENAL IMPAIRMENT** Avoid if the patient has both renal and hepatic impairment.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ► Glipizide (Non-proprietary)

Glipizide 5 mg Glipizide 5mg tablets | 28 tablet **[PoM]** £2.18 DT price = £2.06 | 56 tablet **[PoM]** £6.96

##### ► Minodiab (Pfizer Ltd)

Glipizide 5 mg Minodiab 5mg tablets | 28 tablet **[PoM]** £1.26 DT price = £2.06

## Tolbutamide

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus

##### ► BY MOUTH

- Adult: 0.5–1.5 g daily in divided doses, dose to be taken with or immediately after meals, alternatively 0.5–1.5 g once daily, dose to be taken with or immediately after breakfast; maximum 2 g per day

- **CONTRA-INDICATIONS** Avoid where possible in acute porphyrias p. 969

- **INTERACTIONS** → Appendix 1: sulfonylureas

- **SIDE-EFFECTS** Headache · tinnitus

- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia.

- **BREAST FEEDING** The use of sulfonylureas in breast-feeding should be avoided because there is a theoretical possibility of hypoglycaemia in the infant.

- **RENAL IMPAIRMENT** If necessary, the short-acting drug tolbutamide can be used in renal impairment but careful monitoring of blood-glucose concentration is essential.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Tablet

##### ► Tolbutamide (Non-proprietary)

Tolbutamide 500 mg Tolbutamide 500mg tablets | 28 tablet **[PoM]** £34.88 DT price = £6.71 | 112 tablet **[PoM]** £27.00

## BLOOD GLUCOSE LOWERING DRUGS > THIAZOLIDINEDIONES

### Pioglitazone

- **DRUG ACTION** The thiazolidinedione, pioglitazone, reduces peripheral insulin resistance, leading to a reduction of blood-glucose concentration.

### ● INDICATIONS AND DOSE

#### Type 2 diabetes mellitus (alone or combined with metformin or a sulfonylurea, or with both, or with insulin)

##### ► BY MOUTH

- Adult: Initially 15–30 mg once daily, adjusted according to response to 45 mg once daily, in elderly patients, initiate with lowest possible dose and increase gradually; review treatment after 3–6 months and regularly thereafter

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose of concomitant sulfonylurea or insulin may need to be reduced.

### IMPORTANT SAFETY INFORMATION

#### MHRA/CHM ADVICE: PIOGLITAZONE CARDIOVASCULAR SAFETY (DECEMBER 2007 AND JANUARY 2011)

Incidence of heart failure is increased when pioglitazone is combined with insulin especially in patients with predisposing factors e.g. previous myocardial infarction. Patients who take pioglitazone should be closely monitored for signs of heart failure; treatment should be discontinued if any deterioration in cardiac status occurs.

Pioglitazone should not be used in patients with heart failure or a history of heart failure.

#### PIOGLITAZONE: RISK OF BLADDER CANCER (JULY 2011)

The European Medicines Agency has advised that there is a small increased risk of bladder cancer associated with pioglitazone use. However, in patients who respond adequately to treatment, the benefits of pioglitazone continue to outweigh the risks.

Pioglitazone should not be used in patients with active bladder cancer or a past history of bladder cancer, or in those who have uninvestigated macroscopic haematuria. Pioglitazone should be used with caution in elderly patients as the risk of bladder cancer increases with age.

Before initiating treatment with pioglitazone, patients should be assessed for risk factors of bladder cancer (including age, smoking status, exposure to certain occupational or chemotherapy agents, or previous radiation therapy to the pelvic region) and any macroscopic haematuria should be investigated. The safety and efficacy of pioglitazone should be reviewed after 3–6 months and pioglitazone should be stopped in patients who do not respond adequately to treatment.

Patients already receiving treatment with pioglitazone should be assessed for risk factors of bladder cancer and treatment should be reviewed after 3–6 months, as above.

Patients should be advised to report promptly any haematuria, dysuria, or urinary urgency during treatment.

- **CONTRA-INDICATIONS** History of heart failure · previous or active bladder cancer · uninvestigated macroscopic haematuria
- **CAUTIONS** Avoid in acute porphyrias p. 969 · cardiovascular disease or in combination with insulin (risk of heart failure) · elderly (increased risk of heart failure, fractures, and bladder cancer) · increased risk of bone fractures, particularly in women · risk factors for bladder cancer

#### CAUTIONS, FURTHER INFORMATION

Substitute insulin during peri-operative period.

- **INTERACTIONS** → Appendix 1: pioglitazone
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · arthralgia · dizziness · gastro-intestinal disturbances · haematuria · headache · hypoaesthesia · impotence · oedema · vertigo · visual disturbances · weight gain
  - ▶ **Uncommon** Altered blood lipids · bladder cancer · fatigue · hypoglycaemia · insomnia · proteinuria · sweating
  - ▶ **Rare** Liver dysfunction
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Liver toxicity Rare reports of liver dysfunction; discontinue if jaundice occurs.

- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Avoid.
- **MONITORING REQUIREMENTS** Monitor liver function before treatment and periodically thereafter.

#### PATIENT AND CARER ADVICE

Liver toxicity Patients should be advised to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop.

#### NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* accepts use of pioglitazone (February 2007) with metformin and a sulfonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

##### Tablet

##### ▶ Pioglitazone (Non-proprietary)

**Pioglitazone (as Pioglitazone hydrochloride) 15 mg** Pioglitazone 15mg tablets | 28 tablet [PoM] £25.83 DT price = £1.84

**Pioglitazone (as Pioglitazone hydrochloride) 30 mg** Glidipion 30mg tablets | 28 tablet [PoM] £35.89 DT price = £1.99

**Pioglitazone (as Pioglitazone hydrochloride) 45 mg** Glidipion 45mg tablets | 28 tablet [PoM] £39.55 DT price = £2.62

## Pioglitazone with metformin

The properties listed below are those particular to the combination only. For the properties of the components please consider, pioglitazone p. 667, metformin hydrochloride p. 652.

#### INDICATIONS AND DOSE

##### Type 2 diabetes not controlled by metformin alone

###### ▶ BY MOUTH

- ▶ **Adult:** 1 tablet twice daily, titration with the individual components (pioglitazone and metformin) desirable before initiation

#### INTERACTIONS → Appendix 1: metformin, pioglitazone

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 21

##### ▶ Competact (Takeda UK Ltd)

**Pioglitazone (as Pioglitazone hydrochloride) 15 mg, Metformin hydrochloride 850 mg** Competact 15mg/850mg tablets | 56 tablet [PoM] £35.89 DT price = £35.89

## INSULINS

## Insulins

#### IMPORTANT SAFETY INFORMATION

NHS IMPROVEMENT PATIENT SAFETY ALERT: RISK OF SEVERE HARM AND DEATH DUE TO WITHDRAWING INSULIN FROM PEN DEVICES (NOVEMBER 2016)

Insulin should not be extracted from insulin pen devices.

The strength of insulin in pen devices can vary by multiples of 100 units/mL. Insulin syringes have graduations only suitable for calculating doses of standard 100 units/mL. If insulin extracted from a pen or cartridge is of a higher strength, and that is not considered in determining the volume required, it can lead to a significant and potentially fatal overdose.

#### SIDE-EFFECTS

- ▶ **Common or very common** Fat hypertrophy at injection site · local reactions at injection site · transient oedema
- ▶ **Rare** Hypersensitivity reactions · rash · urticaria

##### Overdose

Overdose causes hypoglycaemia.

- **PREGNANCY** During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

#### BREAST FEEDING

During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

- **HEPATIC IMPAIRMENT** Insulin requirements may be decreased in patients with hepatic impairment.

- **RENAL IMPAIRMENT** Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

#### MONITORING REQUIREMENTS

- ▶ Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.

- ▶ Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
- ▶ In adults It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals).
- ▶ In children It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).
- ▶ While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.

● **DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by *subcutaneous injection*; the injection site should be rotated to prevent lipodystrophy. Injection devices ('pens'), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

● **PRESCRIBING AND DISPENSING INFORMATION**  
Show container to patient or carer and confirm the expected version is dispensed.  
Units The word 'unit' should **not** be abbreviated.

● **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems. Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient's current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited  
Gorse Street, Chadderton  
Oldham  
OL9 9QH  
Tel: 0845 610 1112  
GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from [www.nhsforms.co.uk/](http://www.nhsforms.co.uk/) or by emailing [nhsforms@mmm.com](mailto:nhsforms@mmm.com). Further information is available at [www.npsa.nhs.uk](http://www.npsa.nhs.uk).

**Hypoglycaemia** Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

## INSULINS > INTERMEDIATE-ACTING

F 668

### Biphasic isophane insulin

(Biphasic Isophane Insulin Injection— intermediate acting)

● **INDICATIONS AND DOSE**

**Diabetes mellitus**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements
- ▶ Adult: According to requirements

● **INTERACTIONS** → Appendix 1: insulins

● **SIDE-EFFECTS** Protamine may cause allergic reactions

● **PRESCRIBING AND DISPENSING INFORMATION** A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species.

Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Suspension for injection**

▶ **Humulin M3** (Eli Lilly and Company Ltd)

Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Humulin M3 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT price = £19.08  
Humulin M3 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68

▶ **Humulin M3 KwikPen** (Eli Lilly and Company Ltd)

Insulin human (as Insulin soluble human) 30 unit per 1 ml, Insulin human (as Insulin isophane human) 70 unit per 1 ml Humulin M3 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £21.70 DT price = £21.70

▶ **Hypurin Porcine 30/70 Mix** (Wockhard UK Ltd)

Insulin porcine (as Insulin soluble porcine) 30 unit per 1 ml, Insulin porcine (as Insulin isophane porcine) 70 unit per 1 ml Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £37.80  
Hypurin Porcine 30/70 Mix 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £25.20

▶ **Insuman Comb 15** (Sanofi)

Insulin human (as Insulin soluble human) 15 unit per 1 ml, Insulin human (as Insulin isophane human) 85 unit per 1 ml Insuman Comb 15 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50

▶ **Insuman Comb 25** (Sanofi)

Insulin human (as Insulin soluble human) 25 unit per 1 ml, Insulin human (as Insulin isophane human) 75 unit per 1 ml Insuman Comb 25 100units/ml suspension for injection 5ml vials | 1 vial [PoM] £5.61

Insuman Comb 25 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50

▶ **Insuman Comb 25 SoloStar** (Sanofi)

Insulin human (as Insulin soluble human) 25 unit per 1 ml, Insulin human (as Insulin isophane human) 75 unit per 1 ml Insuman Comb 25 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £19.80

▶ **Insuman Comb 50** (Sanofi)

Insulin human (as Insulin isophane human) 50 unit per 1 ml, Insulin human (as Insulin soluble human) 50 unit per 1 ml Insuman Comb 50 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50

## Isothane insulin

(Isothane Insulin Injection; Isothane Protamine Insulin Injection; Isothane Insulin (NPH)—intermediate acting)

### ● INDICATIONS AND DOSE

#### Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Child: According to requirements
- Adult: According to requirements

### ● INTERACTIONS → Appendix 1: insulins

### ● SIDE-EFFECTS Protamine may cause allergic reactions

### ● PREGNANCY Recommended where longer-acting insulins are needed.

### ● PRESCRIBING AND DISPENSING INFORMATION A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulfate or another suitable protamine.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

##### ► Humulin I (Eli Lilly and Company Ltd)

Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £15.68

Humulin I 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £19.08 DT price = £19.08

##### ► Humulin I KwikPen (Eli Lilly and Company Ltd)

Insulin human (as Insulin isophane human) 100 unit per 1 ml Humulin I KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £21.70 DT price = £21.70

##### ► Hypurin Bovine Isothane (Wockhardt UK Ltd)

Insulin bovine (as Insulin isophane bovine) 100 unit per 1 ml Hypurin Bovine Isothane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72

Hypurin Bovine Isothane 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £41.58

##### ► Hypurin Porcine Isothane (Wockhardt UK Ltd)

Insulin porcine (as Insulin isophane porcine) 100 unit per 1 ml Hypurin Porcine Isothane 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £37.80

Hypurin Porcine Isothane 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £25.20

##### ► Insulatard (Novo Nordisk Ltd)

Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £7.48

##### ► Insulatard InnoLet (Novo Nordisk Ltd)

Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard InnoLet 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £20.40 DT price = £21.70

##### ► Insulatard Penfill (Novo Nordisk Ltd)

Insulin human (as Insulin isophane human) 100 unit per 1 ml Insulatard Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £22.90 DT price = £19.08

##### ► Insuman Basal (Sanofi)

Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 5ml vials | 1 vial [PoM] £5.61

Insuman Basal 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £17.50 DT price = £19.08

##### ► Insuman Basal SoloStar (Sanofi)

Insulin human (as Insulin isophane human) 100 unit per 1 ml Insuman Basal 100units/ml suspension for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £19.80 DT price = £21.70

## INSULINS > INTERMEDIATE-ACTING COMBINED WITH RAPID-ACTING

## Biphasic insulin aspart

(Intermediate-acting insulin)

### ● INDICATIONS AND DOSE

#### Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Child: Administer up to 10 minutes before or soon after a meal, according to requirements
- Adult: Administer up to 10 minutes before or soon after a meal, according to requirements

### ● INTERACTIONS → Appendix 1: insulins

### ● SIDE-EFFECTS Protamine may cause allergic reactions

### ● PRESCRIBING AND DISPENSING INFORMATION Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

##### ► NovoMix 30 FlexPen (Novo Nordisk Ltd)

Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £29.89 DT price = £29.89

##### ► NovoMix 30 Penfill (Novo Nordisk Ltd)

Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 Penfill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £28.79 DT price = £28.79

## Biphasic insulin lispro

(Intermediate-acting insulin)

### ● INDICATIONS AND DOSE

#### Diabetes mellitus

- BY SUBCUTANEOUS INJECTION
- Child: Administer up to 15 minutes before or soon after a meal, according to requirements
- Adult: Administer up to 15 minutes before or soon after a meal, according to requirements

### ● CAUTIONS Children under 12 years (use only if benefit likely compared to soluble insulin)

### ● INTERACTIONS → Appendix 1: insulins

### ● SIDE-EFFECTS Protamine may cause allergic reactions

### ● PRESCRIBING AND DISPENSING INFORMATION Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

##### ► Humalog Mix25 (Eli Lilly and Company Ltd)

Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £16.61

Humalog Mix25 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46 DT price = £29.46

##### ► Humalog Mix25 KwikPen (Eli Lilly and Company Ltd)

Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 KwikPen 100units/ml

suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £30.98 DT price = £30.98

- ▶ **Humalog Mix50** (Eli Lilly and Company Ltd)

**Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml** Humalog Mix50 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46

- ▶ **Humalog Mix50 KwikPen** (Eli Lilly and Company Ltd)

**Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml** Humalog Mix50 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £30.98 DT price = £30.98

## INSULINS > LONG-ACTING

F 668

14-Mar-2017

### Insulin degludec

(Recombinant human insulin analogue—long acting)

#### ● INDICATIONS AND DOSE

##### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Child 1-17 years: Dose to be given according to requirements
- ▶ Adult: Dose to be given according to requirements

- **INTERACTIONS** → Appendix 1: insulins

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin degludec (*Tresiba*®) is available in strengths of 100 units/mL (allows 1-unit dose adjustment) and 200 units/mL (allows 2-unit dose adjustment)—ensure correct strength prescribed.

- **NATIONAL FUNDING/ACCESS DECISIONS**

#### All Wales Medicines Strategy Group (AWMSG) Decisions

- ▶ In adults The *All Wales Medicines Strategy Group* has advised (October 2016) that insulin degludec (*Tresiba*®) is recommended as an option for restricted use within NHS Wales for the treatment of diabetes mellitus in adult patients where treatment with a basal insulin analogue is considered appropriate.
- ▶ In children The *All Wales Medicines Strategy Group* has advised (October 2016) that insulin degludec (*Tresiba*®) is **not** recommended for use within NHS Wales for the treatment of diabetes mellitus in adolescents and children from the age of 1 year.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Tresiba FlexTouch** (Novo Nordisk Ltd) ▼

**Insulin human (as Insulin degludec) 100 unit per 1 ml** Tresiba FlexTouch 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £46.60

**Insulin human (as Insulin degludec) 200 unit per 1 ml** Tresiba FlexTouch 200units/ml solution for injection 3ml pre-filled pen | 3 pre-filled disposable injection [PoM] £55.92

- ▶ **Tresiba Penfill** (Novo Nordisk Ltd) ▼

**Insulin human (as Insulin degludec) 100 unit per 1 ml** Tresiba Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £46.60

## Insulin degludec with liraglutide

02-Jun-2016

The properties listed below are those particular to the combination only. For the properties of the components please consider, insulin degludec above, liraglutide p. 659.

#### ● INDICATIONS AND DOSE

##### As add-on to oral antidiabetics in type 2 diabetes mellitus not controlled by oral antidiabetics alone

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 10 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

##### When transferring from basal insulin in type 2 diabetes mellitus not controlled by oral antidiabetics in combination with basal insulin

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Adult: Initially 16 dose-steps once daily, adjusted according to response; maximum 50 dose-steps per day

- **INTERACTIONS** → Appendix 1: insulins, liraglutide

- **PATIENT AND CARER ADVICE** Counselling advised on administration. Show container to patient and confirm that patient is expecting the version dispensed.

- **NATIONAL FUNDING/ACCESS DECISIONS**

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2015) that insulin degludec with liraglutide (*Xultophy*®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus to improve glycaemic control in combination with oral glucose-lowering medicinal products when these alone or combined with a GLP-1 receptor agonist or with basal insulin do not provide adequate glycaemic control.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Xultophy** (Novo Nordisk Ltd) ▼

**Liraglutide 3.6 mg per 1 ml, Insulin human (as Insulin degludec) 100 unit per 1 ml** Xultophy 100units/ml | 3.6mg/ml solution for injection 3ml pre-filled pen | 3 pre-filled disposable injection [PoM] £95.53

F 668

## Insulin detemir

(Recombinant human insulin analogue—long acting)

#### ● INDICATIONS AND DOSE

##### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Child 2-17 years: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulins

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 670 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Levemir FlexPen** (Novo Nordisk Ltd)

**Insulin human (as Insulin detemir) 100 unit per 1 ml** Levemir FlexPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £42.00 DT price = £42.00

- ▶ **Levemir InnoLet** (Novo Nordisk Ltd)  
Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir InnoLet 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £44.85 DT price = £42.00
- ▶ **Levemir PenFill** (Novo Nordisk Ltd)  
Insulin human (as Insulin detemir) 100 unit per 1 ml Levemir PenFill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £42.00 DT price = £42.00

F 668

## Insulin glargine

(Recombinant human insulin analogue—long acting)

### ● INDICATIONS AND DOSE

#### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2-17 years: According to requirements
- ▶ Adult: According to requirements

#### TOUJEO®

#### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.
- **PRESCRIBING AND DISPENSING INFORMATION** Insulin glargine is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised that *Lantus*® preparations (April 2013) and *Toujeo*® (August 2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin

It is not recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Abasagar** (Eli Lilly and Company Ltd) ▼  
Insulin human (as Insulin glargine) 100 unit per 1 ml Abasagar 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £35.28 DT price = £41.50
- ▶ **Abasagar KwikPen** (Eli Lilly and Company Ltd) ▼  
Insulin human (as Insulin glargine) 100 unit per 1 ml Abasagar KwikPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £35.28 DT price = £41.50
- ▶ **Lantus** (Sanofi)  
Insulin human (as Insulin glargine) 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £41.50 DT price = £41.50
- ▶ **Lantus** 100units/ml solution for injection 10ml vials | 1 vial [PoM] £30.68

- ▶ **Lantus SoloStar** (Sanofi)  
Insulin human (as Insulin glargine) 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £41.50 DT price = £41.50
- ▶ **Toujeo** (Sanofi)  
Insulin human (as Insulin glargine) 300 unit per 1 ml Toujeo 300units/ml solution for injection 1.5ml pre-filled SoloStar pen | 3 pre-filled disposable injection [PoM] £33.13

F 668

## Insulin zinc suspension

(Insulin zinc suspension (mixed)—long acting)

### ● INDICATIONS AND DOSE

#### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 670 is recommended where longer-acting insulins are needed; insulin detemir p. 671 may also be considered.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

- ▶ **Hypurin Bovine Lente** (Wockhardt UK Ltd)  
Insulin bovine (as Insulin zinc suspension mixed bovine) 100 unit per 1 ml Hypurin Bovine Lente 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72

F 668

## Protamine zinc insulin

(Protamine zinc insulin injection—long acting)

### ● INDICATIONS AND DOSE

#### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements
- ▶ Adult: According to requirements

- **INTERACTIONS** → Appendix 1: insulins
- **SIDE-EFFECTS** Protamine may cause allergic reactions
- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 670 is recommended where longer-acting insulins are needed; insulin detemir p. 671 may also be considered.
- **PRESCRIBING AND DISPENSING INFORMATION** A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Suspension for injection

- ▶ **Hypurin Bovine Protamine Zinc** (Wockhardt UK Ltd)  
Insulin bovine (as Insulin protamine zinc bovine) 100 unit per 1 ml Hypurin Bovine Protamine Zinc 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72

## INSULINS &gt; RAPID-ACTING

F 668

## Insulin

(Insulin Injection; Neutral Insulin; Soluble Insulin—short acting)

## ● INDICATIONS AND DOSE

**Diabetes mellitus**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: According to requirements

**Diabetic ketoacidosis | Diabetes during surgery**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult local protocol)

## ● INTERACTIONS → Appendix 1: insulins

- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.

- ▶ With intravenous use For *intravenous infusion* give continuously in Sodium chloride 0.9%. Adsorbed to some extent by plastic infusion set; ensure insulin is not injected into 'dead space' of injection port of the infusion bag.

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.

## ● NATIONAL FUNDING/ACCESS DECISIONS

**NICE technology appraisals (TAs)**

- ▶ Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151 Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, **or**
- whose glycaemic control remains inadequate (HbA<sub>1c</sub> over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

[www.nice.org.uk/TA151](http://www.nice.org.uk/TA151)

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

**Solution for injection**

- ▶ **Actrapid** (Novo Nordisk Ltd)

**Insulin human (as Insulin soluble human) 100 unit per 1 ml** Actrapid 100units/ml solution for injection 10ml vials | 1 vial [PoM] £7.48

- ▶ **Humulin S** (Eli Lilly and Company Ltd)

**Insulin human (as Insulin soluble human) 100 unit per 1 ml** Humulin S 100units/ml solution for injection 10ml vials | 1 vial [PoM] £15.68

Humulin S 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £19.08

- ▶ **Hypurin Bovine Neutral** (Wockhardt UK Ltd)

**Insulin bovine (as Insulin soluble bovine) 100 unit per 1 ml** Hypurin Bovine Neutral 100units/ml solution for injection 10ml vials | 1 vial [PoM] £27.72

Hypurin Bovine Neutral 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £41.58

- ▶ **Hypurin Porcine Neutral** (Wockhardt UK Ltd)

**Insulin porcine (as Insulin soluble porcine) 100 unit per 1 ml** Hypurin Porcine Neutral 100units/ml solution for injection 10ml vials | 1 vial [PoM] £25.20

Hypurin Porcine Neutral 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £37.80

- ▶ **Insuman Infusafast** (Sanofi)

**Insulin human 100 unit per 1 ml** Insuman Infusafast 100units/ml solution for injection 3.15ml cartridges | 5 cartridge [PoM] £250.00

Insuman Infusafast 100units/ml solution for injection 10ml vials | 3 vial [PoM] £250.00

- ▶ **Insuman Rapid** (Sanofi)

**Insulin human (as Insulin soluble human) 100 unit per 1 ml** Insuman Rapid 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £17.50

F 668

## Insulin aspart

16-Jun-2017

(Recombinant human insulin analogue—short acting)

## ● INDICATIONS AND DOSE

**Diabetes mellitus**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2–17 years: Administer immediately before meals or when necessary shortly after meals, according to requirements
- ▶ Adult: Administer immediately before meals or when necessary shortly after meals, according to requirements
- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child 2–17 years: According to requirements
- ▶ Adult: According to requirements

**FIASP®****Diabetes mellitus**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY CONTINUOUS SUBCUTANEOUS INFUSION
- ▶ Adult: According to requirements

- **UNLICENSED USE** Not licensed for use in children under 2 years.

- **INTERACTIONS** → Appendix 1: insulins

- **PREGNANCY** Not known to be harmful—may be used during pregnancy.

- **BREAST FEEDING** Not known to be harmful—may be used during lactation.

- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for

patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

- ▶ With intravenous use in adults For *intravenous infusion*, give continuously in Glucose 5% or Sodium chloride 0.9%; dilute to 0.05–1 unit/mL with infusion fluid; adsorbed to some extent by plastics of infusion set.
- ▶ With intravenous use in children For *intravenous infusion*, dilute to a concentration of 0.05–1 unit/mL with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151  
Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:
  - who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
  - whose glycaemic control remains inadequate (HbA<sub>1c</sub> over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).
 Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

## Insulin glulisine

(Recombinant human insulin analogue–short acting)

#### ● INDICATIONS AND DOSE

##### Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
  - ▶ Child: Administer immediately before meals or when necessary shortly after meals, according to requirements
  - ▶ Adult: Administer immediately before meals or when necessary shortly after meals, according to requirements
- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION
  - ▶ Child: According to requirements
  - ▶ Adult: According to requirements

- **UNLICENSED USE** Not licensed for children under 6 years.

- **INTERACTIONS** → Appendix 1: insulins

- **DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.
- ▶ With intravenous use in adults For *intravenous infusion* (*Apidra*®), give continuously in Sodium chloride 0.9%; dilute to 1 unit/mL with infusion fluid; use a co-extruded polyolefin/polyamide plastic infusion bag with a dedicated infusion line.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151  
Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:
  - who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
  - whose glycaemic control remains inadequate (HbA<sub>1c</sub> over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).
 Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.  
[www.nice.org.uk/TA151](http://www.nice.org.uk/TA151)

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2008) that *Apidra*® is accepted for restricted use within NHS Scotland for the treatment of adults and children over 6 years with diabetes mellitus in whom the use of a short-acting insulin analogue is appropriate.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

#### Apidra (Sanofi)

**Insulin glulisine 100 unit per 1 mL** Apidra 100units/mL solution for injection 10mL vials | 1 vial [PoM] £16.00

Apidra 100units/mL solution for injection 3mL cartridges | 5 cartridge [PoM] £28.30

#### Apidra SoloStar (Sanofi)

**Insulin glulisine 100 unit per 1 mL** Apidra 100units/mL solution for injection 3mL pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £28.30 DT price = £28.30

668

## Insulin lispro

(Recombinant human insulin analogue—short acting)

### INDICATIONS AND DOSE

#### Diabetes mellitus

##### BY SUBCUTANEOUS INJECTION

- Child 2–17 years: Administer shortly before meals or when necessary shortly after meals, according to requirements

- Adult: Administer shortly before meals or when necessary shortly after meals, according to requirements

##### BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION

- Child 2–17 years: According to requirements
- Adult: According to requirements

- UNLICENSED USE** Not licensed for use in children under 2 years.

- CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)

- INTERACTIONS** → Appendix 1: insulins

- PREGNANCY** Not known to be harmful—may be used during pregnancy.

- BREAST FEEDING** Not known to be harmful—may be used during lactation.

- DIRECTIONS FOR ADMINISTRATION** Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens (see also NICE guidance, below). Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.

- With intravenous use in adults For *intravenous infusion* give continuously in Glucose 5% or Sodium chloride 0.9%. Adsorbed to some extent by plastics of infusion set.
- With intravenous use in children For *intravenous infusion*, dilute to a concentration of 0.1–1 unit/mL with Glucose 5% or Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin.

### NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151 Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
- whose glycaemic control remains inadequate (HbA<sub>1c</sub> over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. ### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### Humalog (Eli Lilly and Company Ltd)

**Insulin lispro 100 unit per 1 mL** Humalog 100units/mL solution for injection 10mL vials | 1 vial [PoM] £16.61 DT price = £16.61

Humalog 100units/mL solution for injection 3mL cartridges | 5 cartridge [PoM] £28.31 DT price = £28.31

##### Humalog KwikPen (Eli Lilly and Company Ltd)

**Insulin lispro 100 unit per 1 mL** Humalog KwikPen 100units/mL solution for injection 3mL pre-filled pen | 5 pre-filled disposable injection [PoM] £29.46 DT price = £29.46

**Insulin lispro 200 unit per 1 mL** Humalog KwikPen 200units/mL solution for injection 3mL pre-filled pen | 5 pre-filled disposable injection [PoM] £58.92

## 3.1a Diabetes, diagnosis and monitoring

### Diabetes mellitus, diagnostic and monitoring devices

#### Urinalysis

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with *Micral-Test II*® but this should be followed by confirmation in the laboratory, since false positive results are common.

#### Blood monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulfonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood ketones should be measured according to local guidelines. Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

**Other drugs used for Diabetes, diagnosis and monitoring**  
Glucose, p. 955

## Blood monitoring test strips

### • BLOOD GLUCOSE TESTING STRIPS

**Accu-Chek Inform II testing strips** (Roche Diagnostics Ltd)  
50strip • NHS indicative price available • Drug Tariff (Part IXr)

**Active testing strips** (Roche Diabetes Care Ltd)  
50strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

**Advocate Redi-Code+ testing strips** (Diabetes Care Technology Ltd)  
50strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

**AutoSense testing strips** (Advance Diagnostic Products (NI) Ltd)  
25strip • NHS indicative price = £4.50 • Drug Tariff (Part IXr)

**Aviva testing strips** (Roche Diabetes Care Ltd)  
50strip • NHS indicative price = £15.96 • Drug Tariff (Part IXr)

**BGStar testing strips** (Sanofi)  
50strip • NHS indicative price = £14.73 • Drug Tariff (Part IXr)

**GlucorX HCT Ketone testing strips** (GlucorX Ltd) | 10strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)  
**KetoSens testing strips** (Spirit Healthcare Ltd) | 10strip • NHS indicative price = £9.95 • Drug Tariff (Part IXr)

**Hypodermic insulin injection pens**

- **HYPODERMIC INSULIN INJECTION PENS**  
**AUTOPEN<sup>®</sup> 24**  
*Autopen<sup>®</sup> 24* (for use with Sanofi- Aventis 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2- unit version).  
**Autopen 24 hypodermic insulin injection pen reusable for 3ml cartridge 1 unit dial up / range 1-21 units** (Owen Mumford Ltd)  
1device • NHS indicative price = £16.47 • Drug Tariff (Part IXa)  
**Autopen 24 hypodermic insulin injection pen reusable for 3ml cartridge 2 unit dial up / range 2-42 units** (Owen Mumford Ltd)  
1device • NHS indicative price = £16.47 • Drug Tariff (Part IXa)  
**AUTOPEN<sup>®</sup> CLASSIC**  
*Autopen<sup>®</sup> Classic* (for use with Lilly and Wockhardt 3-mL insulin cartridges), allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version).  
**Autopen Classic hypodermic insulin injection pen reusable for 3ml cartridge 1 unit dial up / range 1-21 units** (Owen Mumford Ltd)  
1device • NHS indicative price = £16.72 • Drug Tariff (Part IXa)  
**Autopen Classic hypodermic insulin injection pen reusable for 3ml cartridge 2 unit dial up / range 2-42 units** (Owen Mumford Ltd)  
1device • NHS indicative price = £16.72 • Drug Tariff (Part IXa)

**CLIKSTAR®**

For use with *Lantus®*, *Apidra®*, and *Insuman®* 3-mL insulin cartridges; allowing 1-unit dose adjustment, max. 80 units.

**ClikSTAR hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-80 units** (Sanofi)

1device • NHS indicative price = £25.00 • Drug Tariff (Part IXa)

**ClikSTAR hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-80 units** (Sanofi)

1device • NHS indicative price = £25.00 • Drug Tariff (Part IXa)

**HUMAPEN® LUXURA HD**

For use with *Humulin®* and *Humalog®* 3-mL cartridges; allowing 0.5-unit dosage adjustment, max. 30 units.

**HumaPen Luxura HD hypodermic insulin injection pen reusable for 3mL cartridge 0.5 unit dial up / range 1-30 units** (Eli Lilly and Company Ltd)

1device • NHS indicative price = £26.82 • Drug Tariff (Part IXa)

**NOVOPEN 4**

For use with *Penfill®* 3-mL insulin cartridges; allowing 1-unit dosage adjustment, max. 60 units.

**NovoPen 4 hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-60 units** (Novo Nordisk Ltd)

1device • NHS indicative price = £26.86 • Drug Tariff (Part IXa)

**NovoPen 4 hypodermic insulin injection pen reusable for 3mL cartridge 1 unit dial up / range 1-60 units** (Novo Nordisk Ltd)

1device • NHS indicative price = £26.86 • Drug Tariff (Part IXa)

**Needle free Insulin delivery systems****• NEEDLE FREE INSULIN DELIVERY SYSTEMS****INSUJET®**

For use with any 10-mL vial or 3-mL cartridge of insulin, allowing 1-unit dosage adjustment, max 40 units.

Available as *starter set* (*Insulet®* device, nozzle cap, nozzle and piston, 1 × 10-mL adaptor, 1 × 3-mL adaptor, 1 cartridge cap removal key), *nozzle pack* (15 nozzles), *cartridge adaptor pack* (15 adaptors), or *vial adaptor pack* (15 adaptors).

**Insulet starter set** (Spirit Healthcare Ltd)

1pack • NHS indicative price = £90.00 • Drug Tariff (Part IXa)

**Urinanalysis reagent strips****• PRESCRIBING AND DISPENSING INFORMATION**

Other reagent strips available for urinalysis

Include: *Combur-3 Test®* (glucose and protein—Roche Diagnostics); *Clinitek Microalbumin®* (albumin and creatinine—Siemens); *Ketodiastix®* (glucose and ketones—Bayer Diagnostics); *Medi-Test Combi 2®* (glucose and protein—BHR); *Micral-Test II®*, used to detect microalbuminuria but this should be followed by confirmation in the laboratory—false positive results are common (albumin—Roche Diagnostics); *Microalbustix®* (albumin and creatinine—Siemens); *Uristix®* (glucose and protein—Siemens).

These reagent strips are not prescribable under National Health Service (NHS).

**• URINE GLUCOSE TESTING STRIPS**

**Diastix testing strips** (Bayer Diagnostics Manufacturing Ltd)

50strip • NHS indicative price = £2.89 • Drug Tariff (Part IXr)

**Medi-Test Glucose testing strips** (BHR Pharmaceuticals Ltd)

50strip • NHS indicative price = £2.33 • Drug Tariff (Part IXr)

50strip • NHS indicative price = £3.06 • Drug Tariff (Part IXr)

**Mission Ketone testing strips** (Spirit Healthcare Ltd)

50strip • NHS indicative price = £2.50 • Drug Tariff (Part IXr)

**3.2 Hypoglycaemia****Hypoglycaemia**

02-Jun-2017

**Treatment of hypoglycaemia**

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. If necessary this may be repeated after 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal (if it is due) can prevent blood-glucose concentration from falling again.

Proprietary products of quick-acting carbohydrate (e.g. *Glucogel®*, *Dextrogluc®*, *GSF-Syrup®*, *Rapilose®* gel) are available on prescription for patients to keep on hand in case of hypoglycaemia.

Alternatively, approximately 10 g of glucose is available from 2 teaspoons of sugar, or from 3 sugar lumps, and also from non-diet versions of the following soft drinks: 110 mL of *Lucozade® Energy Original* (also, see note below), 100 mL of *Coca-Cola®*, 19 mL of *Ribena® Blackcurrant* (to be diluted).

**Note: the carbohydrate content of some commercially available glucose-containing drinks is currently subject to change—individual product labels should be checked.** Patients should be aware that for a time, both old and new bottles and cans may be available—individual product labels should be checked.

**Hypoglycaemia which causes unconsciousness** is an emergency. Glucagon p. 681, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon may be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an 'if necessary' basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose **intravenous infusion 20%** may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Glucose intravenous infusion 50% is not recommended because of the higher risk of extravasation injury and because administration is difficult. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

See also, emergency management of hypoglycaemia in dental practice for further advice.

**Chronic hypoglycaemia**

Diazoxide p. 681, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from

excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

## GLYCOGENOLYTIC HORMONES

### Glucagon

#### ● INDICATIONS AND DOSE

##### Insulin-induced hypoglycaemia

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1 month–1 year: 500 micrograms
- ▶ Child 2–17 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given
- ▶ Child 2–17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given
- ▶ Adult: 1 mg, if no response within 10 minutes intravenous glucose must be given

##### Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour
- ▶ Adult: 2–10 mg, to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

##### Diagnostic aid

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: (consult product literature)

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 unit of glucagon = 1 mg of glucagon.

- **UNLICENSED USE** Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed.

- **CONTRA-INDICATIONS** Pheochromocytoma

- **CAUTIONS** Glucagonoma - ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency - insulinoma

- **INTERACTIONS** → Appendix 1: glucagon

#### ● SIDE-EFFECTS

- ▶ **Rare** Hypersensitivity reactions
- ▶ **Frequency not known** Abdominal pain (in adults) · diarrhoea (in children) · hypokalaemia · hypotension (in adults) · nausea · vomiting

#### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in children When administered by *continuous intravenous infusion*, do not add to infusion fluids containing calcium—precipitation may occur.

#### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Glucagon for hypoglycaemia [www.medicinesforchildren.org.uk/glucagon-for-hypoglycaemia](http://www.medicinesforchildren.org.uk/glucagon-for-hypoglycaemia)

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription-only medicine restriction does not apply where administration is for saving life in emergency.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder and solvent for solution for injection

- ▶ **Glucagen Hypokit** (Novo Nordisk Ltd)  
**Glucagon hydrochloride 1 mg** Glucagen Hypokit 1mg powder and solvent for solution for injection | 1 vial **[PoM]** £11.52 DT price = £11.52

## 3.2a Chronic hypoglycaemia

### THIAZIDE DERIVATIVES

#### Diazoxide

#### ● INDICATIONS AND DOSE

##### Chronic intractable hypoglycaemia

- ▶ BY MOUTH
- ▶ Adult: Initially 5 mg/kg daily in 2–3 divided doses, adjusted according to response; maintenance 3–8 mg/kg daily in 2–3 divided doses

- **CAUTIONS** Aortic coarctation · aortic stenosis · arteriovenous shunt · heart failure · hyperuricaemia · impaired cardiac circulation · impaired cerebral circulation

- **INTERACTIONS** → Appendix 1: diazoxide

- **SIDE-EFFECTS** Taste disturbance · abdominal pain · anaemia · anorexia (prolonged use) · bleeding · constipation · decreased libido · dermatitis · diarrhoea · dizziness · dyspnoea · eosinophilia · extrapyramidal effects · galactorrhoea · headache · heart failure · hyperglycaemia · hyperosmolar non-ketotic coma · hypertrichosis · hyperuricaemia (prolonged use) · hypotension · ileus · lacrimation · leucopenia · lichenoid eruption · musculoskeletal pain · nausea · pancreatitis · pruritus · pulmonary hypertension · raised serum creatinine · raised serum urea · reversible nephritic syndrome · sodium and fluid retention · thrombocytopenia · tinnitus · transient cataracts · visual disturbances · vomiting

- **PREGNANCY** Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Dose reduction may be required.

#### ● MONITORING REQUIREMENTS

- ▶ Monitor blood pressure.
- ▶ Monitor white cell and platelet count during prolonged use.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

##### Tablet

- ▶ **Eudemine** (Focus Pharmaceuticals Ltd)  
**Diazoxide 50 mg** Eudemine 50mg tablets | 100 tablet **[PoM]** £46.45

##### Capsule

- ▶ **Diazoxide (Non-proprietary)**  
**Diazoxide 25 mg** Proglycem 25 capsules | 100 capsule **[PoM]** no price available

## 4 Disorders of bone metabolism

### Bone metabolism

#### Osteoporosis

Osteoporosis occurs most commonly in postmenopausal women and in those taking long-term oral corticosteroids (glucocorticosteroids). Other risk factors for osteoporosis include low body weight, cigarette smoking, excess alcohol intake, lack of physical activity, family history of osteoporosis, and early menopause.

Those at risk of osteoporosis should maintain an adequate intake of **calcium and vitamin D** and any deficiency should be corrected by increasing dietary intake or taking supplements.

Elderly patients, especially those who are housebound or live in residential or nursing homes, are at increased risk of calcium and vitamin D deficiency and may benefit from supplements. Reversible secondary causes of osteoporosis such as hyperthyroidism, hyperparathyroidism, osteomalacia or hypogonadism should be excluded, in both men and women, before treatment for osteoporosis is initiated.

Also see: calcium, phosphorus, vitamin D and oestrogens in postmenopausal osteoporosis.

#### Postmenopausal osteoporosis

The **bisphosphonates** (alendronic acid and risedronate) are effective for preventing postmenopausal osteoporosis.

**Hormone replacement therapy (HRT)** is an option where other therapies are contra-indicated, cannot be tolerated, or if there is a lack of response. The CSM has advised that HRT should **not** be considered first-line therapy for long-term prevention of osteoporosis in women over 50 years of age. HRT is of most benefit for the prophylaxis of postmenopausal osteoporosis if started early in menopause and continued for up to 5 years, but bone loss resumes (possibly at an accelerated rate) on stopping HRT. Women of Afro-Caribbean origin appear to be less susceptible to osteoporosis than those who are white or of Asian origin.

Postmenopausal osteoporosis may be treated with a **bisphosphonate**. The bisphosphonates (such as alendronate and risedronate) decrease the risk of vertebral fracture; alendronate and risedronate have also been shown to reduce non-vertebral fractures. If bisphosphonates are unsuitable calcitriol p. 992 or **strontium ranelate** may be considered. Calcitonin (salmon) p. 689 is no longer recommended for the treatment of postmenopausal osteoporosis as the benefits are outweighed by the risk of malignancy associated with long-term use. Calcitonin (salmon) [unlicensed indication] has been used for pain relief for up to 3 months after a vertebral fracture when other analgesics were ineffective, but the benefits of treatment should be balanced against the risks. **Teriparatide** has been introduced for the treatment of postmenopausal osteoporosis.

Raloxifene hydrochloride p. 709 is licensed for the *prophylaxis and treatment* of vertebral fractures in postmenopausal women.

#### Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible. The risk of osteoporosis may be related to cumulative dose of corticosteroids; even intermittent courses can therefore increase the risk. The greatest rate of bone loss occurs during the first 6–12 months of corticosteroid use and so early steps to prevent the development of osteoporosis are important. Long-term use of high-dose inhaled corticosteroids may also contribute to corticosteroid-induced osteoporosis.

Patients taking (or who are likely to take) an oral corticosteroid for 3 months or longer should be assessed and where necessary given prophylactic treatment; those aged over 65 years are at greater risk. Patients taking oral corticosteroids who have sustained a low trauma fracture should receive treatment for osteoporosis. The therapeutic options for *prophylaxis and treatment* of corticosteroid-induced osteoporosis are the same:

- a bisphosphonate;
- calcitriol [unlicensed indication];
- hormone replacement (HRT in women, testosterone in men [unlicensed indication]).

#### Calcitonin and parathyroid hormone

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. Calcitonin (salmon) (synthetic or recombinant salmon calcitonin) is used to lower the plasma-calcium concentration in patients with hypercalcaemia associated with malignancy.

Calcitonin (salmon) is also licensed for treatment of Paget's disease of bone when other treatments are ineffective or inappropriate; it is also licensed for the prevention of acute bone loss due to sudden immobility. Calcitonin (salmon) is no longer recommended for the prevention or treatment of postmenopausal osteoporosis because the benefits are outweighed by the risk of malignancy associated with long-term use.

Teriparatide p. 690 (a recombinant fragment of parathyroid hormone) is used for the treatment of postmenopausal osteoporosis, osteoporosis in men at increased risk of fracture, and corticosteroid-induced osteoporosis.

Cinacalcet p. 957 is licensed for the treatment of hypercalcaemia in parathyroid carcinoma.

#### Bisphosphonates

Bisphosphonates have an important role in the prophylaxis and treatment of osteoporosis and corticosteroid-induced osteoporosis; alendronic acid p. 683 or risedronate sodium p. 686 are considered the drugs of choice for these conditions. There is no consistent evidence of any further benefit from continuing treatment with a bisphosphonate beyond 3 years in patients with osteoporosis. [\[EvGr\]](#) Discuss (with patients) the discontinuation of bisphosphonates for osteoporosis after 3 years' treatment, giving consideration to the patient's fracture risk and life expectancy. [▶](#)

Bisphosphonates are also used in the treatment of *Paget's disease*, hypercalcaemia of malignancy, and in bone metastases in breast cancer.

#### Strontium ranelate

Strontium ranelate treatment has been associated with an increased risk of serious cardiovascular disease, including myocardial infarction, and the risk should be assessed before treatment and regularly during treatment. Strontium ranelate should be initiated only by specialists for the treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated.

### ANABOLIC STEROIDS

#### Nandrolone

##### • INDICATIONS AND DOSE

**Osteoporosis in postmenopausal women (but not recommended)**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Adult (female): 50 mg every 3 weeks.

- **CONTRA-INDICATIONS** Acute porphyrias p. 969 · male breast cancer · prostate cancer
- **CAUTIONS** Cardiac impairment · diabetes mellitus · epilepsy · hypertension · migraine · skeletal metastases (risk of hypercalcaemia)
- **INTERACTIONS** → Appendix 1: nandrolone
- **SIDE-EFFECTS** Abnormal liver-function tests (with high doses) · acne · amenorrhoea · inhibition of spermatogenesis · liver tumours (with prolonged treatment with anabolic steroids) · premature epiphyseal closure · sodium retention with oedema · virilisation (with high doses including voice changes—sometimes irreversible)

- **HEPATIC IMPAIRMENT** Use in severe hepatic impairment only if benefit outweighs risk.
- **RENAL IMPAIRMENT** Use with caution—may cause sodium and water retention.
- **MONITORING REQUIREMENTS** Monitor skeletal maturation in young patients.
- **LESS SUITABLE FOR PRESCRIBING** Nandrolone injection is less suitable for prescribing.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPIENTS: May contain Arachis (peanut) oil, benzyl alcohol

► **Deca-Durabolin** (Aspen Pharma Trading Ltd)

**Nandrolone decanoate 50 mg per 1 ml** Deca-Durabolin 50mg/1ml solution for injection ampoules | 1 ampoule (PoM) £3.17 (CD4-2)

## BISPHOSPHONATES

### Bisphosphonates

- **DRUG ACTION** Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)**

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

**MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE JAW (NOVEMBER 2009) AND INTRAVENOUS BISPHOSPHONATES: OSTEONECROSIS OF THE JAW—FURTHER MEASURES TO MINIMISE RISK (JULY 2015)**

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure

their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.

Guidance for dentists in primary care is included in *Oral Health Management of Patients Prescribed Bisphosphonates: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, April 2011 (available at [www.sdcep.org.uk](http://www.sdcep.org.uk)).

**MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (DECEMBER 2015)**

Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cotton-bud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

#### PATIENT AND CARER ADVICE

**Atypical femoral fractures** Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

**Osteonecrosis of the jaw** During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms. **Osteonecrosis of the external auditory canal** Patients should be advised to report any ear pain, discharge from ear or an ear infection during treatment with a bisphosphonate.

above

## Alendronic acid (Alendronate)

14-Dec-2016

#### INDICATIONS AND DOSE

##### Treatment of postmenopausal osteoporosis

- BY MOUTH
- Adult (female): 10 mg daily, alternatively 70 mg once weekly.

##### Treatment of osteoporosis in men

- BY MOUTH
- Adult (male): 10 mg daily.

##### Prevention and treatment of corticosteroid-induced osteoporosis in postmenopausal women not receiving hormone replacement therapy

- BY MOUTH
- Adult (female): 10 mg daily.

- **CONTRA-INDICATIONS** Abnormalities of oesophagus · hypocalcaemia · other factors which delay emptying (e.g. stricture or achalasia)
- **CAUTIONS** Active gastro-intestinal bleeding · atypical femoral fractures · duodenitis · dysphagia · exclude other causes of osteoporosis · gastritis · history (within 1 year) of ulcers · surgery of the upper gastro-intestinal tract · symptomatic oesophageal disease · ulcers · upper gastro-intestinal disorders
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal distension · abdominal pain · constipation · diarrhoea · dyspepsia ·

flatulence · headache · oesophageal reactions · regurgitation

- ▶ **Uncommon** Episcleritis · erythema · gastritis · nausea · rash · scleritis · uveitis · vomiting
- ▶ **Rare** Atypical femoral fractures with long-term use · hypocalcaemia · osteonecrosis of the jaw · photosensitivity · severe skin reactions · Stevens-Johnson syndrome · toxic epidermal necrolysis · upper gastro-intestinal ulcers
- ▶ **Very rare** Osteonecrosis of the external auditory canal
- ▶ **Frequency not known** Musculoskeletal pain

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Oesophageal reactions** Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Avoid if eGFR less than 35 mL/minute/1.73 m<sup>2</sup>.

- **MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.

- **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution. Oesophageal reactions Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

#### NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160

Alendronate is recommended as a treatment option for the primary prevention of osteoporotic fractures in the following susceptible postmenopausal women:

- Women over 70 years who have an independent risk factor for fracture (parental history of hip fracture, alcohol intake of 4 or more units per day, or rheumatoid arthritis) or an indicator of low bone mineral density (body mass index under 22 kg/m<sup>2</sup>, ankylosing spondylitis, Crohn's disease, prolonged immobility, untreated premature menopause, or rheumatoid arthritis) and confirmed osteoporosis.
- Women aged 65–69 years who have an independent risk factor for fracture and confirmed osteoporosis.
- Women under 65 years who have an independent risk factor for fracture and at least one additional indicator of low bone mineral density and confirmed osteoporosis.

[www.nice.org.uk/TA160](http://www.nice.org.uk/TA160)

- ▶ Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of

#### osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

Alendronate is recommended as a treatment option for the secondary prevention of osteoporotic fractures in susceptible postmenopausal women.

[www.nice.org.uk/TA161](http://www.nice.org.uk/TA161)

#### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (April 2016) that alendronic acid (Binosto®) is accepted for restricted use within NHS Scotland for the treatment of postmenopausal osteoporosis where alendronic acid is the appropriate treatment choice, but the patient is unable to swallow tablets.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

##### Oral solution

##### ▶ Alendronic acid (Non-proprietary)

Alendronic acid 700 microgram per 1 mL Alendronic acid 70mg/100mL oral solution unit dose sugar free sugar-free | 4 unit dose [PoM] £27.36 DT price = £27.36

##### Effervescent tablet

##### ▶ Binosto (Internis Pharmaceuticals Ltd)

Alendronic acid (as Alendronate sodium) 70 mg Binosto 70mg effervescent tablets sugar-free | 4 tablet [PoM] £22.80 DT price = £22.80

##### Tablet

##### ▶ Alendronic acid (Non-proprietary)

Alendronic acid (as Alendronate sodium) 10 mg Alendronic acid 10mg tablets | 28 tablet [PoM] £3.25 DT price = £1.83

Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg tablets | 4 tablet [PoM] £22.80 DT price = £0.74

##### ▶ Fosamax (Merck Sharp & Dohme Ltd)

Alendronic acid (as Alendronate sodium) 10 mg Fosamax 10mg tablets | 28 tablet [PoM] £23.12 DT price = £1.83

Alendronic acid (as Alendronate sodium) 70 mg Fosamax Once Weekly 70mg tablets | 4 tablet [PoM] £22.80 DT price = £0.74

## Alendronic acid with colecalciferol

The properties listed below are those particular to the combination only. For the properties of the components please consider, alendronic acid p. 683, colecalciferol p. 992.

#### INDICATIONS AND DOSE

##### Treatment of postmenopausal osteoporosis in women at risk of vitamin D deficiency

- ▶ BY MOUTH
- ▶ Adult (female): 1 tablet once weekly.

- **INTERACTIONS** → Appendix 1: bisphosphonates, vitamin D substances

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer alendronic acid with colecalciferol tablets.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Tablet

- Fosavance** (Merck Sharp & Dohme Ltd)  
**Colecalciferol 70 microgram, Alendronic acid (as Alendronate sodium) 70 mg** Fosavance tablets | 4 tablet [PoM] £22.80 DT price = £22.80

## Ibandronic acid

### INDICATIONS AND DOSE

#### Reduction of bone damage in bone metastases in breast cancer

- INITIALLY BY MOUTH
- Adult: 50 mg daily, alternatively (by intravenous infusion) 6 mg every 3–4 weeks

#### Hypercalcaemia of malignancy

- BY INTRAVENOUS INFUSION
- Adult: 2–4 mg as a single infusion, dose to be adjusted according to serum calcium concentration

#### Treatment of postmenopausal osteoporosis

- INITIALLY BY MOUTH
- Adult (female): 150 mg once a month, alternatively (by intravenous injection) 3 mg every 3 months, to be administered over 15–30 seconds.

## CONTRA-INDICATIONS

### GENERAL CONTRA-INDICATIONS

Hypocalcaemia

### SPECIFIC CONTRA-INDICATIONS

- With oral use Abnormalities of the oesophagus · other factors which delay emptying (e.g. stricture or achalasia)

- CAUTIONS** Atypical femoral fractures · cardiac disease (avoid fluid overload)

- INTERACTIONS** → Appendix 1: bisphosphonates

### SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- Common or very common** Abdominal pain · asthenia · bone pain · chills · diarrhoea · dyspepsia · fever · gastritis · headache · hypocalcaemia · hypophosphataemia · influenza-like symptoms · muscle pain · nausea · pharyngitis · rash · vomiting
- Rare** Anaemia · angioedema · atypical femoral fractures · bronchospasm · hypersensitivity reactions · injection-site reactions · pruritus · urticaria
- Very rare** Osteonecrosis of the external auditory canal · osteonecrosis of the jaw

#### SPECIFIC SIDE-EFFECTS

- Common or very common**
- With oral use Severe oesophageal reactions (discontinue)

- PREGNANCY** Avoid.

- BREAST FEEDING** Avoid—present in milk in *animal* studies.

### RENAL IMPAIRMENT

- With intravenous use When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m<sup>2</sup> reduce dose to 4 mg and infuse over 1 hour; if eGFR less than 30 mL/minute/1.73 m<sup>2</sup> reduce dose to 2 mg and infuse over 1 hour.
- With oral use When used for bone metastases, if eGFR 30–50 mL/minute/1.73 m<sup>2</sup> reduce dose to 50 mg on alternative days; if eGFR less than 30 mL/minute/1.73 m<sup>2</sup> reduce dose to 50 mg once weekly. When used for postmenopausal osteoporosis, avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- MONITORING REQUIREMENTS** Monitor renal function and serum calcium, phosphate and magnesium.

- DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least

30 minutes (for most ibandronic acid tablets, 50 mg) or 1 hour (for *Bonviva*® tablets, 150 mg) before first food or drink (other than water) of the day, or another oral medicine; patient should stand or sit upright for at least 1 hour after taking tablet.

For *intravenous infusion* (*Bondronat*®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose in 500 mL infusion fluid and give over 1–2 hours.

- PATIENT AND CARER ADVICE** A patient reminder card should be provided to patients receiving intravenous ibandronic acid (risk of osteonecrosis of the jaw).

Patients or carers should be given advice on how to administer ibandronic acid tablets.

Oesophageal reactions Patients and carers should be advised to stop tablets and seek medical attention for symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

#### Ibandronic acid (Non-proprietary)

**Ibandronic acid (as Ibandronic sodium monohydrate) 1 mg per 1 mL** Ibandronic acid 3mg/3mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £65.20–£68.64

#### Bonviva (Roche Products Ltd)

**Ibandronic acid (as Ibandronic sodium monohydrate) 1 mg per 1 mL** Bonviva 3mg/3mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £68.64

### Solution for infusion

#### Ibandronic acid (Non-proprietary)

**Ibandronic acid (as Ibandronic sodium monohydrate) 1 mg per 1 mL** Ibandronic acid 2mg/2mL solution for infusion vials | 1 vial [PoM] £89.36 (Hospital only)

**Ibandronic acid 6mg/6mL solution for infusion vials** | 1 vial [PoM] £183.68 (Hospital only) | 1 vial [PoM] £165.32

#### Bondronat (Roche Products Ltd)

**Ibandronic acid (as Ibandronic sodium monohydrate) 1 mg per 1 mL** Bondronat 2mg/2mL concentrate for solution for infusion vials | 1 vial [PoM] £89.36 (Hospital only)  
**Bondronat 6mg/6mL concentrate for solution for infusion vials** | 1 vial [PoM] £183.69

### Tablet

#### Ibandronic acid (Non-proprietary)

**Ibandronic acid (as Ibandronic sodium monohydrate)**

**50 mg** Ibandronic acid 50mg tablets | 28 tablet [PoM] £174.51 DT price = £6.13

**Ibandronic acid (as Ibandronic sodium monohydrate)**

**150 mg** Ibandronic acid 150mg tablets | 1 tablet [PoM] £17.48 DT price = £1.13 | 3 tablet [PoM] £52.44

#### Bondronat (Roche Products Ltd)

**Ibandronic acid (as Ibandronic sodium monohydrate)**

**50 mg** Bondronat 50mg tablets | 28 tablet [PoM] £183.69 DT price = £6.13

#### Bonviva (Roche Products Ltd)

**Ibandronic acid (as Ibandronic sodium monohydrate)**

**150 mg** Bonviva 150mg tablets | 1 tablet [PoM] £18.40 DT price = £1.13

#### Iasibon (Aspire Pharma Ltd)

**Ibandronic acid (as Ibandronic sodium monohydrate)**

**50 mg** Iasibon 50mg tablets | 28 tablet [PoM] £174.50 DT price = £6.13

#### Quodixor (Aspire Pharma Ltd)

**Ibandronic acid (as Ibandronic sodium monohydrate)**

**150 mg** Quodixor 150mg tablets | 1 tablet [PoM] £18.40 DT price = £1.13

## Pamidronate disodium

(Formerly called  
aminohydroxypropylidenediphosphonate  
disodium (APD))

### ● INDICATIONS AND DOSE

#### Hypercalcaemia of malignancy

- BY INTRAVENOUS INFUSION
- Adult: 15–60 mg, to be given (via cannula in a relatively large vein) as a single infusion or in divided doses over 2–4 days, dose adjusted according to serum calcium concentration; maximum 90 mg per course

#### Osteolytic lesions and bone pain in bone metastases associated with breast cancer or multiple myeloma

- BY INTRAVENOUS INFUSION
- Adult: 90 mg every 4 weeks, to be administered via cannula in a relatively large vein, dose may alternatively be administered every 3 weeks, to coincide with chemotherapy in breast cancer

#### Paget's disease of bone

- BY INTRAVENOUS INFUSION
- Adult: 30 mg every week for a 6 week course (total dose 180 mg), alternatively initially 30 mg once weekly for 1 week, then increased to 60 mg every 2 weeks (max. per dose 60 mg) for a 6 week course (total dose 210 mg), to be administered via cannula in a relatively large vein, course may be repeated every 6 months; maximum 360 mg per course

- **CAUTIONS** Atypical femoral fractures · cardiac disease (especially in elderly) · ensure adequate hydration · previous thyroid surgery (risk of hypocalcaemia)

- **INTERACTIONS** → Appendix 1: bisphosphonates

### ● SIDE-EFFECTS

- **Common or very common** Abdominal pain · anaemia · anorexia · arthralgia · bone pain · constipation · diarrhoea · drowsiness · fever · headache · hypertension · hypomagnesaemia · hypophosphataemia · influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushes) · insomnia · lymphocytopenia · myalgia · nausea · paraesthesia · rash · symptomatic hypocalcaemia · tetany · thrombocytopenia · vomiting
- **Rare** Acute renal failure · agitation · atypical femoral fractures · confusion · conjunctivitis · deterioration of renal disease · dizziness · dyspepsia · haematuria · hallucinations · hyperkalaemia · hypernatraemia · hypokalaemia · hypotension · isolated cases of seizures · lethargy · leucopenia · muscle cramps · osteonecrosis of the jaw · other ocular symptoms · pruritus
- **Very rare** Osteonecrosis of the external auditory canal
- **Frequency not known** Atrial fibrillation · injection-site reactions · reactivation of herpes simplex · reactivation of herpes zoster

### SIDE-EFFECTS, FURTHER INFORMATION

- Calcium and vitamin D supplements Oral supplements are advised to minimise potential risk of hypocalcaemia for those with mainly lytic bone metastases or multiple myeloma at risk of calcium or vitamin D deficiency (e.g. through malabsorption or lack of exposure to sunlight) and in those with Paget's disease.
- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—no information available.
- **RENAL IMPAIRMENT** Max. infusion rate 20 mg/hour. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>, except in life-threatening hypercalcaemia if benefit outweighs risk. If renal function deteriorates in patients with bone

metastases, withhold dose until serum creatinine returns to within 10% of baseline value.

### ● MONITORING REQUIREMENTS

- Monitor serum electrolytes, calcium and phosphate—possibility of convulsions due to electrolyte changes.
- Assess renal function before each dose.

- **DIRECTIONS FOR ADMINISTRATION** For slow intravenous infusion (*Aredia*®; *Pamidronate disodium*, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For *Aredia*®, reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL. For *Pamidronate disodium* (Medac, Hospira, Wockhardt) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.

- **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw).

### Driving and skilled tasks

Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

##### ► *Pamidronate disodium (Non-proprietary)*

**Pamidronate disodium 3 mg per 1 mL** Pamidronate disodium 15mg/5mL solution for infusion vials | 1 vial [PoM] £27.50 (Hospital only) | 5 vial [PoM] £149.15

Pamidronate disodium 30mg/10mL solution for infusion vials | 1

vial [PoM] £55.00 (Hospital only) | 1 vial [PoM] £59.66

Pamidronate disodium 60mg/20mL solution for infusion vials | 1

vial [PoM] £110.00 (Hospital only)

Pamidronate disodium 90mg/30mL solution for infusion vials | 1

vial [PoM] £165.00 (Hospital only)

**Pamidronate disodium 9 mg per 1 mL** Pamidronate disodium

90mg/10mL solution for infusion vials | 1 vial [PoM] £170.45

**Pamidronate disodium 15 mg per 1 mL** Pamidronate disodium

60mg/4mL solution for infusion ampoules | 1 ampoule [PoM] £119.32

Pamidronate disodium 15mg/1mL solution for infusion ampoules | 4

ampoule [PoM] £119.32

Pamidronate disodium 90mg/6mL solution for infusion ampoules | 1

ampoule [PoM] £170.46

Pamidronate disodium 30mg/2mL solution for infusion ampoules | 2

ampoule [PoM] £119.32

## Risedronate sodium

### ● INDICATIONS AND DOSE

#### Paget's disease of bone

- BY MOUTH
- Adult: 30 mg daily for 2 months, course may be repeated if necessary after at least 2 months

#### Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures

- BY MOUTH
- Adult (female): 5 mg daily, alternatively 35 mg once weekly.

#### Prevention of osteoporosis (including corticosteroid-induced osteoporosis) in postmenopausal women

- BY MOUTH
- Adult (female): 5 mg daily.

#### Treatment of osteoporosis in men at high risk of fractures

- BY MOUTH
- Adult (male): 35 mg once weekly.

- **CONTRA-INDICATIONS** Hypocalcaemia

- **CAUTIONS** Atypical femoral fractures · oesophageal abnormalities · other factors which delay transit or emptying (e.g. stricture or achalasia)

● **INTERACTIONS** → Appendix 1: bisphosphonates

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · constipation · diarrhoea · dyspepsia · headache · musculoskeletal pain · nausea
- ▶ **Uncommon** Duodenitis · dysphagia · gastritis · oesophageal ulcer · oesophagitis · uveitis
- ▶ **Rare** Atypical femoral fractures · glossitis · oesophageal stricture
- ▶ **Very rare** Osteonecrosis of the external auditory canal
- ▶ **Frequency not known** Cutaneous vasculitis · gastroduodenal ulceration · hair loss · hepatic disorders · osteonecrosis of the jaw · Stevens-Johnson syndrome · toxic epidermal necrolysis

● **PREGNANCY** Avoid.

● **BREAST FEEDING** Avoid.

● **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

● **MONITORING REQUIREMENTS**

- ▶ Correct hypocalcaemia before starting.
- ▶ Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.

● **DIRECTIONS FOR ADMINISTRATION** Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day or, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer risedronate sodium tablets.

Oesophageal reactions Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- ▶ Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160

**Risedronate** is recommended as an alternative for women:

- in whom alendronate is contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

[www.nice.org.uk/TA160](http://www.nice.org.uk/TA160)

- ▶ Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161
- This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

**Risedronate** is recommended as an alternative for women:

- in whom alendronate is contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture (parental history of hip fracture,

alcohol intake of 4 or more units per day, or rheumatoid arthritis, as indicated in the full NICE guidance.

[www.nice.org.uk/TA161](http://www.nice.org.uk/TA161)

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

▶ **Risedronate sodium (Non-proprietary)**

**Risedronate sodium 5 mg** Risedronate sodium 5mg tablets | 28 tablet **[PoM]** £24.78 DT price = £18.85

**Risedronate sodium 30 mg** Risedronate sodium 30mg tablets | 28 tablet **[PoM]** £143.95 DT price = £143.83

**Risedronate sodium 35 mg** Risedronate sodium 35mg tablets | 4 tablet **[PoM]** £19.12 DT price = £0.85

▶ **Actonel** (Warner Chilcott UK Ltd, Teva UK Ltd)

**Risedronate sodium 5 mg** Actonel 5mg tablets | 28 tablet **[PoM]** £17.99 DT price = £18.85

**Risedronate sodium 30 mg** Actonel 30mg tablets | 28 tablet **[PoM]** £143.95 DT price = £143.83

**Risedronate sodium 35 mg** Actonel Once a Week 35mg tablets | 4 tablet **[PoM]** £19.12 DT price = £0.85

Actonel 35mg tablets | 4 tablet **[PoM]** no price available DT price = £0.85

## Risedronate with calcium carbonate and colecalciferol

The properties listed below are those particular to the combination only. For the properties of the components please consider, risedronate sodium p. 686, calcium carbonate p. 958, colecalciferol p. 992.

● **INDICATIONS AND DOSE**

**Treatment of postmenopausal osteoporosis to reduce risk of vertebral or hip fractures**

▶ **BY MOUTH**

- ▶ **Adult:** 1 tablet once weekly on day 1 of the weekly cycle, followed by 1 sachet daily on days 2–6 of the weekly cycle

● **INTERACTIONS** → Appendix 1: bisphosphonates, calcium salts, vitamin D substances

● **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole with plenty of water while sitting or standing; to be taken on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after taking tablet. Granules should be stirred into a glass of water and after dissolution complete taken immediately.

● **PRESCRIBING AND DISPENSING INFORMATION** *Actonel Combi*® effervescent granules contain calcium carbonate 2.5 g (calcium 1 g or Ca<sup>2+</sup> 25 mmol) and colecalciferol 22 micrograms (880 units)/sachet.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer calcium carbonate with colecalciferol and risedronate tablets and granules.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet/Granules**

▶ **Actonel Combi** (Teva UK Ltd)

Actonel Combi 35mg tablets and 1000mg/880unit effervescent granules sachets | 4 week supply **[PoM]** £19.12

## Sodium clodronate

### ● INDICATIONS AND DOSE

**Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma**

- BY MOUTH
- Adult: 1.6 g daily in 1–2 divided doses, then increased if necessary up to 3.2 g daily in 2 divided doses

### LORON 520®

**Osteolytic lesions, hypercalcaemia and bone pain associated with skeletal metastases in patients with breast cancer or multiple myeloma**

- BY MOUTH
- Adult: Initially 2 tablets daily in 1–2 divided doses, increased if necessary up to 4 tablets daily

- **CONTRA-INDICATIONS** Acute gastro-intestinal inflammatory conditions
- **CAUTIONS** Atypical femoral fractures · maintain adequate fluid intake during treatment
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
  - **Common or very common** Bronchospasm · diarrhoea · nausea · skin reactions · vomiting
  - **Rare** Atypical femoral fractures
  - **Very rare** Osteonecrosis of the external auditory canal · osteonecrosis of the jaw
- **Frequency not known** Renal impairment · uveitis
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Max. initial dose 1200 mg daily if eGFR 30–50 mL/minute/1.73m<sup>2</sup>. Use half normal dose if eGFR 10–30 mL/minute/1.73m<sup>2</sup>. Avoid if eGFR less than 10 mL/minute/1.73m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Monitor renal function, serum calcium and serum phosphate before and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium clodronate capsules and tablets.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### CAUTIONARY AND ADVISORY LABELS 10

##### ► Sodium clodronate (Non-proprietary)

**Sodium clodronate 800 mg** Sodium clodronate 800mg tablets | 60 capsule [PoM] £116.72 DT price = £146.43

## Zoledronic acid

### ● INDICATIONS AND DOSE

#### ACLASTA®

**Treatment of Paget's disease of bone**

##### ► BY INTRAVENOUS INFUSION

- Adult: 5 mg as a single dose, to be administered over at least 15 minutes, at least 500 mg elemental calcium twice daily (with vitamin D) for at least 10 days is recommended following infusion

**Treatment of postmenopausal osteoporosis and osteoporosis in men (including corticosteroid-induced osteoporosis)**

##### ► BY INTRAVENOUS INFUSION

- Adult: 5 mg once yearly as a single dose, to be administered over at least 15 minutes, in patients with a recent low-trauma hip fracture, the dose should be given 2 or more weeks following hip fracture repair; before first infusion give 50000–125000 units of vitamin D

#### ZOMETA® INFUSION

**Reduction of bone damage in advanced malignancies involving bone**

##### ► BY INTRAVENOUS INFUSION

- Adult: 4 mg every 3–4 weeks, to be administered over at least 15 minutes, calcium 500 mg daily and vitamin D 400 units daily should also be taken

**Hypercalcaemia of malignancy**

##### ► BY INTRAVENOUS INFUSION

- Adult: 4 mg for 1 dose, to be administered over at least 15 minutes

- **CAUTIONS** Atypical femoral fractures · cardiac disease (avoid fluid overload) · concomitant medicines that affect renal function
- **INTERACTIONS** → Appendix 1: bisphosphonates
- **SIDE-EFFECTS**
  - **Common or very common** Anaemia · arthralgia · atrial fibrillation · bone pain · conjunctivitis · dizziness · fever · gastro-intestinal disturbances · headache · hypophosphataemia · influenza-like symptoms · myalgia · renal impairment · rigors
  - **Uncommon** Angioedema · anorexia · anxiety · asthenia · blurred vision · chest pain · cough · dry mouth · dyspnoea · haematuria · hypersensitivity reactions · hypertension · hypokalaemia · hypomagnesaemia · hypotension · injection-site reactions · lethargy · leucopenia · muscle cramps · paraesthesia · peripheral oedema · proteinuria · pruritus · rash · sleep disturbance · stomatitis · sweating · taste disturbance · thrombocytopenia · tremor · urinary frequency · weight gain
  - **Rare** Acute renal failure · atypical femoral fractures · bradycardia · confusion · hyperkalaemia · hypernatraemia · osteonecrosis of the jaw · pancytopenia
  - **Very rare** Episcleritis · osteonecrosis of the external auditory canal · uveitis
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Renal function Renal impairment and renal failure have been reported; ensure patient is hydrated before each dose and assess renal function.
- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.
- **PREGNANCY** Avoid—toxicity in animal studies.

- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—limited information available.
- **RENAL IMPAIRMENT** In advanced malignancies involving bone, if eGFR 50–60 mL/minute/1.73 m<sup>2</sup> reduce dose to 3.5 mg every 3–4 weeks; if eGFR 40–50 mL/minute/1.73 m<sup>2</sup> reduce dose to 3.3 mg every 3–4 weeks; if eGFR 30–40 mL/minute/1.73 m<sup>2</sup> reduce dose to 3 mg every 3–4 weeks; if renal function deteriorates in patients with bone metastases, withhold dose until serum creatinine returns to within 10% of baseline value. Avoid in tumour-induced hypercalcaemia if serum creatinine above 400 micromol/litre. Avoid in advanced malignancies involving bone if eGFR less than 30 mL/minute/1.73 m<sup>2</sup> (or if serum creatinine greater than 265 micromol/litre).  
Avoid in Paget's disease, treatment of postmenopausal osteoporosis and osteoporosis in men if eGFR less than 35 mL/minute/1.73 m<sup>2</sup>.

#### ● MONITORING REQUIREMENTS

- ▶ Correct disturbances of calcium metabolism (e.g. vitamin D deficiency, hypocalcaemia) before starting. Monitor serum electrolytes, calcium, phosphate and magnesium.
- ▶ Monitor renal function in patients at risk, such as those with pre-existing renal impairment, those of advanced age, those taking concomitant nephrotoxic drugs or diuretics, or those who are dehydrated.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Zometa®), give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute requisite dose according to product literature; infuse over at least 15 minutes; administer as a single intravenous solution in a separate infusion line.

- **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw).

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### ZOMETA® INFUSION

##### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (May 2003) that for the prevention of skeletal related events Zometa® is accepted for restricted use within NHS Scotland for the treatment of patients with breast cancer and multiple myeloma if prescribed by an oncologist.

##### ACLASTA®

##### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2008) that in postmenopausal women Aclasta® is accepted for restricted use within the NHS Scotland for the treatment of osteoporosis in those for whom oral treatment options for osteoporosis are inappropriate and when initiated by a specialist.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

- ▶ **Zometa** (Novartis Pharmaceuticals UK Ltd)  
Zoledronic acid (as Zoledronic acid monohydrate)  
800 microgram per 1 mL Zometa 4mg/5mL solution for infusion vials | 1 vial [PoM] £174.14

##### Infusion

- ▶ **Aclasta** (Novartis Pharmaceuticals UK Ltd)  
Zoledronic acid (as Zoledronic acid monohydrate) 50 microgram per 1 mL Aclasta 5mg/100mL infusion bottles | 1 bottle [PoM] £253.38
- ▶ **Zometa** (Novartis Pharmaceuticals UK Ltd)  
Zoledronic acid (as Zoledronic acid monohydrate) 40 microgram per 1 mL Zometa 4mg/100mL infusion bottles | 1 bottle [PoM] £174.14

## CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

### Calcitonin (salmon)

#### (Salcatonin)

#### ● INDICATIONS AND DOSE

##### Hypercalcaemia of malignancy

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 100 units every 6–8 hours (max. per dose 400 units every 6–8 hours), adjusted according to response
- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Up to 10 units/kg, in severe or emergency cases, to be administered by slow intravenous infusion over at least 6 hours

##### Paget's disease of bone

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: 100 units daily, adjusted according to response for maximum 3 months (6 months in exceptional circumstances), a minimum dosage regimen of 50 units three times a week has been shown to achieve clinical and biochemical improvement

##### Prevention of acute bone loss due to sudden immobility

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Adult: Initially 100 units daily in 1–2 divided doses, then reduced to 50 units daily at the start of mobilisation, usual duration of treatment is 2 weeks; maximum 4 weeks

- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Heart failure · history of allergy (skin test advised) · risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)
- **INTERACTIONS** → Appendix 1: calcitonin (salmon)
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · fatigue · flushing · headache · malignancy (with long-term use) · musculoskeletal pain · nausea · taste disturbances · vomiting
  - ▶ **Uncommon** Cough · hypersensitivity reactions · hypertension · injection-site reactions · oedema · polyuria · pruritus · rash · visual disturbances
  - ▶ **Frequency not known** Tremor
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).
- **BREAST FEEDING** Avoid; inhibits lactation in animals.
- **RENAL IMPAIRMENT** Use with caution.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Miacalcin®), give intermittently in Sodium chloride 0.9%. Diluted solution given without delay. Dilute in 500 mL give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

  - ▶ **Calcitonin (salmon) (Non-proprietary)**  
Calcitonin (salmon) 50 units per 1 mL Calcitonin (salmon) 50units/1mL solution for injection ampoules | 5 ampoule [PoM] £167.50
  - Calcitonin (salmon) 100 unit per 1 mL Calcitonin (salmon) 100units/1mL solution for injection ampoules | 5 ampoule [PoM] £220.00
  - Calcitonin (salmon) 200 unit per 1 mL Calcitonin (salmon) 400units/2mL solution for injection vials | 1 vial [PoM] £352.00

## Strontium ranelate

- **DRUG ACTION** Stimulates bone formation and reduces bone resorption.

### ● INDICATIONS AND DOSE

**Treatment of severe osteoporosis in postmenopausal women or men at high risk of fracture for whom other treatments are contra-indicated or not tolerated (initiated under specialist supervision)**

#### ► BY MOUTH

- Adult: 2 g once daily, dose to be taken in water, preferably at bedtime

- **CONTRA-INDICATIONS** Cerebrovascular disease · current or previous venous thromboembolic event · ischaemic heart disease · peripheral arterial disease · temporary or prolonged immobilisation · uncontrolled hypertension
- **CAUTIONS** Predisposition to cardiovascular disease—assess risk before and every 6–12 months during treatment
- **INTERACTIONS** → Appendix 1: strontium ranelate
- **SIDE-EFFECTS**
  - **Common or very common** Dermatitis · diarrhoea · eczema · headache · myocardial infarction · nausea · venous thromboembolism
  - **Very rare** Angioedema · hypersensitivity reactions · pruritus · rash · urticaria
  - **Frequency not known** Abdominal pain · alopecia · bone marrow suppression · constipation · dyspepsia · flatulence · gastro-oesophageal reflux · peripheral oedema · stomatitis · vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

- **Severe allergic reactions** Severe allergic reactions, including drug rash with eosinophilia and systemic symptoms (DRESS), have been reported in patients taking strontium ranelate. DRESS starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal. Treatment with strontium ranelate should not be restarted.
- **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **EFFECT ON LABORATORY TESTS** Interferes with colorimetric measurements of calcium in blood and urine.
- **DIRECTIONS FOR ADMINISTRATION** Avoid food for 2 hours before and after taking granules, particularly calcium-containing products e.g. milk; also preferably avoid concomitant antacids containing aluminium and magnesium hydroxides for 2 hours after taking granules.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer strontium ranelate granules. Severe allergic reactions Patients should be advised to stop taking strontium ranelate and consult their doctor immediately if skin rash develops.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA160

Strontium ranelate is recommended as an alternative for women:

- in whom alendronate and risedronate are contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

[www.nice.org.uk/TA160](http://www.nice.org.uk/TA160)

- Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

Strontium ranelate is recommended as an alternative for women:

- in whom alendronate and risedronate are contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance.

[www.nice.org.uk/TA161](http://www.nice.org.uk/TA161)

Strontium ranelate 2 gram Protelos 2g granules sachets sugar-free | 28 sachet **PoM** £27.08 DT price = £27.08

## CALCIUM REGULATING DRUGS > PARATHYROID HORMONES AND ANALOGUES

## Teriparatide

### ● INDICATIONS AND DOSE

**Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of corticosteroid-induced osteoporosis**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: 20 micrograms daily for maximum duration of treatment 24 months (course not to be repeated)

- **CONTRA-INDICATIONS** Bone metastases · hyperparathyroidism · metabolic bone diseases · Paget's disease · pre-existing hypercalcaemia · previous radiation therapy to the skeleton · skeletal malignancies · unexplained raised alkaline phosphatase

### ● SIDE-EFFECTS

- **Common or very common** Anaemia · arthralgia · asthenia · depression · dizziness · dyspnoea · fatigue · gastro-intestinal disorders · haemorrhoids · headache · increased sweating · muscle cramps · myalgia · nausea · palpitation · reflux · sciatica · vertigo
- **Uncommon** Hypercalcaemia · injection-site reactions · urinary disorders
- **Rare** Hypersensitivity reactions

### ● PREGNANCY

Avoid.

### ● BREAST FEEDING

Avoid.

- **RENAL IMPAIRMENT** Caution in moderate impairment; avoid if severe.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

**Teriparatide** is recommended as an alternative for women:

- in whom alendronate or risedronate, or strontium ranelate are contra-indicated or not tolerated, or where treatment with alendronate or risedronate has been unsatisfactory (indicated by another fragility fracture and a decline in bone mineral density despite treatment for 1 year) **and**
- who comply with particular combinations of bone mineral density measurement, age, and number of fractures, as indicated in the full NICE guidance.

[www.nice.org.uk/TA161](http://www.nice.org.uk/TA161)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2003) that the use of teriparatide (*Forsteo*®) in postmenopausal women should be restricted to the treatment of established (severe) osteoporosis and should be initiated by specialists experienced in the treatment of osteoporosis.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

- **Forsteo** (Eli Lilly and Company Ltd)

Teriparatide 250 microgram per 1 ml Forsteo  
20micrograms/80microlitres solution for injection 2.4ml pre-filled disposable devices | 1 pre-filled disposable injection (PoM) £271.88

## DRUGS AFFECTING BONE STRUCTURE AND MINERALISATION > MONOCLONAL ANTIBODIES

### Denosumab

- **DRUG ACTION** Denosumab is a human monoclonal antibody that inhibits osteoclast formation, function, and survival, thereby decreasing bone resorption.

#### • INDICATIONS AND DOSE

##### PROLIA®

**Treatment of osteoporosis in postmenopausal women and in men at increased risk of fractures | Treatment of bone loss associated with hormone ablation in men with prostate cancer at increased risk of fractures**

##### ► BY SUBCUTANEOUS INJECTION

- Adult: 60 mg every 6 months, supplement with calcium and vitamin D

##### XGEVA®

**Prevention of skeletal related events in patients with bone metastases from solid tumours**

##### ► BY SUBCUTANEOUS INJECTION

- Adult: 120 mg every 4 weeks, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

**Treatment of giant cell tumour of bone that is unresectable or where surgical resection is likely to result in severe morbidity in adults and skeletally mature adolescents**

##### ► BY SUBCUTANEOUS INJECTION

- Adult: 120 mg every 4 weeks, give additional dose on days 8 and 15 of the first month of treatment only, supplementation of at least Calcium 500 mg and vitamin D 400 units daily should also be taken unless hypercalcaemia is present

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: DENOSUMAB: ATYPICAL FEMORAL FRACTURES (FEBRUARY 2013)

Atypical femoral fractures have been reported rarely in patients receiving denosumab for the long-term treatment (2.5 or more years) of postmenopausal osteoporosis.

Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Discontinuation of denosumab in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: DENOSUMAB: MINIMISING THE RISK OF OSTEONECROSIS OF THE JAW: MONITORING FOR HYPOCALCAEMIA—UPDATED RECOMMENDATIONS (SEPTEMBER 2014) AND DENOSUMAB: OSTEONECROSIS OF THE JAW—FURTHER MEASURES TO MINIMISE RISK (JULY 2015)

Denosumab is associated with a risk of osteonecrosis of the jaw (ONJ) and with a risk of hypocalcaemia.

##### Osteonecrosis of the jaw

Osteonecrosis of the jaw is a well-known and common side-effect in patients receiving denosumab 120 mg for cancer. Risk factors include smoking, old age, poor oral hygiene, invasive dental procedures (including tooth extractions, dental implants, oral surgery), comorbidity (including dental disease, anaemia, coagulopathy, infection), advanced cancer, previous treatment with bisphosphonates, and concomitant treatments (including chemotherapy, anti-angiogenic biologics, corticosteroids, and radiotherapy to head and neck). The following precautions are now recommended to reduce the risk of ONJ:

- Denosumab 120 mg (cancer indication)
- A dental examination and appropriate preventative dentistry before starting treatment are now recommended for all patients
- Do not start denosumab in patients with a dental or jaw condition requiring surgery, or in patients who have unhealed lesions from dental or oral surgery
- Denosumab 60 mg (osteoporosis indication)
- Check for ONJ risk factors before starting treatment. A dental examination and appropriate preventative dentistry are now recommended for patients with risk factors

All patients should be given a patient reminder card and informed of the risk of ONJ. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, if they wear dentures they should make sure their dentures fit properly before starting treatment, to maintain good oral hygiene, receive routine dental check-ups during treatment, and immediately report any oral symptoms such as dental mobility, pain, swelling, non-healing sores or discharge to a doctor and dentist. Patients should tell their doctor and dentist that they are receiving denosumab if they need dental treatment or dental surgery.

##### Hypocalcaemia

Denosumab is associated with a risk of hypocalcaemia. This risk increases with the degree of renal impairment. Hypocalcaemia usually occurs in the first weeks of denosumab treatment, but it can also occur later in treatment.

Plasma-calcium concentration monitoring is recommended for denosumab 120 mg (cancer indication):

- before the first dose
- within two weeks after the initial dose
- if suspected symptoms of hypocalcaemia occur
- consider monitoring more frequently in patients with risk factors for hypocalcaemia (e.g. severe renal impairment, creatinine clearance less than 30 mL/minute)

Plasma-calcium concentration monitoring is recommended for denosumab 60 mg (osteoporosis indication):

- before each dose
- within two weeks after the initial dose in patients with risk factors for hypocalcaemia (e.g. severe renal

impairment, creatinine clearance less than 30 mL/minute)

- if suspected symptoms of hypocalcaemia occur
- All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

● **CONTRA-INDICATIONS** Hypocalcaemia

**XGEVA®** Unhealed lesions from dental or oral surgery

● **CAUTIONS** Atypical femoral fractures · hypocalcaemia · osteonecrosis of the jaw—consider temporary interruption of treatment if occurs

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

► **Common or very common** Abdominal discomfort · cataracts · constipation · diarrhoea · dyspnoea · eczema · hypocalcaemia (fatal cases reported) · hypophosphataemia · musculoskeletal pain · pain in extremity · rash · sciatica · sweating · upper respiratory tract infection · urinary tract infection

► **Uncommon** Cellulitis (seek prompt medical attention) · diverticulitis · ear infection · skin infections (seek prompt medical attention)

► **Rare** Atypical femoral fractures · osteonecrosis of the jaw

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception in women of child-bearing potential, during treatment and for at least 5 months after stopping treatment.

● **PREGNANCY** Avoid—toxicity in *animal studies*; risk of toxicity increases with each trimester—advise women who become pregnant during treatment to enrol in the manufacturer's Pregnancy Surveillance Programme (consult product literature).

● **BREAST FEEDING** Avoid (if women do decide to breast-feed during treatment, they should enrol in the manufacturer's Lactation Surveillance Programme—consult product literature).

● **RENAL IMPAIRMENT** Increased risk of hypocalcaemia if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

● **MONITORING REQUIREMENTS** Correct hypocalcaemia and vitamin D deficiency before starting. Monitor plasma-calcium concentration during therapy.

● **PATIENT AND CARER ADVICE** A patient reminder card should be provided (risk of osteonecrosis of the jaw). Atypical femoral fractures Patients should be advised to report any new or unusual thigh, hip, or groin pain during treatment with denosumab.

Osteonecrosis of the jaw All patients should be informed to maintain good oral hygiene, receive routine dental check-ups, and immediately report any oral symptoms such as dental mobility, pain, or swelling to a doctor and dentist. Hypocalcaemia All patients should be advised to report symptoms of hypocalcaemia to their doctor (e.g. muscle spasms, twitches, cramps, numbness or tingling in the fingers, toes, or around the mouth).

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- **Denosumab for the prevention of osteoporotic fractures in postmenopausal women (October 2010) NICE TA204** Denosumab is recommended as a treatment option for the *primary prevention* of osteoporotic fragility fractures in postmenopausal women at increased risk of fractures:
  - who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments **and**
  - who comply with particular combinations of bone mineral density measurement, age, and independent

risk factors for fracture, as indicated in the full NICE guidance.

Denosumab is recommended as a treatment option for the *secondary prevention* of osteoporotic fragility fractures only in postmenopausal women at increased risk of fractures who are unable to comply with the special instructions for administering alendronate and risedronate, or have an intolerance of, or a contra-indication to, those treatments. [www.nice.org.uk/TA204](http://www.nice.org.uk/TA204)

► **Denosumab for the prevention of skeletal-related events in adults with bone metastases from solid tumours (October 2012) NICE TA265**

Denosumab is recommended for the prevention of skeletal-related events in adults with bone metastases from breast cancer and from solid tumours other than prostate if:

- bisphosphonates would otherwise be prescribed, **and**
- the manufacturer provides denosumab with the discount agreed in the patient access scheme.

Denosumab is **not** recommended for preventing skeletal-related events in adults with bone metastases from prostate cancer.

Patients with bone metastases from solid tumours currently receiving denosumab whose disease does not meet the above criteria can continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA265](http://www.nice.org.uk/TA265)

**PROLIA®**

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (November 2010) that denosumab (*Prolia®*) is accepted for restricted use within NHS Scotland for the treatment of osteoporosis in postmenopausal women at increased risk of fractures who have a bone mineral density T-score < -2.5 and ≥ -4.0 and for whom bisphosphonates are unsuitable.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

► **Prolia** (Amgen Ltd)

**Denosumab 60 mg per 1 ml** Prolia 60mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £183.00 DT price = £183.00

► **Xgeva** (Amgen Ltd) ▼

**Denosumab 70 mg per 1 ml** Xgeva 120mg/1.7ml solution for injection vials | 1 vial [PoM] £309.86

## 5 Dopamine responsive conditions

### DOPAMINERGIC DRUGS > DOPAMINE RECEPTOR AGONISTS

## Dopamine-receptor agonists

### Overview

Bromocriptine p. 399 is used for the treatment of galactorrhoea, and for the treatment of prolactinomas (when it reduces both plasma prolactin concentration and tumour size). Bromocriptine also inhibits the release of growth hormone and is sometimes used in the treatment of acromegaly, but somatostatin analogues (such as octreotide p. 877) are more effective.

Cabergoline p. 400 has similar side-effects to bromocriptine, however patients intolerant of bromocriptine may be able to tolerate cabergoline (and *vice versa*).

Quinagolide below has actions and uses similar to those of ergot-derived dopamine agonists, but its side-effects differ slightly.

### Suppression of lactation

Although bromocriptine and cabergoline are licensed to suppress lactation, they are **not** recommended for routine suppression (or for the relief of symptoms of postpartum pain and engorgement) that can be adequately treated with simple analgesics and breast support. If a dopamine-receptor agonist is required, cabergoline is preferred. Quinagolide is not licensed for the suppression of lactation.

## Quinagolide

- **DRUG ACTION** Quinagolide is a non-ergot dopamine D<sub>2</sub> agonist.

### ● INDICATIONS AND DOSE

#### Hyperprolactinaemia

##### ► BY MOUTH

- **Adult:** Initially 25 micrograms once daily for 3 days, dose to be taken at bedtime, increased in steps of 25 micrograms every 3 days; usual dose 75–150 micrograms daily, for doses higher than 300 micrograms daily increase in steps of 75–150 micrograms at intervals of not less than 4 weeks

- **UNLICENSED USE** Not licensed for the suppression of lactation.
- **CAUTIONS** Acute porphyrias p. 969 · history of psychotic illness · history of serious mental disorders
- CAUTIONS, FURTHER INFORMATION**
  - Hyperprolactinemic patients In hyperprolactinaemic patients, the source of the hyperprolactinaemia should be established (i.e. exclude pituitary tumour before treatment).
- **INTERACTIONS** → Appendix 1: dopamine receptor agonists
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · anorexia · constipation or diarrhoea · dizziness · fatigue · flushing · headache · hypotension · insomnia · nasal congestion · nausea · oedema · syncope · vomiting
  - **Very rare** Psychosis
- SIDE-EFFECTS, FURTHER INFORMATION**
  - Gastro-intestinal bleeding Treatment should be withdrawn if gastro-intestinal bleeding occurs.
- **ALLERGY AND CROSS-SENSITIVITY** Quinagolide should not be used in patients with hypersensitivity to quinagolide (does not apply to hypersensitivity to ergot alkaloids).
- **CONCEPTION AND CONTRACEPTION** Advise non-hormonal contraception if pregnancy not desired.
- **PREGNANCY** Discontinue when pregnancy confirmed unless medical reason for continuing (specialist advice needed).
- **BREAST FEEDING** Suppresses lactation.
- **HEPATIC IMPAIRMENT** Avoid—no information available.
- **RENAL IMPAIRMENT** Avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor blood pressure for a few days after starting treatment and following dosage increase.
- **PATIENT AND CARER ADVICE**
  - Sudden onset of sleep** Excessive daytime sleepiness and sudden onset of sleep can occur with dopamine-receptor agonists.

Patients starting treatment with these drugs should be warned of the risk and of the need to exercise caution when driving or operating machinery. Those who have

experienced excessive sedation or sudden onset of sleep should refrain from driving or operating machines until these effects have stopped occurring.

Management of excessive daytime sleepiness should focus on the identification of an underlying cause, such as depression or concomitant medication. Patients should be counselled on improving sleep behaviour.

**Hypotensive reactions** Hypotensive reactions can be disturbing in some patients during the first few days of treatment with dopamine-receptor agonists, particular care should be exercised when driving or operating machinery.

### ● MEDICINAL FORMS

## 6 Gonadotrophin responsive conditions

### Gonadotrophins

#### Drugs affecting gonadotrophins

Danazol p. 699 is licensed for the treatment of *endometriosis* for the relief of severe pain and tenderness in *benign fibrocystic breast disease* where other measures have proved unsatisfactory. It may also be effective in the long-term management of *hereditary angioedema* (unlicensed indication).

Cetrorelix p. 694 and ganirelix p. 694 are luteinising hormone releasing hormone antagonists, which inhibit the release of gonadotrophins (luteinising hormone and follicle stimulating hormone). They are used in the treatment of infertility by assisted reproductive techniques.

#### Gonadorelin analogues

Gonadorelin analogues are used in the treatment of endometriosis, precocious puberty, infertility, male hypersexuality with severe sexual deviation, anaemia due to uterine fibroids (together with iron supplementation), breast cancer, prostate cancer and before intra-uterine surgery. Use of leuprorelin acetate and triptorelin for 3 to 4 months before surgery reduces the uterine volume, fibroid size and associated bleeding. For women undergoing hysterectomy or myomectomy, a vaginal procedure is made more feasible following the use of a gonadorelin analogue.

#### Breast pain (mastalgia)

Once any serious underlying cause for breast pain has been ruled out, most women will respond to reassurance and reduction in dietary fat; withdrawal of an oral contraceptive

or of hormone replacement therapy may help to resolve the pain.

Mild, non-cyclical breast pain is treated with simple analgesics; moderate to severe pain, cyclical pain or symptoms that persist for longer than 6 months may require specific drug treatment.

Danazol is licensed for the relief of severe pain and tenderness in benign fibrocystic breast disease which has not responded to other treatment.

Tamoxifen p. 879 may be a useful adjunct in the treatment of mastalgia [unlicensed indication] especially when symptoms can definitely be related to cyclic oestrogen production; it may be given on the days of the cycle when symptoms are predicted.

Treatment for breast pain should be reviewed after 6 months and continued if necessary. Symptoms recur in about 50% of women within 2 years of withdrawal of therapy but may be less severe.

## PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES

### Cetorelix

#### ● INDICATIONS AND DOSE

**Adjunct in the treatment of female infertility (initiated under specialist supervision)**

##### ▶ BY SUBCUTANEOUS INJECTION

- Adult (female): 250 micrograms once daily, dose to be administered in the morning, starting on day 5 or 6 of ovarian stimulation with gonadotrophins (or each evening starting on day 5 of ovarian stimulation), continue throughout administration of gonadotrophin including day of ovulation induction (or evening before ovulation induction), dose to be injected into the lower abdominal wall.

#### ● SIDE-EFFECTS

- Common or very common Headache · injection site reactions · nausea

- Rare Hypersensitivity reactions

- **PREGNANCY** Avoid in confirmed pregnancy.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Avoid in moderate or severe liver impairment.

- **RENAL IMPAIRMENT** Avoid in moderate or severe renal impairment.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder and solvent for solution for injection**

- ▶ **Cetrotide** (Merck Serono Ltd)

**Cetorelix (as Cetorelix acetate) 250 microgram** Cetrotide 250microgram powder and solvent for solution for injection vials | 1 vial [PoM] £22.61

### Ganirelix

#### ● INDICATIONS AND DOSE

**Adjunct in the treatment of female infertility (initiated under specialist supervision)**

##### ▶ BY SUBCUTANEOUS INJECTION

- Adult: 250 micrograms once daily, dose to be administered in the morning (or each afternoon) starting on day 5 or day 6 of ovarian stimulation with gonadotrophins, continue throughout administration of gonadotrophins including day of ovulation induction (if administering in afternoon, give last dose

in afternoon before ovulation induction), dose to be injected preferably into the upper leg (rotate injection sites to prevent lipatrophy)

#### ● SIDE-EFFECTS

- ▶ **Very rare** Facial oedema · hypersensitivity reactions · rash
- ▶ **Frequency not known** Dyspnoea · headache · injection-site reactions · malaise · nausea

- **PREGNANCY** Avoid in confirmed pregnancy—toxicity in animal studies.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in moderate or severe hepatic impairment.

- **RENAL IMPAIRMENT** Avoid in moderate to severe renal impairment.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Solution for injection**

- ▶ **Orgalutran** (Merck Sharp & Dohme Ltd)

**Ganirelix 500 microgram per 1 ml** Orgalutran 250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £21.48

## PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPIN-RELEASING HORMONES

### Buserelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

#### ● INDICATIONS AND DOSE

##### **Endometriosis**

##### ▶ BY INTRANASAL ADMINISTRATION

- Adult: 300 micrograms 3 times a day maximum duration of treatment 6 months (do not repeat), to be started on days 1 or 2 of menstruation; administer once 150 microgram spray into each nostril

#### **Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)**

##### ▶ BY SUBCUTANEOUS INJECTION

- Adult: 200–500 micrograms once daily, increased if necessary up to 500 micrograms twice daily, starting in early follicular phase (day 1) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down-regulation achieved (usually 1–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of chorionic gonadotrophin at appropriate stage of follicular development)

##### ▶ BY INTRANASAL ADMINISTRATION

- Adult: 150–300 micrograms 4 times a day, (150 micrograms equivalent to one spray), to be administered during waking hours. Start in early follicular phase (day 1) or, after exclusion of pregnancy, in the midluteal phase (day 21) and continued until down-regulation achieved (usually about 2–3 weeks) then maintained during gonadotrophin administration (stopping gonadotrophin and buserelin on administration of

chorionic gonadotrophin at appropriate stage of follicular development)

### Advanced prostate cancer

#### ► INITIALLY BY SUBCUTANEOUS INJECTION

- Adult: 500 micrograms every 8 hours for 7 days, then (by intranasal administration) 200 micrograms 6 times a day, (a single 100 microgram spray to be administered into each nostril)

### ● CONTRA-INDICATIONS

- When used for endometriosis Hormone dependent tumours · undiagnosed vaginal bleeding · use longer than 6 months (do not repeat)
- When used for pituitary desensitisation Hormone dependent tumours · undiagnosed vaginal bleeding

- **CAUTIONS** Depression · diabetes · hypertension · patients with metabolic bone disease (decrease in bone mineral density can occur) · polycystic ovarian disease

### ● SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

Abdominal pain · acne · altered blood lipids · anaphylaxis · anxiety · arthralgia · asthma · bleeding associated with fibroid degeneration (when treating uterine fibroids) · breakthrough bleeding · breast tenderness · changes in appetite · changes in breast size · changes in scalp and body hair · concentration disturbances · constipation · decrease in trabecular bone density · depression · diarrhoea · dizziness · drowsiness · dry eyes · dry skin · dyspareunia · fatigue · gynaecomastia · hair loss · headache · hearing disturbances · hot flushes · hypersensitivity reactions · hypertension · increased sweating · increased thirst · initially withdrawal bleeding · lactation · leucopenia · leucorrhoea · local reactions at injection site · loss of libido · memory disturbances · menopausal-like symptoms · migraine · mood changes · musculoskeletal pain · musculoskeletal weakness · myalgia · nausea · nervousness · oedema of the face and extremities · ovarian cysts (may require withdrawal) · palpitation · paraesthesia · pruritus · rash · reduced glucose tolerance · sexual dysfunction · sleep disturbances · splitting nails · thrombocytopenia · urticaria · vaginal dryness · visual disturbances · vomiting · weight changes

#### SPECIFIC SIDE-EFFECTS

- With intranasal use Altered sense of taste and smell · nasal irritation · nose bleeds

#### SIDE-EFFECTS, FURTHER INFORMATION

- Tumour flare (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain.

- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

### ● DIRECTIONS FOR ADMINISTRATION

- With intranasal use Avoid use of nasal decongestants before and for at least 30 minutes after treatment.
- With subcutaneous use Rotate injection site to prevent atrophy and nodule formation.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer buserelin nasal spray.

### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- **Suprecur** (Sanofi)

Buserelin (as Buserelin acetate) 1 mg per 1 ml Suprecur 5.5mg/5.5ml solution for injection vials | 2 vial **[PoM]** £33.02

- **Suprefact** (Sanofi)

Buserelin (as Buserelin acetate) 1 mg per 1 ml Suprefact 5.5mg/5.5ml solution for injection vials | 2 vial **[PoM]** £34.37

#### Spray

- **Suprecur** (Sanofi)

Buserelin (as Buserelin acetate) 150 microgram per 1 dose Suprecur 150micrograms/dose nasal spray | 168 dose **[PoM]** £105.16

- **Suprefact** (Sanofi)

Buserelin (as Buserelin acetate) 100 microgram per 1 dose Suprefact 100micrograms/dose nasal spray | 336 dose **[PoM]** £122.24

## Goserelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

### ● INDICATIONS AND DOSE

#### ZOLADEX LA<sup>®</sup>

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer

- BY SUBCUTANEOUS INJECTION

- Adult: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall

#### ZOLADEX<sup>®</sup>

Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer | Advanced breast cancer | Oestrogen-receptor-positive early breast cancer

- BY SUBCUTANEOUS INJECTION

- Adult: 3.6 mg every 28 days, to be administered into the anterior abdominal wall

#### Endometriosis

- BY SUBCUTANEOUS INJECTION

- Adult: 3.6 mg every 28 days maximum duration of treatment 6 months (do not repeat), to be administered into the anterior abdominal wall

#### Endometrial thinning before intra-uterine surgery

- BY SUBCUTANEOUS INJECTION

- Adult: 3.6 mg, dose may be repeated after 28 days if uterus is large or to allow flexible surgical timing, to be administered into the anterior abdominal wall

#### Before surgery in women who have anaemia due to uterine fibroids

- BY SUBCUTANEOUS INJECTION

- Adult: 3.6 mg every 28 days maximum duration of treatment 3 months, to be given with continued →

supplementary iron, to be administered into the anterior abdominal wall

**Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (after exclusion of pregnancy) (under expert supervision)**

► BY SUBCUTANEOUS INJECTION

- **Adult:** 3.6 mg, dose given to achieve pituitary down-regulation (usually 1–3 weeks) then gonadotrophin is administered (stopping gonadotrophin on administration of chorionic gonadotrophin at appropriate stage of follicular development), to be administered into the anterior abdominal wall

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding · use longer than 6 months in endometriosis (do not repeat)
- **CAUTIONS** Depression · diabetes · hypertension · patients with metabolic bone disease (decrease in bone mineral density can occur) · polycystic ovarian disease · risk of spinal cord compression in men · risk of ureteric obstruction in men
- **SIDE-EFFECTS**
  - **Rare** Hypercalcaemia (in women)
  - **Frequency not known** Anaphylaxis · arthralgia · asthma · breast tenderness · changes in blood pressure · changes in breast size · changes in scalp and body hair · decrease in trabecular bone density · depression · dizziness · dyspareunia (when used for gynaecological conditions) · gastro-intestinal disturbances · gynaecomastia · headache · heart failure (when used for prostate or breast cancer) · hot flushes · hypersensitivity reactions · increased sweating · local reactions at injection site · loss of libido · menopausal-like symptoms · migraine · mood changes · musculoskeletal pain (when used for gynaecological conditions) · musculoskeletal weakness (when used for gynaecological conditions) · myalgia · myocardial infarction (when used for prostate or breast cancer) · oedema of the face and extremities (when used for gynaecological conditions) · ovarian cysts (may require withdrawal) · palpitation (when used for gynaecological conditions) · paraesthesia · paraesthesia · pruritus · rash · sexual dysfunction · sleep disorders · urticaria · vaginal bleeding · vaginal dryness · visual disturbances · weight change · withdrawal bleeding

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Tumour flare** (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour ‘flare’ may cause spinal cord compression, ureteric obstruction or increased bone pain.
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Men at risk of tumour ‘flare’ should be monitored closely during the first month of therapy for prostate cancer.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Implant**

► **Zoladex** (AstraZeneca UK Ltd)

**Goserelin (as Goserelin acetate) 3.6 mg** Zoladex 3.6mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [PoM] £65.00 DT price = £65.00

► **Zoladex LA** (AstraZeneca UK Ltd)

**Goserelin (as Goserelin acetate) 10.8 mg** Zoladex LA 10.8mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [PoM] £235.00 DT price = £235.00

## Leuporelin acetate

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

• **INDICATIONS AND DOSE**

**PROSTAP 3 DCS®**

**Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer**

► BY SUBCUTANEOUS INJECTION

- **Adult:** 11.25 mg every 3 months

**Endometriosis**

► BY INTRAMUSCULAR INJECTION

- **Adult:** Initially 11.25 mg for 1 dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 11.25 mg every 3 months for maximum 6 months (course not to be repeated)

**PROSTAP SR DCS®**

**Locally advanced prostate cancer as an alternative to surgical castration | Adjuvant treatment to radiotherapy or radical prostatectomy in patients with high-risk localised or locally advanced prostate cancer | Metastatic prostate cancer**

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- **Adult:** 3.75 mg every month

**Endometriosis**

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- **Adult:** Initially 3.75 mg for 1 dose, dose to be given as a single dose in first 5 days of menstrual cycle, then 3.75 mg every month for maximum 6 months (course not to be repeated)

**Endometrial thinning before intra-uterine surgery**

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- **Adult:** Initially 3.75 mg for 1 dose, dose to be given as a single dose between day 3 and 5 of menstrual cycle, 5–6 weeks before surgery

**Reduction of size of uterine fibroids and of associated bleeding before surgery**

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- **Adult:** Initially 3.75 mg every month usually for 3–4 months (maximum 6 months)

• **CONTRA-INDICATIONS**

**GENERAL CONTRA-INDICATIONS**

Undiagnosed vaginal bleeding

**SPECIFIC CONTRA-INDICATIONS**

- When used for endometriosis Use longer than 6 months (do not repeat)
- CAUTIONS** Diabetes · family history of osteoporosis · patients with metabolic bone disease (decrease in bone mineral density can occur) · risk of spinal cord compression in men with prostate cancer · risk of ureteric obstruction in men with prostate cancer
- INTERACTIONS** → Appendix 1: leuporelin
- SIDE-EFFECTS** Alteration of glucose tolerance · altered blood lipids · anaphylaxis · anorexia · asthma · breast tenderness (males and females) · changes in blood pressure · changes in breast size · changes in scalp and body hair · chills · decrease in trabecular bone density · depression · diarrhoea · dizziness · dyspareunia · fatigue · fever · gastrointestinal disturbances · headache · hot flushes · hypersensitivity reactions · increased sweating · jaundice · leucopenia · local reactions at injection site · loss of libido · menopausal-like symptoms · migraine · mood changes · musculoskeletal pain · musculoskeletal weakness · nausea · palpitation · paraesthesia · paralysis · pruritus · pulmonary embolism · rash · sexual dysfunction · sleep disturbances · spinal fracture · thrombocytopenia · urticaria · vaginal bleeding · vaginal dryness · visual disturbances · vomiting · weight changes
- SIDE-EFFECTS, FURTHER INFORMATION**
  - Tumour flare (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain.
- CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- PREGNANCY** Avoid—teratogenic in *animal* studies.
- BREAST FEEDING** Avoid.
- MONITORING REQUIREMENTS**
  - Monitor liver function.
  - Men at risk of tumour 'flare' should be monitored closely during the first month of therapy.
- DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for suspension for injection**

- Prostap 3 DCS** (Takeda UK Ltd)  
Leuporelin acetate **11.25 mg** Prostap 3 DCS 11.25mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £225.72 DT price = £225.72
- Prostap SR DCS** (Takeda UK Ltd)  
Leuporelin acetate **3.75 mg** Prostap SR DCS 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £75.24 DT price = £75.24

**Nafarelin**

- DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

**INDICATIONS AND DOSE****Endometriosis****► BY INTRANASAL ADMINISTRATION**

- Adult (female): 200 micrograms twice daily for maximum 6 months (do not repeat), one spray in one nostril in the morning, and one spray in the other nostril in the evening (starting on days 2–4 of menstruation).

**Pituitary desensitisation before induction of ovulation by gonadotrophins for in vitro fertilisation (under expert supervision)****► BY INTRANASAL ADMINISTRATION**

- Adult: 400 micrograms twice daily, one spray in each nostril, to be started in early follicular phase (day 2) or, after exclusion of pregnancy, in midluteal phase (day 21) and continued until down regulation achieved (usually within 4 weeks) then maintained (usually for 8–12 days) during gonadotrophin administration (stopping gonadotrophin and nafarelin on administration of chorionic gonadotrophin at follicular maturity), discontinue if down-regulation not achieved within 12 weeks

- CONTRA-INDICATIONS** Undiagnosed vaginal bleeding · use longer than 6 months in the treatment of endometriosis (do not repeat)
- CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)
- SIDE-EFFECTS** Acne · anaphylaxis · asthma · changes in breast size · changes in scalp and body hair · decrease in trabecular bone density · depression · dyspareunia · headache · hot flushes · hypersensitivity reactions · hypertension · increased sweating · irritation of the nasal mucosa · loss of libido · menopausal-like symptoms · migraine · mood changes · musculoskeletal pain · musculoskeletal weakness · oedema of the face and extremities · ovarian cysts (may require withdrawal) · palpitation · paraesthesia · pruritus · rash · urticaria · vaginal dryness · visual disturbances · weight changes
- SIDE-EFFECTS, FURTHER INFORMATION**
  - Menopausal-like symptoms These effects can be reduced by hormone replacement (e.g. with an oestrogen and a progestogen or with tibolone).
- CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first dose should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- PREGNANCY** Avoid.
- BREAST FEEDING** Avoid.
- DIRECTIONS FOR ADMINISTRATION** Avoid use of nasal decongestants before and for at least 30 minutes after treatment; repeat dose if sneezing occurs during or immediately after administration.
- PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer nafarelin nasal spray.

## Triptorelin

27-Apr-2017

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

### ● INDICATIONS AND DOSE

#### DECAPEPTYL<sup>®</sup> SR 11.25MG

**Locally advanced non-metastatic prostate cancer as an alternative to surgical castration | Metastatic prostate cancer | Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression**

#### ► BY INTRAMUSCULAR INJECTION

Adult: 11.25 mg every 3 months

#### Endometriosis

#### ► BY INTRAMUSCULAR INJECTION

Adult: 11.25 mg every 3 months for maximum 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

#### DECAPEPTYL<sup>®</sup> SR 22.5MG

**Locally advanced non-metastatic prostate cancer as an alternative to surgical castration | Metastatic prostate cancer | Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression**

#### ► BY INTRAMUSCULAR INJECTION

Adult: 22.5 mg every 6 months

#### DECAPEPTYL<sup>®</sup> SR 3MG

**Locally advanced non-metastatic prostate cancer as an alternative to surgical castration | Metastatic prostate cancer | Adjuvant treatment to radiotherapy in high-risk localised or locally advanced prostate cancer | Neoadjuvant treatment prior to radiotherapy in patients with high-risk localised or locally advanced prostate cancer | Adjuvant treatment to radical prostatectomy in patients with locally advanced prostate cancer at high risk of disease progression**

#### ► BY INTRAMUSCULAR INJECTION

Adult: 3 mg every 4 weeks

#### Endometriosis

#### ► BY INTRAMUSCULAR INJECTION

Adult: 3 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

### Reduction in size of uterine fibroids

#### ► BY INTRAMUSCULAR INJECTION

Adult: 3 mg every 4 weeks for at least 3 months, maximum duration of treatment 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

### GONAPEPTYL DEPOT<sup>®</sup>

#### Advanced prostate cancer

#### ► BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION

Adult: 3.75 mg every 4 weeks

#### Endometriosis | Reduction in size of uterine fibroids

#### ► BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION

Adult: 3.75 mg every 4 weeks maximum duration of 6 months (not to be repeated), to be started during first 5 days of menstrual cycle

### SALVACYL<sup>®</sup>

#### Male hypersexuality with severe sexual deviation

#### ► BY INTRAMUSCULAR INJECTION

Adult: 11.25 mg every 12 weeks

- **CONTRA-INDICATIONS** In endometriosis do not use for longer than 6 months (do not repeat) · undiagnosed vaginal bleeding
- SALVACYL<sup>®</sup>** Severe osteoporosis
- **CAUTIONS**
  - GENERAL CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)
  - SPECIFIC CAUTIONS**
    - When used for prostate cancer Risk factors for osteoporosis · risk of spinal cord compression in men · risk of ureteric obstruction in men
  - SALVACYL<sup>®</sup>** Increased risk of sensitivity to restored testosterone if treatment interrupted—consider administration of an antiandrogen before stopping treatment · transient increase in serum testosterone occurs on initiation—consider administration of an anti-androgen
- **SIDE-EFFECTS**
  - GENERAL SIDE-EFFECTS** Anaphylaxis · arthralgia · asthenia · asthma · breast tenderness (males and females) · changes in blood pressure · changes in breast size · changes in scalp and body hair · depression · gastro-intestinal disturbances · headache · hot flushes · hypersensitivity reactions · increased sweating · local reactions at injection site · mood changes · ovarian cysts (may require withdrawal) · paraesthesia · pruritus · rash · urticaria · visual disturbances · weight changes
  - SPECIFIC SIDE-EFFECTS**
    - When used for endometriosis Decrease in trabecular bone density · dyspareunia · loss of libido · menopausal-like symptoms · migraine · musculoskeletal pain · musculoskeletal weakness · oedema of the face and extremities · palpitation · vaginal dryness · withdrawal bleeding (may occur in the first month of treatment)
    - When used for male hypersexuality with severe sexual deviation Decrease in trabecular bone density · dyspareunia · loss of libido · migraine · musculoskeletal pain · musculoskeletal weakness · oedema of the face and extremities · palpitation
    - When used for prostate cancer Dizziness · dry mouth · hair loss · increased dysuria · myalgia · peripheral oedema · sexual dysfunction · sleep disorders
    - When used for reduction in size of uterine fibroids Bleeding associated with fibroid degeneration · decrease in trabecular bone density · dyspareunia · loss of libido · menopausal-like symptoms · migraine · musculoskeletal

pain · musculoskeletal weakness · oedema of the face and extremities · palpitation · vaginal dryness · withdrawal bleeding (may occur in the first month of treatment)

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Tumour flare (when used for advanced prostate cancer) During the initial stage (1–2 weeks) increased production of testosterone may be associated with progression of prostate cancer. In susceptible patients this tumour 'flare' may cause spinal cord compression, ureteric obstruction or increased bone pain.
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS**
- ▶ When used for Prostate cancer Men at risk of tumour 'flare' should be monitored closely during the first month of therapy.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.
- **PRESCRIBING AND DISPENSING INFORMATION**
- DECAPEPTYL® SR 11.25MG** Each vial includes an overage to allow accurate administration of an 11.25 mg dose.
- DECAPEPTYL® SR 22.5MG** Each vial includes an overage to allow accurate administration of a 22.5 mg dose.
- DECAPEPTYL® SR 3MG** Each vial includes an overage to allow accurate administration of 3 mg dose.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### All Wales Medicines Strategy Group (AWMSG) Decisions

The All Wales Medicines Strategy Group has advised (March 2017) that triptorelin (*Decapeptyl® SR*) is recommended as an option for use within NHS Wales as an adjuvant treatment to radiotherapy and as a neoadjuvant treatment prior to radiotherapy, in patients with high-risk localised or locally advanced prostate cancer.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for suspension for injection

- ▶ **Decapeptyl SR** (Ipsen Ltd)
- Triptorelin (as Triptorelin acetate) 3 mg** Decapeptyl SR 3mg powder and solvent for suspension for injection vials | 1 vial [PoM] £69.00 DT price = £69.00
- Triptorelin (as Triptorelin acetate) 11.25 mg** Decapeptyl SR 11.25mg powder and solvent for suspension for injection vials | 1 vial [PoM] £207.00 DT price = £207.00
- Triptorelin (as Triptorelin embonate) 22.5 mg** Decapeptyl SR 22.5mg powder and solvent for suspension for injection vials | 1 vial [PoM] £414.00 DT price = £414.00
- ▶ **Gonapeptyl Depot** (Ferring Pharmaceuticals Ltd)
- Triptorelin (as Triptorelin acetate) 3.75 mg** Gonapeptyl Depot 3.75mg powder and solvent for suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £81.69
- ▶ **Salvacyl** (Ipsen Ltd)
- Triptorelin (as Triptorelin embonate) 11.25 mg** Salvacyl 11.25mg powder and solvent for suspension for injection vials | 1 vial [PoM] £248.00

## 6.1 Hereditary angioedema

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES

#### Danazol

- **DRUG ACTION** Danazol inhibits pituitary gonadotrophins; it combines androgenic activity with antioestrogenic and antiprogesterogenic activity.

#### ● INDICATIONS AND DOSE

##### Endometriosis

- ▶ **BY MOUTH**
- ▶ **Adult:** 200–800 mg daily in up to 4 divided doses usually for 3–6 months, dose to be adjusted to achieve amenorrhoea, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

##### Severe pain and tenderness in benign fibrocystic breast disease not responding to other treatment

- ▶ **BY MOUTH**
- ▶ **Adult:** 300 mg daily in divided doses usually for 3–6 months, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

##### Hereditary angioedema

- ▶ **BY MOUTH**
- ▶ **Adult:** Initially 100–200 mg daily, dose to be reduced according to response, in women of child-bearing potential, treatment should start during menstruation, preferably on day 1

- **UNLICENSED USE** Not licensed for use in hereditary angioedema.
- **CONTRA-INDICATIONS** Acute porphyrias p. 969 · androgen-dependent tumours · thromboembolic disease · undiagnosed genital bleeding
- **CAUTIONS** Cardiac impairment (avoid if severe) · diabetes mellitus · elderly · epilepsy · history of thrombosis or thromboembolic disease · hypertension · lipoprotein disorder · migraine · polycythaemia
- **INTERACTIONS** → Appendix 1: danazol
- **SIDE-EFFECTS**
- ▶ **Rare** Benign hepatic adenomata · cholestatic jaundice · clitoral hypertrophy · pancreatitis · peliosis hepatis
- ▶ **Frequency not known** Acne · androgenic effects · anxiety · backache · changes in libido · dizziness · eosinophilia · epigastric pain · exfoliative dermatitis · fatigue · fever · flushing and reduction in breast size · hair loss · headache · headache (may indicate benign intracranial hypertension) · hirsutism · insulin resistance · joint pain · joint swelling · leucopenia · menstrual disturbances · mood changes · musculo-skeletal spasm · nausea · nervousness · oedema · oily skin · pleuritic pain · rashes · reversible erythrocytosis · reversible polycythaemia · skin reactions · temporary alteration in lipoproteins and other metabolic changes · thrombocytopenia · thrombotic events · vaginal dryness · vaginal irritation · vertigo · visual disturbances (may indicate benign intracranial hypertension) · voice changes · weight gain
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ **Virilisation** Withdraw if virilisation effects occur—may be irreversible on continued use.
- **CONCEPTION AND CONTRACEPTION** Ensure patients with amenorrhoea are not pregnant. Non-hormonal contraceptive methods should be used, if appropriate.

- **PREGNANCY** Avoid; has weak androgenic effects and virilisation of female fetus reported.
- **BREAST FEEDING** No data available but avoid because of possible androgenic effects in infant.
- **HEPATIC IMPAIRMENT** Caution in hepatic impairment (avoid if severe).
- **RENAL IMPAIRMENT** Caution in renal impairment (avoid if severe).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

#### Capsule

##### Danazol (Non-proprietary)

**Danazol 100 mg** Danazol 100mg capsules | 28 capsule [PoM](#)  
£18.40 [CD4-2](#)

**Danazol 200 mg** Danazol 200mg capsules | 56 capsule [PoM](#)

##### Danol (Sanofi)

**Danazol 100 mg** Danol 100mg capsules | 60 capsule [PoM](#) £16.38  
DT price = £16.38 [CD4-2](#)

**Danazol 200 mg** Danol 200mg capsules | 60 capsule [PoM](#) £32.43  
DT price = £32.43 [CD4-2](#)

## 7 Hypothalamic and anterior pituitary hormone related disorders

### Hypothalamic and anterior pituitary hormones

#### Anterior pituitary hormones

##### Corticotrophins

Tetracosactide below (tetracosactrin), an analogue of corticotropin (ACTH), is used to test adrenocortical function; failure of the plasma cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency.

Both corticotropin and tetracosactide were formerly used as alternatives to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis; their value was limited by the variable and unpredictable therapeutic response and by the waning of their effect with time.

##### Gonadotrophins

Follicle-stimulating hormone (FSH) and luteinising hormone (LH) together, follicle-stimulating hormone alone (as in **folitropin**), or chorionic gonadotrophin p. 702, are used in the treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene citrate p. 723, or in superovulation treatment for assisted conception (such as *in vitro* fertilisation).

The gonadotrophins are also occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

##### Growth hormone

Growth hormone is used to treat deficiency of the hormone in children and in adults. In children it is used in Prader-Willi syndrome, Turner syndrome, chronic renal insufficiency, short children considered small for gestational age at birth, and short stature homeobox-containing gene (SHOX) deficiency.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 705, produced using recombinant DNA technology.

Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children and adolescents with severe primary insulin-like growth factor-I deficiency.

#### Hypothalamic hormones

Gonadorelin p. 701 when injected intravenously in normal subjects leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. **Gonadorelin analogues** are indicated in endometriosis and infertility and in breast and prostate cancer.

## 7.1 Adrenocortical function testing

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPHINS

#### Tetracosactide

(Tetracosactrin)

##### • INDICATIONS AND DOSE

**Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test)**

► BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

► Adult: 250 micrograms for 1 dose

**Diagnosis of adrenocortical insufficiency (diagnostic 5-hour test)**

► BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION

► Adult: 1 mg for 1 dose

**Alternative to corticosteroids in conditions such as Crohn's disease or rheumatoid arthritis (formerly used but value was limited by the variable and unpredictable therapeutic response and by the waning of effect with time)**

► BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION

► Adult: Initially 1 mg daily, alternatively initially 1 mg every 12 hours, (in acute cases), then reduced to 1 mg every 2–3 days, followed by 1 mg once weekly, alternatively 500 micrograms every 2–3 days

• **CONTRA-INDICATIONS** Acute psychosis · adrenogenital syndrome · allergic disorders · asthma · avoid injections containing benzyl alcohol in neonates · Cushing's syndrome · infectious diseases · peptic ulcer · primary adrenocortical insufficiency · refractory heart failure

• **CAUTIONS** Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) · active systemic diseases (should not be used unless adequate disease-specific therapy is being given) · diabetes mellitus · diverticulitis · history of asthma · history of atopic allergy · history of eczema · history of hayfever · history of hypersensitivity · hypertension · latent amoebiasis (may become activated) · latent tuberculosis (may become activated) · myasthenia gravis · ocular herpes simplex · osteoporosis · predisposition to thromboembolic · psychological disturbances may be triggered · recent intestinal anastomosis · reduced immune response (should not be used unless adequate disease-specific therapy is being given) · ulcerative colitis

**CAUTIONS, FURTHER INFORMATION**

- **Risk of anaphylaxis** Should only be administered under medical supervision. Consult product literature.
- **Hypertension** Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
- **Diabetes mellitus** Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.
- **SIDE-EFFECTS** Abdominal distention · abscess · acne · anaphylactic shock · angioneurotic oedema · aseptic necrosis of femoral and humeral heads · benign intracranial pressure increased with papilloedema · calcium deficiency · cardiac disorders · convulsions · Cushing's syndrome · decreased carbohydrate tolerance · dizziness · dyspnoea · ecchymosis · erythema · euphoria · fluid retention · flushing · glaucoma · growth retardation · headache · hirsutism · hyperglycaemia · hyperhidrosis · hypersensitivity reactions (tend to be more severe in patients susceptible to allergies, especially asthma) · hypertension · hypokalaemia · hypokalaemic alkalosis · impaired healing · increased appetite · increased intraocular pressure · infection susceptibility increased · insomnia · irregular menstruation · leukocytosis · malaise · manifestations of latent diabetes mellitus · mood swings · muscle atrophy · muscular weakness · myopathy · nausea · necrotising vasculitis · negative nitrogen balance · osteoporosis · pancreatitis · pathological fracture of long bones · peptic ulcer · personality changes · petechiae · posterior subcapsular cataracts · pruritus · psychotic manifestations · Quincke's oedema · secondary adrenocortical unresponsiveness · secondary pituitary unresponsiveness · severe depression · skin atrophy · skin hyperpigmentation · skin reactions at injection site · sodium retention · spinal compression fractures · tendon rupture · thromboembolism · ulcerative oesophagitis · urticaria · vertigo · vomiting · weight increase
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.
- **PREGNANCY** Avoid (but may be used diagnostically if essential).
- **BREAST FEEDING** Avoid (but may be used diagnostically if essential).
- **HEPATIC IMPAIRMENT** An enhanced effect of tetracosactide therapy may occur in patients with cirrhosis of the liver. Use with caution in hepatic impairment. Monitor hepatic function closely during treatment.
- **RENAL IMPAIRMENT** Use with caution in patients with renal impairment.
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.  
Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.
- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.  
**Solution for injection**  
• **Synacthen** (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd)  
Tetracosactide acetate 250 microgram per 1 ml Synacthen 250micrograms/1ml solution for injection ampoules | 1 ampoule [PoM] £38.00

**Suspension for injection**

EXCIPIENTS: May contain Benzyl alcohol

- **Synacthen Depot** (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd)

Tetracosactide acetate 1 mg per 1 ml Synacthen Depot 1mg/1ml suspension for injection ampoules | 1 ampoule [PoM] £346.28

## 7.2 Assessment of pituitary function

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPIN-RELEASING HORMONES

**Gonadorelin**

(Gonadotrophin-releasing hormone; GnRH; LH-RH)

**• INDICATIONS AND DOSE****Assessment of pituitary function**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 100 micrograms for 1 dose

- **CAUTIONS** Pituitary adenoma

- **SIDE-EFFECTS** Abdominal pain · headache · hypersensitivity reaction on repeated administration of large doses · increased menstrual bleeding · irritation at injection site · nausea

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

**• MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Gonadorelin (Non-proprietary)**

Gonadorelin (as Gonadorelin hydrochloride)

100 microgram Gonadorelin 100microgram powder and solvent for solution for injection vials | 1 vial [PoM] £75.00 (Hospital only)

## 7.3 Gonadotrophin replacement therapy

**GONADOTROPHINS****Choriogonadotropin alfa**

(Human chorionic gonadotropin)

**• INDICATIONS AND DOSE**

**Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene**  
**| Superovulation treatment for assisted conception (such as in vitro fertilisation)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Active thromboembolic disorders · ectopic pregnancy in previous 3 months · hypothalamus malignancy · mammary malignancy · ovarian enlargement or cyst (unless caused by polycystic ovarian disease) · ovarian malignancy · pituitary malignancy · uterine malignancy

- **CAUTIONS** Acute porphyrias p. 969

- **SIDE-EFFECTS** Abdominal pain · breast pain · depression · diarrhoea · ectopic pregnancy · headache · injection-site

reactions · irritability · nausea · ovarian hyperstimulation syndrome · ovarian torsion · tiredness · vomiting

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Ovitrelle** (Merck Serono Ltd)  
**Chorionic gonadotrophin alfa 500 microgram per 1 ml** Ovitrelle 250micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £31.38 [CD4-2]  
Ovitrelle 250micrograms/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £31.38 [CD4-2]

## Chorionic gonadotrophin

(Human chorionic gonadotrophin; HCG)

- **DRUG ACTION** A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone.

### INDICATIONS AND DOSE

**Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Androgen-dependent tumours
- **CAUTIONS** Asthma · cardiac impairment · epilepsy · migraine · prepubertal boys (risk of premature epiphyseal closure or precocious puberty)
- **SIDE-EFFECTS** Gynaecomastia · headache · local reactions · may aggravate ovarian hyperstimulation · mood changes · multiple pregnancy · oedema (particularly in males—reduce dose) · tiredness
- **RENAL IMPAIRMENT** Use with caution.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for solution for injection

- ▶ **Choragon** (Ferring Pharmaceuticals Ltd)  
**Chorionic gonadotrophin human 5000 unit** Choragon 5,000unit powder and solvent for solution for injection ampoules | 3 ampoule [PoM] £9.77 [CD4-2]
- ▶ **Pregnyl** (Merck Sharp & Dohme Ltd)  
**Chorionic gonadotrophin human 1500 unit** Pregnyl 1,500unit powder and solvent for solution for injection ampoules | 1 ampoule [PoM] £2.12 [CD4-2]  
**Chorionic gonadotrophin human 5000 unit** Pregnyl 5,000unit powder and solvent for solution for injection ampoules | 1 ampoule [PoM] £3.15 [CD4-2]

## Corifollitropin alfa

### INDICATIONS AND DOSE

**Controlled ovarian stimulation in combination with a gonadotrophin-releasing hormone antagonist**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (body-weight up to 60 kg): 100 micrograms
- ▶ Adult (body-weight 60 kg and above): 150 micrograms

- **CONTRA-INDICATIONS** History of ovarian hyperstimulation syndrome · ovarian enlargement or cyst · polycystic ovarian syndrome · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 969 · risk factors for thromboembolism · risk of ovarian hyperstimulation syndrome

### SIDE-EFFECTS

- ▶ **Common or very common** Breast pain · fatigue · headache · nausea · ovarian hyperstimulation · pelvic pain
- ▶ **Uncommon** Abdominal distension and pain · constipation · diarrhoea · dizziness · ovarian torsion · vomiting
- ▶ **Frequency not known** Ectopic pregnancy · miscarriage · multiple pregnancies

- **BREAST FEEDING** Avoid.

- **RENAL IMPAIRMENT** Avoid.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Elonva** (Merck Sharp & Dohme Ltd)  
**Corifollitropin alfa 200 microgram per 1 ml** Elonva 100micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £638.00  
**Corifollitropin alfa 300 microgram per 1 ml** Elonva 150micrograms/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £638.00

## Follitropin alfa

(Recombinant human follicle stimulating hormone)

### INDICATIONS AND DOSE

**Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (female): Adjusted according to response.

#### Hypogonadotrophic hypogonadism

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Adult (male): (consult product literature).

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · ovarian enlargement (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of prostate · tumours of testes · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 969 · history of tubal disease

### SIDE-EFFECTS

- ▶ **Common or very common** Fever · gastro-intestinal disturbances · headache · hypersensitivity reactions · injection site reactions · joint pain · ovarian hyperstimulation · varicocele
- ▶ **Very rare** Exacerbation or aggravation of asthma · thromboembolism
- ▶ **Frequency not known** Acne · gynaecomastia · increased risk of miscarriage · increased risk of multiple pregnancy · weight gain

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **PRESCRIBING AND DISPENSING INFORMATION** Follitropin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

### PATIENT AND CARER ADVICE

**Patient advice required around conception and contraception**  
Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**▶ **Bemfola** (Finox Biotech UK) ▼

**Follitropin alfa 600 unit per 1 ml** Bemfola 225units/0.375ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £70.50

Bemfola 300units/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £94.00

Bemfola 150units/0.25ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £47.00

Bemfola 75units/0.125ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £23.50

Bemfola 450units/0.75ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £141.00

▶ **Gonal-f** (Merck Serono Ltd)

**Follitropin alfa 600 unit per 1 ml** Gonal-f 900units/1.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £282.00

Gonal-f 300units/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £94.00

Gonal-f 450units/0.75ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £141.00

▶ **Ovaleap** (Teva UK Ltd) ▼

**Follitropin alfa 600 unit per 1 ml** Ovaleap 450units/0.75ml solution for injection cartridges | 1 cartridge [PoM] £112.80

Ovaleap 900units/1.5ml solution for injection cartridges | 1 cartridge [PoM] £225.60

Ovaleap 300units/0.5ml solution for injection cartridges | 1 cartridge [PoM] £75.20

**Powder and solvent for solution for injection**▶ **Gonal-f** (Merck Serono Ltd)

**Follitropin alfa 75 unit** Gonal-f 75unit powder and solvent for solution for injection vials | 1 vial [PoM] £21.02

**Follitropin alfa 450 unit** Gonal-f 450unit powder and solvent for solution for injection vials | 1 vial [PoM] £126.10

**Follitropin alfa 1050 unit** Gonal-f 1,050unit powder and solvent for solution for injection vials | 1 vial [PoM] £294.22

**Follitropin alfa with lutropin alfa**

The properties listed below are those particular to the combination only. For the properties of the components please consider, follitropin alfa p. 702, lutropin alfa p. 704.

**● INDICATIONS AND DOSE**

**Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)**

## ▶ BY SUBCUTANEOUS INJECTION

▶ Adult (female): Adjusted according to response.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

ELECTROLYTES: May contain Sodium

▶ **Pergoveris** (Merck Serono Ltd)

**Lutropin alfa 75 unit, Follitropin alfa 150 unit** Pergoveris 150unit/75unit powder and solvent for solution for injection vials | 1 vial [PoM] £60.29 | 10 vial [PoM] £602.90

**Follitropin beta**

(Recombinant human follicle stimulating hormone)

**● INDICATIONS AND DOSE**

**Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)**

▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

▶ Adult (female): Adjusted according to response.

**Hypogonadotrophic hypogonadism**

▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

▶ Adult (male): (consult product literature).

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · ovarian enlargement (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of prostate · tumours of testes · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 969 · history of tubal disease

**● SIDE-EFFECTS**

- ▶ **Common or very common** Fever · gastro-intestinal disturbances · headache · hypersensitivity reactions · injection site reactions · joint pain · ovarian hyperstimulation
- ▶ **Very rare** Thromboembolism
- ▶ **Frequency not known** Acne · gynaecomastia · increased risk of miscarriage · increased risk of multiple pregnancy · weight gain

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **DIRECTIONS FOR ADMINISTRATION** Cartridges and vials are used for subcutaneous administration; vials are used for intramuscular injection.

**● PATIENT AND CARER ADVICE**

Patient advice required around conception and contraception  
Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

EXCIPIENTS: May contain Neomycin, streptomycin

▶ **Puregon** (Merck Sharp & Dohme Ltd)

**Follitropin beta 100 unit per 1 ml** Puregon 50units/0.5ml solution for injection vials | 1 vial [PoM] £18.03

**Follitropin beta 200 unit per 1 ml** Puregon 100units/0.5ml solution for injection vials | 1 vial [PoM] £36.06

**Follitropin beta 833 unit per 1 ml** Puregon 900units/1.08ml solution for injection cartridges | 1 cartridge [PoM] £292.23

Puregon 600units/0.72ml solution for injection cartridges | 1 cartridge [PoM] £194.62

Puregon 300units/0.36ml solution for injection cartridges | 1 cartridge [PoM] £97.41

## Lutropin alfa

### (Recombinant human luteinising hormone)

#### ● INDICATIONS AND DOSE

**Treatment of infertility in women with proven hypopituitarism or who have not responded to clomifene (in conjunction with follicle-stimulating hormone) | Superovulation treatment for assisted conception (such as in vitro fertilisation) (in conjunction with follicle-stimulating hormone)**

- BY SUBCUTANEOUS INJECTION
- Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Mammary carcinoma · ovarian carcinoma · ovarian enlargement or cyst (unless caused by polycystic ovarian disease) · tumours of hypothalamus · tumours of pituitary · undiagnosed vaginal bleeding · uterine carcinoma

- **CAUTIONS** Acute porphyrias p. 969

- **SIDE-EFFECTS** Abdominal pain · adnexal torsion · breast pain · ectopic pregnancy · haemoperitoneum · headache · injection-site reactions · nausea · ovarian cyst · ovarian hyperstimulation syndrome · pelvic pain · somnolence · thromboembolism · vomiting

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder and solvent for solution for injection**

- **Luveris** (Merck Serono Ltd)

**Lutropin alfa 75 unit** Luveris 75unit powder and solvent for solution for injection vials | 1 vial [PoM] £31.38

## Menotrophin

#### ● INDICATIONS AND DOSE

**Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)**

- BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult (female): Adjusted according to response.

#### **Hypogonadotrophic hypogonadism**

- BY DEEP INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult (male): (consult product literature).

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · ovarian enlargement (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of prostate · tumours of testes · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 969 · history of tubal disease

#### ● SIDE-EFFECTS

- **Very rare** Thromboembolism
- **Frequency not known** Acne · fever · gastro-intestinal disturbances · gynaecomastia · headache · hypersensitivity reactions · increased risk of multiple pregnancy and miscarriage · injection site reactions · joint pain · ovarian hyperstimulation · weight gain

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

#### ● PRESCRIBING AND DISPENSING INFORMATION

Menotrophin is purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH) and luteinising hormone (LH) in a ratio of 1:1

#### ● PATIENT AND CARER ADVICE

**Patient advice required around conception and contraception**  
Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder and solvent for solution for injection**

- **Menopur** (Ferring Pharmaceuticals Ltd)

**Menotrophin 75 unit** Menopur 75unit powder and solvent for solution for injection vials | 1 vial [PoM] £16.38 | 10 vial [PoM] £163.80

**Menotrophin 150 unit** Menopur 150unit powder and solvent for solution for injection vials | 5 vial [PoM] £163.80 | 10 vial [PoM] £327.60

**Menotrophin 600 unit** Menopur 600unit powder and solvent for solution for injection vials | 1 vial [PoM] £131.04

**Menotrophin 1200 unit** Menopur 1,200unit powder and solvent for solution for injection vials | 1 vial [PoM] £262.08

- **Merional** (IBSA Farmaceutici Italia Srl)

**Menotrophin 75 unit** Merional 75unit powder and solvent for solution for injection vials | 10 vial [PoM] £279.00

**Menotrophin 150 unit** Merional 150unit powder and solvent for solution for injection vials | 10 vial [PoM] £558.00

## Urofollitropin

#### ● INDICATIONS AND DOSE

**Infertility in women with proven hypopituitarism or who have not responded to clomifene | Superovulation treatment for assisted conception (such as in vitro fertilisation)**

- BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- Adult (female): Adjusted according to response.

- **CONTRA-INDICATIONS** Ovarian cysts (not caused by polycystic ovarian syndrome) · tumours of breast · tumours of hypothalamus · tumours of ovaries · tumours of pituitary · tumours of prostate · tumours of testes · tumours of uterus · vaginal bleeding of unknown cause

- **CAUTIONS** Acute porphyrias p. 969

#### ● SIDE-EFFECTS

- **Very rare** Thromboembolism
- **Frequency not known** Fever · gastro-intestinal disturbances · headache · hypersensitivity reactions · increased risk of miscarriage · increased risk of multiple pregnancy · injection site reactions · joint pain · ovarian hyperstimulation

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

#### ● PRESCRIBING AND DISPENSING INFORMATION

Urofollitropin is purified extract of human post-menopausal urine containing follicle-stimulating hormone (FSH).

#### ● PATIENT AND CARER ADVICE

**Patient advice required around conception and contraception**  
Patients planning to conceive should be warned that there is a risk of multiple pregnancy.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder and solvent for solution for injection**

- **Bravelle** (Ferring Pharmaceuticals Ltd)

**Follicle stimulating hormone human (as Urofollitropin)**

**75 unit** Bravelle 75unit powder and solvent for solution for injection vials | 10 vial [PoM] £270.00

- **Fastimon** (IBSA Farmaceutici Italia Srl)

**Follicle stimulating hormone human (as Urofollitropin)**

**75 unit** Fastimon 75unit powder and solvent for solution for injection vials | 10 vial [PoM] £279.00

Follicle stimulating hormone human (as Urofollitropin)  
150 unit Postimon 150unit powder and solvent for solution for  
injection vials | 10 vial [PoM] £558.00

## 7.4 Growth hormone disorders

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GROWTH HORMONE RECEPTOR ANTAGONISTS

#### Pegvisomant

- **DRUG ACTION** Pegvisomant is a genetically modified analogue of human growth hormone and is a highly selective growth hormone receptor antagonist.

##### ● INDICATIONS AND DOSE

**Treatment of acromegaly in patients with inadequate response to surgery, radiation, or both, and to treatment with somatostatin analogues (initiated by a specialist)**

##### ► BY SUBCUTANEOUS INJECTION

- Adult: Initially 80 mg for 1 dose, followed by 10 mg daily, then increased in steps of 5 mg daily, adjusted according to response; maximum 30 mg per day

- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · liver disease

##### ● SIDE-EFFECTS

- **Uncommon** Bleeding tendency · leucocytosis · leucopenia · thrombocytopenia
- **Frequency not known** Abdominal distension · arthralgia · asthenia · constipation · diarrhoea · dizziness · drowsiness · dyspepsia · elevated liver enzymes · fatigue · flatulence · headache · hypercholesterolaemia · hyperglycaemia · hypertension · hypoglycaemia · influenza-like syndrome · injection-site reactions · myalgia · nausea · pruritus · rash · sleep disturbances · sweating · tremor · vomiting · weight gain

##### SIDE-EFFECTS, FURTHER INFORMATION

- Injection-site reactions Rotate injection sites to avoid lipohypertrophy.

- **CONCEPTION AND CONTRACEPTION** Possible increase in female fertility.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **MONITORING REQUIREMENTS** Monitor liver enzymes every 4–6 weeks for 6 months or if symptoms of hepatitis develop.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Powder and solvent for solution for injection**

##### ► Somavert (Pfizer Ltd)

**Pegvisomant 10 mg** Somavert 10mg powder and solvent for solution for injection vials | 30 vial [PoM] £1,500.00 (Hospital only)

**Pegvisomant 15 mg** Somavert 15mg powder and solvent for solution for injection vials | 30 vial [PoM] £2,250.00 (Hospital only)

**Pegvisomant 20 mg** Somavert 20mg powder and solvent for solution for injection vials | 1 vial [PoM] £100.00 (Hospital only) | 30 vial [PoM] £3,000.00 (Hospital only)

**Pegvisomant 25 mg** Somavert 25mg powder and solvent for solution for injection vials | 30 vial [PoM] £3,750.00 (Hospital only)

**Pegvisomant 30 mg** Somavert 30mg powder and solvent for solution for injection vials | 30 vial [PoM] £4,500.00 (Hospital only)

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > HUMAN GROWTH HORMONES

#### Somatropin

(Recombinant Human Growth Hormone)

##### ● INDICATIONS AND DOSE

##### **Gonadal dysgenesis (Turner syndrome)**

##### ► BY SUBCUTANEOUS INJECTION

- Adult: 1.4 mg/m<sup>2</sup> daily, alternatively 45–50 micrograms/kg daily

##### **Deficiency of growth hormone**

##### ► BY SUBCUTANEOUS INJECTION

- Adult: Initially 150–300 micrograms daily, then increased if necessary up to 1 mg daily, dose to be increased gradually, use minimum effective dose (requirements may decrease with age)

##### **DOSE EQUIVALENCE AND CONVERSION**

- Dose formerly expressed in units; somatropin 1 mg ≡ 3 units.

- **CONTRA-INDICATIONS** Evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) · not to be used after renal transplantation · severe obesity in Prader-Willi syndrome · severe respiratory impairment in Prader-Willi syndrome

- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · disorders of the epiphysis of the hip (monitor for limping) · history of malignant disease · hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value · initiation of treatment close to puberty not recommended in child born small for corrected gestational age · papilloedema · relative deficiencies of other pituitary hormones · resolved intracranial hypertension (monitor closely) · Silver-Russell syndrome

- **INTERACTIONS** → Appendix 1: somatropin

- **SIDE-EFFECTS** Antibody formation · arthralgia · benign intracranial hypertension · carpal tunnel syndrome · fluid retention (peripheral oedema) · headache · hyperglycaemia · hypoglycaemia · hypothyroidism · insulin resistance · leukaemia in children with growth hormone deficiency · myalgia · nausea · papilloedema · paraesthesia · reactions at injection site · visual problems · vomiting

##### SIDE-EFFECTS, FURTHER INFORMATION

- Papilloedema Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

- **PREGNANCY** Discontinue if pregnancy occurs—no information available.

- **BREAST FEEDING** No information available. Absorption from milk unlikely.

- **DIRECTIONS FOR ADMINISTRATION** Rotate subcutaneous injection sites to prevent lipatrophy.

**SAIZEN<sup>®</sup> SOLUTION FOR INJECTION** For use by subcutaneous injection.

**NUTROPINAQ<sup>®</sup>** For use by subcutaneous injection.

**OMNITROPE<sup>®</sup>** For use by subcutaneous injection.

**NORDITROPIN<sup>®</sup> PREPARATIONS** For use by subcutaneous injection.

**ZOMACTON<sup>®</sup>** For use by subcutaneous injection.

**GENOTROPIN<sup>®</sup> PREPARATIONS** For use by subcutaneous injection.

**SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION**

For use by subcutaneous injection.

**HUMATROPE®** Cartridges for use by subcutaneous injection. Powder for reconstitution for use by subcutaneous or intramuscular injection.

- **PRESCRIBING AND DISPENSING INFORMATION** Somatropin is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines* and *Biosimilar medicines*, under Guidance on prescribing p. 1.

**SAIZEN® SOLUTION FOR INJECTION** For use with *cool.click®* needle-free autoinjector device or *easypod®* autoinjector device (non-NHS but available free of charge from clinics).

**NUTROPINAQ®** For use with *NutropinAq®* Pen device (non-NHS but available free of charge from clinics).

**OMNITROPE®** For use with *Omnitrope Pen 5®* and *Omnitrope Pen 10®* devices (non-NHS but available free of charge from clinics).

**NORDITROPIN® PREPARATIONS** Cartridges are for use with appropriate *NordiPen®* device (non-NHS but available free of charge from clinics). Multidose disposable prefilled pens for use with *NovoFine®* or *NovoTwist®* needles.

**ZOMACTON®** 4 mg vial for use with *ZomaJet 2® Vision* needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

**SAIZEN® POWDER AND SOLVENT FOR SOLUTION FOR INJECTION** For use with *one.click®* autoinjector device or *cool.click®* needle-free autoinjector device (non-NHS but available free of charge from clinics).

- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- ▶ **Somatropin for the treatment of growth failure in children (May 2010) NICE TA188**

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency
- have Turner syndrome
- have Prader-Willi syndrome
- have chronic renal insufficiency
- are born small for gestational age with subsequent growth failure at 4 years of age or later
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

[www.nice.org.uk/TA188](http://www.nice.org.uk/TA188)

- ▶ **Somatropin for adults with growth hormone deficiency (August 2003) NICE TA64**

Somatropin is recommended in adults **only** if the following 3 criteria are fulfilled:

- Severe growth hormone deficiency, established by an appropriate method,
- Impaired quality of life, measured by means of a specific questionnaire,
- Already receiving treatment for another pituitary hormone deficiency.

Somatropin treatment should be discontinued if the quality of life has not improved sufficiently by 9 months.

Severe growth hormone deficiency developing after linear growth is complete but before the age of 25 years should be treated with growth hormone; treatment should

continue until adult peak bone mass has been achieved. Treatment for adult-onset growth hormone deficiency should be stopped only when the patient and the patient's physician consider it appropriate.

Treatment with somatropin should be initiated and managed by a physician with expertise in growth hormone disorders; maintenance treatment can be prescribed in the community under a shared-care protocol.

## 8 Sex hormone responsive conditions

### Sex hormones

#### Oestrogens and HRT

Oestrogens are necessary for the development of female secondary sexual characteristics; they also stimulate myometrial hypertrophy with endometrial hyperplasia.

In terms of oestrogen activity *natural oestrogens* (estradiol p. 711 (oestradiol), estrone (oestrone), and estriol p. 783 (oestriol)) have a more appropriate profile for hormone replacement therapy (HRT) than *synthetic oestrogens* (ethinylestradiol p. 715 (ethinylestradiol) and mestranol). Tibolone p. 716 has oestrogenic, progestogenic and weak androgenic activity.

Oestrogen therapy is given cyclically or continuously for a number of gynaecological conditions. If long-term therapy is required in women with a uterus, a progestogen should normally be added to reduce the risk of cystic hyperplasia of the endometrium (or of endometriotic foci in women who have had a hysterectomy) and possible transformation to cancer.

Oestrogens are no longer used to suppress lactation because of their association with thromboembolism.

#### Hormone replacement therapy

Hormone replacement therapy (HRT) with small doses of an oestrogen (together with a progestogen in women with a uterus) is appropriate for alleviating menopausal symptoms such as vaginal atrophy or vasomotor instability. Oestrogen given systemically in the perimenopausal and postmenopausal period or tibolone given in the postmenopausal period also diminish postmenopausal osteoporosis but other drugs are preferred. Menopausal atrophic vaginitis may respond to a short course of a topical vaginal oestrogen preparation used for a few weeks and repeated if necessary.

Systemic therapy with an oestrogen or drugs with oestrogenic properties alleviates the symptoms of oestrogen deficiency such as vasomotor symptoms. Tibolone combines oestrogenic and progestogenic activity with weak androgenic activity; it is given continuously, without cyclical progestogen.

HRT may be used in women with early natural or surgical menopause (before age 45 years), since they are at high risk of osteoporosis. For early menopause, HRT can be given until the approximate age of natural menopause (i.e. until age 50 years). Alternatives to HRT should be considered if osteoporosis is the main concern.

Clonidine hydrochloride p. 139 may be used to reduce vasomotor symptoms in women who cannot take an oestrogen, but clonidine hydrochloride may cause unacceptable side-effects.

HRT increases the risk of venous thromboembolism, stroke, endometrial cancer (reduced by a progestogen), breast cancer, and ovarian cancer; there is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. For details of these risks see HRT Risk table.

The minimum effective dose of HRT should be used for the shortest duration. Treatment should be reviewed at least annually and for osteoporosis alternative treatments considered. HRT does not prevent coronary heart disease or protect against a decline in cognitive function and it should not be prescribed for these purposes. Experience of treating women over 65 years with HRT is limited.

For the treatment of menopausal symptoms the benefits of short-term HRT outweigh the risks in the majority of women, especially in those aged under 60 years.

#### Risk of breast cancer

It is estimated that using all types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping. Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use; tibolone has only a limited effect on mammographic density.

#### Risk of endometrial cancer

The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT. In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

#### Risk of ovarian cancer

Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer; this excess risk disappears within a few years of stopping.

#### Risk of venous thromboembolism

Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use. In women who

HRT Risks

Risk	Age range (years)	Background incidence per 1000 women in Europe not using HRT		Additional cases per 1000 women using oestrogen only HRT (estimated)		Additional cases per 1000 women using combined (oestrogen-progesterone) HRT (estimated)	
		Over 5 years	Over 10 years	For 5 years' use	For 10 years' use	For 5 years' use	For 10 years' use
Breast cancer <sup>1</sup>	50-59	10	20	2	6	6	24
	60-69	15	30	3	9	9	36
Endometrial cancer <sup>2,3</sup>	50-59	2	4	4	32	NS	NS
	60-69	3	6	6	48	NS	NS
Ovarian cancer	50-59	2	4	<1	1	<1	1
	60-69	3	6	<1	2	<1	2
Venous thromboembolism <sup>4,5</sup>	50-59	5	–	2	–	7	–
	60-69	8	–	2	–	10	–
Stroke <sup>6</sup>	50-59	4	–	1	–	1	–
	60-69	9	–	3	–	3	–
Coronary heart disease <sup>7,8</sup>	70-79	29-44	–	NS	–	15	–

Where background incidence or additional cases have not been included in the table, this indicates a lack of available data. NS indicates a non-significant difference. Taken from MHRA/CHM (*Drug Safety* 2007; 1 (2): 2-6) available at [www.gov.uk/drug-safety-update](http://www.gov.uk/drug-safety-update)

- 1 Tibolone increases the risk of breast cancer but to a lesser extent than with combined HRT.
- 2 Evidence suggests an increased risk of endometrial cancer with tibolone. After 2.7 years of use (in women of average age 68 years), 1 extra case of endometrial hyperplasia and 4 extra cases of endometrial cancer were diagnosed compared with placebo users.
- 3 The risk of endometrial cancer cannot be reliably estimated in those using combined HRT because the addition of progesterone for at least 10 days per 28-day cycle greatly reduces the additional risk, and addition of a daily progesterone eliminates the additional risk. The risk of endometrial cancer in women who have not used HRT increases with body mass index (BMI); the increased risk of endometrial cancer in users of oestrogen-only HRT or tibolone is more apparent in women who are not overweight.
- 4 Limited data does not suggest an increased risk of thromboembolism with tibolone compared with combined HRT or women not taking HRT.
- 5 Although the level of risk of thromboembolism associated with non-oral routes of administration of HRT has not been established, it may be lower for the transdermal route.
- 6 Tibolone increases the risk of stroke about 2.2 times from the first year of treatment; risk of stroke is age-dependent and therefore the absolute risk of stroke with tibolone increases with age.
- 7 Increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause.
- 8 There is insufficient data to draw a conclusion on the risk of coronary heart disease with tibolone.

have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits. Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

Risk of stroke

Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke. Tibolone increases the risk of stroke about 2.2 times from the first year of treatment.

Risk of coronary heart disease

HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

Choice

The choice of HRT for an individual depends on an overall balance of indication, risk, and convenience. A woman with a uterus normally requires oestrogen with cyclical progesterone for the last 12 to 14 days of the cycle or a preparation which involves continuous administration of an oestrogen and a progesterone (or one which provides both oestrogenic and progestogenic activity in a single preparation). Continuous

combined preparations or tibolone are **not suitable** for use in the perimenopause or within 12 months of the last menstrual period; women who use such preparations may bleed irregularly in the early stages of treatment—if bleeding continues endometrial abnormality should be ruled out and consideration given to changing to cyclical HRT.

An oestrogen alone is suitable for continuous use in women without a uterus. However, in endometriosis, endometrial foci may remain despite hysterectomy and the addition of a progesterone should be considered in these circumstances.

An oestrogen may be given by mouth or by transdermal administration, which avoids first-pass metabolism.

Surgery

Major surgery under general anaesthesia, including orthopaedic and vascular leg surgery, is a predisposing factor for venous thromboembolism and it may be prudent to stop HRT 4–6 weeks before surgery; it should be restarted only after full mobilisation. If HRT is continued or if discontinuation is not possible (e.g. in non-elective surgery), prophylaxis with unfractionated or low molecular weight heparin and graduated compression hosiery is advised.

Reasons to stop HRT

Hormone replacement therapy should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;

- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg;
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment

### Ethinylestradiol

Ethinylestradiol p. 715 (ethinylestradiol) is licensed for short-term treatment of symptoms of oestrogen deficiency, for osteoporosis prophylaxis if other drugs cannot be used and for the treatment of female hypogonadism and menstrual disorders.

Ethinylestradiol is occasionally used under **specialist supervision** for the management of *hereditary haemorrhagic telangiectasia* (but evidence of benefit is limited). It is also used licensed for the palliative treatment of prostate cancer.

### Raloxifene

Raloxifene hydrochloride below is licensed for the treatment and prevention of *postmenopausal osteoporosis*; unlike hormone replacement therapy, raloxifene hydrochloride does not reduce menopausal vasomotor symptoms.

### Progestogens and progesterone receptor modulators

There are two main groups of progestogen, progesterone and its analogues (dydrogesterone and medroxyprogesterone acetate p. 763) and testosterone analogues (norethisterone p. 720 and norgestrel). The newer progestogens (desogestrel p. 758, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 759 is the active isomer of norgestrel and has twice its potency. Progesterone p. 721 and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

Where endometriosis requires drug treatment, it may respond to a progestogen, e.g. norethisterone, administered on a continuous basis. Danazol p. 699 and gonadorelin analogues are also available.

Although oral progestogens have been used widely for menorrhagia they are relatively ineffective compared with tranexamic acid p. 107 or, particularly where dysmenorrhoea is also a factor, mefenamic acid p. 1046; the levonorgestrel-releasing intra-uterine system may be particularly useful for women also requiring contraception. Oral progestogens have also been used for severe dysmenorrhoea, but where contraception is also required in younger women the best choice is a combined oral contraceptive.

Progestogens have also been advocated for the alleviation of premenstrual symptoms, but no convincing physiological basis for such treatment has been shown.

Progestogens have been used for the prevention of miscarriage in women with a history of recurrent miscarriage but there is no evidence of benefit and they are **not** recommended for this purpose. In pregnant women with antiphospholipid antibody syndrome who have suffered recurrent miscarriage, administration of low-dose aspirin p. 117 and a prophylactic dose of a low molecular weight heparin may decrease the risk of fetal loss (use under specialist supervision only).

### Hormone replacement therapy

In women with a uterus a progestogen needs to be added to long-term oestrogen therapy for hormone replacement, to

prevent cystic hyperplasia of the endometrium and possible transformation to cancer; it can be added on a cyclical or a continuous basis. Combined packs incorporating suitable progestogen tablets are available.

### Oral contraception

Desogestrel, gestodene, levonorgestrel, norethisterone, and norgestimate are used in combined oral contraceptives and in progestogen-only contraceptives.

### Cancer

Progestogens also have a role in neoplastic disease.

### Progesterone receptor modulators

Ulipristal acetate p. 757 is a progesterone receptor modulator with a partial progesterone antagonist effect. Ulipristal acetate is used in the pre-operative treatment of moderate to severe symptoms of uterine fibroids; it is also used as an hormonal emergency contraceptive.

### Heavy menstrual bleeding

**EvGr** Ulipristal acetate (up to four courses) is recommended in patients with heavy menstrual bleeding associated with uterine fibroids of a diameter of 3 cm or more, and a haemoglobin level of 102 g/litre or below; ulipristal acetate may also be considered if the haemoglobin level is greater than 102 g/litre. 

## 8.1 Female sex hormone responsive conditions

### CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

#### Raloxifene hydrochloride

##### • INDICATIONS AND DOSE

**Treatment and prevention of postmenopausal osteoporosis**

- BY MOUTH
- Adult: 60 mg once daily

- **CONTRA-INDICATIONS** Cholestasis · endometrial cancer · history of venous thromboembolism · undiagnosed uterine bleeding

- **CAUTIONS** Avoid in acute porphyrias p. 969 · breast cancer (manufacturer advises avoid during treatment for breast cancer) · history of oestrogen-induced hypertriglyceridaemia (monitor serum triglycerides) · risk factors for stroke · risk factors for venous thromboembolism (discontinue if prolonged immobilisation)

- **INTERACTIONS** → Appendix 1: raloxifene

##### • SIDE-EFFECTS

- **Common or very common** Hot flushes · influenza-like symptoms · leg cramps · peripheral oedema
- **Uncommon** Thrombophlebitis · venous thromboembolism
- **Rare** Arterial thromboembolism · breast discomfort · gastro-intestinal disturbances · headache · hypertension · migraine · rashes · thrombocytopenia

- **HEPATIC IMPAIRMENT** Avoid.

- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

##### • NATIONAL FUNDING/ACCESS DECISIONS

##### **NICE technology appraisals (TAs)**

- Alendronate, etidronate, risedronate, raloxifene and strontium ranelate for the primary prevention of osteoporotic

fragility fractures in postmenopausal women (October 2008) NICE TA160

**Raloxifene** is **not** recommended as a treatment option in postmenopausal women for primary prevention of osteoporotic fractures.

[www.nice.org.uk/TA160](http://www.nice.org.uk/TA160)

- ▶ Alendronate, etidronate, risedronate, raloxifene, strontium ranelate, and teriparatide for the secondary prevention of osteoporotic fragility fractures in postmenopausal women (October 2008) NICE TA161

This guideline recommends treatment options for the secondary prevention of osteoporotic fractures in postmenopausal women with confirmed osteoporosis who have also sustained a clinically apparent osteoporotic fracture.

**Raloxifene** is recommended as an alternative treatment option for women:

- in whom alendronate and risedronate are contra-indicated or not tolerated **and**
- who comply with particular combinations of bone mineral density measurement, age, and independent risk factors for fracture, as indicated in the full NICE guidance (available at [www.nice.org.uk/TA161](http://www.nice.org.uk/TA161)).

[www.nice.org.uk/TA161](http://www.nice.org.uk/TA161)

## OESTROGENS

### Conjugated oestrogens (equine)

#### • INDICATIONS AND DOSE

##### PREMARIN® TABLETS

##### Menopausal symptoms

###### ▶ BY MOUTH

Adult: 0.3–1.25 mg daily continuously; with cyclical progesterogen for 12–14 days of each cycle in women with a uterus

##### Osteoporosis prophylaxis

###### ▶ BY MOUTH

Adult: 0.625–1.25 mg daily continuously; with cyclical progesterogen for 12–14 days of each cycle in women with a uterus

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · Dubin-Johnson syndromes (or monitor closely) · history of breast cancer · history of recurrent venous thromboembolism (unless already on anticoagulant treatment) · liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · Rotor syndromes (or monitor closely) · thrombophilic disorder · undiagnosed

vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism

- **CAUTIONS** Acute porphyrias p. 969 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules (closely monitor breast status—risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease (closely monitor breast status—risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease reported · migraine · migraine-like headaches · presence of antiphospholipid antibodies (increased risk of thrombotic events) · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk of breast cancer

#### CAUTIONS, FURTHER INFORMATION

- ▶ Risk of breast cancer It is estimated that using *all* types of HRT, including tibolone, increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- ▶ Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously.

However, this should be weighed against the increased risk of breast cancer.

- ▶ Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- ▶ Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have *predisposing factors* (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

*Travel* involving prolonged immobility further increases the risk of deep vein thrombosis.

- ▶ Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.
- ▶ Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.
- ▶ Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

- **SIDE-EFFECTS** Abdominal bloating · abdominal cramps · altered blood lipids (may lead to pancreatitis, rashes and chloasma) · breast enlargement · breast tenderness · changes in libido · cholestatic jaundice · contact lenses may irritate · depression · dizziness · fluid retention · glucose intolerance · headache · headache (on vigorous exercise) · leg cramps (rule out venous thrombosis) · migraine · mood changes · nausea · premenstrual-like syndrome · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · sodium retention · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size · vaginal candidiasis · vomiting · weight changes

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Withdrawal bleeding** Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in *regular withdrawal bleeding* towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but *irregular bleeding* may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).
- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- ▶ **Premarin** (Pfizer Ltd)

Conjugated oestrogens 300 microgram Premarin 0.3mg tablets | 84 tablet [PoM] £6.07 DT price = £6.07

Conjugated oestrogens 625 microgram Premarin 0.625mg tablets | 84 tablet [PoM] £4.02 DT price = £4.02

Conjugated oestrogens 1.25 mg Premarin 1.25mg tablets | 84 tablet [PoM] £3.58 DT price = £3.58

Combinations available: *Conjugated oestrogens with medroxyprogesterone*, p. 717

## Conjugated oestrogens with bazedoxifene acetate

28-Mar-2017

The properties listed below are those particular to the combination only. For the properties of the components please consider, conjugated oestrogens (equine) p. 710.

#### INDICATIONS AND DOSE

**Menopausal symptoms (in women with at least 12 months since last menses for whom treatment with progestogen-containing therapy is not appropriate)**

- ▶ BY MOUTH
- ▶ Adult: 0.45/20 mg daily continuously

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ Dose expressed as x/y mg conjugated oestrogens/bazedoxifene.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

#### SIDE-EFFECTS

- ▶ **Common or very common** Dry mouth · muscle spasms · somnolence
- ▶ **Uncommon** Cholecystitis
- ▶ **Frequency not known** Visual disturbances

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

- ▶ **Duavive** (Merck Sharp & Dohme Ltd)

Conjugated oestrogens 450 microgram, Bazedoxifene (as Bazedoxifene acetate) 20 mg Duavive 0.45mg/20mg modified-release tablets | 28 tablet [PoM] £15.00

## Estradiol

#### INDICATIONS AND DOSE

##### BEDOL<sup>®</sup>

**Menopausal symptoms | Osteoporosis prophylaxis**

- ▶ BY MOUTH
- ▶ Adult: 2 mg daily, started on day 1–5 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

##### CLIMAVAL<sup>®</sup>

**Menopausal symptoms (if patient has had a hysterectomy)**

- ▶ BY MOUTH
- ▶ Adult: 1–2 mg daily

##### ELLESTE SOLO<sup>®</sup> MX

**Menopausal symptoms**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with MX 40, subsequently adjust according to response

**Osteoporosis prophylaxis**

- ▶ BY TRANSDERMAL APPLICATION
- ▶ Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with MX 80, subsequently adjust according to response

continued →

**ELLESTE-SOLO<sup>®</sup> 1-MG****Menopausal symptoms**

## ► BY MOUTH

- Adult: 1 mg daily, starting on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**ELLESTE-SOLO<sup>®</sup> 2-MG****Menopausal symptoms not controlled with lower strength****Osteoporosis prophylaxis**

## ► BY MOUTH

- Adult: 2 mg daily, started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be given with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**ESTRADERM MX<sup>®</sup>****Menopausal symptoms**

## ► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with *MX25* for first 3 months; subsequently adjust according to response

**Osteoporosis prophylaxis**

## ► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus, initiate therapy with *MX50*; subsequently adjust according to response

**ESTRADOT<sup>®</sup>****Menopausal symptoms**

## ► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with 25 patch for 3 months; subsequently adjust according to response

**Osteoporosis prophylaxis**

## ► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with 50 patch; subsequently adjust according to response

**EVOREL<sup>®</sup>****Menopausal symptoms | Osteoporosis prophylaxis**

## ► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch twice weekly continuously, started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, therapy should be initiated with *Evorel* 50 patch; subsequently adjust according to response; dose may be reduced to *Evorel* 25 patch after first month if necessary for menopausal symptoms **only**

**FEMSEVEN<sup>®</sup>****Menopausal symptoms | Osteoporosis prophylaxis**

## ► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch once weekly continuously, to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *FemSeven* 50 patches for the first few months, subsequently adjust according to response

**OESTROGEL<sup>®</sup>****Menopausal symptoms**

## ► TO THE SKIN

- Adult: Apply 1.5 mg once daily continuously, increased if necessary up to 3 mg after 1 month continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

**Osteoporosis prophylaxis**

## ► TO THE SKIN

- Adult: Apply 1.5 mg once daily continuously, to be applied over an area twice that of the template provided, starting within 5 days of menstruation (or anytime if cycles have ceased or are infrequent), to be used with cyclical progestogen for at least 12 days of each cycle in women with a uterus

**DOSE EQUIVALENCE AND CONVERSION**

- For *Oestrogel*<sup>®</sup>: 2 measures is equivalent to estradiol 1.5 mg.

**PROGYNOVA<sup>®</sup>****Menopausal symptoms**

## ► BY MOUTH

- Adult: 1–2 mg daily continuously, to be started on day 1 of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**Osteoporosis prophylaxis**

## ► BY MOUTH

- Adult: 2 mg daily continuously, to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

**PROGYNOVA<sup>®</sup> TS****Menopausal symptoms | Osteoporosis prophylaxis**

## ► BY TRANSDERMAL APPLICATION

- Adult: Apply 1 patch once weekly continuously, alternatively apply 1 patch once weekly for 3 weeks, followed by a 7-day patch-free interval (cyclical), to be used with cyclical progestogen for 12–14 days of each cycle in women with a uterus, initiate therapy with *Progynova* TS 50, subsequently adjust according to response, women receiving *Progynova* TS 100 patches for menopausal symptoms may continue with this strength for osteoporosis prophylaxis

**SANDRENA<sup>®</sup>****Menopausal symptoms**

## ► TO THE SKIN

- Adult: Apply 1 mg once daily, to be applied over area 1–2 times size of hand; with cyclical progestogen for 12–14 days of each cycle in women with a uterus, dose may be adjusted after 2–3 cycles to lowest effective dose; usual dose 0.5–1.5 mg daily

**ZUMENON<sup>®</sup>****Menopausal symptoms**

## ► BY MOUTH

- Adult: Initially 1 mg daily, to be started within 5 days of onset of menstruation (or any time if cycles have ceased or are infrequent), increased if necessary to 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

**Osteoporosis prophylaxis**

## ► BY MOUTH

- Adult: 2 mg daily, to be taken with a cyclical progestogen for 12–14 days of each cycle in women with a uterus

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · Dubin-Johnson syndrome (or monitor closely) · history of breast cancer · history of recurrent venous thromboembolism (unless already on anticoagulant treatment) · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · Rotor syndrome (or monitor closely) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism
- **CAUTIONS** Acute porphyrias p. 969 · diabetes (increased risk of heart disease) · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia; factors predisposing to thromboembolism · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

#### CAUTIONS, FURTHER INFORMATION

- **Risk of breast cancer** It is estimated that using all types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.  
Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.
- **Risk of endometrial cancer** The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.  
In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.
- **Risk of ovarian cancer** Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- **Risk of venous thromboembolism** Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.  
In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.  
Travel involving prolonged immobility further increases the risk of deep vein thrombosis.
- **Risk of stroke** Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.
- **Risk of coronary heart disease** HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause,

studies suggest a lower relative risk compared with older women.

- ▶ **Other conditions** The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

#### ● SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

Abdominal bloating · abdominal cramps · altered blood lipids (may lead to pancreatitis, rashes and chloasma) · breast enlargement · breast tenderness · changes in libido · cholestatic jaundice · contact lenses may irritate · depression · dizziness · fluid retention · glucose intolerance · headache · headache (on vigorous exercise) · leg cramps (rule out venous thrombosis) · migraine · mood changes · nausea · premenstrual-like syndrome · sodium retention · vaginal candidiasis · vomiting · weight changes

##### SPECIFIC SIDE-EFFECTS

- ▶ With transdermal use Cause contact sensitisation (possible severe hypersensitivity reaction on continued exposure)

##### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Withdrawal bleeding** Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in *regular withdrawal bleeding* towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but *irregular bleeding* may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).
- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.
- **MONITORING REQUIREMENTS**
  - ▶ History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
  - ▶ The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

### ● DIRECTIONS FOR ADMINISTRATION

- With transdermal use Patch should be removed after 3–4 days (or once a week in case of 7-day patch) and replaced with fresh patch on slightly different site; recommended sites: clean, dry, unbroken areas of skin on trunk below waistline; not to be applied on or near breasts or under waistband. If patch falls off in bath allow skin to cool before applying new patch.

### ● PATIENT AND CARER ADVICE

- With transdermal use Patient counselling is advised for estradiol patches (administration).
- With topical use Patient counselling is advised for estradiol gels (administration).

**OESTROGEL**® Apply gel to clean, dry, intact skin such as arms, shoulders or inner thighs and allow to dry for 5 minutes before covering with clothing. Not to be applied on or near breasts or on vulvar region. Avoid skin contact with another person (particularly male) and avoid other skin products or washing the area for at least 1 hour after application.

**SANDRENA**® Apply gel to intact areas of skin such as lower trunk or thighs, using right and left sides on alternate days. Wash hands after application. Not to be applied on the breasts or face and avoid contact with eyes. Allow area of application to dry for 5 minutes and do not wash area for at least 1 hour.

**Estradiol (as Estradiol hemihydrate) 1 mg** Sandrena 1mg gel sachets | 28 sachet [PoM] £5.85 DT price = £5.85 | 91 sachet [PoM] £17.57

Combinations available: **Estradiol with drospirenone**, p. 717 · **Estradiol with dydrogesterone**, p. 717 · **Estradiol with levonorgestrel**, p. 718 · **Estradiol with medroxyprogesterone**, p. 718 · **Estradiol with norethisterone**, p. 718 · **Estradiol with norgestrel**, p. 720

## Estradiol with estriol and estrone

The properties listed below are those particular to the combination only. For the properties of the components please consider, estradiol p. 711, estriol p. 783.

### ● INDICATIONS AND DOSE

#### Menopausal symptoms | Osteoporosis prophylaxis

##### ► BY MOUTH

- Adult: 1–2 tablets daily continuously or cyclically (21 days out of 28), started within 5 days of onset of menstruation (or at any time if cycles have ceased or are infrequent), to be taken with cyclical progestogen for 12–14 days of each cycle in women with a uterus

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- **Hormonin** (AMCo)

**Estril 270 microgram, Estradiol 600 microgram, Estrone 1.4 mg** Hormonin tablets | 84 tablet [PoM] £7.93

## Ethinylestradiol

### (Ethinylestradiol)

#### ● INDICATIONS AND DOSE

**Short-term treatment of symptoms of oestrogen deficiency** • **Osteoporosis prophylaxis if other drugs cannot be used**

##### ► BY MOUTH

- Adult (female): 10–50 micrograms daily for 21 days, repeated after 7-day tablet-free period, to be given with progestogen for 12–14 days per cycle in women with intact uterus.

#### **Female hypogonadism**

##### ► BY MOUTH

- Adult (female): 10–50 micrograms daily usually on cyclical basis, initial oestrogen therapy should be followed by combined oestrogen and progestogen therapy.

#### **Menstrual disorders**

##### ► BY MOUTH

- Adult (female): 20–50 micrograms daily from day 5 to 25 of each cycle, to be given with progestogen, added either throughout the cycle or from day 15 to 25.

#### **Palliative treatment of prostate cancer**

##### ► BY MOUTH

- Adult (male): 0.15–1.5 mg daily.

- **CONTRA-INDICATIONS** Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) • active thrombophlebitis • acute porphyrias p. 969 • Dubin-Johnson and Rotor syndromes (or monitor closely) • gallstones • heart disease associated with pulmonary hypertension • heart disease associated with risk of embolus • history during pregnancy of cholestatic jaundice • history during pregnancy of chorea • history during pregnancy of pemphigoid gestationis • history during pregnancy of pruritus • history of breast cancer • history of haemolytic uraemic syndrome • liver disease (where liver function tests have failed to return to normal) • migraine with aura • oestrogen-dependent cancer • sclerosing treatment for varicose veins • severe or multiple risk factors for arterial disease • severe or multiple risk factors for venous thromboembolism • systemic lupus erythematosus with (or unknown) antiphospholipid antibodies • thrombophilic disorder • transient cerebral ischaemic attacks without headaches • undiagnosed vaginal bleeding • untreated endometrial hyperplasia • venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment)
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice • cardiovascular disease (sodium retention with oedema, thromboembolism) • Crohn's disease • diabetes (increased risk of heart disease) • gene mutations associated with breast cancer (e.g. BRCA 1) • history of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer) • history of endometrial hyperplasia • history of severe depression (especially if induced by hormonal contraceptive) • hyperprolactinaemia (seek specialist advice) • hypophyseal tumours • increased risk of gall-bladder disease • inflammatory bowel disease • migraine (migraine-like headaches) • personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) • presence of antiphospholipid antibodies (increased risk of thrombotic events) • prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer • risk factors for arterial disease • risk factors for migraine • risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) • risk factors for

venous thromboembolism • sickle-cell disease • undiagnosed breast mass

#### **CAUTIONS, FURTHER INFORMATION**

- Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.
- Risk of venous thromboembolism Use with **caution** if any of following factors present but **avoid** if two or more factors present:
  - *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
  - *obesity*—body mass index  $\geq 30 \text{ kg/m}^2$  (avoid if body mass index  $\geq 35 \text{ kg/m}^2$  unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
  - *history of superficial thrombophlebitis*;
  - *age over 35 years* (avoid if over 50 years);
  - *smoking*.
- Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:
  - *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
  - *diabetes mellitus* (avoid if diabetes complications present);
  - *hypertension*—blood pressure above *systolic* 140 mmHg or *diastolic* 90 mmHg (avoid if blood pressure above *systolic* 160 mmHg or *diastolic* 95 mmHg); (In adolescents, avoid if blood pressure very high);
  - *smoking* (avoid if smoking 40 or more cigarettes daily);
  - *age over 35 years* (avoid if over 50 years);
  - *obesity* (avoid if body mass index  $\geq 35 \text{ kg/m}^2$  unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).
- Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).
- **INTERACTIONS** → Appendix 1: hormone replacement therapy
- **SIDE-EFFECTS**
  - **Rare** Gallstones • systemic lupus erythematosus
  - **Frequency not known** Abdominal bloating • abdominal cramps • absence of withdrawal bleeding • altered blood lipids (may lead to pancreatitis) • amenorrhoea after discontinuation • breast enlargement • breast secretion • breast tenderness • cervical erosion • changes in libido • changes in lipid metabolism • changes in vaginal discharge • chloasma • cholestatic jaundice • chorea • contact lenses may irritate • depression • dizziness • feminising effects • fluid retention • glucose intolerance • headache • hepatic tumours • hypertension • irritability • leg cramps (rule out venous thrombosis) • liver impairment • migraine • mood changes • nausea • nervousness • photosensitivity •

premenstrual-like syndrome · rashes · reduced menstrual loss · skin reactions · sodium retention · symptoms of endometriosis may be exacerbated · thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) · uterine fibroids may increase in size · vaginal candidiasis · visual disturbances · vomiting · weight changes · 'spotting' in early cycles

#### SIDE-EFFECTS, FURTHER INFORMATION

- **Withdrawal bleeding** Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in regular withdrawal bleeding towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but irregular bleeding may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).

● **HEPATIC IMPAIRMENT** Avoid.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

##### Tablet

##### ➤ Ethinylestradiol (Non-proprietary)

Ethinylestradiol 10 microgram Ethinylestradiol 10microgram tablets | 21 tablet [PoM] £200.00 DT price = £200.00

Ethinylestradiol 50 microgram Ethinylestradiol 50microgram tablets | 21 tablet [PoM] £200.00 DT price = £200.00

Ethinylestradiol 1 mg Ethinylestradiol 1mg tablets | 28 tablet [PoM] £200.00 DT price = £200.00

## Tibolone

#### ● INDICATIONS AND DOSE

**Short-term treatment of symptoms of oestrogen deficiency (including women being treated with gonadotrophin releasing hormone analogues) | Osteoporosis prophylaxis in women at high risk of fractures when other prophylaxis contra-indicated or not tolerated**

- **BY MOUTH**
- **Adult:** 2.5 mg daily

- **CONTRA-INDICATIONS** Active or recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · acute porphyrias p. 969 · Dubin-Johnson and Rotor syndrome (or monitor closely) · history of breast cancer · history of cardiovascular disease · history of cerebrovascular disease · history of recurrent venous thromboembolism (unless already on anticoagulant treatment) · history of thromboembolism · history of thrombophlebitis · hormone-dependent tumours · liver disease (where liver function tests have failed to return to normal) · oestrogen-dependent cancer · thrombophilic disorder · uninvestigated or undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism
- **CAUTIONS** Acute porphyrias p. 969 · diabetes (increased risk of heart disease) · epilepsy · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · history of liver disease · hypertriglyceridaemia · hypophyseal tumours · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies

(increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · risk of stroke

#### CAUTIONS, FURTHER INFORMATION

- **Other conditions** The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.
- **INTERACTIONS** → Appendix 1: tibolone
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · facial hair · leucorrhoea · vaginal bleeding · weight changes
  - **Rare** Amnesia
  - **Frequency not known** Arthralgia · breast cancer · depression · dizziness · gastro-intestinal disturbances · headache · increased risk of gall-bladder disease · migraine · myalgia · oedema · pruritus · rash · seborrhoeic dermatitis · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size · visual disturbances
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - **Vaginal bleeding** Investigate for endometrial cancer if bleeding continues beyond 6 months or after stopping treatment.
  - **Reasons to withdraw treatment** Withdraw treatment if signs of thromboembolic disease, abnormal liver function tests, or signs of cholestatic jaundice.

● **PREGNANCY** Avoid; toxicity in *animal* studies.

● **BREAST FEEDING** Avoid.

● **HEPATIC IMPAIRMENT** Avoid in acute liver disease or if history of liver disease and liver function tests not returned to normal.

● **RENAL IMPAIRMENT** Patients with renal impairment should be closely monitored (risk of fluid retention).

● **PRESCRIBING AND DISPENSING INFORMATION** Unsuitable for use in the premenopause (unless being treated with gonadotrophin-releasing hormone analogue) and as (or with) an oral contraceptive.

Also unsuitable for use within 12 months of last menstrual period (may cause irregular bleeding).

If transferring from cyclical HRT, start at end of regimen; if transferring from continuous-combined HRT, start at any time.

**● INDICATIONS AND DOSE****CYClo-PROGYNOVA® 2MG TABLETS**

**Menopausal symptoms in women with a uterus | Osteoporosis prophylaxis in women with a uterus**

- **BY MOUTH**
- Adult: 1 tablet daily for 11 days, white tablet to be taken; start on day 5 of menstruation (or at any time if cycles have ceased or are infrequent), then 1 tablet daily for 10 days, brown tablet to be taken, followed by a 7-day tablet free interval

- **INTERACTIONS** → Appendix 1: hormone replacement therapy

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablets**

- **Cyclo-Progynova** (Meda Pharmaceuticals Ltd)  
Cyclo-Progynova 2mg tablets | 21 tablet [PoM] £3.11

**PROGESTOGENS****Norethisterone****● INDICATIONS AND DOSE****Endometriosis**

- **BY MOUTH**
- Adult: 10–15 mg daily for 4–6 months or longer, to be started on day 5 of cycle; increased to 20–25 mg daily if required, dose only increased if spotting occurs and reduced once bleeding has stopped

**Dysfunctional uterine bleeding (to arrest bleeding) | Menorrhagia (to arrest bleeding)**

- **BY MOUTH**
- Adult: 5 mg 3 times a day for 10 days

**Dysfunctional uterine bleeding (to prevent bleeding) | Menorrhagia (to prevent bleeding)**

- **BY MOUTH**
- Adult: 5 mg twice daily, to be taken from day 19 to day 26 of cycle

**Dysmenorrhoea**

- **BY MOUTH**
- Adult: 5 mg 3 times a day for 3–4 cycles, to be taken from day 5–24 of cycle

**Premenstrual syndrome (but not recommended)**

- **BY MOUTH**
- Adult: 5 mg 2–3 times a day for several cycles, to be taken from day 19–26 of cycle

**Postponement of menstruation**

- **BY MOUTH**
- Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

**Breast cancer**

- **BY MOUTH**
- Adult: 40 mg daily, increased if necessary to 60 mg daily

**Short-term contraception**

- **BY DEEP INTRAMUSCULAR INJECTION**
- Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required

**Contraception**

- **BY MOUTH**
- Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

**● CONTRA-INDICATIONS****GENERAL CONTRA-INDICATIONS**

Avoid in patients with a history of liver tumours · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis (non-contraceptive indications) · history during pregnancy of severe pruritus (non-contraceptive indications) · when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

**SPECIFIC CONTRA-INDICATIONS**

- With oral use Acute porphyrias p. 969 · severe arterial disease · undiagnosed vaginal bleeding

**● CAUTIONS****GENERAL CAUTIONS**

Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

**SPECIFIC CAUTIONS**

- When used for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies
- With intramuscular use Disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · possible risk of breast cancer

**CAUTIONS, FURTHER INFORMATION**

- Use as a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
- Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess

risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

● **INTERACTIONS** → Appendix 1: norethisterone

● **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

Acne · alopecia · anaphylactoid reactions · breast tenderness · change in libido · depression · disturbance of appetite · dizziness · fluid retention · headache · hirsutism · insomnia (non-contraceptive indications) · jaundice · menstrual disturbances · nausea · premenstrual-like syndrome · pruritus · rash · skin reactions · urticaria · vomiting · weight change

**SPECIFIC SIDE-EFFECTS**

- ▶ With intramuscular use Injection-site reactions

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives (use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years). The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

● **PREGNANCY**

- ▶ With oral use Masculinisation of female fetuses and other defects reported with non-contraceptive use.

- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation. Higher doses (used in malignant conditions) may suppress lactation and alter milk composition—use lowest effective dose.

- ▶ With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.

- **HEPATIC IMPAIRMENT** When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Avoid in non-contraceptive indications.

- **RENAL IMPAIRMENT** Use with caution in non-contraceptive indications.

● **PATIENT AND CARER ADVICE**

**Missed oral contraceptive pill** The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery. Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the

menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. Contraceptives by injection Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Solution for injection**

- ▶ **Noristerat** (Bayer Plc)

**Norethisterone enantate 200 mg per 1 ml** Noristerat 200mg/1ml solution for injection ampoules | 1 ampoule **[PoM]** £4.05

**Tablet**

- ▶ **Norethisterone (Non-proprietary)**

**Norethisterone 5 mg** Norethisterone 5mg tablets | 30 tablet **[PoM]** £2.48 DT price = £2.18

- ▶ **Noriday** (Pfizer Ltd)

**Norethisterone 350 microgram** Noriday 350microgram tablets | 84 tablet **[PoM]** £2.10 DT price = £1.80

- ▶ **Primolut N** (Bayer Plc)

**Norethisterone 5 mg** Primolut N 5mg tablets | 30 tablet **[PoM]** £2.26 DT price = £2.18

- ▶ **Utovlan** (Pfizer Ltd)

**Norethisterone 5 mg** Utovlan 5mg tablets | 30 tablet **[PoM]** £1.40 DT price = £2.18 | 90 tablet **[PoM]** £4.21

Combinations available: **Estradiol with norethisterone**, p. 718

## Progesterone

06-Jun-2017

● **INDICATIONS AND DOSE**

**CRINONE<sup>®</sup> VAGINAL GEL**

**Infertility due to inadequate luteal phase**

- ▶ BY VAGINA

- ▶ Adult: 1 applicatorful daily, to be started either after documented ovulation or on day 18–21 of cycle, in vitro fertilisation, daily application continued for 30 days after laboratory evidence of pregnancy

**CYCLOGEST<sup>®</sup> PESSARIES**

**Premenstrual syndrome | Post-natal depression**

- ▶ BY VAGINA, OR BY RECTUM

- ▶ Adult: 200–800 mg daily, doses above 200 mg to be given in 2 divided doses, for premenstrual syndrome start on day 12–14 and continue until onset of menstruation (but not recommended); rectally if barrier methods of contraception are used, in patients who have recently given birth or in those who suffer from vaginal infection or recurrent cystitis

**GESTONE<sup>®</sup> SOLUTION FOR INJECTION**

**Dysfunctional uterine bleeding**

- ▶ BY DEEP INTRAMUSCULAR INJECTION

- ▶ Adult: 5–10 mg daily for 5–10 days until 2 days before expected onset of menstruation, to be administered into buttocks

continued →

**Recurrent miscarriage due to inadequate luteal phase (but not recommended) or following in vitro fertilisation or gamete intra-fallopian transfer**

## ► BY DEEP INTRAMUSCULAR INJECTION

- Adult: 25–100 mg 2–7 times a week from day 15, or day of embryo or gamete transfer, until 8–16 weeks of pregnancy, to be administered into buttocks; maximum 200 mg per day

**LUBION®****Supplementation of luteal phase during assisted reproductive technology (ART) treatment in women for whom vaginal preparations are inappropriate**

## ► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Adult: 25 mg once daily from day of oocyte retrieval up to week 12 of pregnancy

**LUTIGEST®****Luteal support as part of an Assisted Reproductive Technology (ART) treatment programme**

## ► BY VAGINA

- Adult: 100 mg 3 times a day, to be started the day after oocyte retrieval, and continued for 30 days once pregnancy is confirmed

**UTROGESTAN® CAPSULES****Progestogenic opposition of oestrogen HRT**

## ► BY MOUTH

- Adult: 200 mg once daily on days 15–26 of each 28-day oestrogen HRT cycle, alternatively 100 mg once daily on days 1–25 of each 28-day oestrogen HRT cycle

**UTROGESTAN® VAGINAL CAPSULES****Supplementation of luteal phase during assisted reproductive technology (ART) cycles**

## ► BY VAGINA

- Adult: 1 capsule 3 times a day from day of embryo transfer until at least week 7 of pregnancy up to week 12 of pregnancy

- **CONTRA-INDICATIONS** Acute porphyrias p. 969 • avoid in patients with a history of liver tumours • breast cancer (unless progestogens are being used in the management of this condition) • genital cancer (unless progestogens are being used in the management of this condition) • history during pregnancy of idiopathic jaundice • history during pregnancy of pemphigoid gestationis • history during pregnancy of severe pruritus • history of thromboembolism • incomplete miscarriage • missed miscarriage • severe arterial disease • thrombophlebitis • undiagnosed vaginal bleeding

- **CAUTIONS** Asthma • cardiac dysfunction • conditions that may worsen with fluid retention • diabetes (progestogens can decrease glucose tolerance—monitor patient closely) • epilepsy • history of depression • hypertension • migraine • susceptibility to thromboembolism (particular caution with high dose)

- **INTERACTIONS** → Appendix 1: progesterone

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

Acne • alopecia • anaphylactoid reactions • bloating • breast tenderness • change in libido • depression • dizziness • drowsiness • fluid retention • headache • hirsutism • insomnia • jaundice • menstrual disturbances • nausea • premenstrual-like syndrome • pruritus • rash • skin reactions • urticaria • weight change

**SPECIFIC SIDE-EFFECTS**

- With intramuscular use or subcutaneous use Injection-site reactions
- With rectal use Diarrhoea • flatulence • pain
- With vaginal use Local irritation
- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Avoid—present in milk.

- **HEPATIC IMPAIRMENT** Avoid in hepatic impairment. Avoid in active liver disease including disorders of hepatic excretion (e.g. Dublin-Johnson or Rotor Syndromes), infective hepatitis (until liver function returns to normal) and liver tumours.

- **RENAL IMPAIRMENT** Use with caution.

● **DIRECTIONS FOR ADMINISTRATION**

- With oral use Capsules should be taken at bedtime on an empty stomach.

● **PATIENT AND CARER ADVICE**

- With oral use Patient counselling is advised for progesterone capsules (administration).

● **NATIONAL FUNDING/ACCESS DECISIONS****LUTIGEST®****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (October 2016) that progesterone (*Lutigest*®) is accepted for use within NHS Scotland for luteal support as part of an assisted reproductive technology (ART) treatment program for infertile women. This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.

**UTROGESTAN® VAGINAL CAPSULES****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (May 2017) that micronised progesterone (*Utrogestan Vaginal*®) is accepted for use within NHS Scotland for supplementation of the luteal phase during Assisted Reproductive Technology cycles in women. This advice is contingent upon the continuing availability of the Patient Access Scheme in Scotland or a list price that is equivalent or lower.

- **LESS SUITABLE FOR PRESCRIBING** Progesterone pessaries are less suitable for prescribing.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Pessary**► **Cyclogest** (Actavis UK Ltd)

**Progesterone 200 mg** Cyclogest 200mg pessaries | 15 pessary [PoM] £8.95 DT price = £8.95

**Progesterone 400 mg** Cyclogest 400mg pessaries | 15 pessary [PoM] £12.96 DT price = £12.96

► **Lutigest** (Ferring Pharmaceuticals Ltd)

**Progesterone 100 mg** Lutigest 100mg vaginal tablets | 21 pessary [PoM] £19.50 DT price = £19.50

**Solution for injection**► **Gestone** (Nordic Pharma Ltd)

**Progesterone 50 mg per 1 ml** Gestone 50mg/1ml solution for injection ampoules | 10 ampoule [PoM] £45.00

Gestone 100mg/2ml solution for injection ampoules | 10 ampoule [PoM] £45.00

► **Lubion** (Pharmasure Ltd)

**Progesterone 22.35 mg per 1 ml** Lubion 25mg/1.119ml solution for injection vials | 7 vial [PoM] £56.00

**Vaginal gel**► **Crinone** (Merck Serono Ltd)

**Progesterone 80 mg per 1 gram** Crinone 8% progesterone vaginal gel | 15 unit dose [PoM] £30.83

**Capsule**

EXCIPIENTS: May contain Arachis (peanut) oil

► **Utrogestan** (Besins Healthcare (UK) Ltd)

**Progesterone 100 mg** Utrogestan 100mg capsules | 30 capsule [PoM] £5.13

**Progesterone 200 mg** Utrogestan 200mg vaginal capsules with applicators | 21 capsule [PoM] £21.00

## 8.1a Anti-oestrogens

### OVULATION STIMULANTS

#### Clomifene citrate

(Clomiphene citrate)

- **DRUG ACTION** Anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct.

#### ● INDICATIONS AND DOSE

**Treatment of female infertility due to oligomenorrhoea or secondary amenorrhoea (e.g. associated with polycystic ovarian disease)**

##### ► BY MOUTH

- Adult (female): 50 mg daily for 5 days, to be started within about 5 days of onset of menstruation (preferably on 2nd day) or at any time (normally preceded by a progestogen induced withdrawal bleed) if cycles have ceased, followed by 100 mg daily if required for a further 5 days, this second course may be given in absence of ovulation; most patients who are going to respond will do so to first course, 3 courses should constitute adequate therapeutic trial; long-term cyclical therapy not recommended.

#### IMPORTANT SAFETY INFORMATION

The CSM has recommended that clomifene should not normally be used for longer than 6 cycles (possibly increased risk of ovarian cancer).

- **CONTRA-INDICATIONS** Abnormal uterine bleeding of undetermined cause · hormone-dependent tumours · ovarian cysts
- **CAUTIONS** Ectopic pregnancy · incidence of multiple births increased (consider ultrasound monitoring) · ovarian hyperstimulation syndrome · polycystic ovary syndrome (cysts may enlarge during treatment, also risk of exaggerated response to usual doses) · uterine fibroids
- **INTERACTIONS** → Appendix 1: clomifene
- **SIDE-EFFECTS** Abdominal discomfort · breast tenderness · convulsions · depression · dizziness · endometriosis · hair loss · headache · hot flushes · insomnia · intermenstrual spotting · menorrhagia · nausea · ovarian hyperstimulation (withdraw) · rashes · visual disturbances (withdraw and initiate ophthalmological examination) · vomiting · weight gain
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Possible effects on fetal development.
- **BREAST FEEDING** May inhibit lactation.
- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.
- **PATIENT AND CARER ADVICE**

Patient advice required around conception and contraception  
Patients planning to conceive should be warned that there is a risk of multiple pregnancy (*rarely* more than twins).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

##### ► Clomifene citrate (Non-proprietary)

Clomifene citrate 50 mg Clomifene 50mg tablets | 30 tablet [PoM]  
£21.74 DT price = £10.15

##### ► Clomid (Sanofi)

Clomifene citrate 50 mg Clomid 50mg tablets | 30 tablet [PoM]  
£10.15 DT price = £10.15

## 8.2 Male sex hormone responsive conditions

### Androgens, anti-androgens and anabolic steroids

#### Androgens

Androgens cause masculinisation; they may be used as replacement therapy in castrated adults and in those who are hypogonadal due to either pituitary or testicular disease. In the normal male they inhibit pituitary gonadotrophin secretion and depress spermatogenesis. Androgens also have an anabolic action which led to the development of anabolic steroids.

Androgens are useless as a treatment of impotence and impaired spermatogenesis unless there is associated hypogonadism; they should not be given until the hypogonadism has been properly investigated. Treatment should be under expert supervision.

When given to patients with hypopituitarism they can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which will stimulate spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate, propionate or undecanoate, or alternatively *Sustanon*®, which consists of a mixture of testosterone esters and has a longer duration of action, may be used.

#### Anti-androgens

##### Cyproterone acetate

Cyproterone acetate p. 725 is an anti-androgen used in the treatment of severe hypersexuality and sexual deviation in the male. It inhibits spermatogenesis and produces reversible infertility (but is not a male contraceptive); abnormal sperm forms are produced. Fully informed consent is recommended and an initial spermatogram. As hepatic tumours have been produced in *animal* studies, careful consideration should be given to the risk/benefit ratio before treatment. Cyproterone acetate is also licensed for use alone in patients with metastatic prostate cancer refractory to gonadorelin analogue therapy and has been used as an adjunct in prostatic cancer and in the treatment of acne and hirsutism in women.

##### Dutasteride and finasteride

Dutasteride p. 741 and finasteride p. 742 are alternatives to alpha-blockers particularly in men with a significantly enlarged prostate. Finasteride is also licensed for use with doxazosin p. 738 in the management of benign prostatic hyperplasia.

A low strength of finasteride is licensed for treating male-pattern baldness in men.

#### Anabolic steroids

Anabolic steroids have some androgenic action but they cause less virilisation than androgens in women. They are used in the treatment of some *aplastic anaemias*. Anabolic steroids have been given for osteoporosis in women but they are no longer advocated for this purpose.

The protein-building properties of anabolic steroids have not proved beneficial in the clinical setting. Their use as

body builders or tonics is unjustified; some athletes abuse them.

## ANDROGENS

### Androgens

- **CONTRA-INDICATIONS** Breast cancer in males · history of liver tumours · hypercalcaemia · prostate cancer
- **CAUTIONS** Cardiac impairment · diabetes mellitus · elderly · epilepsy · hypertension · ischaemic heart disease · migraine · pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored · skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) · sleep apnoea · stop treatment or reduce dose if severe polycythaemia occurs · tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Acne · androgenic effects (to be assessed regularly in women) · anxiety · arthralgia · asthenia · changes in libido · cholestatic jaundice · depression · electrolyte disturbances · excessive duration of penile erection · excessive frequency of penile erection · gastro-intestinal bleeding · gynaecomastia · headache · hirsutism · hypercalcaemia · hypertension · increased bone growth · irritability · male-pattern baldness · muscle cramps · nausea · nervousness · oedema · paraesthesia · polycythaemia · precocious sexual development in pre-pubertal males · premature closure of epiphyses in pre-pubertal males · prostate abnormalities · prostate cancer · pruritus · seborrhoea · sodium retention · suppression of virilism in women · vomiting · weight gain
  - ▶ **Rare** Liver tumours
  - ▶ **Frequency not known** Sleep apnoea
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Polycythaemia Stop treatment or reduce dose if severe polycythaemia occurs.
- **PREGNANCY** Avoid—causes masculinisation of female fetus.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid if possible—fluid retention and dose-related toxicity.
- **RENAL IMPAIRMENT** Caution—potential for fluid retention.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor haematocrit and haemoglobin before treatment, every three months for the first year, and yearly thereafter.
  - ▶ Monitor prostate and PSA in men over 45 years.
- **PATIENT AND CARER ADVICE** Androgenic effects in women Women should be advised to report any signs of virilisation e.g. deepening of the voice or hirsutism.

▮ above

### Mesterolone

#### ● INDICATIONS AND DOSE

**Androgen deficiency | Male infertility associated with hypogonadism**

- ▶ **BY MOUTH**
- ▶ **Adult:** 25 mg 3–4 times a day for several months, then maintenance 50–75 mg daily in divided doses

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- ▶ **Pro-Viron** (Bayer Plc)  
**Mesterolone 25 mg** Pro-Viron 25mg tablets | 30 tablet [PoM]  
£4.19 [CD4-2]

▮ above

### Testosterone

#### ● INDICATIONS AND DOSE

##### TESTIM®

**Hypogonadism due to testosterone deficiency in men**

▶ **BY TRANSDERMAL APPLICATION**

- ▶ **Adult:** Apply 50 mg once daily, subsequent application adjusted according to response; maximum 100 mg per day

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ One tube of 5 g contains 50 mg testosterone.

##### TESTOGEL®

**Hypogonadism due to androgen deficiency in men**

▶ **BY TRANSDERMAL APPLICATION**

- ▶ **Adult:** Apply 50 mg once daily; increased in steps of 25 mg, adjusted according to response; maximum 100 mg per day

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ One sachet of 5 g contains 50 mg of testosterone.

##### TOSTRAN®

**Hypogonadism due to testosterone deficiency in men**

▶ **BY TRANSDERMAL APPLICATION**

- ▶ **Adult:** Apply 60 mg once daily, subsequent application adjusted according to response; maximum 80 mg per day

##### DOSE EQUIVALENCE AND CONVERSION

- ▶ 1 g of gel contains 20 mg testosterone.

- **SIDE-EFFECTS** Allergic reactions · local irritation · suppression of spermatogenesis
- **DIRECTIONS FOR ADMINISTRATION** Avoid skin contact with gel application sites to prevent testosterone transfer to other people, especially pregnant women and children—consult product literature.
- **TESTOGEL®** Apply thin layer of gel on clean, dry, healthy skin such as shoulders, arms or abdomen, immediately after sachet is opened. Not to be applied on genital area as high alcohol content may cause local irritation. Allow to dry for 3–5 minutes before dressing. Wash hands with soap and water after applying gel, avoid shower or bath for at least 6 hours.
- **TESTIM®** Squeeze entire content of tube on to one palm and apply as a thin layer on clean, dry, healthy skin of shoulder or upper arm, preferably in the morning after washing or bathing (if 2 tubes required use 1 per shoulder or upper arm); rub in and allow to dry before putting on clothing to cover site; wash hands with soap after application; avoid washing application site for at least 6 hours.
- **TOSTRAN®** Apply gel on clean, dry, intact skin of abdomen or both inner thighs, preferably in the morning. Gently rub in with a finger until dry before dressing. Wash hands with soap and water after applying gel; avoid washing application site for at least 2 hours. Not to be applied on genital area.
- **PATIENT AND CARER ADVICE** Patient or carer should be given advice on how to administer testosterone gel.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Gel**

EXCIPIENTS: May contain Butylated hydroxytoluene, propylene glycol

► **Testim** (Ferring Pharmaceuticals Ltd)

**Testosterone 50 mg** Testim 50mg/5g gel | 30 tube [PoM] £32.00 DT price = £32.00 [CD4-2]

► **Testogel** (Besins Healthcare (UK) Ltd)

**Testosterone 50 mg** Testogel 50mg/5g gel sachets | 30 sachet [PoM] £31.11 DT price = £31.11 [CD4-2]

► **Tostran** (Kyowa Kirin Ltd)

**Testosterone 20 mg per 1 gram** Tostran 2% gel | 60 gram [PoM] £28.67 DT price = £28.67 [CD4-2]

## Testosterone decanoate, isocaproate, phenylpropionate and propionate

The properties listed below are those particular to the combination only. For the properties of the components please consider, testosterone propionate below.

**INDICATIONS AND DOSE****Androgen deficiency**

- BY DEEP INTRAMUSCULAR INJECTION
- Adult: 1 mL every 3 weeks

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

EXCIPIENTS: May contain Arachis (peanut) oil, benzyl alcohol

► **Sustanon** (Aspen Pharma Trading Ltd)

**Testosterone propionate 30 mg per 1 mL, Testosterone isocaproate 60 mg per 1 mL, Testosterone phenylpropionate 60 mg per 1 mL, Testosterone decanoate 100 mg per 1 mL** Sustanon 250mg/1mL solution for injection ampoules | 1 ampoule [PoM] £2.45 [CD4-2]

## Testosterone enantate

**INDICATIONS AND DOSE****Hypogonadism**

- BY SLOW INTRAMUSCULAR INJECTION
- Adult: Initially 250 mg every 2–3 weeks; maintenance 250 mg every 3–6 weeks

**Breast cancer**

- BY SLOW INTRAMUSCULAR INJECTION
- Adult: 250 mg every 2–3 weeks

● **UNLICENSED USE** Not licensed for use in breast cancer.

● **SIDE-EFFECTS** Suppression of spermatogenesis

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

► **Testosterone enantate (Non-proprietary)**

**Testosterone enantate 250 mg per 1 mL** Testosterone enantate 250mg/1mL solution for injection ampoules | 3 ampoule [PoM] £79.75 DT price = £79.75 [CD4-2]

## Testosterone propionate

**INDICATIONS AND DOSE****Androgen deficiency**

- BY INTRAMUSCULAR INJECTION
- Adult: 50 mg 2–3 times a week

**Delayed puberty in males**

- BY INTRAMUSCULAR INJECTION
- Adult: 50 mg once weekly

**Breast cancer in women**

- BY INTRAMUSCULAR INJECTION
- Adult: 100 mg 2–3 times a week

● **SIDE-EFFECTS** Suppression of spermatogenesis

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

## Testosterone undecanoate

**INDICATIONS AND DOSE****Androgen deficiency**

- BY MOUTH
- Adult: 120–160 mg daily for 2–3 weeks; maintenance 40–120 mg daily

**Hypogonadism**

- BY DEEP INTRAMUSCULAR INJECTION
- Adult (male): 1 g every 10–14 weeks, to be given over 2 minutes, if necessary, second dose may be given after 6 weeks to achieve rapid steady state plasma testosterone levels and then every 10–14 weeks.

● **SIDE-EFFECTS** Suppression of spermatogenesis

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

► **Nebido** (Bayer Plc)

**Testosterone undecanoate 250 mg per 1 mL** Nebido 1000mg/4mL solution for injection vials | 1 vial [PoM] £87.11 DT price = £87.11 [CD4-2]

**Capsule**

CAUTIONARY AND ADVISORY LABELS 21, 25

► **Restandol** (Merck Sharp & Dohme Ltd)

**Testosterone undecanoate 40 mg** Restandol 40mg Testocaps | 30 capsule [PoM] £8.55 [CD4-2] | 60 capsule [PoM] £17.10 DT price = £17.10 [CD4-2]

## 8.2a Male sex hormone antagonism

### ANTI-ANDROGENS

## Cyproterone acetate

**INDICATIONS AND DOSE****Hyper-sexuality in males | Sexual deviation in males**

- BY MOUTH
- Adult: 50 mg twice daily, to be taken after food

**Prevention of tumour flare with initial gonadorelin analogue therapy**

- BY MOUTH
- Adult (male): 200 mg daily in 2–3 divided doses for 5–7 days before initiation of gonadorelin analogue, followed by 200 mg daily in 2–3 divided doses for 3–4 weeks after initiation of gonadorelin analogue; maximum 300 mg per day.

**Long-term palliative therapy where gonadorelin analogues or orchidectomy contra-indicated, not tolerated, or where oral therapy preferred**

- BY MOUTH
- Adult (male): 200–300 mg daily in 2–3 divided doses.

continued →

**Hot flushes with gonadorelin analogue therapy or after orchidectomy**

## ► BY MOUTH

- Adult (male): Initially 50 mg daily, then adjusted according to response to 50–150 mg daily in 1–3 divided doses.

- **CONTRA-INDICATIONS** In hypersexuality, Dubin-Johnson syndrome · in hypersexuality, history of thromboembolic disorders · in hypersexuality, liver-disease · in hypersexuality, malignant diseases · in hypersexuality, previous or existing liver tumours · in hypersexuality, Rotor syndrome · in hypersexuality, severe depression · in hypersexuality, severe diabetes (with vascular changes) · in hypersexuality, sickle-cell anaemia · in hypersexuality, wasting diseases · meningioma or history of meningioma
- **CAUTIONS** Diabetes mellitus · in prostate cancer, severe depression · in prostate cancer, sickle-cell anaemia · ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)
- **INTERACTIONS** → Appendix 1: cyproterone
- **SIDE-EFFECTS**
  - **Rare** Hypersensitivity reactions · osteoporosis · rash
  - **Frequency not known** Breathlessness · changes in hair pattern · fatigue · gynaecomastia (rarely leading to galactorrhoea and benign breast nodules) · hepatic failure · hepatitis · hepatotoxicity · inhibition of spermatogenesis · jaundice · lassitude · reduced sebum production (may clear acne) · risk of recurrence of thromboembolic disease · weight changes

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Hepatotoxicity** Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).
- **HEPATIC IMPAIRMENT** Avoid (unless used for prostate cancer)—dose-related toxicity.
- **MONITORING REQUIREMENTS**
  - Monitor blood counts initially and throughout treatment.
  - Monitor adrenocortical function regularly.
  - Monitor hepatic function regularly—liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.

• **PATIENT AND CARER ADVICE**

**Driving and skilled tasks** Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution

**Tablet****CAUTIONARY AND ADVISORY LABELS 21**► **Cyproterone acetate (Non-proprietary)**

**Cyproterone acetate 50 mg** Cyproterone 50mg tablets | 56 tablet [PoM] £48.95 | 168 tablet [PoM] £87.00 DT price = £87.00

**Cyproterone acetate 100 mg** Cyproterone 100mg tablets | 84 tablet [PoM] £132.57 DT price = £55.19

► **Androcur** (Bayer Plc)

**Cyproterone acetate 50 mg** Androcur 50mg tablets | 56 tablet [PoM] £29.25

► **Cyprostat** (Bayer Plc)

**Cyproterone acetate 50 mg** Cyprostat 50mg tablets | 168 tablet [PoM] £87.00 DT price = £87.00

**Cyproterone acetate 100 mg** Cyprostat 100mg tablets | 84 tablet [PoM] £87.00 DT price = £55.19

## 9 Thyroid disorders

### PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > THYROID STIMULATING HORMONES

#### Thyrotropin alfa

##### (Recombinant human thyroid stimulating hormone; rhTSH)

- **DRUG ACTION** Thyrotropin alfa is a recombinant form of thyrotrophin (thyroid stimulating hormone).

• **INDICATIONS AND DOSE**

**Detection of thyroid remnants and thyroid cancer in post-thyroidectomy patients, together with serum thyroglobulin testing (with or without radioiodine imaging) | To increase radio-iodine uptake for the ablation of thyroid remnant tissue in suitable post-thyroidectomy patients**

## ► BY INTRAMUSCULAR INJECTION

- **Adult:** 900 micrograms every 24 hours for 2 doses, dose to be administered into the gluteal muscle, consult product literature for further information on indications and dose
- **CAUTIONS** Presence of thyroglobulin autoantibodies may give false negative results
- **SIDE-EFFECTS**
  - **Common or very common** Dizziness · fatigue · headache · nausea · vomiting
  - **Uncommon** Asthenia · back pain · influenza-like symptoms · paraesthesia · rash · urticaria
  - **Rare** Diarrhoea
  - **Very rare** Arthralgia · dyspnoea · flushing · hyperhidrosis · injection-site pain · injection-site pruritus · injection-site rash · injection-site reactions · myalgia · pain at site of metastases · palpitation · tremor
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if previous hypersensitivity to bovine or human thyrotrophin.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for injection**► **Thyrogen** (Genzyme Therapeutics Ltd)

**Thyrotropin alfa 900 microgram** Thyrogen 900microgram powder for solution for injection vials | 2 vial [PoM] £583.04

## 9.1 Hyperthyroidism

### Antithyroid drugs

#### Overview

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole p. 727 is the most commonly used drug. Propylthiouracil p. 728 should be reserved for patients who are intolerant of carbimazole or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Over-treatment with antithyroid drugs can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.

A combination of carbimazole with levothyroxine sodium p. 729 daily, may be used in a *blocking-replacement regimen*; therapy is usually given for 18 months. The blocking-replacement regimen is **not** suitable during pregnancy.

**Iodine** has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide ( $^{131}\text{I}$ ) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 145 is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol hydrochloride but nadolol p. 144 is also used.

*Thyrotoxic crisis* ('thyroid storm') requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone p. 637 (as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

### Pregnancy

Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

**Other drugs used for Hyperthyroidism** Metoprolol tartrate, p. 149

## ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

### Carbimazole

#### ● INDICATIONS AND DOSE

##### Hyperthyroidism

###### > BY MOUTH

- Adult: 15–40 mg daily continue until the patient becomes euthyroid, usually after 4 to 8 weeks, higher doses should be prescribed under specialist supervision only, then reduced to 5–15 mg daily, reduce dose gradually, therapy usually given for 12 to 18 months

#### Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

##### > BY MOUTH

- Adult: 40–60 mg daily, therapy usually given for 18 months

#### DOSE EQUIVALENCE AND CONVERSION

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

#### IMPORTANT SAFETY INFORMATION

##### NEUTROPENIA AND AGRANULOCYTOSIS

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.
- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

- **CONTRA-INDICATIONS** Severe blood disorders

- **INTERACTIONS** → Appendix 1: carbimazole

#### ● SIDE-EFFECTS

- **Common or very common** Arthralgia · fever · headache · jaundice · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance
- **Rare** Agranulocytosis · alopecia · bone marrow suppression · jaundice · myopathy · pancytopenia

#### SIDE-EFFECTS, FURTHER INFORMATION

Rashes and pruritus are common with carbimazole but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted.

- **PREGNANCY** Carbimazole can be given but the blocking-replacement regimen is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate. Carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).
- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.
- **PATIENT AND CARER ADVICE** Warn patient or carers to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

##### Tablet

##### > Carbimazole (Non-proprietary)

**Carbimazole 5 mg** Carbimazole 5mg tablets | 100 tablet **[PoM]**  
£84.80 DT price = £62.37

**Carbimazole 20 mg** Carbimazole 20mg tablets | 100 tablet **[PoM]**  
£216.00 DT price = £166.71

## ANTITHYROID DRUGS &gt; THIOURACILS

## Propylthiouracil

## ● INDICATIONS AND DOSE

**Hyperthyroidism**

## ▶ BY MOUTH

- Adult: Initially 200–400 mg daily in divided doses until the patient becomes euthyroid, then reduced to 50–150 mg daily in divided doses, initial dose should be gradually reduced to the maintenance dose

**DOSE EQUIVALENCE AND CONVERSION**

- When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

- **INTERACTIONS** → Appendix 1: propylthiouracil

● **SIDE-EFFECTS**

- ▶ **Common or very common** Arthralgia · fever · headache · jaundice · leucopenia · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance
- ▶ **Rare** Agranulocytosis · alopecia · aplastic anaemia · bone marrow suppression · cutaneous vasculitis · encephalopathy · hepatic disorders · hepatic failure · hepatic necrosis · hepatitis · hypoproteinaemia · jaundice · lupus erythematosus-like syndromes · myopathy · nephritis · pancytopenia · thrombocytopenia

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Hepatotoxicity** Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.

- **PREGNANCY** Propylthiouracil can be given but the blocking-replacement regimen is **not** suitable. Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function.

Monitor infant's thyroid status.

- **HEPATIC IMPAIRMENT** Reduce dose.

- **RENAL IMPAIRMENT** Use three-quarters normal dose if eGFR 10–50 mL/minute/1.73 m<sup>2</sup>. Use half normal dose if eGFR less than 10 mL/minute/1.73 m<sup>2</sup>.

- **MONITORING REQUIREMENTS** Monitor for hepatotoxicity.

- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**▶ **Propylthiouracil (Non-proprietary)**

Propylthiouracil 50 mg Propylthiouracil 50mg tablets | 56 tablet [PoM] £71.44 DT price = £59.47 | 100 tablet [PoM] £127.57

## VITAMINS AND TRACE ELEMENTS

## Iodide with iodine

● **INDICATIONS AND DOSE****Thyrotoxicosis (pre-operative)**

## ▶ BY MOUTH USING ORAL SOLUTION

- Adult: 0.1–0.3 mL 3 times a day

- **CAUTIONS** Children · not for long-term treatment

- **SIDE-EFFECTS** Bronchitis · conjunctivitis · coryza-like symptoms · depression (on prolonged treatment) · goitre in infants of mothers taking iodides · headache · hypersensitivity reactions · impotence (on prolonged treatment) · insomnia (on prolonged treatment) · lacrimation · laryngitis · pain in salivary glands · rashes

- **PREGNANCY** Neonatal goitre and hypothyroidism.

- **BREAST FEEDING** Stop breast-feeding. Danger of neonatal hypothyroidism or goitre. Appears to be concentrated in milk.

- **DIRECTIONS FOR ADMINISTRATION** For oral solution, dilute well with milk or water.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Oral solution**

## CAUTIONARY AND ADVISORY LABELS 27

▶ **Iodide with iodine (Non-proprietary)**

Iodine 50 mg per 1 mL, Potassium iodide 100 mg per 1 mL Iodine aqueous oral solution | 500 mL [P] £9.58

## 9.2 Hypothyroidism

## Thyroid hormones

**Overview**

Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto's thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. Levothyroxine sodium p. 729 (thyroxine sodium) is the treatment of choice for *maintenance* therapy.

In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine sodium should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone.

Liothyronine sodium p. 729 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in *severe hypothyroid states* when a rapid response is desired.

Liothyronine sodium by intravenous injection is the treatment of choice in *hypothyroid coma*. Adjunctive therapy includes intravenous fluids, hydrocortisone p. 637, and treatment of infection; assisted ventilation is often required.

## THYROID HORMONES

## Levothyroxine sodium

(Thyroxine sodium)

## ● INDICATIONS AND DOSE

**Hypothyroidism**

## ► BY MOUTH

- Adult 18–49 years: Initially 50–100 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks, adjusted according to response; maintenance 100–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication
- Adult 50 years and over: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

**Hypothyroidism in patients with cardiac disease | Severe hypothyroidism**

## ► BY MOUTH

- Adult: Initially 25 micrograms once daily; adjusted in steps of 25 micrograms every 4 weeks, adjusted according to response; maintenance 50–200 micrograms once daily, dose to be taken preferably at least 30 minutes before breakfast, caffeine-containing liquids (e.g. coffee, tea), or other medication

**Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole**

## ► BY MOUTH

- Adult: 50–150 micrograms daily therapy usually given for 18 months

## ● CONTRA-INDICATIONS Thyrotoxicosis

- CAUTIONS Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

## CAUTIONS, FURTHER INFORMATION

- Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.

## ● INTERACTIONS → Appendix 1: levothyroxine

- SIDE-EFFECTS Anginal pain (usually at excessive dosage) · arrhythmias (usually at excessive dosage) · diarrhoea (usually at excessive dosage) · excitability (usually at excessive dosage) · fever · flushing · headache · heat intolerance · hypersensitivity reactions · insomnia (usually at excessive dosage) · muscle cramp · muscular weakness · oedema · palpitation (usually at excessive dosage) · pruritus · rash · restlessness (usually at excessive dosage) · sweating · tachycardia (usually at excessive dosage) · transient hair loss in children · tremor (usually at excessive dosage) · vomiting (usually at excessive dosage) · weight-loss

## SIDE-EFFECTS, FURTHER INFORMATION

- Initial dosage in patients with cardiovascular disorders If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial

ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.

- PREGNANCY Levothyroxine requirement may increase during pregnancy. Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

- BREAST FEEDING Amount too small to affect tests for neonatal hypothyroidism.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**

## ► Levothyroxine sodium (Non-proprietary)

**Levothyroxine sodium anhydrous 12.5 microgram** Levothyroxine sodium 12.5microgram tablets | 28 tablet [PoM] £12.75–£15.00 DT price = £14.10

**Levothyroxine sodium anhydrous 25 microgram** Levothyroxine sodium 25microgram tablets | 28 tablet [PoM] £4.00 DT price = £2.91 | 500 tablet [PoM] £56.25

Levothyroxine sodium 25microgram tablets lactose free | 100 tablet [PoM] no price available

**Levothyroxine sodium anhydrous 50 microgram** Levothyroxine sodium 50microgram tablets lactose free | 100 tablet [PoM] no price available

Levothyroxine sodium 50microgram tablets | 28 tablet [PoM] £4.98 DT price = £1.66 | 1000 tablet [PoM] £68.21

**Levothyroxine sodium anhydrous 75 microgram** Levothyroxine sodium 75microgram tablets | 28 tablet [PoM] £2.82–£4.00 DT price = £3.34

**Levothyroxine sodium anhydrous 100 microgram** Levothyroxine sodium 100microgram tablets lactose free | 100 tablet [PoM] no price available

Levothyroxine sodium 100microgram tablets | 28 tablet [PoM] £4.75 DT price = £1.66 | 1000 tablet [PoM] £68.57

## ► Eltroxin (AMCo)

**Levothyroxine sodium anhydrous 25 microgram** Eltroxin 25microgram tablets | 28 tablet [PoM] £2.33 DT price = £2.91

**Levothyroxine sodium anhydrous 50 microgram** Eltroxin 50microgram tablets | 28 tablet [PoM] £1.33 DT price = £1.66

**Levothyroxine sodium anhydrous 100 microgram** Eltroxin 100microgram tablets | 28 tablet [PoM] £1.33 DT price = £1.66

**Oral solution**

## ► Levothyroxine sodium (Non-proprietary)

**Levothyroxine sodium anhydrous 5 microgram per**

1 ml Levothyroxine sodium 25micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £95.00 DT price = £94.59

**Levothyroxine sodium anhydrous 10 microgram per**

1 ml Levothyroxine sodium 50micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £94.44 DT price = £93.02

**Levothyroxine sodium anhydrous 20 microgram per**

1 ml Levothyroxine sodium 100micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £165.00 DT price = £164.14

## Liothyronine sodium

(L-Tri-iodothyronine sodium)

## ● INDICATIONS AND DOSE

**Hypothyroidism**

## ► BY MOUTH

- Adult: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses, dose should be increased gradually, smaller initial doses given for the elderly

**Hypothyroid coma**

## ► BY SLOW INTRAVENOUS INJECTION

- Adult: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, continued →

alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ 20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.
- ▶ Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

- **CONTRA-INDICATIONS** Thyrotoxicosis
- **CAUTIONS** Cardiovascular disorders · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · elderly · hypertension · long-standing hypothyroidism · myocardial infarction · myocardial insufficiency · panhypopituitarism (initiate corticosteroid therapy before starting liothyronine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting liothyronine)

#### CAUTIONS, FURTHER INFORMATION

- ▶ Cardiovascular disorders Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia.
- **INTERACTIONS** → Appendix 1: liothyronine
- **SIDE-EFFECTS** Anginal pain (usually at excessive dosage) · arrhythmias (usually at excessive dosage) · diarrhoea (usually at excessive dosage) · excitability (usually at excessive dosage) · fever · flushing · headache · heat intolerance · hypersensitivity reactions · insomnia (usually at excessive dosage) · muscle cramp · muscular weakness · oedema · palpitation (usually at excessive dosage) · pruritus · rash · restlessness (usually at excessive dosage) · sweating · tachycardia (usually at excessive dosage) · tremor (usually at excessive dosage) · vomiting (usually at excessive dosage) · weight-loss

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Initial dosage in patients with cardiovascular disorders If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose.
- **PREGNANCY** Liothyronine requirement may increase during pregnancy. Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.  
Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).
- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.
- **PRESCRIBING AND DISPENSING INFORMATION**  
Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

#### Tablet

##### ▶ Liothyronine sodium (Non-proprietary)

## 1 Bladder and urinary disorders

### 1.1 Urinary frequency, enuresis, and incontinence

#### Urinary frequency, enuresis and incontinence

##### Urinary frequency and incontinence

Incontinence in adults which arises from detrusor instability is managed by combining drug therapy with conservative methods for managing urge incontinence such as pelvic floor exercises and bladder training; stress incontinence is generally managed by non-drug methods. Duloxetine p. 350 can be added and is licensed for the treatment of moderate to severe stress incontinence in women; it may be more effective when used as an adjunct to pelvic floor exercises.

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity. Oxybutynin hydrochloride p. 733 also has a direct relaxant effect on urinary smooth muscle. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose. A modified-release preparation of oxybutynin hydrochloride is effective and has fewer side-effects; a transdermal patch is also available. The efficacy and side-effects of tolterodine tartrate p. 735 are comparable to those of modified-release oxybutynin hydrochloride. Flavoxate hydrochloride p. 733 has less marked side-effects but it is also less effective. Darifenacin p. 732, fesoterodine fumarate p. 732, propiverine hydrochloride p. 735, solifenacin succinate p. 734, and trospium chloride p. 734 are newer antimuscarinic drugs licensed for urinary frequency, urgency, and incontinence. The need for continuing antimuscarinic drug therapy should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

Propantheline bromide p. 84 and tricyclic antidepressants were used for urge incontinence but they are little used now because of their side-effects. The use of imipramine hydrochloride p. 359 is limited by its potential to cause cardiac side-effects.

Mirabegron p. 736, a selective  $\beta_3$  agonist, is licensed for the treatment of urinary frequency, urgency, and urge incontinence associated with overactive bladder syndrome.

Purified bovine collagen implant (*Contigen*®, Bard) is indicated for urinary incontinence caused by intrinsic sphincter deficiency (poor or non-functioning bladder outlet mechanism). The implant should be inserted only by surgeons or physicians trained in the technique for injection of the implant.

See also Nocturnal enuresis in children, below.

#### Nocturnal enuresis in children

23-May-2017

##### Description of condition

Nocturnal enuresis is the involuntary discharge of urine during sleep, which is common in young children. Children are generally expected to be dry by a developmental age of 5 years, and historically it has been common practice to consider children for treatment only when they reach 7 years; however, symptoms may still persist in a small proportion by the age of 10 years.

##### Treatment

###### Children under 5 years

**EvGr** For children under 5 years, treatment is usually unnecessary as the condition is likely to resolve spontaneously. Reassurance and advice can be useful for some families. 

###### Non Drug Treatment

**EvGr** Initially, advice should be given on fluid intake, diet, toileting behaviour, and use of reward systems. For children who do not respond to this advice (more than 1–2 wet beds per week), an enuresis alarm should be the recommended treatment for motivated, well-supported children. Alarms in

children under 7 years should be considered depending on the child's maturity, motivation and understanding of the alarm. Alarms have a lower relapse rate than drug treatment when discontinued.

Treatment using an alarm should be reviewed after 4 weeks and continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months but the condition is still improving and the child remains motivated to use the alarm, it is recommended to continue the treatment. Combined treatment with desmopressin p. 628, or the use of desmopressin alone, is recommended if the initial alarm treatment is unsuccessful or it is no longer appropriate or desirable. 

### Drug Treatment

**[EvGr]** Treatment with oral or sublingual desmopressin is recommended for children over 5 years of age when alarm use is inappropriate or undesirable, or when rapid or short-term results are the priority (for example, to cover periods away from home). Desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm alone. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Repeated courses of desmopressin can be used in responsive children who experience repeated recurrences of bedwetting, but should be withdrawn **gradually** at regular intervals (for 1 week every 3 months) for full reassessment.

Under specialist supervision, nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with desmopressin alone or in combination with an antimuscarinic drug (such as oxybutynin hydrochloride p. 733 or tolterodine tartrate p. 735 [unlicensed indication]). Treatment should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine hydrochloride p. 359 can be considered for children who have not responded to all other treatments and have undergone specialist assessment, however relapse is common after withdrawal and children and their carers should be aware of the dangers of overdose. Initial treatment should continue for 3 months; further courses can be considered following a medical review every 3 months. Tricyclic antidepressants should be withdrawn gradually. 

### Useful Resources

Bedwetting in under 19s. National Institute for Health and Care Excellence. Clinical guideline CG111. October 2010. [www.nice.org.uk/guidance/cg111](http://www.nice.org.uk/guidance/cg111)

## ANTIMUSCARINICS

### Antimuscarinics (systemic)

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · prostatic enlargement (in adults) · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention
- **CAUTIONS** Acute myocardial infarction (in adults) · arrhythmias (may be worsened) · autonomic neuropathy · cardiac insufficiency (due to association with tachycardia) · cardiac surgery (due to association with tachycardia) · children (increased risk of side-effects) · conditions characterised by tachycardia · congestive heart failure (may be worsened) · coronary artery disease (may be worsened) · diarrhoea · elderly (especially if frail) · gastro-oesophageal reflux disease · hiatus hernia with reflux oesophagitis · hypertension · hyperthyroidism (due to association with tachycardia) · individuals susceptible to

angle-closure glaucoma · prostatic hyperplasia (in adults) · pyrexia · ulcerative colitis

### ● SIDE-EFFECTS

- **Common or very common** Constipation · dilation of pupils with loss of accommodation · dry mouth · photophobia · reduced bronchial secretions · skin dryness · skin flushing · transient bradycardia (followed by tachycardia, palpitation and arrhythmias) · urinary retention · urinary urgency
- **Uncommon** Confusion (in children) · confusion (particularly in the elderly) · giddiness · nausea · vomiting
- **Very rare** Angle-closure glaucoma
- **Frequency not known** Angioedema · blurred vision · blurred vision · central nervous system stimulation · convulsion · diarrhoea · difficulty in micturition · disorientation · dizziness · drowsiness · dry eyes · euphoria · fatigue · flatulence · hallucinations · headache · impaired memory · palpitation · photosensitivity · rash · reduced sweating (may lead to heat sensations and fainting in hot environments or patients with fever) · restlessness · taste disturbances

### ● PATIENT AND CARER ADVICE

#### Driving and skilled tasks

Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

## ANTIMUSCARINICS > URINARY

 above

### Darifenacin

#### ● INDICATIONS AND DOSE

**Urinary frequency | Urinary urgency | Incontinence**

##### ► BY MOUTH

- **Adult:** Initially 7.5 mg once daily, increased if necessary to 15 mg after 2 weeks

- **INTERACTIONS** → Appendix 1: darifenacin

#### ● SIDE-EFFECTS

- **Uncommon** Cough · dyspnoea · hypertension · impotence · insomnia · oedema · rhinitis · ulcerative stomatitis · vaginitis · weakness

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Present in milk in animal studies—manufacturer advises caution.

- **HEPATIC IMPAIRMENT** Max. 7.5 mg daily in moderate impairment. Avoid in severe impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Modified-release tablet**

CAUTIONARY AND ADVISORY LABELS 3, 25

- **Emselex** (Merus Labs Luxco S.a R.L.)

**Darifenacin (as Darifenacin hydrobromide) 7.5 mg** Emselex 7.5mg modified-release tablets | 28 tablet **[PoM]** £25.48 DT price = £25.48

**Darifenacin (as Darifenacin hydrobromide) 15 mg** Emselex 15mg modified-release tablets | 28 tablet **[PoM]** £25.48 DT price = £25.48

### Fesoterodine fumarate

08-May-2017

#### ● INDICATIONS AND DOSE

**Urinary frequency | Urinary urgency | Urge incontinence**

##### ► BY MOUTH

- **Adult:** 4 mg once daily, increased if necessary up to 8 mg once daily

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises max. 4 mg daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have hepatic or renal impairment. For dose adjustments with concurrent use of moderate inhibitors of CYP3A4 in patients with hepatic or renal impairment, consult product literature.

- **INTERACTIONS** → Appendix 1: fesoterodine

- **SIDE-EFFECTS**

- ▶ **Common or very common** Insomnia
- ▶ **Uncommon** Cough · nasal dryness · pharyngolaryngeal pain · vertigo

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises increase dose cautiously in mild impairment; max. 4 mg daily in moderate impairment. Manufacturer advises avoid in severe impairment.

- **RENAL IMPAIRMENT** Increase dose cautiously if eGFR 30–80 mL/minute/1.73m<sup>2</sup>; max. 4 mg daily if eGFR less than 30 mL/minute/1.73m<sup>2</sup>.

- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (June 2008) that fesoterodine (*Toviaz*®) is accepted for restricted use within NHS Scotland as a second-line treatment for overactive bladder syndrome.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Modified-release tablet**

**F 732****Flavoxate hydrochloride**

- **INDICATIONS AND DOSE**

**Urinary frequency | Urinary incontinence | Dysuria | Urinary urgency | Bladder spasm due to catheterisation, cytосcopy, or surgery**

- ▶ **BY MOUTH**

- ▶ **Adult:** 200 mg 3 times a day

- **CONTRA-INDICATIONS** Gastro-intestinal haemorrhage

- **INTERACTIONS** → Appendix 1: flavoxate

- **SIDE-EFFECTS** Eosinophilia · erythema · leucopenia · pruritus · urticaria · vertigo

- **PREGNANCY** Manufacturer advises avoid unless no safer alternative.

- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **PRESCRIBING AND DISPENSING INFORMATION** The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**

CAUTIONARY AND ADVISORY LABELS 3

- ▶ **Urispas** (Recordati Pharmaceuticals Ltd)

**Flavoxate hydrochloride 200 mg** Urispas 200 tablets | 90 tablet [POM] £11.67 DT price = £11.67

**F 732****Oxybutynin hydrochloride**

- **INDICATIONS AND DOSE**

**Urinary frequency | Urinary urgency | Urinary incontinence | Neurogenic bladder instability**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ **Child 5–11 years:** Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
- ▶ **Child 12–17 years:** Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- ▶ **Adult:** Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- ▶ **Elderly:** Initially 2.5–3 mg twice daily, increased if tolerated to 5 mg twice daily, adjusted according to response

- ▶ **BY MOUTH USING MODIFIED-RELEASE TABLETS**

- ▶ **Child 5–17 years:** Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day
- ▶ **Adult:** Initially 5 mg once daily, increased in steps of 5 mg every week, adjusted according to response; maximum 20 mg per day

**Urinary frequency | Urinary urgency | Urinary incontinence**

- ▶ **BY TRANSDERMAL APPLICATION USING PATCHES**

- ▶ **Adult:** Apply 1 patch twice weekly, patch is to be applied to clean, dry unbroken skin on abdomen, hip or buttock. Patch should be removed every 3–4 days and site replacement patch on a different area. The same area should be avoided for 7 days

**Nocturnal enuresis associated with overactive bladder**

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

- ▶ **Child 5–17 years:** 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime

- ▶ **BY MOUTH USING MODIFIED-RELEASE TABLETS**

- ▶ **Child 5–17 years:** Initially 5 mg once daily, adjusted in steps of 5 mg every week, adjusted according to response; maximum 15 mg per day

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel*® XL

- **CAUTIONS** Acute porphyrias p. 969

- **INTERACTIONS** → Appendix 1: oxybutynin

- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

- ▶ **Uncommon** Anorexia · facial flushing
- ▶ **Rare** Night terrors
- ▶ **Frequency not known** Cognitive impairment (in adults)

**SPECIFIC SIDE-EFFECTS**

- ▶ **Rare**
- ▶ With transdermal use Application site reactions with patches
- **PREGNANCY** Manufacturers advise avoid unless essential—toxicity in animal studies.
- **BREAST FEEDING** Manufacturers advise avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.

### ● DIRECTIONS FOR ADMINISTRATION

- With transdermal use in adults Apply patches to clean, dry, unbroken skin on abdomen, hip or buttock, remove after every 3–4 days and site replacement patch on a different area (avoid using same area for 7 days).

### ● PRESCRIBING AND DISPENSING INFORMATION

- In adults The need for continuing therapy for urinary incontinence should be reviewed every 4–6 weeks until symptoms stabilise, and then every 6–12 months.
- In children The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.

### ● PATIENT AND CARER ADVICE

- Medicines for Children leaflet: Oxybutynin for daytime urinary symptoms [www.medicinesforchildren.org.uk/oxybutynin-for-daytime-urinary-symptoms](http://www.medicinesforchildren.org.uk/oxybutynin-for-daytime-urinary-symptoms)
- With transdermal use Patients or carers should be given advice on how to administer oxybutynin transdermal patches.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2005) that *Kentera*® should be restricted for use in patients who benefit from oral oxybutynin but cannot tolerate its side-effects.

## BETA<sub>3</sub>-ADRENOCEPTOR AGONISTS

### Mirabegron

#### ● INDICATIONS AND DOSE

##### Urinary frequency, urgency, and urge incontinence

###### ▶ BY MOUTH

- ▶ Adult: 50 mg once daily

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises reduce dose to 25 mg once daily in patients with mild hepatic impairment with concurrent use of potent inhibitors of CYP3A4; avoid in moderate impairment.

Manufacturer advises reduce dose to 25 mg once daily if eGFR 30–89 mL/minute/1.73 m<sup>2</sup> with concurrent use of potent inhibitors of CYP3A4; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

- **CONTRA-INDICATIONS** Severe uncontrolled hypertension (systolic blood pressure  $\geq 180$  mmHg or diastolic blood pressure  $\geq 110$  mmHg)
- **CAUTIONS** History of QT-interval prolongation · stage 2 hypertension
- **INTERACTIONS** → Appendix 1: mirabegron
- **SIDE-EFFECTS**
- ▶ **Common or very common** Tachycardia · urinary-tract infection
- ▶ **Uncommon** Atrial fibrillation · dyspepsia · gastritis · hypertension · joint swelling · palpitation · pruritus · rash · vulvovaginal infection · vulvovaginal pruritus
- **CONCEPTION AND CONTRACEPTION** Contraception advised in women of child-bearing potential.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Reduce dose to 25 mg once daily in moderate impairment. Avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Reduce dose to 25 mg once daily if eGFR 15–29 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 15 mL/minute/1.73 m<sup>2</sup>—no information available.
- **MONITORING REQUIREMENTS** Blood pressure should be monitored before starting treatment and regularly during treatment, especially in patients with pre-existing hypertension.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Mirabegron for treating symptoms of overactive bladder** (June 2013) NICE TA290

Mirabegron is recommended as an option only for patients in whom antimuscarinic drugs are ineffective, contra-indicated, or not tolerated; patients currently receiving mirabegron who do not meet these criteria should have the option to continue until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA290](http://www.nice.org.uk/TA290)

## 1.2 Urinary retention

### Urinary retention

31-May-2017

#### Description of condition

Urinary retention is the inability to voluntarily urinate. It may be secondary to urethral blockage, drug treatment (such as use of antimuscarinic drugs, sympathomimetics, tricyclic antidepressants), conditions that reduce detrusor contractions or interfere with relaxation of the urethra, neurogenic causes, or it may occur postpartum or postoperatively.

*Acute* urinary retention is a medical emergency characterised by the abrupt development of the inability to pass urine (over a period of hours).

*Chronic* urinary retention is the gradual (over months or years) development of the inability to empty the bladder completely, characterised by a residual volume greater than one litre or associated with the presence of a distended or palpable bladder.

#### Urinary retention due to benign prostatic hyperplasia

The most common cause of urinary retention in men is benign prostatic hyperplasia. Men with an enlarged prostate can have lower urinary tract symptoms associated with obstruction, such as urinary retention (acute or chronic), frequency, urgency or nocturia.

#### Treatment

Treatment of urinary retention depends on the underlying condition. Catheterisation is used to relieve acute painful urinary retention or when no cause can be found. Surgical procedures or dilatation are often used to correct mechanical outflow obstructions.

##### Acute urinary retention

**[EvGr]** Acute retention is painful and requires immediate treatment by catheterisation. Before the catheter is removed an alpha-adrenoceptor blocker (such as alfuzosin hydrochloride p. 737, doxazosin p. 738, tamsulosin hydrochloride p. 739, prazosin p. 739, indoramin p. 738 or terazosin p. 741) should be given for at least two days to manage acute urinary retention **[A]**.

##### Chronic urinary retention

**[EvGr]** In patients with chronic urinary retention, intermittent bladder catheterisation should be offered before an indwelling catheter. Catheters may be used as a long-term solution where persistent urinary retention is causing

incontinence, infection, or renal dysfunction and a surgical solution is not feasible. **⚠** Their use is associated with an increased risk of adverse events including recurrent urinary infections, trauma to the urethra, pain, and stone formation.

**EvGr** In men who have symptoms that are bothersome, drug treatment should only be offered when other conservative management options have failed. Men with moderate-to-severe symptoms should be offered an alpha-adrenoceptor blocker (alfuzosin hydrochloride, doxazosin, tamsulosin hydrochloride or terazosin). Treatment should initially be reviewed after 4–6 weeks and then every 6–12 months. **⚠**

The parasymphathomimetic bethanechol chloride p. 741 increases detrusor muscle contraction. It is licensed for acute postoperative, postpartum and neurogenic urinary retention but its use has largely been superseded by catheterisation.

### Urinary retention due to benign prostatic hyperplasia

In patients with benign prostatic hyperplasia, treatment is influenced by the severity of symptoms and their effect on the patient's quality of life. **EvGr** Watchful waiting is suitable for men with symptoms that are not troublesome and in those who have not yet developed complications of benign prostatic hyperplasia such as renal impairment, urinary retention or recurrent infection.

The recommended treatment of benign prostatic hyperplasia is usually an alpha-adrenoceptor blocker. The alpha<sub>1</sub>-selective adrenoceptor blockers relax smooth muscle in benign prostatic hyperplasia producing an increase in urinary flow-rate and an improvement in obstructive symptoms.

In patients with an enlarged prostate, a raised prostate specific antigen concentration, and who are considered to be at high risk of progression (such as the elderly), a 5 $\alpha$ -reductase inhibitor (such as finasteride p. 742 or dutasteride p. 741) should be used. A combination of an alpha-adrenoceptor blocker and a 5 $\alpha$ -reductase inhibitor can be offered if symptoms remain a problem.

Surgery is recommended for men with more severe symptoms that do not respond to drug therapy, or who have complications such as acute urinary retention, haematuria, renal failure, bladder calculi or recurrent urinary-tract infection. **⚠**

## ALPHA-ADRENOCEPTOR BLOCKERS

### Alfuzosin hydrochloride

#### ● INDICATIONS AND DOSE

##### Benign prostatic hyperplasia

###### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: 2.5 mg 3 times a day; maximum 10 mg per day
- Elderly: Initially 2.5 mg twice daily, adjusted according to response; maximum 10 mg per day

###### ► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: 10 mg once daily

##### Acute urinary retention associated with benign prostatic hyperplasia

###### ► BY MOUTH USING MODIFIED-RELEASE TABLETS

- Elderly: 10 mg once daily for 2–3 days during catheterisation and for one day after removal; max. 4 days

- **CONTRA-INDICATIONS** Avoid if history of micturition syncope • avoid if history of postural hypotension

- **CAUTIONS** Acute heart failure • concomitant antihypertensives (reduced dosage and specialist supervision may be required) • discontinue if angina worsens • elderly • history of QT-interval prolongation • patients undergoing cataract surgery (risk of intra-operative floppy iris syndrome)

- **INTERACTIONS** → Appendix 1: alpha blockers

#### ● SIDE-EFFECTS

- **Uncommon** Chest pain • flushes
- **Frequency not known** Angioedema • asthenia • blurred vision • cholestasis • depression • dizziness • drowsiness • dry mouth • erectile disorders (including priapism) • gastrointestinal disturbances • headache • hypersensitivity • hypotension (notably postural hypotension) • intra-operative floppy iris syndrome • liver damage • oedema • palpitations • pruritus • rash • rhinitis • syncope • tachycardia

#### SIDE-EFFECTS, FURTHER INFORMATION

- **First dose effect** First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.
- **HEPATIC IMPAIRMENT** Initial dose 2.5 mg once daily, adjusted according to response to 2.5 mg twice daily in mild to moderate impairment—avoid if severe. Avoid modified-release preparations.
- **RENAL IMPAIRMENT** Initial dose 2.5 mg twice daily and adjust according to response. Manufacturers advise avoid use of modified-release preparations if eGFR less than 30 mL/minute/1.73 m<sup>2</sup> as limited experience.
- **PATIENT AND CARER ADVICE** Patient should be counselled on the first dose effect.  
**Driving and skilled tasks**  
May affect performance of skilled tasks e.g. driving.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

##### ► Alfuzosin hydrochloride (Non-proprietary)

**Alfuzosin hydrochloride 10 mg** Alfuzosin 10mg modified-release tablets | 30 tablet **[PoM]** no price available DT price = £12.51

##### ► Besavar XL (Zentiva)

**Alfuzosin hydrochloride 10 mg** Besavar XL 10mg tablets | 30 tablet **[PoM]** £12.51 DT price = £12.51

##### ► Fuzatal XL (Teva UK Ltd)

**Alfuzosin hydrochloride 10 mg** Fuzatal XL 10mg tablets | 30 tablet **[PoM]** £12.76 DT price = £12.51

##### ► Vasran XL (Ranbaxy (UK) Ltd)

**Alfuzosin hydrochloride 10 mg** Vasran XL 10mg tablets | 30 tablet **[PoM]** £11.48 DT price = £12.51

##### ► Xatral XL (Sanofi)

**Alfuzosin hydrochloride 10 mg** Xatral XL 10mg tablets | 10 tablet **[PoM]** £4.17 | 30 tablet **[PoM]** £12.51 DT price = £12.51

#### Tablet

##### ► Alfuzosin hydrochloride (Non-proprietary)

**Alfuzosin hydrochloride 2.5 mg** Alfuzosin 2.5mg tablets | 60 tablet **[PoM]** £21.20 DT price = £2.10

##### ► Xatral (Sanofi)

**Alfuzosin hydrochloride 2.5 mg** Xatral 2.5mg tablets | 60 tablet **[PoM]** £20.37 DT price = £2.10

## Doxazosin

### • INDICATIONS AND DOSE

#### Hypertension

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily; maximum 16 mg per day

##### ► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

#### Benign prostatic hyperplasia

##### ► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Adult: Initially 1 mg daily, dose may be doubled at intervals of 1–2 weeks according to response; usual maintenance 2–4 mg daily; maximum 8 mg per day

##### ► BY MOUTH USING MODIFIED-RELEASE MEDICINES

- Adult: Initially 4 mg once daily, dose can be adjusted after 4 weeks, then increased if necessary to 8 mg once daily

### DOSE EQUIVALENCE AND CONVERSION

- Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.

- **CONTRA-INDICATIONS** History of micturition syncope (in patients with benign prostatic hypertrophy) · history of postural hypotension · monotherapy in patients with overflow bladder or anuria

- **CAUTIONS** Care with initial dose (postural hypotension) · cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · heart failure · pulmonary oedema due to aortic or mitral stenosis

- **INTERACTIONS** → Appendix 1: alpha blockers

#### ● SIDE-EFFECTS

- **Common or very common** Anxiety · back pain · coughing · dyspnoea · fatigue · influenza-like symptoms · myalgia · paraesthesia · sleep disturbance · vertigo
- **Uncommon** Agitation · angina · arthralgia · epistaxis · gout · hypoaesthesia · micturition disturbance · myocardial infarction · tinnitus · tremor · weight changes
- **Very rare** Abnormal ejaculation · alopecia · arrhythmias · bradycardia · bronchospasm · cholestasis · gynaecomastia · hepatitis · hot flushes · jaundice · leucopenia · thrombocytopenia
- **Frequency not known** Angioedema · asthenia · blurred vision · depression · dizziness · drowsiness · dry mouth · erectile disorders · gastro-intestinal disturbances · headache · hypersensitivity · hypotension · intra-operative floppy iris syndrome · oedema · palpitations · postural hypotension · priapism · pruritus · rash · rhinitis · syncope · tachycardia

- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Accumulates in milk in *animal* studies—manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Use with caution. Manufacturer advises avoid in severe impairment—no information available.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for doxazosin tablets (initial dose).

#### Driving and skilled tasks

May affect performance of skilled tasks e.g. driving.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

#### Modified-release tablet

##### CAUTIONARY AND ADVISORY LABELS 25

##### ► **Cardura XL** (Pfizer Ltd)

**Doxazosin (as Doxazosin mesilate) 4 mg** Cardura XL 4mg tablets | 28 tablet [PoM] £5.00 DT price = £5.00

##### ► **Doxadura** (Discovery Pharmaceuticals)

**Doxazosin (as Doxazosin mesilate) 1 mg** Doxadura 1mg tablets | 28 tablet [PoM] £0.64 DT price = £0.71

**Doxazosin (as Doxazosin mesilate) 2 mg** Doxadura 2mg tablets | 28 tablet [PoM] £0.66 DT price = £0.74

**Doxazosin (as Doxazosin mesilate) 4 mg** Doxadura 4mg tablets | 28 tablet [PoM] £0.73 DT price = £0.84

## Indoramin

### • INDICATIONS AND DOSE

#### Hypertension

##### ► BY MOUTH

- Adult: Initially 25 mg twice daily, increased in steps of 25–50 mg every 2 weeks, maximum daily dose should be given in divided doses; maximum 200 mg per day

#### Benign prostatic hyperplasia

##### ► BY MOUTH

- Adult: 20 mg twice daily, increased in steps of 20 mg every 2 weeks if required, increased if necessary up to 100 mg daily in divided doses
- Elderly: 20 mg daily may be adequate, dose to be taken at night

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

- **CONTRA-INDICATIONS** Established heart failure · history micturition syncope (when used for benign prostatic hyperplasia) · history of postural hypotension (when used for benign prostatic hyperplasia)

- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · control incipient heart failure before initiating indoramin · elderly · epilepsy (convulsions in *animal* studies) · history of depression · Parkinson's disease (extrapyramidal disorders reported)

- **INTERACTIONS** → Appendix 1: alpha blockers

## ● SIDE-EFFECTS

- **Common or very common** Sedation
- **Uncommon** Failure of ejaculation · fatigue · weight gain
- **Frequency not known** Angioedema · asthenia · blurred vision · depression · dizziness · drowsiness · dry mouth · erectile disorders · extrapyramidal disorders · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypotension · incontinence · intra-operative floppy iris syndrome · oedema · palpitations · postural hypotension · priapism · pruritus · rash · rhinitis · syncope · tachycardia · urinary frequency

● **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

● **BREAST FEEDING** No information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● **RENAL IMPAIRMENT** Manufacturer advises caution.

## ● PATIENT AND CARER ADVICE

### Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Tablet

#### CAUTIONARY AND ADVISORY LABELS 2

#### ► Indoramin (Non-proprietary)

Indoramin hydrochloride 20 mg Indoramin 20mg tablets | 60 tablet [PoM] £61.00 DT price = £8.21

Indoramin (as Indoramin hydrochloride) 25 mg Indoramin 25mg tablets | 84 tablet [PoM] £60.26 DT price = £60.26

#### ► Doralese Tiltab (Chemidex Pharma Ltd)

Indoramin hydrochloride 20 mg Doralese Tiltab 20mg tablets | 60 tablet [PoM] £11.44 DT price = £8.21

## Prazosin

## ● INDICATIONS AND DOSE

### Hypertension

#### ► BY MOUTH

- **Adult:** Initially 500 micrograms 2–3 times a day for 3–7 days, the initial dose should be taken on retiring to bed at night to avoid collapse, increased to 1 mg 2–3 times a day for a further 3–7 days, then increased if necessary up to 20 mg daily in divided doses

### Congestive heart failure (rarely used)

#### ► BY MOUTH

- **Adult:** 500 micrograms 2–4 times a day, initial dose to be taken at bedtime, then increased to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses

### Raynaud's syndrome (but efficacy not established)

#### ► BY MOUTH

- **Adult:** Initially 500 micrograms twice daily, initial dose to be taken at bedtime, dose may be increased after 3–7 days, then increased if necessary to 1–2 mg twice daily

### Benign prostatic hyperplasia

#### ► BY MOUTH

- **Adult:** Initially 500 micrograms twice daily for 3–7 days, subsequent doses should be adjusted according to response, maintenance 2 mg twice daily, initiate with lowest possible dose in elderly patients

## DOSE ADJUSTMENTS DUE TO INTERACTIONS

Caution with concomitant antihypertensives in benign prostatic hyperplasia—reduced dosage and specialist supervision may be required.

- **CONTRA-INDICATIONS** History of micturition syncope · history of postural hypotension · not recommended for

congestive heart failure due to mechanical obstruction (e.g. aortic stenosis)

- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · first dose hypotension

- **INTERACTIONS** → Appendix 1: alpha blockers

## ● SIDE-EFFECTS

- **Common or very common** Blurred vision · depression · dizziness · drowsiness · dry mouth · dyspnoea · gastro-intestinal disturbances · headache · nasal congestion · nervousness · oedema · palpitations · syncope · urinary frequency · vertigo · weakness
- **Uncommon** Arthralgia · epistaxis · eye disorders · insomnia · paraesthesia · pruritus · rash · sweating · tachycardia · tinnitus · urticaria
- **Rare** Alopecia · bradycardia · flushing · gynaecomastia · hallucinations · pancreatitis · priapism · urinary incontinence · vasculitis · worsening of narcolepsy
- **Frequency not known** Angioedema · asthenia · erectile disorders · hypersensitivity reactions · hypotension · intra-operative floppy iris syndrome · postural hypotension · rhinitis

● **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.

● **BREAST FEEDING** Present in milk, amount probably too small to be harmful; manufacturer advises use with caution.

● **HEPATIC IMPAIRMENT** Initially 500 micrograms daily; increased with caution.

● **RENAL IMPAIRMENT** Initially 500 micrograms daily in moderate to severe impairment; increased with caution.

## ● PATIENT AND CARER ADVICE

**First dose effect** First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patients should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.

### Driving and skilled tasks

May affect performance of skilled tasks e.g. driving.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution

### Tablet

#### ► Prazosin (Non-proprietary)

Prazosin (as Prazosin hydrochloride) 2 mg Minipress 2mg tablets | 100 tablet [PoM] no price available

Prazosin (as Prazosin hydrochloride) 5 mg Minipress 5mg tablets | 100 tablet [PoM] no price available

#### ► Hypovase (Pfizer Ltd)

Prazosin (as Prazosin hydrochloride) 500 microgram Hypovase 500microgram tablets | 60 tablet [PoM] £2.69 DT price = £2.69

**Tamsulosin hydrochloride 400 microgram** Tamurex 400microgram modified-release capsules | 30 capsule [PoM] £3.50 DT price = £3.89

## Tamsulosin with dutasteride

The properties listed below are those particular to the combination only. For the properties of the components please consider, tamsulosin hydrochloride p. 739, dutasteride p. 741.

#### ● INDICATIONS AND DOSE

##### Benign prostatic hyperplasia

- BY MOUTH
- Adult (male): 1 capsule daily.

- **INTERACTIONS** → Appendix 1: alpha blockers, dutasteride

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

May affect performance of skilled tasks e.g. driving.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

CAUTIONARY AND ADVISORY LABELS 25

##### ► Combodart (GlaxoSmithKline UK Ltd)

**Tamsulosin hydrochloride 400 microgram, Dutasteride 500 microgram** Combodart 0.5mg/0.4mg capsules | 30 capsule [PoM] £23.76 DT price = £23.76

## Tamsulosin with solifenacin

The properties listed below are those particular to the combination only. For the properties of the components please consider, tamsulosin hydrochloride p. 739, solifenacin succinate p. 734.

#### ● INDICATIONS AND DOSE

##### Moderate to severe urinary frequency, urgency, and obstructive symptoms associated with benign prostatic hyperplasia when monotherapy ineffective

- BY MOUTH
- Adult (male): 1 tablet daily.

##### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises max. 1 *Vesomni*<sup>®</sup> tablet daily with concurrent use of potent inhibitors of CYP3A4; avoid concurrent use in patients who also have moderate hepatic impairment, severe renal impairment, are poor metabolisers of CYP2D6, or in patients also taking a potent inhibitor of CYP2D6.

- **INTERACTIONS** → Appendix 1: alpha blockers, solifenacin

- **HEPATIC IMPAIRMENT** Max. 1 *Vesomni*<sup>®</sup> tablet daily in moderate impairment.

- **RENAL IMPAIRMENT** Max. 1 *Vesomni*<sup>®</sup> tablet daily if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

##### ► Vesomni (Astellas Pharma Ltd)

**Tamsulosin hydrochloride 400 microgram, Solifenacin succinate 6 mg** Vesomni 6mg/0.4mg modified-release tablets | 30 tablet [PoM] £27.62 DT price = £27.62

## Terazosin

### ● INDICATIONS AND DOSE

#### Mild to moderate hypertension

##### ► BY MOUTH

- Adult: 1 mg daily for 7 days, then increased if necessary to 2 mg daily, dose should be taken at bedtime; maintenance 2–10 mg once daily, doses above 20 mg rarely improve efficacy

#### Benign prostatic hyperplasia

##### ► BY MOUTH

- Adult: Initially 1 mg daily, dose should be taken at bedtime, if necessary dose may be doubled at intervals of 1–2 weeks according to response; maintenance 5–10 mg daily; maximum 10 mg per day

- **CONTRA-INDICATIONS** History of micturition syncope (in benign prostatic hyperplasia) · history of postural hypotension (in benign prostatic hyperplasia)
- **CAUTIONS** Cataract surgery (risk of intra-operative floppy iris syndrome) · elderly · first dose
- **CAUTIONS, FURTHER INFORMATION**
  - First dose First dose may cause collapse due to hypotension within 30–90 minutes, therefore should be taken on retiring to bed; may also occur with rapid dose increase.
- **INTERACTIONS** → Appendix 1: alpha blockers
- **SIDE-EFFECTS** Angioedema · asthenia · back pain · blurred vision · decreased libido · depression · dizziness · drowsiness · dry mouth · dyspnoea · erectile disorders · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypotension · intra-operative floppy iris syndrome · nervousness · oedema · pain in extremities · palpitations · paraesthesia · postural hypotension · priapism · pruritus · rash · rhinitis · syncope · tachycardia · thrombocytopenia · weight gain
- **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
- **BREAST FEEDING** No information available.
- **PATIENT AND CARER ADVICE** Patient counselling is advised for terazosin tablets (initial dose).  
First dose effect First dose may cause collapse due to hypotensive effect (therefore should be taken on retiring to bed). Patient should be warned to lie down if symptoms such as dizziness, fatigue or sweating develop, and to remain lying down until they abate completely.  
**Driving and skilled tasks**  
May affect performance of skilled tasks e.g. driving.

### ● MEDICINAL FORMS

Hytrin tablets starter pack | 28 tablet [PoM] £13.00

## CHOLINE ESTERS

## Bethanechol chloride

### ● INDICATIONS AND DOSE

#### Urinary retention

##### ► BY MOUTH

- Adult: 10–25 mg 3–4 times a day, to be taken 30 minutes before food

- **CONTRA-INDICATIONS** Bradycardia · cardiovascular disorders · conditions where increased motility of the gastro-intestinal tract could be harmful · conditions where increased motility of the urinary tract could be harmful · epilepsy · heart block · hyperthyroidism · hypotension · intestinal obstruction · obstructive airways disease · parkinsonism · peptic ulcer · recent myocardial infarction · urinary obstruction
- **CAUTIONS** Autonomic neuropathy (use lower initial dose)
- **SIDE-EFFECTS** Abdominal pain · bradycardia · bronchoconstriction · diarrhoea · eructation · flushing · headache · hypotension · increased lacrimation · increased salivation · increased sweating · nausea · rhinorrhoea · vomiting
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid; gastrointestinal disturbances in infant reported.
- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 22

##### ► Myotonine (Glenwood GmbH)

**Bethanechol chloride 10 mg** Myotonine 10mg tablets | 100 tablet [PoM] £18.51

**Bethanechol chloride 25 mg** Myotonine 25mg tablets | 100 tablet [PoM] £27.26

## 5 $\alpha$ -REDUCTASE INHIBITORS

## Dutasteride

- **DRUG ACTION** A specific inhibitor of the enzyme 5 $\alpha$ -reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

### ● INDICATIONS AND DOSE

#### Benign prostatic hyperplasia

##### ► BY MOUTH

- Adult: 500 micrograms daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

- **INTERACTIONS** → Appendix 1: dutasteride
- **SIDE-EFFECTS** Breast enlargement · breast tenderness · decreased libido · ejaculation disorders · impotence
- **CONCEPTION AND CONTRACEPTION** Dutasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment—no information available.

- **EFFECT ON LABORATORY TESTS** May decrease serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.
- **HANDLING AND STORAGE** Women of childbearing potential should avoid handling leaking capsules of dutasteride.
- **PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

#### Capsule

CAUTIONARY AND ADVISORY LABELS 25

► **Avodart** (GlaxoSmithKline UK Ltd)

**Dutasteride 500 microgram** Avodart 500microgram capsules | 30 capsule **[PoM]** £14.60 DT price = £14.60

Combinations available: **Tamsulosin with dutasteride**, p. 740

## Finasteride

05-Jun-2017

- **DRUG ACTION** A specific inhibitor of the enzyme 5 $\alpha$ -reductase, which metabolises testosterone into the more potent androgen, dihydrotestosterone.

#### ● INDICATIONS AND DOSE

##### Benign prostatic hyperplasia

► BY MOUTH

► Adult: 5 mg daily, review treatment at 3–6 months and then every 6–12 months (may require several months treatment before benefit is obtained)

##### Androgenetic alopecia in men

► BY MOUTH

► Adult: 1 mg daily

#### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: RARE REPORTS OF DEPRESSION AND SUICIDAL THOUGHTS (MAY 2017)**

The MHRA has received reports of depression and, in rare cases, suicidal thoughts in men taking finasteride (*Propecia*®) for male pattern hair loss; depression is also associated with *Proscar*® for benign prostatic hyperplasia. Patients should be advised to stop finasteride immediately and inform a healthcare professional if they develop depression.

- **CAUTIONS** Obstructive uropathy
- **SIDE-EFFECTS**
  - Rare Depression • suicidal ideation
  - **Frequency not known** Breast enlargement • breast tenderness • decreased libido • ejaculation disorders • face swelling • hypersensitivity reactions • impotence • lip swelling • male breast cancer • pruritus • rash • testicular pain
- **CONCEPTION AND CONTRACEPTION** Finasteride is excreted in semen and use of a condom is recommended if sexual partner is pregnant or likely to become pregnant.
- **EFFECT ON LABORATORY TESTS** Decreases serum concentration of prostate cancer markers such as prostate-specific antigen; reference values may need adjustment.
- **HANDLING AND STORAGE** Women of childbearing potential should avoid handling crushed or broken tablets of finasteride.
- **PATIENT AND CARER ADVICE** Cases of male breast cancer have been reported. Patients or their carers should be told to promptly report to their doctor any changes in breast tissue such as lumps, pain, or nipple discharge.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

**NHS restrictions** Finasteride is not prescribable under the NHS for the treatment of androgenetic alopecia in men.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, powder

#### Tablet

##### ► **Finasteride (Non-proprietary)**

**Finasteride 1 mg** Finasteride 1mg tablets | 28 tablet **[PoM]** no price available

**Finasteride 5 mg** Finasteride 5mg tablets | 28 tablet **[PoM]** £11.85 DT price = £11.12

##### ► **Aindeem** (Actavis UK Ltd)

**Finasteride 1 mg** Aindeem 1mg tablet | 28 tablet **[PoM]** £33.68 | 84 tablet **[PoM]** £88.40

##### ► **Propecia** (Merck Sharp & Dohme Ltd)

**Finasteride 1 mg** Propecia 1mg tablets | 28 tablet **[PoM]** £33.68 | 84 tablet **[PoM]** £88.40

**Finasteride 5 mg** Proscar 5mg tablets | 28 tablet **[PoM]** £13.94 DT price = £1.12

## 1.3 Urological pain

### Urological pain

#### Treatment

The acute pain of *ureteric colic* may be relieved with pethidine hydrochloride p. 445. **Diclofenac** by injection or as suppositories is also effective and compares favourably with pethidine hydrochloride; other non-steroidal anti-inflammatory drugs are occasionally given by injection.

Lidocaine hydrochloride gel is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation.

#### Alkalinisation of urine

*Alkalinisation* of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections. Sodium bicarbonate p. 950 is used as a urinary alkalinising agent in some metabolic and renal disorders.

#### ALKALISING DRUGS

### Citric acid with potassium citrate

#### ● INDICATIONS AND DOSE

**Relief of discomfort in mild urinary-tract infections | Alkalinisation of urine**

► BY MOUTH USING ORAL SOLUTION

► Adult: 10 mL 3 times a day, diluted well with water

- **CAUTIONS** Cardiac disease • elderly
- **INTERACTIONS** → Appendix 1: potassium citrate
- **SIDE-EFFECTS** Hyperkalaemia on prolonged high dosage • mild diuresis
- **RENAL IMPAIRMENT** Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-

strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K<sup>+</sup>/10 mL.

- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Oral solution

CAUTIONARY AND ADVISORY LABELS 27

- ▶ **Citric acid with potassium citrate (Non-proprietary)**

Citric acid monohydrate 50 mg per 1 mL, Potassium citrate 300 mg per 1 mL Potassium citrate mixture | 200 mL [GSL] £1.33 DT price = £1.33 | 200 mL [P] £1.33 DT price = £1.33

## Sodium citrate

#### ● INDICATIONS AND DOSE

##### Bladder washouts

- ▶ Adult: (consult product literature)

##### Relief of discomfort in mild urinary-tract infections

- ▶ BY MOUTH

- ▶ Adult: (consult product literature)

##### MICOLETTE®

##### Constipation

- ▶ BY RECTUM

- ▶ Child 3–17 years: 5–10 mL for 1 dose
- ▶ Adult: 5–10 mL for 1 dose

##### MICRALAX®

##### Constipation

- ▶ BY RECTUM

- ▶ Child 3–17 years: 5 mL for 1 dose
- ▶ Adult: 5 mL for 1 dose

##### RELAXIT®

##### Constipation

- ▶ BY RECTUM

- ▶ Child 1 month–2 years: 5 mL for 1 dose, insert only half the nozzle length
- ▶ Child 3–17 years: 5 mL for 1 dose
- ▶ Adult: 5 mL for 1 dose

#### ● CONTRA-INDICATIONS

- ▶ With rectal use Acute gastro-intestinal conditions

#### ● CAUTIONS

- ▶ With oral use Cardiac disease · elderly · hypertension · patients on a sodium-restricted diet
- ▶ With rectal use Debilitated patients (in adults) · sodium and water retention in susceptible individuals

#### ● INTERACTIONS → Appendix 1: sodium citrate

#### ● SIDE-EFFECTS

- ▶ With oral use Mild diuresis

#### ● PREGNANCY

- ▶ With oral use Use with caution.

#### ● RENAL IMPAIRMENT

- ▶ With oral use In patients with fluid retention, avoid antacids containing large amounts of sodium.

#### ● PRESCRIBING AND DISPENSING INFORMATION

Sodium citrate 300 mmol/litre (88.2 mg/mL) oral solution is licensed for use before general anaesthesia for caesarean section (available from Viridian).

- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of sodium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

##### Granules

- ▶ **Sodium citrate (Non-proprietary)**

Sodium citrate 4 gram Cystitis Relief 4g oral granules sachets | 6 sachet [GSL] £2.38

- ▶ Brands may include Cymalon (sodium citrate), Cystocalm

##### Oral solution

- ▶ **Sodium citrate (Non-proprietary)**

Sodium citrate 88.23 mg per 1 mL Sodium citrate 0.3M oral solution | 30 mL [PoM] £4.50

Sodium citrate 441.17mg/5ml oral solution | 30 mL [PoM] no price available

##### Powder

- ▶ **Sodium citrate (Non-proprietary)**

Sodium citrate 1 mg per 1 mg Sodium citrate powder | 500 gram [GSL] £6.86 DT price = £6.86

##### Irrigation solution

- ▶ **Sodium citrate (Non-proprietary)**

Sodium citrate 3% irrigation solution 1litre bags | 1 bag no price available

##### Enema

- ▶ **Micolette Micro-enema** (Pinewood Healthcare)

Sodium citrate 90 mg per 1 mL Micolette Micro-enema 5mL | 12 enema [P] £4.26

- ▶ **Micralax Micro-enema** (Focus Pharmaceuticals Ltd)

Sodium citrate 90 mg per 1 mL Micralax Micro-enema 5mL | 12 enema [P] £4.87

- ▶ **Relaxit** (Supra Enterprises Ltd)

Sodium citrate 90 mg per 1 mL Relaxit Micro-enema 5mL | 12 enema £5.21

## TERPENES

### Anethol with borneol, camphene, cineole, fenchone and pinene

#### ● INDICATIONS AND DOSE

##### Urolithiasis for the expulsion of calculi

- ▶ BY MOUTH

- ▶ Adult: 1–2 capsules 3–4 times a day, to be taken before food

- **LESS SUITABLE FOR PRESCRIBING** Preparation is less suitable for prescribing.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Rowatinex** (Meadow Laboratories Ltd)

Cineole 3 mg, Anethol 4 mg, Fenchone 4 mg, Borneol 10 mg, Camphene 15 mg, Pinene 31 mg Rowatinex capsules | 50 capsule [PoM] £7.35

## 2 Bladder instillations and urological surgery

### Bladder instillations and urological surgery

#### Bladder infection

Various solutions are available as irrigations or washouts.

Aqueous chlorhexidine p. 1108 can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas* spp. Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they

may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% p. 953 (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Continuous bladder irrigation with amphotericin p. 561 50 micrograms/mL may be of value in mycotic infections in adults.

### Dissolution of blood clots

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% p. 743 may also be helpful.

### Bladder cancer

Bladder instillations of doxorubicin hydrochloride p. 835 and mitomycin p. 850 are used for recurrent superficial bladder tumours. Such instillations reduce systemic side-effects; adverse effects on the bladder (e.g. micturition disorders and reduction in bladder capacity) may occur.

Instillation of epirubicin hydrochloride p. 836 is used for treatment and prophylaxis of certain forms of superficial bladder cancer; instillation of doxorubicin hydrochloride is also used for some papillary tumours.

Instillation of BCG (*Bacillus Calmette-Guérin* p. 884), a live attenuated strain derived from *Mycobacterium bovis* is licensed for the treatment of primary or recurrent bladder carcinoma *in-situ* and for the prevention of recurrence following transurethral resection.

### Urological surgery

Glycine below irrigation solution 1.5% is the irrigant of choice for transurethral resection of the prostate gland and bladder tumours; sterile sodium chloride solution 0.9% (physiological saline) is used for percutaneous renal surgery.

### Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

## ANTISEPTICS AND DISINFECTANTS

### Chlorhexidine with lidocaine

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine p. 1108, lidocaine hydrochloride p. 1242.

#### • INDICATIONS AND DOSE

##### Urethral sounding and catheterisation

- BY URETHRAL APPLICATION
- Adult: 6–11 mL

##### Cystoscopy

- BY URETHRAL APPLICATION
- Adult: 11 mL, then 6–11 mL if required

#### • INTERACTIONS → Appendix 1: antiarrhythmics

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Gel

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

- **Instillagel** (CliniMed Ltd)

**Chlorhexidine gluconate 500 microgram per 1 mL, Lidocaine hydrochloride 20 mg per 1 mL** Instillagel gel | 60 mL [P] £14.05 DT price = £14.05 | 110 mL [P] £15.76 DT price = £15.76

## IRRIGATING SOLUTIONS

### Glycine

#### • INDICATIONS AND DOSE

**Bladder irrigation during urological surgery | Irrigation for transurethral resection of the prostate gland and bladder tumours**

- Adult: (consult product literature)

#### • CAUTIONS

##### CAUTIONS, FURTHER INFORMATION

- **Urological surgery** There is a high risk of fluid absorption from the irrigant used in endoscopic surgery within the urinary tract.

#### • SIDE-EFFECTS

Haemolysis • hypervolaemia • renal failure

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Irrigation solution

- **Glycine (Non-proprietary)**

Glycine 1.5% irrigation solution 3litre Easyflow bags | 1 bag no price available

Glycine 1.5% irrigation solution 1litre Flowfusor bottles | 1 bottle no price available

Glycine 1.5% irrigation solution 1litre Easyflow bags | 1 bag no price available

Glycine 1.5% irrigation solution 2litre Flowfusor bottles | 1 bottle no price available

## UROLOGICAL ANTI-INFLAMMATORY DRUGS

### Dimethyl sulfoxide

#### • INDICATIONS AND DOSE

**Symptomatic relief in interstitial cystitis (Hunner's ulcer)**

- BY INTRAVESICAL INSTILLATION

- Adult: 50 mL every 2 weeks retained for 15 minutes then voided by the patient, 50% solution is used and instilled into the bladder

#### • SIDE-EFFECTS

Bladder spasm • hypersensitivity

#### • MONITORING REQUIREMENTS

Ophthalmic, renal and hepatic assessments at intervals of 6 months are required in long-term treatment.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Liquid

- **RIMSO-50** (Thornton & Ross Ltd)

**Dimethyl sulfoxide 500 mg per 1 mL** RIMSO-50 solution for instillation | 50 mL [PoM] £324.00

## Catheter maintenance solutions

#### • CATHETER MAINTENANCE SOLUTIONS

**OptiFlo R citric acid 6% catheter maintenance solution** (Bard Ltd) 50mL • NHS indicative price = £3.60 • Drug Tariff (Part IXa)100mL • NHS indicative price = £3.60 • Drug Tariff (Part IXa)

**OptiFlo S saline 0.9% catheter maintenance solution** (Bard Ltd) **Sodium chloride 9 mg per 1 mL** 50mL • NHS indicative price = £3.39 • Drug Tariff (Part IXa)100mL • NHS indicative price = £3.39 • Drug Tariff (Part IXa)

**Uro-Tainer M sodium chloride 0.9% catheter maintenance solution** (B.Braun Medical Ltd) **Sodium chloride 9 mg per 1 mL** 50mL • No NHS indicative price available • Drug Tariff (Part IXa)100mL • No NHS indicative price available • Drug Tariff (Part IXa)

**Uro-Tainer sodium chloride 0.9% catheter maintenance solution** (B.Braun Medical Ltd) **Sodium chloride 9 mg per 1 ml 50ml** • NHS indicative price = £3.51 • Drug Tariff (Part IXa)100ml • NHS indicative price = £3.51 • Drug Tariff (Part IXa)

## 3 Contraception

### Contraceptives, hormonal

#### Overview

The Fraser Guidelines (Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at [www.tinyurl.com/bpg16](http://www.tinyurl.com/bpg16)) should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at [www.fsrh.org](http://www.fsrh.org)) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

**Hormonal contraception** is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

**Intra-uterine devices** are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

**Barrier methods** alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a **spermicide**. Occasionally sensitivity reactions occur. A female condom (*Femidom*®) is also available; it is pre-lubricated but does not contain a spermicide.

#### Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen ('combined oral contraceptives') are effective preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'phasic'. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

#### Combined Oral Contraceptives Monophasic 21-day preparations

Oestrogen content	Progestogen content	Brand
Ethinylestradiol 20 micrograms	Desogestrel 150 micrograms	Gedarel® 20/150

Estradiol valerate 2 mg	Dienogest 3 mg	
Estradiol valerate 1 mg		

Choice

The majority of combined oral contraceptives contain ethinylestradiol p. 715 as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- *Low strength preparations* (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.

- *Standard strength preparations* (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram *phased* preparations) are appropriate for standard use. Phased preparations are generally reserved for women who *either* do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens ethinylestradiol with desogestrel p. 751, ethinylestradiol with drospirenone p. 752, and ethinylestradiol with gestodene p. 753 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 751 is in the combined oral contraceptive *Qlaira*®. Nomegestrol is the progestogen contained in the combined oral contraceptive *Zoely*®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (*Evr*a®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (*NuvaRing*®).

Surgery

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommenced at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;
- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.

## Progestogen-only contraceptives

### Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

### Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate p. 763 (*Depo-Provera*®, *SAYANA PRESS*®) is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*®, *SAYANA PRESS*®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

**Norethisterone enantate** (*Noristerat*®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An **etonogestrel-releasing implant** (*Nexplanon*®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

### Intra-uterine progestogen-only device

The progestogen-only intra-uterine systems *Mirena*®, *Jaydess*® and *Levosert*® release levonorgestrel p. 759 directly into the uterine cavity. *Mirena*® is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. *Jaydess*® and *Levosert*® are licensed for contraception, and *Levosert*® is additionally

licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

### Surgery

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

## Emergency contraception

### Hormonal methods

Hormonal emergency contraceptives include levonorgestrel and ulipristal acetate p. 757; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device. Ulipristal acetate is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

### Intra-uterine device

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin p. 507). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

## Contraceptives, interactions

06-Jun-2017

### Overview

The effectiveness of combined oral contraceptives, progestogen-only oral contraceptives, contraceptive patches, vaginal rings, and emergency hormonal contraception can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 297, eslicarbazepine acetate p. 299, nevirapine p. 609, oxcarbazepine p. 306, phenytoin p. 308, phenobarbital p. 318,

primidone p. 319, ritonavir p. 621, St John's Wort, topiramate p. 315 and, above all, rifabutin p. 543 and rifampicin p. 549) and possibly also griseofulvin p. 568. **EvGr** A condom together with a long-acting method (such as an injectable contraceptive) may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists. **A**

### Combined hormonal contraceptives interactions

**EvGr** Women using combined hormonal contraceptive patches, vaginal rings or oral tablets who require enzyme-inducing drugs or griseofulvin should be advised to change to a reliable contraceptive method that is unaffected by enzyme-inducers, such as some parenteral progestogen-only contraceptives (medroxyprogesterone acetate p. 763 and norethisterone p. 720) or intra-uterine devices (levonorgestrel p. 759; see also Contraceptives, non-hormonal p. 749). This should be continued for the duration of treatment and for four weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed: **A**

#### Short course (2 months or less) of an enzyme-inducing drug

**EvGr** Continuing the combined hormonal contraceptive method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug. **A**

#### Long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin) or a course of griseofulvin

**EvGr** Use a monophasic combined oral contraceptive at a dose of ethinylestradiol 50 micrograms or more daily [unlicensed use] and use either an extended or a 'tricycling' regimen (i.e. taking three packets of monophasic tablets without a break followed by a shortened tablet-free interval of four days [unlicensed use]); continue for the duration of treatment with the interacting drug and for four weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use] on specialist advice, or to use additional precautions, or to change to a method unaffected by the interacting drugs.

Use of contraceptive patches and vaginal rings (including concurrent use of two patches or two vaginal rings) is not recommended for women taking enzyme-inducing drugs over a long period. **A**

#### Long-term course (over 2 months) of rifampicin or rifabutin

An alternative method of contraception (such as an IUD) is **always** recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for four weeks after stopping the enzyme-inducing drug.

#### Antibacterials that do not induce liver enzymes

**EvGr** It is recommended that no additional contraceptive precautions are required when *combined* oral contraceptives, contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes, unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman. **A**

There had been concerns that some antibacterials that do not induce liver enzymes (e.g. ampicillin p. 520, doxycycline p. 534) reduce the efficacy of *combined* oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel. However, there is a lack of evidence to support this interaction.

#### Oral progestogen-only contraceptives interactions

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes.

**EvGr** The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs or griseofulvin

and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an interacting drug and for at least 4 weeks afterwards.

For a short course of an enzyme-inducing drug (less than two months), continuing the progestogen-only oral method may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for four weeks after stopping the enzyme-inducing drug. **A**

### Parenteral progestogen-only contraceptives interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. **EvGr** The effectiveness of intramuscular norethisterone injection and intramuscular and subcutaneous medroxyprogesterone acetate injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.

Effectiveness of the etonogestrel-releasing implant p. 762 may be reduced by enzyme-inducing drugs or griseofulvin and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the interacting drug and for at least 4 weeks after stopping.

For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, continued contraception with the implant may be appropriate if used in combination with consistent and careful use of condoms for the duration of treatment and for 4 weeks after stopping the enzyme-inducing drug. **A**

### Hormonal emergency contraception interactions

The effectiveness of levonorgestrel and ulipristal acetate p. 757 is reduced in women taking enzyme-inducing drugs or griseofulvin (and for at least 4 weeks after stopping). **EvGr** A copper intra-uterine device can be offered instead. If the copper intra-uterine device is declined or unsuitable, the dose of levonorgestrel should be increased (See *Dose adjustments due to interactions* under levonorgestrel). There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers. **A**

The effectiveness of ulipristal acetate for emergency contraception may be reduced by drugs that increase gastric pH (such as regular use of antacids, H<sub>2</sub> receptor antagonists and proton pump inhibitors). **EvGr** Levonorgestrel or a copper intra-uterine device should be considered as alternatives.

Hormonal contraception should not be newly initiated in a patient until five days after administration of ulipristal acetate as emergency hormonal contraception—the contraceptive effect of ulipristal acetate will be reduced. Consistent and careful use of condoms is recommended.

Ulipristal acetate can be used as emergency hormonal contraception more than once in the same cycle. **A** Conversely, manufacturer advises that use of levonorgestrel as emergency contraception more than once in the same cycle is not advisable due to increased risk of side-effects (such as menstrual irregularities).

**EvGr** Levonorgestrel should not be used (as emergency hormonal contraception) within 5 days of administration of ulipristal acetate (as emergency hormonal contraception), as the contraceptive effect of ulipristal acetate may be reduced by progestogens.

Ulipristal acetate is not recommended for use in women who have severe asthma treated by oral corticosteroids, due to the antiglucocorticoid effect of ulipristal acetate. **A**

### Useful Resources

Drug interactions with hormonal contraception. The Faculty of Sexual and Reproductive Healthcare. Clinical guidance. January 2017.

## Contraceptives, non-hormonal

### Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished. They have two components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol '9' p. 764 has been associated with genital lesions, which may increase the risk of acquiring these infections.

### Contraceptive devices

#### Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm<sup>2</sup> of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (*Gyne Fix*®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

#### Caution with oil-based lubricants

Products such as petroleum jelly (*Vaseline*®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

ischaemic attacks without headaches · undiagnosed vaginal bleeding

- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · Crohn's disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression especially if induced by hormonal contraceptive · hyperprolactinaemia (seek specialist advice) · inflammatory bowel disease · migraine · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for arterial disease · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

#### CAUTIONS, FURTHER INFORMATION

- **Risk of venous thromboembolism** There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of *arterial* thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

- **Risk factors for venous thromboembolism** Use with **caution** if any of following factors present but **avoid** if two or more factors present:
  - *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
  - *obesity*; body mass index  $\geq 30$  kg/m<sup>2</sup> (avoid if body mass index  $\geq 35$  kg/m<sup>2</sup> unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
  - *history of superficial thrombophlebitis*;
  - *age over 35 years* (avoid if over 50 years);
  - *smoking*.

## 3.1 Contraception, combined

### OESTROGENS COMBINED WITH PROGESTOGENS

## Combined hormonal contraceptives

- **CONTRA-INDICATIONS** Acute porphyrias p. 969 · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease · severe or multiple risk factors for venous thromboembolism · systemic lupus erythematosus with (or unknown) antiphospholipid antibodies · transient cerebral

**Combined Hormonal Contraception and Risk of Venous Thromboembolism**

Progestogen in Combined Hormonal Contraceptive	Estimated incidence per 10 000 women per year of use
Non-pregnant, not using combined hormonal contraception	2
Levonorgestrel <sup>1</sup>	5–7
Norgestimate <sup>1</sup>	5–7
Norethisterone <sup>1</sup>	5–7
Etonogestrel <sup>1</sup>	6–12
Norelgestromin <sup>1</sup>	6–12
Gestodene <sup>1</sup>	9–12
Desogestrel <sup>1</sup>	9–12
Drospirenone <sup>1</sup>	9–12
Dienogest <sup>2</sup>	Not known—insufficient data
Nomegestrol <sup>2</sup>	Not known—insufficient data

<sup>1</sup>Combined with ethinylestradiol <sup>2</sup>Combined with estradiol

- ▶ Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:
  - *familial history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
  - *diabetes mellitus* (avoid if diabetes complications present);
  - *hypertension*; blood pressure above *systolic 140 mmHg or diastolic 90 mmHg* (avoid if blood pressure above *systolic 160 mmHg or diastolic 95 mmHg*); (in adolescents, avoid if blood pressure very high);
  - *smoking* (avoid if smoking 40 or more cigarettes daily);
  - *age over 35 years* (avoid if over 50 years);
  - *obesity* (avoid if body mass index  $\geq 35 \text{ kg/m}^2$  unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
  - *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).
- ▶ Migraine Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

- **INTERACTIONS** → Appendix 1: combined hormonal contraceptives
- **SIDE-EFFECTS**
  - ▶ **Rare** Gallstones • systemic lupus erythematosus
  - ▶ **Frequency not known** Abdominal cramps • absence of withdrawal bleeding • amenorrhoea after discontinuation • breast enlargement • breast secretion • breast tenderness • cervical erosion • changes in libido • changes in lipid metabolism • changes in vaginal discharge • chloasma • chorea • contact lenses may irritate • depression • fluid retention • headache • hepatic tumours • hypertension •

irritability • leg cramps • liver impairment • nausea • nervousness • photosensitivity • reduced menstrual loss • skin reactions • thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) • visual disturbances • vomiting • ‘spotting’ in early cycles

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.
- ▶ **Cervical cancer** Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years.

The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With oral use Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. **21-day combined preparations**, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. **Every day (ED) combined preparations**, 1 **active** tablet daily for 21 days, followed by 1 **inactive** tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when **inactive** tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.  
Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations.  
Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days. Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for *Qlaira*®).  
After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for *Qlaira*®).  
After abortion or miscarriage Start same day.
- **PATIENT AND CARER ADVICE**
  - ▶ **Missed pill** The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning* or *end* of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets).

Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

**Travel** Women taking oral contraceptives are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

**Diarrhoea and vomiting** Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery. If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

F 749

## Dienogest with estradiol valerate

### ● INDICATIONS AND DOSE

**Contraception with 28-day combined preparations | Menstrual symptoms with 28-day combined preparations**

#### ► BY MOUTH

- Females of childbearing potential: 1 active tablet once daily for 26 days, followed by 1 inactive tablet daily for 2 days, withdrawal bleeding may occur during the 2-day interval of *inactive* tablets, tablets should be taken at approximately the same time each day

- **DIRECTIONS FOR ADMINISTRATION** Changing to *Qlaira*®: start the first active *Qlaira*® tablet on the day after taking the last active tablet of the previous brand

### ● PATIENT AND CARER ADVICE

#### Missed doses

A missed pill for a patient taking *Qlaira*® is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*®, refer to product literature.

**Diarrhoea and vomiting** In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Qlaira*®, refer to product literature.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ► **Dienogest with estradiol valerate (Non-proprietary)**

**Dienogest 2 mg, Estradiol valerate 2 mg** Estradiol valerate 2mg / Dienogest 2mg tablets | 15 tablet [PoM] no price available

**Estradiol valerate 2 mg, Dienogest 3 mg** Estradiol valerate 2mg / Dienogest 3mg tablets | 51 tablet [PoM] no price available

##### ► **Qlaira** (Bayer Plc)

Qlaira tablets | 84 tablet [PoM] £25.18

### Tablet

#### ► Ethinylestradiol with drospirenone (Non-proprietary)

Ethinylestradiol 30 microgram, Drospirenone

3 mg Ethinylestradiol 30microgram / Drospirenone 3mg tablets | 63

tablet [PoM] no price available DT price = £14.70

#### ► Acondro (Mylan Ltd)

Ethinylestradiol 30 microgram, Drospirenone 3 mg Acondro

0.03mg/3mg tablets | 63 tablet [PoM] £8.35 DT price = £14.70

#### ► Cleosensa (Actavis UK Ltd)

Ethinylestradiol 30 microgram, Drospirenone 3 mg Cleosensa

0.03mg/3mg tablets | 63 tablet [PoM] £14.70 DT price = £14.70

#### ► Daylette (Consilient Health Ltd)

Ethinylestradiol 20 microgram, Drospirenone 3 mg Daylette

0.02mg/3mg tablets | 84 tablet [PoM] £10.50 DT price = £14.70

#### ► Dretine (Teva UK Ltd)

Ethinylestradiol 30 microgram, Drospirenone 3 mg Dretine

0.03mg/3mg tablets | 63 tablet [PoM] £8.30 DT price = £14.70

#### ► ELOINE (Bayer Plc)

Ethinylestradiol 20 microgram, Drospirenone 3 mg Eloine

0.02mg/3mg tablets | 84 tablet [PoM] £14.70 DT price = £14.70

#### ► Eilanite (Stragen UK Ltd)

Ethinylestradiol 30 microgram, Drospirenone 3 mg Eilanite

0.03mg/3mg tablets | 63 tablet [PoM] £14.70 DT price = £14.70

#### ► Lucette (Consilient Health Ltd)

Ethinylestradiol 30 microgram, Drospirenone 3 mg Lucette

0.03mg/3mg tablets | 63 tablet [PoM] £9.35 DT price = £14.70

#### ► Yacella (Morningside Healthcare Ltd)

Ethinylestradiol 30 microgram, Drospirenone 3 mg Yacella

0.03mg/3mg tablets | 63 tablet [PoM] £8.30 DT price = £14.70

#### ► Yasmin (Bayer Plc)

Ethinylestradiol 30 microgram, Drospirenone 3 mg Yasmin

tablets | 63 tablet [PoM] £14.70 DT price = £14.70

#### ► Yiznell (Lupin (Europe) Ltd)

Ethinylestradiol 30 microgram, Drospirenone 3 mg Yiznell

0.03mg/3mg tablets | 63 tablet [PoM] £8.30 DT price = £14.70

► 749

## Ethinylestradiol with etonogestrel

### • INDICATIONS AND DOSE

**Contraception | Menstrual symptoms**

#### ► BY VAGINA

- Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

### • DIRECTIONS FOR ADMINISTRATION

Changing method of contraception to vaginal ring

Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.

Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer vaginal ring. Counselling The presence of the ring should be checked regularly.

#### Missed doses

**Expulsion, delayed insertion or removal, or broken vaginal ring**

If the vaginal ring is expelled for *less than 3 hours*, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for *more than 3 hours* or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;

- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

**F 749****Ethinylestradiol with norelgestromin****● INDICATIONS AND DOSE****Contraception | Menstrual symptoms****► BY TRANSDERMAL APPLICATION**

- Females of childbearing potential: Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free

interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

- **DIRECTIONS FOR ADMINISTRATION** Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch. Changing to a transdermal combined hormonal contraceptive **Changing from combined oral contraception** Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last *active* tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.

**Changing from progestogen-only method**

- from an implant, apply first patch on the day implant removed
- from an injection, apply first patch when next injection due
- from oral progestogen, first patch may be applied on any day after stopping pill

For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

**After childbirth (not breast-feeding)** Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

**After abortion or miscarriage** Before 20 weeks' gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

- **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer patches.

**Travel** Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

**Missed doses**

**Delayed application or detached patch** If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):

- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
- for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on

the usual 'change day', the day after day 28; no additional contraception is required.

#### • NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2003) that *Evra*® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

## 3.2 Contraception, devices

**Contraception devices not listed below** Levonorgestrel, p. 759

### CONTRACEPTIVE DEVICES

#### Intra-uterine contraceptive devices (copper)

##### ● INDICATIONS AND DOSE

##### Contraception

- ▶ BY INTRA-UTERINE ADMINISTRATION
- ▶ Females of childbearing potential: (consult product literature)

##### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

- **CONTRA-INDICATIONS** Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) · distorted uterine cavity · established or marked immunosuppression · genital malignancy · medical diathermy · pelvic inflammatory disease · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · small uterine cavity · unexplained uterine bleeding · Wilson's disease

- **CAUTIONS** Anaemia · anticoagulant therapy (avoid if possible) · diabetes · disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age

##### CAUTIONS, FURTHER INFORMATION

- ▶ Risk of infection The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old *or*
- they are over 25 years old *and*
  - have a new partner *or*
  - have had more than one partner in the past year *or*
  - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend *as an emergency* if she experiences sustained pain during the next 20 days.

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- **SIDE-EFFECTS** Allergy · bleeding (on insertion) · cervical perforation · displacement · dysmenorrhoea · expulsion · menorrhagia · occasionally epileptic seizure (on insertion) · pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection may be exacerbated · uterine perforation · vasovagal attack (on insertion)

##### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Presence of significant symptoms (especially pain) Advise the patient to seek medical attention promptly in case of significant symptoms.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a copper allergy.
- **PREGNANCY** If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.
- **BREAST FEEDING** Not known to be harmful.
- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet.* Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.
- **PRESCRIBING AND DISPENSING INFORMATION**

## 3.3 Contraception, emergency

**Other drugs used for Contraception, emergency** Intra-uterine contraceptive devices (copper), p. 756 • Levonorgestrel, p. 759

### PROGESTERONE RECEPTOR MODULATORS

#### Ulipristal acetate

- **DRUG ACTION** Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect.

#### • INDICATIONS AND DOSE

**Pre-operative and intermittent treatment of moderate to severe symptoms of uterine fibroids**

##### ► BY MOUTH

- Adult: 5 mg once daily for up to 3 months starting during the first week of menstruation, courses may be repeated if necessary, re-treatment should start no sooner than during the first week of the second menstruation following completion of the first course; max. 4 courses

#### Emergency contraception

##### ► BY MOUTH

- Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

#### • CONTRA-INDICATIONS

##### GENERAL CONTRA-INDICATIONS

Repeated use as an emergency contraceptive within a menstrual cycle

##### SPECIFIC CONTRA-INDICATIONS

- When used for uterine fibroids Breast cancer • cervical cancer • ovarian cancer • undiagnosed vaginal bleeding • uterine cancer • vaginal bleeding not caused by uterine fibroids

- **CAUTIONS** Uncontrolled severe asthma

- **INTERACTIONS** → Appendix 1: ulipristal

## Vaginal contraceptives

#### • SILICONE CONTRACEPTIVE DIAPHRAGMS

**Milex arcing spring silicone diaphragm 60mm** (Durbin Plc)  
1 device • NHS indicative price = £9.31 • Drug Tariff (Part IXa)

**Milex arcing spring silicone diaphragm 65mm** (Durbin Plc)  
1 device • NHS indicative price = £9.31 • Drug Tariff (Part IXa)

**Milex omniflex coil spring silicone diaphragm 65mm** (Durbin Plc)  
1 device • NHS indicative price = £9.31 • Drug Tariff (Part IXa)

**Milex omniflex coil spring silicone diaphragm 70mm** (Durbin Plc)  
1 device • NHS indicative price = £9.31 • Drug Tariff (Part IXa)

### ● SIDE-EFFECTS

#### ► Common or very common

- When used for emergency contraception Abdominal pain · back pain · diarrhoea · dizziness · fatigue · gastro-intestinal disturbances · headache · menstrual irregularities · muscle spasms · nausea · vomiting
- When used for uterine fibroids Abdominal pain · acne · breast pain · dizziness · endometrial thickening · headache · hot flushes · hyperhidrosis · malaise · menstrual disturbances · myalgia · nausea · oedema · ovarian cyst (including rupture) · pelvic pain · uterine haemorrhage

#### ► Uncommon

- When used for emergency contraception Blurred vision · breast tenderness · dry mouth · hot flushes · pruritus · rash · tremor · uterine spasm
- When used for uterine fibroids Anxiety · constipation · dry mouth · dyspepsia · epistaxis · flatulence · urinary incontinence

● **CONCEPTION AND CONTRACEPTION** When ulipristal is given as an emergency contraceptive the effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for *Qlaira*®) and 9 days for oral progestogen-only contraceptives. When ulipristal is given for uterine fibroids non-hormonal contraceptive methods (barrier methods or intra-uterine device) should be used both during treatment and for 12 days after stopping, if required.

● **PREGNANCY** Limited information available when used as an emergency contraceptive. Manufacturer advises avoid for uterine fibroids—no information available.

● **BREAST FEEDING** In emergency contraception manufacturer advises avoid for 1 week after administration—present in milk. When used for uterine fibroids, manufacturer advises avoid—no information available.

### ● HEPATIC IMPAIRMENT

- When used for Emergency contraception Manufacturer advises avoid in severe impairment—no information available.
- When used for Uterine fibroids Manufacturer advises avoid in moderate to severe impairment unless patient is closely monitored—no information available.

### ● RENAL IMPAIRMENT

- When used for Uterine fibroids Manufacturer advises avoid in severe impairment unless patient is closely monitored—no information available.

### ● MONITORING REQUIREMENTS

- When used for Uterine fibroids Periodic monitoring of the endometrium is recommended following repeated intermittent treatment.

### ● PATIENT AND CARER ADVICE

- When used for Emergency contraception If vomiting occurs within 3 hours of taking a dose, a replacement dose should be given. When prescribing or supplying hormonal emergency contraception, women should be advised:
  - that their next period may be early or late;
  - that a barrier method of contraception needs to be used until the next period;
  - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
  - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

Treatment free intervals

- When used for Uterine fibroids The prescriber should explain the requirement for treatment free intervals.

### Missed doses

- When used for Uterine fibroids If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- **Ellaone** (HRA Pharma UK Ltd)  
**Ulipristal acetate 30 mg** EllaOne 30mg tablets | 1 tablet **P** £14.05
- **Esmya** (Gedeon Richter (UK) Ltd)  
**Ulipristal acetate 5 mg** Esmya 5mg tablets | 28 tablet **POm** £114.13

## 3.4 Contraception, oral progestogen-only

**Other drugs used for Contraception, oral progestogen-only** Norethisterone, p. 720

## PROGESTOGENS

### Desogestrel

#### ● INDICATIONS AND DOSE

##### Contraception

##### ► BY MOUTH

- Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a 'missed pill'

● **CONTRA-INDICATIONS** Acute porphyrias p. 969 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

● **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies

#### CAUTIONS, FURTHER INFORMATION

- Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

● **INTERACTIONS** → Appendix 1: desogestrel

● **SIDE-EFFECTS** Breast discomfort · changes in libido · depression · disturbance of appetite · dizziness · headache · menstrual irregularities · nausea · skin disorders · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

● **PREGNANCY** Not known to be harmful.

● **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

- **HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

#### ● PATIENT AND CARER ADVICE

**Missed pill** The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

**Surgery** All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

**Starting routine** One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

**Changing from a combined oral contraceptive** Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

**After childbirth** Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. **Diarrhoea and vomiting** Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (September 2003) that *Cerazette*® should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated.

#### ● MEDICINAL FORMS

## Levonorgestrel

18-Feb-2016

### ● INDICATIONS AND DOSE

#### Emergency contraception

- ▶ BY MOUTH
- ▶ Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours

#### Contraception

- ▶ BY MOUTH
- ▶ Females of childbearing potential: 1 tablet daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a "missed pill"

#### JAYDESS® 13.5MG INTRA-UTERINE DEVICE

#### Contraception

- ▶ BY VAGINA
- ▶ Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery (12 weeks if uterus involution is substantially delayed); effective for 3 years

#### LEVOSERT® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

#### Contraception | Menorrhagia

- ▶ BY INTRA-UTERINE ADMINISTRATION
- ▶ Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester abortion; postpartum insertions should be delayed until at least 6 weeks after delivery; effective for 3 years

#### MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

#### Contraception | Menorrhagia

- ▶ BY INTRA-UTERINE ADMINISTRATION
- ▶ Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

#### Prevention of endometrial hyperplasia during oestrogen replacement therapy

- ▶ BY INTRA-UTERINE ADMINISTRATION
- ▶ Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

continued →

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and for up to 4 weeks after stopping); a copper intra-uterine device should preferably be used instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]; pregnancy should be excluded following use, and medical advice sought if pregnancy occurs.

There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

With the progestogen-only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

**● UNLICENSED USE**

- ▶ With oral use in children Consult product literature for licensing status of individual preparations.
- ▶ With vaginal use in children Not licensed for use in women under 18 years.

**IMPORTANT SAFETY INFORMATION****MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS**

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

**● CONTRA-INDICATIONS**

- ▶ With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration · acute cervicitis · acute vaginitis · distorted uterine cavity · established immunosuppression · genital malignancy · history of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception · infected abortion during the previous three months · marked immunosuppression · not suitable for emergency contraception · pelvic inflammatory disease · postpartum endometritis · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · small uterine cavity · unexplained uterine bleeding
- ▶ With oral use Acute porphyrias p. 969
- ▶ With oral use for contraception History of breast cancer but can be used after 5 years if no evidence of disease and non-

hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

**● CAUTIONS**

- ▶ With intra-uterine use Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · anaemia · anticoagulant therapy (avoid if possible) · diabetes · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age
- ▶ With oral use for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- ▶ When used for emergency contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · past ectopic pregnancy · severe malabsorption syndromes

**CAUTIONS, FURTHER INFORMATION**

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- ▶ Risk of infection with intra-uterine devices The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old *or*
- they are over 25 years old *and*
- have a new partner *or*
- have had more than one partner in the past year *or*
- their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an *emergency* if she experiences sustained pain during the next 20 days.

- ▶ Use as a contraceptive in co-morbidities
- ▶ With oral use The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

**MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE** Advanced uterine atrophy

- **INTERACTIONS** → Appendix 1: levonorgestrel

**● SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Depression (sometimes severe) · headache · nausea
- ▶ **Frequency not known** Vomiting

**SPECIFIC SIDE-EFFECTS**

- ▶ **Common or very common**
- ▶ With intra-uterine use Changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) · abdominal pain · acne · alopecia · back pain · breast pain · expulsion · hirsutism · migraine · nervousness · pelvic pain · peripheral oedema · salpingitis

### ► Uncommon

- With intra-uterine use Abdominal distension · cervicitis · eczema · pelvic inflammatory disease · pruritus · skin hyperpigmentation

### ► Rare

- With intra-uterine use Rash · uterine perforation

### ► Frequency not known

- With intra-uterine use Functional ovarian cysts (usually asymptomatic and usually resolve spontaneously—ultrasound monitoring recommended) · allergy · bleeding (on insertion) · cervical perforation · displacement · dysmenorrhoea · epileptic seizures (on insertion) · menorrhagia · pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection may be exacerbated · vasovagal attack (on insertion)
- With oral use Breast discomfort · breast tenderness · changes in libido · disturbances of appetite · dizziness · fatigue · menstrual irregularities · skin disorders

### SIDE-EFFECTS, FURTHER INFORMATION

- Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception.

- With intra-uterine use Endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern may often become very light or absent.

Removal of the intra-uterine system should be considered if the patient experiences migraine or severe headache, jaundice, marked increase of blood pressure, or severe arterial disease.

### ● PREGNANCY

- With oral use Not known to be harmful.
- With vaginal use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.

- BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

- HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

### ● MONITORING REQUIREMENTS

- With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.

### ● DIRECTIONS FOR ADMINISTRATION

- With intra-uterine use *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

### ● PRESCRIBING AND DISPENSING INFORMATION

- With intra-uterine use Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

### MIRENA<sup>®</sup> 20MICROGRAMS/24HOURS INTRA-UTERINE

**DEVICE** When system is removed (and not immediately replaced) and pregnancy is not desired, remove during the first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

**JAYDESS<sup>®</sup> 13.5MG INTRA-UTERINE DEVICE** When system is removed (and not immediately replaced) and pregnancy is not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle and there is intercourse within 7 days.

**LEVONELLE<sup>®</sup> ONE STEP** Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

### ● PATIENT AND CARER ADVICE

Diarrhoea and vomiting with use as an oral contraceptive Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery. Starting routine

- With oral use for contraception One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

- With intra-uterine use Counsel women to seek medical attention promptly in case of significant symptoms, especially pain. Patient counselling advised. Patient information leaflet to be provided.
- With oral use for emergency contraception If vomiting occurs within 2 hours of taking levonorgestrel, a replacement dose should be given.

When prescribing or supplying hormonal emergency contraception, women should be advised:

- that their next period may be early or late;
- that a barrier method of contraception needs to be used until the next period;
- to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
- to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

### Missed doses

When used as an oral contraceptive, the following advice is recommended 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not

protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days\*.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

- **EXCEPTIONS TO LEGAL CATEGORY** *Levonelle® One Step* can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Intra-uterine device

- ▶ **Jaydess** (Bayer Plc) ▼  
**Levonorgestrel 13.5 mg** Jaydess 13.5mg intra-uterine device | 1 device [PoM] £69.22
- ▶ **Levosert** (Allergan Ltd)

## 3.5 Contraception, parenteral progestogen-only

**Other drugs used for Contraception, parenteral progestogen-only** Norethisterone, p. 720

### PROGESTOGENS

#### Etonogestrel

27-Sep-2016

##### • INDICATIONS AND DOSE

**Contraception (no hormonal contraceptive use in previous month)**

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

##### Contraception (postpartum)

- ▶ BY SUBDERMAL IMPLANTATION

▶ Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery (delay until 28 days postpartum if breast-feeding), implant should be removed within 3 years of insertion

##### Contraception following abortion or miscarriage in the second trimester

- ▶ BY SUBDERMAL IMPLANTATION

▶ Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

##### Contraception following abortion or miscarriage in the first trimester

- ▶ BY SUBDERMAL IMPLANTATION

▶ Females of childbearing potential: 1 implant to be inserted within 5 days after abortion or miscarriage, implant should be removed within 3 years of insertion

##### Contraception (changing from other hormonal contraceptive)

- ▶ BY SUBDERMAL IMPLANTATION

▶ Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

- **UNLICENSED USE** *Nexplanon®* not licensed for use in females outside of the age range 18–40 years.

##### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2016): *NEXPLANON®* (ETONOGESTREL) CONTRACEPTIVE IMPLANTS: REPORTS OF DEVICE IN VASCULATURE AND LUNG

There have been rare reports of *Nexplanon®* implants reaching the lung via the pulmonary artery. An implant that cannot be palpated at its insertion site should be located and removed as soon as possible; if unable to locate implant within the arm, the MHRA recommends using chest imaging. Correct subdermal insertion reduces the risk of these events.

- **CONTRA-INDICATIONS** Acute porphyria · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · history of jaundice in pregnancy · malabsorption syndromes · possible risk of breast cancer · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- **INTERACTIONS** → Appendix 1: etonogestrel
- **SIDE-EFFECTS** Breast discomfort · changes in libido · depression · disturbance of appetite · dizziness · headache · injection-site reactions · menstrual irregularities · nausea · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.
  - ▶ Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the

contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

- **PREGNANCY** Not known to be harmful, remove implant if pregnancy occurs.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **DIRECTIONS FOR ADMINISTRATION** The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.
- **PATIENT AND CARER ADVICE** Full counselling backed by patient information leaflet required before administration.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Implant

##### ● Etogestrel (Non-proprietary)

**Etonogestrel 68 mg** Etonogestrel 68mg implant | 1 device [PoM] no price available DT price = £83.43

##### ● Nexplanon (Merck Sharp & Dohme Ltd)

**Etonogestrel 68 mg** Nexplanon 68mg implant | 1 device [PoM] £83.43 DT price = £83.43

## Medroxyprogesterone acetate

24-May-2017

#### ● INDICATIONS AND DOSE

##### Dysfunctional uterine bleeding

###### ► BY MOUTH

- Adult: 2.5–10 mg daily for 5–10 days, repeated for 2 cycles, begin treatment on day 16–21 of cycle

##### Secondary amenorrhoea

###### ► BY MOUTH

- Adult: 2.5–10 mg daily for 5–10 days, repeated for 3 cycles, begin treatment on day 16–21 of cycle

##### Mild to moderate endometriosis

###### ► BY MOUTH

- Adult: 10 mg 3 times a day for 90 consecutive days, begin treatment on day 1 of cycle

##### Progestogenic opposition of oestrogen HRT

###### ► BY MOUTH

- Adult: 10 mg daily for the last 14 days of each 28-day oestrogen HRT cycle

##### Endometrial cancer | Renal cell cancer

###### ► BY MOUTH

- Adult: 200–600 mg daily

##### Breast cancer

###### ► BY MOUTH

- Adult: 0.4–1.5 g daily

##### Contraception

###### ► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

###### ► BY SUBCUTANEOUS INJECTION

- Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

##### Long-term contraception

###### ► BY DEEP INTRAMUSCULAR INJECTION

- Females of childbearing potential: 150 mg every 12 weeks, first dose to be administered within the first

5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)

###### ► BY SUBCUTANEOUS INJECTION

- Females of childbearing potential: 104 mg every 13 weeks, first dose to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

##### Contraception (when patient changing from other hormonal contraceptive)

###### ► BY SUBCUTANEOUS INJECTION

- Females of childbearing potential: (consult product literature)

##### Hot flushes caused by long-term androgen suppression in men with prostate cancer

###### ► BY MOUTH

- Adult: 20 mg once daily initially for 10 weeks, evaluate effect at the end of the treatment period

- **UNLICENSED USE** [EvGr] Not licensed for the treatment of hot flushes caused by long-term androgen suppression in men. 

#### ● CONTRA-INDICATIONS

##### GENERAL CONTRA-INDICATIONS

- Acute porphyrias p. 969 · severe arterial disease · undiagnosed vaginal bleeding

##### SPECIFIC CONTRA-INDICATIONS

- With intramuscular use or subcutaneous use History of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable
- With oral use Breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history of liver tumours

#### ● CAUTIONS

##### GENERAL CAUTIONS

- Possible risk of breast cancer

##### SPECIFIC CAUTIONS

- With intramuscular use or subcutaneous use History during pregnancy in disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus
- With oral use Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

- **INTERACTIONS** → Appendix 1: medroxyprogesterone

#### ● SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

- Breast discomfort · changes in libido · depression · dizziness · headache · indigestion · loss of vision during treatment (discontinue treatment if papilloedema or retinal vascular lesions) · menstrual irregularities · nausea · pruritus · vomiting · weight gain

##### SPECIFIC SIDE-EFFECTS

- Rare
- With intramuscular use or subcutaneous use Osteoporosis · osteoporotic fractures
- Frequency not known
- With intramuscular use or subcutaneous use Disturbance of appetite · injection site-reactions · reduced bone mineral density · skin disorders
- With oral use Acne · adrenergic-like effects (when used for malignant disease) · alopecia · anaphylactoid reactions · bloating · breast tenderness · cervical erosions (when used for malignant disease) · confusion (when used for

malignant disease) • congestive heart failure (when used for malignant disease) • constipation (when used for malignant disease) • diarrhoea (when used for malignant disease) • drowsiness • dry mouth (when used for malignant disease) • euphoria (when used for malignant disease) • fluid retention • galactorrhoea (when used for malignant disease) • glucocorticoid effects may lead to a cushingoid syndrome (with high doses for malignant disease) • hirsutism • hypercalcaemia (when used for malignant disease) • hyperpyrexia (when used for malignant disease) • hypertension (when used for malignant disease) • insomnia • jaundice • loss of concentration (when used for malignant disease) • nervousness (when used for malignant disease) • palpitation (when used for malignant disease) • premenstrual-like syndrome • raised platelet count (when used for malignant disease) • raised white blood cell count (when used for malignant disease) • rash • retinal thrombosis (when used for malignant disease) • skin reactions • tachycardia (when used for malignant disease) • urticaria • vision disorders (when used for malignant disease)

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ With intramuscular use or subcutaneous use Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.
- ▶ With intramuscular use or subcutaneous use Reduction in bone mineral density occurs in the first 2–3 years of use then stabilises.

#### CONCEPTION AND CONTRACEPTION

- ▶ With intramuscular use If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.
- ▶ With subcutaneous use If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

#### PREGNANCY

- ▶ With oral use Avoid—genital malformations and cardiac defects reported.
- ▶ With intramuscular use or subcutaneous use Not known to be harmful.

- **BREAST FEEDING** Present in milk—no adverse effects reported. Progestogen-only contraceptives do not affect lactation.

- ▶ With intramuscular use or subcutaneous use The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

- **HEPATIC IMPAIRMENT** Avoid in liver tumour.

- ▶ With oral use Avoid in hepatic impairment.
- ▶ With intramuscular use or subcutaneous use Caution in severe liver disease and recurrent cholestatic jaundice.

#### RENAL IMPAIRMENT

- ▶ When used for Mild to moderate endometriosis or Progestogenic opposition of oestrogen HRT or Dysfunctional uterine bleeding or Secondary amenorrhoea Use with caution.

#### PATIENT AND CARER ADVICE

- ▶ With intramuscular use or subcutaneous use Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

##### Tablet

- ▶ **Climanor** (ReSource Medical UK Ltd)

**Medroxyprogesterone acetate 5 mg** Climanor 5mg tablets | 28 tablet **[PoM]** £3.27

- ▶ **Provera** (Pfizer Ltd)

**Medroxyprogesterone acetate 2.5 mg** Provera 2.5mg tablets | 30 tablet **[PoM]** £1.84 DT price = £1.84

**Medroxyprogesterone acetate 5 mg** Provera 5mg tablets | 10 tablet **[PoM]** £1.23 DT price = £1.23 | 100 tablet **[PoM]** £12.32

**Medroxyprogesterone acetate 10 mg** Provera 10mg tablets | 10 tablet **[PoM]** £2.47 | 90 tablet **[PoM]** £22.16 DT price = £22.16 | 100 tablet **[PoM]** £24.73

**Medroxyprogesterone acetate 100 mg** Provera 100mg tablets | 60 tablet **[PoM]** £29.98 | 100 tablet **[PoM]** £49.94 DT price = £49.94

**Medroxyprogesterone acetate 200 mg** Provera 200mg tablets | 30 tablet **[PoM]** £29.65 DT price = £29.65

**Medroxyprogesterone acetate 400 mg** Provera 400mg tablets | 30 tablet **[PoM]** £58.67 DT price = £58.67

#### Suspension for injection

- ▶ **Depo-Provera** (Pfizer Ltd)

**Medroxyprogesterone acetate 150 mg per 1 ml** Depo-Provera 150mg/1ml suspension for injection pre-filled syringes | 1 pre-filled disposable injection **[PoM]** £6.01 DT price = £6.01

- ▶ **Sayana Press** (Pfizer Ltd)

**Medroxyprogesterone acetate 160 mg per 1 ml** Sayana Press 104mg/0.65 ml suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection **[PoM]** £6.90

## 3.6 Contraception, spermicidal

### SPERMICIDALS

#### Nonoxinol

##### INDICATIONS AND DOSE

**Spermicidal contraceptive in conjunction with barrier methods of contraception such as diaphragms or caps**

- ▶ BY VAGINA

- ▶ Females of childbearing potential: (consult product literature)

- **SIDE-EFFECTS** Genital lesions

##### SIDE-EFFECTS, FURTHER INFORMATION

High frequency use of the spermicide nonoxinol '9' has been associated with genital lesions, which may increase the risk of acquiring these infections.

- **CONCEPTION AND CONTRACEPTION** No evidence of harm to latex condoms and diaphragms.

- **PREGNANCY** Toxicity in *animal* studies.

- **BREAST FEEDING** Present in milk in *animal* studies.

##### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Gel

EXCIPIENTS: May contain Hydroxybenzoates (parabens), propylene glycol, sorbic acid

- ▶ **Gygel** (Marlborough Pharmaceuticals Ltd)

**Nonoxinol-9 20 mg per 1 ml** Gygel 2% contraceptive jelly | 30 gram **[GSL]** £4.25 | 81 gram **[GSL]** £11.00

## 4 Erectile and ejaculatory conditions

### 4.1 Erectile dysfunction

#### Erectile dysfunction

06-Mar-2017

##### Description of condition

Erectile dysfunction (impotence) is the persistent inability to attain and maintain an erection that is sufficient to permit satisfactory sexual performance. It can have physical or psychological causes. Erectile dysfunction can also be a side-effect of drugs such as antihypertensives, antidepressants, antipsychotics, cytotoxic drugs and recreational drugs (including alcohol).

Risk factors for erectile dysfunction include sedentary lifestyle, obesity, smoking, hypercholesterolaemia and metabolic syndrome. Erectile dysfunction increases the risk of cardiovascular disease. All men with unexplained erectile dysfunction should be evaluated for the presence of cardiovascular risk factors and any identified risk should be addressed.

##### Drug treatment

**[EvGr]** The recommended approach for the management of erectile dysfunction is a combination of drug treatment and lifestyle changes (including regular exercise, reduction in body mass index, smoking cessation, and reduced alcohol consumption).

An oral phosphodiesterase type-5 inhibitor is the first-line drug treatment for erectile dysfunction, regardless of the cause. **[A]** These drugs act by increasing the blood flow to the penis. They do not initiate an erection—sexual stimulation is required.

The choice of oral phosphodiesterase type-5 inhibitor depends on the frequency of intercourse and response to treatment. **[EvGr]** Avanafil below, sildenafil p. 766 and vardenafil p. 768 are short-acting drugs and are suitable for occasional use as required. Tadalafil p. 767 is a longer-acting drug. It can be used as required, but can also be used as a regular lower daily dose to allow for spontaneous (rather than scheduled) sexual activity or in those who have frequent sexual activity. A patient with erectile dysfunction should receive six doses of an individual phosphodiesterase type-5 inhibitor at the maximum dose (with sexual stimulation) before being classified as a non-responder. Patients who fail to respond to the maximum dose of at least two different phosphodiesterase type-5 inhibitors should be referred to a specialist.

Intracavernosal, intraurethral or topical application of alprostadil p. 769 (prostaglandin E<sub>1</sub>) is recommended as second-line therapy under careful medical supervision. Intracavernosal or intraurethral preparations can also be used to aid diagnosis. **[A]**

##### Priapism associated with alprostadil

Manufacturers advise that patients should seek medical help if a prolonged erection lasting four hours or more occurs; application of an ice pack to the upper-inner thigh (alternating between the left and right thighs every two minutes for up to ten minutes) may result in reflex opening of the venous valves.

If priapism has lasted more than six hours, treatment should not be delayed; manufacturer advises management as follows:

- Initial therapy by penile aspiration: using aseptic technique, 20–50mL of blood should be aspirated using a 19–21 gauge butterfly needle inserted into the *corpus*

*cavernosum*; if necessary the procedure may be repeated on the opposite side;

- Lavage: if initial aspiration is unsuccessful, a second 19–21 gauge butterfly needle can be inserted into the opposite *corpus cavernosum*; sterile physiological saline can be injected through the first needle and drained through the second;
- If aspiration and lavage are unsuccessful, intracavernosal injection of a sympathomimetic with action on alpha-adrenergic receptors can be given, with continuous monitoring of blood pressure and pulse—see phenylephrine hydrochloride p. 772 [unlicensed indication], adrenaline/epinephrine p. 771 [unlicensed indication], and metaraminol p. 772 [unlicensed indication]. Extreme **caution** is required in patients with coronary heart disease, hypertension, cerebral ischaemia and in patients taking a monoamine-oxidase inhibitor (facilities for managing hypertensive crisis should be available when administered to patients taking MAOIs);
- If necessary the sympathomimetic injections can be followed by further aspiration of blood through the same butterfly needle;
- If administration of a sympathomimetic drug is unsuccessful, urgent referral for surgical management is required.

##### Prescribing on the NHS

Some drug treatments for erectile dysfunction may only be prescribed on the NHS under certain circumstances; for details see the criteria listed in part XVIII of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: [www.nhsbsa.nhs.uk/PrescriptionServices/4940.aspx](http://www.nhsbsa.nhs.uk/PrescriptionServices/4940.aspx).

Health and Personal Social Services for Northern Ireland Drug Tariff: [www.hscbusiness.hscni.net/services/2034.htm](http://www.hscbusiness.hscni.net/services/2034.htm).

Scottish Drug Tariff: [www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/](http://www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/).

#### PHOSPHODIESTERASE TYPE-5 INHIBITORS

##### Avanafil

###### ● INDICATIONS AND DOSE

###### Erectile dysfunction

###### ► BY MOUTH

- Adult: Initially 100 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

###### Erectile dysfunction in patients on alpha-blocker therapy

###### ► BY MOUTH

- Adult: Initially 50 mg, to be taken approximately 15–30 minutes before sexual activity, then adjusted according to response to 50–200 mg (max. per dose 200 mg), to be taken as a single dose as needed; maximum 1 dose per day

###### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises max. 100 mg once every 48 hours with concurrent use of moderate inhibitors of CYP3A4.

- CONTRA-INDICATIONS** Avoid if systolic blood pressure below 90 mmHg (no information available) · blood pressure >170/100 mmHg · hereditary degenerative retinal disorders · history of non-arteritic anterior ischaemic optic neuropathy · life-threatening arrhythmia in previous 6 months · mild to severe heart failure · patients in whom vasodilation or sexual activity are inadvisable · recent history of myocardial infarction · recent history of stroke · recent unstable angina

- **CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · bleeding disorders · cardiovascular disease · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
  - **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors
  - **SIDE-EFFECTS**
    - ▶ **Common or very common** Back pain · dizziness · dyspepsia · flushing · headache · migraine · myalgia · nasal congestion · nausea · visual disturbances · vomiting
    - ▶ **Uncommon** Drowsiness · epistaxis · hypertension · hypotension · malaise · painful red eyes · palpitation · tachycardia
    - ▶ **Rare** Abdominal pain · diarrhoea · dry mouth · facial oedema · gastritis · genital irritation · gout · haematuria · hyperactivity · hyperbilirubinaemia · hypersensitivity reactions · increased serum creatinine · insomnia · muscle spasms · peripheral oedema · pollakiuria · priapism · rash · Stevens-Johnson syndrome · syncope · weight gain
    - ▶ **Frequency not known** Arrhythmia · myocardial infarction · non-arteritic anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) · retinal vascular occlusion · seizures · serious cardiovascular events · sudden hearing loss (discontinue drug and seek medical advice) · unstable angina
  - **HEPATIC IMPAIRMENT** Use lowest effective initial dose in mild to moderate impairment, adjusted according to response. Manufacturer advises avoid in severe impairment—no information available.
  - **RENAL IMPAIRMENT** Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
  - **PATIENT AND CARER ADVICE** Onset of effect may be delayed if taken with food.
  - **NATIONAL FUNDING/ACCESS DECISIONS**  
**NHS restrictions** Spedra<sup>®</sup> is not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in Part XVIII of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'.
- The Drug Tariffs can be accessed online at: National Health Service Drug Tariff for England and Wales: [www.ppa.org.uk/ppa/edt\\_intro.htm](http://www.ppa.org.uk/ppa/edt_intro.htm); Health and Personal Social Services for Northern Ireland Drug Tariff: [www.hscbusiness.hscni.net/services/2034.htm](http://www.hscbusiness.hscni.net/services/2034.htm); Scottish Drug Tariff: [www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/](http://www.isdscotland.org/Health-Topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/)

#### • MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

• **Spedra** (A. Menarini Farmaceutica Internazionale SRL) ▼

**Avanafil 50 mg** Spedra 50mg tablets | 4 tablet [PoM] £10.94 DT price = £10.94 | 8 tablet [PoM] £19.70 DT price = £19.70

**Avanafil 100 mg** Spedra 100mg tablets | 4 tablet [PoM] £14.08 DT price = £14.08 | 8 tablet [PoM] £26.26 DT price = £26.26

**Avanafil 200 mg** Spedra 200mg tablets | 4 tablet [PoM] £21.90 DT price = £21.90 | 8 tablet [PoM] £39.40 DT price = £39.40

## Sildenafil

#### • INDICATIONS AND DOSE

**Pulmonary arterial hypertension (initiated under specialist supervision)**

- ▶ **BY MOUTH**
- ▶ **Adult:** 20 mg 3 times a day

#### ▶ **BY INTRAVENOUS INJECTION**

- ▶ **Adult:** 10 mg 3 times a day, use intravenous route when the oral route is not appropriate

#### **Erectile dysfunction**

##### ▶ **BY MOUTH**

- ▶ **Adult:** Initially 50 mg, to be taken approximately 1 hour before sexual activity, adjusted according to response to 25–100 mg (max. per dose 100 mg) as required, to be taken as a single dose; maximum 1 dose per day

#### **DOSE ADJUSTMENTS DUE TO INTERACTIONS**

- ▶ When used for Erectile dysfunction Manufacturer advises a starting dose of 25 mg with concurrent use of moderate and potent inhibitors of CYP3A4. Manufacturer advises if concurrent use of ritonavir is unavoidable, the max. dose should not exceed 25 mg within 48 hours.
- ▶ With oral use for Pulmonary arterial hypertension Manufacturer advises reduce dose to 20 mg twice daily with concurrent use of moderate inhibitors of CYP3A4. Manufacturer advises reduce dose to 20 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).
- ▶ With intravenous use for Pulmonary arterial hypertension Manufacturer advises reduce dose to 10 mg twice daily with concurrent use of moderate inhibitors of CYP3A4. Manufacturer advises reduce dose to 10 mg once daily with concurrent use of some potent inhibitors of CYP3A4 (avoid with ketoconazole, itraconazole and ritonavir).

#### • **CONTRA-INDICATIONS**

##### **GENERAL CONTRA-INDICATIONS**

Hereditary degenerative retinal disorders · history of non-arteritic anterior ischaemic optic neuropathy · recent history of myocardial infarction · recent history of stroke

##### **SPECIFIC CONTRA-INDICATIONS**

- ▶ When used for erectile dysfunction Avoid if systolic blood pressure below 90 mmHg (no information available) · patients in whom vasodilation or sexual activity are inadvisable · recent unstable angina
- ▶ When used for pulmonary arterial hypertension Sickle-cell anaemia

#### • **CAUTIONS**

##### **GENERAL CAUTIONS**

Active peptic ulceration · bleeding disorders · cardiovascular disease · left ventricular outflow obstruction

##### **SPECIFIC CAUTIONS**

- ▶ When used for erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
- ▶ When used for pulmonary arterial hypertension Anatomical deformation of the penis · autonomic dysfunction · hypotension (avoid if systolic blood pressure below 90 mmHg) · intravascular volume depletion · predisposition to priapism · pulmonary veno-occlusive disease
- **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

#### • **SIDE-EFFECTS**

##### **GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Back pain · dyspepsia · flushing · migraine · myalgia · nasal congestion · visual disturbances
- ▶ **Frequency not known** Non-arteritic anterior ischaemic optic neuropathy (discontinue if sudden visual impairment occurs) · sudden hearing loss (advise patient to seek medical help)

## SPECIFIC SIDE-EFFECTS

## ► Common or very common

- When used for erectile dysfunction Nausea · dizziness · vomiting
- When used for pulmonary arterial hypertension Abdominal distension · alopecia · anaemia · anxiety · bronchitis · cellulitis · cough · diarrhoea · dry mouth · epistaxis · fever · gastritis · gastro-oesophageal reflux · haemorrhoids · headache · influenza-like symptoms · insomnia · limb pain · night sweats · oedema · painful red eyes · paraesthesia · photophobia · retinal haemorrhage · tremor · vertigo

## ► Uncommon

- When used for erectile dysfunction Chest pain · drowsiness · dry mouth · epistaxis · fatigue · hypertension · hypoaesthesia · hypotension · painful red eyes · palpitation · tachycardia · tinnitus · vertigo
- When used for pulmonary arterial hypertension Gynaecomastia · haematuria · penile haemorrhage · priapism

## ► Rare

- When used for erectile dysfunction Atrial fibrillation · cerebrovascular accident · facial oedema · hypersensitivity reactions · priapism · rash · Stevens-Johnson syndrome · syncope

## ► Frequency not known

- When used for erectile dysfunction Arrhythmia · myocardial infarction · seizures · unstable angina
- When used for pulmonary arterial hypertension Rash · retinal vascular occlusion

- **PREGNANCY** Use only if potential benefit outweighs risk—no evidence of harm in animal studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** In pulmonary arterial hypertension, if usual dose not tolerated, reduce *oral* dose to 20 mg twice daily and *intravenous* dose to 10 mg twice daily. For erectile dysfunction, use initial dose of 25 mg. Manufacturer advises avoid in severe impairment.

- **RENAL IMPAIRMENT** Use initial dose of 25 mg in erectile dysfunction if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

In pulmonary hypertension, if usual dose not tolerated, reduce *oral* dose to 20 mg twice daily and *intravenous* dose to 10 mg twice daily.

● **TREATMENT CESSATION**

- When used for Pulmonary arterial hypertension Consider gradual withdrawal.

● **PATIENT AND CARER ADVICE**

- When used for erectile dysfunction Onset of effect may be delayed if taken with food.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (January 2010 and February 2011) that sildenafil tablets (*Revatio*®) should be initiated for patients with pulmonary arterial hypertension only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists and that sildenafil injection (*Revatio*®) should be prescribed only on the advice of specialists in the Scottish Pulmonary Vascular Unit or the Scottish Adult Congenital Cardiac Service.

**NHS restrictions** *Viagra*® is not prescribable under NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

● **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

**Tablet**► **Sildenafil (Non-proprietary)**

**Sildenafil (as Sildenafil citrate) 20 mg** Sildenafil 20mg tablets | 90 tablet [PoM] £379.38–£424.01

**Sildenafil (as Sildenafil citrate) 25 mg** Sildenafil 25mg tablets | 4 tablet [PoM] £16.59 DT price = £0.78 | 8 tablet [PoM] £33.19

**Sildenafil (as Sildenafil citrate) 50 mg** Sildenafil 50mg tablets | 4 tablet [PoM] £21.27 DT price = £0.86 | 8 tablet [PoM] £42.54

**Sildenafil (as Sildenafil citrate) 100 mg** Sildenafil 100mg tablets | 4 tablet [PoM] £23.50 DT price = £0.94 | 8 tablet [PoM] £46.99 | 12 tablet [PoM] £3.69

► **Revatio (Pfizer Ltd)**

**Sildenafil (as Sildenafil citrate) 20 mg** Revatio 20mg tablets | 90 tablet [PoM] £446.33

► **Viagra (Pfizer Ltd)**

**Sildenafil (as Sildenafil citrate) 25 mg** Viagra 25mg tablets | 4 tablet [PoM] £16.59 DT price = £0.78 | 8 tablet [PoM] £33.19

**Sildenafil (as Sildenafil citrate) 50 mg** Viagra 50mg tablets | 4 tablet [PoM] £21.27 DT price = £0.86 | 8 tablet [PoM] £42.54

**Sildenafil (as Sildenafil citrate) 100 mg** Viagra 100mg tablets | 4 tablet [PoM] £23.50 DT price = £0.94 | 8 tablet [PoM] £46.99

► **Vizarsin (Consilient Health Ltd)**

**Sildenafil (as Sildenafil citrate) 25 mg** Vizarsin 25mg tablets | 4 tablet [PoM] £14.10 DT price = £0.78

**Sildenafil (as Sildenafil citrate) 50 mg** Vizarsin 50mg tablets | 4 tablet [PoM] £18.07 DT price = £0.86

**Sildenafil (as Sildenafil citrate) 100 mg** Vizarsin 100mg tablets | 4 tablet [PoM] £19.97 DT price = £0.94

**Solution for injection**► **Revatio (Pfizer Ltd)**

**Sildenafil (as Sildenafil citrate), 8 mg per 1 ml** Revatio 10mg/12.5ml solution for injection vials | 1 vial [PoM] £45.28

**Oral suspension**► **Revatio (Pfizer Ltd)**

**Sildenafil (as Sildenafil citrate) 10 mg per 1 ml** Revatio 10mg/ml oral suspension sugar-free | 112 ml [PoM] £186.75

**Chewable tablet**

CAUTIONARY AND ADVISORY LABELS 24

EXCIPIENTS: May contain Aspartame

► **Nipatra (AMCo)**

**Sildenafil (as Sildenafil citrate) 25 mg** Nipatra 25mg chewable tablets sugar-free | 4 tablet [PoM] £1.05 sugar-free | 8 tablet [PoM] £2.10

**Sildenafil (as Sildenafil citrate) 50 mg** Nipatra 50mg chewable tablets sugar-free | 4 tablet [PoM] £1.03 sugar-free | 8 tablet [PoM] £2.06

**Sildenafil (as Sildenafil citrate) 100 mg** Nipatra 100mg chewable tablets sugar-free | 4 tablet [PoM] £1.11 sugar-free | 8 tablet [PoM] £2.22

**Tadalafil**● **INDICATIONS AND DOSE****Pulmonary arterial hypertension (initiated under specialist supervision)**

- BY MOUTH
- Adult: 40 mg once daily

**Erectile dysfunction**

- BY MOUTH
- Adult: Initially 10 mg once daily (max. per dose 20 mg), to be taken at least 30 minutes before sexual activity, subsequent doses adjusted according to response, the effect of intermittent dosing may persist for longer than 24 hours, daily dose of 10–20 mg not recommended; maximum 1 dose per day

**Erectile dysfunction; for patients who anticipate sexual activity at least twice a week**

- BY MOUTH
- Adult: 5 mg once daily, reduced to 2.5 mg once daily, adjusted according to response, the effect continued →

of intermittent dosing may persist for longer than 24 hours

### Benign prostatic hyperplasia

- BY MOUTH
- Adult: 5 mg once daily

### CONTRA-INDICATIONS

#### GENERAL CONTRA-INDICATIONS

History of non-arteritic anterior ischaemic optic neuropathy

#### SPECIFIC CONTRA-INDICATIONS

- When used for benign prostatic hyperplasia or erectile dysfunction Hypotension (avoid if systolic blood pressure below 90 mmHg) • mild to severe heart failure • myocardial infarction • patients in whom vasodilation or sexual activity are inadvisable • recent stroke • uncontrolled arrhythmias • uncontrolled hypertension • unstable angina
- When used for pulmonary arterial hypertension acute myocardial infarction in past 90 days

### CAUTIONS

- When used for benign prostatic hyperplasia or erectile dysfunction Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) • cardiovascular disease • left ventricular outflow obstruction • predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia)
- When used for pulmonary arterial hypertension Anatomical deformation of the penis • aortic and mitral valve disease • congestive cardiomyopathy • coronary artery disease • hereditary degenerative retinal disorders • hypotension (avoid if systolic blood pressure below 90 mmHg) • left ventricular dysfunction • life-threatening arrhythmias • pericardial constriction • predisposition to priapism • pulmonary veno-occlusive disease • uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors

### SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

- **Common or very common** Back pain • dyspepsia • flushing • headache • myalgia • nausea • vomiting
- **Uncommon** Hypertension • tachycardia
- **Frequency not known** Arrhythmia • myocardial infarction • non-arteritic anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) • retinal vascular occlusion • sudden hearing loss (discontinue drug and seek medical advice) • unstable angina

#### SPECIFIC SIDE-EFFECTS

- **Common or very common**
  - When used for benign prostatic hyperplasia or erectile dysfunction Dizziness • migraine • nasal congestion • visual disturbances
  - When used for pulmonary arterial hypertension Blurred vision • chest pain • epistaxis • facial oedema • gastro-oesophageal reflux • hypotension • increased uterine bleeding • limb pain • nasopharyngitis • palpitation • rash
- **Uncommon**
  - When used for benign prostatic hyperplasia or erectile dysfunction Epistaxis • hypotension • painful red eyes • palpitation
- When used for pulmonary arterial hypertension Amnesia • hyperhidrosis • priapism • seizures
- **Rare**
  - When used for benign prostatic hyperplasia or erectile dysfunction Facial oedema • hypersensitivity reactions • priapism • rash • Stevens-Johnson syndrome • syncope
- **Frequency not known**
  - When used for benign prostatic hyperplasia or erectile dysfunction Abdominal pain • increased sweating • seizures • serious cardiovascular events • transient amnesia

- When used for pulmonary arterial hypertension Stevens-Johnson syndrome • stroke • visual field defect

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** For pulmonary arterial hypertension use initial dose of 20 mg once daily in mild to moderate impairment. Use maximum dose of 10 mg in erectile dysfunction and benign prostatic hyperplasia. When used for pulmonary arterial hypertension, avoid in severe impairment. Manufacturer advises caution in severe impairment and for regular once-daily dosing in erectile dysfunction and benign prostatic hyperplasia—no information available.

- **RENAL IMPAIRMENT** In pulmonary arterial hypertension for patients with mild to moderate impairment, initially use 20 mg once daily, increased to 40 mg once daily if tolerated. For erectile dysfunction and benign prostatic hyperplasia, maximum dose 10 mg if eGFR less than 30 mL/minute/1.73 m<sup>2</sup> (avoid regular once-daily dosing). In pulmonary arterial hypertension, avoid in severe impairment.

### NATIONAL FUNDING/ACCESS DECISIONS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (June 2012) that tadalafil (*Adcirca*®) should be initiated only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

**NHS restrictions** *Cialis*® is not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII of the Drug Tariff (Part XII of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- **Adcirca** (Eli Lilly and Company Ltd)

**Tadalafil 20 mg** Adcirca 20mg tablets | 56 tablet [PoM] £491.22

- **Cialis** (Eli Lilly and Company Ltd)

**Tadalafil 2.5 mg** Cialis 2.5mg tablets | 28 tablet [PoM] £54.99 DT price = £54.99

**Tadalafil 5 mg** Cialis 5mg tablets | 28 tablet [PoM] £54.99 DT price = £54.99

**Tadalafil 10 mg** Cialis 10mg tablets | 4 tablet [PoM] £28.88 DT price = £28.88

**Tadalafil 20 mg** Cialis 20mg tablets | 4 tablet [PoM] £28.88 DT price = £28.88 | 8 tablet [PoM] £57.76

## Vardenafil

### INDICATIONS AND DOSE

#### Erectile dysfunction

- BY MOUTH USING TABLETS

- **Adult:** Initially 10 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response, onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

- BY MOUTH USING ORODISPERSIBLE TABLET

- **Adult:** 10 mg, to be taken approximately 25–60 minutes before sexual activity; maximum 10 mg per day

#### Erectile dysfunction (patients on alpha-blocker therapy)

- BY MOUTH USING TABLETS

- **Adult:** Initially 5 mg (max. per dose 20 mg), to be taken approximately 25–60 minutes before sexual activity, subsequent doses adjusted according to response,

onset of effect may be delayed if taken with high-fat meal; maximum 1 dose per day

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ **Levitra<sup>®</sup> 10 mg orodispersible tablets and Levitra<sup>®</sup> 10 mg film coated tablets are not bioequivalent.**

- **CONTRA-INDICATIONS** Avoid if systolic blood pressure below 90 mmHg. hereditary degenerative retinal disorders · myocardial infarction · patients in whom vasodilation or sexual activity are inadvisable · previous history of non-arteritic anterior ischaemic optic neuropathy · recent stroke · unstable angina
- **CAUTIONS** Active peptic ulceration · anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · bleeding disorders · cardiovascular disease · elderly · left ventricular outflow obstruction · predisposition to priapism (e.g. in sickle-cell disease, multiple myeloma, or leukaemia) · susceptibility to prolongation of QT interval
- **INTERACTIONS** → Appendix 1: phosphodiesterase type-5 inhibitors
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Back pain · dizziness · dyspepsia · flushing · headache · migraine · myalgia · nasal congestion · nausea · visual disturbances · vomiting
  - ▶ **Uncommon** Drowsiness · dyspnoea · epistaxis · hypertension · hypotension · increased lacrimation · painful red eyes · palpitation · photosensitivity · tachycardia
  - ▶ **Rare** Anxiety · facial oedema · hypersensitivity reactions · hypertonia · priapism · raised intra-ocular pressure · rash · Stevens-Johnson syndrome · syncope · transient amnesia
  - ▶ **Frequency not known** Arrhythmia · myocardial infarction · non-arteritic anterior ischaemic optic neuropathy (stop drug if sudden visual impairment occurs) · retinal vascular occlusion · seizures · serious cardiovascular events · sudden hearing loss (discontinue drug and seek medical advice) · unstable angina
- **HEPATIC IMPAIRMENT** Initial dose 5 mg in mild to moderate impairment, increased subsequently according to response (max. 10 mg in moderate impairment). Manufacturer advises avoid in severe impairment.
  - Orodispersible tablets not suitable for patients with moderate hepatic impairment.
- **RENAL IMPAIRMENT** Initial dose 5 mg if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>. Orodispersible tablets not suitable if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **PRESCRIBING AND DISPENSING INFORMATION**
  - Orodispersible tablets not suitable for initiation of therapy in patients taking alpha-blockers.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2011) that vardenafil orodispersible tablets (*Levitra<sup>®</sup>*) are accepted for restricted use within NHS Scotland for men for whom an orodispersible tablet is an appropriate formulation.

**NHS restrictions** *Levitra<sup>®</sup>* is not prescribable under the NHS for the treatment of erectile dysfunction except in men who meet the criteria listed in part XVIIIB of the Drug Tariff (Part XIb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under How to use the BNF.

#### LEVITRA<sup>®</sup> ORODISPERSIBLE TABLETS

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2011) that vardenafil orodispersible tablets (*Levitra<sup>®</sup>*) are accepted for restricted use within NHS Scotland for men

for whom an orodispersible tablet is an appropriate formulation.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Orodispersible tablet

EXCIPIENTS: May contain Aspartame

#### ▶ Levitra (Bayer Plc)

**Vardenafil (as Vardenafil hydrochloride trihydrate) 10 mg** Levitra 10mg orodispersible tablets sugar-free | 4 tablet [PoM] £19.67 DT price = £19.67

#### Tablet

#### ▶ Levitra (Bayer Plc)

**Vardenafil (as Vardenafil hydrochloride trihydrate) 5 mg** Levitra 5mg tablets | 4 tablet [PoM] £8.32 DT price = £8.32 | 8 tablet [PoM] £16.63

**Vardenafil (as Vardenafil hydrochloride trihydrate) 10 mg** Levitra 10mg tablets | 4 tablet [PoM] £14.78 DT price = £14.78 | 8 tablet [PoM] £29.57

**Vardenafil (as Vardenafil hydrochloride trihydrate) 20 mg** Levitra 20mg tablets | 4 tablet [PoM] £24.30 DT price = £24.30 | 8 tablet [PoM] £48.60

## PROSTAGLANDIN ANALOGUES AND PROSTAMIDES ▶ PROSTAGLANDINS

### Alprostadil

#### INDICATIONS AND DOSE

#### Erectile dysfunction (initiated under specialist supervision)

##### ▶ BY URETHRAL APPLICATION

- ▶ Adult: Initially 250 micrograms, adjusted according to response; usual dose 0.125–1 mg; maximum 2 doses per day; maximum 7 doses per week

#### Aid to diagnosis of erectile dysfunction

##### ▶ BY URETHRAL APPLICATION

- ▶ Adult: 500 micrograms for 1 dose

#### Erectile dysfunction

##### ▶ TO THE SKIN

- ▶ Adult: Apply 300 micrograms, to the tip of the penis, 5–30 minutes before sexual activity; max 1 dose in 24 hours not more than 2–3 times per week

#### CAVERJECT<sup>®</sup>

#### Erectile dysfunction

##### ▶ BY INTRACavernosal INJECTION

- ▶ Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

#### Erectile dysfunction associated with neurological dysfunction

##### ▶ BY INTRACavernosal INJECTION

- ▶ Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; continued →

usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

#### Aid to diagnosis

- BY INTRACAVERNOSAL INJECTION
- Adult: 10–20 micrograms for 1 dose (consult product literature)

#### Aid to diagnosis where evidence of neurological dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

#### CAVERJECT® DUAL CHAMBER

##### Erectile dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 2.5 micrograms for 1 dose (first dose), followed by 5 micrograms for 1 dose (second dose), to be given if some response to first dose, alternatively 7.5 micrograms for 1 dose (second dose), to be given if no response to first dose, then increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

#### Erectile dysfunction associated with neurological dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 1.25 micrograms for 1 dose (first dose), then 2.5 micrograms for 1 dose (second dose), then 5 micrograms for 1 dose (third dose), increased in steps of 5–10 micrograms, to obtain a dose suitable for producing erection lasting not more than 1 hour; if no response to dose then next higher dose can be given within 1 hour, if there is a response the next dose should not be given for at least 24 hours; usual dose 5–20 micrograms (max. per dose 60 micrograms), maximum frequency of injection not more than 3 times per week with at least 24 hour interval between injections

#### Aid to diagnosis

- BY INTRACAVERNOSAL INJECTION
- Adult: 10–20 micrograms for 1 dose (consult product literature)

#### Aid to diagnosis where evidence of neurological dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 5 micrograms (max. per dose 10 micrograms) for 1 dose, (consult product literature)

#### VIRIDAL® DUO CONTINUATION PACK

##### Erectile dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

##### Neurogenic erectile dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for

producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

#### VIRIDAL® DUO STARTER PACK

##### Neurogenic erectile dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 2.5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

##### Erectile dysfunction

- BY INTRACAVERNOSAL INJECTION
- Adult: Initially 5 micrograms, increased in steps of 2.5–5 micrograms, to obtain dose suitable for producing erection not lasting more than 1 hour; usual dose 10–20 micrograms (max. per dose 40 micrograms), maximum frequency of injection not more than 2–3 times per week with at least 24 hour interval between injections; reduce dose if erection lasts longer than 2 hours

#### ● CONTRA-INDICATIONS

##### GENERAL CONTRA-INDICATIONS

Not for use in patients with penile implants or when sexual activity medically inadvisable (e.g. orthostatic hypotension, myocardial infarction, and syncope) · not for use with other agents for erectile dysfunction · predisposition to prolonged erection (as in thrombocythemia, polycythemia, sickle cell anaemia, multiple myeloma or leukaemia) · urethral application contra-indicated in balanitis · urethral application contra-indicated in severe curvature · urethral application contra-indicated in severe hypospadias · urethral application contra-indicated in urethral stricture · urethral application contra-indicated in urethritis

##### SPECIFIC CONTRA-INDICATIONS

- With topical use Balanitis · severe curvature · severe hypospadias · urethral stricture · urethritis
- **CAUTIONS** Anatomical deformations of penis (painful erection more likely)—follow up regularly to detect signs of penile fibrosis (consider discontinuation if angulation, cavernosal fibrosis or Peyronie's disease develop) · priapism (patients should be instructed to report any erection lasting 4 hours or longer)
- **INTERACTIONS** → Appendix 1: alprostadil
- **SIDE-EFFECTS**
- **Common or very common** Dizziness · haematoma · haemosiderin deposits · headache · hypertension · hypotension · influenza-like syndrome · injection site reactions · other localised pain (buttocks, leg, testicular, abdominal) · penile fibrosis · penile oedema · penile pain · penile rash · urethral bleeding · urethral burning
- **Uncommon** Abnormal ejaculation · asthenia · balanitis · dry mouth · haematuria · irritation · leg cramps · local reactions · micturition difficulties · mydriasis · nausea · pelvic pain · penile numbness or sensitivity · penile warmth · phimosis · priapism · pruritus · rapid pulse · scrotal erythema · scrotal oedema · scrotal pain · supraventricular extrasystole · sweating · syncope · testicular oedema · testicular thickening · urethral stenosis · vasodilatation
- **Rare** Anaphylaxis · erythema · hypersensitivity reactions · rash · urinary-tract infection · urticaria · vertigo

## ● CONCEPTION AND CONTRACEPTION

- With urethral use If partner is pregnant, barrier contraception should be used. No evidence of harm to latex condoms and diaphragms.
- With topical use Condoms should be used to avoid exposure to women of child-bearing age, pregnant or lactating women. No evidence of harm to latex condoms.

## ● DIRECTIONS FOR ADMINISTRATION

- With intracavernosal use The first dose of the intracavernosal injection must be given by medically trained personnel; self-administration may only be undertaken after proper training.
- With urethral use During initiation of treatment the urethral application should be used under medical supervision; self-administration may only be undertaken after proper training.

## ● PATIENT AND CARER ADVICE

Patients should be instructed to report any erection lasting 4 hours or longer.

- With topical use Counsel patients that condoms should be used to avoid local reactions and exposure of alprostadil to women of childbearing age, pregnant, or lactating women.

## ● NATIONAL FUNDING/ACCESS DECISIONS

**NHS restrictions** *Caverject*®, *Viridal*® Duo, *Vitaros*® and *MUSE*® are not prescribable under the NHS for treatment of erectile dysfunction except in men who meet the criteria listed in part XVIII of the Drug Tariff (Part Xlb of the Northern Ireland Drug Tariff, Part 12 of the Scottish Drug Tariff). The prescription must be endorsed 'SLS'. For more information see *Prices in the BNF*, under *How to use BNF publications*.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Stick

- Muse** (Meda Pharmaceuticals Ltd)

**Alprostadil 250 microgram** Muse 250microgram urethral sticks | 1 applicator [PoM] £11.30 DT price = £11.30 | 6 applicator [PoM] £67.79  
**Alprostadil 500 microgram** Muse 500microgram urethral sticks | 1 applicator [PoM] £11.30 DT price = £11.30 | 6 applicator [PoM] £67.79  
**Alprostadil 1 mg** Muse 1000microgram urethral sticks | 1 applicator [PoM] £11.56 DT price = £11.56 | 6 applicator [PoM] £65.67

### Cream

- Vitaros** (Ferring Pharmaceuticals Ltd)

**Alprostadil 3 mg per 1 gram** Vitaros 3mg/g cream | 4 applicator [PoM] £40.00

## Powder and solvent for solution for injection

- Caverject** (Pfizer Ltd)

**Alprostadil 10 microgram** Caverject 10microgram powder and solvent for solution for injection vials | 1 vial [PoM] £9.24 DT price = £9.24

**Alprostadil 20 microgram** Caverject 20microgram powder and solvent for solution for injection vials | 1 vial [PoM] £11.94 DT price = £11.94

**Alprostadil 40 microgram** Caverject 40microgram powder and solvent for solution for injection vials | 1 vial [PoM] £21.58 DT price = £21.58

- Caverject Dual Chamber** (Pfizer Ltd)

**Alprostadil 10 microgram** Caverject Dual Chamber 10microgram powder and solvent for solution for injection | 2 pre-filled disposable injection [PoM] £14.70

**Alprostadil 20 microgram** Caverject Dual Chamber 20microgram powder and solvent for solution for injection | 2 pre-filled disposable injection [PoM] £19.00

- Viridal** (UCB Pharma Ltd)

**Alprostadil 10 microgram** Viridal Duo Starter Pack 10microgram powder and solvent for solution for injection cartridges with device | 2 cartridge [PoM] £20.13 (Hospital only)

Viridal Duo Continuation Pack 10microgram powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £16.55

**Alprostadil 20 microgram** Viridal Duo Starter Pack 20microgram powder and solvent for solution for injection cartridges with device | 2 cartridge [PoM] £24.54 (Hospital only)

Viridal Duo Continuation Pack 20microgram powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £21.39

**Alprostadil 40 microgram** Viridal Duo Starter Pack 40microgram powder and solvent for solution for injection cartridges with device | 2 cartridge [PoM] £29.83 (Hospital only)  
 Viridal Duo Continuation Pack 40microgram powder and solvent for solution for injection cartridges | 2 cartridge [PoM] £27.22

## SYMPATHOMIMETICS > VASOCONSTRICTOR

### Adrenaline/epinephrine

- DRUG ACTION** Acts on both alpha and beta receptors and increases both heart rate and contractility (beta, effects); it can cause peripheral vasodilation (a beta, effect) or vasoconstriction (an alpha effect).

#### ● INDICATIONS AND DOSE

**Priapism associated with alprostadil, if aspiration and lavage of corpora are unsuccessful (alternative to phenylephrine or metaraminol)**

##### ► BY INTRACAVERNOSAL INJECTION

- Adult: 10–20 micrograms every 5–10 minutes, using a 20 microgram/mL solution. **Important:** if suitable strength of adrenaline not available may be specially prepared by diluting 0.1 mL of the adrenaline 1 in 1000 (1 mg/mL) injection to 5 mL with sodium chloride 0.9%, continuously monitor blood pressure and pulse; maximum 100 micrograms per course

- UNLICENSED USE** The use of adrenaline for the treatment of priapism is an unlicensed indication.
- CAUTIONS** Arteriosclerosis · arrhythmias · cerebrovascular disease · cor pulmonale · diabetes mellitus · elderly · hypercalcaemia · hyperreflexia · hypertension · hyperthyroidism · hypokalaemia · ischaemic heart disease · obstructive cardiomyopathy · occlusive vascular disease · organic brain damage · phaeochromocytoma · prostate disorders · psychoneurosis · severe angina · susceptibility to angle-closure glaucoma
- INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- SIDE-EFFECTS** Angina · angle-closure glaucoma · anorexia · anxiety · arrhythmias · cold extremities · confusion · difficulty in micturition · dizziness · dry mouth · dyspnoea · headache · hyperglycaemia · hypersalivation · hypertension (risk of cerebral haemorrhage) · hypokalaemia · insomnia · metabolic acidosis · mydriasis · myocardial infarction · nausea · pallor · palpitation · psychosis · pulmonary oedema (on excessive dosage or extreme sensitivity) · restlessness · sweating · tachycardia · tissue necrosis at injection site · tissue necrosis of bowel · tissue necrosis of extremities · tissue necrosis of kidneys · tissue necrosis of liver · tremor · urinary retention · vomiting · weakness
- RENAL IMPAIRMENT** Manufacturers advise use with caution in severe impairment.
- MONITORING REQUIREMENTS** Monitor blood pressure and ECG.

Adrenaline (base) 1mg/1ml (1 in 1,000) solution for injection ampoules | 10 ampoule [PoM] £6.01 DT price = £6.01

## Metaraminol

### ● INDICATIONS AND DOSE

#### **Priapism (alternative to intracavernosal injections of phenylephrine and adrenaline)**

- BY INTRACAVERNOSAL INJECTION
- Adult: 1 mg every 15 minutes

- **UNLICENSED USE** Use for priapism is an unlicensed indication.
- **CONTRA-INDICATIONS** Hypertension
- **CAUTIONS** Associated with fatal hypertensive crises · cirrhosis · coronary vascular thrombosis · diabetes mellitus · elderly · extravasation at injection site may cause necrosis · following myocardial infarction · hypercapnia · hyperthyroidism · hypoxia · mesenteric vascular thrombosis · peripheral vascular thrombosis · Prinzmetal's variant angina · uncorrected hypovolaemia
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Angle-closure glaucoma · anorexia · anxiety · arrhythmias · bradycardia · confusion · dyspnoea · fatal ventricular arrhythmia reported in Laennec's cirrhosis · headache · hypertension · hypoxia · insomnia · nausea · palpitation · peripheral ischaemia · psychosis · tachycardia · tremor · urinary retention · vomiting · weakness
- **MONITORING REQUIREMENTS** Monitor blood pressure and rate of flow frequently.
- **DIRECTIONS FOR ADMINISTRATION** For *intracavernosal injection*, dilute 1 mg (0.1 mL of 10 mg/mL) metaraminol injection to 50 mL with Sodium chloride injection 0.9% and give carefully by slow injection into the corpora in 5 mL injections.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

#### **Solution for injection**

##### ► Metaraminol (Non-proprietary)

Metaraminol (as Metaraminol tartrate) 10 mg per 1 mL Metaraminol 10mg/1mL solution for injection ampoules | 10 ampoule [PoM] £31.97

## Phenylephrine hydrochloride

### ● INDICATIONS AND DOSE

#### **Priapism associated with alprostadil, if aspiration and lavage of the corpora are unsuccessful (alternative to adrenaline or metaraminol)**

- BY INTRACAVERNOSAL INJECTION
- Adult: 100–200 micrograms every 5–10 minutes, dose to be administered using a 200 micrograms/mL solution; maximum 1 mg per course

- **UNLICENSED USE** Use of phenylephrine hydrochloride injection in priapism is an unlicensed indication.
- **CONTRA-INDICATIONS** Hypertension
- **INTERACTIONS** → Appendix 1: sympathomimetics, vasoconstrictor
- **SIDE-EFFECTS** Arrhythmias · hypertension · palpitation · tachycardia
- **DIRECTIONS FOR ADMINISTRATION** For *intracavernosal injection*, if suitable strength of phenylephrine injection is not available, it may be specially prepared by diluting 0.1 mL of the phenylephrine 1% (10 mg/mL) injection to 5 mL with sodium chloride 0.9%.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

#### **Solution for injection**

##### ► Phenylephrine hydrochloride (Non-proprietary)

Phenylephrine (as Phenylephrine hydrochloride) 50 microgram per 1 mL Phenylephrine 500micrograms/10mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £15.00 | 10 pre-filled disposable injection [PoM] £150.00

##### Phenylephrine hydrochloride 100 microgram per

1 mL Phenylephrine 1mg/10mL solution for injection ampoules | 10 ampoule [PoM] £40.00

Phenylephrine hydrochloride 10 mg per 1 mL Phenylephrine 10mg/1mL solution for injection ampoules | 10 ampoule [PoM] £99.12

## VASODILATORS > PERIPHERAL VASODILATORS

### Aviptadil with phentolamine mesilate

09-Feb-2017

- **DRUG ACTION** Phentolamine is a short-acting alpha-adrenoceptor antagonist that acts directly on vascular smooth muscle, resulting in vasodilatation; aviptadil is a vasoactive intestinal polypeptide that acts as a smooth muscle relaxant.

### ● INDICATIONS AND DOSE

#### **Erectile dysfunction**

- BY INTRACAVERNOSAL INJECTION

► Adult: 25/2000 micrograms, frequency of injection should not exceed once daily or three times weekly, duration of erection should not exceed 1 hour

#### **DOSE EQUIVALENCE AND CONVERSION**

- Dose expressed as x/y micrograms of aviptadil/phentolamine.

- **CONTRA-INDICATIONS** Anatomical deformation of the penis (e.g. angulation, cavernosal fibrosis, Peyronie's disease) · not for use with other agents for erectile dysfunction · patients for whom sexual activity is inadvisable · penile implants · predisposition to priapism (e.g. in sickle cell anaemia or trait, multiple myeloma, or leukemia)
- **CAUTIONS** Concomitant treatment with anticoagulants (potential increased risk of bleeding) · history of psychiatric disorder or addiction (potential for abuse) · severe cardiovascular disease · severe cerebrovascular disease
- **SIDE-EFFECTS**
  - Common or very common Flushing
  - Uncommon Dizziness · headache · palpitation · tachycardia
  - Rare Penile fibrosis (following multiple injections) · priapism
  - Very rare Angina · myocardial infarction
- **MONITORING REQUIREMENTS** Manufacturer advises monitor regularly (e.g. every 3 months), particularly in the initial stages of self-injection therapy; careful examination of the penis is recommended to detect signs of penile fibrosis or Peyronie's disease—discontinue treatment in patients who develop penile angulation, cavernosal fibrosis, or Peyronie's disease.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises that the initial injections of *Invicorp*® must be administered by medically trained personnel; self-administration may only be undertaken after proper training.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C).
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients should be instructed to report any erection lasting 4 hours or longer.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

▶ **Invicorp** (Evolan Pharma AB)

Aviptadil 71.43 microgram per 1 ml, Phentolamine mesilate 5.71 mg per 1 ml Invicorp 25micrograms/2mg/0.35ml solution for injection ampoules | 2 ampoule [PoM] £19.00 | 5 ampoule [PoM] £47.50

## 4.2 Premature ejaculation

### SELECTIVE SEROTONIN RE-UP TAKE INHIBITORS

#### Dapoxetine

● **DRUG ACTION** Dapoxetine is a short-acting selective serotonin re-uptake inhibitor.

#### ● INDICATIONS AND DOSE

**Premature ejaculation in men who meet all the following criteria: poor control over ejaculation, a history of premature ejaculation over the past 6 months, marked distress or interpersonal difficulty as a consequence of premature ejaculation, and an intravaginal ejaculatory latency time of less than two minutes**

▶ BY MOUTH

▶ **Adult:** Initially 30 mg, to be taken approximately 1–3 hours before sexual activity, subsequent doses adjusted according to response; review treatment after 4 weeks (or 6 doses) and at least every 6 months thereafter, not recommended for adults 65 years and over; maximum 1 dose per day; maximum 60 mg per day

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises max. dose 30 mg with concurrent use of moderate inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 60 mg. Manufacturer advises avoid with concurrent use of potent inhibitors of CYP3A4 except in patients verified to be extensive CYP2D6 metabolisers where manufacturer recommends max. dose 30 mg.

● **CONTRA-INDICATIONS** History of bipolar disorder · history of mania · history of severe depression · history of syncope · significant cardiac disease · uncontrolled epilepsy

● **CAUTIONS** Bleeding disorders · epilepsy (discontinue if convulsions develop) · susceptibility to angle-closure glaucoma

● **INTERACTIONS** → Appendix 1: SSRIs

#### ● SIDE-EFFECTS

▶ **Common or very common** Abdominal distension · abdominal pain · abnormal dreams · agitation · anxiety · constipation · diarrhoea · dizziness · drowsiness · dry mouth · dyspepsia · flushing · headache · hypertension · impaired attention · irritability · malaise · nausea · paraesthesia · sexual dysfunction · sleep disturbances · sweating · tinnitus · tremor · visual disturbances · vomiting

▶ **Uncommon** Abnormal thoughts · bradycardia · bruxism · confusion · depression · eye pain · hypotension · mood disturbances · mydriasis · postural hypotension · pruritus · restlessness · sinus arrest · syncope · tachycardia · taste disturbances · vertigo

▶ **Rare** Defaecation urgency · sudden onset of sleep

#### SIDE-EFFECTS, FURTHER INFORMATION

Discontinue if psychiatric disorder develops.

Avoid if postural hypotension occurs during test dose.

● **HEPATIC IMPAIRMENT** Avoid in moderate to severe impairment.

● **RENAL IMPAIRMENT** Use with caution if eGFR 30–80 mL/minute/1.73 m<sup>2</sup>; avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

● **PRE-TREATMENT SCREENING** Test for postural hypotension before starting treatment.

#### ● PATIENT AND CARER ADVICE

Postural hypotension and syncope Patients should be advised to maintain hydration and to sit or lie down until prodromal symptoms such as nausea, dizziness, and sweating abate.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

## 5 Obstetrics

### Obstetrics

#### Prostaglandins and oxytocics

Prostaglandins and oxytocics are used to induce abortion or induce or augment labour and to minimise blood loss from the placental site. They include oxytocin p. 775, carbococin p. 776, ergometrine maleate p. 776, and the prostaglandins. All induce uterine contractions with varying degrees of pain according to the strength of contractions induced.

#### Induction of abortion

Gemeprost p. 778, a prostaglandin administered vaginally as pessaries, is suitable for the medical induction of late therapeutic abortion; gemeprost is also used to ripen the cervix before surgical abortion, particularly in primigravidas. The prostaglandin misoprostol p. 778 is given by mouth, buccally, sublingually, or vaginally, to induce medical abortion [unlicensed indication]; intravaginal use ripens the cervix before surgical abortion [unlicensed indication]. Extra-amniotic dinoprostone is rarely used nowadays.

Pre-treatment with mifepristone p. 777 can facilitate the process of medical abortion. It sensitises the uterus to subsequent administration of a prostaglandin and, therefore, abortion occurs in a shorter time and with a lower dose of prostaglandin.

#### Induction and augmentation of labour

Dinoprostone is available as vaginal tablets, pessaries and vaginal gels for the induction of labour. The intravenous solution is rarely used; it is associated with more side-effects.

Oxytocin (Syntocinon®) is administered by slow intravenous infusion, using an infusion pump, to induce or augment labour, usually in conjunction with amniotomy. Uterine activity must be monitored carefully and hyperstimulation avoided. Large doses of oxytocin may result in excessive fluid retention.

Misoprostol is given orally or vaginally for the induction of labour [unlicensed indication].

NICE Guidance, Induction of labour (updated July 2008), available at [www.nice.org.uk/guidance/CG70](http://www.nice.org.uk/guidance/CG70).

**Prevention and treatment of haemorrhage**

Bleeding due to incomplete miscarriage or abortion can be controlled with ergometrine maleate and oxytocin (*Syntometrine*®) given intramuscularly, the dose is adjusted according to the patient's condition and blood loss. This is commonly used before surgical evacuation of the uterus, particularly when surgery is delayed. Oxytocin and ergometrine maleate combined are more effective in early pregnancy than either drug alone.

Active management of the third stage of labour reduces the risk of postpartum haemorrhage; oxytocin is given by intramuscular injection [unlicensed] on delivery of the anterior shoulder or, at the latest, immediately after the baby is delivered. Alternatively, ergometrine maleate with oxytocin (*Syntometrine*®) can be given by intramuscular injection in the absence of hypertension; oxytocin alone causes less nausea, vomiting, and hypertension than when given with ergometrine maleate.

In excessive uterine bleeding, any placental products remaining in the uterus should be removed. Oxytocic drugs are used to treat postpartum haemorrhage caused by uterine atony; treatment options are as follows:

- oxytocin by slow intravenous injection, in severe cases by intravenous infusion of oxytocin at a rate that controls uterine atony *or*
- ergometrine by intramuscular injection *or*
- ergometrine by slow intravenous injection (use with caution—risk of hypertension) *or*
- ergometrine with oxytocin (*Syntometrine*®) by intramuscular injection

Carboprost p. 776 has an important role in severe postpartum haemorrhage unresponsive to ergometrine maleate and oxytocin.

Misoprostol [unlicensed] can be used in postpartum haemorrhage when oxytocin, ergometrine maleate, and carboprost are not available or are inappropriate.

**Mifepristone**

For termination of pregnancy, a single dose of mifepristone is followed by administration of a prostaglandin (gemeprost or misoprostol [unlicensed]).

Guidelines of the Royal College of Obstetricians and Gynaecologists (November 2011) include [unlicensed] regimens for inducing medical abortion.

**Myometrial relaxants**

Tocolytic drugs postpone *premature labour* and they are used with the aim of reducing harm to the child. However, there is no satisfactory evidence that the use of these drugs reduces mortality. The greatest benefit is gained by using the delay to administer corticosteroid therapy or to implement other measures which improve perinatal health (including transfer to a unit with neonatal intensive care facility).

The oxytocin receptor antagonist, atosiban p. 777, is licensed for the inhibition of uncomplicated premature labour *between 24 and 33 weeks of gestation*. Atosiban may be preferable to a beta<sub>2</sub> agonist because it has fewer side effects. The dihydropyridine calcium-channel blocker nifedipine p. 157 also has fewer side-effects than a beta<sub>2</sub> agonist.

The beta<sub>2</sub> agonists salbutamol p. 244 and terbutaline sulfate p. 246 are licensed for inhibiting uncomplicated premature labour between 22 and 37 weeks of gestation to permit a delay in delivery of up to 48 hours. Use of high-dose short acting beta<sub>2</sub> agonists in obstetric indications has been associated with serious, sometimes fatal cardiovascular events in the mother and fetus, particularly when used for a prolonged period of time. Oral therapy is no longer recommended and parenteral therapy should be restricted to a maximum duration of 48 hours, given under the supervision of a specialist, and with close monitoring.

Indometacin p. 1043, a cyclo-oxygenase inhibitor, also inhibits labour [unlicensed indication] and it can be useful in situations where a beta<sub>2</sub> agonist is not appropriate; however, there are concerns about neonatal complications such as transient impairment of renal function and premature closure of ductus arteriosus.

**5.1 Induction of labour****PROSTAGLANDINS AND OXYTOCICS****Dinoprostone****• INDICATIONS AND DOSE****PROPESS®****Cervical ripening and induction of labour at term****► BY VAGINA**

- Adult: 1 pessary, insert pessary (in retrieval device) high into posterior fornix and remove when cervical ripening adequate; if oxytocin necessary, remove 30 minutes before oxytocin infusion; remove if cervical ripening inadequate after 24 hours (dose not to be repeated)

**PROSTIN E2® VAGINAL GEL****Induction of labour****► BY VAGINA**

- Adult: 1 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg after 6 hours if required; maximum 3 mg per course

**Induction of labour (unfavourable primigravida)****► BY VAGINA**

- Adult: 2 mg, inserted high into the posterior fornix (avoid administration into the cervical canal), followed by 1–2 mg if required, after 6 hours; maximum 4 mg per course

**PROSTIN E2® VAGINAL TABLETS****Induction of labour****► BY VAGINA**

- Adult: 3 mg, inserted high into the posterior fornix, followed by 3 mg after 6–8 hours, to be given if labour not established; maximum 6 mg per course

**DOSE EQUIVALENCE AND CONVERSION**

- *Prostin E2 Vaginal tablets and Vaginal Gel* are not bioequivalent.

- **CONTRA-INDICATIONS** Active cardiac disease · active pulmonary disease · avoid extra-amniotic route in cervicitis or vaginitis · fetal distress · fetal malpresentation · grand multiparas · history of caesarean section · history of difficult or traumatic delivery · history of major uterine surgery · major cephalopelvic disproportion · multiple pregnancy · placenta praevia or unexplained vaginal bleeding during pregnancy · ruptured membranes · untreated pelvic infection
- **CAUTIONS** Effect of oxytocin enhanced · history of asthma · history of epilepsy · history of glaucoma and raised intra-ocular pressure · hypertension · risk factors for disseminated intravascular coagulation · uterine rupture · uterine scarring
- **SIDE-EFFECTS** Abruptio placenta · amniotic fluid embolism · backache · bronchospasm · cardiac arrest · diarrhoea · disseminated intravascular coagulation · fetal distress · fever · low Apgar scores · maternal hypertension · nausea · pulmonary embolism · rapid cervical dilation · severe uterine contractions · stillbirth or neonatal death · uterine hypercontractility with or without fetal bradycardia · uterine hypertonus · uterine rupture · vaginal symptoms (warmth, irritation, pain) · vomiting

- **HEPATIC IMPAIRMENT** Manufacturers advise avoid.
- **RENAL IMPAIRMENT** Manufacturers advise avoid.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for disseminated intravascular coagulation after parturition.
  - ▶ Monitor uterine activity and fetal status (particular care if history of uterine hypertony)
  - ▶ Care needed in monitoring uterine activity when used in sequence following oxytocin.
- **PRESCRIBING AND DISPENSING INFORMATION Important:** Do not confuse dose of *Prostin E2*® vaginal gel with that of *Prostin E2*® vaginal tablets—not bioequivalent.
- **LESS SUITABLE FOR PRESCRIBING** Intravenous solution rarely used and is considered less suitable for prescribing. Extra-amniotic solution less commonly used and is considered less suitable for prescribing.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Pessary

- ▶ **Prostin E2** (Pfizer Ltd)

**Dinoprostone 3 mg** Prostin E2 3mg vaginal tablets | 8 pessary [PoM] £106.23 (Hospital only)

##### Vaginal gel

- ▶ **Prostin E2** (Pfizer Ltd)

**Dinoprostone 400 microgram per 1 ml** Prostin E2 1mg vaginal gel | 2.5 ml [PoM] £13.28 (Hospital only)

**Dinoprostone 800 microgram per 1 ml** Prostin E2 2mg vaginal gel | 2.5 ml [PoM] £13.28 (Hospital only)

##### Vaginal device

- ▶ **Propress** (Ferring Pharmaceutical Ltd)

**Dinoprostone 10 mg** Propress 10mg vaginal delivery system | 5 device [PoM] £150.00

## Oxytocin

#### ● INDICATIONS AND DOSE

**Induction of labour for medical reasons | Stimulation of labour in hypotonic uterine inertia**

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 0.001–0.004 unit/minute, not to be started for at least 6 hours after administration of vaginal prostaglandin, dose increased at intervals of at least 30 minutes until a maximum of 3–4 contractions occur every 10 minutes (0.01 units/minute is often adequate) up to max. 0.02 units/minute, if regular contractions not established after a total 5 units, stop induction attempt (may be repeated next day starting again at 0.001–0.004 units/minute)

##### Caesarean section

- ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5 units immediately after delivery

**Prevention of postpartum haemorrhage after delivery of placenta**

- ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5 units, if infusion previously used for induction or enhancement of labour, increase rate during third stage and for next few hours

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Adult: 10 units, can be used instead of oxytocin with ergometrine (*Syntometrine*®).

**Treatment of postpartum haemorrhage**

- ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5 units, repeated if necessary

**Treatment of severe cases of postpartum haemorrhage (following intravenous injection)**

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 40 units, given in 500 mL infusion fluid given at a rate sufficient to control uterine atony

#### Incomplete, inevitable, or missed miscarriage

- ▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 5 units, followed by (by intravenous infusion) 0.02–0.04 unit/minute if required, the rate of infusion can be faster if necessary

- **UNLICENSED USE** Oxytocin doses in the BNF may differ from those in the product literature. Administration by Intramuscular injection is an unlicensed use.

#### IMPORTANT SAFETY INFORMATION

Prolonged intravenous administration at high doses with large volume of fluid (which is possible in inevitable or missed miscarriage or postpartum haemorrhage) may cause water intoxication with hyponatraemia. To avoid: use electrolyte-containing diluent (i.e. not glucose), increase oxytocin concentration to reduce fluid, restrict fluid intake by mouth; monitor fluid and electrolytes.

- **CONTRA-INDICATIONS** Any condition where spontaneous labour inadvisable • any condition where vaginal delivery inadvisable • avoid intravenous injection during labour • avoid prolonged administration in oxytocin-resistant uterine inertia • avoid rapid intravenous injection (may transiently reduce blood pressure) • fetal distress (discontinue immediately if this occurs) • hypertonic uterine contractions (discontinue immediately if this occurs) • severe cardiovascular disease • severe pre-eclamptic toxemia
- **CAUTIONS** Avoid large infusion volumes and restrict fluid intake by mouth (risk of hyponatraemia and water-intoxication) • enhancement of labour—presence of borderline cephalopelvic disproportion (avoid if significant) • history of lower-uterine segment caesarean section • induction of labour—presence of borderline cephalopelvic disproportion (avoid if significant) • mild pregnancy-induced cardiac disease • mild pregnancy-induced hypertension • moderate pregnancy-induced cardiac disease • moderate pregnancy-induced hypertension • risk factors for disseminated intravascular coagulation • secondary uterine inertia • women over 35 years

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmia • headache • nausea • vomiting
- ▶ **Rare** Anaphylactoid reactions (with dyspnoea, hypotension, or shock) • disseminated intravascular coagulation • hyponatraemia associated with high doses with large infusion volumes of electrolyte-free fluid • rash • uterine hyperstimulation (usually with excessive doses—may cause fetal distress, asphyxia, and death, or may lead to hypertonicity, tetanic contractions, soft-tissue damage or uterine rupture) • uterine spasm (may occur at low doses) • water intoxication associated with high doses with large infusion volumes of electrolyte-free fluid

#### SIDE-EFFECTS, FURTHER INFORMATION

Avoid rapid intravenous injection (may transiently reduce blood pressure).

##### Overdose

Placental abruption and amniotic fluid embolism reported on overdose.

#### ● MONITORING REQUIREMENTS

- ▶ Careful monitoring of fetal heart rate and uterine motility essential for dose titration.
- ▶ Monitor for disseminated intravascular coagulation after parturition.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Syntocinon*®), give continuously in Glucose 5% or Sodium chloride 0.9%. Preferably given via a variable-speed infusion pump in a concentration appropriate to the pump; if given by drip infusion for *induction* or

*enhancement of labour*, dilute 5 units in 500 mL infusion fluid or for higher doses, 10 units in 500 mL; for *treatment of postpartum uterine haemorrhage* dilute 40 units in 500 mL; if high doses given for prolonged period (e.g. for inevitable or missed abortion or for postpartum haemorrhage), use low volume of an electrolyte-containing infusion fluid (not Glucose 5%) given at higher concentration than for induction or enhancement of labour; close attention to patient's fluid and electrolyte status essential.

#### • MEDICINAL FORMS

## Carboprost

##### • INDICATIONS AND DOSE

###### Postpartum haemorrhage due to uterine atony in patients unresponsive to ergometrine and oxytocin

###### ► BY DEEP INTRAMUSCULAR INJECTION

- Adult: 250 micrograms, repeated if necessary, to be given at intervals of not less than 15 minutes. Total dose should not exceed 2 mg (8 doses)

## Ergometrine with oxytocin

The properties listed below are those particular to the combination only. For the properties of the components please consider, ergometrine maleate p. 776, oxytocin p. 775.

### ● INDICATIONS AND DOSE

**Active management of the third stage of labour | Postpartum haemorrhage caused by uterine atony**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: 1 mL for one dose
- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: No longer recommended

**Bleeding due to incomplete miscarriage or abortion**

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Adult: Adjusted according to response to, the patient's condition and blood loss

### ● INTERACTIONS → Appendix 1: ergometrine

### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Solution for injection**

- ▶ **Syntometrine** (Alliance Pharmaceuticals Ltd)  
Ergometrine maleate 500 microgram per 1 mL, Oxytocin 5 unit per 1 mL Syntometrine 500micrograms/1mL solution for injection ampoules | 5 ampoule [PoM] £7.87

## 5.3 Premature labour

**Other drugs used for Premature labour** Nifedipine, p. 157  
• Salbutamol, p. 244 • Terbutaline sulfate, p. 246

## OXYTOCIN RECEPTOR ANTAGONISTS

### Atosiban

### ● INDICATIONS AND DOSE

**Uncomplicated premature labour between 24 and 33 weeks of gestation**

- ▶ INITIALLY BY INTRAVENOUS INJECTION
- ▶ Adult: Initially 6.75 mg over 1 minute, then (by intravenous infusion) 18 mg/hour for 3 hours, then (by intravenous infusion) reduced to 6 mg/hour for up to 45 hours. Maximum duration of treatment is 48 hours

- **CONTRA-INDICATIONS** Abruptio placenta • antepartum haemorrhage (requiring immediate delivery) • eclampsia • intra-uterine fetal death • intra-uterine infection • intra-uterine growth restriction with abnormal fetal heart rate • placenta praevia • premature rupture of membranes after 30 weeks' gestation • severe pre-eclampsia

- **CAUTIONS** Abnormal placental site • intra-uterine growth restriction

### ● SIDE-EFFECTS

- ▶ **Common or very common** Dizziness • headache • hot flushes • hyperglycaemia • hypotension • injection-site reaction • nausea • tachycardia • vomiting
- ▶ **Uncommon** Fever • insomnia • pruritus • rash

- **HEPATIC IMPAIRMENT** No information available.

- **RENAL IMPAIRMENT** No information available.

- **MONITORING REQUIREMENTS** Monitor blood loss after delivery.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Tractocile® concentrate for intravenous infusion), give continuously in Glucose 5% or Sodium chloride 0.9%. Withdraw 10 mL infusion fluid from 100-mL bag and replace with 10 mL atosiban concentrate (7.5 mg/mL) to produce a final concentration of 750 micrograms/mL.

### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Solution for injection**

##### ▶ **Atosiban (Non-proprietary)**

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Atosiban 6.75mg/0.9mL solution for injection vials | 1 vial [PoM] £18.41 (Hospital only)

##### ▶ **Tractocile** (Ferring Pharmaceuticals Ltd)

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Tractocile 6.75mg/0.9mL solution for injection vials | 1 vial [PoM] £18.41 (Hospital only)

#### **Solution for infusion**

##### ▶ **Atosiban (Non-proprietary)**

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Atosiban 37.5mg/5mL concentrate for solution for infusion vials | 1 vial [PoM] £52.82 (Hospital only)

Atosiban 37.5mg/5mL solution for infusion vials | 1 vial [PoM] £51.09

##### ▶ **Tractocile** (Ferring Pharmaceuticals Ltd)

Atosiban (as Atosiban acetate) 7.5 mg per 1 mL Tractocile 37.5mg/5mL solution for infusion vials | 1 vial [PoM] £52.82 (Hospital only)

## 5.4 Termination of pregnancy

### PROGESTERONE RECEPTOR MODULATORS

### Mifepristone

- **DRUG ACTION** Mifepristone, an antiprogesterone steroid, sensitises the myometrium to prostaglandin-induced contractions and ripens the cervix.

### ● INDICATIONS AND DOSE

**Cervical ripening before mechanical cervical dilatation for termination of pregnancy of up to 84 days gestation (under close medical supervision)**

- ▶ BY MOUTH
- ▶ Adult: 200 mg for 1 dose, to be taken 36–48 hours before procedure

**Labour induction in fetal death in utero where prostaglandin or oxytocin inappropriate (under close medical supervision)**

- ▶ BY MOUTH
- ▶ Adult: 600 mg once daily for 2 days, if labour not started within 72 hours of first dose, another method should be used

**Medical termination of intra-uterine pregnancy of up to 49 days gestation (under close medical supervision)**

- ▶ BY MOUTH
- ▶ Adult: 600 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina or misoprostol 400 micrograms by mouth, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

**Medical termination of intra-uterine pregnancy of 50–63 days gestation (under close medical supervision)**

- ▶ BY MOUTH
- ▶ Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later (unless abortion already complete) by gemeprost 1 mg by vagina; observe for at least 3 hours (or until bleeding or pain at acceptable level); follow-up visit within 2 weeks to verify complete expulsion and to assess vaginal bleeding

continued →

**Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) (under close medical supervision)**

## ► BY MOUTH

- Adult: 600 mg for 1 dose, alternatively 200 mg for 1 dose, dose followed 36–48 hours later by gemeprost 1 mg by vagina every 3 hours up to max. 5 mg or misoprostol; if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended

- **CONTRA-INDICATIONS** Acute porphyrias p. 969 · chronic adrenal failure · suspected ectopic pregnancy (use other specific means of termination) · uncontrolled severe asthma
- **CAUTIONS** Adrenal suppression (may require corticosteroid) · anticoagulant therapy · asthma (avoid if severe and uncontrolled) · existing cardiovascular disease · haemorrhagic disorders · history of endocarditis · prosthetic heart valve · risk factors for cardiovascular disease
- **INTERACTIONS** → Appendix 1: mifepristone
- **SIDE-EFFECTS**
  - **Common or very common** Gastro-intestinal cramps · uterine contractions · vaginal bleeding (sometimes severe) may occur between administration of mifepristone and surgery (and rarely abortion may occur before surgery)
  - **Uncommon** Hypersensitivity reactions · rash · urticaria
  - **Rare** Chills · dizziness · fever · headache · hot flushes · hypotension · malaise
  - **Frequency not known** Infections · toxic shock syndrome
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS** Careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension).
- **PRESCRIBING AND DISPENSING INFORMATION** Supplied to NHS hospitals and premises approved under Abortion Act 1967.
- **PATIENT AND CARER ADVICE** Patient information leaflet to be provided.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 10

► **Mifepristone (Non-proprietary)**

**Mifepristone 200 mg** Mifepristone 200mg tablets | 1 tablet [PoM]  
no price available (Hospital only)

► **Mifegyne** (Nordic Pharma Ltd)

**Mifepristone 200 mg** Mifegyne 200mg tablets | 3 tablet [PoM]  
£52.66 (Hospital only)

**PROSTAGLANDINS AND OXYTOXICS****Gemeprost**● **INDICATIONS AND DOSE****Cervical ripening prior to first trimester surgical abortion**

## ► BY VAGINA

- Adult: 1 mg, dose to be inserted into posterior fornix 3 hours before surgery

**Second trimester abortion**

## ► BY VAGINA

- Adult: 1 mg every 3 hours for maximum 5 administrations, to be inserted into posterior fornix,

second course may begin 24 hours after start of treatment (if treatment fails, pregnancy should be terminated by another method)

**Second trimester intra-uterine death**

## ► BY VAGINA

- Adult: 1 mg every 3 hours for maximum 5 administrations only, to be inserted into posterior fornix

**Medical termination of intra-uterine pregnancy of up to 49 days gestation following mifepristone | Medical termination of intra-uterine pregnancy of 50–63 days gestation following mifepristone**

## ► BY VAGINA

- Adult: 1 mg

**Termination of pregnancy of 13–24 weeks gestation (in combination with a prostaglandin) following mifepristone**

## ► BY VAGINA

- Adult: 1 mg every 3 hours, if abortion does not occur, 24 hours after start of treatment repeat course of gemeprost 1 mg by vagina up to max. 5 mg; follow-up visit after appropriate interval to assess vaginal bleeding recommended, careful monitoring of blood pressure and pulse essential for 3 hours after administration of gemeprost pessary (risk of profound hypotension); maximum 5 mg per course

- **CONTRA-INDICATIONS** Placenta praevia · unexplained vaginal bleeding · uterine scarring
- **CAUTIONS** Cardiovascular insufficiency · cervicitis · obstructive airways disease · raised intra-ocular pressure · vaginitis
- **SIDE-EFFECTS** Backache · chest pain · chills · coronary artery spasm · diarrhoea · dizziness · dyspnoea · flushing · headache · mild pyrexia · muscle weakness · myocardial infarction · nausea · palpitation · severe hypotension · uterine pain · uterine rupture (most commonly in multiparas or if history of uterine surgery or if given with intravenous oxytocics) · vaginal bleeding · vomiting
- **RENAL IMPAIRMENT** Manufacturer advises avoid.
- **MONITORING REQUIREMENTS**
  - If used in combination with mifepristone, carefully monitor blood pressure and pulse for 3 hours.
  - When used for second trimester intra-uterine death, monitor for coagulopathy during treatment.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Pessary**► **Gemeprost (Non-proprietary)**

**Gemeprost 1 mg** Gemeprost 1mg pessaries | 5 pessary [PoM] no price available

**Misoprostol**

- **DRUG ACTION** Misoprostol acts as a potent uterine stimulant.

● **INDICATIONS AND DOSE****Termination of pregnancy following mifepristone (gestation up to 49 days)**

## ► BY MOUTH

- Adult: 400 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone

**Termination of pregnancy following mifepristone (gestation 50 to 63 days)**

- ▶ INITIALLY BY VAGINA, OR BY BUCCAL ADMINISTRATION, OR BY SUBLINGUAL ADMINISTRATION
- ▶ Adult: 800 micrograms for 1 dose, dose to be given 24–48 hours after mifepristone, if abortion has not occurred 4 hours after first misoprostol dose a further dose may be given, (by mouth or by vagina) 400 micrograms for 1 dose

**Termination of pregnancy following mifepristone (gestation of 9 to 13 weeks)**

- ▶ INITIALLY BY VAGINA
- ▶ Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses

**Termination of pregnancy following mifepristone (gestation of 13 to 24 weeks)**

- ▶ INITIALLY BY VAGINA
- ▶ Adult: 800 micrograms for 1 dose, dose to be given 36–48 hours after mifepristone, followed by (by vagina or by mouth) 400 micrograms every 3 hours if required for a maximum of 4 doses, if abortion has not occurred 3 hours after the last dose of misoprostol, a further dose of mifepristone may be given, and misoprostol may be recommenced 12 hours later

- **UNLICENSED USE** Use of misoprostol for termination of pregnancy is an unlicensed use.
- **CAUTIONS** Conditions where hypotension might precipitate severe complications (e.g. cerebrovascular disease, cardiovascular disease) · inflammatory bowel disease
- **INTERACTIONS** → Appendix 1: misoprostol
- **SIDE-EFFECTS**
  - ▶ Common or very common Diarrhoea
  - ▶ Frequency not known Abdominal pain · abnormal vaginal bleeding · dizziness · dyspepsia · flatulence · intermenstrual bleeding · menorrhagia · nausea · postmenopausal bleeding · rashes · vomiting
- **BREAST FEEDING** Present in milk, but amount probably too small to be harmful.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 21

▶ **Misoprostol (Non-proprietary)**

**Misoprostol 200 microgram** Misoprostol 200microgram vaginal tablets | 4 tablet [PoM] no price available (Hospital only)

▶ **Topogyne** (Nordic Pharma Ltd)

**Misoprostol 400 microgram** Topogyne 400microgram tablets | 16 tablet [PoM] £128.00 (Hospital only)

## 6 Vaginal and vulval conditions

### Vaginal and vulval conditions

**Management**

Symptoms are often restricted to the vulva, but infections almost invariably involve the vagina which should also be treated. Applications to the vulva alone are likely to give only symptomatic relief without cure.

*Aqueous medicated douches* may disturb normal vaginal acidity and bacterial flora.

*Topical anaesthetic agents* give only symptomatic relief and may cause sensitivity reactions. They are indicated only in cases of pruritus where specific local causes have been excluded.

*Systemic drugs* are required in the treatment of infections such as gonorrhoea and syphilis.

**Preparations for vaginal and vulval changes****Topical HRT for vaginal atrophy**

A cream containing an oestrogen may be applied on a short-term basis to improve the vaginal epithelium in *menopausal atrophic vaginitis*. It is **important** to bear in mind that topical oestrogens should be used in the **smallest effective** amount to minimise systemic effects. Modified-release vaginal tablets and an impregnated vaginal ring are now also available.

The risk of endometrial hyperplasia and carcinoma is increased when *systemic* oestrogens are administered alone for prolonged periods. The endometrial safety of long-term or repeated use of *topical* vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

Topical oestrogens are also used in postmenopausal women before vaginal surgery for prolapse when there is epithelial atrophy.

**Non-hormonal preparations for vaginal atrophy**

Several non-hormonal vaginal moisturisers are available and some are prescribable on the NHS (consult Drug Tariff).

**Vaginal and vulval infections**

Effective specific treatments are available for the common vaginal infections.

**Fungal infections**

*Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis* is treated primarily with antifungal pessaries or cream inserted high into the vagina (including during menstruation). Single-dose preparations offer an advantage when compliance is a problem. Local irritation may occur on application of vaginal antifungal products.

**Imidazole** drugs (clotrimazole p. 781, econazole nitrate p. 781, fenticonazole nitrate p. 782, and miconazole p. 782) are effective against candida in short courses of 1 to 14 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 562 or itraconazole p. 564 is also effective.

**Vulvovaginal candidiasis in pregnancy**

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

**Recurrent vulvovaginal candidiasis**

Recurrence of vulvovaginal candidiasis is particularly likely if there are predisposing factors, such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection may also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus as well as the gastro-intestinal tract and the bladder. The partner may also be the source of reinfection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

**Other infections**

*Trichomonal infections* commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 512 or tinidazole p. 514.

*Bacterial infections* with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin below cream and metronidazole gel are indicated for bacterial vaginosis.

Vaginal preparations intended to restore normal acidity may prevent recurrence of vaginal infections and permit the re-establishment of the normal vaginal flora.

The antiviral drugs aciclovir p. 599, famciclovir p. 601, and valaciclovir p. 602 can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration; they have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.

## 6.1 Vaginal and vulval infections

### 6.1a Vaginal and vulval bacterial infections

**Other drugs used for Vaginal and vulval bacterial infections** Metronidazole, p. 512

#### ANTIBACTERIALS > LINCOSAMIDES

### Clindamycin

● **INDICATIONS AND DOSE**

**DALACIN® 2% CREAM**

**Bacterial vaginosis**

- ▶ BY VAGINA
- ▶ Adult: 1 applicatorful daily for 3–7 nights, dose to be administered at night

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ 1 applicatorful delivers a 5 g dose of clindamycin 2%.

● **SIDE-EFFECTS** Cervicitis · irritation · cystitis

**SIDE-EFFECTS, FURTHER INFORMATION**

Clindamycin 2% cream is poorly absorbed into the blood—low risk of systemic effects.

● **CONCEPTION AND CONTRACEPTION** Damages latex condoms and diaphragms.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Cream**

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

▶ **Dalacin** (Pfizer Ltd)

Clindamycin (as Clindamycin phosphate) 20 mg per 1 gram Dalacin 2% cream | 40 gram **[PoM]** £10.86 DT price = £10.86

#### ANTISEPTICS AND DISINFECTANTS

### Dequalinium chloride

13-Mar-2017

- **DRUG ACTION** Dequalinium chloride is a bactericidal anti-infective which causes bacterial cell death by increasing cell permeability and reducing enzyme activity.

● **INDICATIONS AND DOSE**

**Bacterial vaginosis**

- ▶ BY VAGINA
- ▶ Adult 18–55 years: 10 mg once daily for 6 days, inserted at night

● **CONTRA-INDICATIONS** Vaginal ulceration

● **SIDE-EFFECTS**

- ▶ **Common or very common** Vaginal candidiasis · vulvovaginal burning sensation · vulvovaginal pruritus
- ▶ **Uncommon** Headache · nausea · vaginal haemorrhage · vaginal pain
- ▶ **Frequency not known** Cystitis · fever · uterine bleeding · vaginal dryness · vaginal ulceration
- **CONCEPTION AND CONTRACEPTION** Does not affect efficacy of latex condoms; however, manufacturer advises avoid use of non-latex condoms and intravaginal devices—no information available

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (November 2016) that dequalinium chloride (*Fluomizin*®) is accepted for restricted use within NHS Scotland for treatment of bacterial vaginosis in patients for whom the initial treatment is not effective or well tolerated.

**All Wales Medicines Strategy Group (AWMSG) Decisions**

The *All Wales Medicines Strategy Group* has advised (November 2016) that dequalinium chloride (*Fluomizin*®) is recommended as an option for restricted use within NHS Wales for the treatment of bacterial vaginosis only after initial treatment is ineffective or not tolerated, as an alternative option to clindamycin vaginal cream.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

▶ **Fluomizin** (KoRa Healthcare)

Dequalinium chloride 10 mg Fluomizin 10mg vaginal tablets | 6 tablet **[PoM]** £6.95

#### CARBOXYLIC ACIDS

### Lactic acid

● **INDICATIONS AND DOSE**

**BALANCE ACTIV RX® GEL**

**Prevention of bacterial vaginosis**

- ▶ BY VAGINA
- ▶ Adult: 5 mL 1–2 times a week, insert the content of 1 tube (5 mL)

**RELACTAGEL® GEL**

**Prevention of bacterial vaginosis**

- ▶ BY VAGINA
- ▶ Adult: 5 mL daily for 2–3 nights after menstruation, insert the contents of one tube

## • SIDE-EFFECTS

**RELACTAGEL® GEL** Mild irritation

## • CONCEPTION AND CONTRACEPTION

**RELACTAGEL® GEL** Not recommended if trying to conceive.

## • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Gel

EXCIPIENTS: May contain Propylene glycol

► **Balance Activ** (BBI Healthcare Ltd)

Balance Activ BV vaginal pH correction gel | 7 device £5.25

Balance Activ pessaries | 7 pessary £5.25

► **Relactagel** (KoRa Healthcare)

Relactagel vaginal pH correction gel | 7 device £5.25

# 6.1b Vaginal and vulval fungal infections

## Other drugs used for Vaginal and vulval fungal infections

Fluconazole, p. 562 • Itraconazole, p. 564

## ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

### Clotrimazole

#### • INDICATIONS AND DOSE

**Superficial sites of infection in vaginal and vulval candidiasis (dose for 1% or 2% cream)**

► BY VAGINA USING CREAM

► Adult: Apply 2–3 times a day, to be applied to anogenital area

**Vaginal candidiasis (dose for 10% intravaginal cream)**

► BY VAGINA USING VAGINAL CREAM

► Adult: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary

**Vaginal candidiasis**

► BY VAGINA USING PESSARIES

► Adult: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 100 mg for 6 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary

**Recurrent vulvovaginal candidiasis**

► BY VAGINA USING PESSARIES

► Adult: 500 mg every week for 6 months, dose to be administered following topical imidazole for 10–14 days

• **INTERACTIONS** → Appendix 1: antifungals, imidazole

• **SIDE-EFFECTS** Local irritation

• **CONCEPTION AND CONTRACEPTION** Cream and pessaries may damage latex condoms and diaphragms.

• **PREGNANCY** Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

• **EXCEPTIONS TO LEGAL CATEGORY** Brands for sale to the public include **Canesten®** Internal Cream.

#### • MEDICINAL FORMS

## Fenticonazole nitrate

### • INDICATIONS AND DOSE

#### Vaginal and vulva candidiasis

- BY VAGINA USING CAPSULES
- Adult: 200 mg daily for 3 days, alternatively 600 mg daily for 1 dose, to be inserted at night
- BY VAGINA USING CREAM
- Adult: 1 applicatorful twice daily for 3 days

#### DOSE EQUIVALENCE AND CONVERSION

- With topical use
- 1 applicatorful delivers a 5 g dose of fenticonazole 2 %.

- **SIDE-EFFECTS** Local irritation
- **CONCEPTION AND CONTRACEPTION** Intravaginal cream and vaginal capsules damage latex condoms and diaphragms.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), propylene glycol, wool fat and related substances including lanolin

- **Gynoxin** (Recordati Pharmaceuticals Ltd)

**Fenticonazole nitrate 20 mg per 1 gram** Gynoxin 2% vaginal cream | 30 gram [PoM] £3.74

#### Capsule

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

- **Gynoxin** (Recordati Pharmaceuticals Ltd)

**Fenticonazole nitrate 200 mg** Gynoxin 200mg vaginal capsules | 3 capsule [PoM] £2.42

**Fenticonazole nitrate 600 mg** Gynoxin 600mg vaginal capsules | 1 capsule [PoM] £2.62

- **CAUTIONS** Avoid in acute porphyrias p. 969 • avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative
- **INTERACTIONS** → Appendix 1: antifungals, azoles
- **SIDE-EFFECTS**
  - Common or very common Nausea • rash • vomiting
  - Frequency not known Occasional local irritation
- **CONCEPTION AND CONTRACEPTION** *Gyno-Daktarin*<sup>®</sup> damages latex condoms and diaphragms.
- **PREGNANCY** Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection.
- **BREAST FEEDING** Manufacturer advises caution—no information available.

EXCIPIENTS: May contain Hydroxybenzoates (parabens)

- **Gyno-Daktarin** (Janssen-Cilag Ltd)

**Miconazole nitrate 12 gram** Gyno-Daktarin 1200 mg vaginal capsules | 1 capsule [PoM] £2.94 DT price = £2.94

#### Cream

EXCIPIENTS: May contain Butylated hydroxyanisole

- **Gyno-Daktarin** (Janssen-Cilag Ltd)

**Miconazole nitrate 20 mg per 1 gram** Gyno-Daktarin 2% vaginal cream | 78 gram [PoM] £4.33

## 6.2 Vaginal atrophy

### OESTROGENS

#### Estradiol

### • INDICATIONS AND DOSE

#### ESTRING<sup>®</sup>

#### Postmenopausal urogenital conditions (not suitable for vasomotor symptoms or osteoporosis prophylaxis)

- BY VAGINA
- Adult: To be inserted into upper third of vagina and worn continuously; replace after 3 months; max. duration of continuous treatment 2 years

#### VAGIFEM<sup>®</sup>

#### Improve the vaginal epithelium in menopausal atrophic vaginitis

- BY VAGINA
- Adult: 1 tablet daily for 2 weeks, then reduced to 1 tablet twice weekly

- **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) • active thrombophlebitis • Dubin-Johnson syndrome (or monitor closely) • history of breast cancer • history of recurrent venous thromboembolism (unless already on anticoagulant treatment) • oestrogen-dependent cancer • recent arterial thromboembolic disease (e.g. angina or myocardial infarction) • Rotor syndrome (or monitor closely) • thrombophilic disorder • undiagnosed vaginal bleeding • untreated endometrial hyperplasia • venous thromboembolism
- **CAUTIONS** Acute porphyrias p. 969 • diabetes (increased risk of heart disease) • history of breast nodules—closely monitor breast status (risk of breast cancer) • history of endometrial hyperplasia; factors predisposing to thromboembolism • history of fibrocystic disease—closely monitor breast status (risk of breast cancer) • hypophyseal tumours • increased risk of gall-bladder disease • interrupt treatment periodically to assess need for continued treatment • migraine (or migraine-like headaches) •

## Ketoconazole

16-Jun-2017

### • INDICATIONS AND DOSE

#### Vaginal and vulva candidiasis

- BY VAGINA USING CREAM
- Adult: Apply 1–2 times a day, to be applied to the anogenital area

- **SIDE-EFFECTS** Occasional local irritation
- **CONCEPTION AND CONTRACEPTION** Effects on latex condoms and diaphragms not yet known.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- **Nizoral** (Janssen-Cilag Ltd)

**Ketoconazole 20 mg per 1 gram** Nizoral 2% cream | 30 gram [PoM] £4.24 DT price = £4.24

## Miconazole

### • INDICATIONS AND DOSE

#### Vaginal and vulval candidiasis

- BY VAGINA USING CAPSULES
- Child: 1 capsule daily, ovule to be inserted at night as a single dose, dose can be repeated once if necessary
- Adult: 1 capsule daily, ovule to be inserted at night as a single dose, dose can be repeated once if necessary
- BY VAGINA USING CREAM
- Adult: Apply 1 applicatorful daily for 10 to 14 days, alternatively apply 1 applicatorful twice daily for 7 days, course can be repeated once if necessary

#### Superficial sites of infection in vaginal and vulval candidiasis | Vulvitis

- BY VAGINA USING CREAM
- Adult: Apply twice daily, apply to the anogenital area

presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

#### CAUTIONS, FURTHER INFORMATION

- **Risk of breast cancer** It is estimated that using *all* types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

- **Risk of endometrial cancer** The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

- **Risk of ovarian cancer** Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.
- **Risk of venous thromboembolism** Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In *women who have predisposing factors* (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

- **Risk of stroke** Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke. Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.
- **Risk of coronary heart disease** HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.
- **Other conditions** The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

- **SIDE-EFFECTS** Abdominal bloating · abdominal cramps · altered blood lipids (may lead to pancreatitis, rashes and chloasma) · breast enlargement · breast tenderness · changes in libido · cholestatic jaundice · contact lenses may irritate · depression · dizziness · fluid retention · glucose intolerance · headache · headache (on vigorous exercise) · leg cramps (rule out venous thrombosis) · local irritation · migraine · mood changes · nausea ·

premenstrual-like syndrome · sodium retention · vaginal candidiasis · vomiting · weight changes

#### SIDE-EFFECTS, FURTHER INFORMATION

- **Withdrawal bleeding** Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in *regular withdrawal bleeding* towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but *irregular bleeding* may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

- **CONCEPTION AND CONTRACEPTION** HRT does **not** provide contraception and a woman is considered potentially fertile for 2 years after her last menstrual period if she is under 50 years, and for 1 year if she is over 50 years. A woman who is under 50 years and free of all risk factors for venous and arterial disease can use a low-oestrogen combined oral contraceptive pill to provide both relief of menopausal symptoms and contraception; it is recommended that the oral contraceptive be stopped at 50 years of age since there are more suitable alternatives. If any potentially fertile woman needs HRT, non-hormonal contraceptive measures (such as condoms) are necessary. Measurement of follicle-stimulating hormone can help to determine fertility, but high measurements alone (particularly in women aged under 50 years) do not necessarily preclude the possibility of becoming pregnant.

**VAGIFEM®** No evidence of damage to latex condoms and diaphragms.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid; adverse effects on lactation.
- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

#### MONITORING REQUIREMENTS

- History of breast nodules or fibrocystic disease—closely monitor breast status (risk of breast cancer).
- The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Pessary

- **Vagifem** (Novo Nordisk Ltd)

**Estradiol 10 microgram** Vagifem 10microgram vaginal tablets | 24 pessary [PoM] £16.72 DT price = £16.72

#### Vaginal delivery system

CAUTIONARY AND ADVISORY LABELS 10

- **Estring** (Pfizer Ltd)

**Estradiol (as Estradiol hemihydrate) 7.5 microgram per**

**24 hour** Estring 7.5micrograms/24hours vaginal delivery system | 1 device [PoM] £31.42

## Estriol

#### INDICATIONS AND DOSE

##### OVESTIN®

**Improve the vaginal epithelium in menopausal atrophic vaginitis (short-term use)**

- BY VAGINA

- **Adult:** Apply 1 applicatorful daily for 2–3 weeks, then reduced to 1 applicatorful twice weekly, continued →

discontinue every 2–3 months for 4 weeks to assess need for further treatment

**Vaginal surgery for prolapse when there is epithelial atrophy in postmenopausal women (before surgery)**

► BY VAGINA

► Adult: Apply 1 applicatorful daily for 2 weeks before surgery, resume 2 weeks after surgery

• **CONTRA-INDICATIONS** Active arterial thromboembolic disease (e.g. angina or myocardial infarction) · active thrombophlebitis · Dubin-Johnson syndrome (or monitor closely) · history of breast cancer · history of recurrent venous thromboembolism (unless already on anticoagulant treatment) · oestrogen-dependent cancer · recent arterial thromboembolic disease (e.g. angina or myocardial infarction) · Rotor syndrome (or monitor closely) · thrombophilic disorder · undiagnosed vaginal bleeding · untreated endometrial hyperplasia · venous thromboembolism

• **CAUTIONS** Acute porphyrias p. 969 · diabetes (increased risk of heart disease) · factors predisposing to thromboembolism · history of breast nodules—closely monitor breast status (risk of breast cancer) · history of endometrial hyperplasia · history of fibrocystic disease—closely monitor breast status (risk of breast cancer) · hypophyseal tumours · increased risk of gall-bladder disease · interrupt treatment periodically to assess need for continued treatment · migraine (or migraine-like headaches) · presence of antiphospholipid antibodies (increased risk of thrombotic events) · prolonged exposure to unopposed oestrogens may increase risk of developing endometrial cancer · risk factors for oestrogen-dependent tumours (e.g. breast cancer in first-degree relative) · symptoms of endometriosis may be exacerbated · uterine fibroids may increase in size

**CAUTIONS, FURTHER INFORMATION**

► Risk of breast cancer It is estimated that using *all* types of HRT increases the risk of breast cancer within 1–2 years of initiating treatment. The increased risk is related to the duration of HRT use (but not to the age at which HRT is started) and this excess risk disappears within 5 years of stopping.

Radiological detection of breast cancer can be made more difficult as mammographic density can increase with HRT use.

► Risk of endometrial cancer The increased risk of endometrial cancer depends on the dose and duration of oestrogen-only HRT.

In women with a uterus, the addition of a progestogen cyclically (for at least 10 days per 28-day cycle) reduces the additional risk of endometrial cancer; this additional risk is eliminated if a progestogen is given continuously. However, this should be weighed against the increased risk of breast cancer.

► Risk of ovarian cancer Long-term use of combined HRT or oestrogen-only HRT is associated with a small increased risk of ovarian cancer. This excess risk disappears within a few years of stopping.

► Risk of venous thromboembolism Women using combined or oestrogen-only HRT are at an increased risk of deep vein thrombosis and of pulmonary embolism especially in the first year of use.

In women who have predisposing factors (such as a personal or family history of deep vein thrombosis or pulmonary embolism, severe varicose veins, obesity, trauma, or prolonged bed-rest) it is prudent to review the need for HRT, as in some cases the risks of HRT may exceed the benefits.

Travel involving prolonged immobility further increases the risk of deep vein thrombosis.

► Risk of stroke Risk of stroke increases with age, therefore older women have a greater absolute risk of stroke.

Combined HRT or oestrogen-only HRT slightly increases the risk of stroke.

► Risk of coronary heart disease HRT does not prevent coronary heart disease and should not be prescribed for this purpose. There is an increased risk of coronary heart disease in women who start combined HRT more than 10 years after menopause. Although very little information is available on the risk of coronary heart disease in younger women who start HRT close to the menopause, studies suggest a lower relative risk compared with older women.

► Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, atherosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from HRT.

• **SIDE-EFFECTS** Abdominal bloating · abdominal cramps · altered blood lipids (may lead to pancreatitis, rashes and chloasma) · breast enlargement · breast tenderness · changes in libido · cholestatic jaundice · contact lenses may irritate · depression · dizziness · fluid retention · glucose intolerance · headache · leg cramps · local irritation · migraine · mood changes · nausea · premenstrual-like syndrome · sodium retention · vaginal candidiasis · vomiting · weight changes

**SIDE-EFFECTS, FURTHER INFORMATION**

► Leg Cramps Venous thrombosis should be ruled out.

► Withdrawal Bleeding Cyclical HRT (where a progestogen is taken for 12–14 days of each 28-day oestrogen treatment cycle) usually results in *regular withdrawal bleeding* towards the end of the progestogen. The aim of continuous combined HRT (where a combination of oestrogen and progestogen is taken, usually in a single tablet, throughout each 28-day treatment cycle) is to avoid bleeding, but *irregular bleeding* may occur during the early treatment stages (if it continues endometrial abnormality should be excluded and consideration given to cyclical HRT instead).

• **CONCEPTION AND CONTRACEPTION** Effect on latex condoms and diaphragms not yet known.

• **PREGNANCY** Not known to be harmful.

• **BREAST FEEDING** Avoid; adverse effects on lactation.

• **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

• **RENAL IMPAIRMENT** Manufacturer advises caution in renal disease. Evidence for caution is unsatisfactory and many women with these conditions may stand to benefit from HRT.

**MONITORING REQUIREMENTS**

► Closely monitor breast status if history of breast nodules or fibrocystic disease (risk of breast cancer).

► The endometrial safety of long-term or repeated use of topical vaginal oestrogens is uncertain; treatment should be reviewed at least annually, with special consideration given to any symptoms of endometrial hyperplasia or carcinoma.

## Immune system

### 1 Immune system disorders and transplantation

#### Immune response

##### Inflammatory bowel disease

Azathioprine p. 787, ciclosporin p. 788, mercaptopurine p. 844, and methotrexate p. 844 have a role in the treatment of inflammatory bowel disease.

Folic acid p. 937 should be given to reduce the possibility of methotrexate toxicity [unlicensed indication]. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

##### Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 796), calcineurin inhibitors (ciclosporin or tacrolimus p. 791), corticosteroids, or sirolimus p. 790. Choice is dependent on the type of organ, time after transplantation, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

##### Impaired immune responsiveness

Modification of tissue reactions caused by corticosteroids and other immunosuppressants may result in the rapid spread of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised— **important**: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella–zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

##### Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions,

usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced when allopurinol p. 1021 is given concurrently.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil reduces the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher.

Cyclophosphamide p. 830 is less commonly prescribed as an immunosuppressant.

##### Corticosteroids and other immunosuppressants

Prednisolone p. 639 is widely used in oncology. It has a marked antitumour effect in acute lymphoblastic leukaemia, Hodgkin's disease, and the non-Hodgkin lymphomas. It has a role in the palliation of symptomatic end-stage malignant disease when it may enhance appetite and produce a sense of well-being.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-myelotoxic but markedly nephrotoxic. It has an important role in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart–lung transplantation, and for prophylaxis and treatment of graft-versus-host disease.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects, but the incidence of neurotoxicity appears to be greater; cardiomyopathy has also been reported. Disturbance of glucose metabolism also appears to be significant.

Sirolimus is a non-calcineurin inhibiting immunosuppressant licensed for renal transplantation.

Basiliximab p. 795 is used for prophylaxis of acute rejection in allogeneic renal transplantation. It is given with ciclosporin and corticosteroid immunosuppression regimens; its use should be confined to specialist centres.

Belatacept p. 797 is a fusion protein and co-stimulation blocker that prevents T-cell activation; it is licensed for prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus. It is used with interleukin-2 receptor antagonist

induction, in combination with corticosteroids and a mycophenolic acid.

Antithymocyte immunoglobulin (rabbit) below is licensed for the prophylaxis of organ rejection in renal and heart allograft recipients and for the treatment of corticosteroid-resistant allograft rejection in renal transplantation. Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

### NICE technology appraisals (TAs)

**Immunosuppressive therapy for renal transplantation in adults (September 2004)** NICE TA85

When selecting immunosuppressive therapy for induction therapy in the prophylaxis of organ rejection following renal transplantation in adults, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects.

Mycophenolate mofetil [mycophenolic acid also available but not licensed for use in children] is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Sirolimus is recommended as a component of immunosuppressive regimen **only if** intolerance necessitates the withdrawal of a calcineurin inhibitor. These recommendations may not be consistent with the marketing authorisation of some of the products.

[www.nice.org.uk/TA85](http://www.nice.org.uk/TA85)

**Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006)** NICE TA99

When selecting immunosuppressive therapy for renal transplantation in children and adolescents, NICE has recommended that for induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil is recommended as part of an immunosuppressive regimen **only if**:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Mycophenolic acid is not recommended as part of an immunosuppressive regimen for renal transplantation in children or adolescents.

Sirolimus [not licensed for use in children] is recommended as a component of immunosuppressive regimen **only if** intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products.

[www.nice.org.uk/TA99](http://www.nice.org.uk/TA99)

**Other drugs used for immune system disorders and transplantation** Chloroquine, p. 582 • Everolimus, p. 900 • Hydroxychloroquine sulfate, p. 1001 • Rituximab, p. 820

## IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

### Antithymocyte immunoglobulin (rabbit)

#### • INDICATIONS AND DOSE

##### **Prophylaxis of organ rejection in heart allograft recipients**

###### ► BY INTRAVENOUS INFUSION

- Adult: 1–2.5 mg/kg daily for 3–5 days, to be given over at least 6 hours

##### **Prophylaxis of organ rejection in renal allograft recipients**

###### ► BY INTRAVENOUS INFUSION

- Adult: 1–1.5 mg/kg daily for 3–9 days, to be given over at least 6 hours

##### **Treatment of corticosteroid-resistant allograft rejection in renal transplantation**

###### ► BY INTRAVENOUS INFUSION

- Adult: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

#### DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

#### • CONTRA-INDICATIONS Infection

- **SIDE-EFFECTS** Anaphylaxis • cytokine release syndrome • diarrhoea • dysphagia • fever • hypotension • increased susceptibility to infection • increased susceptibility to malignancy • infusion-related reactions • lymphopenia • myalgia • nausea • neutropenia • pruritus • rash • serum sickness • shivering • thrombocytopenia • vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor blood count.

- **DIRECTIONS FOR ADMINISTRATION** For *continuous intravenous infusion* (Thymoglobuline®) in Glucose 5% or Sodium chloride 0.9%; reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with infusion fluid to a total volume of 50–500 mL (usually 50 mL/vial); begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); not to be given with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Solution for infusion**

###### ► Antithymocyte immunoglobulin (rabbit) (Non-proprietary)

Antithymocyte immunoglobulin (rabbit) 20 mg per 1 mL Grafalon 100mg/5mL concentrate for solution for infusion vials | 1 vial [PoM] no price available

##### **Powder and solvent for solution for infusion**

###### ► Thymoglobulin (Sanofi)

Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobuline 25mg powder and solvent for solution for infusion vials | 1 vial [PoM] £158.77 (Hospital only)

**IMMUNOSUPPRESSANTS > ANTIMETABOLITES****Azathioprine**

11-May-2017

- **DRUG ACTION** Azathioprine is metabolised to mercaptopurine.

● **INDICATIONS AND DOSE**

**Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Maintenance of remission of acute ulcerative colitis**

► BY MOUTH

- Adult: 2–2.5 mg/kg daily, some patients may respond to lower doses

**Rheumatoid arthritis that has not responded to other disease-modifying drugs | Severe systemic lupus erythematosus and other connective tissue disorders | Polymyositis in cases of corticosteroid resistance**

► BY MOUTH

- Adult: Initially up to 2.5 mg/kg daily in divided doses, adjusted according to response, rarely more than 3 mg/kg daily; maintenance 1–3 mg/kg daily, consider withdrawal if no improvement within 3 months

**Autoimmune conditions**

► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Adult: 1–3 mg/kg daily, adjusted according to response, consider withdrawal if no improvement within 3 months, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

**Suppression of transplant rejection**

► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Adult: 1–2.5 mg/kg daily, adjusted according to response, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

**Severe refractory eczema, normal or high TPMT activity**

► BY MOUTH

- Adult: 1–3 mg/kg daily

**Severe refractory eczema, intermediate TPMT activity**

► BY MOUTH

- Adult: 0.5–1.5 mg/kg daily

**Generalised myasthenia gravis**

► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Adult: Initially 0.5–1 mg/kg daily, then increased to 2–2.5 mg/kg daily, dose is increased over 3–4 weeks, azathioprine is usually started at the same time as the corticosteroid and allows a lower maintenance dose of the corticosteroid to be used, oral administration preferable, if not possible then can be given by intravenous injection (intravenous solution very irritant) or by intravenous infusion

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

- **UNLICENSED USE** Azathioprine doses given in BNF for suppression of transplant rejection and autoimmune conditions may differ from those in product literature. Use for severe refractory eczema is unlicensed.

● **CONTRA-INDICATIONS**

- When used for severe refractory eczema absent thiopurine methyltransferase (TPMT) activity · very low thiopurine methyltransferase (TPMT) activity

- **CAUTIONS** Reduce dose in elderly · reduced thiopurine methyltransferase activity

- **INTERACTIONS** → Appendix 1: azathioprine

● **SIDE-EFFECTS**

- **Rare** Hepatic veno-occlusive disease · lymphoma · pancreatitis · pneumonitis · red cell aplasia
- **Frequency not known** Arthralgia · cholestatic jaundice · colitis in patients also receiving corticosteroids · diarrhoea · dizziness · dose-related bone marrow suppression · fever · hair loss · herpes zoster infection · hypersensitivity reactions · hypotension · increased susceptibility to infections in patients also receiving corticosteroids · interstitial nephritis · liver impairment · malaise · myalgia · nausea · neutropenia · rash · rigors · thrombocytopenia · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Red cell aplasia** Cases of pure red cell aplasia have been reported with azathioprine; dose reduction or discontinuation should be considered under specialist supervision.
- **Neutropenia and thrombocytopenia** Usually resolved by reducing the dose.
- **Hypersensitivity reactions** Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis) call for immediate withdrawal.
- **Nausea, vomiting and diarrhoea** Nausea, vomiting and diarrhoea may occur, usually starting early during the course of treatment, and in rheumatoid arthritis it may be appropriate to withdraw the drug.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in hypersensitivity to mercaptopurine.

- **PREGNANCY** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in *animal* studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

- **BREAST FEEDING** Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Reduce dose. Monitor liver function.

- **RENAL IMPAIRMENT** Reduce dose.

● **PRE-TREATMENT SCREENING**

Thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

● **MONITORING REQUIREMENTS**

- Monitor for toxicity throughout treatment.
- Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
- Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

### ● DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *intravenous injection*, give over at least 1 minute (followed by 50 mL sodium chloride intravenous infusion). For *intravenous infusion* (Imuran®), give intermittently in Glucose 5% or Sodium Chloride 0.9%. Reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a volume of 20–200 mL with infusion fluid. Intravenous injection is alkaline and very irritant, intravenous route should therefore be used **only** if oral route not feasible.

### ● PATIENT AND CARER ADVICE

Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

#### Tablet

CAUTIONARY AND ADVISORY LABELS 21

#### ► Azathioprine (Non-proprietary)

**Azathioprine 25 mg** Azathioprine 25mg tablets | 28 tablet [PoM] £8.41 DT price = £1.66 | 100 tablet [PoM] £33.26

**Azathioprine 50 mg** Azathioprine 50mg tablets | 56 tablet [PoM] £7.28 DT price = £2.21 | 100 tablet [PoM] £16.55

#### ► Azapress (Ennogen Pharma Ltd)

**Azathioprine 50 mg** Azapress 50mg tablets | 56 tablet [PoM] £2.83 DT price = £2.21

#### ► Imuran (Aspen Pharma Trading Ltd)

**Azathioprine 25 mg** Imuran 25mg tablets | 100 tablet [PoM] £10.99  
**Azathioprine 50 mg** Imuran 50mg tablets | 100 tablet [PoM] £7.99

#### Powder for solution for injection

#### ► Imuran (Aspen Pharma Trading Ltd)

**Azathioprine 50 mg** Imuran 50mg powder for solution for injection vials | 1 vial [PoM] £15.38

## IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

### Ciclosporin (Cyclosporin)

01-Sep-2016

- DRUG ACTION** Ciclosporin inhibits production and release of lymphokines, thereby suppressing cell-mediated immune response.

### ● INDICATIONS AND DOSE

#### Severe acute ulcerative colitis refractory to corticosteroid treatment

##### ► BY CONTINUOUS INTRAVENOUS INFUSION

- Adult: 2 mg/kg, to be given over 24 hours, dose adjusted according to blood-ciclosporin concentration and response

#### Severe active rheumatoid arthritis when conventional second-line therapy inappropriate or ineffective (administered on expert advice)

##### ► BY MOUTH

- Adult: Initially 2.5 mg/kg daily in 2 divided doses, increased if necessary up to 4 mg/kg daily after 6 weeks, if dose increases are necessary they should be made gradually, discontinue if response insufficient after 3 months, dose adjusted according to response for maintenance and treatment reviewed after 6 months (continue only if benefits outweigh risks)

#### Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

##### ► BY MOUTH

- Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of

8 weeks but may be used for longer under specialist supervision, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum

#### Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

##### ► BY MOUTH

- Adult: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision

#### Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

##### ► BY MOUTH

- Adult: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

#### Organ transplantation (used alone)

##### ► BY MOUTH

- Adult: 10–15 mg/kg, to be administered 4–12 hours before transplantation, followed by 10–15 mg/kg daily for 1–2 weeks postoperatively, then maintenance 2–6 mg/kg daily, reduce dose gradually to maintenance. Dose should be adjusted according to blood-ciclosporin concentration and renal function; dose is lower if given concomitantly with other immunosuppressant therapy (e.g. corticosteroids); if necessary one-third corresponding oral dose can be given by intravenous infusion over 2–6 hours

#### Bone-marrow transplantation | Prevention and treatment of graft-versus-host disease

##### ► INITIALLY BY INTRAVENOUS INFUSION

- Adult: 3–5 mg/kg daily, to be administered over 2–6 hours from day before transplantation to 2 weeks postoperatively, alternatively (by mouth) initially 12.5–15 mg/kg daily, then (by mouth) 12.5 mg/kg daily for 3–6 months and then tailed off (may take up to a year after transplantation)

#### Nephrotic syndrome

##### ► BY MOUTH

- Adult: 5 mg/kg daily in 2 divided doses, for maintenance reduce to lowest effective dose according to proteinuria and serum creatinine measurements; discontinue after 3 months if no improvement in glomerulonephritis or glomerulosclerosis (after 6 months in membranous glomerulonephritis)

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

- With oral use Manufacturer advises increase dose by 50% or switch to intravenous administration with concurrent use of octreotide.

- UNLICENSED USE** Not licensed for use in severe acute ulcerative colitis refractory to corticosteroid treatment

#### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: CICLOSPORIN MUST BE PRESCRIBED AND DISPENSED BY BRAND NAME (DECEMBER 2009)

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

- CONTRA-INDICATIONS** Abnormal baseline renal function (in non-transplant indications) · malignancy (in non-transplant indications) · uncontrolled hypertension (in non-transplant indications) · uncontrolled infections (in non-transplant indications)

- **CAUTIONS** Elderly—monitor renal function · hyperuricaemia · in atopic dermatitis, active herpes simplex infections—allow infection to clear before starting (if they occur during treatment withdraw if severe) · in atopic dermatitis, *Staphylococcus aureus* skin infections—not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) · in psoriasis treat, patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option) · in uveitis, Behcet's syndrome (monitor neurological status) · lymphoproliferative disorders (discontinue treatment) · malignancy
- CAUTIONS, FURTHER INFORMATION**
- ▶ **Malignancy**  
In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis) and treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option); discontinue if lymphoproliferative disorder develops.
- **INTERACTIONS** → Appendix 1: ciclosporin
- **SIDE-EFFECTS**
- ▶ **Common or very common**  
Abdominal pain · acne · anorexia · convulsion · diarrhoea · fatigue · flushing · gingival hyperplasia · headache · hepatic dysfunction · hirsutism · hyperglycaemia · hyperkalaemia · hyperlipidaemia · hypertension · hypertrichosis · hyperuricaemia · hypomagnesaemia · leucopenia · muscle cramps · myalgia · nausea · paraesthesia · peptic ulcer · pyrexia · renal dysfunction (renal structural changes on long-term administration) · tremor · vomiting
- ▶ **Uncommon**  
Anaemia · oedema · signs of encephalopathy · thrombocytopenia · weight gain
- ▶ **Rare**  
Gynaecomastia · haemolytic uraemic syndrome · menstrual disturbances · micro-angiopathic haemolytic anaemia · motor polyneuropathy · muscle weakness · myopathy · pancreatitis
- ▶ **Very rare**  
Visual disturbances secondary to benign intracranial hypertension
- ▶ **Frequency not known**
- ▶ With intravenous use Anaphylaxis
- ▶ With systemic use Migraine · pain in lower extremities
- **PREGNANCY** Crosses placenta; manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk.
- **HEPATIC IMPAIRMENT** Extensively metabolised by the liver—manufacturer advises consider dose adjustment based on bilirubin and liver enzyme levels.
- **RENAL IMPAIRMENT** In non-transplant indications, manufacturer advises establishing baseline renal function before initiation of treatment; if baseline function is impaired in non-transplant indications, except nephrotic syndrome—avoid. In nephrotic syndrome, manufacturer advises initial dose should not exceed 2.5 mg/kg daily in patients with baseline renal impairment. *During treatment* for non-transplant indications, manufacturer recommends if eGFR decreases by more than 25% below baseline on more than one measurement, reduce dose by 25–50%. If the eGFR decrease from baseline exceeds 35%, further dose reduction should be considered (even if within normal range); discontinue if reduction not successful within 1 month.
- **MONITORING REQUIREMENTS**
- ▶ Monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details).
- ▶ Dermatological and physical examination, including blood pressure and renal function measurements required at least twice before starting treatment for psoriasis or atopic dermatitis.
- ▶ Monitor liver function.
- ▶ Monitor serum potassium, especially in renal dysfunction (risk of hyperkalaemia).
- ▶ Monitor serum magnesium.
- ▶ Measure blood lipids before treatment and after the first month of treatment.
- ▶ In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month.
- ▶ Investigate lymphadenopathy that persists despite improvement in atopic dermatitis.
- ▶ Monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate dose reduction in transplant patients (exclude rejection if kidney transplant) or discontinuation in non-transplant patients.
- ▶ Monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives.
- ▶ In long-term management of nephrotic syndrome, perform renal biopsies at yearly intervals.
- ▶ In rheumatoid arthritis measure serum creatinine at least twice before treatment. During treatment, monitor serum creatinine every 2 weeks for first 3 months, then every month for a further 3 months, then every 4–8 weeks depending on the stability of the disease, concomitant medication, and concomitant diseases (or more frequently if dose increased or concomitant NSAIDs introduced or increased).
- ▶ Monitor hepatic function if concomitant NSAIDs given.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With oral use Mix solution with orange or apple juice, or other soft drink (to improve taste) immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. Total daily dose should be taken in 2 divided doses.
- ▶ With intravenous use For intravenous infusion (*Sandimmun*®), give intermittently or continuously in Glucose 5% or Sodium Chloride 0.9%; dilute to a concentration of 50 mg in 20–100 mL; give intermittent infusion over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.
- **PRESCRIBING AND DISPENSING INFORMATION**
- Brand name prescribing Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function (for transplant indications).  
*Sandimmun*® capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.
- **PATIENT AND CARER ADVICE** Patients and carers should be counselled on the administration of different formulations of ciclosporin. Manufacturer advises avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Solution for infusion**

EXCIPIENTS: May contain Alcohol, polyoxyl castor oils

► **Sandimmun** (Novartis Pharmaceuticals UK Ltd)

**Ciclosporin 50 mg per 1 ml** Sandimmun 250mg/5ml concentrate for solution for infusion ampoules | 10 ampoule [PoM](#) £110.05

Sandimmun 50mg/1ml concentrate for solution for infusion ampoules | 10 ampoule [PoM](#) £23.23

#### **Oral solution**

EXCIPIENTS: May contain Alcohol, propylene glycol

► **Neoral** (Novartis Pharmaceuticals UK Ltd)

**Ciclosporin 100 mg per 1 ml** Neoral 100mg/ml oral solution sugar-free | 50 ml [PoM](#) £102.30

#### **Capsule**

EXCIPIENTS: May contain Ethanol, ethyl lactate, propylene glycol

► **Ciclosporin (Non-proprietary)**

**Ciclosporin 25 mg** Ciclosporin 25mg capsules | 30 capsule [PoM](#) no price available DT price = £18.37

**Ciclosporin 50 mg** Ciclosporin 50mg capsules | 30 capsule [PoM](#) no price available DT price = £35.97

**Ciclosporin 100 mg** Ciclosporin 100mg capsules | 30 capsule [PoM](#) no price available DT price = £68.28

► **Capimune** (Mylan Ltd)

**Ciclosporin 25 mg** Capimune 25mg capsules | 30 capsule [PoM](#) £13.05 DT price = £18.37

**Ciclosporin 50 mg** Capimune 50mg capsules | 30 capsule [PoM](#) £25.50 DT price = £35.97

**Ciclosporin 100 mg** Capimune 100mg capsules | 30 capsule [PoM](#) £48.50 DT price = £68.28

► **Capsorin** (Morningside Healthcare Ltd)

**Ciclosporin 25 mg** Capsorin 25mg capsules | 30 capsule [PoM](#) £13.05 DT price = £18.37

**Ciclosporin 50 mg** Capsorin 50mg capsules | 30 capsule [PoM](#) £25.59 DT price = £35.97

**Ciclosporin 100 mg** Capsorin 100mg capsules | 30 capsule [PoM](#) £48.89 DT price = £68.28

► **Deximune** (Dexcel-Pharma Ltd)

**Ciclosporin 25 mg** Deximune 25mg capsules | 30 capsule [PoM](#) £13.06 DT price = £18.37

**Ciclosporin 50 mg** Deximune 50mg capsules | 30 capsule [PoM](#) £25.60 DT price = £35.97

**Ciclosporin 100 mg** Deximune 100mg capsules | 30 capsule [PoM](#) £48.90 DT price = £68.28

► **Neoral** (Novartis Pharmaceuticals UK Ltd)

**Ciclosporin 10 mg** Neoral 10mg capsules | 60 capsule [PoM](#) £18.25 DT price = £18.25

**Ciclosporin 25 mg** Neoral 25mg capsules | 30 capsule [PoM](#) £18.37 DT price = £18.37

**Ciclosporin 50 mg** Neoral 50mg capsules | 30 capsule [PoM](#) £35.97 DT price = £35.97

**Ciclosporin 100 mg** Neoral 100mg capsules | 30 capsule [PoM](#) £68.28 DT price = £68.28

► **Vanquoral** (Teva UK Ltd)

**Ciclosporin 10 mg** Vanquoral 10mg capsules | 30 capsule [PoM](#) £12.75 | 60 capsule [PoM](#) £12.75 DT price = £18.25

**Ciclosporin 25 mg** Vanquoral 25mg capsules | 30 capsule [PoM](#) £13.05 DT price = £18.37

**Ciclosporin 50 mg** Vanquoral 50mg capsules | 30 capsule [PoM](#) £25.59 DT price = £35.97

**Ciclosporin 100 mg** Vanquoral 100mg capsules | 30 capsule [PoM](#) £48.89 DT price = £68.28

be given 4 hours after ciclosporin), ciclosporin should then be withdrawn over 4–8 weeks (if not possible, sirolimus should be discontinued and an alternate immunosuppressive regimen used), dose to be adjusted according to whole blood-sirolimus trough concentration

### **DOSE EQUIVALENCE AND CONVERSION**

► The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should **not** be used as a substitute for other tablet strengths.

● **CAUTIONS** Hyperlipidaemia · increased susceptibility to infection (especially urinary-tract infection) · increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)

● **INTERACTIONS** → Appendix 1: sirolimus

### ● **SIDE-EFFECTS**

► **Common or very common** Abdominal pain · acne · anaemia · arthralgia · ascites · constipation · diarrhoea · epistaxis · haemolytic uraemic syndrome · headache · hypercholesterolaemia · hyperglycaemia · hypertension · hypertriglyceridaemia · hypokalaemia · hypophosphataemia · impaired healing · leucopenia · lymphocele · nausea · neutropenia · oedema · osteonecrosis · pleural effusion · pneumonitis · proteinuria · pyrexia · rash · stomatitis · tachycardia · thrombocytopenia · thrombotic thrombocytopenic purpura · venous thromboembolism

► **Uncommon** Nephrotic syndrome · pancreatitis · pancytopenia · pericardial effusion · pulmonary embolism · pulmonary haemorrhage

► **Rare** Alveolar proteinosis · anaphylactic reactions · angioedema · exfoliative dermatitis · hepatic necrosis · hypersensitivity reactions · hypersensitivity vasculitis · interstitial lung disease · lymphoedema

► **Frequency not known** Focal segmental glomerulosclerosis · reversible impairment of male fertility

● **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment and for 12 weeks after stopping.

● **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** In severe impairment decrease dose by 50% and monitor whole blood-sirolimus trough concentration every 5–7 days until 3 consecutive measurements have shown stable blood-sirolimus concentration. Clearance reduced in mild to moderate impairment. Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.

### ● **MONITORING REQUIREMENTS**

► Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).

► Manufacturer advises pre-dose ('trough') whole blood-sirolimus concentration (using **chromatographic** assay) when used with ciclosporin should be 4–12 micrograms/litre (local treatment protocols may differ); after withdrawal of ciclosporin pre-dose whole blood-sirolimus concentration should be 12–20 micrograms/litre (local treatment protocols may differ).

► Close monitoring of whole blood-sirolimus concentration required if concomitant treatment with potent inducers or inhibitors of metabolism and after discontinuing them, or if ciclosporin dose reduced significantly or stopped.

► When changing between oral solution and tablets, measurement of whole blood 'trough' sirolimus concentration after 1–2 weeks is recommended.

► Therapeutic drug monitoring assays Sirolimus whole-blood concentration is measured using either high performance

## **Sirolimus**

● **DRUG ACTION** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

### ● **INDICATIONS AND DOSE**

**Prophylaxis of organ rejection in kidney allograft recipients**

► **BY MOUTH**

► **Adult:** Initially 6 mg for 1 dose, to be given after surgery once wound has healed, then 2 mg once daily; to be given in combination with ciclosporin and corticosteroid for 2–3 months (sirolimus doses should

liquid chromatography (HPLC) or immunoassay. Switching between different immunoassays or between an immunoassay and HPLC can lead to clinically significant differences in results and therefore incorrect dose adjustments. Adjustment to the target therapeutic dose range should be made with knowledge of the assay used and corresponding reference range.

- ▶ Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.
- **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sirolimus. Patients should be advised to avoid excessive exposure to UV light.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Oral solution

EXCIPIENTS: May contain Ethanol

##### ▶ Rapamune (Pfizer Ltd)

Sirolimus 1 mg per 1 mL Rapamune 1mg/mL oral solution sugar-free | 60 mL [PoM] £162.41

##### Tablet

##### ▶ Rapamune (Pfizer Ltd)

Sirolimus 500 microgram Rapamune 0.5mg tablets | 30 tablet [PoM] £69.00 DT price = £69.00

Sirolimus 1 mg Rapamune 1mg tablets | 30 tablet [PoM] £86.49 DT price = £86.49

Sirolimus 2 mg Rapamune 2mg tablets | 30 tablet [PoM] £172.98 DT price = £172.98

## Tacrolimus

- **DRUG ACTION** Tacrolimus is a calcineurin inhibitor.

#### ● INDICATIONS AND DOSE

##### ADOPT®

**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation**

- ▶ BY MOUTH
- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation**

- ▶ BY MOUTH
- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation**

- ▶ BY MOUTH
- ▶ Adult: Initially 75 micrograms/kg daily in 2 divided doses

**Allograft rejection resistant to conventional immunosuppressive therapy**

- ▶ BY MOUTH
- ▶ Adult: Seek specialist advice

#### ADVAGRAF®

**Prophylaxis of graft rejection following liver transplantation, starting 12–18 hours after transplantation**

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 micrograms/kg once daily, to be taken in the morning

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation**

- ▶ BY MOUTH
- ▶ Adult: Initially 200–300 micrograms/kg once daily, to be taken in the morning

**Allograft rejection resistant to conventional immunosuppressive therapy**

- ▶ BY MOUTH
- ▶ Adult: Seek specialist advice

#### CAPEXION®

**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

- ▶ BY MOUTH
- ▶ Adult: Initially 100–200 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation**

- ▶ BY MOUTH
- ▶ Adult: Initially 200–300 micrograms/kg daily in 2 divided doses

**Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation**

- ▶ BY MOUTH

### Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

#### ► BY MOUTH

- Adult: Initially 75 micrograms/kg daily in 2 divided doses

### Allograft rejection resistant to conventional immunosuppressive therapy

#### ► BY MOUTH

- Adult: Seek specialist advice

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- **Adoport<sup>®</sup>, Prograf<sup>®</sup>, Capexion<sup>®</sup>, Tacni<sup>®</sup>, and Vivadex<sup>®</sup>** are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- **Modigraf<sup>®</sup>** granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- **Advagraf<sup>®</sup>** is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: **Envarsus<sup>®</sup>** is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- **CAUTIONS** Increased risk of infections · lymphoproliferative disorders · malignancies · neurotoxicity · QT-interval prolongation · UV light (avoid excessive exposure to sunlight and sunlamps)

- **INTERACTIONS** → Appendix 1: tacrolimus

#### ● SIDE-EFFECTS

- **Common or very common** Acne · alopecia · anaemia · anorexia · anxiety · arthralgia · ascites · bile-duct abnormalities · bloating · blood disorders · cholestasis · confusion · constipation · depression · diarrhoea · dizziness · dyspepsia · dyspnoea · electrolyte disturbances · flatulence · gastro-intestinal inflammation · gastro-intestinal perforation · gastro-intestinal ulceration · haemorrhage · headache · hepatic dysfunction · hyperglycaemia · hyperkalaemia · hypertension · hyperuricaemia · hypokalaemia · impaired hearing · ischaemic events · jaundice · leucopenia · mood changes · muscle cramp · nausea · oedema · pancytopenia · paraesthesia · parenchymal lung disorders · peripheral neuropathy · photophobia · pleural effusion · psychosis · renal failure · renal impairment · renal tubular necrosis · seizures · sleep disturbances · sweating · tachycardia · thrombocytopenia · thromboembolic events · tinnitus · tremor · urinary abnormalities · visual disturbances · vomiting · weight changes
- **Uncommon** Amnesia · arrhythmia · cardiac arrest · cardiomyopathy · cataract · cerebrovascular accident · coagulation disorders · coma · dermatitis · dysmenorrhoea · encephalopathy · gastro-intestinal reflux disease · heart failure · hypertonia · hypoglycaemia · influenza-like symptoms · palpitation · pancreatitis · paralysis · paralytic

ileus · peritonitis · photosensitivity · respiratory failure · speech disorder

- **Rare** Blindness · dehydration · hirsutism · pericardial effusion · posterior reversible encephalopathy syndrome · respiratory distress syndrome · thrombotic thrombocytopenic purpura · toxic epidermal necrolysis
- **Very rare** Haemorrhagic cystitis · myasthenia · Stevens-Johnson syndrome
- **Frequency not known** Agranulocytosis · haemolytic anaemia · pure red cell aplasia

#### SIDE-EFFECTS, FURTHER INFORMATION

- **Cardiomyopathy** Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).
- **HEPATIC IMPAIRMENT** Dose reduction may be necessary in severe impairment.
- **MONITORING REQUIREMENTS**
  - After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
  - Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.

#### ● DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (*Prograf<sup>®</sup>*); give continuously in Glucose 5% or Sodium Chloride 0.9%. Dilute concentrate in infusion fluid to a final concentration of 4–100 micrograms/mL; give over 24 hours. Tacrolimus is incompatible with PVC.

#### ● PATIENT AND CARER ADVICE

Avoid excessive exposure to UV light including sunlight.

#### Driving and skilled tasks

May affect performance of skilled tasks (e.g. driving).

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

- With oral use The *Scottish Medicines Consortium* has advised (November 2010) that tacrolimus granules for oral suspension (*Modigraf<sup>®</sup>*) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Modified-release tablet

###### ► Envarsus (Chiesi Ltd)

Tacrolimus (as Tacrolimus monohydrate)

**750 microgram** Envarsus 750microgram modified-release tablets | 30 tablet (PoM) £44.33

- **DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

● **INDICATIONS AND DOSE**

**Acute gout in patients whose condition has not responded adequately to treatment with NSAIDs or colchicine, or who are intolerant of them**

► **BY SUBCUTANEOUS INJECTION**

- **Adult:** 150 mg for 1 dose, dose may be repeated at least 12 weeks after initial response if symptoms recur, patients who do not respond to initial dose should not be retreated

**Treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome)**

► **BY SUBCUTANEOUS INJECTION**

- **Adult:** (consult product literature)

- **CONTRA-INDICATIONS** Active infection · leucopenia · neutropenia
- **CAUTIONS** History of recurrent infection · latent and active tuberculosis · predisposition to infection
- **CAUTIONS, FURTHER INFORMATION**
  - **Vaccinations** Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - **Common or very common** Back pain · increased susceptibility to infection (including serious infection) · injection-site reactions · malaise · neutropenia · vertigo
  - **Uncommon** Gastro-oesophageal reflux
  - **Frequency not known** Malignancy · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for up to 3 months after last dose.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Consider if benefit outweighs risk—not known if present in human milk.
- **HEPATIC IMPAIRMENT** No information available.
- **RENAL IMPAIRMENT** Limited information available but manufacturer advises no dose adjustment required.
- **PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.
- **MONITORING REQUIREMENTS**
  - Monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.
  - Monitor for signs and symptoms of tuberculosis during and after treatment.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

## IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

### Basiliximab

- **DRUG ACTION** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.

#### ● INDICATIONS AND DOSE

**Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)**

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- **Adult:** Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs

- **CAUTIONS** Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS** Atrial flutter · cardiac arrest · cytokine release syndrome · palpitations · severe hypersensitivity reactions
- **CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for 16 weeks after last dose.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Simulect<sup>®</sup>) give intermittently in Glucose 5% or Sodium chloride 0.9%; reconstitute 10 mg with 2.5 mL water for injections then dilute to at least 25 mL with infusion fluid; reconstitute 20 mg with 5 mL water for injections then dilute to at least 50 mL with infusion fluid; give over 20–30 minutes.
- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.

#### **Powder and solvent for solution for injection**

### Belimumab

24-Oct-2016

#### ● INDICATIONS AND DOSE

**Adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy**

- BY INTRAVENOUS INFUSION
- **Adult:** 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months

- **CAUTIONS** Do not initiate until active infections controlled · history or development of malignancy · predisposition to infection
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**  
► **Common or very common** Infusion-related reactions  
► **Frequency not known** Depression · diarrhoea · hypersensitivity reactions · infections · insomnia ·

leucopenia · migraine · nausea · pain in extremities · pyrexia · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related side-effects are reported commonly, including severe or life-threatening hypersensitivity and infusion reactions. Premedication with an antihistamine, with or without an antipyretic may be considered.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment and for at least 4 months after last dose.
- **PREGNANCY** Avoid unless essential.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Delay in the onset of acute hypersensitivity reactions has been observed; patients should remain under clinical supervision for several hours following at least the first 2 infusions.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Benlysta<sup>®</sup>), give intermittently in Sodium chloride 0.9%; reconstitute with water for injections (120 mg in 1.5 mL, 400 mg in 4.8 mL) to produce a solution containing 80 mg/mL; gently swirl vial for 60 seconds, then allow to stand; swirl vial (without shaking) for 60 seconds every 5 minutes until dissolved; dilute requisite dose with infusion fluid to a final volume of 250 mL and give over 1 hour.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**  
► **Belimumab for treating active autoantibody-positive systemic lupus erythematosus (June 2016)** NICE TA397  
Belimumab is recommended as an add-on treatment option in adults with active autoantibody-positive systemic lupus erythematosus, only if all of the following criteria apply:
  - there is evidence for serological disease activity (defined as positive anti-double-stranded DNA and low complement) and a Safety of Estrogen in Lupus National Assessment—Systemic Lupus Erythematosus Disease Activity Index (SELENA-SLEDAI) score of greater than or equal to 10 despite standard therapy;
  - treatment with belimumab is continued after 24 weeks only if the SELENA-SLEDAI score has improved by 4 points or more;
  - the manufacturer provides belimumab with the discount agreed in the patient access scheme; **and**
  - under the conditions specified in the NICE managed access agreement documentation.

Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA397](http://www.nice.org.uk/TA397)

#### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (May 2017) that belimumab (Benlysta<sup>®</sup>) is accepted for restricted use within NHS Scotland as adjunctive therapy in patients with active, autoantibody-positive systemic lupus erythematosus with a high degree of disease activity despite standard therapy, and who have evidence of serological disease activity and a Safety of Estrogens in Lupus Erythematosus National Assessment-Systemic Lupus Erythematosus Disease Activity Index (SELENA-SLEDAI) score of 10 or greater. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for infusion**

##### ► **Benlysta** (GlaxoSmithKline UK Ltd) ▼

**Belimumab 120 mg** Benlysta 120mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £121.50 (Hospital only)

## IMMUNOSUPPRESSANTS > PURINE SYNTHESIS INHIBITORS

### Mycophenolate mofetil

#### ● INDICATIONS AND DOSE

##### **Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)**

###### ► BY MOUTH

Adult: 1 g twice daily, to be started within 72 hours of transplantation

###### ► BY INTRAVENOUS INFUSION

Adult: 1 g twice daily for maximum 14 days, then transfer to oral therapy, to be started within 24 hours of transplantation

##### **Prophylaxis of acute rejection in cardiac transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)**

###### ► BY MOUTH

Adult: 1.5 g twice daily, to be started within 5 days of transplantation

##### **Prophylaxis of acute rejection in hepatic transplantation (in combination with ciclosporin and corticosteroids) (under expert supervision)**

###### ► INITIALLY BY INTRAVENOUS INFUSION

Adult: 1 g twice daily for 4 days, up to a maximum of 14 days, to be started within 24 hours of transplantation, then (by mouth) 1.5 g twice daily, the dose route should be changed as soon as is tolerated

#### **MYFORTIC®**

##### **Renal transplantation**

###### ► BY MOUTH

Adult: 720 mg twice daily, to be started within 72 hours of transplantation

#### **DOSE EQUIVALENCE AND CONVERSION**

► For *Myfortic*®: Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

- **CAUTIONS** Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) · children (higher incidence of side-effects may call for temporary reduction of dose or interruption) · delayed graft function · elderly (increased risk of infection, gastro-intestinal haemorrhage and pulmonary oedema) · increased susceptibility to skin cancer (avoid exposure to strong sunlight) · risk of hypogammaglobulinaemia or bronchiectasis when used in combination with other immunosuppressants

#### **CAUTIONS, FURTHER INFORMATION**

- Hypogammaglobulinaemia or bronchiectasis Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.
- **INTERACTIONS** → Appendix 1: mycophenolate
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · acne · agitation · alopecia · anaemia · anorexia · anxiety · arthralgia · blood

disorders · confusion · constipation · convulsions · cough · depression · disturbances of blood lipids · disturbances of electrolytes and blood lipids · dizziness · dyspnoea · flatulence · gastro-intestinal bleeding · gastro-intestinal inflammation · gastro-intestinal ulceration · gingival hyperplasia · headache · hepatitis · hyperglycaemia · hypertension · hypotension · infections · influenza-like syndrome · insomnia · jaundice · leucopenia · malignancy (particularly of the skin) · myasthenic syndrome · nausea · oedema · pancreatitis · pancytopenia · paraesthesia · rash · red cell aplasia · renal impairment · skin hypertrophy · stomatitis · tachycardia · taste disturbance · thrombocytopenia · tremor · vasodilatation · vomiting · weight loss

- **Frequency not known** Interstitial lung disease · intestinal villous atrophy · progressive multifocal leucoencephalopathy · pulmonary fibrosis
- SIDE-EFFECTS, FURTHER INFORMATION**  
Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

#### ● **CONCEPTION AND CONTRACEPTION**

**Pregnancy prevention** In females of child-bearing potential, exclude pregnancy immediately before and during treatment.

Women should use 2 methods of effective contraception during treatment, and for 6 weeks after discontinuation. Men should use condoms during treatment and for at least 90 days after discontinuation of treatment; female partners of male patients should also use effective contraception during treatment and for 90 days after discontinuation.

**MYFORTIC®** Manufacturer advises that men should use condoms during treatment and for 13 weeks after last dose.

- **PREGNANCY** Avoid unless no suitable alternative—congenital malformations and spontaneous abortions reported.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** No data available in cardiac or hepatic transplant patients with renal impairment.
- **MONITORING REQUIREMENTS** Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For *intravenous infusion* (*CellCept*®), give intermittently in Glucose 5%; reconstitute each 500-mg vial with 14 mL glucose 5% and dilute the contents of 2 vials in 140 mL infusion fluid; give over 2 hours.
- **PATIENT AND CARER ADVICE**  
Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.

#### ● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

##### **Gastro-resistant tablet**

CAUTIONARY AND ADVISORY LABELS 25

##### ► **Myfortic** (Novartis Pharmaceuticals UK Ltd)

**Mycophenolic acid (as Mycophenolate sodium) 180 mg** Myfortic 180mg gastro-resistant tablets | 120 tablet [PoM] £96.72

**Mycophenolic acid (as Mycophenolate sodium) 360 mg** Myfortic 360mg gastro-resistant tablets | 120 tablet [PoM] £193.43

##### **Tablet**

## IMMUNOSUPPRESSANTS > T-CELL ACTIVATION INHIBITORS

### Belatacept

#### • INDICATIONS AND DOSE

**Prophylaxis of graft rejection in adults undergoing renal transplantation who are seropositive for the Epstein-Barr virus**

- BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- **CAUTIONS** Increased risk of acute graft rejection—with tapering of corticosteroid, particularly in patients with high immunologic risk · increased risk of infection · latent and active tuberculosis · risk factors for post-transplant lymphoproliferative disorder

- **INTERACTIONS** → Appendix 1: belatacept

#### • SIDE-EFFECTS

- **Common or very common** Anaemia · constipation · cough · dehydration · diarrhoea · headache · hypertension · hypophosphataemia · infection · leucopenia · malignancy · nausea · peripheral oedema · pyrexia · vomiting
- **Uncommon** Infusion related reactions · progressive multifocal leucoencephalopathy

#### SIDE-EFFECTS, FURTHER INFORMATION

Side effects are reported when used in combination with basiliximab, mycophenolate mofetil and corticosteroids.

- **CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for up to 8 weeks after last dose.

- **PREGNANCY** Use only if essential.

- **BREAST FEEDING** Avoid—no information available.

- **PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.

- **MONITORING REQUIREMENTS** Patients should be monitored for signs and symptoms of tuberculosis during and after treatment.

- **PATIENT AND CARER ADVICE** Patients should be advised to avoid excessive exposure to UV light including sunlight.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

- **Nulojix** (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Belatacept 250 mg** Nulojix 250mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £354.52 (Hospital only) | 2 vial [PoM] £709.04 (Hospital only)

## 1.1 Multiple sclerosis

### Multiple sclerosis

02-Nov-2016

#### Description of condition

Multiple sclerosis is a chronic, immune-mediated, demyelinating inflammatory condition of the central nervous system, which affects the brain, optic nerves and spinal cord, and leads to progressive severe disability.

*Relapsing-remitting* multiple sclerosis is the most common pattern of the disease. It is characterised by periods of exacerbation of symptoms (relapses) followed by unpredictable periods of stability (remission). The severity and frequency of relapses varies greatly between patients, but on average occur once or twice per year. This clinical pattern often develops into *secondary-progressive* multiple sclerosis, with progressive disability unrelated to relapses. Most patients develop secondary progressive disease 6–10 years after onset.

*Primary-progressive* multiple sclerosis follows a gradual course, with the development of symptoms that worsen over time, without relapses and remissions.

*Progressive-relapsing* multiple sclerosis follows a course of steadily worsening neurological function from onset, in addition to acute relapses.

#### Disease activity in relapsing-remitting multiple sclerosis

*Active* disease is defined as at least two clinically significant relapses occurring within the last 2 years. *Highly active* disease is characterised by an unchanged/increased relapse rate or by ongoing severe relapses compared with the previous year, despite treatment with interferon beta p. 799. *Rapidly-evolving severe* relapsing-remitting multiple sclerosis is defined by two or more disabling relapses in 1 year, and one or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

#### Aims of treatment

There is no cure for multiple sclerosis. The overall aims of treatment are to modify the course of the disease and manage symptoms, in order to improve quality of life. Treatment is aimed at reducing the frequency and duration of relapses and at preventing or slowing disability.

#### Drug treatment

Shared decision-making between the patient and their clinicians is particularly important in the treatment of multiple sclerosis, due to the unpredictability of the condition and the lack of evidence of long-term benefit of treatments. [EvGr] A discussion about treatment options, disease activity, risk, and benefit should take place to ensure that treatment choices are right for the patient and their circumstances. [A] The choice of drug also depends on the patient's disability status, individual tolerance, disease severity and disease activity (see *Disease activity in relapsing-remitting multiple sclerosis* above). [EvGr] Treatment should be initiated as early as possible, under the supervision of a specialist. [A]

**Note:** NHS England (May 2014) has provided guidance on the use of interferon beta, glatiramer acetate p. 801, fingolimod p. 802 and natalizumab p. 805 for the treatment of multiple sclerosis in England, see *Useful resources* below. This Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing these treatment options. See also *National funding/access decisions*, under individual monographs for teriflunomide p. 806, dimethyl fumarate p. 801 and alemtuzumab p. 804.

Low levels of vitamin D are believed to be a risk factor for developing multiple sclerosis. Patients with diagnosed multiple sclerosis are usually given regular vitamin D after assessment of their serum levels of vitamin D, but there is insufficient evidence to support its use as a treatment for multiple sclerosis. [EvGr] Patients should not be offered vitamin D solely for the purpose of treating multiple sclerosis. [A]

### Relapsing-remitting multiple sclerosis

[EvGr] Disease-modifying drugs are the recommended treatment for patients presenting with *active* relapsing-remitting multiple sclerosis. Interferon beta and glatiramer acetate may be the preferred choice for some patients, due to their established safety profile, and the long term clinical experience associated with their use. [A] Peginterferon beta-1a p. 800 requires less frequent administration and is available as an alternative to the non-pegylated interferon beta therapies.

Teriflunomide and dimethyl fumarate are treatment options for patients with *active* disease. [EvGr] They may be preferred due to their oral route of administration. [A] There is insufficient evidence for the use of either drug to treat *highly active* or *rapidly-evolving severe* relapsing-remitting multiple sclerosis.

[EvGr] More active disease may be treated with natalizumab or alemtuzumab. Natalizumab may be preferred due to the complex safety profile associated with alemtuzumab. Natalizumab is only recommended for the treatment of *rapidly-evolving severe* relapsing-remitting multiple sclerosis. Although licensed as a treatment option in all patients with *active* disease, alemtuzumab may be used more frequently in patients for whom other disease-modifying treatments have not been effective, due to the risk of serious side effects associated with its use.

Fingolimod is also taken by the oral route and is the recommended treatment for patients with *highly active* disease. [A] The NHS England Clinical Commissioning Policy (see *Useful resources* below) advises that fingolimod is a suitable alternative for patients receiving natalizumab who are at high risk of developing progressive multifocal leukoencephalopathy (defined as patients previously exposed to the JC virus or who are receiving immunosuppressants or who have been receiving treatment with natalizumab for more than 2 years).

### Secondary progressive multiple sclerosis

Currently, only interferon beta 1b is licensed for use in secondary progressive multiple sclerosis. Interferon beta 1b reduces the risk of relapse and of short-term relapse-related disability, but does not prevent the development of permanent physical disability or retard progression once it is established. Therefore its role in secondary progressive disease is limited.

### Primary progressive multiple sclerosis

Currently there are no effective disease-modifying treatments licensed for primary progressive multiple sclerosis. Interferon beta [unlicensed indication] has been used, but there is limited evidence to support its use due to the lack of a significant reduction in disability progression.

### Progressive-relapsing multiple sclerosis

There are no specific treatment options for this type of multiple sclerosis. None of the currently licensed disease-

modifying drugs are recommended in non-relapsing progressive disease.

## Management of symptoms

Other than episodes of neurological dysfunction, chronic symptoms (such as fatigue, spasticity, visual problems, and emotional lability) produce much of the disability in multiple sclerosis. [EvGr] Smoking may increase the progression of disability in multiple sclerosis, and cessation should be encouraged. [A]

### Relapses

Suspected relapses should be referred to a specialist for diagnosis and treatment. [EvGr] Corticosteroids are recommended for reducing inflammation and accelerating recovery in acute relapses of relapsing-remitting multiple sclerosis. Oral methylprednisolone p. 638 is recommended as the first-line option. Intravenous methylprednisolone should be considered as an alternative if oral methylprednisolone has failed or is not tolerated or if hospitalisation is required. [A]

### Fatigue and impaired mobility

[EvGr] Regular exercise may have beneficial effects on mobility and fatigue in patients with multiple sclerosis, and should be encouraged. Cognitive behavioural techniques for fatigue should also be considered in combination with exercise. Amantadine hydrochloride p. 397 [unlicensed indication] may be used to treat fatigue related to multiple sclerosis. Vitamin B<sub>12</sub> injections are **not** recommended as a treatment for fatigue in patients with multiple sclerosis. [A] Fampidine p. 799 is licensed for the improvement of walking in patients with multiple sclerosis who have a walking disability. [EvGr] NICE do not consider it to be a cost-effective treatment and do not recommend its use. [A]

### Spasticity

Many factors may aggravate spasticity in multiple sclerosis, including constipation, infection, poor mobility aids, pressure ulcers, posture and pain. [EvGr] These causes should be managed appropriately. The first-line options for managing spasticity in multiple sclerosis are baclofen p. 1026 or gabapentin p. 301 [unlicensed indication]. They may be used cautiously in combination if the individual drugs are ineffective or if side effects prevent an increase in the dose of either drug. Tizanidine p. 1027 or dantrolene sodium p. 1236 are second-line options; benzodiazepines may be used as third-line therapy and may also be effective in treating nocturnal spasms. [A] A cannabis extract p. 1026 containing dronabinol and cannabidiol is licensed as an adjunct treatment for moderate-to-severe spasticity associated with multiple sclerosis in patients who have not responded adequately to other skeletal muscle relaxants. [EvGr] NICE do not consider it to be a cost-effective treatment and do not recommend its use. [A]

### Oscillopsia

[EvGr] Gabapentin [unlicensed indication] is the first-line treatment for oscillopsia; memantine hydrochloride p. 291 [unlicensed indication] is the second-line option. [A]

### Emotional lability

[EvGr] Amitriptyline hydrochloride p. 355 [unlicensed indication] may be used to treat emotional lability in patients with multiple sclerosis. [A]

## CHOLINERGIC RECEPTOR STIMULATING DRUGS

## Fampridine

21-Mar-2017

## ● INDICATIONS AND DOSE

**Improvement of walking disability in multiple sclerosis (specialist use only)**

► BY MOUTH

► Adult: 10 mg every 12 hours, discontinue treatment if no improvement within 2 weeks

- **CONTRA-INDICATIONS** History of seizures (discontinue treatment if seizures occur)
- **CAUTIONS** Atrioventricular conduction disorders · predisposition to seizures · sinoatrial conduction disorders · symptomatic cardiac rhythm disorders

## ● SIDE-EFFECTS

- Common or very common Anxiety · back pain · constipation · dizziness · dyspepsia · dyspnoea · headache · insomnia · malaise · nausea · paraesthesia · pharyngolaryngeal pain · tremor · urinary tract infection · vomiting
- Uncommon Seizures

● **PREGNANCY** Avoid—toxicity in *animal* studies.

● **BREAST FEEDING** Avoid—no information available.

● **RENAL IMPAIRMENT** Avoid if eGFR less than 80 mL/minute/1.73 m<sup>2</sup>.

● **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (pack contains a desiccant) and discard any tablets remaining 7 days after opening.

## ● NATIONAL FUNDING/ACCESS DECISIONS

## Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2016) that fampridine (*Fampyra*®) is **not** recommended for use within NHS Scotland for the improvement of walking in adult patients with multiple sclerosis (MS) with walking disability (EDSS [expanded disability status scale] 4 to 7) as the economic case was not demonstrated.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

## Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 23, 25

► *Fampyra* (Biogen Idec Ltd) ▼

Fampridine 10 mg *Fampyra* 10mg modified-release tablets | 28 tablet (PoM) £181.00 | 56 tablet (PoM) £362.00

## IMMUNOSTIMULANTS &gt; INTERFERONS

## Interferon beta

## ● INDICATIONS AND DOSE

## AVONEX® INJECTION

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

► BY INTRAMUSCULAR INJECTION

► Adult: (consult product literature)

## AVONEX® VIAL

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

► BY INTRAMUSCULAR INJECTION

► Adult: (consult product literature)

## BETAFERON® INJECTION

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

► BY SUBCUTANEOUS INJECTION

► Adult: (consult product literature)

## EXTAVIA®

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For secondary progressive multiple sclerosis with active disease | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

► BY SUBCUTANEOUS INJECTION

► Adult: (consult product literature)

## REBIF® CARTRIDGE

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

► BY SUBCUTANEOUS INJECTION

► Adult: (consult product literature)

## REBIF® PRE-FILLED PEN AND SYRINGE

For relapsing, remitting multiple sclerosis (characterised by at least two attacks of neurological dysfunction over the previous 2 or 3 years, followed by complete or incomplete recovery) who are able to walk unaided | For a single demyelinating event with an active inflammatory process (if severe enough to require intravenous corticosteroid and patient at high risk of developing multiple sclerosis)

► BY SUBCUTANEOUS INJECTION

► Adult: (consult product literature)

- **CONTRA-INDICATIONS** Decompensated liver disease · severe depressive illness

## CONTRA-INDICATIONS, FURTHER INFORMATION

Consult product literature for further information on contra-indications.

- **CAUTIONS** History of cardiac disorders · history of depressive disorders (avoid in severe depression or in those with suicidal ideation) · history of seizures · history of severe myelosuppression

**CAUTIONS, FURTHER INFORMATION**

Consult product literature for further information on cautions.

- **INTERACTIONS** → Appendix 1: interferons
- **SIDE-EFFECTS** Alopecia · anaphylaxis · blood disorders · chills · confusion · convulsions · fever · hepatitis · hypersensitivity reactions · influenza-like symptoms (decreasing over time) · irritation at injection site (including inflammation, hypersensitivity, necrosis) · malaise · menstrual disorders · mood and personality changes · myalgia · nausea · nephrotic syndrome · suicide attempts · thrombotic microangiopathy · thyroid dysfunction · urticaria · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

Also consult product literature for all side effects.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment.
- **RENAL IMPAIRMENT** Caution in severe renal impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for signs of hepatic injury—hepatic failure has been reported rarely.
  - ▶ Patients should be monitored for clinical features of thrombotic microangiopathy (TMA), including thrombocytopenia, new onset hypertension, fever, central nervous system symptoms (e.g. confusion and paresis), and impaired renal function. Any signs of TMA should be investigated fully and, if diagnosed, interferon beta should be stopped immediately and treatment for TMA promptly initiated (consult product literature for details).
  - ▶ Patients should also be monitored for signs and symptoms of nephrotic syndrome, including oedema, proteinuria, and impaired renal function—monitor renal function periodically. If nephrotic syndrome develops, treat promptly and consider stopping interferon beta treatment.

**● PRESCRIBING AND DISPENSING INFORMATION**

**REBIF® CARTRIDGE** Cartridges for use with *RebiSmart®* auto-injector device.

**BETAFERON® INJECTION** An auto-injector device (*Betaject®* Light) is available from Bayer Schering.

**EXTAVIA®** An auto-injector device (*ExtaviPro®* 30G) is supplied as part of the *ExtaviPro®* 30G kit.

**● NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

- ▶ **Interferon beta and glatiramer acetate for multiple sclerosis (January 2002) NICE TA32**  
Interferon beta and glatiramer acetate are **not** recommended for the treatment of multiple sclerosis in the NHS in England and Wales.

Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment.

[www.nice.org.uk/TA32](http://www.nice.org.uk/TA32)

**NHS restrictions**

**NHS England Clinical Commissioning Policy** NHS England (May 2014) has provided guidance on the use of interferon beta p. 799 for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see [www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04](http://www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04).

## IMMUNOSTIMULANTS > OTHER

### Glatiramer acetate

- **DRUG ACTION** Glatiramer is an immunomodulating drug comprising synthetic polypeptides.

#### ● INDICATIONS AND DOSE

**Treatment of initial symptoms in patients at high risk of developing multiple sclerosis (initiated under specialist supervision) | Reducing frequency of relapses in ambulatory patients with relapsing-remitting multiple sclerosis who have had at least 2 clinical relapses in the past 2 years (initiated under specialist supervision)**

##### ▶ BY SUBCUTANEOUS INJECTION

Adult: 20 mg daily

- **CAUTIONS** Cardiac disorders
- **INTERACTIONS** → Appendix 1: glatiramer
- **SIDE-EFFECTS**
  - ▶ Common or very common Anxiety · arthralgia · asthenia · back pain · chest pain · constipation · depression · dyspepsia · dyspnoea (may occur within minutes of injection) · flushing · headache · hypersensitivity reactions · hypertonia · influenza-like symptoms · injection-site reactions · lymphadenopathy · nausea · oedema · palpitation · rash · sweating · syncope · tachycardia · tremor
  - ▶ Rare Seizures
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- ▶ **Interferon beta and glatiramer acetate for multiple sclerosis (January 2002)** NICE TA32

Interferon beta and glatiramer acetate are **not** recommended for the treatment of multiple sclerosis in the NHS in England and Wales.

Patients who are currently receiving interferon beta or glatiramer acetate for multiple sclerosis, whether as routine therapy or as part of a clinical trial, should have the option to continue treatment until they and their consultant consider it appropriate to stop, having regard to the established criteria for withdrawal from treatment.

[www.nice.org.uk/TA32](http://www.nice.org.uk/TA32)

### NHS restrictions

**NHS England Clinical Commissioning Policy** NHS England (May 2014) has provided guidance on the use of glatiramer acetate for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see [www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04](http://www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04).

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

#### ▶ Copaxone (Teva UK Ltd)

**Glatiramer acetate 20 mg per 1 ml** Copaxone 20mg/1ml solution for injection pre-filled syringes | 28 pre-filled disposable injection [PoM] £513.95

**Glatiramer acetate 40 mg per 1 ml** Copaxone 40mg/1ml solution for injection pre-filled syringes | 12 pre-filled disposable injection [PoM] £513.95

## IMMUNOSUPPRESSANTS > IMMUNOMODULATING DRUGS

### Dimethyl fumarate

- **DRUG ACTION** Dimethyl fumarate has immunomodulatory and anti-inflammatory properties.

#### ● INDICATIONS AND DOSE

**Treatment of adults with relapsing-remitting multiple sclerosis (initiated by a specialist)**

##### ▶ BY MOUTH

Adult: 120 mg twice daily for 7 days, then increased to 240 mg twice daily, for dose adjustment due to side effects—consult product literature

- **CAUTIONS** Reduced lymphocyte count · risk of serious infections (do not start treatment until resolved and consider suspending treatment if infection develops during treatment) · severe active gastro-intestinal disease
- **INTERACTIONS** → Appendix 1: dimethyl fumarate
- **SIDE-EFFECTS** Abdominal pain · burning sensation · diarrhoea · dyspepsia · erythema · flushing (may be severe and indicate hypersensitivity) · gastritis · gastroenteritis · leucopenia · lymphopenia · nausea · proteinuria · pruritus · rash · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Progressive multifocal leukoencephalopathy (PML) Severe prolonged lymphopenia reported, and patients are exposed to a potential risk of PML. Treatment should be stopped immediately if PML is suspected.
- **CONCEPTION AND CONTRACEPTION** Contraception required in women of child-bearing potential (consider non-hormonal methods).
- **PREGNANCY** Manufacturer advises avoid unless essential and potential benefit outweighs risk—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid.
  - **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
  - **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
  - **MONITORING REQUIREMENTS**
    - ▶ Monitor full blood count (including lymphocytes) before treatment (within 6 months before initiation), then every 6 to 12 months thereafter, and as clinically indicated.
    - ▶ Monitor patient closely for features of progressive multifocal leukoencephalopathy (PML) (e.g. signs and symptoms of neurological dysfunction) and other opportunistic infections.
    - ▶ Monitor renal and hepatic function before treatment, after 3 and 6 months of treatment, then every 6 to 12 months thereafter, and as clinically indicated.
  - **PATIENT AND CARER ADVICE** Patient information leaflet should be provided.
    - Counselling is advised on progressive multifocal leukoencephalopathy.
  - **NATIONAL FUNDING/ACCESS DECISIONS**
    - **NICE technology appraisals (TAs)**
      - ▶ Dimethyl fumarate for treating relapsing-remitting multiple sclerosis (August 2014) NICE TA320
- Dimethyl fumarate is recommended for the treatment of active relapsing-remitting multiple sclerosis, only if:
- the patient does not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis and
  - the manufacturer provides dimethyl fumarate with the discount agreed in the patient access scheme
- Patients currently receiving dimethyl fumarate whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.
- [www.nice.org.uk/TA320](http://www.nice.org.uk/TA320)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Gastro-resistant capsule**

CAUTIONARY AND ADVISORY LABELS 21, 25

#### ▶ **Tecfidera** (Biogen Idec Ltd)

**Dimethyl fumarate 120 mg** Tecfidera 120mg gastro-resistant

capsules | 14 capsule [PoM] £343.00

**Dimethyl fumarate 240 mg** Tecfidera 240mg gastro-resistant

capsules | 56 capsule [PoM] £1,373.00

## Fingolimod

22-Jul-2016

- **DRUG ACTION** Fingolimod is an immunomodulating drug.

#### ● **INDICATIONS AND DOSE**

**Treatment of highly active relapsing-remitting multiple sclerosis in patients who have high disease activity despite treatment with at least one disease modifying therapy or in those with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)**

#### ▶ **BY MOUTH**

- ▶ Adult: 500 micrograms once daily

#### **IMPORTANT SAFETY INFORMATION**

**MHRA/CHM ADVICE: MULTIPLE SCLEROSIS THERAPIES: SIGNAL OF REBOUND EFFECT AFTER STOPPING OR SWITCHING THERAPY (APRIL 2017)**

A signal of rebound syndrome in multiple sclerosis patients whose treatment with fingolimod was stopped or switched to other treatments has been reported in two recently published articles. The MHRA advise to be vigilant for such events and report any suspected

adverse effects relating to fingolimod, or other treatments for multiple sclerosis, via the Yellow Card Scheme, while this report is under investigation.

**MHRA/CHM ADVICE: FINGOLIMOD—NOT RECOMMENDED FOR PATIENTS AT KNOWN RISK OF CARDIOVASCULAR EVENTS. ADVICE FOR EXTENDED MONITORING FOR THOSE WITH SIGNIFICANT BRADYCARDIA OR HEART BLOCK AFTER THE FIRST DOSE AND FOLLOWING TREATMENT INTERRUPTION (JANUARY 2013)**

Fingolimod is known to cause transient bradycardias and heart block after the first dose. Fingolimod is not recommended in the following patient groups who are at high risk of cardiovascular events unless the anticipated benefits outweigh the potential risks, and advice from a cardiologist is sought before initiation:

#### **Patients with the following medical conditions:**

- 2nd degree Mobitz Type II or higher degree atrioventricular block, sick sinus syndrome, or sino-atrial heart block
- significant QT prolongation (QT-interval greater than 470 milliseconds in women, or greater than 450 milliseconds in men)
- history of symptomatic bradycardia or recurrent syncope, known ischaemic heart disease, cerebrovascular disease, history of myocardial infarction, congestive heart failure, history of cardiac arrest, uncontrolled hypertension, or severe sleep apnoea.

#### **Patients receiving the following antiarrhythmic or heart-rate lowering drugs :**

- class Ia or class III antiarrhythmics
- beta blockers
- heart rate-lowering calcium channel blockers
- other substances which may decrease heart rate (e.g. digoxin, anticholinesteratic drugs or pilocarpine).

All patients receiving fingolimod should be monitored at treatment initiation, (first dose monitoring), and after treatment interruption (see note below); monitoring should include:

#### **Pre-treatment**

- a 12-lead ECG and blood pressure measurement before starting

#### **During the first 6 hours of treatment**

- continuous ECG monitoring for 6 hours
- blood pressure and heart rate measurement every hour

#### **After 6 hours of treatment**

- a further 12-lead ECG and blood pressure measurement

If heart rate at the end of the 6 hour period is at its lowest since fingolimod was first administered, monitoring should be extended by at least 2 hours and until heart rate increases.

Extended monitoring, (at least overnight), should be performed in patients with evidence of clinically important cardiac effects during first dose monitoring. Monitoring in patients requiring pharmacological intervention for bradyarrhythmia-related symptoms during first dose monitoring should be extended at least overnight, and first dose monitoring should be repeated after the second dose.

#### **Note**

First dose monitoring as above **should be repeated** in all patients whose treatment is interrupted for:

- 1 day or more during the first 2 weeks of treatment
- more than 7 days during weeks 3 and 4 of treatment
- more than 2 weeks after one month of treatment

If the treatment interruption is of shorter duration than the above, repeated monitoring is not required and treatment should be continued with the next dose as planned.

- **CONTRA-INDICATIONS** Active malignancies · immunosuppression · severe active infection

- **CAUTIONS** Check varicella zoster virus status—consult product literature for further information • chronic obstructive pulmonary disease • pulmonary fibrosis • risk of macular oedema • severe respiratory disease • susceptibility to QT-interval prolongation (including electrolyte disturbances)

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Washout period** A washout period is recommended when switching treatment from some disease modifying therapies—consult product literature for further information.
- **INTERACTIONS** → Appendix 1: fingolimod
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alopecia • AV block • back pain • basal cell carcinoma • blurred vision • bradycardia • bronchitis • cough • depression • diarrhoea • dizziness • dyspnoea • eczema • gastroenteritis • headache • herpes • hypertension • influenza • leucopenia • lymphopenia • malaise • migraine • pruritus • sinusitis • tinea versicolor • tinea versicolor
  - ▶ **Uncommon** Macular oedema • neutropenia • pneumonia
  - ▶ **Rare** Lymphoma
  - ▶ **Frequency not known** Haemophagocytic syndrome • lymphoma • posterior reversible encephalopathy syndrome • progressive multifocal leukoencephalopathy
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ **Basal-cell carcinoma** Patients should be advised to seek medical advice if they have any signs of basal-cell carcinoma including skin nodules, patches or open sores that do not heal within weeks.
  - ▶ **Progressive multifocal leukoencephalopathy (PML)** and other opportunistic infections Patients should be advised to seek medical attention if they have any signs of PML or any other infections. Suspension of treatment should be considered if a patient develops a severe infection, taking into consideration the risk-benefit.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment. Ensure effective contraception during and for at least 2 months after treatment.
- **PREGNANCY** Avoid (toxicity in animal studies).
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises eye examination recommended 3–4 months after initiation of treatment (and before initiation of treatment in patients with diabetes or history of uveitis).
  - ▶ Manufacturer advises skin examination for signs of basal-cell carcinoma before starting treatment and then at least yearly thereafter.
  - ▶ Monitor hepatic transaminases before treatment, then every 3 months for 1 year, then periodically thereafter.
  - ▶ Monitor full blood count before treatment, at 3 months, then at least yearly thereafter and if signs of infection—interrupt treatment if lymphocyte count reduced—consult product literature.
  - ▶ Monitor for signs and symptoms of haemophagocytic syndrome (including pyrexia, asthenia, hepatosplenomegaly and adenopathy—may be associated with hepatic failure and respiratory distress; also progressive cytopenia, elevated serum-ferritin concentrations, hypertriglyceridaemia, hypofibrinogenaemia, coagulopathy, hepatic cytolysis, hyponatraemia)—initiate treatment immediately.
  - ▶ Manufacturer advises to monitor routine MRI for lesions suggestive of progressive multifocal leukoencephalopathy (PML), particularly in patients considered at increased risk.

#### NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Fingolimod for the treatment of highly active relapsing-remitting multiple sclerosis (April 2012)** NICE TA254 Fingolimod is recommended as an option for the treatment of highly active relapsing-remitting multiple sclerosis in adults, only if:

- they have an unchanged or increased relapse rate or ongoing severe relapses compared with the previous year despite treatment with interferon beta, **and**
  - the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme
- Patients currently receiving fingolimod whose disease does not meet the above criteria should be able to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA254](http://www.nice.org.uk/TA254)

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* (SMC) has advised (August 2012) that fingolimod (*Gilenya*®) is accepted for restricted use within NHS Scotland as single disease modifying therapy in highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta, with an unchanged or increased relapse rate or ongoing severe relapses, as compared to the previous year.

All Wales Medicines Strategy Group (AWMSG) Decisions The *All Wales Medicines Strategy Group* has advised (January 2017) that fingolimod (*Gilenya*®) is recommended as an option for use within NHS Wales as a single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous recent MRI, only if the manufacturer provides fingolimod with the discount agreed as part of the patient access scheme or where the list price is equivalent or lower.

##### NHS restrictions

**NHS England Clinical Commissioning Policy** NHS England (May 2014) has provided guidance on the use of fingolimod for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for initiating and discontinuing this treatment option, see [www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04/](http://www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04/).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

- ▶ **Gilenya** (Novartis Pharmaceuticals UK Ltd) ▼

**Fingolimod (as Fingolimod hydrochloride)**

**500 microgram** Gilenya 0.5mg capsules | 7 capsule **[PoM]** £367.50  
| 28 capsule **[PoM]** £1,470.00

#### IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS

##### Daclizumab

25-Apr-2017

- **DRUG ACTION** Daclizumab is a humanised monoclonal antibody that inhibits interleukin-2 receptor binding.

##### INDICATIONS AND DOSE

##### Relapsing multiple sclerosis (initiated by a specialist)

- ▶ **BY SUBCUTANEOUS INJECTION**

- ▶ **Adult:** 150 mg once a month, to be administered into the thigh, abdomen or upper arm

- **CAUTIONS** History of depressive disorders • patients over 55 years—limited information available • severe active infection (consider delaying treatment initiation)

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Tuberculosis** Manufacturer advises screening for active tuberculosis before starting treatment in patients who have had tuberculosis or who live in endemic areas; monitor for signs and symptoms of tuberculosis during treatment.
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abnormal liver function tests • acne • anaemia • decreased lymphocyte count • depression • dermatitis • diarrhoea • eczema • erythema • folliculitis • hepatitis • influenza • lymphadenopathy • nasopharyngitis • oropharyngeal pain • pruritus • psoriasis • pyrexia • rash • respiratory tract infection • rhinitis
  - ▶ **Uncommon** Colitis • serious skin reactions

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Serious skin reactions** Serious skin reactions (including exfoliative rash or dermatitis, and toxic skin eruption) have been reported; if a diffuse or highly inflammatory rash develops—manufacturer advises referral to a dermatologist and discontinuation may be required.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment or when serum transaminases are greater than 2 times the upper limit of normal range.

#### ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor liver function before treatment, monthly during treatment and for up to 4 months after the last dose—treatment interruption or discontinuation may be required if serum transaminases are greater than 3 times the upper limit of normal range (consult product literature).
- ▶ Manufacturer advises monitor full blood count every 3 months.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C). May be stored at room temperature up to 30°C for up to 30 days.

#### ● PATIENT AND CARER ADVICE

Patients should be provided with a patient card.

Manufacturer advises patients and their carers should be advised to report any signs of hepatic injury, or symptoms of new or worsening depression and/or suicidal ideation. Patients or carers should also be given advice on how to administer daclizumab injection.

#### Missed doses

Manufacturer advises if a dose is more than 2 weeks late, the missed dose should not be administered and the next dose should be administered at the normal time.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (April 2017) that daclizumab (Zinbryta®) is accepted for restricted use within NHS Scotland only for the treatment of rapidly evolving severe (RES) relapsing remitting multiple sclerosis (RRMS), or RRMS with an inadequate response to disease modifying therapy. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Zinbryta** (Biogen Idec Ltd) ▼

**Daclizumab 150 mg per 1 ml** Zinbryta 150mg/1ml solution for injection pre-filled pen | 1 pre-filled disposable injection (PoM) £1,596.67

### IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > ANTI-LYMPHOCYTE

## Anti-lymphocyte monoclonal antibodies

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

#### IMPORTANT SAFETY INFORMATION

All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Allergic reactions • angioedema • bronchospasm • chills • cytokine release syndrome • dyspnoea • fever • flushing • nausea • pruritus • rash • tumour pain • vomiting
- ▶ **Frequency not known** Cardiac events

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Infusion-related side-effects** In rare cases infusion reactions may be fatal.

Infusion-related side-effects occur predominantly during the first infusion. Patients should receive premedication before administration of anti-lymphocyte monoclonal antibodies to reduce these effects—consult product literature for details of individual regimens.

The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

- ▶ **Cytokine release syndrome** Fatalities following **severe** cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored **very closely** (and a slower rate of infusion considered).

- **PRE-TREATMENT SCREENING** All patients should be screened for hepatitis B before treatment.

- **MONITORING REQUIREMENTS** Patients should also be monitored for cytopenias—consult product literature for specific recommendations.

► above

## Alemtuzumab

#### ● INDICATIONS AND DOSE

**Treatment of adults with relapsing-remitting multiple sclerosis with active disease defined by clinical or imaging features**

- ▶ **BY INTRAVENOUS INFUSION**
- ▶ **Adult:** (consult product literature)

- **UNLICENSED USE** Although no longer licensed for oncological and transplant indications, alemtuzumab is

also available through a patient access programme for these indications.

#### IMPORTANT SAFETY INFORMATION

Alemtuzumab should be given under the care of a specialist with facilities for the management of hypersensitivity and anaphylactic reactions.

- **CONTRA-INDICATIONS** Human immunodeficiency virus
- **CAUTIONS** Hepatitis B carriers · hepatitis C carriers · in patients with active infection, a delay in initiation of alemtuzumab treatment should be considered until the infection is fully controlled · not recommended for inactive disease · not recommended for stable disease · patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course · patients with previous autoimmune conditions other than multiple sclerosis · pretreatment before administration is required (consult product literature)

#### CAUTIONS, FURTHER INFORMATION

For full details of cautions, consult product literature.

- ▶ Autoimmune mediated conditions The risk of autoimmune mediated conditions may increase during treatment, including immune thrombocytopenic purpura, thyroid disorders, nephropathies, and cytopenias, and should be monitored for throughout the course of treatment (consult product literature).

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### SIDE-EFFECTS

##### SIDE-EFFECTS, FURTHER INFORMATION

For full side effects details (including monitoring and management) consult product literature

- **CONCEPTION AND CONTRACEPTION** Women of childbearing potential should use effective contraception during and for 4 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. Autoimmune thyroid disease during treatment may affect fetus (consult product literature).
- **BREAST FEEDING** Manufacturer advises avoid during and for 4 months after each treatment course unless potential benefit outweighs risk.
- **PRE-TREATMENT SCREENING** Screening patients at high risk of hepatitis B or C is recommended before treatment. All patients should be evaluated for active or latent tuberculosis before starting treatment.
- **MONITORING REQUIREMENTS** HPV screening should be carried out annually in female patients.
- **PRESCRIBING AND DISPENSING INFORMATION** All patients should receive oral prophylaxis for herpes infection starting on the first day of treatment and continuing for at least a month following each treatment course.
- **PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card and patient guide.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**  
▶ Alemtuzumab for treating relapsing-remitting multiple sclerosis (May 2014) NICE TA312  
Alemtuzumab is recommended as an option, within its marketing authorisation, for treating adults with active relapsing-remitting multiple sclerosis.  
[www.nice.org.uk/TA312](http://www.nice.org.uk/TA312)

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

- ▶ **Lemtrada** (Genzyme Therapeutics Ltd) ▼

Alemtuzumab 10 mg per 1 ml Lemtrada 12mg/1.2ml concentrate for solution for infusion vials | 1 vial [PoM](#) £7,045.00 (Hospital only)

■ 804

## Natalizumab

- **DRUG ACTION** Natalizumab is a monoclonal antibody that inhibits the migration of leucocytes into the central nervous system, hence reducing inflammation and demyelination.

#### INDICATIONS AND DOSE

**Highly active relapsing-remitting multiple sclerosis despite treatment with interferon beta or glatiramer acetate, or those patients with rapidly evolving severe relapsing-remitting multiple sclerosis (initiated under specialist supervision)**

##### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult 18–65 years: 300 mg every 4 weeks, treatment should be discontinued if no response after 6 months

- **CONTRA-INDICATIONS** Active infection · active malignancies (except cutaneous basal cell carcinoma) · immunosuppression · progressive multifocal leucoencephalopathy

#### CAUTIONS

##### CAUTIONS, FURTHER INFORMATION

For information on cautions consult product literature.

- ▶ Progressive Multifocal Leucoencephalopathy Natalizumab is associated with an increased risk of opportunistic infection and progressive multifocal leucoencephalopathy (PML) caused by JC virus. The risk of developing PML increases with the presence of anti-JCV antibodies, previous use of immunosuppressant therapy, and treatment duration (especially beyond 2 years of treatment); the risk beyond 4 years of treatment is not known. Patients with all three risk factors should only be treated with natalizumab if the benefits of treatment outweigh the risks. Treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### SIDE-EFFECTS

- ▶ **Common or very common** Arthralgia · arthralgia (during infusion) · autoantibodies · dizziness (during infusion) · fatigue (during infusion) · headache (during infusion) · nasopharyngitis · nausea (during infusion) · pyrexia (during infusion) · rigors (during infusion) · urinary-tract infection · urticaria (during infusion) · vomiting (during infusion)
- ▶ **Uncommon** Hypersensitivity reactions (discontinue permanently) · Progressive Multifocal Leucoencephalopathy (PML)
- ▶ **Frequency not known** Flushing (during infusion) · increased risk of opportunistic infection · liver toxicity

##### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Progressive Multifocal Leucoencephalopathy If Progressive Multifocal Leucoencephalopathy (PML) is suspected, treatment should be suspended until PML has been excluded. If a patient develops an opportunistic infection or PML, natalizumab should be permanently discontinued.
- ▶ Liver toxicity Discontinue treatment if significant liver injury occurs.
- **PREGNANCY** Avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Present in milk in *animal* studies—avoid.

### ● PRE-TREATMENT SCREENING

Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended before starting treatment with natalizumab.

Testing for serum anti-JCV antibodies before starting treatment or in those with unknown antibody status already receiving natalizumab is recommended and should be repeated every 6 months (consult product literature for full details).

### ● MONITORING REQUIREMENTS

- ▶ Monitor liver function.
- ▶ Progressive Multifocal Leucoencephalopathy A magnetic resonance image (MRI) scan is recommended annually. Patients should be monitored for new or worsening neurological symptoms, and for cognitive and psychiatric signs of PML.
- ▶ All patients should continue to be monitored for signs and symptoms that may be suggestive of PML for approximately 6 months following discontinuation of treatment.
- ▶ Hypersensitivity reactions Patients should be observed for hypersensitivity reactions, including anaphylaxis, during the infusion and for 1 hour after completion of the infusion.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Tysabri®), give intermittently in Sodium chloride 0.9%; dilute 300 mg in 100 mL infusion fluid; gently invert to mix, do not shake. Use within 8 hours of dilution and give over 1 hour.

- **PATIENT AND CARER ADVICE** A patient alert card should be provided.

Hypersensitivity reactions Patients should be told the importance of uninterrupted dosing, particularly in the early months of treatment (intermittent therapy may increase risk of sensitisation).  
Progressive Multifocal Leucoencephalopathy Patients should be informed about the risks of PML before starting treatment with natalizumab and again after 2 years; they should be given an alert card which includes information about the symptoms of PML.

Liver toxicity Advise patients to seek immediate medical attention if symptoms such as jaundice or dark urine develop.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ Natalizumab for the treatment of adults with highly active relapsing-remitting multiple sclerosis (August 2007)  
NICE TA127

Natalizumab is an option for the treatment only of rapidly evolving severe relapsing-remitting multiple sclerosis (RES). RES is defined by 2 or more disabling relapses in 1 year, and 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

[www.nice.org.uk/TA127](http://www.nice.org.uk/TA127)

#### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (August 2007) that natalizumab is accepted for restricted use as single disease-modifying therapy in highly active relapsing-remitting multiple sclerosis only in patients with rapidly evolving severe relapsing-remitting multiple sclerosis defined by 2 or more disabling relapses in 1 year and with 1 or more gadolinium-enhancing lesions on brain magnetic resonance imaging (MRI) or a significant increase in T2 lesion load compared with a previous MRI.

#### NHS restrictions

**NHS England Clinical Commissioning Policy** NHS England (May 2014) has provided guidance on the use of natalizumab for the treatment of multiple sclerosis in England. An NHS England Clinical Commissioning Policy outlines the funding arrangements and the criteria for

initiating and discontinuing this treatment option, see [www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04/](http://www.england.nhs.uk/commissioning/spec-services/npc-crg/group-d/d04/).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

**ELECTROLYTES:** May contain Sodium

▶ **Tysabri** (Biogen Idec Ltd) ▼

**Natalizumab 20 mg per 1 mL** Tysabri 300mg/15ml concentrate for solution for infusion vials | 1 vial (POM) £1,130.00 (Hospital only)

## IMMUNOSUPPRESSANTS > PYRIMIDINE SYNTHESIS INHIBITORS

### Teriflunomide

- **DRUG ACTION** Teriflunomide is a metabolite of leflunomide which has immunomodulating and anti-inflammatory properties.

### ● INDICATIONS AND DOSE

#### Treatment of relapsing-remitting multiple sclerosis (initiated under specialist supervision)

- ▶ BY MOUTH
- ▶ Adult: 14 mg once daily

- **CONTRA-INDICATIONS** Anaemia • leucopenia • neutropenia • serious infection • severe hypoproteinaemia • severe immunodeficiency • significantly impaired bone-marrow function • thrombocytopenia

- **CAUTIONS** Adult over 65 years • anaemia • dyspnoea—assess for interstitial lung disease and consider suspending treatment • hypoproteinaemia (avoid if severe) • impaired bone-marrow function (avoid if severe) • latent tuberculosis • leucopenia • persistent cough—assess for interstitial lung disease and consider suspending treatment • severe infection—delay or suspend treatment until resolved • significant alcohol consumption • signs or symptoms of serious skin reactions (including ulcerative stomatitis, Stevens-Johnson syndrome, and toxic epidermal necrolysis)—discontinue treatment • switching between other immunomodulating drugs • thrombocytopenia

- **INTERACTIONS** → Appendix 1: teriflunomide

### ● SIDE-EFFECTS

- ▶ **Common or very common** Acne • alopecia • anxiety • carpal tunnel syndrome • cystitis • diarrhoea • elevated liver enzymes • gastroenteritis • hyperaesthesia • hypertension • laryngitis • leucopenia • menorrhagia • musculoskeletal pain • myalgia • nausea • neuralgia • neutropenia • oral infection • paraesthesia • peripheral neuropathy • pollakiuria • rash • respiratory tract infection • sciatica • tinea pedis • urinary tract infection • vomiting • weight loss
- ▶ **Uncommon** Anaemia • thrombocytopenia
- ▶ **Very rare** Interstitial lung disease • pancreatitis

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Accelerated elimination procedure **Important:** accelerated elimination procedure recommended following discontinuation due to serious adverse effects (consult product literature).
- ▶ Hepatic injury Discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.
- **CONCEPTION AND CONTRACEPTION** Effective contraception essential for women of child-bearing potential during treatment and for up to 2 years after treatment. In patients undergoing treatment with teriflunomide that are planning to conceive, the accelerated elimination procedure should be used prior to conception. Use of non-oral contraception is

recommended during the accelerated elimination procedure—consult product literature.

- **PREGNANCY** Avoid—toxicity in animal studies.
- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor full blood count (including differential white cell count and platelet count) before treatment and as clinically indicated during treatment.
  - ▶ Monitor blood pressure before treatment and periodically thereafter.
  - ▶ Hepatic monitoring Monitor liver function before treatment and every 2 weeks for first 6 months then every 8 weeks thereafter or as clinically indicated (pre-existing liver disease may increase risk). Increase to weekly monitoring if alanine aminotransferase (ALT) is 2–3 times the upper limit of reference range; discontinue treatment if signs or symptoms of hepatic injury, or if liver enzymes exceed 3 times the upper limit of reference range.
- **TREATMENT CESSATION**

Accelerated elimination procedures To aid drug elimination in case of serious adverse effect or before conception, stop treatment and give *either* colestyramine p. 191 or charcoal, activated p. 1256. After the accelerated elimination procedure a plasma concentration of less than 20 micrograms/litre (measured on 2 occasions at least 14 days apart) and a waiting period of one and a half months are necessary before conception.

#### • NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ Teriflunomide for treating relapsing-remitting multiple sclerosis (January 2014) NICE TA303  
Teriflunomide is recommended for the treatment of adults with active relapsing-remitting multiple sclerosis (normally defined as 2 clinically significant relapses in the previous 2 years), in adults who:
  - do not have highly active or rapidly evolving severe relapsing-remitting multiple sclerosis **and**
  - the manufacturer provides teriflunomide with the discount agreed in the patient access scheme[www.nice.org.uk/TA303](http://www.nice.org.uk/TA303)

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2014) that the use of teriflunomide (*Aubagio*)<sup>®</sup> in NHS Scotland is restricted to use in patients with relapsing-remitting multiple sclerosis who do not have highly active disease, and only as an alternative to treatment with interferon beta or glatiramer acetate.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- ▶ **Aubagio** (Genzyme Therapeutics Ltd) ▼

## Malignant disease

### 1 Antibody responsive malignancy

#### ANTINEOPLASTIC DRUGS > MONOCLONAL ANTIBODIES

##### Bevacizumab

- **DRUG ACTION** Bevacizumab is a monoclonal antibody that inhibits vascular endothelial growth factor.

##### • INDICATIONS AND DOSE

**Treatment of metastatic colorectal cancer in combination with fluoropyrimidine-based chemotherapy** | **First-line treatment of metastatic breast cancer in combination with paclitaxel when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate** | **First-line treatment of metastatic breast cancer in combination with capecitabine when treatment with other chemotherapy, including taxanes or anthracyclines is not appropriate (patients who have received adjuvant taxane or anthracycline-containing regimens in the previous 12 months should not be treated with bevacizumab in combination with capecitabine)** | **Advanced or metastatic renal cell carcinoma in combination with interferon alfa-2a** | **First-line treatment of unresectable advanced, metastatic or recurrent non-small cell lung cancer other than predominantly squamous cell histology (in combination with platinum-based chemotherapy)** | **First-line treatment of advanced (FIGO stages IIIB, IIIC and IV) epithelial ovarian, fallopian tube, or primary peritoneal cancer (in combination with carboplatin and paclitaxel)** | **First recurrence of platinum-sensitive epithelial ovarian, fallopian tube, or primary peritoneal cancer in patients who have not been treated previously with bevacizumab or other drugs that target vascular endothelial growth factor (in combination with carboplatin and gemcitabine)**

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult local protocol)

##### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: BEVACIZUMAB AND SUNITINIB: RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)**

Treatment with bevacizumab or sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with bevacizumab or sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with bevacizumab or sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with bevacizumab or sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

- **CAUTIONS** Elective surgery (withhold treatment and avoid for at least 28 days after major surgery or until wound fully healed) · history of arterial thromboembolism · history of cardiovascular disease (increased risk of cardiovascular events, especially in the elderly) · history of hypertension (increased risk of proteinuria—discontinue if nephrotic syndrome) · increased risk of fistulas (discontinue

permanently if tracheo-oesophageal or grade 4 fistula develops) · increased risk of haemorrhage · increased risk of tumour-associated haemorrhage · intra-abdominal inflammation (risk of gastro-intestinal perforation and gall bladder perforation · uncontrolled hypertension · untreated CNS metastases

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS** Abdominal pain · alopecia · anaemia · anorexia · arterial thromboembolism · asthenia · bone marrow suppression · chest pain · congestive heart failure · constipation · dehydration · diarrhoea · drowsiness · dry skin · dysarthria · dyspnoea · exfoliative dermatitis · extravasation · eye disorders · fistulas · flushing · gall bladder perforation · gastro-intestinal perforation · haemorrhage · hand-foot syndrome · headache · hypersensitivity reactions · hypertension · hyperuricaemia · hypotension · hypoxia · impaired wound healing · infection · intestinal obstruction · lethargy · mucocutaneous bleeding · nausea · necrotising fasciitis (discontinue and initiate treatment promptly) · neutropenia · oral mucositis · osteonecrosis of the jaw · peripheral neuropathy · posterior reversible encephalopathy syndrome · proteinuria · pulmonary hypertension · pyrexia · rash · rhinitis · rigors · skin discoloration · supraventricular tachycardia · syncope · taste disturbances · thrombocytopenia · thromboembolism · tumour lysis syndrome · vomiting

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 6 months after treatment in women.

● **PREGNANCY** Avoid—toxicity in *animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for at least 6 months after treatment.

● **MONITORING REQUIREMENTS**

- ▶ Monitor for necrotising fasciitis (usually secondary to wound healing complications, gastro-intestinal perforation or fistula formation)—discontinue and initiate treatment promptly.
- ▶ Monitor blood pressure.
- ▶ Monitor for congestive heart failure.
- ▶ Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, headache, altered mental status, visual disturbance or cortical blindness, with or without hypertension).
- ▶ Consider dental check-up before initiating treatment (risk of osteonecrosis of the jaw).

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

▶ Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284

Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).

[www.nice.org.uk/TA284](http://www.nice.org.uk/TA284)

▶ Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242

Bevacizumab in combination with non-oxaliplatin (fluoropyrimidine-based) chemotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy; see also NICE guidance Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007).

[www.nice.org.uk/TA242](http://www.nice.org.uk/TA242)

▶ Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285

Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

[www.nice.org.uk/TA285](http://www.nice.org.uk/TA285)

▶ Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012) NICE TA263

Bevacizumab in combinations with capecitabine is **not** recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months.

[www.nice.org.uk/TA263](http://www.nice.org.uk/TA263)

▶ Bevacizumab in combination with a taxane for the first-line treatment of metastatic breast cancer (February 2011) NICE TA214

Bevacizumab in combination with a taxane is **not** recommended for the first-line treatment of metastatic breast cancer.

[www.nice.org.uk/TA214](http://www.nice.org.uk/TA214)

▶ Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212

Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is **not** recommended for the treatment of metastatic colorectal cancer.

[www.nice.org.uk/TA212](http://www.nice.org.uk/TA212)

▶ Bevacizumab and cetuximab for the treatment of metastatic colorectal cancer (January 2007) NICE TA118

Bevacizumab in combination with fluorouracil plus folinic acid, with or without irinotecan, is **not** recommended for the first-line treatment of metastatic colorectal cancer; see also NICE guidance Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy.

[www.nice.org.uk/TA118](http://www.nice.org.uk/TA118)

▶ Bevacizumab (first-line), sorafenib (first and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178

Bevacizumab, sorafenib, and temsirolimus are **not** recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma. Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.

[www.nice.org.uk/TA178](http://www.nice.org.uk/TA178)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (April 2012) that bevacizumab (*Avastin*<sup>®</sup>) is **not** recommended for use within NHS Scotland for the first line treatment of patients with metastatic breast cancer in whom treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate.

The *Scottish Medicines Consortium* has advised (August 2015) that bevacizumab (*Avastin*<sup>®</sup>) is accepted for restricted use within NHS Scotland in combination with paclitaxel for the treatment of adult patients with platinum-resistant recurrent epithelial ovarian, fallopian

tube, or primary peritoneal cancer who received no more than two prior chemotherapy regimens and who have not received prior therapy with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

The *Scottish Medicines Consortium* has advised (October 2015) that bevacizumab (*Avastin*®) is accepted for restricted use within NHS Scotland in combination with carboplatin and paclitaxel for the first-line treatment of advanced FIGO stage IV epithelial ovarian, fallopian tube, or primary peritoneal cancer.

#### • **INDICATIONS AND DOSE**

##### **Relapsed or refractory Philadelphia chromosome-negative acute lymphoblastic leukaemia**

###### ▶ **BY CONTINUOUS INTRAVENOUS INFUSION**

• **Adult** (body-weight 45 kg and above): Initially 9 micrograms/24 hours on days 1–7 of first cycle, followed by 28 micrograms/24 hours on days 8–28, first cycle is followed by a 2 week treatment-free interval, then 28 micrograms/24 hours for days 1–28 of second and subsequent cycles—patients who achieve complete remission after 2 treatment cycles may receive up to 3 additional cycles of consolidation treatment, for dose adjustments due to side-effects and infusion-related reactions or patients with high tumour burden—consult product literature

#### • **CAUTIONS** Aphasia · brain injuries (severe) · cerebellar disease · dementia · elderly—limited information available · epilepsy · paresis · Parkinson's disease · patients may need pre-medication to minimise adverse reactions · psychosis · seizure · severe hepatic impairment · severe renal impairment · stroke

#### • **CAUTIONS, FURTHER INFORMATION**

▶ **Pre-medication** Manufacturer advises pre-medication with intravenous dexamethasone and an anti-pyretic—consult product literature.  
▶ **Neurological events** There is potentially a higher risk of neurological events in patients with clinically relevant CNS pathology—manufacturer advises caution.

#### • **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### • **SIDE-EFFECTS**

▶ **Common or very common** Anaemia · aphasia · arthralgia · chills · cognitive disorder · confusion · constipation · convulsion · cough · cytokine release syndrome · decreased appetite · diarrhoea · disorientation · dizziness · electrolyte disturbances · encephalopathy · fatigue · headache · hypoalbuminemia · hypotension · infusion-related reactions · insomnia · leucocytosis · leucopenia · lymphopenia · memory impairment · nausea · neutropenia · oedema · pain (including abdominal, bone and back) · paraesthesia · peripheral oedema · pneumonia · pyrexia · rash · sepsis · tachycardia · thrombocytopenia · tremor · tumour lysis syndrome · vomiting  
▶ **Uncommon** Pancreatitis

▶ **Frequency not known** Bone marrow suppression · leukoencephalopathy (including progressive multifocal leukoencephalopathy)

#### **SIDE-EFFECTS, FURTHER INFORMATION**

▶ **Pancreatitis** Life-threatening or fatal cases of pancreatitis have been reported; manufacturer advises monitor for signs and symptoms of pancreatitis during treatment—temporary interruption or discontinuation may be required (consult product literature).  
▶ **Cytokine release syndrome, infusion-reactions and tumour lysis syndrome** Life-threatening (including fatal) cases of cytokine release syndrome and tumour lysis syndrome have been reported in patients taking blinatumomab. Manufacturer advises monitor signs and symptoms of cytokine release syndrome and infusion reactions during treatment; temporary interruption or discontinuation may be required—consult product literature.

• **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for at least 48 hours after treatment in women of child-bearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

• **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available; if exposed during pregnancy, monitor infant for B-cell depletion. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

• **BREAST FEEDING** Manufacturer advises avoid during and for at least 48 hours after treatment—no information available.

• **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

• **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

• **MONITORING REQUIREMENTS** Manufacturer advises neurological examination prior to the initiation of treatment and continued monitoring during treatment—consult product literature.

• **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after reconstitution and dilution.

#### • **PATIENT AND CARER ADVICE**

A patient alert card should be provided.

Educational materials should be provided to patients, carers and healthcare professionals to ensure blinatumomab is used in a safe and effective way, and to prevent the risk of medication errors and neurological events—consult product information.

#### **Driving and skilled tasks**

Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of confusion, disorientation, co-ordination and balance disorders, seizures and disturbances in consciousness.

#### • **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

##### **Powder for solution for infusion**

###### ▶ **Blinicyto** (Amgen Ltd) ▼

**Blinatumomab 38.5 microgram** Blinicyto 38.5 micrograms powder for concentrate and solution for solution for infusion vials | 1 vial [PoM] £2,017.00

## Brentuximab vedotin

### • INDICATIONS AND DOSE

**Treatment of relapsed or refractory CD-30 positive Hodgkin's disease following autologous stem cell transplant or following at least two prior therapies, when autologous stem cell transplant or multi-agent chemotherapy is not a treatment option | Relapsed or refractory systemic anaplastic large cell lymphoma**

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

• **CAUTIONS** Elevated BMI—risk of hyperglycaemia · high tumour burden—risk of tumour lysis syndrome · rapidly proliferating tumours—risk of tumour lysis syndrome

• **INTERACTIONS** → Appendix 1: monoclonal antibodies

### • SIDE-EFFECTS

► **Common or very common** Anaphylaxis · arthralgia · back pain · constipation · cough · demyelinating polyneuropathy · diarrhoea · dizziness · dyspnoea · fatigue · hyperglycaemia · infusion-related reactions · myalgia · peripheral neuropathy · pruritus · rash

► **Uncommon** Stevens-Johnson syndrome

► **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · progressive multifocal leucoencephalopathy · thromboembolism · tumour lysis syndrome · vomiting

• **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for 6 months after treatment in men and women.

• **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).

• **BREAST FEEDING** Avoid—no information available.

### • MONITORING REQUIREMENTS

► Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or behavioural signs or symptoms).

► Monitor for new or worsening abdominal pain—investigate and withhold treatment if acute pancreatitis suspected and discontinue if confirmed (fatal cases reported).

► Monitor for pulmonary toxicity—treat symptoms promptly.

► Routinely monitor hepatic function.

► Monitor for infusion-related (including anaphylactic) reactions.

► Monitor for signs of peripheral neuropathy—consult product literature for treatment adjustment.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for infusion**

ELECTROLYTES: May contain Sodium

► **Adcetris** (Takeda UK Ltd) ▼

**Brentuximab vedotin 50 mg** Adcetris 50mg powder for concentrate for solution for infusion vials | 1 vial [Pom] £2,500.00

## Catumaxomab

### • INDICATIONS AND DOSE

**Treatment of malignant ascites in patients with epithelial cell adhesion molecule (EpCAM) positive carcinomas, where standard therapy is not available or no longer feasible**

► BY INTRAPERITONEAL INFUSION

► Adult: (consult product literature)

• **CAUTIONS** Haemodynamic insufficiency · hypoproteinaemia · oedema

• **INTERACTIONS** → Appendix 1: monoclonal antibodies

### • SIDE-EFFECTS

► **Common or very common** Abdominal pain · anorexia · anxiety · arthralgia · cholangitis · constipation · cough · dehydration · diarrhoea · dizziness · dyspepsia · dyspnoea · electrolyte disturbances · flatulence · flushing · haematuria · headache · hyperglycaemia · hypertension · hypotension · hypoxia · ileus · infection · insomnia · leucocyturia · myalgia · pleural effusion · proteinuria · rash · skin reactions · sweating · tachycardia · vertigo

► **Uncommon** Acute renal failure · gastro-intestinal haemorrhage · intestinal obstruction · seizures

► **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · infusion related side-effects · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

► Infusion-related side-effects Infusion-related side-effects have been reported with catumaxomab; premedication with analgesics, antipyretics, or NSAIDs is recommended by the manufacturer.

• **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

• **PREGNANCY** Avoid—limited information available.

• **BREAST FEEDING** Avoid—limited information available.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Solution for infusion**

► **Removab** (Neovii Biotech GmbH)

**Catumaxomab 100 microgram per 1 ml** Removab

50micrograms/0.5ml concentrate for solution for infusion pre-filled syringes | 1 pre-filled disposable injection [Pom] £2,500.00 (Hospital only)

Removab 10micrograms/0.1ml concentrate for solution for infusion pre-filled syringes | 1 pre-filled disposable injection [Pom] £510.00 (Hospital only)

## Cetuximab

### • INDICATIONS AND DOSE

**Treatment of wild-type RAS metastatic colorectal cancer in patients with tumours expressing epidermal growth factor receptor, as combination therapy, or as monotherapy if oxaliplatin- and irinotecan-based therapy has failed or if irinotecan is not tolerated |**

**Treatment of locally advanced squamous cell cancer of the head and neck (in combination with radiotherapy) |**

**Treatment of recurrent or metastatic squamous cell cancer of the head and neck (in combination with platinum-based chemotherapy)**

► BY INTRAVENOUS INFUSION

► Adult (initiated by a specialist): (consult product literature or local protocols)

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative

keratitis is diagnosed.

Patients must receive an antihistamine and a corticosteroid at least one hour before infusion. Resuscitation facilities should be available and treatment should be initiated by a specialist.

● **CONTRA-INDICATIONS** Combination of cetuximab with oxaliplatin-containing chemotherapy is contra-indicated in patients with metastatic colorectal cancer who have mutant or unknown *RAS* status. *RAS* mutated colorectal tumours (or if *RAS* tumour status unknown)

● **CAUTIONS** Cardiopulmonary disease · cardiovascular disease · history of keratitis · pulmonary disease—discontinue if interstitial lung disease · risk factors for keratitis · severe dry eye · ulcerative keratitis (including contact lens use)

● **INTERACTIONS** → Appendix 1: monoclonal antibodies

● **SIDE-EFFECTS**

► **Common or very common** Acne · aseptic meningitis · blepharitis · bronchospasm · chills · conjunctivitis · desquamation · diarrhoea · dizziness · dry skin · dyspnoea · fever · headache · hypertension · hypertrichosis · hypocalcaemia · hypomagnesaemia · hypotension · infusion-related reactions · keratitis · nail disorders · nausea · pruritus · rash · severe (sometimes fatal) hypersensitivity reactions (possibly delayed onset) · shock · skin reactions · urticaria · vomiting

► **Very rare** Stevens-Johnson syndrome · toxic epidermal necrolysis

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825

● **PREGNANCY** Use only if potential benefit outweighs risk—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **BREAST FEEDING** Avoid breast-feeding during and for 2 months after treatment—no information available.

● **PRE-TREATMENT SCREENING** Evidence of non-mutated (wild-type) *RAS* status (at exons 2, 3 and 4 of *KRAS* and *NRAS*) is required before cetuximab is initiated for the treatment of metastatic colorectal cancer, and should be determined by an experienced laboratory using a validated test method.

● **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available.

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

► **Cetuximab for the treatment of locally advanced squamous cell cancer of the head and neck (June 2008)** NICE TA145  
Cetuximab in combination with radiotherapy is an option for the treatment of locally advanced squamous cell cancer of the head and neck in patients who have a Karnofsky performance status of 90% or greater and when all forms of platinum-based chemoradiotherapy treatment are contra-indicated.

[www.nice.org.uk/TA145](http://www.nice.org.uk/TA145)

► **Cetuximab for the treatment of recurrent or metastatic squamous cell cancer of the head and neck (June 2009)** NICE TA172

Cetuximab in combination with platinum-based chemotherapy is **not** recommended for the treatment of recurrent or metastatic squamous cell cancer of the head and neck.

[www.nice.org.uk/TA172](http://www.nice.org.uk/TA172)

► **Cetuximab for the first-line treatment of metastatic colorectal cancer (August 2009)** NICE TA176

Cetuximab in combination with fluorouracil, folinic acid and oxaliplatin is an option for the first-line treatment of metastatic colorectal cancer under the following circumstances:

- the primary tumour has been resected or is potentially operable;
- the metastatic disease is confined to the liver and is unresectable; and
- the patient is fit to undergo surgery to resect the primary colorectal tumour and to undergo liver surgery if the metastases become resectable after treatment with cetuximab.

In patients unable to tolerate oxaliplatin, or in whom oxaliplatin is contra-indicated, cetuximab in combination with fluorouracil, folinic acid and irinotecan can be used as an alternative.

In addition, the manufacturer is required to rebate 16% of the amount of cetuximab used per patient when used in combination with fluorouracil, folinic acid, and oxaliplatin.

Patients who meet the above criteria should receive cetuximab for no more than 16 weeks. At 16 weeks, cetuximab should be stopped and the patient should be assessed for resection of liver metastases.

[www.nice.org.uk/TA176](http://www.nice.org.uk/TA176)

► **Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012)** NICE TA242

Cetuximab monotherapy or combination chemotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.

[www.nice.org.uk/TA242](http://www.nice.org.uk/TA242)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (December 2014) that cetuximab (*Erbix*®) is accepted for restricted use within NHS Scotland, in combination with irinotecan or oxaliplatin-based chemotherapy, for the treatment of *RAS* wild-type metastatic colorectal cancer in patients who have not previously received chemotherapy for their metastatic disease (first-line treatment).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

► **Erbix** (Merck Serono Ltd)

**Cetuximab 5 mg per 1 ml** Erbix 100mg/20ml solution for infusion vials | 1 vial [PoM] £178.10 (Hospital only)

Erbix 500mg/100ml solution for infusion vials | 1 vial [PoM] £890.50 (Hospital only)

## Daratumumab

12-Apr-2017

● **DRUG ACTION** Daratumumab is a monoclonal antibody that binds to CD38, a cell-surface protein, resulting in tumour cell death by immune-mediated actions and apoptosis.

● **INDICATIONS AND DOSE**

**Treatment of relapsed and refractory multiple myeloma (as monotherapy after failure of a proteasome inhibitor and an immunomodulatory agent) (specialist use only)**

► **BY INTRAVENOUS INFUSION**

► **Adult:** 16 mg/kg once weekly for weeks 1 to 8, then 16 mg/kg every 2 weeks for weeks 9 to 24, then 16 mg/kg every 4 weeks for week 25 onwards until disease progression, for dose adjustments due to side-effects and infusion-related reactions—consult product literature

● **CAUTIONS** History of obstructive pulmonary disorder (consider additional post-medication—consult product literature); patients may need pre-medication to minimise adverse reactions; risk of herpes zoster reactivation (consider antiviral prophylaxis)

## CAUTIONS, FURTHER INFORMATION

- **Infusion-related reactions** Serious infusion-related reactions can occur and daratumumab should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises pre-medication with intravenous corticosteroid, an antihistamine and an anti-pyretic and post-medication with oral corticosteroids—consult product literature. Manufacturer advises patients should be closely monitored for signs of infusion-related reactions during and after administration; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

• **SIDE-EFFECTS**

- **Common or very common** Anaemia · arthralgia · back pain · chills · constipation · cough · decreased appetite · diarrhoea · dyspnoea · fatigue · headache · hypertension · infusion-related reactions · lymphopenia · musculoskeletal chest pain · nasal congestion · nausea · neutropenia · pain in extremity · pyrexia · thrombocytopenia · vomiting

- **Frequency not known** Haemolysis

## SIDE-EFFECTS, FURTHER INFORMATION

- **Infusion-related reactions** Manufacturer advises treatment should be immediately interrupted if an infusion-related reaction of any grade or severity occurs—consult product literature for specific management recommendations.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for 3 months after stopping treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **EFFECT ON LABORATORY TESTS** Possible positive indirect Coombs test (may affect antibody screening).
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage advice following dilution.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) Decisions**  
The Scottish Medicines Consortium has advised (January 2017) that daratumumab (*Darzalex*®) is **not** recommended for use within NHS Scotland as monotherapy for the treatment of adult patients with relapsed and refractory multiple myeloma, whose prior therapy included a proteasome inhibitor and an immunomodulatory agent and who have demonstrated disease progression on the last therapy, as insufficient clinical analysis was submitted and the economic case was not demonstrated. This advice takes account of the views from a Patient and Clinician Engagement (PACE) meeting.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

EXCIPIENTS: May contain Polysorbates

ELECTROLYTES: May contain Sodium

- **Darzalex** (Janssen-Cilag Ltd)

**Daratumumab 20mg per 1ml** Darzalex 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £360.00  
Darzalex 400mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1440.00

## Elotuzumab

07-Apr-2017

- **DRUG ACTION** Elotuzumab is a monoclonal antibody that targets the signalling lymphocytic activation molecule family member 7 (SLAMF7) protein, thereby activating natural killer cells and mediating myeloma cell death.

• **INDICATIONS AND DOSE**

**Multiple myeloma in patients who have received at least one prior therapy (in combination with lenalidomide and dexamethasone) (specialist use only)**

- **BY INTRAVENOUS INFUSION**

► **Adult:** 10 mg/kg every week, on days 1, 8, 15 and 22 of cycles 1 and 2, then 10 mg/kg every 2 weeks, on days 1 and 15 of subsequent cycles

- **CAUTIONS** Pre-medication must be administered to minimise the development of infusion-related reactions—consult product literature · secondary primary malignancies

## CAUTIONS, FURTHER INFORMATION

- **Secondary primary malignancies** Manufacturer advises to monitor for the development of secondary primary malignancy before and during treatment with elotuzumab.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

• **SIDE-EFFECTS**

- **Common or very common** Chest pain · cough · deep vein thrombosis · diarrhoea · fatigue · headache · herpes zoster · hypoaesthesia · infusion-related reactions · lymphopenia · mood changes · nasopharyngitis · night sweats · oropharyngeal pain · pneumonia · pyrexia · upper respiratory tract infection · weight loss

## SIDE-EFFECTS, FURTHER INFORMATION

Side-effects reported when used in combination with lenalidomide and dexamethasone.

- **Infusion-related reactions** Manufacturer advises for mild-to-moderate infusion reactions interrupt treatment or reduce infusion rate, and monitor closely (consult product literature); permanently discontinue therapy in severe infusion reactions.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of childbearing potential; male patients should continue effective contraceptive measures for 180 days after stopping treatment if their partner is pregnant or of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of the infusion.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

EXCIPIENTS: May contain Polysorbates, sucrose

- **Emplliciti** (Bristol-Myers Squibb Pharmaceuticals Ltd) ▼

**Elotuzumab 300 mg** Emplliciti 300mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £1,085.00

**Elotuzumab 400 mg** Emplliciti 400mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £1,446.00

## Ipilimumab

- **DRUG ACTION** Ipilimumab causes T-cell activation.

### ● INDICATIONS AND DOSE

#### Treatment of unresectable or metastatic advanced melanoma

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

### ● CAUTIONS

#### CAUTIONS, FURTHER INFORMATION

For full details consult product literature.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS** Infusion-related side-effects

#### SIDE-EFFECTS, FURTHER INFORMATION

For further information on side-effects, (including monitoring and management of side effects) consult product literature.

- ▶ Immune-related reactions A corticosteroid can be used after starting ipilimumab, to treat immune-related reactions.

- **CONCEPTION AND CONTRACEPTION** Use effective contraception.

- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).

- **BREAST FEEDING** Discontinue breast-feeding—no information available.

- **HEPATIC IMPAIRMENT** Use with caution if plasma-bilirubin concentration greater than 3 times upper limit of normal range or if plasma-transaminase concentration 5 times or greater than the upper limit of normal range.

- **MONITORING REQUIREMENTS** For information on monitoring of side effects, consult product literature.

- **PRESCRIBING AND DISPENSING INFORMATION** Infusion-related side-effects have been reported; premedication with paracetamol and an antihistamine is recommended.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ **Ipilimumab for previously untreated advanced (unresectable or metastatic) melanoma (July 2014) NICE TA319**

Ipilimumab is recommended, within its marketing authorisation, as an option for treating adults with previously untreated advanced (unresectable or metastatic) melanoma, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA319](http://www.nice.org.uk/TA319)

- ▶ **Ipilimumab for previously treated advanced (unresectable or metastatic) melanoma (December 2012) NICE TA268**

Ipilimumab is recommended as an option for the treatment of advanced (unresectable or metastatic) melanoma in patients who have received prior therapy, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA268](http://www.nice.org.uk/TA268)

- ▶ **Nivolumab in combination with ipilimumab for treating advanced melanoma (July 2016) NICE TA400**

Nivolumab in combination with ipilimumab is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA400](http://www.nice.org.uk/TA400)

#### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (March 2013) that ipilimumab (Yervoy®) is accepted for restricted use within NHS Scotland for the treatment of advanced (unresectable or metastatic) melanoma in adults who have received prior therapy, only whilst ipilimumab is available at the price agreed in the patient access scheme.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Yervoy** (Bristol-Myers Squibb Pharmaceuticals Ltd) ▼

**Ipilimumab 5 mg per 1 ml** Yervoy 50mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £3,750.00 (Hospital only)  
Yervoy 200mg/40ml concentrate for solution for infusion vials | 1 vial [PoM] £15,000.00 (Hospital only)

## Necitumumab

21-Feb-2017

- **DRUG ACTION** Necitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

### ● INDICATIONS AND DOSE

**Locally advanced or metastatic epidermal growth factor receptor expressing squamous non-small-cell lung cancer, in patients who have not received previous chemotherapy (in combination with gemcitabine and cisplatin) (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 800 mg once daily on days 1 and 8 of a 3-week cycle, for up to 6 cycles, patients whose disease has not progressed after combination therapy may continue with necitumumab monotherapy, for dose adjustments due to infusion-related reactions or skin reactions—consult product literature

- **CAUTIONS** Cardiorespiratory disorders (no information available) • history of thromboembolic events • patients may need pre-medication to minimise the development of infusion-related and skin reactions (consult product literature) • risk factors for thromboembolic events

#### CAUTIONS, FURTHER INFORMATION

- ▶ Thromboembolic events Manufacturer advises that necitumumab should not be administered to patients with multiple risk factors for thromboembolic events unless the benefits outweigh the risks. Thromboprophylaxis should be considered after assessment of a patient's risk factors.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

### ● SIDE-EFFECTS

- ▶ **Common or very common** Conjunctivitis • dysphagia • dysuria • electrolyte disturbances • epistaxis • haemoptysis • headache • hypomagnesaemia (severe) • infusion-related reactions • mouth ulceration • muscle spasms • oropharyngeal pain • phlebitis • pyrexia • skin reactions • stomatitis • taste disturbance • thromboembolic events • urinary tract infection • vomiting • weight loss

- ▶ **Frequency not known** Cardiorespiratory arrest • eyelash growth

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective contraception during and for 3 months after treatment.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—limited information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

### ● BREAST FEEDING

Manufacturer advises avoid during treatment and for at least 4 months after the last dose—no information available.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor patients during and following each infusion for signs of hypersensitivity and infusion-related reactions; monitor electrolytes (including magnesium, potassium and calcium) prior to each infusion and after completion of treatment, until within normal limits—correct any electrolyte disturbance promptly.

• **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises necitumumab should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities and resources for the treatment of infusion-related reactions are immediately available.

• **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C); consult product literature for storage conditions after preparation of the infusion.

• **PATIENT AND CARER ADVICE** Manufacturer advises patients and their carers should be made aware of the symptoms of thromboembolism and advised to seek medical attention if they experience sudden breathlessness, chest pain, or swelling of a limb.

#### • NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

► Necitumumab for untreated advanced or metastatic squamous non-small-cell lung cancer (September 2016) NICE TA411

Necitumumab, in combination with gemcitabine and cisplatin, is **not** recommended within its marketing authorisation for adults with locally advanced or metastatic epidermal growth factor receptor (EGFR)-expressing squamous non-small-cell lung cancer that has not been treated with chemotherapy.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA411](http://www.nice.org.uk/TA411)

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

ELECTROLYTES: May contain Sodium

► **Portrazza** (Eli Lilly and Company Ltd) ▼

**Necitumumab 16 mg per 1 ml** Portrazza 800mg/50ml concentrate for solution for infusion vials | 1 vial **[PoM]** £1,450.00 (Hospital only)

## Nivolumab

23-Mar-2017

• **DRUG ACTION** Nivolumab is a human immunoglobulin G4 monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor thereby potentiating an immune response to tumour cells.

#### • INDICATIONS AND DOSE

**Treatment of unresectable or metastatic advanced melanoma in combination with ipilimumab**

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

**Treatment of unresectable or metastatic advanced melanoma (as monotherapy) | Treatment of locally advanced or metastatic non-small cell lung cancer after prior chemotherapy | Treatment of advanced renal cell carcinoma after prior therapy (as monotherapy)**

► BY INTRAVENOUS INFUSION

► Adult: 3 mg/kg every 2 weeks, consult product literature for information on dose adjustments based on individual patient safety and tolerability

• **CAUTIONS** Patients may need pre-medication to minimise the development of infusion-related reactions

• **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### • SIDE-EFFECTS

► **Common or very common** Abdominal pain · alopecia · arthralgia · blurred vision · colitis · constipation · cough · decreased appetite · diarrhoea · dizziness · dry eyes · dry mouth · dry skin · dyspnoea · erythema · headache · hyperglycaemia · hypertension · infusion-related reactions

· malaise · musculoskeletal pain · nausea · oedema · peripheral neuropathy · pneumonitis · pruritus · pyrexia · rash · stomatitis · thyroid disorders · upper respiratory tract infection · vitiligo · vomiting

► **Uncommon** Adrenal insufficiency · anaphylactic reaction · arthritis · chest pain · dehydration · diabetic ketoacidosis · eosinophilia · erythema multiforme · hepatitis · hyperbilirubinaemia · hypophysitis · hypopituitarism · metabolic acidosis · pancreatitis · pleural effusion · polymyalgia rheumatica · polyneuropathy · psoriasis · renal failure · rosacea · tachycardia · tubulointerstitial nephritis · urticaria · uveitis · vasculitis

► **Rare** Arrhythmias · autoimmune neuropathy · cholestasis · demyelination · diabetes mellitus · duodenal ulcer · gastritis · Guillain-Barré syndrome · histiocytic necrotising lymphadenitis (Kikuchi lymphadenitis) · lung infiltration · myasthenic syndrome · myopathy · toxic epidermal necrolysis

► **Frequency not known** Cardiac adverse events

#### SIDE-EFFECTS, FURTHER INFORMATION

Side effects listed are reported when nivolumab is used as monotherapy; if combination therapy used, consult product literature for further information.

► **Immune-related reactions** Manufacturer advises that most immune-related adverse reactions improved or resolved with appropriate management, including initiation of corticosteroids and treatment modifications—consult product literature for further information.

► **Infusion-related reactions** Manufacturer advises that patients with mild or moderate infusion reactions may continue treatment with close monitoring and use of pre-medication according to local guidelines; discontinue treatment if severe infusion reactions occur.

• **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for at least 5 months after treatment in women of childbearing potential.

• **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies.

• **BREAST FEEDING** Manufacturer advises avoid—no information available.

• **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in moderate to severe impairment—limited information available.

• **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions, cardiac and pulmonary reactions, and electrolyte disturbances before and periodically during treatment. Patients should be monitored for adverse reactions for at least 5 months after the last dose.

• **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for *intermittent intravenous infusion*, give undiluted or dilute to a concentration of not less than 1 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 60 minutes through an in-line filter (pore size 0.2–1.2 micron).

• **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage conditions after preparation of the infusion.

• **PATIENT AND CARER ADVICE** Patients should be provided with a patient alert card with each prescription.

#### • NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

► Nivolumab for treating advanced (unresectable or metastatic) melanoma (February 2016) NICE TA384

Nivolumab as monotherapy is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults.

[www.nice.org.uk/TA384](http://www.nice.org.uk/TA384)

- ▶ **Nivolumab in combination with ipilimumab for treating advanced melanoma (July 2016)** NICE TA400  
Nivolumab in combination with ipilimumab is recommended, within its marketing authorisation, as a treatment option for advanced (unresectable or metastatic) melanoma in adults, only if the manufacturer provides ipilimumab with the discount agreed in the patient access scheme.  
[www.nice.org.uk/TA400](http://www.nice.org.uk/TA400)
- ▶ **Nivolumab for previously treated advanced renal cell carcinoma (November 2016)** NICE TA417  
Nivolumab is recommended, within its marketing authorisation, as a treatment option for previously treated advanced renal cell carcinoma in adults, only if the manufacturer provides nivolumab with the discount agreed in the patient access scheme.  
[www.nice.org.uk/TA417](http://www.nice.org.uk/TA417)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2016) that nivolumab (*Opdivo*®) is accepted for use within NHS Scotland for the treatment of locally advanced or metastatic squamous non-small cell lung cancer after prior chemotherapy in adults; it has also advised (August 2016) that nivolumab (*Opdivo*®) is accepted for restricted use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab and (October 2016) for restricted use for the treatment of locally advanced or metastatic non-squamous non-small cell lung cancer after prior chemotherapy in adults, subject to a 2-year clinical stopping rule. It has also advised (November 2016) that nivolumab (*Opdivo*®) is accepted for restricted use within NHS Scotland in combination with ipilimumab for the first-line treatment of advanced (unresectable or metastatic) melanoma in adults. This advice is contingent upon the continuing availability of the Patient Access Scheme (PAS) in NHS Scotland or a list price that is equivalent or lower.  
The *Scottish Medicines Consortium* has advised (November 2016) that nivolumab (*Opdivo*®) is **not** recommended within NHS Scotland as monotherapy for the treatment of advanced renal cell carcinoma after prior therapy in adults as the economic case was not demonstrated.

## Obinutuzumab

21-Apr-2017

#### ● INDICATIONS AND DOSE

**Treatment of previously untreated chronic lymphocytic leukaemia in patients for whom full-dose fludarabine-based therapy is unsuitable due to co-morbidities**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** For obinutuzumab contra-indications, consult product literature.

#### ● CAUTIONS

##### CAUTIONS, FURTHER INFORMATION

For full details on the cautions of obinutuzumab, consult product literature.

- ▶ Hepatitis B infection and reactivation Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **obinutuzumab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS** For full side effect details for obinutuzumab (including monitoring and management), consult product literature.

- **CONCEPTION AND CONTRACEPTION** Use effective contraception during and for 18 months after treatment.

- **PREGNANCY** Avoid unless potential benefit outweighs risk of B-lymphocyte depletion in fetus.

- **BREAST FEEDING** Avoid breast-feeding during and for 18 months after treatment—present in milk in *animal* studies.

- **MONITORING REQUIREMENTS** Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

- **PRESCRIBING AND DISPENSING INFORMATION** Infusion related side-effects have been reported; Patients should receive premedication with paracetamol, an antihistamine, and a corticosteroid before each dose—consult product literature for details.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015)** NICE TA343

Obinutuzumab, in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:

- bendamustine-based therapy is not suitable **and**
- the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.

Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA343](http://www.nice.org.uk/TA343)

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2017) that obinutuzumab (*Gazyvaro*®) is accepted for use within NHS Scotland in combination with bendamustine followed by obinutuzumab maintenance for the treatment of patients with follicular lymphoma who did not respond or who progressed during or up to six months after treatment with rituximab or a rituximab-containing regimen. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

- ▶ **Gazyvaro** (Roche Products Ltd) ▼

**Obinutuzumab 25 mg per 1 ml** Gazyvaro 1000mg/40ml concentrate for solution for infusion vials | 1 vial [PoM] £3,312.00 (Hospital only)

## Ofatumumab

### ● INDICATIONS AND DOSE

**Treatment of chronic lymphocytic leukaemia (CLL) in patients refractory to fludarabine and alemtuzumab | Treatment of CLL in patients who have not received prior therapy and who are not eligible for fludarabine based therapy (in combination with chlorambucil or bendamustine)**

#### ► BY INTRAVENOUS INFUSION

► **Adult:** Premedication must be given 30 minutes to 2 hours before each dose—consult product literature for details

- **CONTRA-INDICATIONS** For full details on the contra-indications for ofatumumab, consult product literature.
- **CAUTIONS** History of cardiac disease—monitor closely and discontinue treatment if cardiac arrhythmias occur
- CAUTIONS, FURTHER INFORMATION**  
For full details about the cautions for ofatumumab, consult product literature
- **Hepatitis B infection and reactivation** Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **ofatumumab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

### ● SIDE-EFFECTS

#### SIDE-EFFECTS, FURTHER INFORMATION

Infusion-related side-effects (including cytokine release syndrome) have been reported with ofatumumab; premedication with paracetamol, an antihistamine, and a corticosteroid must be given—consult product literature.

For full details (including monitoring and management of side-effects) consult product literature.

- **CONCEPTION AND CONTRACEPTION** Use effective contraception during and for 12 months after treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Discontinue breast-feeding during and for 12 months after treatment—no information available.
- **RENAL IMPAIRMENT** No information available for creatinine clearance less than 30 mL/minute.
- **MONITORING REQUIREMENTS**
  - Monitor electrolytes (including potassium and magnesium) before and during administration and correct if abnormal.
  - Patients must be monitored closely during each infusion for the onset of infusion reactions.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**
  - Ofatumumab for the treatment of chronic lymphocytic leukaemia refractory to fludarabine and alemtuzumab (October 2010) NICE TA202

Ofatumumab is **not** recommended for the treatment of chronic lymphocytic leukaemia that is refractory to fludarabine and alemtuzumab.

Patients currently receiving ofatumumab for this condition should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA202](http://www.nice.org.uk/TA202)

- Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia (June 2015) NICE TA344

Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if:

- the person is ineligible for fludarabine-based therapy **and**
  - bendamustine is not suitable **and**
  - the manufacturer provides ofatumumab with the discount agreed in the patient access scheme.
- Patients currently receiving ofatumumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA344](http://www.nice.org.uk/TA344)

### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2015) that ofatumumab (*Arzerra*®) is accepted for restricted use within NHS Scotland for the treatment of chronic lymphocytic leukaemia in patients who have not received prior therapy and who are not eligible for fludarabine-based therapy. It is restricted to use in patients who would not be considered for bendamustine therapy and who would receive chlorambucil-based therapy.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

ELECTROLYTES: May contain Sodium

#### ► *Arzerra* (Novartis Pharmaceuticals UK Ltd)

**Ofatumumab 20 mg per 1 mL** *Arzerra* 100mg/5mL concentrate for solution for infusion vials | 3 vial [PoM] £546.00 (Hospital only)  
*Arzerra* 1000mg/50mL concentrate for solution for infusion vials | 1 vial [PoM] £1,820.00 (Hospital only)

## Panitumumab

- **DRUG ACTION** Panitumumab is a monoclonal antibody that binds to the epidermal growth factor receptor (EGFR).

### ● INDICATIONS AND DOSE

**Treatment of non-mutated RAS metastatic colorectal cancer (combination therapy) | Treatment of non-mutated RAS metastatic colorectal cancer (monotherapy after failure of fluoropyrimidine-, oxaliplatin-, and irinotecan-containing chemotherapy regimens)**

#### ► BY INTRAVENOUS INFUSION

► **Adult:** (consult product literature)

### IMPORTANT SAFETY INFORMATION

#### MHRA/CHM ADVICE: SEVERE SKIN REACTIONS

Severe skin reactions have been reported very commonly in patients treated with panitumumab. Patients receiving panitumumab who have severe skin reactions or develop worsening skin reactions should be monitored for the development of inflammatory or infectious sequelae (including cellulitis, sepsis, and necrotising fasciitis). Appropriate treatment should be promptly initiated and panitumumab withheld or discontinued.

#### MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and

symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

- **CONTRA-INDICATIONS** Interstitial pulmonary disease - the combination of panitumumab with oxaliplatin-containing chemotherapy is contra-indicated in patients with mutant RAS metastatic colorectal cancer or for whom RAS status is unknown
- **CAUTIONS** History of keratitis · history of severe dry eye · history of ulcerative keratitis · pulmonary disease—discontinue if interstitial lung disease develops · risk factors for keratitis · risk factors for severe dry eye · risk factors for ulcerative keratitis (including contact lens use)
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anorexia · anxiety · back pain · biochemical disturbances · cellulitis · cheilitis · chills · cough · deep vein thrombosis · dyspepsia · dyspnoea · electrolyte disturbances · epistaxis · eyelash growth · flushing · folliculitis · gastro-oesophageal reflux disease · hyperhidrosis · insomnia · malaise · pain in extremities · peripheral oedema · pulmonary embolism · pyrexia · rectal haemorrhage · severe hypersensitivity reactions (possibly delayed) · urinary tract infection · weight loss
  - ▶ **Uncommon** Bronchospasm · cyanosis · hirsutism · infusion-related reactions · nasal dryness
  - ▶ **Rare** Keratitis · skin necrosis · Stevens-Johnson syndrome · toxic epidermal necrolysis
  - ▶ **Frequency not known** Abdominal pain · acne · alopecia · bone-marrow suppression · conjunctivitis · constipation · dehydration · diarrhoea · dizziness · dry eyes · dry mouth · dry skin · erythema · extravasation · hand-foot syndrome · headache · hypertension · hypertrichosis · hyperuricaemia · hypocalcaemia · hypomagnesaemia · hypotension · increased lacrimation · interstitial lung disease · mucosal inflammation · nail disorders · nausea · ocular disorders · ocular hyperaemia · oral mucositis · pruritus · rash · skin reactions · tachycardia · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 6 months after treatment.
- **PREGNANCY** Avoid (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding during and for 2 months after treatment.
- **PRE-TREATMENT SCREENING** Evidence of non-mutated RAS status (at exons 2, 3 and 4 of KRAS and NRAS) is required before panitumumab treatment is initiated, and should be determined by an experienced laboratory using a validated test method.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for hypomagnesaemia.
  - ▶ Monitor for hypocalcaemia.
  - ▶ Monitor for dermatological reactions including Stevens-Johnson syndrome and toxic epidermal necrolysis (consult product literature).
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**
  - ▶ Cetuximab, bevacizumab and panitumumab for the treatment of metastatic colorectal cancer after first-line chemotherapy (January 2012) NICE TA242  
Panitumumab monotherapy is **not** recommended for the treatment of patients with metastatic colorectal cancer that has progressed after first-line chemotherapy.  
[www.nice.org.uk/TA242](http://www.nice.org.uk/TA242)

## • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

ELECTROLYTES: May contain Sodium

#### ▶ Vectibix (Amgen Ltd)

**Panitumumab 20 mg per 1 ml** Vectibix 400mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1,517.16 (Hospital only)  
**Vectibix 100mg/5ml** concentrate for solution for infusion vials | 1 vial [PoM] £379.29 (Hospital only)

## Pembrolizumab

01-Jun-2016

- **DRUG ACTION** Pembrolizumab is a monoclonal antibody, which binds to the programmed death-1 (PD-1) receptor, thereby potentiating an immune response to tumour cells.

### • INDICATIONS AND DOSE

#### Treatment of unresectable or metastatic advanced melanoma

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 2 mg/kg every 3 weeks

- **CAUTIONS** Patients may need pretreatment to minimise the development of adverse reactions (consult product literature)
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · alopecia · arthritis · blood dyscrasia · changes in hair colour · chills · colitis · constipation · cough · decreased appetite · depigmentation · diarrhoea · dizziness · dry eye · dry mouth · dry skin · eczema · erythema · headache · hepatitis · influenza-like symptoms · infusion-related reactions · insomnia · malaise · musculoskeletal pain · myositis · nausea · oedema · peripheral neuropathy · pneumonitis · pruritus · pyrexia · rash · shortness of breath · taste disturbances · thyroid dysfunction · vomiting
  - ▶ **Uncommon** Adrenal insufficiency · dermatitis · diabetes mellitus · electrolyte imbalance · epilepsy · hypertension · inflammation of the pituitary gland · lethargy · lichenoid keratosis · nephritis · pancreatitis · papule · psoriasis · tenosynovitis · uveitis
  - ▶ **Rare** Guillain-Barré syndrome · myasthenic syndrome · small intestinal perforation

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Immune-related reactions Most immune-related adverse reactions are reversible and managed by temporarily stopping treatment and administration of a corticosteroid—consult product literature for further information.
- ▶ Infusion-related reactions Manufacturer advises to permanently discontinue treatment in patients with severe infusion reactions.
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during treatment and for at least 4 months after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs and symptoms of infusion- and immune-related reactions.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Keytruda<sup>®</sup>), give intermittently in Sodium chloride 0.9% or Glucose 5%. Reconstitute each 50 mg vial with 2.3 mL water for injection, to produce a 25 mg/mL solution. Gently swirl without shaking to dissolve, and allow up to 5 minutes for the bubbles to clear. Withdraw the required

volume and transfer into an intravenous bag containing infusion fluid to prepare a final concentration ranging from 1–10 mg/mL; give over 30 minutes.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C.

- **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### **NICE technology appraisals (TAs)**

- ▶ **Pembrolizumab for treating advanced melanoma after disease progression with ipilimumab (October 2015)**

NICE TA357

Pembrolizumab is recommended as an option for treating advanced (unresectable or metastatic) melanoma only if:

- the disease has progressed with ipilimumab and, for BRAF V600 mutation-positive disease, a BRAF or MEK inhibitor **and**
- the manufacturer provides pembrolizumab with the discount agreed in the patient access scheme.

[www.nice.org.uk/guidance/TA357](http://www.nice.org.uk/guidance/TA357)

- ▶ **Pembrolizumab for advanced melanoma not previously treated with ipilimumab (November 2015)** NICE TA366  
Pembrolizumab is recommended as an option for treating advanced (unresectable or metastatic) melanoma that has not been previously treated with ipilimumab, only if the manufacturer provides pembrolizumab with the discount agreed in the patient access scheme.

[www.nice.org.uk/guidance/TA366](http://www.nice.org.uk/guidance/TA366)

- ▶ **Pembrolizumab for treating PD-L1-positive non-small-cell lung cancer after chemotherapy (January 2017)** NICE TA428  
Pembrolizumab is recommended as an option for treating locally advanced or metastatic PD-L1-positive non-small-cell lung cancer in adults who have had at least one chemotherapy (and targeted treatment if they have an epidermal growth factor receptor (EGFR)- or anaplastic lymphoma kinase (ALK)-positive tumour), only if:
  - pembrolizumab is stopped at 2 years of uninterrupted treatment and no documented disease progression, **and**
  - the manufacturer provides pembrolizumab with the discount agreed in the patient access scheme, which has been revised in the context of this appraisal. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they or their clinician consider it appropriate to stop

[www.nice.org.uk/guidance/TA428](http://www.nice.org.uk/guidance/TA428)

##### **Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (November 2015) that pembrolizumab (*Keytruda*®) is accepted for use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously untreated with ipilimumab. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (December 2016) that pembrolizumab (*Keytruda*®) is **not** recommended for use within NHS Scotland as monotherapy for the treatment of advanced (unresectable or metastatic) melanoma in adults previously treated with ipilimumab as the economic case was not demonstrated.

The *Scottish Medicines Consortium* has advised (January 2017) that pembrolizumab (*Keytruda*®) is accepted for restricted use within NHS Scotland for the treatment of locally advanced or metastatic non-small cell lung carcinoma (NSCLC) in adults whose tumours express programmed death ligand 1 (PD-L1) and who have received at least one prior chemotherapy regimen, subject to a two-year clinical stopping rule. The advice is

contingent upon the continuing availability of pembrolizumab at the price agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Powder for solution for infusion**

CAUTIONARY AND ADVISORY LABELS 3

- ▶ **Keytruda** (Merck Sharp & Dohme Ltd) ▼

**Pembrolizumab 50 mg** Keytruda 50mg powder for concentrate for solution for infusion vials | 1 vial (PoM) £1,315.00 (Hospital only)

## Pertuzumab

19-Apr-2017

- **DRUG ACTION** Pertuzumab is a recombinant humanised monoclonal antibody, and acts by inhibiting human epidermal growth factor receptor 2 protein (HER2) dimerisation.

#### ● INDICATIONS AND DOSE

**Treatment of HER2-positive metastatic or locally recurrent unresectable breast cancer in combination with trastuzumab and docetaxel, in patients who have not received previous anti-HER2 therapy or chemotherapy (initiated by a specialist)**

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature)

- **CAUTIONS** Conditions that could impair left ventricular function · history of congestive heart failure · impaired left ventricular function · prior anthracycline exposure · radiotherapy to the chest area · recent myocardial infarction · serious cardiac arrhythmia · uncontrolled hypertension

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · arthralgia · chills · constipation · cough · decreased appetite · diarrhoea · dizziness · dry skin · dyspepsia · dyspnoea · febrile neutropenia · headache · increased lacrimation · infusion-related reactions · insomnia · left ventricular dysfunction · leucopenia · malaise · myalgia · nail disorder · nasopharyngitis · neutropenia · oedema · pain · paronychia · peripheral neuropathy · pleural effusion · pruritus · pyrexia · rash · severe hypersensitivity reactions · taste disturbance · upper respiratory-tract infection
- ▶ **Uncommon** Interstitial lung disease
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

#### **SIDE-EFFECTS, FURTHER INFORMATION**

Side effects mostly described for pertuzumab in combination with trastuzumab and docetaxel.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for six months after treatment in women of childbearing potential.
- **PREGNANCY** Avoid (toxicity in *animal studies*). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Caution—no information available.

- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

#### ● MONITORING REQUIREMENTS

- ▶ Assess for signs and symptoms of congestive heart failure (including left ventricular ejection fraction) before and

during treatment—consult product literature, and withhold treatment if necessary.

- ▶ Monitor for febrile neutropenia.

- **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available.

- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

- ▶ **Pertuzumab for the neoadjuvant treatment of HER2-positive breast cancer (December 2016)** NICE TA424

Pertuzumab, in combination with trastuzumab and chemotherapy, is recommended, within its marketing authorisation, as an option for neoadjuvant treatment in adults with human epidermal growth factor receptor 2 (HER2)-positive, locally advanced, inflammatory or early-stage breast cancer at high risk of recurrence, only if the manufacturer provides it with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA424](http://www.nice.org.uk/TA424)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2016) that pertuzumab (*Perjeta*®) is **not** recommended for use within NHS Scotland in combination with trastuzumab and chemotherapy for the neoadjuvant treatment of patients with human epidermal growth factor receptor 2 (HER2)-positive, locally advanced, inflammatory, or early stage breast cancer at high risk of recurrence, as the economic case was not demonstrated.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

- ▶ **Perjeta** (Roche Products Ltd) ▼

Pertuzumab 30 mg per 1 ml Perjeta 420mg/14ml concentrate for solution for infusion vials | 1 vial **PoM** £2,395.00 (Hospital only)

## Ramucirumab

31-May-2016

- **DRUG ACTION** Ramucirumab is a human monoclonal antibody that binds to the vascular endothelial growth factor receptor-2 (VEGFR-2), inhibiting VEGF-induced angiogenesis.

- **INDICATIONS AND DOSE**

**Treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma, in combination with paclitaxel, in patients with disease progression after prior platinum and fluoropyrimidine chemotherapy**

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** 8 mg/kg on days 1 and 15 of a 28 day cycle, dose to be administered prior to paclitaxel infusion, consult product literature for dose adjustments due to side-effects and infusion-related reactions

**Treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma, as monotherapy, in patients with disease progression after prior platinum or fluoropyrimidine chemotherapy, and for whom treatment in combination with paclitaxel is not appropriate**

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** 8 mg/kg every 2 weeks, consult product literature for dose adjustments due to side-effects and infusion-related reactions

**Treatment of metastatic colorectal cancer, in combination with FOLFIRI (irinotecan, fluorouracil and folinic acid), in patients with disease progression on, or after, prior therapy with bevacizumab, oxaliplatin and a fluoropyrimidine**

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** 8 mg/kg every 2 weeks, dose to be administered prior to FOLFIRI administration, consult product literature for dose adjustments due to side-effects and infusion-related reactions

**Treatment of locally advanced or metastatic non-small cell lung cancer, in combination with docetaxel, in patients with disease progression after platinum-based chemotherapy**

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ **Adult:** 10 mg/kg on day 1 of a 21 day cycle, dose to be administered prior to docetaxel infusion, consult product literature for dose adjustments due to side-effects and infusion-related reactions

- **CAUTIONS** Elective surgery—discontinue treatment for at least 4 weeks prior to surgery • hypertension—must be controlled before initiation • impaired wound healing—discontinue treatment until wound fully healed • pretreatment is recommended to minimise the development of adverse reactions (consult product literature) • risk of bleeding

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain • diarrhoea • epistaxis • gastro-intestinal haemorrhage • headache • hypertension • hypoalbuminaemia • hypokalaemia • hyponatraemia • leucopenia • malaise • mucosal inflammation • neutropenia • palmar-plantar erythrodysesthesia syndrome • peripheral oedema • proteinuria • stomatitis • thrombocytopenia
- ▶ **Frequency not known** Arterial thromboembolic events (permanently discontinue if severe) • fistula (permanently discontinue) • gastro-intestinal perforation (permanently discontinue) • infusion-related reactions • intestinal obstruction • rash • sepsis (in combination with paclitaxel)

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Infusion-related reactions** Infusion-related hypersensitivity reactions have been reported with ramucirumab, particularly during or following the first or second infusion; if the patient experiences a grade 1 or 2 infusion-related reaction, the manufacturer advises to reduce rate of infusion by 50% and give premedication for all subsequent infusions—consult product literature. Manufacturer advises to permanently discontinue treatment in the event of a grade 3 or 4 infusion-related reaction.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for up to 3 months after treatment in women of childbearing potential.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding during treatment and for at least 3 months after treatment—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe cirrhosis, cirrhosis with hepatic encephalopathy, cirrhosis with clinically significant ascites, or hepatorenal syndrome—use only if potential benefit outweighs risk of progressive hepatic failure.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor for signs of infusion-related hypersensitivity reactions; monitor blood pressure prior to each infusion; monitor for development or worsening of proteinuria

during treatment—consult product literature; monitor blood counts and coagulation parameters in patients at risk of bleeding.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Cymrza®), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and invert gently to mix. Do not exceed a rate of 25 mg/minute, and give over approximately 60 minutes via an infusion pump using a separate infusion line with a protein sparing 0.22 micron filter.

- **PRESCRIBING AND DISPENSING INFORMATION** For Cymrza®, each 10 mL vial contains sodium 17 mg (equivalent to Na<sup>+</sup> 0.74 mmol).

- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

- Ramucirumab for treating advanced gastric cancer or gastro-oesophageal junction adenocarcinoma previously treated with chemotherapy (January 2016) NICE TA378

Ramucirumab alone or in combination with paclitaxel is **not** recommended for the treatment of advanced gastric cancer or gastro-oesophageal junction adenocarcinoma previously treated with chemotherapy.

Patients whose treatment was started before this guidance was published, should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA378](http://www.nice.org.uk/TA378)

- Ramucirumab for previously treated locally advanced or metastatic non-small-cell lung cancer (August 2016) NICE TA403

Ramucirumab, in combination with docetaxel, is **not** recommended for treating locally advanced or metastatic non-small-cell lung cancer in patients whose disease has progressed after platinum-based chemotherapy.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinicians consider it appropriate to stop.

[www.nice.org.uk/TA403](http://www.nice.org.uk/TA403)

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

## Rituximab

- **INDICATIONS AND DOSE**

**Treatment of severe active rheumatoid arthritis in patients whose condition has not responded adequately to other disease-modifying antirheumatic drugs (including one or more tumour necrosis factor inhibitors) or who are intolerant of them (in combination with methotrexate)**

- BY INTRAVENOUS INFUSION

- Adult: 1 g, then 1 g after 2 weeks, patients should receive premedication before each infusion (consult product literature for details)

**Treatment of previously untreated stage III–IV follicular lymphoma (in combination with other chemotherapy) | Maintenance therapy in patients with follicular non-Hodgkin's lymphoma that has responded to induction therapy (in combination with other chemotherapy) | Treatment of diffuse large B-cell non-Hodgkin's lymphoma (in combination with other chemotherapy) | Treatment of chemotherapy-resistant or relapsed stage III–IV follicular non-Hodgkin's lymphoma | Previously untreated or relapsed chronic lymphocytic leukaemia | Induction of remission in patients with severe, active granulomatosis with polyangiitis (Wegener's) and microscopic polyangiitis (in combination with glucocorticoids)**

- BY INTRAVENOUS INFUSION

- Adult: Patients should receive premedication before each dose (consult product literature for details) (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Severe heart failure (when used to treat granulomatosis with polyangiitis or microscopic polyangiitis) · severe infection · severe, uncontrolled heart disease (when used to treat granulomatosis with polyangiitis or microscopic polyangiitis)

#### CONTRA-INDICATIONS, FURTHER INFORMATION

For full details on contra-indications, consult product literature.

- **CAUTIONS**

#### GENERAL CAUTIONS

History of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported · patients receiving cardiotoxic chemotherapy; in adults exacerbation of angina, arrhythmia, and heart failure have been reported · transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)

#### SPECIFIC CAUTIONS

- When used for rheumatoid arthritis Predisposition to infection

#### CAUTIONS, FURTHER INFORMATION

For full details on cautions, consult product literature or local treatment protocol.

- Hepatitis B infection and reactivation Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking rituximab. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

- **SIDE-EFFECTS** Abdominal pain · anaemia · antibody formation · aplastic anaemia · arthralgia · asthenia · blood disorders · depression · dyspepsia · headache · hypertension · hypotension · injection-site reactions · leucopenia · lupus erythematosus-like syndrome · migraine · muscle spasm · pancytopenia · paraesthesia · progressive multifocal leucoencephalopathy · pruritus · rhinitis · severe fatal skin reactions · severe skin reactions (permanently discontinue treatment if occurs) · sore throat · Stevens-Johnson syndrome (permanently discontinue treatment if occurs) · thrombocytopenia · toxic epidermal necrolysis (permanently discontinue treatment if occurs) · urticaria · worsening heart failure

#### SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

For full details, including management of side-effects, consult product literature.

- **Progressive multifocal leucoencephalopathy** Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded.

- **CONCEPTION AND CONTRACEPTION** Effective contraception (in both sexes) required during and for 12 months after treatment.

- **PREGNANCY** Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.

- **BREAST FEEDING** Avoid breast-feeding during and for 12 months after treatment.

- **MONITORING REQUIREMENTS** For full details on monitoring requirements consult product literature.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion (MabThera®)*, give intermittently in Glucose 5% or Sodium chloride 0.9%; dilute to 1–4 mg/mL and gently invert bag to avoid foaming.

#### • PATIENT AND CARER ADVICE

**Alert card** Patients treated for granulomatosis with polyangiitis and microscopic polyangiitis or rheumatoid arthritis should be provided with a patient alert card with each infusion.

#### • NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Rituximab in combination with glucocorticoids for treating anti-neutrophil cytoplasmic antibody-associated vasculitis (March 2014)** NICE TA308

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with glucocorticoids, is recommended as an option for inducing remission in adults with anti-neutrophil cytoplasmic antibody [ANCA]-associated vasculitis (severely active granulomatosis with polyangiitis [Wegener's] and microscopic polyangiitis), only if:

- further cyclophosphamide treatment would exceed the maximum cumulative cyclophosphamide dose, **or**
- cyclophosphamide is contra-indicated or not tolerated, **or**
- the patient has not completed their family, and treatment with cyclophosphamide may materially affect their fertility, **or**
- the disease has remained active or progressed despite a course of cyclophosphamide lasting 3–6 months **or**
- the patient has had uroepithelial malignancy.

[www.nice.org.uk/TA308](http://www.nice.org.uk/TA308)

- ▶ **Adalimumab, etanercept, infliximab, rituximab, and abatacept for the treatment of rheumatoid arthritis after the failure of a TNF inhibitor (August 2010)** NICE TA195  
Rituximab, in combination with methotrexate, is an option for the treatment of severe active rheumatoid arthritis in adults who have had an inadequate response to, or are intolerant of, other disease-modifying antirheumatic drugs (DMARDs), including at least 1 tumour necrosis factor (TNF) inhibitor. Repeat courses of rituximab should be given no more frequently than every 6 months, and should only be continued if an adequate response is achieved and maintained.

[www.nice.org.uk/TA195](http://www.nice.org.uk/TA195)

- ▶ **Rituximab for the first-line treatment of stage III–IV follicular lymphoma (January 2012)** NICE TA243

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with:

- cyclophosphamide, vincristine and prednisolone (CVP);
- cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP);
- mitoxantrone, chlorambucil and prednisolone (MCP);

- cyclophosphamide, doxorubicin, etoposide, prednisolone and interferon- $\alpha$  (CHVPi); **or**
- chlorambucil

is recommended as an option for the treatment of symptomatic stage III and IV follicular lymphoma in previously untreated patients.

[www.nice.org.uk/TA243](http://www.nice.org.uk/TA243)

- ▶ **Rituximab for the treatment of relapsed or refractory stage III or IV follicular non-Hodgkin's lymphoma (February 2008)** NICE TA137

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with chemotherapy, is an option for the induction of remission in patients with relapsed stage III or IV follicular non-Hodgkin's lymphoma.

Rituximab monotherapy as maintenance therapy is an option for the treatment of patients with relapsed stage III or IV follicular non-Hodgkin's lymphoma in remission induced with chemotherapy (with or without rituximab).

Rituximab monotherapy is an option for the treatment of patients with relapsed or refractory stage III or IV follicular non-Hodgkin's lymphoma, when all alternative treatment options have been exhausted (that is, if there is resistance to or intolerance of chemotherapy).

[www.nice.org.uk/TA137](http://www.nice.org.uk/TA137)

- ▶ **Rituximab for the treatment of relapsed or refractory chronic lymphocytic leukaemia (July 2010)** NICE TA193

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab in combination with fludarabine and cyclophosphamide is recommended as a treatment option for people with relapsed or refractory chronic lymphocytic leukaemia except when the condition:

- is refractory to fludarabine (that is, it has not responded to fludarabine, or has relapsed within 6 months of treatment), **or**
- has previously been treated with rituximab, unless it was in the context of a clinical trial, at a dose lower than the dose currently licensed for chronic lymphocytic leukaemia or with chemotherapy other than fludarabine and cyclophosphamide.

Rituximab in combination with fludarabine and cyclophosphamide is recommended only in the context of research for patients with relapsed or refractory chronic lymphocytic leukaemia that has previously been treated with rituximab, unless rituximab has been given as specified above.

[www.nice.org.uk/TA193](http://www.nice.org.uk/TA193)

- ▶ **Rituximab for the first-line maintenance treatment of follicular non-Hodgkin's lymphoma (June 2011)** NICE TA226

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab maintenance therapy is recommended as an option for the treatment of people with follicular non-Hodgkin's lymphoma that has responded to first-line induction therapy with rituximab in combination with chemotherapy.

[www.nice.org.uk/TA226](http://www.nice.org.uk/TA226)

- ▶ **Rituximab for the first-line treatment of chronic lymphocytic leukaemia (July 2009)** NICE TA174

This NICE guidance was issued for rituximab by intravenous infusion. Rituximab, in combination with fludarabine and cyclophosphamide, is recommended as an option for the first-line treatment of chronic lymphocytic leukaemia.

[www.nice.org.uk/TA174](http://www.nice.org.uk/TA174)

- ▶ **Idelalisib for treating chronic lymphocytic leukaemia (October 2015)** NICE TA359

Rituximab, in combination with idelalisib, is recommended as an option for treatment in adults:

- who have untreated chronic lymphocytic leukaemia **or**

- who have chronic lymphocytic leukaemia when the disease has been treated but has relapsed within 24 months and
  - if the manufacturer provides idelalisib with the discount agreed in the simple discount agreement.
- Patients who are already receiving idelalisib should continue treatment until they or their clinician consider it appropriate to stop.
- [www.nice.org.uk/guidance/TA359](http://www.nice.org.uk/guidance/TA359)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2013) that Rituximab (*MabThera*®) is accepted for restricted use within NHS Scotland, in combination with glucocorticoids for the induction of remission in adult patients with severe, active granulomatosis with polyangiitis (Wegener's) and microscopic polyangiitis. It is restricted to use in patients who have relapsed following treatment with cyclophosphamide or who are intolerant to or unable to receive cyclophosphamide.

The *Scottish Medicines Consortium* has advised (June 2014) that subcutaneous rituximab (*MabThera*®) is accepted for restricted use within NHS Scotland, in accordance with UK licensing, except in the maintenance setting, where use is restricted to patients who have responded to induction therapy with rituximab plus chemotherapy.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

###### ▶ *MabThera* (Roche Products Ltd)

Rituximab 10 mg per 1 mL *MabThera* 100mg/10mL concentrate for solution for infusion vials | 2 vial [PoM] £349.25  
*MabThera* 500mg/50mL concentrate for solution for infusion vials | 1 vial [PoM] £873.15

## Siltuximab

- **DRUG ACTION** Siltuximab is a monoclonal antibody that inhibits interleukin-6 receptor binding.

#### INDICATIONS AND DOSE

**Treatment of multicentric Castleman's disease (MCD) in patients who are human immunodeficiency virus (HIV) negative and human herpesvirus-8 (HHV-8) negative**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 11 mg/kg every 3 weeks

- **CAUTIONS** Patients at increased risk of gastrointestinal perforation—promptly investigate those presenting with symptoms suggestive of gastrointestinal perforation • severe infection—withhold treatment until resolved • treat infection prior to treatment

#### CAUTIONS, FURTHER INFORMATION

- ▶ Hypersensitivity reactions Infusion-related side-effects are reported commonly with siltuximab; resuscitation facilities should be available during treatment.

Consult product literature for further information about siltuximab cautions.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### SIDE-EFFECTS

- ▶ **Common or very common** Infusion related side effects
- ▶ **Frequency not known** Abdominal pain • anaphylaxis • hepatitis B reactivation • hypersensitivity reactions • hypertension • hypertriglyceridaemia • hypoglobulinaemia • increased haemoglobin levels • infections • localised oedema • maculopapular rash • nasopharyngitis • neutropenia • pruritus • renal impairment • thrombocytopenia • upper respiratory tract infection • weight gain

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Infusion-related side effects** Siltuximab therapy should be discontinued permanently in the event of a severe infusion-related reaction, anaphylaxis, a severe allergic reaction, or the occurrence of cytokine-release syndrome. Mild to moderate infusion-related reactions may improve by temporarily reducing the rate or stopping the infusion. When restarting treatment, a reduced infusion rate and the administration of antihistamines, paracetamol, and corticosteroids should be considered. Consider discontinuation of siltuximab if more than 2 doses are delayed due to treatment-related toxicities during the first 48 weeks—for full details consult product literature.
- **CONCEPTION AND CONTRACEPTION** Women of childbearing potential should use effective contraception during and for 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in hepatic impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor neutrophil and platelet count, and haemoglobin levels prior to each dose of siltuximab treatment for the first 12 months and thereafter prior to every third dosing cycle. Consider delaying treatment if required neutrophil, platelet, and haemoglobin levels not achieved—consult product literature for details.
  - ▶ Monitor for infection during treatment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Sylvant*®), give intermittently in Glucose 5%. Allow vials to reach room temperature over approximately 30 minutes, then reconstitute each 100 mg vial with 5.2 mL of water for injection, and each 400 mg vial with 20 mL of water for injection, to produce a 20 mg/mL solution. Gently swirl without shaking to dissolve. Further dilute to 250 mL with glucose 5% and gently mix. Use within 6 hours of dilution and give over 60 minutes using an administration set lined with polyvinyl chloride or polyurethane, through a low-protein binding in-line 0.2 micron filter.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for infusion

###### ▶ *Sylvant* (Janssen-Cilag Ltd) ▼

**Siltuximab 100 mg** *Sylvant* 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £415.00 (Hospital only)

**Siltuximab 400 mg** *Sylvant* 400mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £1,661.00 (Hospital only)

## Trastuzumab

24-Feb-2016

### ● INDICATIONS AND DOSE

**Treatment of early breast cancer which overexpresses human epidermal growth factor receptor-2 (HER2) (initiated by a specialist)** **Treatment of metastatic breast cancer in patients with HER2-positive tumours who have not received chemotherapy for metastatic breast cancer and in whom anthracycline treatment is inappropriate (in combination with paclitaxel or docetaxel) (initiated by a specialist)** **Treatment of metastatic breast cancer in postmenopausal patients with hormone-receptor positive HER2-positive tumours not previously treated with trastuzumab (in combination with an aromatase inhibitor) (initiated by a specialist)**

- BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- Adult: (consult product literature or local protocols)

**Monotherapy for metastatic breast cancer in patients with tumours that overexpress HER2 who have received at least 2 chemotherapy regimens including, where appropriate, an anthracycline and a taxane (initiated by a specialist)**

- BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- Adult: Women with oestrogen-receptor-positive breast cancer should also have received hormonal therapy (consult product literature or local protocols)

**Treatment of metastatic gastric cancer in patients with HER2-positive tumours who have not received treatment for metastatic gastric cancer (in combination with capecitabine or fluorouracil and cisplatin) (initiated by a specialist)**

- BY INTRAVENOUS INFUSION
- Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Severe dyspnoea at rest
- **CAUTIONS** Coronary artery disease · history of hypertension · symptomatic heart failure · uncontrolled arrhythmias
- **INTERACTIONS** → Appendix 1: monoclonal antibodies
- **SIDE-EFFECTS** Acne · alopecia · alopecia · anaphylaxis · angioedema · anxiety · arthralgia · arthritis · asthenia · bone pain · bone-marrow suppression · cardiotoxicity · chest pain · chills · depression · dizziness · drowsiness · dry eye · dry skin · ecchymosis · extravasation · fever · gastro-intestinal symptoms · headache · hepatitis · hypersensitivity reactions · hypertension · hypertonion · hyperuricaemia · hypotension · increased lacrimation · infection · infusion-related side-effects (possibly delayed onset) · insomnia · leg cramps · malaise · mastitis · myalgia · nail disorders · nausea · oedema · oral mucositis · paraesthesia · paresis · peripheral neuropathy · pruritus · pulmonary events (possibly delayed onset) · rash · sweating · taste disturbance · thromboembolism · tremor · tumour lysis syndrome · urticaria · vomiting · weight loss
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Manufacturer advises avoid—oligohydramnios reported. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Avoid breast-feeding during treatment and for 7 months afterwards.
- **MONITORING REQUIREMENTS**
  - Cardiotoxicity Monitor cardiac function before and during treatment—for details of monitoring and managing cardiotoxicity, consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available during administration of trastuzumab.

- **PRESCRIBING AND DISPENSING INFORMATION** When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab is **not** interchangeable with trastuzumab emtansine.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257  
Lapatinib or trastuzumab in combination with an aromatase inhibitor is **not** recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA257](http://www.nice.org.uk/TA257)

- Guidance on the use of trastuzumab for the treatment of advanced breast cancer (March 2002) NICE TA34  
Trastuzumab in combination with paclitaxel is recommended as an option for patients with tumours expressing human epidermal growth factor receptor 2 (HER2) scored at levels of 3+ who have not received chemotherapy for metastatic breast cancer, and in whom anthracycline treatment is inappropriate.

Trastuzumab monotherapy is recommended as an option for patients with tumours expressing HER2 scored at levels of 3+ who have received at least two chemotherapy regimens for metastatic breast cancer. Prior chemotherapy must have included at least an anthracycline and a taxane where these treatments are appropriate. It should also have included hormonal therapy in suitable oestrogen-receptor-positive patients.

[www.nice.org.uk/TA34](http://www.nice.org.uk/TA34)

- Trastuzumab for the adjuvant treatment of early-stage HER2-positive breast cancer (August 2006) NICE TA107  
Trastuzumab, given at 3-week intervals for 1 year or until disease recurrence (whichever is the shorter period), is recommended as an option for women with early-stage HER2-positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy (if applicable).
- Trastuzumab for the treatment of HER2-positive metastatic gastric cancer (November 2010) NICE TA208  
Trastuzumab in combination with cisplatin and capecitabine or fluorouracil is recommended for human epidermal growth factor receptor-2-positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction in patients who:
  - have not received treatment for metastatic disease and
  - have tumours expressing high levels of HER2 as defined by a positive immunohistochemistry score of 3.

[www.nice.org.uk/TA208](http://www.nice.org.uk/TA208)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2013) that subcutaneous trastuzumab injection (*Herceptin*®) is accepted for restricted use within NHS Scotland for the treatment of adults with HER2 positive metastatic breast cancer and early breast cancer, when used within licensed indications excluding use in combination with an aromatase inhibitor for the treatment of postmenopausal patients with hormone-receptor positive metastatic breast cancer, not previously treated with trastuzumab.

The *Scottish Medicines Consortium* has advised (September 2015) that trastuzumab solution for infusion

(*Herceptin*®) is accepted for restricted use within NHS Scotland in combination with capecitabine or fluorouracil and cisplatin for the treatment of patients with HER2 positive metastatic adenocarcinoma of the stomach or gastro-oesophageal junction, who have not received prior anti-cancer treatment for their metastatic disease. It is restricted to patients with metastatic gastric cancer whose tumours have HER2 over-expression, as determined by an accurate and validated assay.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- ▶ **Herceptin** (Roche Products Ltd)  
Trastuzumab 120 mg per 1 ml Herceptin 600mg/5ml solution for injection vials | 1 vial [PoM] £1,222.20 (Hospital only)

#### Powder for solution for infusion

- ▶ **Herceptin** (Roche Products Ltd)  
Trastuzumab 150 mg Herceptin 150mg powder for solution for infusion vials | 1 vial [PoM] £407.40

## Trastuzumab emtansine

15-Apr-2016

- **DRUG ACTION** Trastuzumab emtansine is an antibody-drug conjugate that contains trastuzumab covalently linked to DM1, a cytotoxic microtubule inhibitor.

### • INDICATIONS AND DOSE

**Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have previously received trastuzumab and a taxane separately or in combination (initiated by a specialist) | Monotherapy for the treatment of HER2-positive, unresectable, locally advanced or metastatic breast cancer, in adult patients who have developed disease recurrence during or within 6 months of completing adjuvant therapy (initiated by a specialist)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Dyspnoea at rest—increased risk of pulmonary events · history of congestive heart failure · patients over 75 years · peripheral neuropathy (temporarily discontinue treatment—consult product literature) · recent history of myocardial infarction · recent history of unstable angina · risk of left ventricular dysfunction—consult product literature for specific risks with trastuzumab treatment · serious arrhythmias

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

### • SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · arthralgia · blurred vision · chills · conjunctivitis · constipation · cough · diarrhoea · dizziness · dry eye · dry mouth · dysgeusia · dyspepsia · dyspnoea · epistaxis · gingival bleeding · haemorrhage · hand-foot syndrome · headache · hypertension · hypokalaemia · increased lacrimation · infusion-related reactions · insomnia · left ventricular dysfunction · malaise · memory impairment · myalgia · nail disorder · peripheral neuropathy · peripheral oedema · pruritus · pyrexia · rash · thrombocytopenia · urinary tract infection · urticaria
- ▶ **Uncommon** Hepatic failure · hepatic toxicity · interstitial lung disease · nodular regenerative hyperplasia · pneumonitis · portal hypertension
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during and for 6 months after stopping treatment in women and men.

- **PREGNANCY** Manufacturer advises avoid—oligohydramnios reported with trastuzumab. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for 6 months after treatment.

- **HEPATIC IMPAIRMENT** Consult product literature for dose modification in cases of abnormal liver function tests. Consult product literature for initiating treatment and discontinuation in cases of abnormal liver function tests.

- **RENAL IMPAIRMENT** No information available—manufacturer advises caution in severe impairment.

### • MONITORING REQUIREMENTS

- ▶ Monitor hepatic function before each dose.
- ▶ Monitor for signs and symptoms of neurotoxicity.
- ▶ Monitor closely for infusion-related and hypersensitivity reactions.
- ▶ Monitor platelet count before each dose and as clinically indicated (consult product literature for treatment modification in thrombocytopenia).
- ▶ Test cardiac function before treatment and regularly during treatment—delay or discontinue treatment in cases of left ventricular dysfunction.
- ▶ Monitor for dyspnoea, cough, fatigue and pulmonary infiltrates—discontinue if interstitial lung disease or pneumonitis confirmed (fatal cases reported).

- **DIRECTIONS FOR ADMINISTRATION** Resuscitation facilities should be available during administration of trastuzumab emtansine.

- **PRESCRIBING AND DISPENSING INFORMATION** When prescribing, dispensing or administering, check that this is the correct preparation—trastuzumab emtansine and trastuzumab are **not** interchangeable.

### • NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ Trastuzumab emtansine for treating HER2-positive, unresectable locally advanced or metastatic breast cancer after treatment with trastuzumab and a taxane (December 2015) NICE TA371

Trastuzumab emtansine is **not** recommended for treating adults with human epidermal growth factor 2 (HER2) positive, unresectable locally advanced or metastatic breast cancer previously treated with trastuzumab and a taxane.

[www.nice.org.uk/TA371](http://www.nice.org.uk/TA371)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2017) that trastuzumab emtansine (*Kadcyla*®) is accepted for use within NHS Scotland as monotherapy for the treatment of patients with human epidermal growth factor type 2 (HER2)-positive, unresectable locally advanced or metastatic breast cancer who previously received trastuzumab and a taxane, separately or in combination, and have either received prior therapy for locally advanced or metastatic disease or developed disease recurrence during or within six months of completing adjuvant therapy. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

Trastuzumab emtansine 100 mg Kadcyla 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £1,641.01  
Trastuzumab emtansine 160 mg Kadcyla 160mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £2,625.62

## 2 Cytotoxic responsive malignancy

### Cytotoxic drugs

#### Overview

The chemotherapy of cancer is complex and should be confined to specialists in oncology. Cytotoxic drugs have both anti-cancer activity and the potential to damage normal tissue; most cytotoxic drugs are teratogenic. Chemotherapy may be given with a curative intent or it may aim to prolong life or to palliate symptoms. In an increasing number of cases chemotherapy may be combined with radiotherapy or surgery or both as either neoadjuvant treatment (initial chemotherapy aimed at shrinking the primary tumour, thereby rendering local therapy less destructive or more effective) or as adjuvant treatment (which follows definitive treatment of the primary disease, when the risk of subclinical metastatic disease is known to be high). All cytotoxic drugs cause side-effects and a balance has to be struck between likely benefit and acceptable toxicity.

Combinations of cytotoxic drugs, as continuous or pulsed cycles of treatment, are frequently more toxic than single drugs but have the advantage in certain tumours of enhanced response, reduced development of drug resistance and increased survival. However for some tumours, single-agent chemotherapy remains the treatment of choice.

Cytotoxic drugs fall into a number of classes, each with characteristic antitumour activity, sites of action, and toxicity. A knowledge of sites of metabolism and excretion is important because impaired drug handling as a result of disease is not uncommon and may result in enhanced toxicity.

#### Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas
- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

#### Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Copies, and further information may be obtained from:  
Department of Health  
PO Box 777  
London  
SE1 6XH

Fax: 01623 724524

It is also available from the Department of Health website ([www.dh.gov.uk](http://www.dh.gov.uk)).

#### Safe systems for cytotoxic medicines

NHS cancer networks have been established across the UK to bring together all stakeholders in all sectors of care, to work

collaboratively to plan and deliver high quality cancer services for a given population. NHS cancer networks have websites containing information on local chemotherapy services and treatment.

Safe system requirements:

- cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care coordinated by a multidisciplinary team
- cytotoxic drugs should be prescribed, dispensed, and administered only in the context of a written protocol or treatment plan
- injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- oral cytotoxic medicines should be dispensed with clear directions for use

#### IMPORTANT SAFETY INFORMATION

##### RISK OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy.

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

#### Doses

Doses of cytotoxic drugs are determined using a variety of different methods including body-surface area or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from some of the drug entries in this chapter. However, even where dose statements have been provided, detailed specialist literature, individual hospital chemotherapy protocols, or local cancer networks should be consulted before prescribing, dispensing, or administering cytotoxic drugs.

Prescriptions should **not** be repeated except on the instructions of a specialist.

#### Side-effects of cytotoxic drugs

Side-effects common to most cytotoxic drugs are discussed below whilst side-effects characteristic of a particular drug or class of drugs (e.g. neurotoxicity with vinca alkaloids) are mentioned in the appropriate sections. Manufacturers' product literature, hospital-trust protocols, and cancer-network protocols should be consulted for full details of side-effects associated with individual drugs and specific chemotherapy regimes.

Many side-effects of cytotoxic drugs often do not occur at the time of administration, but days or weeks later. It is therefore important that patients and healthcare professionals can identify symptoms that cause concern and can contact an expert for advice. Toxicities should be

accurately recorded using a recognised scoring system such as the Common Toxicity Criteria for Adverse Events (CTCAE) developed by the National Cancer Institute.

### Extravasation of intravenous drugs

A number of cytotoxic drugs will cause severe local tissue necrosis if leakage into the extravascular compartment occurs. To reduce the risk of extravasation injury it is recommended that cytotoxic drugs are administered by appropriately trained staff. See information on the prevention and management of extravasation injury.

### Oral mucositis

A sore mouth is a common complication of cancer chemotherapy; it is most often associated with fluorouracil p. 842, methotrexate p. 844, and the anthracyclines. It is best to prevent the complication. Good oral hygiene (rinsing the mouth frequently and effective brushing of the teeth with a soft brush 2–3 times daily) is probably beneficial. For fluorouracil p. 842, sucking ice chips during short infusions of the drug is also helpful.

Once a sore mouth has developed, treatment is much less effective. Saline mouthwashes should be used but there is no good evidence to support the use of antiseptic or anti-inflammatory mouthwashes. In general, mucositis is self-limiting but with poor oral hygiene it can be a focus for blood-borne infection.

### Tumour lysis syndrome

Tumour lysis syndrome occurs secondary to spontaneous or treatment-related rapid destruction of malignant cells. Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration, and renal impairment are also predisposing factors. Features include hyperkalaemia, hyperuricaemia (see below), and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early identification of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

### Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure. Allopurinol p. 1021 should be started 24 hours before treating such tumours and patients should be adequately hydrated. The dose of mercaptopurine p. 844 or azathioprine p. 787 should be reduced if allopurinol needs to be given concomitantly. Febuxostat p. 1021 may also be used and should be started 2 days before cytotoxic therapy is initiated.

Rasburicase p. 870, a recombinant urate oxidase, is licensed for hyperuricaemia in patients with haematological malignancy. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

### Bone-marrow suppression

All cytotoxic drugs except vincristine sulfate p. 858 and bleomycin p. 849 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as carmustine p. 829, lomustine p. 832, and melphalan p. 833. Peripheral blood counts must be checked before each treatment, and doses should be reduced or therapy delayed if bone-marrow has not recovered.

Cytotoxic drugs may be contra-indicated in patients with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Fever in a neutropenic patient (neutrophil count less than  $1.06 \times 10^9/\text{litre}$ ) requires immediate broad-spectrum antibacterial therapy. Appropriate bacteriological investigations should be conducted as soon as possible. Patients taking cytotoxic drugs who have signs or symptoms of infection should be advised to seek prompt medical attention. All patients should initially be investigated and treated under the supervision of the appropriate oncology or haematology specialist.

In selected patients, the duration and the severity of neutropenia can be reduced by the use of recombinant human granulocyte-colony stimulating factors.

Symptomatic anaemia is usually treated with red blood cell transfusions. For guidance on the use of erythropoietins in patients with cancer, see MHRA/CHM advice and NICE guidance.

See advice on the use of live vaccines in individuals with impaired immune response, see Vaccines.

### Alopecia

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients. No pharmacological methods of preventing this are available.

### Thromboembolism

Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

### Pregnancy and reproductive function

Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given before cytotoxic therapy begins - women of childbearing age should use effective contraception during and after treatment.

Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.

### Nausea and vomiting

Nausea and vomiting cause considerable distress to many patients who receive chemotherapy and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Patients vary in their susceptibility to drug-induced nausea and vomiting; those affected more often include women, patients under 50 years of age, anxious patients, and those who experience motion sickness. Susceptibility also increases with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs administered and to the individual's susceptibility to emetogenic stimuli.

*Mildly emetogenic treatment*—fluorouracil, etoposide p. 853, methotrexate p. 844 (less than  $100 \text{ mg/m}^2$ , low dose

in children), the vinca alkaloids, and abdominal radiotherapy.

**Moderately emetogenic treatment**—the taxanes, doxorubicin hydrochloride p. 835, intermediate and low doses of cyclophosphamide p. 830, mitoxantrone p. 837, and high doses of methotrexate (0.1–1.2 g/m<sup>2</sup>).

**Highly emetogenic treatment**—cisplatin p. 852, dacarbazine p. 831, and high doses of cyclophosphamide.

#### Prevention of acute symptoms

For patients at *low risk of emesis*, pretreatment with dexamethasone p. 635 or lorazepam p. 322 may be used.

For patients at *high risk of emesis*, a 5HT<sub>3</sub>-receptor antagonist, usually given by mouth in combination with dexamethasone and the neurokinin receptor antagonist aprepitant p. 412 is effective.

#### Prevention of delayed symptoms

For delayed symptoms associated with moderately emetogenic chemotherapy, a combination of dexamethasone and 5HT<sub>3</sub>-receptor antagonist is effective; for highly emetogenic chemotherapy, a combination of dexamethasone and aprepitant is effective. Metoclopramide hydrochloride p. 411 is also licensed for delayed chemotherapy-induced nausea and vomiting.

#### Prevention of anticipatory symptoms

Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam can be helpful for its amnesic, sedative, and anxiolytic effects.

### Treatment for cytotoxic-induced side effects

#### Anthracycline side-effects

##### Anthracycline-induced cardiotoxicity

The anthracycline cytotoxic drugs are associated with dose-related, cumulative, and potentially life-threatening cardiotoxic side-effects.

##### Anthracycline extravasation

Local guidelines for the management of extravasation should be followed or specialist advice sought.

See further information on the prevention and management of extravasation injury.

#### Chemotherapy-induced mucositis and myelosuppression

Folinic acid p. 869 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate p. 844 and thus speed recovery from methotrexate-induced mucositis or myelosuppression ('folinic acid rescue').

Folinic acid is also used in the management of methotrexate overdose, together with other measures to maintain fluid and electrolyte balance, and to manage possible renal failure.

Folinic acid does not counteract the antibacterial activity of folate antagonists such as trimethoprim p. 542.

When folinic acid and fluorouracil p. 842 are used together in metastatic colorectal cancer the response-rate improves compared to that with fluorouracil alone.

The calcium salt of levofolinic acid p. 870, a single isomer of folinic acid, is also used for rescue therapy following methotrexate administration, for cases of methotrexate overdose, and for use with fluorouracil for colorectal cancer. The dose of calcium levofolinate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate therapy, and for use with fluorouracil for colorectal cancer.

#### Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 830 and ifosfamide p. 832; it is caused by the metabolite acrolein. Mesna p. 869 reacts specifically with this metabolite in the urinary tract, preventing toxicity. Mesna is used routinely (preferably by mouth) in patients receiving ifosfamide, and in patients receiving

cyclophosphamide by the intravenous route at a high dose (e.g. more than 2 g) or in those who experienced urothelial toxicity when given cyclophosphamide previously.

### Anthracyclines and other cytotoxic antibiotics

Drugs in this group are widely used. Many cytotoxic antibiotics act as radiomimetics and simultaneous use of radiotherapy should be **avoided** because it may markedly increased toxicity. Daunorubicin p. 835, doxorubicin hydrochloride p. 835, epirubicin hydrochloride p. 836 and idarubicin hydrochloride p. 837 are anthracycline antibiotics. Mitoxantrone p. 837 is an anthracycline derivative.

Doxorubicin hydrochloride is available as both *conventional* and *liposomal* formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. *Conventional* doxorubicin hydrochloride is used to treat the acute leukaemias, Hodgkin's and non-Hodgkin's lymphomas, paediatric malignancies, and some solid tumours including breast cancer.

Epirubicin hydrochloride is structurally related to doxorubicin hydrochloride and clinical trials suggest that it is as effective in the treatment of breast cancer.

Idarubicin hydrochloride has general properties similar to those of doxorubicin hydrochloride; it is mostly used in the treatment of haematological malignancies.

Daunorubicin also has general properties similar to those of doxorubicin hydrochloride.

Mitoxantrone is structurally related to doxorubicin hydrochloride.

Pixantrone p. 838 is licensed as monotherapy for the treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas, although the benefits of using it as a fifth-line or greater chemotherapy in refractory patients has not been established.

Bleomycin p. 849 is given intravenously or intramuscularly to treat metastatic germ cell cancer and, in some regimens, non-Hodgkin's lymphoma.

Dactinomycin is principally used to treat paediatric cancers. Its side-effects are similar to those of doxorubicin, except that cardiac toxicity is not a problem.

Mitomycin p. 850 is given intravenously to treat upper gastrointestinal and breast cancers and by bladder instillation for superficial bladder tumours. It causes delayed bone marrow toxicity and therefore it is usually administered at 6-weekly intervals.

### Vinca alkaloids

The vinca alkaloids, vinblastine sulfate p. 858, vincristine sulfate p. 858, and vindesine sulfate p. 859, are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer).

Vinorelbine p. 860 is a semi-synthetic vinca alkaloid. See also, role of vinorelbine in the treatment of breast cancer.

### Antimetabolites

Antimetabolites are incorporated into new nuclear material or combine irreversibly with cellular enzymes, preventing normal cellular division.

### Alkylating drugs

Extensive experience is available with these drugs, which are among the most widely used in cancer chemotherapy. They act by damaging DNA, thus interfering with cell replication.

Cyclophosphamide is used mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours. It is given by mouth or intravenously; it is inactive until metabolised by the liver.

Ifosfamide is related to cyclophosphamide and is given intravenously.

Melphalan p. 833 is licensed for the treatment of multiple myeloma, polycythaemia vera, childhood neuroblastoma, advanced ovarian adenocarcinoma, and advanced breast cancer. However, in practice, melphalan is rarely used for ovarian adenocarcinoma; it is no longer used for advanced breast cancer. Melphalan is also licensed for regional arterial perfusion in localised melanoma of the extremities and localised soft-tissue sarcoma of the extremities.

Lomustine p. 832 is a lipid-soluble nitrosourea and the drug is given at intervals of 4 to 6 weeks.

Carmustine p. 829 has similar activity to lomustine; it is given to patients with multiple myeloma, non-Hodgkin's lymphomas, and brain tumours. Carmustine implants are licensed for intralesional use in adults for the treatment of recurrent glioblastoma multiforme as an adjunct to surgery. Carmustine implants are also licensed for high-grade malignant glioma as adjunctive treatment to surgery and radiotherapy.

Estramustine phosphate p. 831 is a combination of an oestrogen and chlormethine used predominantly in prostate cancer. It is given by mouth and has both an antimitotic effect and (by reducing testosterone concentration) a hormonal effect.

MITOBRONITOL is occasionally used to treat chronic myeloid leukaemia; it is available on a named-patient basis from specialist importing companies.

## ANTINEOPLASTIC DRUGS > ALKYLATING AGENTS

### Bendamustine hydrochloride

#### ● INDICATIONS AND DOSE

**Treatment of chronic lymphocytic leukaemia | Treatment of non-Hodgkin's lymphoma | Treatment of multiple myeloma**

- BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

● **CONTRA-INDICATIONS** Jaundice • low leucocyte count • low platelet count • major surgery less than 30 days before start of treatment • severe bone marrow suppression

● **CAUTIONS** Avoid in Acute porphyrias p. 969 • cardiac disorders—monitor serum potassium and ECG

● **INTERACTIONS** → Appendix 1: alkylating agents

#### ● SIDE-EFFECTS

- **Common or very common** Amenorrhoea • angina • anorexia • arrhythmias • chills • constipation • dehydration • diarrhoea • electrolyte disturbances • haemorrhage • hypertension • hypokalaemia • hypotension • infection • insomnia • malaise • pain • palpitation • pyrexia • respiratory dysfunction
- **Uncommon** Pericardial effusion
- **Rare** Acute circulatory failure • drowsiness • sweating • voice changes
- **Very rare** Anticholinergic syndrome • ataxia • cardiac failure • encephalitis • haemolysis • multiple organ failure • myocardial infarction • neurological disorders • paraesthesia • peripheral neuropathy • phlebitis • pulmonary fibrosis • tachycardia • taste disturbance
- **Frequency not known** Alopecia • bone-marrow suppression • extravasation • hyperuricaemia • male sterility • nausea • oral mucositis • premature menopause • secondary malignancy • Stevens-Johnson syndrome • thromboembolism • toxic epidermal necrolysis • tumour lysis syndrome • vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- **Secondary malignancy** Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

● **CONCEPTION AND CONTRACEPTION** Effective contraception is required during treatment in men or women, and for 6 months after treatment in men. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **PREGNANCY** Avoid (teratogenic and mutagenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Consider a 30% dose reduction in moderate impairment. Avoid in severe impairment.

● **RENAL IMPAIRMENT** No information available on use in patients with creatinine clearance less than 10 mL/minute.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- **Bendamustine for the first-line treatment of chronic lymphocytic leukaemia (February 2011)** NICE TA216 Bendamustine is recommended as an option for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

[www.nice.org.uk/TA216](http://www.nice.org.uk/TA216)

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2011) that bendamustine (Levact®) is accepted for restricted use within NHS Scotland for the treatment of chronic lymphocytic leukaemia in patients for whom fludarabine combination chemotherapy is not appropriate.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for infusion

###### ► Bendamustine hydrochloride (Non-proprietary)

**Bendamustine hydrochloride 25 mg** Bendamustine 25mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £6.85-£65.98 | 5 vial [PoM] £312.53-£347.26 (Hospital only) | 20 vial [PoM] £1,241.14 (Hospital only)

**Bendamustine hydrochloride 100 mg** Bendamustine 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £27.77-£262.02 | 5 vial [PoM] £1,241.14-£1,379.04 (Hospital only)

###### ► Levact (Napp Pharmaceuticals Ltd)

**Bendamustine hydrochloride 25 mg** Levact 25mg powder for concentrate for solution for infusion vials | 5 vial [PoM] £347.26 (Hospital only)

**Bendamustine hydrochloride 100 mg** Levact 100mg powder for concentrate for solution for infusion vials | 5 vial [PoM] £1,379.04 (Hospital only)

## Busulfan

### (Busulphan)

#### ● INDICATIONS AND DOSE

**Chronic myeloid leukaemia, induction of remission**

##### ► BY MOUTH

- **Adult:** 60 micrograms/kg daily (max. per dose 4 mg); maintenance 0.5–2 mg daily

##### Conditioning treatment before haematopoietic progenitor cell transplantation

##### ► BY MOUTH, OR BY INTRAVENOUS INFUSION

- **Adult:** (consult local protocol)

##### Conditioning treatment before haematopoietic progenitor cell transplantation in patients who are candidates for a reduced-intensity conditioning (RIC) regimen

##### ► BY INTRAVENOUS INFUSION

- **Adult:** (consult local protocol)

**DOSES AT EXTREMES OF BODY-WEIGHT**

Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Avoid in Acute porphyrias p. 969 · high dose (antiepileptic prophylaxis required) · history of seizures (antiepileptic prophylaxis required) · ineffective once in blast crisis phase · previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) · previous radiation therapy (increased risk of hepatic veno-occlusive disease) · risk of second malignancy · three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
  - GENERAL SIDE-EFFECTS**
    - ▶ **Common or very common** Cardiac tamponade in thalassaemia · hepatic fibrosis · hepatic veno-occlusive disease · hepatotoxicity · hyperbilirubinaemia · jaundice · pneumonia · skin hyperpigmentation
    - ▶ **Rare** Aplastic anaemia · seizures · visual disturbances
    - ▶ **Very rare** Gynaecomastia · myasthenia gravis
  - ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · irreversible bone-marrow aplasia · lung toxicity · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting
  - SPECIFIC SIDE-EFFECTS**
    - ▶ With intravenous use Extravasation
  - SIDE-EFFECTS, FURTHER INFORMATION**
    - ▶ Lung toxicity Discontinue if lung toxicity develops.
    - ▶ Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
- **CONCEPTION AND CONTRACEPTION** Manufacturers advise effective contraception during and for 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic in *animals*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. In patients with hepatic impairment, manufacturer advises regular liver function tests—consult product literature.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor cardiac and liver function.
  - ▶ Frequent blood tests are necessary because excessive myelosuppression may result in irreversible bone-marrow aplasia.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

**Tablet**▶ **Busulfan (Non-proprietary)**

**Busulfan 2 mg** Busulfan 2mg tablets | 25 tablet [PoM] £69.02

**Solution for infusion**▶ **Busilvex** (Pierre Fabre Ltd)

**Busulfan 6 mg per 1 ml** Busilvex 60mg/10ml concentrate for solution for infusion ampoules | 8 ampoule [PoM] £1,610.00 (Hospital only)

**Carmustine****• INDICATIONS AND DOSE**

**Multiple myeloma | Non-Hodgkin's lymphomas | Brain tumours**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

**Recurrent glioblastoma multiforme as an adjunct to surgery | High-grade malignant glioma as adjunctive treatment to surgery and radiotherapy**

- ▶ BY INTRALESIONAL IMPLANTATION
- ▶ Adult: (consult product literature)

- **CAUTIONS** Avoid in Acute porphyrias p. 969
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

Alopecia · bone-marrow suppression (delayed) · hyperuricaemia · irritant to tissues · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

**SPECIFIC SIDE-EFFECTS**

- ▶ With intravenous use Pulmonary fibrosis (delayed) · renal damage (cumulative)
- SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in *animals*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - NICE technology appraisals (TAs)**
    - ▶ Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121 Carmustine implants are an option for the treatment of newly diagnosed high-grade (Grade 3 or 4) glioma **only** for patients in whom at least 90% of the tumour has been resected. Carmustine implants should only be used within specialist centres.  
[www.nice.org.uk/TA121](http://www.nice.org.uk/TA121)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Implant**▶ **Gladel** (Eisai Ltd)

**Carmustine 7.7 mg** Gladel 7.7mg implant | 8 device [PoM] £5,203.00 (Hospital only)

**Powder and solvent for solution for infusion**▶ **Carmustine** (Non-proprietary)

**Carmustine 100 mg** Gladel 100mg powder and solvent for solution for infusion | 1 vial [PoM] £1,009.00

## Chlorambucil

### ● INDICATIONS AND DOSE

**Some lymphomas and chronic leukaemias (used either alone or in combination therapy)**

- BY MOUTH
- Adult: (consult local protocol)

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Avoid in Acute porphyrias p. 969 · children with nephrotic syndrome (increased seizure risk) · history of epilepsy (increased seizure risk)
  - **INTERACTIONS** → Appendix 1: alkylating agents
  - **SIDE-EFFECTS**
    - **Uncommon** Skin rash
    - **Very rare** Male sterility (in prepubertal and pubertal males)
    - **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · premature menopause · secondary malignancy · Stevens-Johnson syndrome · thromboembolism · toxic epidermal necrolysis · tumour lysis syndrome · vomiting
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - **Secondary malignancy** Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
    - **Skin reactions** If a rash occurs further chlorambucil is contra-indicated and cyclophosphamide is substituted.
  - **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
  - **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
  - **BREAST FEEDING** Discontinue breast-feeding.
  - **HEPATIC IMPAIRMENT** Manufacturer advises consider dose reduction in severe impairment—limited information available.
  - **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

    - **Obinutuzumab in combination with chlorambucil for untreated chronic lymphocytic leukaemia (June 2015)** NICE TA343

Obinutuzumab, in combination with chlorambucil, is an option for untreated chronic lymphocytic leukaemia in patients who have comorbidities that make full-dose fludarabine-based therapy unsuitable for them, only if:

    - bendamustine-based therapy is not suitable **and**
    - the manufacturer provides obinutuzumab with the discount agreed in the patient access scheme.

Patients currently receiving obinutuzumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA343](http://www.nice.org.uk/TA343)

  - **Ofatumumab in combination with chlorambucil or bendamustine for untreated chronic lymphocytic leukaemia (June 2015)** NICE TA344
- Ofatumumab in combination with chlorambucil is an option for untreated chronic lymphocytic leukaemia only if:
- the person is ineligible for fludarabine-based therapy **and**
  - bendamustine is not suitable **and**
  - the manufacturer provides ofatumumab with the discount agreed in the patient access scheme.

Patients currently receiving ofatumumab that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA344](http://www.nice.org.uk/TA344)

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ► Chlorambucil (Non-proprietary)

**Chlorambucil 2 mg** Chlorambucil 2mg tablets | 25 tablet **[PoM]**  
£42.87 DT price = £42.87

## Cyclophosphamide

### ● INDICATIONS AND DOSE

**Rheumatoid arthritis with severe systemic manifestations**

- BY MOUTH
- Adult: 1–1.5 mg/kg daily

**Severe systemic rheumatoid arthritis | Other connective tissue diseases (especially with active vasculitis)**

- BY INTRAVENOUS INJECTION
- Adult: 0.5–1 g every 2 weeks, then reduced to 0.5–1 g every month, frequency adjusted according to clinical response and haematological monitoring. To be given with prophylactic mesna

**Used, mainly in combination with other agents for treating a wide range of malignancies, including some leukaemias, lymphomas, and solid tumours**

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

- **UNLICENSED USE** Not licensed for rheumatoid arthritis with severe systemic manifestations.

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Haemorrhagic cystitis
- **CAUTIONS** Avoid in Acute porphyrias p. 969 · diabetes mellitus · previous or concurrent mediastinal irradiation—risk of cardiotoxicity
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**

**GENERAL SIDE-EFFECTS**

  - **Common or very common** Anorexia · cardiotoxicity at high doses · disturbances of carbohydrate metabolism · inappropriate secretion of anti-diuretic hormone · interstitial pulmonary fibrosis · pancreatitis · pigmentation of nails · pigmentation of palms · pigmentation of soles · urothelial toxicity
  - **Rare** Hepatotoxicity · renal dysfunction
  - **Frequency not known** Alopecia · bone-marrow suppression · haemorrhagic cystitis · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

**SPECIFIC SIDE-EFFECTS**

  - With intravenous use Extravasation

**SIDE-EFFECTS, FURTHER INFORMATION**

  - **Haemorrhagic cystitis** A urinary metabolite of cyclophosphamide, acrolein, can cause haemorrhagic cystitis; this is a rare but serious complication; increased fluid intake for 24–48 hours after intravenous injection, can prevent this complication. When high-dose therapy (e.g. more than 2 g intravenously) is used or when the patient is considered to be at high risk of cystitis (e.g. because of pelvic irradiation), mesna (given initially

intravenously then by mouth) can also help prevent cystitis.

- **Secondary malignancy** Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding during and for 36 hours after stopping treatment.

- **HEPATIC IMPAIRMENT** Reduce dose—consult local treatment protocol for details.

- **RENAL IMPAIRMENT** Reduce dose if serum creatinine concentration greater than 120 micromol/litre.

#### • DIRECTIONS FOR ADMINISTRATION

For intravenous infusion (cyclophosphamide injection; *Baxter*) give via drip tubing in Glucose 5% or Sodium chloride 0.9%; reconstitute 500 mg with 25 mL sodium chloride 0.9%; reconstitute 1 g with 50 mL sodium chloride 0.9%.

#### • MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection, solution for infusion

#### Tablet

CAUTIONARY AND ADVISORY LABELS 25, 27

##### ► Cyclophosphamide (Non-proprietary)

Cyclophosphamide (as Cyclophosphamide monohydrate)

50 mg Cyclophosphamide 50mg tablets | 100 tablet **[PoM]** £139.00  
DT price = £139.00

##### ► Cytoxan (Imported (United States))

Cyclophosphamide 25 mg Cytoxan 25mg tablets | 100 tablet **[PoM]**  
no price available

#### Powder for solution for injection

##### ► Cyclophosphamide (Non-proprietary)

Cyclophosphamide (as Cyclophosphamide monohydrate)

500 mg Cyclophosphamide 500mg powder for solution for injection vials | 1 vial **[PoM]** £9.66 (Hospital only) | 1 vial **[PoM]** £9.66

Cyclophosphamide (as Cyclophosphamide monohydrate)

1 gram Cyclophosphamide 1g powder for solution for injection vials | 1 vial **[PoM]** £17.06 (Hospital only) | 1 vial **[PoM]** £17.91

Cyclophosphamide (as Cyclophosphamide monohydrate)

2 gram Cyclophosphamide 2g powder for solution for injection vials | 1 vial **[PoM]** £34.12 (Hospital only)

## Dacarbazine

#### • INDICATIONS AND DOSE

**Metastatic melanoma | Soft-tissue sarcomas (combination therapy) | Hodgkin's disease (combination therapy)**

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: (consult local protocol)

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: alkylating agents

#### • SIDE-EFFECTS

- **Rare** Irritant to skin · irritant to tissues · liver necrosis due to hepatic vein thrombosis

- **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · myelosuppression · oral mucositis · severe nausea · severe vomiting · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **PREGNANCY** Avoid (carcinogenic and teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

- **PRESCRIBING AND DISPENSING INFORMATION** Dacarbazine is a component of a commonly used combination for Hodgkin's disease (ABVD—doxorubicin [previously *Adriamycin*®], bleomycin, vinblastine, and dacarbazine).

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

##### ► Dacarbazine (Non-proprietary)

Dacarbazine (as Dacarbazine citrate) 500 mg Dacarbazine 500mg powder for solution for infusion vials | 1 vial **[PoM]** £37.50

Dacarbazine (as Dacarbazine citrate) 1 gram Dacarbazine 1g powder for solution for infusion vials | 1 vial **[PoM]** £70.00

#### Powder for solution for injection

##### ► Dacarbazine (Non-proprietary)

Dacarbazine (as Dacarbazine citrate) 100 mg Dacarbazine 100mg powder for solution for injection vials | 10 vial **[PoM]** £90.00

Dacarbazine (as Dacarbazine citrate) 200 mg Dacarbazine 200mg powder for solution for injection vials | 10 vial **[PoM]** £160.00

## Estramustine phosphate

#### • INDICATIONS AND DOSE

##### Prostate cancer

##### ► BY MOUTH

- **Adult:** Initially 560–840 mg daily in divided doses; maintenance 140–1400 mg daily in divided doses

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Peptic ulceration · severe cardiovascular disease · thromboembolic disorders

- **CAUTIONS** Avoid in Acute porphyrias p. 969 · cardiovascular disease · cerebrovascular disease · conditions which might be aggravated by fluid retention (such as epilepsy or migraine) · congestive heart failure · diabetes · hypercalcaemia · hypertension

- **INTERACTIONS** → Appendix 1: alkylating agents

#### • SIDE-EFFECTS

- **Rare** Angioedema

- **Frequency not known** Alopecia · altered endocrine function · altered liver function · bone-marrow suppression · congestive heart failure · diarrhoea · gynaecomastia · hyperuricaemia · impotence · ischaemic heart disease · male sterility · myocardial infarction · nausea · oedema · oral mucositis · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- **Secondary malignancy** Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

- **CONCEPTION AND CONTRACEPTION** Men should use effective contraceptive methods during treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Avoid in severe impairment. In hepatic impairment, manufacturer advises regular liver function tests.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **DIRECTIONS FOR ADMINISTRATION** Each dose should be taken not less than 1 hour before or 2 hours after meals and should not be taken with products containing calcium, magnesium or aluminium, including dairy products and antacid medication.
- **PATIENT AND CARER ADVICE** Patients should be given advice on how to administer estramustine capsules.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

CAUTIONARY AND ADVISORY LABELS 5, 23

##### ► Estracyt (Pfizer Ltd)

Estramustine phosphate (as Estramustine sodium phosphate)  
140 mg Estracyt 140mg capsules | 100 capsule [PoM] £171.28

## Ifosfamide

#### ● INDICATIONS AND DOSE

##### Malignant disease

- BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Acute infection · urinary-tract infection · urinary-tract obstruction · urothelial damage
- **CAUTIONS** Avoid in Acute porphyrias p. 969 · diabetes mellitus
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
  - **Common or very common** Confusion · disorientation · drowsiness · psychosis · renal toxicity (may lead to tubular dysfunction, Fanconi's syndrome, or diabetes insipidus) · restlessness · urothelial toxicity
  - **Uncommon** Severe encephalopathy
  - **Rare** Anorexia · constipation · convulsions · diarrhoea
  - **Very rare** Jaundice · syndrome of inappropriate antidiuretic hormone secretion · thrombophlebitis
  - **Frequency not known** Acute pancreatitis · alopecia · arrhythmias · bone-marrow suppression · extravasation · heart failure · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
  - Urothelial toxicity Mesna is routinely given with ifosfamide to reduce urothelial toxicity.
  - Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Avoid if serum creatinine concentration greater than 120 micromol/litre.
- **MONITORING REQUIREMENTS** Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for injection

##### ► Ifosfamide (Non-proprietary)

Ifosfamide 1 gram Ifosfamide 1g powder for concentrate for solution for injection vials | 1 vial [PoM] £91.32

Ifosfamide 2 gram Ifosfamide 2g powder for concentrate for solution for injection vials | 1 vial [PoM] £179.88

## Lomustine

- **DRUG ACTION** Lomustine is a lipid-soluble nitrosourea.

#### ● INDICATIONS AND DOSE

##### Hodgkin's disease resistant to conventional therapy | Malignant melanoma | Certain solid tumours

- BY MOUTH
- Adult: 120–130 mg/m<sup>2</sup> every 6–8 weeks, dose is for when lomustine is used alone

#### IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES  
See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Coeliac disease
- **CAUTIONS** Avoid in Acute porphyrias p. 969
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression (delayed) · hyperuricaemia · male sterility · nausea · oral mucositis · permanent bone marrow damage (with prolonged use) · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
  - Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid in severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** The brand name *CENU*® has been used for lomustine capsules.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

##### Capsule

  - **Lomustine (Non-proprietary)**
    - Lomustine 10 mg** CeeNU 10mg capsules | 20 capsule [PoM] no price available
    - Lomustine 40 mg** Lomustine 40mg capsules | 20 capsule [PoM] £780.82
    - Lomustine 100 mg** CeeNU 100mg capsules | 20 capsule [PoM] no price available

## Melphalan

### ● INDICATIONS AND DOSE

#### Multiple myeloma

- BY MOUTH
  - Adult: 150 micrograms/kg daily for 4 days, dose to be repeated every 6 weeks, dose may vary according to regimen
- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  - Adult: (consult product literature)

#### Polycythaemia vera

- BY MOUTH
  - Adult: Initially 6–10 mg daily for 5–7 days, then reduced to 2–4 mg daily until satisfactory response, then reduced to 2–6 mg once weekly

#### Localised malignant melanoma of the extremities |

#### Localised soft-tissue sarcoma of the extremities

- BY REGIONAL ARTERIAL PERFUSION
  - Adult: (consult local protocol)

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Avoid in Acute porphyrias p. 969
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS**
  - GENERAL SIDE-EFFECTS**
    - **Rare** Interstitial pneumonitis · life threatening pulmonary fibrosis
    - **Frequency not known** Alopecia · bone-marrow suppression (delayed) · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting
  - SPECIFIC SIDE-EFFECTS**
    - With intravenous use Extravasation
  - SIDE-EFFECTS, FURTHER INFORMATION**
    - Secondary malignancy Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Reduce dose initially (consult product literature).
- **MONITORING REQUIREMENTS** Monitor full blood count before and throughout treatment.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder and solvent for solution for injection

##### ► Melphalan (Non-proprietary)

Melphalan (as Melphalan hydrochloride) 50 mg Melphalan 50mg powder and solvent for solution for injection vials | 1 vial [PoM] £137.37

#### Tablet

##### ► Melphalan (Non-proprietary)

Melphalan 2 mg Melphalan 2mg tablets | 25 tablet [PoM] £45.38 DT price = £45.38

## Temozolomide

- **DRUG ACTION** Temozolomide is structurally related to dacarbazine.

### ● INDICATIONS AND DOSE

**Newly diagnosed glioblastoma multiforme in adults (in combination with radiotherapy) and subsequently as monotherapy | Second-line treatment of malignant glioma in adults**

- BY MOUTH
  - Adult: (consult product literature)

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** *Pneumocystis jirovecii* pneumonia—consult product literature for monitoring and prophylaxis requirements
- **INTERACTIONS** → Appendix 1: alkylating agents
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**  
For further information on side-effects consult product literature.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
  - Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported).
  - Monitor for myelodysplastic syndrome.
  - Monitor for secondary malignancies.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - Temozolomide for the treatment of recurrent malignant glioma (brain cancer) (April 2001) NICE TA23  
Temozolomide may be considered for the treatment of recurrent malignant glioma, which has not responded to first-line chemotherapy.  
[www.nice.org.uk/TA23](http://www.nice.org.uk/TA23)
  - Carmustine implants and temozolomide for the treatment of newly diagnosed high-grade glioma (June 2007) NICE TA121  
Temozolomide is an option for the treatment of newly diagnosed glioblastoma multiforme in patients with a WHO performance status of 0 or 1.  
[www.nice.org.uk/TA121](http://www.nice.org.uk/TA121)

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

**Capsule**

CAUTIONARY AND ADVISORY LABELS 23, 25

**Thiotepa**

● **INDICATIONS AND DOSE**

**Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy**

► **BY INTRAVENOUS INFUSION**

► **Adult:** (consult local protocol)

● **CAUTIONS** Avoid in Acute porphyrias p. 969

● **INTERACTIONS** → Appendix 1: alkylating agents

● **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · male sterility · nausea · oral mucositis · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

► **Secondary malignancy** Prolonged use of alkylating drugs, particularly when combined with extensive irradiation, is associated with a marked increase in the incidence of acute non-lymphocytic leukaemia.

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **PREGNANCY** Avoid (teratogenic and embryotoxic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

## ANTINEOPLASTIC DRUGS > ANTHRACYCLINES AND RELATED DRUGS

### Daunorubicin

#### ● INDICATIONS AND DOSE

**Acute myelogenous leukaemia | Acute lymphocytic leukaemia**

► BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

**Advanced AIDS-related Kaposi's sarcoma (liposomal formulation only)**

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

● **CONTRA-INDICATIONS** Myocardial insufficiency · previous treatment with maximum cumulative doses of daunorubicin or other anthracycline · recent myocardial infarction · severe arrhythmia

● **CAUTIONS** Caution in handling—irritant to tissues

● **INTERACTIONS** → Appendix 1: anthracyclines

● **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

► **Cardiotoxicity** All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Reduce dose according to serum bilirubin concentration—consult local protocol for details. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Reduce dose by 25% if serum creatinine 105–265 micromol/litre. Reduce dose by 50% if serum creatinine greater than 265 micromol/litre. Avoid in severe impairment.

● **MONITORING REQUIREMENTS** Cardiac monitoring essential.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Emulsion for infusion

► **DaunoXome** (Galen Ltd)

Daunorubicin (as Daunorubicin hydrochloride citrate)

50 mg DaunoXome 50mg emulsion for infusion vials | 1 vial [PoM]  
£250.00

##### Powder for solution for infusion

► **Daunorubicin (Non-proprietary)**

Daunorubicin (as Daunorubicin hydrochloride)

20 mg Daunorubicin 20mg powder for solution for infusion vials | 10 vial [PoM] £650.00 (Hospital only)

### Doxorubicin hydrochloride

10-Jun-2016

#### ● INDICATIONS AND DOSE

**Acute leukaemias | Hodgkin's lymphoma | Non-Hodgkin's lymphoma | Some solid tumours including breast cancer**

► BY INTRAVENOUS INJECTION

► Adult: (consult product literature)

**Some papillary bladder tumours (bladder instillation) | Recurrent superficial bladder tumours (bladder instillation) | Transitional cell carcinoma (bladder instillation) | Carcinoma in situ (bladder instillation)**

► BY INTRAVESICAL INSTILLATION

► Adult: (consult product literature)

#### CAELYX®

**For AIDS-related Kaposi's sarcoma in patients with low CD4 count and extensive mucocutaneous or visceral disease | Advanced ovarian cancer when platinum-based chemotherapy has failed | Progressive multiple myeloma (in combination with bortezomib) in patients who have received at least one prior therapy and who have undergone or are unsuitable for bone-marrow transplantation | Monotherapy for metastatic breast cancer in patients with increased cardiac risk**

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

#### MYOCET®

**For use with cyclophosphamide for metastatic breast cancer**

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

● **CONTRA-INDICATIONS** Consult product literature

● **CAUTIONS** Cardiac disease · caution in handling—irritant to tissues · consult product literature · elderly · hypertension · previous myocardial irradiation

● **INTERACTIONS** → Appendix 1: anthracyclines

#### ● SIDE-EFFECTS

► **Common or very common** Dehydration · diarrhoea · red colouration of the urine

► **Uncommon** Supraventricular tachycardia (related to drug administration)

► **Frequency not known** Alopecia · bone-marrow suppression · cardiomyopathy (with higher cumulative doses) · consult product literature · extravasation · heart failure (potentially fatal) · hyperuricaemia · nausea · oral mucositis · renal damage · thromboembolism · tumour lysis syndrome · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

► **Extravasation** Extravasation can cause severe tissue necrosis.

► **Cardiomyopathy** Higher cumulative doses are associated with cardiomyopathy and it is usual to limit total cumulative doses to 450 mg/m<sup>2</sup> because symptomatic and potentially fatal heart failure is common above this dose.

► **Cardiotoxic** Some evidence suggests that weekly low-dose administration may be less cardiotoxic.

► **Liposomal formulations** *Liposomal* formulations of doxorubicin may reduce the incidence of cardiotoxicity and lower the potential for local necrosis, but infusion reactions, sometimes severe, may occur. Hand-foot syndrome (painful, macular reddening skin eruptions) occurs commonly with liposomal doxorubicin and may be dose limiting. It can occur after 2–3 treatment cycles and may be prevented by cooling hands and feet and avoiding socks, gloves, or tight-fitting footwear for 4–7 days after treatment.

► **Elevated bilirubin concentration** Doxorubicin is largely excreted in the bile and an elevated bilirubin concentration is an indication for reducing the dose.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

● **PREGNANCY** Avoid (teratogenic and toxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Reduce dose according to bilirubin concentration—consult product literature or local treatment protocol for details. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Consult product literature in severe impairment.
- **MONITORING REQUIREMENTS** Patients should be assessed before treatment, by echocardiography. Cardiac monitoring during treatment may assist in determining safe dosage.

- **DIRECTIONS FOR ADMINISTRATION** *Conventional* doxorubicin is given by injection into a fast-running infusion, commonly at 21-day intervals.
- **PRESCRIBING AND DISPENSING INFORMATION** Doxorubicin is available as both *conventional* and *liposomal* formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable.

#### • NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016)** NICE TA389  
Pegylated liposomal doxorubicin hydrochloride (PLDH) monotherapy or in combination with platinum, is recommended as an option for treating recurrent ovarian cancer.

PLDH, in combination with trabectedin, is **not** recommended for treating the first recurrence of platinum-sensitive ovarian cancer.

Patients currently receiving PLDH in combination with trabectedin should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

## Epirubicin hydrochloride

#### • INDICATIONS AND DOSE

##### Treatment of breast cancer | Treatment and prophylaxis of certain forms of superficial bladder cancer

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVESICAL INSTILLATION
- ▶ Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Bladder inflammation or contraction (when used as a bladder instillation) · catheterisation difficulties (when used as a bladder instillation) · haematuria (when used as a bladder instillation) · invasive tumours penetrating the bladder (when used as a bladder instillation) · myocardiopathy · previous treatment with maximum cumulative doses of epirubicin or other anthracycline · recent myocardial infarction · severe arrhythmia · severe myocardial insufficiency · unstable angina · urinary tract infections (when used as a bladder instillation)

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: anthracyclines

- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · cardiotoxicity · extravasation · hyperpigmentation of nails · hyperpigmentation of oral mucosa · hyperpigmentation of skin · hyperuricaemia · nausea · oral mucositis · red colouration of the urine · thromboembolism · tumour lysis syndrome · vomiting

##### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Cardiotoxicity A maximum cumulative dose of 0.9–1 g/m<sup>2</sup> is recommended to help avoid cardiotoxicity.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **PREGNANCY** Avoid (carcinogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Reduce dose according to bilirubin concentration—consult local treatment protocol for details. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Dose reduction may be necessary in severe impairment.

#### • MEDICAL FORMS

## Pixantrone

### ● INDICATIONS AND DOSE

**Treatment of refractory or multiply relapsed aggressive non-Hodgkin B-cell lymphomas (monotherapy)**

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

● **CONTRA-INDICATIONS** Active severe infection · risk factors for severe infection

● **CAUTIONS** Active cardiovascular disease · cardiac risk factors · caution in handling—irritant to tissues · concurrent radiotherapy to the mediastinal area · history of cardiovascular disease · previous radiotherapy to the mediastinal area · previous therapy with anthracenediones · previous therapy with anthracyclines

● **INTERACTIONS** → Appendix 1: anthracyclines

### ● SIDE-EFFECTS

► **Common or very common** Abdominal pain · abnormal liver function tests · biochemical disturbances · bone pain · cardiac disorders · cardiac toxicity (during or following treatment) · chromaturia · conjunctivitis · constipation · cough · diarrhoea · drowsiness · dry mouth · dyspepsia · dyspnoea · electrolyte disturbances · haematuria · headache · hypotension · infection · loss of appetite · malaise · nail disorder · oedema · pallor · paraesthesia · proteinuria · pruritus · pyrexia · severe myelosuppression · skin discolouration · tachycardia · taste disturbances · vein discolouration · weight loss

► **Uncommon** Anxiety · arrhythmia · arthralgia · arthritis · dizziness · dry eye · keratitis · musculoskeletal pain · musculoskeletal weakness · night sweats · oesophagitis · oliguria · petechiae · pleural effusion · pneumonitis · rash · rectal haemorrhage · rhinorrhoea · skin ulcer · sleep disorder · spontaneous erection · tumour progression · vein disorder · vertigo

► **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · photosensitivity · thromboembolism · tumour lysis syndrome · vomiting

● **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

● **RENAL IMPAIRMENT** No information available—manufacturer advises caution.

### ● MONITORING REQUIREMENTS

► Baseline investigations should include a full blood count, assessment of cardiac function measured by left ventricular ejection fraction, and measurement of serum concentrations of total bilirubin and total creatinine.

► Full blood count and cardiac function should be monitored throughout treatment.

### ● PATIENT AND CARER ADVICE

Photosensitivity Photosensitivity is a theoretical risk and patients should be advised to follow sun protection strategies.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

► Pixantrone monotherapy for treating multiply relapsed or refractory aggressive non-Hodgkin's B-cell lymphoma (February 2014) NICE TA306

Pixantrone monotherapy is recommended as an option for treating adults with multiply relapsed or refractory aggressive non-Hodgkin's B-cell lymphoma in patients:

- who have previously been treated with rituximab and
- who are receiving third- or fourth-line treatment and
- if the manufacturer provides pixantrone with the discount agreed in the patient access scheme.

## ANTINEOPLASTIC DRUGS > ANTIMETABOLITES

## Azacitidine

28-Sep-2016

● **DRUG ACTION** Azacitidine is a pyrimidine analogue.

### ● INDICATIONS AND DOSE

**Treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, and acute myeloid leukaemia, in adults who are not eligible for haematopoietic stem cell transplantation**

► BY SUBCUTANEOUS INJECTION

► Adult: (consult local protocol)

● **CONTRA-INDICATIONS** Advanced malignant hepatic tumour

● **CAUTIONS** History of severe congestive heart failure · unstable cardiac disease (consider cardiopulmonary assessment before and during treatment) · unstable pulmonary disease (consider cardiopulmonary assessment before and during treatment)

● **INTERACTIONS** → Appendix 1: azacitidine

### ● SIDE-EFFECTS

► **Common or very common** Abdominal pain · anorexia · anxiety · arthralgia · cerebral haemorrhage · constipation · diarrhoea · dizziness · drowsiness · dyspepsia · dyspnoea · gastro-intestinal disturbances · haematoma · haematuria · haemorrhage · headache · hypertension · hypokalaemia · hypotension · injection-site reactions · insomnia · myalgia · pneumonia · rash

► **Uncommon** Anaphylactic reactions · hypersensitivity reactions

► **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hepatic coma · hepatic failure · hyperuricaemia · nausea · oral mucositis · renal failure · thromboembolism · tumour lysis syndrome · vomiting

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.

● **PREGNANCY** Avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Caution in severe impairment.

● **RENAL IMPAIRMENT** Delay next treatment cycle if serum-creatinine or blood urea nitrogen greater than twice baseline value and above the upper level of normal until values return to normal or baseline, and then reduce dose by 50% on the next treatment cycle. Reduce dose by 50% on the next treatment cycle if serum-bicarbonate concentration less than 20 mmol/litre.

### ● MONITORING REQUIREMENTS

► Monitor liver function tests, serum creatinine, and serum bicarbonate before initiation of treatment and before each treatment cycle.

- ▶ Monitor full blood count before initiation of treatment, before each treatment cycle, and as clinically indicated.
- ▶ Monitor for bleeding.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ Azacitidine for treating acute myeloid leukaemia with more than 30% bone marrow blasts (July 2016) NICE TA399  
Azacitidine is **not** recommended, within its marketing authorisation, for treating acute myeloid leukaemia with greater than 30% bone marrow blasts in patients aged 65 years or above who are not eligible for haematopoietic stem cell transplant.

Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.  
[www.nice.org.uk/TA399](http://www.nice.org.uk/TA399)

- ▶ Azacitidine for the treatment of myelodysplastic syndromes, chronic myelomonocytic leukaemia and acute myeloid leukaemia (March 2011) NICE TA218  
Azacitidine is recommended in adults who are not eligible for haematopoietic stem cell transplantation as an option for the treatment of intermediate-2 and high-risk myelodysplastic syndromes, chronic myelomonocytic leukaemia, or acute myeloid leukaemia.  
[www.nice.org.uk/TA218](http://www.nice.org.uk/TA218)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for suspension for injection

- ▶ **Vidaza** (Celgene Ltd)  
Azacitidine 100 mg Vidaza 100mg powder for suspension for injection vials | 1 vial (PoM) £321.00

## Capecitabine

- **DRUG ACTION** Capecitabine is metabolised to fluorouracil.

#### ● INDICATIONS AND DOSE

##### Stage III colon cancer, adjuvant following surgery (monotherapy)

- ▶ BY MOUTH
- ▶ Adult: 1.25 g/m<sup>2</sup> twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

##### Stage III colon cancer, adjuvant following surgery (combination therapy)

- ▶ BY MOUTH
- ▶ Adult: 0.8–1 g/m<sup>2</sup> twice daily for 14 days, subsequent courses repeated after a 7-day interval, recommended duration of treatment is 6 months, adjust dose according to tolerability—consult product literature

##### Metastatic colorectal cancer (monotherapy)

- ▶ BY MOUTH
- ▶ Adult: 1.25 g/m<sup>2</sup> twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

##### Metastatic colorectal cancer (combination therapy)

- ▶ BY MOUTH
- ▶ Adult: 0.8–1 g/m<sup>2</sup> twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

##### Advanced gastric cancer (first-line treatment in combination with a platinum based regimen)

- ▶ BY MOUTH
- ▶ Adult: 0.8–1 g/m<sup>2</sup> twice daily for 14 days, subsequent courses repeated after a 7-day interval, alternatively 625 mg/m<sup>2</sup> twice daily given continuously, adjust dose according to tolerability—consult product literature

**Locally advanced or metastatic breast cancer (second-line treatment as monotherapy after failure of a taxane and anthracycline regimen or where further anthracycline treatment is not indicated) | Locally advanced or metastatic breast cancer (second-line treatment, in combination with docetaxel, where previous therapy included an anthracycline)**

- ▶ BY MOUTH
- ▶ Adult: 1.25 g/m<sup>2</sup> twice daily for 14 days, subsequent courses repeated after a 7-day interval, adjust dose according to tolerability—consult product literature

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Dihydropyrimidine dehydrogenase deficiency
- **CAUTIONS** Diabetes mellitus · diarrhoea or dehydration—consult product literature for guidance on dose modification and treatment interruption · electrolyte disturbances · history of angina pectoris · history of arrhythmias · history of significant cardiovascular disease · nervous system disease
- **INTERACTIONS** → Appendix 1: capecitabine
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**  
For further information on side-effects, consult product literature.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function in mild to moderate impairment—consult product literature for guidance on treatment interruption; avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce starting dose of 1.25 g/m<sup>2</sup> to 75% if creatinine clearance 30–50 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor plasma-calcium concentration.
  - ▶ Monitor for eye disorders (including keratitis and corneal disorders).
  - ▶ Severe skin reactions Monitor for symptoms of severe skin reactions (including Stevens-Johnson syndrome and toxic epidermal necrolysis)—permanently discontinue treatment immediately if symptoms occur.
  - ▶ Hand-foot syndrome Monitor for symptoms of hand-foot syndrome—interrupt treatment if significant syndrome occurs and refer to product literature.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**
  - ▶ Bevacizumab in combination with capecitabine for the first-line treatment of metastatic breast cancer (August 2012) NICE TA263  
Bevacizumab in combinations with capecitabine is **not** recommended within its marketing authorisation for the first-line treatment of metastatic breast cancer, that is, when treatment with other chemotherapy options including taxanes or anthracyclines is not considered appropriate, or when taxanes or anthracyclines have been used as part of adjuvant treatment in the previous 12 months.  
[www.nice.org.uk/TA263](http://www.nice.org.uk/TA263)

- ▶ **Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212** Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is **not** recommended for the treatment of metastatic colorectal cancer.

[www.nice.org.uk/TA212](http://www.nice.org.uk/TA212)

- ▶ **Capecitabine for the treatment of advanced gastric cancer (July 2010) NICE TA191**

Capecitabine in combination with a platinum-based regimen is recommended for the first-line treatment of inoperable advanced gastric cancer.

[www.nice.org.uk/TA191](http://www.nice.org.uk/TA191)

- ▶ **Capecitabine and tegafur with uracil for metastatic colorectal cancer (May 2003) NICE TA61** Capecitabine or tegafur with uracil [now discontinued] (in combination with folinic acid) is an option for the first-line treatment of metastatic colorectal cancer.

[www.nice.org.uk/TA61](http://www.nice.org.uk/TA61)

- ▶ **Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer (April 2006) NICE TA100** Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes' C) colon cancer.

[www.nice.org.uk/TA100](http://www.nice.org.uk/TA100)

## Cladribine

#### • INDICATIONS AND DOSE

##### LEUSTAT®

**B-cell chronic lymphocytic leukaemia in patients who have failed to respond to standard regimens containing an alkylating agent | Hairy cell leukaemia**

##### ▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature or local protocols)

##### LITAK®

**Hairy cell leukaemia**

##### ▶ BY SUBCUTANEOUS INJECTION

▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Use irradiated blood only

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Immunosuppressive effect of cladribine** Cladribine has a potent and prolonged immunosuppressive effect. Patients treated with cladribine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

- **INTERACTIONS** → Appendix 1: cladribine

- **SIDE-EFFECTS** Abdominal pain · acute renal failure (with high doses) · alopecia · anxiety · arthralgia · asthenia · bone-marrow suppression · chills · constipation · cough · diarrhoea · dizziness · dyspnoea · extravasation · flatulence · haemolytic anaemia · headache · hyperuricaemia · insomnia · malaise · myalgia · nausea · oedema · oral mucositis · pruritus · purpura · rash · severe myelosuppression (with neutropenia, anaemia and thrombocytopenia) · severe neurotoxicity (with high doses) · sweating · tachycardia · thromboembolism · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that men should not father children during and for 6 months after treatment.

- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Regular monitoring recommended in hepatic impairment.

- **RENAL IMPAIRMENT** Regular monitoring recommended in renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** *Litak*® for subcutaneous use only—no dilution required.

#### • MEDICINAL FORMS

##### Solution for injection

##### ▶ **Litak (Lipomed GmbH)**

**Cladribine 2 mg per 1 ml** *Litak* 10mg/5ml solution for injection vials | 1 vial [PoM](#) £165.00 (Hospital only) | 5 vial [PoM](#) £820.00 (Hospital only)

##### Solution for infusion

##### ▶ **Leustat (Janssen-Cilag Ltd)**

**Cladribine 1 mg per 1 ml** *Leustat* 10mg/10ml solution for infusion vials | 1 vial [PoM](#) £159.70

## Clofarabine

#### • INDICATIONS AND DOSE

**Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens**

##### ▶ BY INTRAVENOUS INFUSION

▶ Adult 18–20 years: (consult local protocol)

- **CAUTIONS** Cardiac disease

- **INTERACTIONS** → Appendix 1: clofarabine

- **SIDE-EFFECTS** Abdominal pain · agitation · alopecia · anxiety · arthralgia · bone-marrow suppression · cough · diarrhoea · dizziness · drowsiness · dyspnoea · extravasation · flushing · haematoma · haematuria · hand-foot (desquamative) syndrome · headache · hyperuricaemia · hypotension · jaundice · myalgia · nausea · oedema · oral mucositis · pancreatitis · paraesthesia · pericardial effusion · peripheral neuropathy · pruritus · rash · restlessness · sweating · tachycardia · thromboembolism · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Evoltra** (Sanofi) ▼

**Clofarabine 1 mg per 1 ml** Evoltra 20mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £1,326.18 (Hospital only)

## Cytarabine

- **DRUG ACTION** Cytarabine acts by interfering with pyrimidine synthesis.

#### INDICATIONS AND DOSE

##### Induction of remission of acute myeloblastic leukaemia

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult local protocol)

##### Lymphomatous meningitis

- ▶ BY INTRATHECAL INJECTION
- ▶ Adult: (consult local protocol)

#### IMPORTANT SAFETY INFORMATION

Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

- **INTERACTIONS** → Appendix 1: cytarabine
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose—consult product literature.
- **MONITORING REQUIREMENTS**
  - ▶ Haematological monitoring Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.

#### NATIONAL FUNDING/ACCESS DECISIONS

##### DEPOCYTE®

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2007) that liposomal cytarabine suspension (*DepoCyte*®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

##### Solution for injection

- ▶ **Cytarabine (Non-proprietary)**

**Cytarabine 20 mg per 1 ml** Cytarabine 500mg/25ml solution for injection vials | 1 vial [PoM] £19.50

**Cytarabine 100mg/5ml solution for injection vials** | 5 vial [PoM] £20.98-£30.00

**Cytarabine 100 mg per 1 ml** Cytarabine 1g/10ml solution for injection vials | 1 vial [PoM] £40.00

**Cytarabine 500mg/5ml solution for injection vials** | 5 vial [PoM] £100.00

**Cytarabine 4g/40ml solution for injection vials** | 1 vial [PoM] no price available

Cytarabine 100mg/1ml solution for injection vials | 5 vial [PoM]

£30.00

Cytarabine 2g/20ml solution for injection vials | 1 vial [PoM] £79.00

#### Suspension for injection

- ▶ **DepoCyte** (Napp Pharmaceuticals Ltd)

**Cytarabine 10 mg per 1 ml** DepoCyte 50mg/5ml suspension for injection vials | 1 vial [PoM] £1,223.75 (Hospital only)

## Decitabine

- **DRUG ACTION** Decitabine is a pyrimidine analogue.

#### INDICATIONS AND DOSE

**Treatment of newly diagnosed acute myeloid leukaemia in patients over 65 years of age who are not candidates for standard induction chemotherapy**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Elderly: (consult local protocol)

- **CAUTIONS** History of severe congestive heart failure · history of unstable cardiac disease
- **INTERACTIONS** → Appendix 1: decitabine
- **SIDE-EFFECTS**
  - ▶ Common or very common Diarrhoea · epistaxis · headache
  - ▶ Uncommon Acute febrile neutrophilic dermatosis
  - ▶ Frequency not known Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Men must avoid fathering a child during and for 3 months after treatment.
- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for infusion

ELECTROLYTES: May contain Potassium, sodium

- ▶ **Dacogen** (Janssen-Cilag Ltd) ▼

**Decitabine 50 mg** Dacogen 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £970.86

## Fludarabine phosphate

#### INDICATIONS AND DOSE

**Initial treatment of advanced B-cell chronic lymphocytic leukaemia (CLL) or after first line treatment in patients with sufficient bone-marrow reserves**

- ▶ BY MOUTH
  - ▶ Adult: 40 mg/m<sup>2</sup> for 5 days every 28 days, usually given for 6 cycles
- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
  - ▶ Adult: (consult product literature)

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Haemolytic anaemia
- **CAUTIONS** Increased susceptibility to skin cancer · worsening of existing skin cancer
- **CAUTIONS, FURTHER INFORMATION**  
Co-trimoxazole is used to prevent pneumocytis infection.

- Immunosuppression Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

- **INTERACTIONS** → Appendix 1: fludarabine

- **SIDE-EFFECTS**

- **Common or very common** Acute myeloid leukaemia · anorexia · chills · cough · diarrhoea · fever · immunosuppression · malaise · myelodysplastic syndrome · myelosuppression (may be cumulative) · oedema · peripheral neuropathy · pneumonia · rash · visual disturbances · weakness
- **Uncommon** Autoimmune disorder · confusion · fibrosis · haemorrhage · immune-mediated haemolytic anaemia · neutropenia · pneumonitis · pulmonary toxicity · thrombocytopenia
- **Rare** Agitation · arrhythmia · blindness · coma · heart failure · optic neuropathy · seizures · skin cancer · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **Frequency not known** Alopecia · bone-marrow suppression · extravasation · haemorrhagic cystitis · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

- **PREGNANCY** Avoid (embryotoxic and teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding.

- **RENAL IMPAIRMENT** Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.

- **MONITORING REQUIREMENTS**

- Monitor for signs of haemolysis.
- Monitor for neurological toxicity.
- Assess creatinine clearance in patients over 65 years before treatment initiation.

- **DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

- **NATIONAL FUNDING/ACCESS DECISIONS**

- NICE technology appraisals (TAs)**

- Fludarabine monotherapy for the first-line treatment of chronic lymphocytic leukaemia (February 2007) NICE TA119 Fludarabine monotherapy is **not** recommended for the first-line treatment of chronic lymphocytic leukaemia. [www.nice.org.uk/TA119](http://www.nice.org.uk/TA119)
- Fludarabine for the treatment of B-cell chronic lymphocytic leukaemia (September 2001) NICE TA29 Oral fludarabine is recommended for the second-line treatment of B-cell chronic lymphocytic leukaemia in patients who have either failed, or are intolerant of, first line chemotherapy, and who would otherwise have received combination chemotherapy of either:
  - cyclophosphamide, doxorubicin, vincristine and prednisolone (CHOP)
  - cyclophosphamide, doxorubicin and prednisolone (CAP) or
  - cyclophosphamide, vincristine and prednisolone (CVP)
 Intravenous fludarabine should only be used when oral fludarabine is contra-indicated. [www.nice.org.uk/TA29](http://www.nice.org.uk/TA29)

## Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2006) that fludarabine is accepted for restricted use for the treatment of B-cell chronic lymphocytic leukaemia (CLL) in patients with sufficient bone marrow reserves. First-line treatment should only be initiated in patients with advanced disease, Rai stages III/IV (Binet stage C), or Rai stages I/II (Binet stage A/B) where the patient has disease-related symptoms or evidence of progressive disease.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

- Solution for injection**

- **Fludarabine phosphate (Non-proprietary)**

Fludarabine phosphate 25 mg per 1 ml Fludarabine phosphate 50mg/2ml concentrate for solution for injection vials | 1 vial [PoM] £156.00 (Hospital only) | 1 vial [PoM] £155.00

- Tablet**

- **Fludara** (Sanofi)

Fludarabine phosphate 10 mg Fludara 10mg tablets | 15 tablet [PoM] £302.48 (Hospital only) | 20 tablet [PoM] £403.31 (Hospital only)

- Powder for solution for injection**

- **Fludarabine phosphate (Non-proprietary)**

Fludarabine phosphate 50 mg Fludarabine phosphate 50mg powder for solution for injection vials | 1 vial [PoM] £155.00 (Hospital only)

- **Fludara** (Sanofi)

Fludarabine phosphate 50 mg Fludara 50mg powder for solution for injection vials | 5 vial [PoM] £735.34 (Hospital only)

## Fluorouracil

- **INDICATIONS AND DOSE**

**Treatment of some solid tumours including gastro-intestinal tract cancers and breast cancer | In combination with folinic acid in advanced colorectal cancer**

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY INTRA-ARTERIAL INFUSION
- Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: fluorouracil

- **SIDE-EFFECTS**

- **Rare** Cerebellar syndrome
- **Frequency not known** Alopecia · bone-marrow suppression · desquamative hand-foot syndrome (on prolonged infusion) · extravasation · hyperuricaemia · mucositis · myelosuppression · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **HANDLING AND STORAGE** Caution in handling—irritant to tissues.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

- Solution for injection**

- **Fluorouracil (Non-proprietary)**

Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 500mg/20ml solution for injection vials | 10 vial [PoM] £64.00 Fluorouracil 250mg/10ml solution for injection vials | 5 vial [PoM] £24.00

Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml Fluorouracil 1g/20ml solution for injection vials | 1 vial [PoM] £12.80 Fluorouracil 500mg/10ml solution for injection vials | 1 vial [PoM] £6.40 | 5 vial [PoM] £32.00

**Solution for infusion**► **Fluorouracil (Non-proprietary)**

Fluorouracil (as Fluorouracil sodium) 25 mg per 1 ml Fluorouracil 2.5g/100ml solution for infusion vials | 1 vial [PoM] £32.00

Fluorouracil (as Fluorouracil sodium) 50 mg per 1 ml Fluorouracil 5g/100ml solution for infusion vials | 1 vial [PoM] £64.00  
Fluorouracil 2.5g/50ml solution for infusion vials | 1 vial [PoM] £32.00

**Gemcitabine**

10-Jun-2016

● **INDICATIONS AND DOSE**

**First-line treatment for locally advanced or metastatic non-small cell lung cancer (as monotherapy in elderly patients and in palliative treatment; otherwise in combination with cisplatin) | Treatment of locally advanced or metastatic pancreatic cancer | Treatment of advanced or metastatic bladder cancer (in combination with cisplatin) | Treatment of locally advanced or metastatic epithelial ovarian cancer which has relapsed after a recurrence-free interval of at least 6 months following previous platinum-based therapy (in combination with carboplatin) | Treatment of metastatic breast cancer which has relapsed after previous chemotherapy including an anthracycline (in combination with paclitaxel)**

► BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

● **INTERACTIONS** → Appendix 1: gemcitabine● **SIDE-EFFECTS**► **Rare** Haemolytic uraemic syndrome

► **Frequency not known** Alopecia • bone-marrow suppression • extravasation • hyperuricaemia • influenza-like symptoms • microangiopathic haemolytic anaemia • mild gastro-intestinal side-effects • musculoskeletal pain • nausea • oral mucositis • pulmonary toxicity • rash • renal impairment • thromboembolism • tumour lysis syndrome • vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

► **Microangiopathic haemolytic anaemia** Gemcitabine should be discontinued if signs of microangiopathic haemolytic anaemia occur.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.

● **PREGNANCY** Avoid (teratogenic in animal studies). See *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● **RENAL IMPAIRMENT** Manufacturer advises caution.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

► **Gemcitabine for the treatment of pancreatic cancer (May 2001)** NICE TA25

Gemcitabine is an option for first-line chemotherapy for patients with advanced or metastatic adenocarcinoma of the pancreas and a Karnofsky score of at least 50 [Karnofsky score is a measure of the ability to perform ordinary tasks].

Gemcitabine is not recommended for patients who can have potentially curative surgery. There is insufficient evidence about its use for second-line treatment of pancreatic adenocarcinoma.

[www.nice.org.uk/TA25](http://www.nice.org.uk/TA25)

► **Gemcitabine for the treatment of metastatic breast cancer (January 2007)** NICE TA116

Gemcitabine, in combination with paclitaxel, is an option for the treatment of metastatic breast cancer **only** when docetaxel monotherapy or docetaxel plus capecitabine are also considered appropriate.

[www.nice.org.uk/TA116](http://www.nice.org.uk/TA116)

► **Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013)** NICE TA285

Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.

[www.nice.org.uk/TA285](http://www.nice.org.uk/TA285)

► **Paclitaxel as albumin-bound nanoparticles in combination with gemcitabine for previously untreated metastatic pancreatic cancer (October 2015)** NICE TA360

Gemcitabine in combination with albumin-bound paclitaxel (nab-paclitaxel, *Abraxane*®) is **not** recommended for the treatment of previously untreated metastatic adenocarcinoma of the pancreas.

Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA360](http://www.nice.org.uk/TA360)

► **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016)** NICE TA389

Gemcitabine, in combination with carboplatin, is **not** recommended for treating the first recurrence of platinum-sensitive ovarian cancer.

Patient currently receiving gemcitabine in combination with carboplatin should have the option to continue their treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA389](http://www.nice.org.uk/TA389)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (November 2006) that gemcitabine is accepted for restricted use for the treatment of metastatic breast cancer, which has relapsed following previous chemotherapy including an anthracycline (unless contra-indicated).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**► **Gemcitabine (Non-proprietary)**

**Gemcitabine (as Gemcitabine hydrochloride) 200 mg**

Gemcitabine 200mg/5.3ml concentrate for solution for infusion vials | 1 vial [PoM] £32.00 (Hospital only)

Gemcitabine 200mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £6.40

Gemcitabine 200mg/2ml concentrate for solution for infusion vials | 1 vial [PoM] no price available

**Gemcitabine (as Gemcitabine hydrochloride) 1 gram** Gemcitabine

1g/26.3ml concentrate for solution for infusion vials | 1 vial [PoM] £162.00 (Hospital only)

Gemcitabine 1g/25ml concentrate for solution for infusion vials | 1 vial [PoM] £13.09

Gemcitabine 1g/10ml concentrate for solution for infusion vials | 1 vial [PoM] no price available

**Gemcitabine (as Gemcitabine hydrochloride) 2 gram** Gemcitabine 2g/50ml concentrate for solution for infusion vials | 1 vial [PoM] £26.86

Gemcitabine 2g/20ml concentrate for solution for infusion vials | 1 vial [PoM] no price available

Gemcitabine 2g/52.6ml concentrate for solution for infusion vials | 1 vial [PoM] £324.00 (Hospital only)

**Gemcitabine (as Gemcitabine hydrochloride) 10 mg per**

**1 ml** Gemcitabine 1.6g/160ml infusion bags | 1 bag [PoM] £140.00

Gemcitabine 2.2g/220ml infusion bags | 1 bag [PoM] £200.00

Gemcitabine 2g/200ml infusion bags | 1 bag [PoM] £180.00

Gemcitabine 1.2g/120ml infusion bags | 1 bag [PoM] £120.00

Gemcitabine 1.8g/180ml infusion bags | 1 bag [PoM] £160.00

**Powder for solution for infusion**► **Gemcitabine (Non-proprietary)**

**Gemcitabine (as Gemcitabine hydrochloride) 200 mg** Gemcitabine 200mg powder for solution for infusion vials | 1 vial [PoM] £32.00-£32.55 (Hospital only) | 1 vial [PoM] £32.00

**Gemcitabine (as Gemcitabine hydrochloride) 1 gram** Gemcitabine 1g powder for solution for infusion vials | 1 vial [PoM] £162.00-£162.76 (Hospital only) | 1 vial [PoM] £162.00

**Gemcitabine (as Gemcitabine hydrochloride)**

**1.5 gram** Gemcitabine 1.5g powder for solution for infusion vials | 1 vial [PoM] £231.93

**Gemcitabine (as Gemcitabine hydrochloride) 2 gram** Gemcitabine 2g powder for solution for infusion vials | 1 vial [PoM] £324.00 (Hospital only) | 1 vial [PoM] £324.00

► **Gemzar** (Eli Lilly and Company Ltd)

**Gemcitabine (as Gemcitabine hydrochloride) 200 mg** Gemzar 200mg powder for solution for infusion vials | 1 vial [PoM] £32.55 (Hospital only)

**Gemcitabine (as Gemcitabine hydrochloride) 1 gram** Gemzar 1g powder for solution for infusion vials | 1 vial [PoM] £162.76 (Hospital only)

**Mercaptopurine****(6-Mercaptopurine)**● **INDICATIONS AND DOSE**

**Severe acute Crohn's disease | Maintenance of remission of Crohn's disease | Ulcerative colitis**

► **BY MOUTH**

► Adult: 1–1.5 mg/kg daily, some patients may respond to lower doses

**Acute leukaemias | Chronic myeloid leukaemia**

► **BY MOUTH USING TABLETS**

► Adult: Initially 2.5 mg/kg daily, adjusted according to response, alternatively initially 50–75 mg/m<sup>2</sup> daily, adjusted according to response

► **BY MOUTH USING ORAL SUSPENSION**

► Adult: Initially 25–75 mg/m<sup>2</sup> daily, adjusted according to response

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises reduce dose to one-quarter of the usual dose with concurrent use of allopurinol.

**DOSE EQUIVALENCE AND CONVERSION**

► Mercaptopurine tablets and *Xaluprine*<sup>®</sup> oral suspension are **not** bioequivalent, haematological monitoring is advised when switching formulations.

- **UNLICENSED USE** Not licensed for use in severe ulcerative colitis and Crohn's disease.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Reduced thiopurine methyltransferase activity
- **CAUTIONS, FURTHER INFORMATION**
  - Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
- **INTERACTIONS** → Appendix 1: mercaptopurine
- **SIDE-EFFECTS**
  - **Rare** Pancreatitis · transient oligospermia
  - **Very rare** Intestinal ulceration · lymphoma

- **Frequency not known** Alopecia · anorexia · bone-marrow suppression · hepatotoxicity · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

- **Gastro-intestinal side-effects** Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** May need dose reduction.
- **RENAL IMPAIRMENT** Reduce dose.
- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.
- **MONITORING REQUIREMENTS** Monitor liver function.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

**Oral suspension**

EXCIPIENTS: May contain Aspartame

► **Xaluprine** (Nova Laboratories Ltd)

**Mercaptopurine 20 mg per 1 ml** Xaluprine 20mg/ml oral suspension | 100 ml [PoM] £170.00

**Tablet**► **Mercaptopurine (Non-proprietary)**

**Mercaptopurine 50 mg** Mercaptopurine 50mg tablets | 25 tablet [PoM] £49.15 DT price = £49.15

**Methotrexate**

17-May-2017

- **DRUG ACTION** Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

● **INDICATIONS AND DOSE**

**Severe Crohn's disease**

► **BY INTRAMUSCULAR INJECTION**

► Adult: Initially 25 mg once weekly until remission induced; maintenance 15 mg once weekly

**Maintenance of remission of severe Crohn's disease**

► **BY MOUTH**

► Adult: 10–25 mg once weekly

**Moderate to severe active rheumatoid arthritis**

► **BY MOUTH**

► Adult: 7.5 mg once weekly, adjusted according to response; maximum 20 mg per week

**Severe active rheumatoid arthritis**

► **BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**

► Adult: Initially 7.5 mg once weekly, then increased in steps of 2.5 mg once weekly, adjusted according to response; maximum 25 mg per week

**Neoplastic diseases**

► **BY INTRAVENOUS INJECTION, OR BY INTRATHECAL INJECTION, OR BY INTRA-ARTERIAL INFUSION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION, OR BY MOUTH**

► Adult: (consult product literature)

### Severe psoriasis unresponsive to conventional therapy (specialist use only)

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** Initially 2.5–10 mg once weekly, then increased in steps of 2.5–5 mg, adjusted according to response, dose to be adjusted at intervals of at least 1 week; usual dose 7.5–15 mg once weekly, stop treatment if inadequate response after 3 months at the optimum dose; maximum 30 mg per week

- **UNLICENSED USE** Not licensed for use in severe Crohn's disease.

#### IMPORTANT SAFETY INFORMATION

Note that the dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

- **CONTRA-INDICATIONS** Active infection (in non-malignant conditions) · ascites · immunodeficiency syndromes (in non-malignant conditions) · significant pleural effusion

- **CAUTIONS** Acute porphyrias p. 969 · photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported) · diarrhoea · extreme caution in blood disorders (avoid if severe) · peptic ulceration · risk of accumulation in pleural effusion or ascites—drain before treatment · ulcerative colitis · ulcerative stomatitis

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Blood count** Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another anti-folate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.
- ▶ **Gastro-intestinal toxicity** Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.
- ▶ **Liver toxicity** Liver cirrhosis reported. Treatment should not be started or should be discontinued if any abnormality of liver function tests or liver biopsy is present or develops during therapy. Abnormalities can return to normal within 2 weeks after which treatment may be recommenced if judged appropriate.
- ▶ **Pulmonary toxicity** Pulmonary toxicity may be a special problem in rheumatoid arthritis (patient to seek medical attention if dyspnoea, cough or fever); monitor for symptoms at each visit—discontinue if pneumonitis suspected.

- **INTERACTIONS** → Appendix 1: methotrexate

#### ● SIDE-EFFECTS

- ▶ **Rare** Pneumonitis
- ▶ **Frequency not known** Abdominal discomfort · acne · alopecia · anaphylactic reactions · anorexia · arthralgia · blood disorders · changes in nail pigmentation · changes in skin pigmentation · chills · chronic pulmonary fibrosis · confusion · conjunctivitis · cystitis · diarrhoea · dizziness · drowsiness · dyspepsia · dysuria · ecchymosis · fever · furunculosis · gastro-intestinal bleeding · gastro-intestinal ulceration · haematuria · headache · hepatotoxicity ·

hypotension · impotence · injection-site reactions · insomnia · interstitial pneumonitis · malaise · menstrual disturbances · mood changes · mucositis · myalgia · myelosuppression · nausea · neurotoxicity · osteoporosis · paraesthesia · pericardial tamponade · pericarditis · photosensitivity · pleuritic pain · precipitation of diabetes · pruritus · pulmonary fibrosis · pulmonary oedema · rash · reduced libido · renal failure · Stevens-Johnson syndrome · telangiectasia · thrombosis · toxic epidermal necrolysis · toxic megacolon · urticaria · vaginitis · vasculitis · visual disturbance · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

In patients taking methotrexate for non-malignant conditions who experience side-effects, folic acid given on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.

Treatment with folinic acid (as calcium folinate) may be required in acute toxicity.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 3 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).
- **BREAST FEEDING** Discontinue breast-feeding—present in milk.
- **HEPATIC IMPAIRMENT** When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.
- **RENAL IMPAIRMENT** Reduce dose. Risk of nephrotoxicity at high doses. Avoid in severe impairment.
- **PRE-TREATMENT SCREENING** Exclude pregnancy before treatment.

Patients should have full blood count and renal and liver function tests before starting treatment.

#### ● MONITORING REQUIREMENTS

- ▶ In view of reports of blood dyscrasias (including fatalities) and liver cirrhosis with low-dose methotrexate patients should:
  - have full blood count and renal and liver function tests repeated every 1–2 weeks until therapy stabilised, thereafter patients should be monitored every 2–3 months.
  - be advised to report all symptoms and signs suggestive of infection, especially sore throat
- ▶ Local protocols for frequency of monitoring may vary.
- ▶ Treatment with folinic acid (as calcium folinate) may be required in acute toxicity.

- **PRESCRIBING AND DISPENSING INFORMATION** Folinic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.

The licensed routes of administration for parenteral preparations vary—further information can be found in the product literature for the individual preparations.

#### ● PATIENT AND CARER ADVICE

Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).

Patients should be advised to avoid self-medication with over-the-counter aspirin or ibuprofen.

Patients should be counselled on the dose, treatment booklet, and the use of NSAIDs.

**Methotrexate treatment booklets** Methotrexate treatment booklets should be issued where appropriate.

In **England, Wales, and Northern Ireland**, they are available for purchase from:

Grorse Street, Chadderton  
Oldham  
OL9 9QH  
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Hospitals can order supplies from [www.nhsforms.co.uk](http://www.nhsforms.co.uk) or by emailing [nhsforms@mmm.com](mailto:nhsforms@mmm.com).

In **Scotland**, treatment booklets can be obtained by emailing stockorders.dppas@theapsgroup.com or by fax on 0131 629 9967.

These booklets include advice for adults taking oral methotrexate for inflammatory conditions, and a section for recording results of blood tests and dosage information.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

### Tablet

#### ► Methotrexate (Non-proprietary)

**Methotrexate 2.5 mg** Methotrexate 2.5mg tablets | 24 tablet [PoM] £3.75 | 28 tablet [PoM] £3.82 DT price = £1.77 | 100 tablet [PoM] £14.19

**Methotrexate 10 mg** Methotrexate 10mg tablets | 100 tablet [PoM] £57.21 DT price = £37.97

#### ► Maxtrex (Pfizer Ltd)

**Methotrexate 2.5 mg** Maxtrex 2.5mg tablets | 24 tablet [PoM] £2.39 | 100 tablet [PoM] £9.96

**Methotrexate 10 mg** Maxtrex 10mg tablets | 100 tablet [PoM] £45.16 DT price = £37.97

### Solution for injection

#### ► Methotrexate (Non-proprietary)

**Methotrexate (as Methotrexate sodium) 2.5 mg per 1 ml** Methotrexate 5mg/2ml solution for injection vials | 5 vial [PoM] £36.00

**Methotrexate (as Methotrexate sodium) 25 mg per 1 ml** Methotrexate 1g/40ml solution for injection vials | 1 vial [PoM]

£43.68 (Hospital only) | 1 vial [PoM] £44.57-£67.50

Methotrexate 500mg/20ml solution for injection vials | 1 vial [PoM]

£38.30 (Hospital only) | 1 vial [PoM] £22.56-£48.00

Methotrexate 50mg/2ml solution for injection vials | 1 vial [PoM]

£4.49 (Hospital only) | 1 vial [PoM] £3.00 | 5 vial [PoM] £35.00

Methotrexate 200mg/8ml solution for injection vials | 1 vial [PoM]

£10.02

**Methotrexate (as Methotrexate sodium) 100 mg per 1 ml** Methotrexate 1g/10ml solution for injection vials | 1 vial [PoM]

£85.00

#### ► Metoject PEN (medac UK)

**Methotrexate 50 mg per 1 ml** Metoject PEN 30mg/0.6ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £18.95

Metoject PEN 22.5mg/0.45ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £18.45

Metoject PEN 12.5mg/0.25ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £16.50

Metoject PEN 20mg/0.4ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £17.84

Metoject PEN 17.5mg/0.35ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £17.50

Metoject PEN 7.5mg/0.15ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £14.85

Metoject PEN 10mg/0.2ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £15.29

Metoject PEN 27.5mg/0.55ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £18.89

Metoject PEN 25mg/0.5ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £18.48

Metoject PEN 15mg/0.3ml solution for injection pre-filled pen | 1 pre-filled disposable injection [PoM] £16.57

#### ► Nordimet (Nordic Pharma Ltd)

**Methotrexate 25 mg per 1 ml** Nordimet 15mg/0.6ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £14.92

Nordimet 20mg/0.8ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £16.06

Nordimet 22.5mg/0.9ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £16.61

Nordimet 12.5mg/0.5ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £14.85

Nordimet 10mg/0.4ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £13.77

Nordimet 17.5mg/0.7ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £15.75

Nordimet 25mg/1ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £16.64

Nordimet 7.5mg/0.3ml solution for injection pre-filled pens | 1 pre-filled disposable injection [PoM] £13.37

#### ► Zlatal (Nordic Pharma Ltd)

**Methotrexate (as Methotrexate sodium) 25 mg per 1 ml** Zlatal 17.5mg/0.7ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £15.75

Zlatal 10mg/0.4ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £13.77

Zlatal 25mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.64

Zlatal 20mg/0.8ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.06

Zlatal 12.5mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.85

Zlatal 7.5mg/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £13.37

Zlatal 22.5mg/0.9ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.61

Zlatal 15mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.92

### Solution for infusion

#### ► Methotrexate (Non-proprietary)

**Methotrexate (as Methotrexate sodium) 25 mg per 1 ml** Methotrexate 5g/200ml solution for infusion vials | 1 vial [PoM]

£200.57

**Methotrexate (as Methotrexate sodium) 100 mg per 1 ml** Methotrexate 5g/50ml solution for infusion vials | 1 vial [PoM]

£400.00

### Oral solution

#### ► Methotrexate (Non-proprietary)

**Methotrexate (as Methotrexate sodium) 2 mg per 1 ml** Methotrexate 2mg/ml oral solution sugar free sugar-free | 35 ml [PoM]

£95.00-£114.00 DT price = £95.00 sugar-free | 65 ml [PoM]

£125.00 DT price = £125.00

## Nelarabine

### • INDICATIONS AND DOSE

**T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in patients who have relapsed or who are refractory after receiving at least two previous regimens**

► BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

• **CAUTIONS** Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity) · previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

• **INTERACTIONS** → Appendix 1: nelarabine

### • SIDE-EFFECTS

► **Common or very common** Neurotoxicity (discontinue)

► **Frequency not known** Abdominal pain · alopecia · amnesia · anorexia · arthralgia · asthenia · ataxia · benign and malignant tumours · blurred vision · bone-marrow suppression · confusion · constipation · cough · demyelination · diarrhoea · dizziness · drowsiness · dyspnoea · electrolyte disturbances · extravasation · fatigue · headache · hyperuricaemia · hypoesthesia · hypotension · muscle weakness · myalgia · nausea · oedema · oral mucositis · paraesthesia · peripheral neurological disorders · pleural effusion · pyrexia · seizures · taste disturbance · thromboembolism · tremor · tumour lysis syndrome · vomiting · wheezing

• **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.

- **PREGNANCY** Avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **MONITORING REQUIREMENTS**
  - Neurotoxicity Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.
- **PATIENT AND CARER ADVICE**

**Driving and skilled tasks**

Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (March 2008) that the use of nelarabine (*Atriance*®) within NHS Scotland is restricted to bridging treatment before stem cell transplantation.
- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for infusion**

ELECTROLYTES: May contain Sodium

  - **Atriance** (Novartis Pharmaceuticals UK Ltd) ▼

Nelarabine 5 mg per 1 ml Atriance 250mg/50ml solution for infusion vials | 6 vial [PoM] £1,332.00

## Pemetrexed

- **DRUG ACTION** Pemetrexed inhibits thymidylate transferase and other folate-dependent enzymes.
- **INDICATIONS AND DOSE**

**Treatment of unresectable malignant pleural mesothelioma which has not previously been treated with chemotherapy (in combination with cisplatin) | First-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (in combination with cisplatin) | Second-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology (monotherapy) | Maintenance treatment in locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following platinum-based chemotherapy (monotherapy)**

  - BY INTRAVENOUS INFUSION
  - Adult: (consult local protocol)
- **CAUTIONS** Diabetes · history of cardiovascular disease · prophylactic folic acid supplementation required (consult product literature) · prophylactic vitamin B<sub>12</sub> supplementation required (consult product literature)
- **INTERACTIONS** → Appendix 1: pemetrexed
- **SIDE-EFFECTS**
  - Common or very common Conjunctivitis · dehydration · gastro-intestinal disturbances · increased lacrimation · neuropathy · oedema · skin disorders
  - Uncommon Arrhythmias · colitis · interstitial pneumonitis
  - Rare Acute renal failure · hepatitis · peripheral ischaemia
  - Frequency not known Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · Stevens-Johnson syndrome · thromboembolism · toxic epidermal necrolysis · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment. Men must avoid fathering a child during and for 6 months after treatment.
- **PREGNANCY** Avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 45 mL/minute—no information available.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - Pemetrexed for the treatment of non-small cell lung cancer (June 2010) NICE TA190

Pemetrexed is an option for the maintenance treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology that has not progressed immediately following combination therapy of a platinum compound with either gemcitabine, paclitaxel, or docetaxel.

[www.nice.org.uk/TA190](http://www.nice.org.uk/TA190)

  - Pemetrexed for the treatment of non-small cell lung cancer (August 2007) NICE TA124

Pemetrexed is **not** recommended for the treatment of locally advanced or metastatic non-small cell lung cancer which has previously been treated with chemotherapy.

[www.nice.org.uk/TA124](http://www.nice.org.uk/TA124)

  - Pemetrexed for the first-line treatment of non-small cell lung cancer (September 2009) NICE TA181

Pemetrexed, in combination with cisplatin, is an option for the first-line treatment of locally advanced or metastatic non-small cell lung cancer only if the histology of the tumour has been confirmed as adenocarcinoma or large-cell carcinoma.

[www.nice.org.uk/TA181](http://www.nice.org.uk/TA181)

  - Pemetrexed maintenance treatment for non-squamous non-small-cell lung cancer after pemetrexed and cisplatin (August 2016) NICE TA402

Pemetrexed is recommended as an option for the maintenance treatment of locally advanced or metastatic non-squamous non-small-cell lung cancer when: a patient's disease has not progressed immediately after 4 cycles of pemetrexed and cisplatin induction therapy; their Eastern Cooperative Oncology Group (ECOG) performance status is 0 or 1 at the start of maintenance treatment; the company provides the drug according to the terms of the commercial access agreement as agreed with NHS England.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinicians consider it appropriate to stop.

[www.nice.org.uk/TA402](http://www.nice.org.uk/TA402)

  - Pemetrexed for the treatment of malignant pleural mesothelioma (January 2008) NICE TA135

Pemetrexed is an option for the treatment of malignant pleural mesothelioma only in patients who have a WHO performance status of 0 or 1 [WHO performance status is a measure of the ability to perform ordinary tasks], who are considered to have advanced disease and for whom surgical resection is considered inappropriate.

[www.nice.org.uk/TA135](http://www.nice.org.uk/TA135)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (August 2008) that pemetrexed (*Alimta*®) is accepted for restricted use within NHS Scotland as monotherapy for the second-line treatment of locally advanced or metastatic non-small cell lung cancer without predominantly squamous cell histology; it is restricted for use in patients with good performance status who would otherwise be eligible for docetaxel treatment.

The *Scottish Medicines Consortium* has advised (January 2010) that pemetrexed (*Alimta*®) is accepted for restricted use within NHS Scotland in combination with cisplatin for the first-line treatment of locally advanced or metastatic non-small cell lung cancer other than predominantly squamous cell histology; it is restricted to patients in

whom the histology of the tumour has been confirmed as adenocarcinoma or large cell carcinoma.

The *Scottish Medicines Consortium* has advised (July 2005) that pemetrexed (*Alimta*®) in combination with cisplatin is accepted for restricted use within NHS Scotland for previously untreated patients with stage III/IV unresectable malignant pleural mesothelioma.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

##### ► Pemetrexed (Non-proprietary)

## Tegafur with gimeracil and oteracil

- **DRUG ACTION** Tegafur is a prodrug of fluorouracil. Gimeracil inhibits the degradation of fluorouracil and oteracil decreases the activity of fluorouracil in normal gastrointestinal mucosa.

#### • INDICATIONS AND DOSE

**Treatment of advanced gastric cancer when used in combination with cisplatin**

- BY MOUTH
- Adult: (consult local protocol)

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
 See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Dihydropyrimidine dehydrogenase deficiency
- **INTERACTIONS** → Appendix 1: tegafur
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · neuropathy · ocular toxicity · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for up to 6 months after treatment.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Reduce dose if creatinine clearance 30–50 mL/minute—consult product literature. Manufacturer advises avoid if creatinine clearance less than 30 mL/minute.

#### • NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2012) that tegafur with gimeracil and oteracil (*Teysuno*®) is accepted for restricted use within NHS Scotland for the treatment of advanced gastric cancer, when given in combination with cisplatin, in patients who are unsuitable for an anthracycline, fluorouracil and platinum triplet first-line regimen.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 23

##### ► Teysuno (Nordic Pharma Ltd)

**Gimeracil 4.35 mg, Oteracil (as Oteracil potassium) 11.8 mg,**

**Tegafur 15 mg** Teysuno 15mg/4.35mg/11.8mg capsules | 126 capsule [PoM] £279.72

**Tegafur 20 mg** Teysuno 20mg/5.8mg/15.8mg capsules | 84 capsule [PoM] £248.40

## Tioguanine

(Thioguanine)

#### • INDICATIONS AND DOSE

**Acute leukaemia | Chronic myeloid leukaemia**

- BY MOUTH
- Adult: 100–200 mg/m<sup>2</sup> daily, can be given at various stages of treatment in short-term cycles

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
 See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity
- **CAUTIONS** Thiopurine methyltransferase status  
**CAUTIONS, FURTHER INFORMATION**
- Thiopurine methyltransferase The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
- Long-term therapy Long-term therapy is no longer recommended because of the high risk of liver toxicity.
- **INTERACTIONS** → Appendix 1: tioguanine
- **SIDE-EFFECTS**
- Rare Intestinal necrosis · intestinal perforation
- Frequency not known Alopecia · bone-marrow suppression · hepatotoxicity (discontinue) · hyperuricaemia · nausea · oral mucositis · stomatitis · thromboembolism · tumour lysis syndrome · vomiting · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
- Gastro-intestinal side-effects Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men or women.
- **PREGNANCY** Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Reduce dose.
- **RENAL IMPAIRMENT** Reduce dose.
- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.
- **MONITORING REQUIREMENTS** Monitor liver function weekly—discontinue if liver toxicity develops.
- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

**Tablet**▶ **Tioguanine (Non-proprietary)**

**Tioguanine 40 mg** Tioguanine 40mg tablets | 25 tablet **[PoM]**  
£109.57

## Trifluridine with tipiracil

24-Apr-2017

- **DRUG ACTION** Trifluridine is an antimetabolite that interferes with cancer cell DNA synthesis and inhibits cell proliferation; tipiracil is a TPase inhibitor that boosts trifluridine concentrations.

● **INDICATIONS AND DOSE**

**Metastatic colorectal cancer, in patients previously treated with (or unsuitable for treatment with) available therapies including fluoropyrimidine-, oxaliplatin-, and irinotecan-based chemotherapies, or anti-vascular endothelial growth factor (VEGF) agents, or anti-epidermal growth factor receptor (EGFR) agents (specialist use only)**

▶ **BY MOUTH**

- **Adult:** Initially 35 mg/m<sup>2</sup> twice daily (max. per dose 80 mg), given on days 1 to 5 and days 8 to 12 of each 28-day cycle, consult product literature for further information on dose adjustment

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · bone-marrow suppression · constipation · cough · diarrhoea · dizziness · dysgeusia · dyspnoea · flushing · headache · hypoalbuminaemia · nausea · palmer-plantar erythrodysesthesia · peripheral neuropathy · proteinuria · pruritus · rash · stomatitis · vomiting
- ▶ **Uncommon** Acute pancreatitis · angina · arrhythmia · blood pressure changes · blood-electrolyte concentration changes · blurred vision · buccal polyp · cataract · dehydration · diplopia · dry eye · dyspepsia · dysphonia · embolism · epistaxis · erythema · gastritis · gastro-oesophageal reflux disease · gout · haematuria · haemorrhage · hepatotoxicity · hyperglycaemia · lethargy · leukocyturia · muscle spasm · neurotoxicity · oesophagitis · palpitations · paraesthesia · photosensitivity reaction · pulmonary embolism · renal failure · septic shock (fatal cases have been reported) · syncope · urticaria · vertigo
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of child-bearing potential and in men with a partner of child-bearing potential, during treatment and for 6 months after stopping treatment. Manufacturer also advises use of an additional barrier method in women using hormonal contraceptives—effect of trifluridine with tipiracil on hormonal contraception unknown.
- **PREGNANCY** Manufacturer advises avoid unless essential—reproductive toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate-to-severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution if eGFR 30–59 mL/minute/1.73 m<sup>2</sup>—monitor for haematological toxicities; manufacturer advises avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>—no information available.

● **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises obtain baseline blood cell counts before and during treatment; monitor closely for myelosuppression.
- ▶ Manufacturer also advises monitoring for proteinuria before and during treatment.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

- ▶ Trifluridine with tipiracil for previously treated metastatic colorectal cancer (August 2016) NICE TA405  
Trifluridine with tipiracil is recommended, within its marketing authorisation, as an option for treating metastatic colorectal cancer in adults, only when provided by the manufacturer with the discount agreed in the patient access scheme.

[www.nice.org.uk/guidance/TA405](http://www.nice.org.uk/guidance/TA405)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (February 2017) that trifluridine with tipiracil (*Lonsurf*<sup>®</sup>) is accepted for use within NHS Scotland for the treatment of adults with metastatic colorectal cancer who have been previously treated with, or are not considered candidates for, available therapies including fluoropyrimidine-, oxaliplatin- and irinotecan-based chemotherapies, anti-vascular endothelial growth factor agents, and anti-epidermal growth factor receptor agents.

This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

## ANTINEOPLASTIC DRUGS > CYTOTOXIC ANTIBIOTICS AND RELATED SUBSTANCES

### Bleomycin

● **INDICATIONS AND DOSE**

**Squamous cell carcinoma | Metastatic germ cell cancer | Non-Hodgkin's lymphoma**

- ▶ BY INTRAVENOUS INJECTION, OR BY LOCAL INFILTRATION, OR BY INTRA-ARTERIAL INFUSION, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ **Adult:** (consult product literature or local protocols)

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: bleomycin

● **SIDE-EFFECTS**

- ▶ **Common or very common** Dermatological toxicity · mucositis

- ▶ **Frequency not known** Alopecia · chills (after drug administration) · extravasation · fever (after drug administration) · hypersensitivity reactions · hyperuricaemia · increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques · less bone marrow suppression · nausea · oral mucositis · progressive pulmonary fibrosis (dose-related) · pulmonary toxicity · Raynaud's phenomenon · thromboembolism · tumour lysis syndrome · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hypersensitivity reactions** Hypersensitivity reactions manifest by chills and fevers commonly occur a few hours after drug administration and may be prevented by simultaneous administration of a corticosteroid, for example hydrocortisone intravenously.
- ▶ **Progressive pulmonary fibrosis** This is dose-related, occurring more commonly at cumulative doses greater than 300 000 units and in the elderly. Basal lung crepitations or suspicious chest X-ray changes are an indication to stop therapy with this drug.
- ▶ **Respiratory failure** Patients who have received extensive treatment with bleomycin (e.g. cumulative dose more than 100 000 units) may be at risk of developing respiratory failure if a general anaesthetic is given with high inspired oxygen concentrations. Anaesthetists should be warned of this.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825
- **BREAST FEEDING** Discontinue breast feeding.
- **RENAL IMPAIRMENT** Reduce dose by half if serum creatinine 177–354 micromol/litre; reduce dose further if serum-creatinine greater than 354 micromol/litre.
- **PRESCRIBING AND DISPENSING INFORMATION** To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for injection

- ▶ **Bleo-Kyowa** (Kyowa Kirin Ltd)  
**Bleomycin (as Bleomycin sulfate) 15000 unit** Bleo-Kyowa  
15,000 unit powder for solution for injection vials | 10 vial [PoM]  
£190.60

## Mitomycin

#### INDICATIONS AND DOSE

##### Recurrent superficial bladder tumours (bladder instillation)

- ▶ BY INTRAVESICAL INSTILLATION
- ▶ Adult: (consult product literature or local protocols)

##### Upper gastro-intestinal cancers | Breast cancers

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1: mitomycin
- **SIDE-EFFECTS**

#### GENERAL SIDE-EFFECTS

Alopecia · bone marrow damage · bone-marrow suppression · hyperuricaemia · lung fibrosis · nausea · oral mucositis · renal damage · thromboembolism · tumour lysis syndrome · vomiting

#### SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Extravasation
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ **Bone-marrow toxicity** Mitomycin is usually administered at 6-weekly intervals because it causes delayed bone-marrow toxicity. Prolonged use may result in a permanent effect.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

#### Powder for solution for injection

- ▶ **Mitomycin-C** (Kyowa Kirin Ltd)  
**Mitomycin 2 mg** Mitomycin-C Kyowa 2mg powder for solution for injection vials | 10 vial [PoM] £58.83
- Mitomycin 10 mg** Mitomycin-C Kyowa 10mg powder for solution for injection vials | 1 vial [PoM] £21.37
- Mitomycin 20 mg** Mitomycin-C Kyowa 20mg powder for solution for injection vials | 1 vial [PoM] £39.94
- Mitomycin 40 mg** Mitomycin-C Kyowa 40mg powder for solution for injection vials | 1 vial [PoM] £79.88

## Pentostatin

#### INDICATIONS AND DOSE

##### Hairy cell leukaemia (initiated in specialist centres)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: To be given on alternate weeks (consult product literature)

- **INTERACTIONS** → Appendix 1: pentostatin
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · immunosuppression · myelosuppression · nausea · neurotoxicity (withhold or discontinue) · oral mucositis · severe rash (withhold treatment) · thromboembolism · tumour lysis syndrome · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

Pentostatin can cause myelosuppression, immunosuppression, and a number of other side-effects that may be severe. Treatment should be withheld in patients who develop a severe rash, and withheld or discontinued in patients showing signs of neurotoxicity.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises that men should not father children during and for 6 months after treatment.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—limited information available.
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 60 mL/minute.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for injection

- ▶ **Nipent** (Hospira UK Ltd)  
**Pentostatin 10 mg** Nipent 10mg powder for solution for injection vials | 1 vial [PoM] £734.21 (Hospital only)

**ANTINEOPLASTIC DRUGS > PLANT ALKALOIDS****Trabectedin**

10-Jun-2016

**• INDICATIONS AND DOSE**

**Treatment of advanced soft-tissue sarcoma when treatment with anthracyclines and ifosfamide has failed or is contra-indicated | Treatment of relapsed platinum-sensitive ovarian cancer (in combination with pegylated liposomal doxorubicin)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Elevated creatine phosphokinase (consult product literature)
- **INTERACTIONS** → Appendix 1: trabectedin
- **SIDE-EFFECTS**
- ▶ **Uncommon** Rhabdomyolysis (with raised creatine phosphokinase)
- ▶ **Rare** Hepatic failure (fatal cases reported)
- ▶ **Frequency not known** Abdominal pain · alopecia · anorexia · arthralgia · asthenia · back pain · bone-marrow suppression · constipation · cough · dehydration · diarrhoea · dizziness · dyspepsia · dyspnoea · extravasation · fatigue · flushing · headache · hepatobiliary disorders · hyperuricaemia · hypokalaemia · hypotension · increased blood creatine kinase · insomnia · myalgia · nausea · oedema · oral mucositis · paraesthesia · peripheral neuropathy · pyrexia · taste disturbance · thromboembolism · tumour lysis syndrome · vomiting

**SIDE-EFFECTS, FURTHER INFORMATION**

A corticosteroid, such as dexamethasone by intravenous infusion, must be given 30 minutes before therapy for its antiemetic and hepatoprotective effects (consult product literature).

- **CONCEPTION AND CONTRACEPTION** Effective contraception recommended during and for at least 3 months after treatment in women and during and for at least 5 months after treatment in men.
- **PREGNANCY** See *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid breast-feeding during and for 3 months after treatment.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in impairment—consider dose reduction. Avoid in patients with raised bilirubin. Monitor hepatic function closely in patients with hepatic impairment.
- **RENAL IMPAIRMENT** Avoid monotherapy if creatinine clearance less than 30 mL/minute. Avoid combination regimens if creatinine clearance less than 60 mL/minute.
- **MONITORING REQUIREMENTS**
- ▶ Specific haematological, renal and hepatic parameters must be monitored and within certain ranges prior to starting treatment and repeated weekly during the first 2 cycles and at least once between treatments in subsequent cycles—consult product literature for full details.
- ▶ Monitor for signs and symptoms of rhabdomyolysis (including myelotoxicity, severe liver function disorder, renal failure, muscle weakness or pain)—monitor creatine phosphokinase closely and discontinue treatment (consult product literature).
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE technology appraisals (TAs)**
- ▶ Trabectedin for the treatment of advanced soft tissue sarcoma (February 2010) NICE TA185
- Trabectedin is an option for advanced soft tissue sarcoma when treatment with anthracyclines and ifosfamide has failed, is inappropriate or is not tolerated. The cost of trabectedin for treatment after the fifth cycle is met by the manufacturer.

[www.nice.org.uk/TA185](http://www.nice.org.uk/TA185)

- ▶ Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389

Trabectedin in combination with pegylated liposomal doxorubicin hydrochloride (PLDH) is **not** recommended for treating the first recurrence of platinum-sensitive ovarian cancer.

Patients currently receiving trabectedin in combination with PLDH should have the option to continue their treatment until they or their clinician consider it appropriate to stop.

[www.nice.org.uk/TA389](http://www.nice.org.uk/TA389)

**• MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder for solution for infusion**

- ▶ **Yondelis** (Pharma Mar, S.A.)

**Trabectedin 250 microgram** Yondelis 0.25mg powder for concentrate for solution for infusion vials | 1 vial (POM) £363.00 (Hospital only)

**Trabectedin 1mg** Yondelis 1mg powder for concentrate for solution for infusion vials | 1 vial (POM) £1,366.00 (Hospital only)

**ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS****Carboplatin**

10-Jun-2016

**• INDICATIONS AND DOSE**

**Treatment of advanced ovarian cancer and lung cancer (particularly the small cell type)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: The dose of carboplatin is determined according to renal function rather than body surface area (consult product literature)

- **INTERACTIONS** → Appendix 1: platinum compounds
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · myelosuppression · nausea · nausea · nephrotoxicity · neurotoxicity · oral mucositis · ototoxicity · thromboembolism · tumour lysis syndrome · vomiting · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
- Carboplatin is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Reduce dose. Avoid if creatinine clearance less than 20 mL/minute. Monitor haematological parameters in renal impairment. Monitor renal function in renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Carboplatin can be given in an outpatient setting.
- **NATIONAL FUNDING/ACCESS DECISIONS**
- **NICE technology appraisals (TAs)**
- ▶ Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284
- Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer).

[www.nice.org.uk/TA284](http://www.nice.org.uk/TA284)

- ▶ Bevacizumab in combination with gemcitabine and carboplatin for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (May 2013) NICE TA285  
Bevacizumab in combination with gemcitabine and carboplatin is **not** recommended within its marketing authorisation, that is, for the treatment of the first recurrence of platinum-sensitive advanced ovarian cancer (including fallopian tube and primary peritoneal cancer) that has not been previously treated with bevacizumab or other vascular endothelial growth factor (VEGF) inhibitors or VEGF receptor-targeted agents.  
[www.nice.org.uk/TA285](http://www.nice.org.uk/TA285)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

##### ▶ Carboplatin (Non-proprietary)

Carboplatin 10 mg per 1 ml Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £22.04 (Hospital only) | 1 vial [PoM] £20.00  
Carboplatin 150mg/15ml concentrate for solution for infusion vials | 1 vial [PoM] £56.92 (Hospital only) | 1 vial [PoM] £50.00  
Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial [PoM] £260.00  
Carboplatin 600mg/60ml solution for infusion vials | 1 vial [PoM] £260.00  
Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial [PoM] £168.85 (Hospital only) | 1 vial [PoM] £160.00  
Carboplatin 450mg/45ml solution for infusion vials | 1 vial [PoM] £197.48  
Carboplatin 150mg/15ml solution for infusion vials | 1 vial [PoM] £65.83  
Carboplatin 50mg/5ml solution for infusion vials | 1 vial [PoM] £22.86

## Cisplatin

#### ● INDICATIONS AND DOSE

**Treatment of testicular, lung, cervical, bladder, head and neck, and ovarian cancer (alone or in combination)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

#### ● CAUTIONS

##### CAUTIONS, FURTHER INFORMATION

- ▶ Hydration Cisplatin requires intensive intravenous hydration and treatment may be complicated by severe nausea and vomiting.
- **INTERACTIONS** → Appendix 1: platinum compounds
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · hypomagnesaemia · myelosuppression · nephrotoxicity · oral mucositis · ototoxicity · peripheral neuropathy · severe nausea · severe vomiting · thromboembolism · tumour lysis syndrome
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and toxic in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825).
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid if possible—nephrotoxic.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor full blood count.
  - ▶ Monitor audiology.
  - ▶ Monitor plasma electrolytes.
  - ▶ Nephrotoxicity Monitoring of renal function is essential.
- **DIRECTIONS FOR ADMINISTRATION** Cisplatin is increasingly given in a day care setting.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

##### ▶ Cisplatin (Non-proprietary)

Cisplatin 1 mg per 1 ml Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £25.11 DT price = £26.47 (Hospital only) | 1 vial [PoM] no price available DT price = £26.47  
Cisplatin 100mg/100ml solution for infusion vials | 1 vial [PoM] £50.22 (Hospital only) | 1 vial [PoM] £50.22-£55.64  
Cisplatin 10mg/10ml solution for infusion vials | 1 vial [PoM] £5.90 (Hospital only) | 1 vial [PoM] £5.90  
Cisplatin 50mg/50ml solution for infusion vials | 1 vial [PoM] £25.37 DT price = £26.47 (Hospital only) | 1 vial [PoM] £25.37-£28.11 DT price = £26.47  
Cisplatin 10mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £5.90 (Hospital only) | 1 vial [PoM] no price available  
Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial [PoM] £50.22 (Hospital only) | 1 vial [PoM] no price available

## Oxaliplatin

#### ● INDICATIONS AND DOSE

**Treatment of metastatic colorectal cancer (in combination with fluorouracil and folinic acid) | Treatment of colon cancer after resection of the primary tumour (adjuvant treatment)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Peripheral neuropathy with functional impairment

- **INTERACTIONS** → Appendix 1: platinum compounds

- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal disturbances · hyperuricaemia · myelosuppression · nausea · neurotoxicity (dose limiting) · ototoxicity · posterior reversible encephalopathy syndrome (associated with oxaliplatin combination chemotherapy) · sensory peripheral neuropathy (dose limiting) · thromboembolism · transient vision loss (reversible on discontinuation) · tumour lysis syndrome · vomiting

##### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Respiratory symptoms If unexplained respiratory symptoms occur, oxaliplatin should be discontinued until investigations exclude interstitial lung disease and pulmonary fibrosis.
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for 4 months after treatment in women and 6 months after treatment in men.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Reduce dose in mild to moderate impairment (consult product literature). Avoid if creatinine clearance less than 30 mL/minute.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**
  - ▶ Capecitabine and oxaliplatin in the adjuvant treatment of stage III (Dukes' C) colon cancer (April 2006) NICE TA100  
Capecitabine alone or oxaliplatin combined with fluorouracil and folinic acid are options for adjuvant treatment following surgery for stage III (Dukes' C) colon cancer.  
[www.nice.org.uk/TA100](http://www.nice.org.uk/TA100)
  - ▶ Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93  
A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer.

Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently.

[www.nice.org.uk/TA93](http://www.nice.org.uk/TA93)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

##### ▶ Oxaliplatin (Non-proprietary)

**Oxaliplatin 5 mg per 1 ml** Oxaliplatin 100mg/20ml concentrate for solution for infusion vials | 1 vial [PoM] £283.32–£330.00 (Hospital only) | 1 vial [PoM] £313.50  
**Oxaliplatin 50mg/10ml concentrate** for solution for infusion vials | 1 vial [PoM] £141.48–£165.00 (Hospital only) | 1 vial [PoM] £156.75  
**Oxaliplatin 200mg/40ml concentrate** for solution for infusion vials | 1 vial [PoM] £595.65 (Hospital only) | 1 vial [PoM] £627.00

#### Powder for solution for infusion

##### ▶ Oxaliplatin (Non-proprietary)

**Oxaliplatin 50 mg** Oxaliplatin 50mg powder for solution for infusion vials | 1 vial [PoM] £156.75  
**Oxaliplatin 100 mg** Oxaliplatin 100mg powder for solution for infusion vials | 1 vial [PoM] £313.50

## ANTINEOPLASTIC DRUGS > PODOPHYLLOTOXIN DERIVATIVES

### Etoposide

#### ● INDICATIONS AND DOSE

**Small cell carcinoma of the bronchus, the lymphomas and testicular cancer**

- ▶ BY MOUTH
  - ▶ Adult: 120–240 mg/m<sup>2</sup> daily for 5 days
- ▶ BY INTRAVENOUS INFUSION
  - ▶ Adult: (consult product literature)

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
 See Cytotoxic drugs p. 825.

- **INTERACTIONS** → Appendix 1: etoposide
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · hyperuricaemia · irritant to tissues · nausea · oral mucositis (more common if given with doxorubicin) · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Conceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Consider dose reduction—consult local treatment protocol for details.
- **DIRECTIONS FOR ADMINISTRATION** Etoposide may be given orally or by slow intravenous infusion, the oral dose being double the intravenous dose. A preparation containing etoposide phosphate can be given by intravenous injection or infusion. Etoposide is usually given daily for 3–5 days and courses should not be repeated more frequently than at intervals of 21 days.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for infusion

##### ▶ Etoposide (Non-proprietary)

**Etoposide 20 mg per 1 ml** Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] no price available (Hospital only) | 1 vial [PoM] £11.50 | 10 vial [PoM] £115.00

Etoposide 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £60.75–£70.33 (Hospital only)

##### ▶ Eposin (medac UK)

**Etoposide 20 mg per 1 ml** Eposin 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £67.50 (Hospital only)  
 Eposin 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £13.50 (Hospital only)

#### Powder for solution for injection

##### ▶ Etopophos (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Etoposide (as Etoposide phosphate) 100 mg** Etopophos 100mg powder for solution for injection vials | 10 vial [PoM] £261.68 (Hospital only)

#### Capsole

CAUTIONARY AND ADVISORY LABELS 23

##### ▶ Vepesid (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Etoposide 50 mg** Vepesid 50mg capsules | 20 capsule [PoM] £99.82 (Hospital only)

**Etoposide 100 mg** Vepesid 100mg capsules | 10 capsule [PoM] £87.23 (Hospital only)

## ANTINEOPLASTIC DRUGS > TAXANES

### Cabazitaxel

17-Mar-2017

#### ● INDICATIONS AND DOSE

**Treatment of hormone refractory metastatic prostate cancer in patients who have previously been treated with a docetaxel-containing regimen (in combination with prednisone or prednisolone)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Avoid in acute porphyrias p. 969

- **INTERACTIONS** → Appendix 1: taxanes

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Hypersensitivity reactions
- ▶ **Frequency not known** Abdominal pain · alopecia · anxiety · arthralgia · atrial fibrillation · bone-marrow suppression · chest pain · chills · confusion · constipation · cough · dehydration · diarrhoea · dizziness · dry mouth · dry skin · dyspepsia · dyspnoea · electrolyte disturbances · erythema · extravasation · flushing · gastroesophageal reflux · haemorrhoids · headache · hyperglycaemia · hypertension · hyperuricaemia · hypoesthesia · hypotension · increased lacrimation · malaise · muscle spasm · myalgia · nausea · oedema · oral mucositis · paraesthesia · peripheral neuropathy · rectal haemorrhage · renal disorders (fatal cases of renal failure reported) · sciatica · tachycardia · taste disturbance · thromboembolism · tinnitus · tumour lysis syndrome · urinary incontinence · urinary retention · vertigo · vomiting · weight changes

#### SIDE-EFFECTS, FURTHER INFORMATION

For further information on side-effects, consult product literature.

- ▶ Hypersensitivity reactions Routine premedication with a corticosteroid, an antihistamine, and a histamine H<sub>2</sub>-receptor antagonist is recommended to prevent severe hypersensitivity reactions.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment (women) and for up to 6 months after treatment (men).
- **PREGNANCY** See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Use with caution if creatinine clearance less than 50 mL/minute.
- **MONITORING REQUIREMENTS** Monitor electrolytes—correct dehydration.
- **DIRECTIONS FOR ADMINISTRATION** Intravenous infusion incompatible with PVC.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- ▶ Cabazitaxel for hormone-relapsed metastatic prostate cancer treated with docetaxel (updated August 2016) NICE TA391  
Cabazitaxel in combination with prednisone or prednisolone is recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients whose disease has progressed during or after docetaxel chemotherapy, only if the following criteria are met:
  - the patient has an eastern cooperative oncology group (ECOG) performance status of 0 or 1
  - the patient has had 225 mg/m<sup>2</sup> or more of docetaxel
  - treatment with cabazitaxel is stopped when the disease progresses or after a maximum of 10 cycles
  - the manufacturer provides cabazitaxel with the discount agreed in the patient access scheme
  - NHS trusts purchase cabazitaxel in accordance with the commercial access agreement, either in vials (at a reduced price to reflect the average cost of waste per patient), or in pre-prepared intravenous infusion bags.

Patients currently receiving cabazitaxel that is not recommended according to the above criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA391](http://www.nice.org.uk/TA391)

### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2016) that cabazitaxel (*Jevtana*®) in combination with prednisone or prednisolone is accepted for restricted use within NHS Scotland for the treatment of adult patients with hormone refractory metastatic prostate cancer previously treated with a docetaxel-containing regimen (patients who have received at least 225 mg/m<sup>2</sup> (three cycles) of docetaxel and have an Eastern Cooperative Oncology Group (ECOG) performance status of 0 or 1). This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

EXCIPIENTS: May contain Ethanol

#### ▶ Jevtana (Sanofi)

Cabazitaxel 40 mg per 1 ml JEVTANA 60mg/1.5ml concentrate and solvent for solution for infusion vials | 1 vial [PoM] £3,696.00 (Hospital only)

## Docetaxel

### ● INDICATIONS AND DOSE

**Adjuvant treatment of operable node-positive and operable node-negative breast cancer (in combination with doxorubicin and cyclophosphamide) | Initial chemotherapy of locally advanced or metastatic breast cancer (with doxorubicin) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline or an alkylating drug has failed (monotherapy) | Locally advanced or metastatic breast cancer where cytotoxic chemotherapy with an anthracycline has failed (with capecitabine) | Initial chemotherapy of metastatic breast cancer which overexpresses human epidermal growth factor-2 (with trastuzumab) | Locally advanced or metastatic non-small cell lung cancer where previous chemotherapy has failed | Initial chemotherapy of unresectable, locally advanced or metastatic non-small cell lung cancer (with cisplatin) | Hormone-resistant metastatic prostate cancer (in combination with prednisone or prednisolone) | Initial treatment of metastatic gastric adenocarcinoma,**

**including adenocarcinoma of the gastro-oesophageal junction (with cisplatin and fluorouracil) | Induction treatment of locally advanced squamous cell carcinoma of the head and neck (with cisplatin and fluorouracil)**

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Avoid in acute porphyrias p. 969 - consult product literature
- **INTERACTIONS** → Appendix 1: taxanes
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · cystoid macular oedema · extravasation · fatal respiratory disorders · gastro-intestinal toxicity · heart failure · hypersensitivity reactions · hyperuricaemia · nausea · oral mucositis · peripheral neurotoxicity · persistent fluid retention (commonly as leg oedema that worsens during treatment) can be resistant to treatment · severe skin reactions · thromboembolism · tumour lysis syndrome · vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

Consult product literature for monitoring and management of side effects.

- ▶ Hypersensitivity reactions and fluid retention Pretreatment with dexamethasone by mouth is recommended for reducing fluid retention and hypersensitivity reactions (consult product literature).
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception for men and women during treatment, and for at least 6 months after stopping treatment in men.
- **PREGNANCY** Avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to liver enzymes (consult product literature). Avoid in severe impairment. Monitor liver function in hepatic impairment.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- ▶ Docetaxel for the treatment of hormone-refractory metastatic prostate cancer (June 2006) NICE TA101  
Docetaxel is an option for hormone-refractory metastatic prostate cancer and a Karnofsky score of at least 60% [Karnofsky score is a measure of the ability to perform ordinary tasks].  
[www.nice.org.uk/TA101](http://www.nice.org.uk/TA101)
- ▶ Docetaxel for the adjuvant treatment of early node-positive breast cancer (September 2006) NICE TA109  
Docetaxel, when given concurrently with doxorubicin and cyclophosphamide (TAC regimen), is recommended as an option for the adjuvant treatment of women with early node-positive breast cancer.  
[www.nice.org.uk/TA109](http://www.nice.org.uk/TA109)

### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that docetaxel (*Taxotere*®) in combination with cisplatin and fluorouracil is accepted for restricted use within NHS Scotland for the induction treatment of patients with unresectable (May 2007) and resectable (June 2008) locally advanced squamous cell carcinoma of the head and neck.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

EXCIPIENTS: May contain Ethanol

#### ▶ Docetaxel (Non-proprietary)

Docetaxel 10 mg per 1 ml Docetaxel 80mg/8ml concentrate for solution for infusion vials | 1 vial [PoM] £534.75 (Hospital only)  
Docetaxel 160mg/16ml concentrate for solution for infusion vials | 1 vial [PoM] £1,069.50 (Hospital only)

- Docetaxel 20mg/2ml concentrate for solution for infusion vials | 1 vial [PoM] £162.75 (Hospital only)
- Docetaxel 20 mg per 1 ml** Docetaxel 80mg/4ml concentrate for solution for infusion vials | 1 vial [PoM] £530.00
- Docetaxel 160mg/8ml concentrate for solution for infusion vials | 1 vial [PoM] no price available
- Docetaxel 140mg/7ml concentrate for solution for infusion vials | 1 vial [PoM] £900.00
- Docetaxel 20mg/1ml concentrate for solution for infusion vials | 1 vial [PoM] £160.00
- ▶ **Taxceus** (medac UK)
- Docetaxel 20 mg per 1 ml** Taxceus 80mg/4ml concentrate for solution for infusion vials | 1 vial [PoM] £508.01
- Taxceus 140mg/7ml concentrate for solution for infusion vials | 1 vial [PoM] £720.10
- Taxceus 20mg/1ml concentrate for solution for infusion vials | 1 vial [PoM] £154.61
- ▶ **Taxotere** (Sanofi)
- Docetaxel 20 mg per 1 ml** Taxotere 20mg/1ml concentrate for solution for infusion vials | 1 vial [PoM] £153.47 (Hospital only)
- Taxotere 160mg/8ml concentrate for solution for infusion vials | 1 vial [PoM] £1,008.54 (Hospital only)
- Taxotere 80mg/4ml concentrate for solution for infusion vials | 1 vial [PoM] £504.27 (Hospital only)

## Paclitaxel

01-Jun-2016

- **DRUG ACTION** Paclitaxel is a member of the taxane group of drugs.

### ● INDICATIONS AND DOSE

**Treatment of ovarian cancer (advanced or residual disease following laparotomy) in combination with cisplatin (conventional paclitaxel only) | Treatment of metastatic ovarian cancer where platinum-containing therapy has failed (conventional paclitaxel only) | Treatment of locally advanced or metastatic breast cancer (in combination with other cytotoxics or alone if other cytotoxics have failed or are inappropriate) (conventional paclitaxel only) | Adjuvant treatment of node-positive breast cancer following treatment with anthracycline and cyclophosphamide (conventional paclitaxel only) | Treatment of non-small cell lung cancer (in combination with cisplatin) when surgery or radiotherapy not appropriate (conventional paclitaxel only) | Treatment of advanced AIDS-related Kaposi's sarcoma where liposomal anthracycline therapy has failed (conventional paclitaxel only) | First-line treatment of metastatic adenocarcinoma of the pancreas (in combination with gemcitabine) (conventional paclitaxel only) | Monotherapy of metastatic breast cancer when first-line treatment has failed and standard, anthracycline-containing therapy is not indicated (albumin-bound paclitaxel only) | In combination with gemcitabine for the first-line treatment of metastatic adenocarcinoma of the pancreas (albumin-bound paclitaxel only)**

▶ BY INTRAVENOUS INFUSION

▶ Adult: (consult product literature or local protocols)

- **CAUTIONS** Avoid in acute porphyrias p. 969 • consult product literature • patients aged over 75 years with metastatic adenocarcinoma of the pancreas
- **INTERACTIONS** → Appendix 1: taxanes
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Arrhythmia • arthralgia • febrile neutropenia • gastro-intestinal disorders • myalgia • peripheral neuropathy • sensory neuropathy • tachycardia
  - ▶ **Rare** Bradycardia • cardiac arrest • congestive heart failure • left ventricular dysfunction
  - ▶ **Frequency not known** Alopecia • arrhythmias (nearly always asymptomatic) • asymptomatic hypotension • bone-marrow suppression • bradycardia • cardiac conduction defects • extravasation • hypersensitivity reactions •

hyperuricaemia • muscle pain • myelosuppression • nausea • neutropenia • oral mucositis • pneumonitis • Stevens-Johnson syndrome • thromboembolism • toxic epidermal necrolysis • tumour lysis syndrome • vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hypersensitivity reactions** Routine premedication with a corticosteroid, an antihistamine and a histamine H<sub>2</sub>-receptor antagonist is recommended to prevent severe hypersensitivity reactions; hypersensitivity reactions may occur rarely despite premedication.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Cardiac monitoring should be undertaken, particularly if patients have underlying cardiac disease or previous exposure to anthracyclines.
  - ▶ Patients should be monitored for signs and symptoms of pneumonitis and sepsis.
- **PRESCRIBING AND DISPENSING INFORMATION** Paclitaxel is available as both conventional and albumin-bound formulations. The different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are not interchangeable. Prescribers should specify the brand to be dispensed.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - ▶ Paclitaxel for ovarian cancer (January 2003) NICE TA55  
*Either* paclitaxel in combination with a platinum compound (cisplatin or carboplatin) *or* a platinum compound alone are alternatives for the first-line treatment of ovarian cancer (usually following surgery). [www.nice.org.uk/TA55](http://www.nice.org.uk/TA55)
  - ▶ Paclitaxel for the adjuvant treatment of early node-positive breast cancer (September 2006) NICE TA108  
Paclitaxel, within its licensed indication, is **not** recommended for the adjuvant treatment of women with early node-positive breast cancer. [www.nice.org.uk/TA108](http://www.nice.org.uk/TA108)
  - ▶ Bevacizumab in combination with paclitaxel and carboplatin for the first-line treatment of advanced ovarian cancer (May 2013) NICE TA284  
Bevacizumab in combination with paclitaxel and carboplatin is **not** recommended for the first-line treatment of advanced ovarian cancer (including fallopian tube and primary peritoneal cancer). [www.nice.org.uk/TA284](http://www.nice.org.uk/TA284)
  - ▶ Paclitaxel as albumin-bound nanoparticles in combination with gemcitabine for previously untreated metastatic pancreatic cancer (October 2015) NICE TA360  
Albumin-bound paclitaxel (nab-paclitaxel, *Abraxane*®) with gemcitabine, within its licensed indication, is **not** recommended for the treatment of previously untreated metastatic adenocarcinoma of the pancreas.  
Patients whose treatment was started before this guidance was published should continue treatment until they and their clinician consider it appropriate to stop. [www.nice.org.uk/TA360](http://www.nice.org.uk/TA360)
  - ▶ Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389  
Paclitaxel, in combination with platinum or as monotherapy, is recommended as an option for treating recurrent ovarian cancer. [www.nice.org.uk/TA389](http://www.nice.org.uk/TA389)

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

EXCIPIENTS: May contain Polyoxyl castor oils

#### ► Paclitaxel (Non-proprietary)

**Paclitaxel 6 mg per 1 ml** Paclitaxel 150mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £504.90-£561.00 (Hospital only) | 1 vial [PoM] £300.52  
**Paclitaxel 30mg/5ml** concentrate for solution for infusion vials | 1 vial [PoM] £112.31-£116.05 (Hospital only) | 1 vial [PoM] £105.84  
**Paclitaxel 300mg/50ml** concentrate for solution for infusion vials | 1 vial [PoM] £1,009.80-£1,122.00 (Hospital only) | 1 vial [PoM] £951.63  
**Paclitaxel 100mg/16.7ml** concentrate for solution for infusion vials | 1 vial [PoM] £336.60-£374.00 (Hospital only) | 1 vial [PoM] £317.21

### Powder for suspension for infusion

ELECTROLYTES: May contain Sodium

#### ► Abraxane (Celgene Ltd)

**Paclitaxel albumin 100 mg** Abraxane 100mg powder for suspension for infusion vials | 1 vial [PoM] £246.00 (Hospital only)

## ANTINEOPLASTIC DRUGS > TOPOISOMERASE I INHIBITORS

### Irinotecan hydrochloride

23-May-2017

- **DRUG ACTION** Irinotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

#### ● INDICATIONS AND DOSE

**Metastatic colorectal cancer in combination with fluorouracil and folinic acid or as monotherapy when treatment containing fluorouracil has failed** | Treatment of epidermal growth factor receptor-expressing metastatic colorectal cancer after failure of chemotherapy that has included irinotecan (in combination with cetuximab) | **First-line treatment of metastatic carcinoma of the colon or rectum (in combination with fluorouracil, folinic acid and bevacizumab)** | **First-line treatment of metastatic colorectal carcinoma (in combination with capecitabine with or without bevacizumab)**

##### ► BY INTRAVENOUS INFUSION

- Adult: (consult product literature or local protocols)

**Metastatic adenocarcinoma of the pancreas in patients who have progressed following gemcitabine based therapy (in combination with fluorouracil and leucovorin) (specialist use only)**

##### ► BY INTRAVENOUS INFUSION USING LIPID FORMULATION

- Adult: (consult product literature or local protocols)

- **CONTRA-INDICATIONS** Bowel obstruction · chronic inflammatory bowel disease

- **CAUTIONS** Raised plasma-bilirubin concentration · risk factors for cardiac disease · risk factors for pulmonary toxicity · underweight patients—increased risk of adverse events

- **INTERACTIONS** → Appendix 1: irinotecan

#### ● SIDE-EFFECTS

- **Uncommon** Interstitial pulmonary disease
- **Frequency not known** Acute cholinergic syndrome (with early diarrhoea) and delayed diarrhoea (consult product literature) · alopecia · anorexia · asthenia · bone-marrow suppression · extravasation · gastro-intestinal effects (delayed diarrhoea requiring prompt treatment may follow irinotecan treatment) · hyperuricaemia · myelosuppression (dose limiting) · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** For *conventional* formulations, manufacturer advises effective contraception during treatment and for up to 1 month after treatment in women of child-bearing potential, and up to 3 months after treatment in men. For *liposomal*

formulations, manufacturer advises effective contraception during treatment and for up to 1 month after treatment in women of child-bearing potential, and up to 4 months after treatment in men.

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING** For *conventional* formulations, manufacturer advises avoid. For *liposomal* formulations, manufacturer advises avoid until one month after the last dose—no information available.
- **HEPATIC IMPAIRMENT** For *conventional* formulations, manufacturer advises dose adjustment—consult product literature. Manufacturer advises monitor liver function at baseline and before each cycle; also monitor complete blood counts weekly if plasma-bilirubin concentration 1.5–3 times the upper limit of normal; avoid if plasma-bilirubin concentration greater than 3 times the upper limit of normal.

For *liposomal* formulations, manufacturer advises use with caution; avoid if bilirubin greater than 2 mg/dL or if plasma-transaminase greater than 2.5 times the upper limit of normal (greater than 5 times the upper limit of normal if liver metastasis present)—limited information available.

- **RENAL IMPAIRMENT** For *conventional* formulations, manufacturer advises avoid—no information available. For *liposomal* formulations, manufacturer advises avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Monitor respiratory function.
- **PRESCRIBING AND DISPENSING INFORMATION** Irinotecan is available as both *conventional* and *liposomal* formulations. Manufacturers advise that the different formulations vary in their licensed indications, pharmacokinetics, dosage and administration, and are **not** interchangeable.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

- Irinotecan, oxaliplatin, and raltitrexed for advanced colorectal cancer (August 2005) NICE TA93

A combination of fluorouracil and folinic acid with either irinotecan or oxaliplatin are options for first-line treatment for advanced colorectal cancer.

Irinotecan alone or fluorouracil and folinic acid with oxaliplatin are options for patients who require further treatment subsequently.

[www.nice.org.uk/TA93](http://www.nice.org.uk/TA93)

- Pegylated liposomal irinotecan for treating pancreatic cancer after gemcitabine (April 2017) NICE TA440

Pegylated liposomal irinotecan, in combination with fluorouracil and leucovorin, is **not** recommended for treating metastatic adenocarcinoma of the pancreas in adults whose disease has progressed after gemcitabine-based therapy.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/TA440](http://www.nice.org.uk/guidance/TA440)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2017) that liposomal irinotecan (*Onivyde*®) is **not** recommended for use within NHS Scotland for the treatment of metastatic adenocarcinoma of the pancreas, in combination with fluorouracil and leucovorin (folinic acid), in patients who have progressed following gemcitabine based therapy as there was insufficient evidence submitted.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

ELECTROLYTES: May contain Sodium

#### ▶ Irinotecan hydrochloride (Non-proprietary)

**Irinotecan hydrochloride trihydrate 20 mg per 1 ml** Irinotecan 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £601.25–£650.00 (Hospital only)  
**Irinotecan 40mg/2ml concentrate for solution for infusion vials** | 1 vial [PoM] £49.03–£53.00 (Hospital only) | 1 vial [PoM] £47.37–£50.35  
**Irinotecan 300mg/15ml concentrate for solution for infusion vials** | 1 vial [PoM] £390.00 (Hospital only) | 1 vial [PoM] £348.42–£390.00  
**Irinotecan 100mg/5ml concentrate for solution for infusion vials** | 1 vial [PoM] £120.25–£130.00 (Hospital only) | 1 vial [PoM] £116.15–£123.50

#### ▶ Campto (Pfizer Ltd)

**Irinotecan hydrochloride trihydrate 20 mg per 1 ml** Campto 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £130.00 (Hospital only)  
**Campto 40mg/2ml concentrate for solution for infusion vials** | 1 vial [PoM] £53.00 (Hospital only)  
**Campto 300mg/15ml concentrate for solution for infusion vials** | 1 vial [PoM] £390.00 (Hospital only)

#### ▶ Onivyde (Baxalta UK Ltd)

**Irinotecan hydrochloride trihydrate 5 mg per 1 ml** Onivyde 50mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £615.35 (Hospital only)

## Topotecan

10-Jun-2016

- **DRUG ACTION** Topotecan inhibits topoisomerase I, an enzyme involved in DNA replication.

### ● INDICATIONS AND DOSE

**Metastatic ovarian cancer when first-line or subsequent treatment has failed | Treatment of recurrent carcinoma of the cervix, after radiotherapy, and for patients with stage IVB disease (in combination with cisplatin)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

**Relapsed small-cell lung cancer when retreatment with the first-line regimen is considered inappropriate**

- ▶ BY INTRAVENOUS INFUSION, OR BY MOUTH
- ▶ Adult: (consult product literature or local protocols)

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
 See Cytotoxic drugs p. 825.

- **INTERACTIONS** → Appendix 1: topotecan
- **SIDE-EFFECTS** Alopecia · anorexia · asthenia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · myelosuppression (dose-limiting) · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenicity and fetal loss in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose. Avoid infusion if creatinine clearance less than 20 mL/minute. Avoid oral route if creatinine clearance less than 60 mL/minute.

## NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- ▶ **Topotecan for the treatment of recurrent and stage IVB cervical cancer (October 2009) NICE TA183**  
 Topotecan in combination with cisplatin is recommended as a treatment option for recurrent or stage IVB cervical cancer in patients who have not previously received cisplatin.  
[www.nice.org.uk/TA183](http://www.nice.org.uk/TA183)
- ▶ **Topotecan for the treatment of relapsed small-cell lung cancer (November 2009) NICE TA184**  
 Oral topotecan is recommended as an option for treatment in patients with relapsed small-cell lung cancer only if re-treatment with the first-line regimen is not considered appropriate, and the combination of cyclophosphamide, doxorubicin and vincristine is contra-indicated.  
 Intravenous topotecan is not recommended for people with relapsed small-cell lung cancer.  
[www.nice.org.uk/TA184](http://www.nice.org.uk/TA184)
- ▶ **Topotecan, pegylated liposomal doxorubicin hydrochloride, paclitaxel, trabectedin and gemcitabine for treating recurrent ovarian cancer (April 2016) NICE TA389**  
 Topotecan is **not** recommended for treating first recurrence of platinum-sensitive ovarian cancer, recurrent platinum-resistant ovarian cancer, or platinum-refractory ovarian cancer.

Patients currently receiving topotecan should have the option to continue their treatment until they or their clinician consider it appropriate to stop.

[www.nice.org.uk/TA389](http://www.nice.org.uk/TA389)

### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2007) that topotecan (*Hycamtin*®) is accepted for restricted use in combination with cisplatin for treatment of recurrent carcinoma of the cervix after radiotherapy and for stage IVB disease; it is restricted to patients who have not previously received cisplatin treatment.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

#### ▶ Topotecan (Non-proprietary)

**Topotecan (as Topotecan hydrochloride) 1 mg per 1 ml** Topotecan 4mg/4ml concentrate for solution for infusion vials | 1 vial [PoM] £261.55 (Hospital only) | 1 vial [PoM] no price available | 5 vial [PoM] £1,453.10 (Hospital only)  
**Topotecan 1mg/1ml concentrate for solution for infusion vials** | 1 vial [PoM] £87.88 (Hospital only) | 1 vial [PoM] no price available | 5 vial [PoM] £488.25 (Hospital only)

### Powder for solution for infusion

#### ▶ Hycamtin (Novartis Pharmaceuticals UK Ltd)

**Topotecan (as Topotecan hydrochloride) 1 mg** Hycamtin 1mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £97.65

**Topotecan (as Topotecan hydrochloride) 4 mg** Hycamtin 4mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £348.76

#### ▶ Potactasol (Actavis UK Ltd)

**Topotecan (as Topotecan hydrochloride) 1 mg** Potactasol 1mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £97.00 (Hospital only)

**Topotecan (as Topotecan hydrochloride) 4 mg** Potactasol 4mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £290.00 (Hospital only)

### Capsule

CAUTIONARY AND ADVISORY LABELS 25

#### ▶ Hycamtin (Novartis Pharmaceuticals UK Ltd)

**Topotecan (as Topotecan hydrochloride) 250 microgram** Hycamtin 0.25mg capsules | 10 capsule [PoM] £75.00

**Topotecan (as Topotecan hydrochloride) 1 mg** Hycamtin 1mg capsules | 10 capsule [PoM] £360.00

## ANTINEOPLASTIC DRUGS &gt; VINCA ALKALOIDS

## Vinblastine sulfate

## ● INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

- Adult: (consult product literature)

## IMPORTANT SAFETY INFORMATION

Vinblastine is for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

## ● CONTRA-INDICATIONS

## CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1: vinca alkaloids

- **SIDE-EFFECTS** Abdominal pain · alopecia · autonomic neuropathy · constipation · hyperuricaemia · loss of deep tendon reflexes · motor weakness · myelosuppression (dose-limiting) · nausea · neurotoxicity · oral mucositis · ototoxicity · peripheral neuropathy · peripheral paraesthesia · severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) · severe local irritation (care must be taken to avoid extravasation) · thromboembolism · tumour lysis syndrome · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Neurotoxicity Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinblastine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Dose reduction may be necessary—consult local treatment protocol for details.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Solution for injection

- **Vinblastine sulfate (Non-proprietary)**

**Vinblastine sulfate 1 mg per 1 mL** Vinblastine 10mg/10mL solution for injection vials | 5 vial **[PoM]** £85.00

## Vincristine sulfate

## ● INDICATIONS AND DOSE

Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)

- Adult: (consult local protocol)

## IMPORTANT SAFETY INFORMATION

Vincristine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

## ● CONTRA-INDICATIONS

## CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues · neuromuscular disease
  - **INTERACTIONS** → Appendix 1: vinca alkaloids
  - **SIDE-EFFECTS**
    - **Rare** Diarrhoea · inappropriate secretion of antidiuretic hormone · intestinal necrosis · paralytic ileus · seizures · urinary retention
    - **Frequency not known** Abdominal pain · alopecia · autonomic neuropathy · constipation · extravasation · eye disorders · hyperuricaemia · loss of deep tendon reflexes · motor weakness · muscle wasting · myelosuppression (negligible) · nausea · neurotoxicity · oral mucositis · ototoxicity · peripheral neuropathy · peripheral paraesthesia · severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) · severe local irritation (care must be taken to avoid extravasation) · thromboembolism · tumour lysis syndrome · vomiting
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Neurotoxicity Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.
- Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
  - **PREGNANCY** Avoid (teratogenicity and fetal loss in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
  - **BREAST FEEDING** Discontinue breast-feeding.
  - **HEPATIC IMPAIRMENT** Dose reduction may be necessary—consult local treatment protocol for details.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Solution for injection

- **Vincristine sulfate (Non-proprietary)**

**Vincristine sulfate 1 mg per 1 mL** Vincristine 1mg/1mL solution for injection vials | 1 vial **[PoM]** £13.47 (Hospital only) | 5 vial **[PoM]** £67.35

Vincristine 2mg/2mL solution for injection vials | 1 vial [PoM] £26.66  
(Hospital only) | 5 vial [PoM] £133.30  
Vincristine 5mg/5mL solution for injection vials | 5 vial [PoM] £329.50

## Vindesine sulfate

### • INDICATIONS AND DOSE

**Variety of cancers including leukaemias, lymphomas, and some solid tumours (e.g. breast and lung cancer)**

▶ Adult: (consult product literature)

### IMPORTANT SAFETY INFORMATION

Vindesine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

### • CONTRA-INDICATIONS

**CONTRA-INDICATIONS, FURTHER INFORMATION**  
Intrathecal injection **contra-indicated**.

• **CAUTIONS** Caution in handling—irritant to tissues · neuromuscular disease

• **INTERACTIONS** → Appendix 1: vinca alkaloids

• **SIDE-EFFECTS** Alopecia · autonomic neuropathy · bone-marrow suppression · extravasation · hyperuricaemia · irritant to tissues · myelosuppression (dose-limiting) · nausea · neurotoxicity · oral mucositis · peripheral neuropathy · severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) · severe local irritation (if extravasated) · thromboembolism · tumour lysis syndrome · vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

• **Neurotoxicity** Neurotoxicity, usually as peripheral or autonomic neuropathy; it occurs less often with vindesine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.

Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation. Recovery from neurotoxic effects is usually slow but complete.

• **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

• **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

• **BREAST FEEDING** Discontinue breast-feeding.

• **HEPATIC IMPAIRMENT** Dose reduction may be necessary.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for injection

▶ **Eldisine** (Genus Pharmaceuticals Ltd)

**Vindesine sulfate 5 mg** Eldisine 5mg powder for solution for injection vials | 1 vial [PoM] £66.55 (Hospital only)

## Vinflunine

### • INDICATIONS AND DOSE

**Treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract after failure of a platinum-containing regimen (monotherapy)**

▶ Adult: (consult local protocol)

### IMPORTANT SAFETY INFORMATION

Vinflunine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

### • CONTRA-INDICATIONS

**CONTRA-INDICATIONS, FURTHER INFORMATION**  
Intrathecal injection **contra-indicated**.

• **CAUTIONS** Cardiovascular disease · QT-interval prolongation (avoid hypokalaemia)

• **INTERACTIONS** → Appendix 1: vinca alkaloids

### • SIDE-EFFECTS

▶ **Common or very common** Anorexia · cutaneous reactions · dehydration · diarrhoea · dyspepsia · fatigue · hypertension · hypotension · insomnia · oedema · sweating · tachycardia · thrombosis

▶ **Uncommon** Increased weight · myocardial infarction · renal failure

▶ **Frequency not known** Alopecia · autonomic neuropathy · blurred vision · extravasation · hyperuricaemia · inappropriate anti-diuretic hormone secretion · myelosuppression (dose-limiting) · nausea · neurotoxicity · oral mucositis · peripheral neuropathy · QT-interval prolongation · severe bronchospasm following administration (more commonly when used in combination with mitomycin-C) · severe local irritation (if extravasated) · thromboembolism · tumour lysis syndrome · vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

• **Neurotoxicity** Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

• **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for up to 3 months after treatment.

• **PREGNANCY** Avoid unless essential—teratogenicity and embryotoxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

• **BREAST FEEDING** Discontinue breast-feeding.

• **HEPATIC IMPAIRMENT** Reduce dose—consult product literature.

• **RENAL IMPAIRMENT** Reduce dose if creatinine clearance less than 60 mL/minute—consult product literature.

## NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- **Vinflunine** for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract (January 2013) NICE TA272

Vinflunine is **not** recommended for the treatment of advanced or metastatic transitional cell carcinoma of the urothelial tract that has progressed after treatment with platinum-based chemotherapy.  
[www.nice.org.uk/TA272](http://www.nice.org.uk/TA272)

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

- **Javior** (Pierre Fabre Ltd)  
**Vinflunine (as Vinflunine ditartrate) 25 mg per 1 ml** Javior  
 250mg/10ml concentrate for solution for infusion | 1 vial [PoM](#)  
 £1,062.50  
 Javior 50mg/2ml concentrate for solution for infusion | 1 vial [PoM](#)  
 £212.50

## Vinorelbine

- **DRUG ACTION** Vinorelbine is a semi-synthetic vinca alkaloid.

### INDICATIONS AND DOSE

#### Advanced breast cancer | Advanced non-small cell lung cancer

- **BY MOUTH**
- Adult: 60 mg/m<sup>2</sup> once weekly for 3 weeks, then increased if tolerated to 80 mg/m<sup>2</sup> once weekly (max. per dose 160 mg once weekly)
- **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- Adult: (consult product literature)

### IMPORTANT SAFETY INFORMATION

Vinorelbine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
 See Cytotoxic drugs p. 825.

## CONTRA-INDICATIONS

- With oral use concurrent radiotherapy if treating the liver · long-term oxygen therapy · previous significant surgical resection of small bowel · previous significant surgical resection of stomach

### CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues · ischaemic heart disease

- **INTERACTIONS** → Appendix 1: vinca alkaloids

### SIDE-EFFECTS

- **Rare** Pancreatitis
- **Frequency not known** Alopecia · autonomic neuropathy · extravasation · hyperuricaemia · hyponatraemia · inappropriate secretion of antidiuretic hormone · irritant to tissues · motor weakness · myelosuppression (dose-limiting) · nausea · neurotoxicity · oral mucositis · peripheral neuropathy · severe bronchospasm following administration of the vinca alkaloids (more commonly when used in combination with mitomycin-C) · severe

local irritation (if extravasated) · thromboembolism · tumour lysis syndrome · vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

- **Neurotoxicity** Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinorelbine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.

Motor weakness can also occur, and increasing motor weakness calls for dose reduction or discontinuation of these drugs. Recovery from neurotoxic effects is usually slow but complete.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment; men must avoid fathering a child during and for at least 3 months after treatment.

- **PREGNANCY** Avoid unless essential (teratogenicity, and fetal loss in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding.

### HEPATIC IMPAIRMENT

- With oral use Reduce *oral* dose in moderate impairment. Avoid *oral* use in severe impairment.
- With injectable use Reduce *intravenous* dose in severe impairment. Consult product literature.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

#### Vinorelbine (Non-proprietary)

**Vinorelbine (as Vinorelbine tartrate) 10 mg per 1 ml** Vinorelbine  
 50mg/5ml concentrate for solution for infusion vials | 1 vial [PoM](#)  
 £139.00 | 10 vial [PoM](#) £1,539.80  
 Vinorelbine 10mg/1ml concentrate for solution for infusion vials | 1 vial [PoM](#) £29.00 | 10 vial [PoM](#) £329.50

#### Navelbine (Pierre Fabre Ltd)

**Vinorelbine (as Vinorelbine tartrate) 10 mg per 1 ml** Navelbine  
 10mg/1ml concentrate for solution for infusion vials | 10 vial [PoM](#)  
 £297.45 (Hospital only)  
 Navelbine 50mg/5ml concentrate for solution for infusion vials | 10 vial [PoM](#) £1,399.79 (Hospital only)

### Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

#### Navelbine (Pierre Fabre Ltd)

**Vinorelbine (as Vinorelbine tartrate) 20 mg** Navelbine 20mg capsules | 1 capsule [PoM](#) £43.98 (Hospital only)

**Vinorelbine (as Vinorelbine tartrate) 30 mg** Navelbine 30mg capsules | 1 capsule [PoM](#) £65.98 (Hospital only)

**Vinorelbine (as Vinorelbine tartrate) 80 mg** Navelbine 80mg capsules | 1 capsule [PoM](#) £175.92 (Hospital only)

## ANTINEOPLASTIC DRUGS > OTHER

## Amsacrine

24-May-2017

### INDICATIONS AND DOSE

**Acute leukaemia (refractory to anthracycline chemotherapy used alone or in combination with other chemotherapy agents) (specialist use only)**

- **BY INTRAVENOUS INFUSION**
- Adult: (consult product literature)

- **CAUTIONS** Hypokalaemia—increased risk of ventricular fibrillation (correct hypokalaemia before initiating treatment)

- **INTERACTIONS** → Appendix 1: amsacrine

### SIDE-EFFECTS

- **Common or very common** Abdominal pain · alopecia · arrhythmias · bone marrow suppression · cardiotoxicity · congestive heart failure · diarrhoea · dyspnoea · emotional

lability · Grand mal seizure · haematuria · haemorrhage · hepatic insufficiency · hepatitis · hypokalaemia · hypotension · infection · jaundice · nausea · pancytopenia · purpura · raised hepatic enzymes · rash · stomatitis · thrombocytopenia · urticaria · vomiting

► **Rare** Acute renal insufficiency · anaemia · anuria · confusion · dizziness · granulocytopenia · headache · hypoesthesia · lethargy · leucopenia · peripheral neuropathy · proteinuria · reduced ejection fraction · visual disturbances · weight changes

► **Frequency not known** Cardiac arrest · hyperuricaemia

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in women of child-bearing potential, and during and for 6 months after treatment in men.

● **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises consider dose reduction in hepatic impairment. Manufacturer advises monitor liver function at baseline and during treatment—increased risk of toxicity.

● **RENAL IMPAIRMENT** Manufacturer advises consider dose reduction in renal impairment. Manufacturer advises monitor renal function at baseline and during treatment—increased risk of toxicity.

#### ● MONITORING REQUIREMENTS

► Manufacturer advises monitor full blood count, liver function and renal function regularly; electrolytes should be re-evaluated prior to each treatment.  
► Manufacturer advises monitor for cardiotoxicity during treatment.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

► **Amsidine** (Eurocept International bv)

**Amsacrine 50 mg per 1 ml** Amsidine 75mg/1.5ml solution for infusion ampoules and diluent | 6 ampoule **[PoM]** £1,200.00 (Hospital only)

## Arsenic trioxide

#### ● INDICATIONS AND DOSE

**Acute promyelocytic leukaemia in patients who have relapsed or failed to respond to previous treatment with a retinoid and chemotherapy**

► BY INTRAVENOUS INFUSION

► Adult: (consult local protocol)

● **CAUTIONS** Hypokalaemia (correct before treatment) · hypomagnesaemia (correct before treatment) · previous treatment with anthracyclines (increased risk of QT interval prolongation)

● **INTERACTIONS** → Appendix 1: arsenic trioxide

#### ● SIDE-EFFECTS

► **Common or very common** Atrial fibrillation · atrial flutter · diarrhoea · fatigue · haemorrhage · hyperglycaemia · hypokalaemia · leucocyte activation syndrome · musculoskeletal pain · paraesthesia · pleuritic pain · QT interval prolongation

► **Uncommon** Abdominal pain · blurred vision · hypotension · oedema · pneumonitis · rash · renal failure · seizures · tachycardia · vasculitis

► **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- **Leucocyte activation syndrome** Signs and symptoms of leucocyte activation syndrome include unexplained fever, dyspnoea, weight gain, pulmonary infiltrates, pleural or pericardial effusions, with or without leucocytosis—treat with high dose corticosteroids, consult product literature.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment in men and women.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—limited information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution—limited information available.
- **MONITORING REQUIREMENTS** ECG required before and during treatment—consult product literature.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

► **Trisenox** (Teva UK Ltd)

**Arsenic trioxide 1 mg per 1 ml** Trisenox 10mg/10ml concentrate for solution for infusion ampoules | 10 ampoule **[PoM]** £2,920.00 (Hospital only)

## Asparaginase

16-Mar-2017

● **DRUG ACTION** Asparaginase is an enzyme which acts by breaking down L-asparagine to aspartic acid and ammonia, this disrupts protein synthesis of tumour cells.

#### ● INDICATIONS AND DOSE

**Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)**

► BY INTRAVENOUS INFUSION

► Adult: 5000 units/m<sup>2</sup> every 3 days

● **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy · history of serious haemorrhage related to asparaginase therapy · history of serious thrombosis related to asparaginase therapy · pancreatitis · pre-existing known coagulopathy

● **CAUTIONS** Diabetes (may raise blood glucose) · hypersensitivity reactions · hypertriglyceridaemia (severe)—increased risk of acute pancreatitis

#### CAUTIONS, FURTHER INFORMATION

► **Hypersensitivity reactions** Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—asparaginase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; in the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated. Manufacturer advises an intracutaneous or small intravenous test dose can be used but is of limited value for predicting which patients will experience an allergic reaction.

● **INTERACTIONS** → Appendix 1: asparaginase

#### ● SIDE-EFFECTS

► **Common or very common** Abdominal pain · acute pancreatitis—discontinue if suspected and do not re-start if confirmed · agitation · anaemia · confusion · decreased appetite · decreased clotting factors · decreased fibrinogen · depression · diarrhoea · dizziness · elevated blood lipids · haemorrhage · hallucination · hyperglycaemia · hypersensitivity reactions · hypoalbuminaemia · hypoglycaemia · myelosuppression · nausea · oedema · pain · somnolence · thrombosis · vomiting · weight loss

- ▶ **Uncommon** Headache · hyperammonaemia · hyperuricaemia
- ▶ **Rare** Convulsion · diabetic ketoacidosis · disturbances in consciousness (including coma) · hepatotoxicity · ischaemic stroke · parotitis · reversible posterior leucoencephalopathy syndrome
- ▶ **Very rare** Hypoparathyroidism · hypothyroidism (secondary) · tremor

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hepatotoxicity** There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome; manufacturer advises interrupt treatment if these symptoms develop.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 3 months after last dose; asparaginase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

#### MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor trough serum asparaginase levels 3 days after administration; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
- ▶ Manufacturer advises monitor bilirubin, hepatic transaminases, and coagulation parameters before and during treatment; in addition, monitor plasma and urinary glucose, amylase, lipase, triglycerides, cholesterol and serum protein levels during treatment.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator (2–8°C)—consult product literature for storage conditions after reconstitution and dilution.

#### PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Manufacturer advises asparaginase has moderate influence on driving and performance of skilled tasks—increased risk of dizziness and somnolence.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for infusion

- ▶ **Spectrila** (medac UK) ▼  
Asparaginase 10000 unit Spectrila 10,000unit powder for concentrate for solution for infusion vials | 1 vial (PoM) £450.00 (Hospital only)

## Crisantaspase

16-Mar-2017

- **DRUG ACTION** Crisantaspase is the enzyme asparaginase produced by *Erwinia chrysanthemi*.

#### INDICATIONS AND DOSE

##### Acute lymphoblastic leukaemia

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy

- **CAUTIONS** Diabetes (may raise blood glucose)

- **INTERACTIONS** → Appendix 1: crisantaspase

#### SIDE-EFFECTS

- ▶ **Common or very common** Coagulation disorders · confusion · convulsions · diarrhoea · dizziness · drowsiness · headache · lethargy · liver dysfunction · neurotoxicity · pancreatitis

- ▶ **Uncommon** Anaphylaxis · changes in blood lipids · hyperglycaemia

- ▶ **Rare** CNS depression

- ▶ **Very rare** Abdominal pain · hypertension · myalgia

- ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **PREGNANCY** Avoid. See also, *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION** Facilities for the management of anaphylaxis should be available.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for injection

- ▶ **Erwinase** (EUSA Pharma Ltd)  
Crisantaspase 10000 unit Erwinase 10,000unit powder for solution for injection vials | 5 vial (PoM) £3,065.00

## Eribulin

#### INDICATIONS AND DOSE

**Treatment of locally advanced or metastatic breast cancer when the disease has progressed after treatment with at least 1 chemotherapy regimen for advanced disease**

##### BY INTRAVENOUS INJECTION

- ▶ **Adult:** Give on day 1 and day 8 of a 21-day cycle, previous therapy should have included an anthracycline and a taxane in either the adjuvant or metastatic setting unless the patient is unsuitable for these treatments (consult local protocol)

- **CONTRA-INDICATIONS** Congenital long QT syndrome

- **CAUTIONS** Bradyarrhythmias (increased susceptibility to QT-interval prolongation) · congestive heart failure (increased susceptibility to QT-interval prolongation) · electrolyte disturbances (increased susceptibility to QT-interval prolongation) · susceptibility to QT-interval prolongation

- **INTERACTIONS** → Appendix 1: eribulin

- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · myelosuppression · nausea · oral mucositis · peripheral neuropathy · QT-interval prolongation · thromboembolism · tumour lysis syndrome · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

For further information on side effects, consult product literature.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for up to 3 months after treatment in men or women.

- **PREGNANCY** Avoid unless essential (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Reduce dose.

- **RENAL IMPAIRMENT** Consider dose reduction if creatinine clearance less than 40 mL/minute.

### ● MONITORING REQUIREMENTS

- ▶ Monitor for signs of peripheral neuropathy—severe peripheral neurotoxicity requires treatment delay or dose reduction (consult product literature).
- ▶ ECG monitoring recommended in patients prescribed concomitant use of drugs that prolong the QT-interval or who are susceptible to QT-interval prolongation.
- ▶ Monitor electrolytes periodically.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ Eribulin for treating locally advanced or metastatic breast cancer after 2 or more chemotherapy regimens (December 2016) NICE TA423

Eribulin is recommended for the treatment of locally advanced or metastatic breast cancer, only if:

- the condition has progressed after at least 2 chemotherapy regimens (which may include an anthracycline or a taxane, and capecitabine), and
- the manufacturer provides eribulin with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA423](http://www.nice.org.uk/TA423)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2016) that eribulin (*Halaven*®) is accepted for restricted use within NHS Scotland for the treatment of patients with locally advanced or metastatic breast cancer that has progressed after at least two prior chemotherapy regimens for advanced disease, which includes capecitabine if indicated.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

EXCIPIENTS: May contain Ethanol

- ▶ **Halaven** (Eisai Ltd)

**Eribulin 44 mg per 1 mL** Halaven 0.88mg/2mL solution for injection vials | 1 vial [PoM](#) £361.00 (Hospital only)  
Halaven 1.32mg/3mL solution for injection vials | 1 vial [PoM](#) £541.50 (Hospital only)

## Hydroxycarbamide

### (Hydroxyurea)

### ● INDICATIONS AND DOSE

**Treatment of chronic myeloid leukaemia | Treatment of cancer of the cervix in conjunction with radiotherapy | Polycythaemia**

- ▶ BY MOUTH

Adult: 20–30 mg/kg daily, alternatively 80 mg/kg every 3 days

**Sickle-cell disease –consult with a specialist centre**

- ▶ BY MOUTH

Adult: Initially 15 mg/kg daily, increased in steps of 2.5–5 mg/kg daily, dose to be increased every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day

### IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop)

- **INTERACTIONS** → Appendix 1: hydroxycarbamide

### ● SIDE-EFFECTS

- ▶ **Common or very common** Headache · myelosuppression · skin reactions
- ▶ **Rare** Amenorrhoea (in sickle-cell disease) · fever (in sickle-cell disease)
- ▶ **Frequency not known** Alopecia · bleeding (in sickle-cell disease) · bone-marrow suppression · dizziness · hyperuricaemia · hypomagnesaemia (in sickle-cell disease) · nausea · oral mucositis · rash · reduced sperm count and activity · skin cancers (particularly in elderly patients) · thromboembolism · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception before and during treatment.

- **PREGNANCY** Avoid (teratogenic in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment, unless used for malignant conditions.

- **RENAL IMPAIRMENT** In sickle-cell disease, reduce initial dose by 50% if eGFR less than 60 mL/minute/1.73 m<sup>2</sup>. In sickle-cell disease, avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.

Use with caution in malignant disease.

### ● MONITORING REQUIREMENTS

- ▶ Monitor renal and hepatic function before and during treatment.
- ▶ Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on maximum dose).
- ▶ Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.
- **PATIENT AND CARER ADVICE** Patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

#### Tablet

- ▶ **Siklos** (Nordic Pharma Ltd)

**Hydroxycarbamide 100 mg** Siklos 100mg tablets | 60 tablet [PoM](#)  
£100.00 DT price = £100.00

**Hydroxycarbamide 1 gram** Siklos 1000mg tablets | 30 tablet [PoM](#)  
£500.00

#### Capsule

- ▶ **Hydroxycarbamide (Non-proprietary)**

**Hydroxycarbamide 500 mg** Hydroxycarbamide 500mg capsules | 100 capsule [PoM](#) £86.00 DT price = £12.12

- ▶ **Droxia** (Imported (United States))

**Hydroxycarbamide 300 mg** Droxia 300mg capsules | 60 capsule [PoM](#) no price available

- ▶ **Hydrea** (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Hydroxycarbamide 500 mg** Hydrea 500mg capsules | 100 capsule [PoM](#) £10.47 DT price = £12.12

## Mitotane

- **DRUG ACTION** Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

### ● INDICATIONS AND DOSE

**Symptomatic treatment of advanced or inoperable adrenocortical carcinoma**

- ▶ BY MOUTH

Adult: Initially 2–3 g daily in 2–3 divided doses adjusted according to plasma-concentration monitoring, in severe illness initial dose continued →

can be increased up to 6 g daily, reduce dose or interrupt treatment if signs of toxicity, discontinue if inadequate response after 3 months

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Avoid in acute porphyrias p. 969 · risk of accumulation in overweight patients
  - **INTERACTIONS** → Appendix 1: mitotane
  - **SIDE-EFFECTS**
    - ▶ **Common or very common** Anaemia · anorexia · asthenia · ataxia · cognitive impairment · confusion · diarrhoea · dizziness · drowsiness · endocrine side effects · epigastric discomfort · gastro-intestinal disturbances · gynaecomastia · headache · hypercholesterolaemia · hypertriglyceridaemia · hypogonadism · leucopenia · liver disorders · movement disorder · myasthenia · nausea · neuropathy · neurotoxicity · paraesthesia · prolonged bleeding time · rash · thrombocytopenia · thyroid disorders · vomiting
    - ▶ **Rare** Flushing · haematuria · haemorrhagic cystitis · hypersalivation · hypertension · hypouricaemia · ocular disorders · postural hypotension · proteinuria · pyrexia · visual disturbances
    - ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
  - **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
  - **PREGNANCY** Manufacturer advises avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
  - **BREAST FEEDING** Discontinue breast-feeding.
  - **HEPATIC IMPAIRMENT** Avoid in severe impairment. Manufacturer advises caution in mild to moderate impairment; monitoring of plasma-mitotane concentration is recommended.
  - **RENAL IMPAIRMENT** Avoid in severe impairment. Manufacturer advises caution in mild to moderate impairment; monitoring of plasma-mitotane concentration is recommended.
  - **MONITORING REQUIREMENTS**
    - ▶ Plasma-mitotane concentration for optimum response 14–20 mg/litre.
    - ▶ Monitor plasma-mitotane concentration—consult product literature.
  - **PRESCRIBING AND DISPENSING INFORMATION** Corticosteroid replacement therapy Corticosteroid replacement therapy is necessary with treatment with mitotane. The dose of glucocorticoid should be increased in case of shock, trauma, or infection.
  - **PATIENT AND CARER ADVICE** Patients should be warned to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency).
- Driving and skilled tasks**  
Central nervous system toxicity may affect performance of skilled tasks (e.g. driving).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

**CAUTIONARY AND ADVISORY LABELS** 2, 10, 21

▶ **Lysodren** (HRA Pharma UK Ltd)

**Mitotane 500 mg** Lysodren 500mg tablets | 100 tablet (PoM)  
£590.97

## Panobinostat

01-Feb-2017

- **DRUG ACTION** Panobinostat is a histone deacetylase inhibitor, which promotes cell-cycle arrest and apoptosis of tumour cells via multiple pathways.

#### ● INDICATIONS AND DOSE

**Treatment of relapsed or refractory multiple myeloma (in combination with bortezomib and dexamethasone), in patients who have received at least two prior regimens, including bortezomib and an immunomodulatory agent**

▶ **BY MOUTH**

- ▶ **Adult 18–74 years:** 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), for doses of dexamethasone and bortezomib, or dose adjustment due to side-effects—consult product literature
- ▶ **Adult 75 years and over:** 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 8 cycles. Patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), alternatively initially 15 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 1 cycle, increased if tolerated to 20 mg once daily, on days 1, 3, 5, 8, 10 and 12 of a 21-day cycle for 7 subsequent cycles, patients with clinical benefit should continue treatment for 8 additional cycles; total duration 16 cycles (48 weeks), lower dose may be used for the first cycle depending on patient's condition and co-morbidities, for doses of dexamethasone and bortezomib, or dose adjustment due to side-effects—consult product literature

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises reduce dose to 10 mg with concurrent use of potent inhibitors of CYP3A4; if the potent inhibitor of CYP3A4 is to be continued, consider increasing the dose to 15 mg if tolerated. Manufacturer advises avoid potent inhibitors of CYP3A4 if possible in patients taking a reduced panobinostat dose due to side-effects, or in those with hepatic impairment.

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Coagulation disorders · elderly · QT-interval prolongation · risk factors for QT-interval prolongation
- CAUTIONS, FURTHER INFORMATION**
  - ▶ Risk factors for QT-interval prolongation Patients at risk of developing QT-interval prolongation include those with long QT syndrome, or uncontrolled or significant cardiac disease.
- **INTERACTIONS** → Appendix 1: panobinostat
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal distension · abdominal pain · abnormal hepatic function · anaemia · atrial fibrillation · bradycardia · cheilitis · cough · decreased appetite · dehydration · diarrhoea · dizziness · dry mouth · dysgeusia · dyspnoea · dyspnoea · electrolyte disturbances · epistaxis · erythema · fatigue · flatulence · fluid retention · gastritis · haemorrhage (may lead to haemorrhagic shock) · headache · hyperglycaemia · hypertension · hypoalbuminaemia · hypotension (including orthostatic) · hypothyroidism · insomnia · joint swelling · leucopenia · lymphopenia · nausea · neutropenia · palpitations · pancytopenia · peripheral oedema · QT-interval prolongation · rash · renal failure · respiratory failure · skin lesions · syncope · tachycardia · thrombocytopenia · tremor · urinary incontinence · vomiting · wheezing
  - ▶ **Uncommon** Colitis · myocardial infarction

**SIDE-EFFECTS, FURTHER INFORMATION**

Side-effects are reported when used in combination with bortezomib and dexamethasone.

- ▶ **Gastro-intestinal disorders** Manufacturer advises that patients are treated with anti-diarrhoeals, or any additional treatment, in accordance with local treatment guidelines at the first sign of abdominal cramping or onset of diarrhoea.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before starting treatment in women of child-bearing potential, and ensure highly effective contraception used during treatment and for 3 months after last dose. Women using hormonal contraceptives should also use a barrier method of contraception. Highly effective contraception also required for men and their female partners during treatment and for 6 months after last dose.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises reduce initial dose to 15 mg during the first treatment cycle in mild impairment—dose may be increased to 20 mg based on patient tolerability; reduce initial dose to 10 mg during the first treatment cycle in moderate impairment—dose may be increased to 15 mg based on patient tolerability. Manufacturer advises frequent monitoring of hepatic function in mild and moderate impairment, particularly during the dose escalation phase; avoid in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor full blood count before treatment, then frequently during treatment; reduce dose or interrupt treatment if thrombocytopenia or neutropenia occur—consult product literature.
  - ▶ Manufacturer advises monitor ECG before treatment and repeat periodically before each treatment cycle; QTcF should be <480 milliseconds before treatment initiation—consult product literature.
  - ▶ Manufacturer advises monitor electrolytes before treatment and periodically as clinically indicated, especially in patients with diarrhoea; monitor thyroid and pituitary function (free T4 and TSH) as clinically indicated; monitor hepatic function before treatment and regularly during treatment as clinically indicated.
  - ▶ Manufacturer advises monitor patients over 65 years more frequently, especially for thrombocytopenia and gastro-intestinal toxicity.
- **PATIENT AND CARER ADVICE** Manufacturer advises that patients and their carers should be told to seek medical advice if severe gastro-intestinal toxicity occurs.
 

**Missed doses**  
Manufacturer advises if a dose is missed, it can be taken up to 12 hours after the specified dose time.

**Driving and skilled tasks**  
Dizziness may affect performance of skilled tasks (e.g. driving).
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - ▶ **Panobinostat for treating multiple myeloma after at least 2 previous treatments (January 2016)** NICE TA380  
Panobinostat, in combination with bortezomib and dexamethasone, is recommended as an option for treating relapsed or refractory multiple myeloma in patients who have received at least 2 prior regimens including bortezomib and an immunomodulatory agent when the

manufacturer provides panobinostat with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA380](http://www.nice.org.uk/TA380)

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**10 mg** Farydak 10mg capsules | 6 capsule [PoM] £3,492.00

**Panobinostat (as Panobinostat lactate anhydrous) 15 mg** Farydak 15mg capsules | 6 capsule [PoM] £3,492.00

**Panobinostat (as Panobinostat lactate anhydrous)**

**20 mg** Farydak 20mg capsules | 6 capsule [PoM] £4,656.00

**Pegaspargase**

16-Mar-2017

- **DRUG ACTION** Pegaspargase breaks down the amino acid L-asparagine, thereby interfering with the growth of malignant cells, which are unable to synthesise L-asparagine.

**INDICATIONS AND DOSE**

**Acute lymphoblastic leukaemia (in combination with other antineoplastic drugs) (specialist use only)**

- ▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ **Adult 18-21 years:** 2500 units/m<sup>2</sup> every 14 days
- ▶ **Adult 22 years and over:** 2000 units/m<sup>2</sup> every 14 days

- **CONTRA-INDICATIONS** History of pancreatitis • history of serious haemorrhagic event with previous L-asparaginase therapy • history of serious thrombosis with previous L-asparaginase therapy
- **CAUTIONS** Concomitant use of other hepatotoxic drugs (particularly in pre-existing hepatic impairment)—monitor hepatic function • diabetes (may raise blood glucose) • hypersensitivity reactions • marked decrease of leukocyte count at start of treatment is possible—may be associated with significant rise in serum uric acid and development of uric acid nephropathy
- ▶ **CAUTIONS, FURTHER INFORMATION**

Hypersensitivity reactions. Serious hypersensitivity reactions, including life-threatening anaphylaxis, can occur—pegaspargase should only be administered when appropriately trained staff and resuscitation facilities are immediately available; manufacturer advises patients should be closely monitored for signs of hypersensitivity during treatment and for an hour after administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

- **INTERACTIONS** → Appendix 1: pegaspargase

**SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain • convulsion • diarrhoea • elevated blood lipids • hyperglycaemia • hypersensitivity reactions • hypoxia • myelosuppression • pain in extremities • pancreatitis—discontinue if suspected and do not re-start if confirmed • peripheral motor neuropathy • rash • stomatitis • syncope • thrombosis—discontinue treatment • vomiting
- ▶ **Rare** Acute renal failure • reversible posterior leukoencephalopathy syndrome
- ▶ **Very rare** Tremor
- ▶ **Frequency not known** Confusion • decreased clotting factors • decreased fibrinogen • diabetic ketoacidosis • hepatobiliary disorders • hyperammonaemia—monitor if symptoms present • somnolence • toxic epidermal necrolysis

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Hepatobiliary disorders** There have been rare reports of cholestasis, icterus, hepatic cell necrosis and hepatic failure with fatal outcome.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in men and women of child-bearing potential during treatment and for at least 6 months after discontinuing treatment; pegaspargase may reduce effectiveness of oral contraceptives—additional precautions (e.g. barrier method) are required, see also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Manufacturer advises avoid unless essential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises trough serum asparaginase activity levels may be measured before the next administration of pegaspargase; consider switching to a different asparaginase preparation if target levels not reached—seek expert advice.
  - ▶ Manufacturer advises monitor plasma and urine glucose levels during treatment; monitor coagulation profile at baseline and periodically during and after treatment (particularly with concomitant use of other drugs that inhibit coagulation); monitor serum amylase.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises for intramuscular injection, volumes over 3 mL must be divided between more than one site.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator between 2–8°C.
- **PATIENT AND CARER ADVICE**

Pancreatitis. Manufacturer advises patients and carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek medical attention if symptoms such as persistent, severe abdominal pain develop.

**Driving and skilled tasks**  
Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of confusion and somnolence.

**NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

- ▶ **Pegaspargase for treating acute lymphoblastic leukaemia (September 2016)** NICE TA408  
Pegaspargase, as part of antineoplastic combination therapy, is recommended as an option for treating acute lymphoblastic leukaemia only in patients with untreated newly diagnosed disease.

Patients whose treatment was started within the NHS before this guidance was published may continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/ta408](http://www.nice.org.uk/guidance/ta408)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (October 2016) that pegaspargase (*Oncaspar*®) is accepted for use within NHS Scotland as a component of antineoplastic combination therapy in acute lymphoblastic leukaemia.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

**Procarbazine**

- **DRUG ACTION** Procarbazine is a mild monoamine-oxidase inhibitor.

**INDICATIONS AND DOSE****Hodgkin's lymphoma**

- ▶ BY MOUTH
- ▶ Adult: (consult local protocol)

**IMPORTANT SAFETY INFORMATION****RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Pre-existing severe leucopenia · pre-existing severe thrombocytopenia
- **CAUTIONS** Cardiovascular disease · cerebrovascular disease · epilepsy · pheochromocytoma · procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary)
- **INTERACTIONS** → Appendix 1: procarbazine
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Loss of appetite
  - ▶ **Frequency not known** Alopecia · bone-marrow suppression · hypersensitivity rash (discontinue treatment) · hyperuricaemia · jaundice · myelosuppression · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid (teratogenic in animal studies and isolated reports in humans). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

**MEDICINAL FORMS**

## RETINOID AND RELATED DRUGS

### Boxarotene

- **DRUG ACTION** Boxarotene is an agonist at the retinoid X receptor, which is involved in the regulation of cell differentiation and proliferation. Boxarotene can cause regression of cutaneous T-cell lymphoma.

#### • INDICATIONS AND DOSE

**Skin manifestations of cutaneous T-cell lymphoma refractory to previous systemic treatment**

- ▶ **BY MOUTH**  
 ▶ Adult: Initially 300 mg/m<sup>2</sup> once daily, adjusted according to response, to be taken with a meal

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
 See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** History of pancreatitis · hypervitaminosis A · uncontrolled hyperlipidaemia · uncontrolled hypothyroidism
- **CAUTIONS** Avoid in acute porphyrias p. 969 · hyperlipidaemia · hypothyroidism
- **INTERACTIONS** → Appendix 1: retinoids
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · headache · hyperlipidaemia · hyperuricaemia · hypothyroidism · immunosuppression · leucopenia · myelosuppression · nausea · oral mucositis · pruritus · rash · thromboembolism · tumour lysis syndrome · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Caution—hypersensitivity to retinoids.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 1 month after treatment in men and women.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2002) that boxarotene is recommended for restricted use as a second-line treatment for patients with advanced cutaneous T-cell lymphoma.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

- ▶ **Targretin** (Eisai Ltd)  
**Boxarotene 75 mg** Targretin 75mg capsules | 100 capsule **[PoM]**  
 £937.50

## Tretinoin

#### • INDICATIONS AND DOSE

**Induction of remission in acute promyelocytic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)**

- ▶ **BY MOUTH**  
 ▶ Adult: 45 mg/m<sup>2</sup> daily in 2 divided doses maximum duration of treatment is 90 days, consult product literature for details of concomitant chemotherapy

- **CAUTIONS** Increased risk of thromboembolism during first month of treatment
- **INTERACTIONS** → Appendix 1: retinoids
- **SIDE-EFFECTS** Alopecia · anxiety · arrhythmias · benign intracranial hypertension (children particularly susceptible—consider dose reduction if intractable headache in children) · bone pain · cheilitis · chest pain · confusion · depression · dizziness · dry mucous membranes · dry skin · erythema · flushing · gastro-intestinal disturbances · genital ulceration · headache · hearing disturbances · hypercalcaemia · insomnia · oedema · pancreatitis · paraesthesia · pruritus · raised lipids · raised liver enzymes · raised serum creatinine · rash · retinoic acid syndrome · shivering · sweating · thromboembolism · visual disturbances

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Retinoic acid syndrome** Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective).
- **PREGNANCY** Teratogenic. See *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Avoid (discontinue breast-feeding).
- **HEPATIC IMPAIRMENT** Reduce dose to 25 mg/m<sup>2</sup>.
- **RENAL IMPAIRMENT** Reduce dose to 25 mg/m<sup>2</sup>.
- **MONITORING REQUIREMENTS** Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Tretinoin is the acid form of vitamin A.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops, cream, gel

##### Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

## 2.1 Cytotoxic drug-induced side effects

### ANTIDOTES AND CHELATORS > IRON CHELATORS

#### Dexrazoxane

- **DRUG ACTION** Dexrazoxane is an iron chelator.

#### ● INDICATIONS AND DOSE

##### CARDIOXANE®

**Prevention of chronic cumulative cardiotoxicity caused by doxorubicin or epirubicin treatment in advanced or metastatic breast cancer patients who have received a prior cumulative dose of 300 mg/m<sup>2</sup> of doxorubicin or a prior cumulative dose of 540 mg/m<sup>2</sup> of epirubicin when further anthracycline treatment is required**

##### ► BY INTRAVENOUS INFUSION

- Adult: Administer 10 times the doxorubicin-equivalent dose or 10 times the epirubicin-equivalent dose, dose to be given 30 minutes before anthracycline administration

##### SAVENE®

##### Anthracycline extravasation

##### ► BY INTRAVENOUS INFUSION

- Adult: Initially 1 g/m<sup>2</sup> daily (max. per dose 2 g) for 2 days, then 500 mg/m<sup>2</sup> for 1 day, first dose to be given as soon as possible and within 6 hours after injury

- **CONTRA-INDICATIONS** Children

- **CAUTIONS** Myelosuppression (effects may be additive to those of chemotherapy)

**CARDIOXANE®** Manufacturer advises caution in patients with heart failure—no information available • manufacturer advises caution in patients with myocardial infarction in previous 12 months—no information available • manufacturer advises caution in patients with symptomatic valvular heart disease—no information available • manufacturer advises caution in patients with uncontrolled angina—no information available

- **SIDE-EFFECTS**

##### CARDIOXANE®

- **Common or very common** Anorexia • asthenia • diarrhoea • dizziness • dry mouth • dyspnoea • erythema • infection • malaise • nausea • oedema • paraesthesia • peripheral neuropathy • stomatitis • syncope • vomiting
- **Uncommon** Abdominal pain • acute myeloid leukaemia • constipation • cough • dyspepsia • headache • lymphoedema • nail disorder • reduced ejection fraction • tachycardia • thromboembolism (when given with cytotoxic drugs)
- **Frequency not known** Alopecia • anaemia • blood disorders • fatigue • injection-site reactions • leucopenia • phlebitis • pruritus • pyrexia • thrombocytopenia

##### SAVENE®

- **Common or very common** Alopecia • anaemia • anorexia • blood disorders • diarrhoea • dizziness • drowsiness • dry mouth • dyspnoea • erythema • fatigue • infection • injection-site reactions • leucopenia • malaise • nausea • oedema • peripheral neuropathy • peripheral oedema • phlebitis • pruritus • pyrexia • stomatitis • syncope • thrombocytopenia • tremor • vaginal haemorrhage • vomiting
- **Uncommon** Drowsiness • myalgia • thromboembolism (when given with cytotoxic drugs) • weight loss

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 3 months after treatment in men and women.

- **PREGNANCY** Avoid unless essential (toxicity in *animal* studies).
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT**  
**CARDIOXANE®** Manufacturer advises that if anthracycline dose is reduced, reduce the *Cardioxane®* dose by a similar ratio.

**SAVENE®** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT**

**CARDIOXANE®** Manufacturer advises reduce dose by 50% if creatinine clearance less than 40 mL/minute.

**SAVENE®** Manufacturer advises avoid—risk of accumulation.

- **MONITORING REQUIREMENTS**

- Monitor full blood count.
- Monitor for cardiac toxicity.
- Monitor liver function.

- **DIRECTIONS FOR ADMINISTRATION** Local coolants such as ice packs should be removed at least 15 minutes before administration.

**CARDIOXANE®** For *intravenous infusion*, give intermittently in Compound sodium lactate; reconstitute each vial with 25 mL water for injections and dilute each vial with 25–100 mL infusion fluid; give requisite dose over 15 minutes.

**SAVENE®** For *intravenous infusion*, give intermittently in diluent; reconstitute each 500-mg vial with 25 mL of diluent; dilute requisite dose further in remaining diluent and give over 1–2 hours into a large vein in an area other than the one affected.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for infusion**

► **Cardioxane** (Clintigen Healthcare Ltd)

**Dexrazoxane 500 mg** Cardioxane 500mg powder for solution for infusion vials | 1 vial (PoM) £156.57

#### **Powder and solvent for solution for infusion**

ELECTROLYTES: May contain Potassium, sodium

► **Savene** (Clintigen Healthcare Ltd)

**Dexrazoxane 500 mg** Savene 500mg powder for concentrate and solvent for solution for infusion vials | 10 vial (PoM) no price available

### DETOXIFYING DRUGS > RECOMBINANT HUMAN KERATINOCYTE GROWTH FACTORS

#### Palifermin

- **DRUG ACTION** Palifermin is a human keratinocyte growth factor.

#### ● INDICATIONS AND DOSE

**Management of oral mucositis in patients with haematological malignancies receiving myeloblastic radiochemotherapy with autologous haematopoietic stem-cell support**

##### ► BY INTRAVENOUS INJECTION

- Adult: 60 micrograms/kg once daily for 3 doses (third dose given 24–48 hours before myeloblastic therapy) then 3 further doses at least 24 hours after myeloblastic therapy, and more than 4 days after most recent palifermin injection, starting on the same day as (but after) stem-cell infusion

- **SIDE-EFFECTS** Arthralgia • discoloration of the tongue • erythema • fever • oedema • oral paraesthesia • pruritus • rash • skin hyperpigmentation • taste disturbance • thickening of the tongue

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
  - **BREAST FEEDING** Manufacturer advises avoid—no information available.
- 
- **MEDICINAL FORMS**  
There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines listed.

## DETOXIFYING DRUGS > UROPROTECTIVE DRUGS

### Mesna

#### ● INDICATIONS AND DOSE

##### Cytotoxic induced urothelial toxicity

- BY MOUTH, OR BY INTRAVENOUS INJECTION
- Adult: Dose to be calculated according to oxazaphosphorine (cyclophosphamide or ifosfamide) treatment (consult product literature)

#### ● SIDE-EFFECTS

- **Common or very common** Colic · depression · diarrhoea · fatigue · headache · hypotension · irritability · joint pains · limb pains · nausea · rash · tachycardia · vomiting
- **Rare** Hypersensitivity reactions (more common in patients with auto-immune disorders)
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to thiol-containing compounds.
- **PREGNANCY** Not known to be harmful. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **EFFECT ON LABORATORY TESTS** False positive urinary ketones. False positive or false negative urinary erythrocytes.
- **DIRECTIONS FOR ADMINISTRATION** For oral administration of the injection, contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

##### Solution for injection

- **Mesna 100 (non-proprietary)**  
Mesna 100 mg per 1 ml Mesna 1g/10ml solution for injection ampoules | 15 ampoule [PoM](#) £441.15  
Mesna 400mg/4ml solution for injection ampoules | 5 ampoule [PoM](#)  
no price available | 15 ampoule [PoM](#) £201.15

##### Tablet

- **Mesna (Non-proprietary)**  
Mesna 400 mg Mesna 400mg tablets | 10 tablet [PoM](#) £134.30  
Mesna 600 mg Mesna 600mg tablets | 10 tablet [PoM](#) £190.60

## VITAMINS AND TRACE ELEMENTS > FOLATES

### Folinic acid

#### ● INDICATIONS AND DOSE

##### Prevention of methotrexate-induced adverse effects

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: 15 mg every 6 hours for 24 hours, to be started usually 12–24 hours after start of methotrexate infusion, dose may be continued by mouth, consult local treatment protocol for further information

##### Suspected methotrexate overdose

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Initial dose equal to or exceeding dose of methotrexate, to be given at a maximum rate of

160 mg/minute, consult poisons information centres for advice on continuing management

##### Adjunct to fluorouracil in colorectal cancer

- BY SLOW INTRAVENOUS INJECTION
- Adult: (consult product literature)

##### SODIOFOLIN®

##### As an antidote to methotrexate

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: (consult product literature)

##### Adjunct to fluorouracil in colorectal cancer

- BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Intrathecal injection
- **CAUTIONS** Avoid simultaneous administration of methotrexate · **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B<sub>12</sub> deficiency
- **INTERACTIONS** → Appendix 1: folates
- **SIDE-EFFECTS**
  - **Rare** Agitation (after high doses) · depression (after high doses) · insomnia (after high doses) · pyrexia (after parenteral use)
- **PREGNANCY** Not known to be harmful; benefit outweighs risk.
- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**
  - Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine for the treatment of metastatic colorectal cancer (December 2010) NICE TA212  
Bevacizumab in combination with oxaliplatin and either fluorouracil plus folinic acid or capecitabine is not recommended for the treatment of metastatic colorectal cancer.

Levofolinic acid

● **DRUG ACTION** Levofolinic acid is an isomer of folinic acid.

● **INDICATIONS AND DOSE**

**Prevention of methotrexate-induced adverse effects**

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Usual dose 7.5 mg every 6 hours for 10 doses, usually started 12–24 hours after beginning of methotrexate infusion

**Suspected methotrexate overdose**

- BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Adult: Initial dose at least 50% of the dose of methotrexate, intravenous infusion to be administered at a maximum rate of 160 mg/minute, consult poisons information centres for advice on continuing management

**Adjunct to fluorouracil in colorectal cancer**

- BY SLOW INTRAVENOUS INJECTION
- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Intrathecal injection
- **CAUTIONS** Avoid simultaneous administration of methotrexate · **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B<sub>12</sub> deficiency
- **INTERACTIONS** → Appendix 1: folates
- **SIDE-EFFECTS**
  - Rare Agitation (after high doses) · depression (after high doses) · insomnia (after high doses) · pyrexia (after parenteral use)
- **PREGNANCY** Not known to be harmful; benefit outweighs risk.
- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

- **Isovin** (Pfizer Ltd)
  - Levofolinic acid (as Calcium levofolinate) 10 mg per 1 ml Isovin 175mg/17.5ml solution for injection vials | 1 vial **[PoM]** £81.33 (Hospital only)
  - Isovin 25mg/2.5ml solution for injection vials | 1 vial **[PoM]** £11.62 (Hospital only)

● **SIDE-EFFECTS**

- **Common or very common** Fever
- **Uncommon** Anaphylaxis · bronchospasm · diarrhoea · haemolytic anaemia · headache · hypersensitivity reactions · methaemoglobinaemia · nausea · rash · vomiting
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor closely for hypersensitivity.
- **EFFECT ON LABORATORY TESTS** May interfere with test for uric acid—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (*Fasturtec*®), give intermittently in Sodium chloride 0.9%; reconstitute with solvent provided; gently swirl vial without shaking to dissolve; dilute requisite dose to 50 mL with infusion fluid and give over 30 minutes.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for infusion**

- **Fasturtec** (Sanofi)

**Rasburicase 1.5 mg** Fasturtec 1.5mg powder and solvent for solution for infusion vials | 3 vial **[PoM]** £208.39 (Hospital only)

**Rasburicase 7.5 mg** Fasturtec 7.5mg powder and solvent for solution for infusion vials | 1 vial **[PoM]** £347.32 (Hospital only)

3 Hormone responsive malignancy

Breast cancer

01-Jun-2016

Description of condition

Breast cancer is the most common form of malignancy in women. The causes of breast cancer are complex and there are several risk factors. Established risk factors include age, early onset of menstruation, late menopause, greater age at first completed pregnancy, and a family history. The use of oral contraceptives and postmenopausal HRT are also associated with a small excess risk.

Non-invasive breast cancer, also known as ductal carcinoma *in situ*, is when the cancer remains localised in the ducts. However, in most cases, the cancer is invasive at the time of diagnosis, which means that malignant cells are liable to spread beyond the immediate area of the tumour. Invasive breast cancer, where malignant cells spread beyond the ducts, can be defined as early breast cancer (operable, primary, stage I/II), locally advanced disease (inoperable local, stage III) and advanced disease (metastatic, stage IV).

Aims of treatment

Reducing mortality, increasing progression-free and disease-free survival and improving quality of life are the main aims of the available treatments for breast cancer and are dependant on the stage of the disease.

Surgery and radiotherapy aim to remove the tumour mass, while adjuvant drug therapy aims to reduce the risk of recurrence and the risk of developing invasive disease. Advanced breast cancer is not curable and treatment aims to achieve remission, to prolong the disease free survival, to relieve symptoms and improve quality of life.

Treatment

The course of the disease and the therapeutic approach vary depending on the characteristics of the cancer; factors such as patient age and menopausal status, tumour size and

2.1a Hyperuricaemia associated with cytotoxic drugs

**Other drugs used for Hyperuricaemia associated with cytotoxic drugs** Allopurinol, p. 1021 · Febuxostat, p. 1021

DETOXIFYING DRUGS > URATE OXIDASES

Rasburicase

● **INDICATIONS AND DOSE**

**Prophylaxis and treatment of acute hyperuricaemia, before and during initiation of chemotherapy, in patients with haematological malignancy and high tumour burden at risk of rapid lysis**

- BY INTRAVENOUS INFUSION
- Adult: 200 micrograms/kg once daily for up to 7 days according to plasma-uric acid concentration

- **CONTRA-INDICATIONS** G6PD deficiency
- **CAUTIONS** Atopic allergies

grade, involvement of axillary lymph nodes or skin, and presence of hormone receptors within the tumour may inform the extent and aggressiveness of the disease. The management of patients with breast cancer involves surgery, radiotherapy, drug therapy, or a combination of these.

### Early and locally advanced breast cancer

**EvGr** For operable breast cancer, primary treatment is surgical using breast-conserving surgery or mastectomy, followed by adjuvant therapy to eradicate the micro-metastases that cause relapses. Radiotherapy is recommended after breast conserving surgery, as it reduces local recurrence rates. It is also used after mastectomy if there is a high risk of recurrence.

Drug therapy can be used after surgery (adjuvant therapy) or may be offered before surgery (neoadjuvant therapy) to achieve local tumour downsizing in order to make breast-conserving surgery possible. The choice of adjuvant therapy is determined by the safety and efficacy of the drugs, the oestrogen-receptor status, and the human epidermal growth factor 2 (HER2) status of the primary tumour.

Adjuvant chemotherapy or radiotherapy should be considered for all patients, irrespective of age, and it should be started as soon as clinically possible within 31 days of surgery.

A high-dose anthracycline-based chemotherapy regimen is usually preferred to a low-dose anthracycline-based regimen or to a non-anthracycline-based regimen. Choice of chemotherapy regimen is usually guided by local policy, Clinical Cancer Networks, and funding arrangements.

Adjuvant anthracycline-taxane combination chemotherapy should be considered in patients where the additional benefit outweighs risk. For patients with lymph node-positive breast cancer, docetaxel p. 854 can be added as part of an adjuvant chemotherapy regimen; paclitaxel p. 855 is not recommended.

Following surgery, tamoxifen p. 879, alone or in combination with chemotherapy, can be given to premenopausal women with oestrogen-receptor-positive early invasive breast cancer. If chemotherapy has not been selected, tamoxifen can be used in combination with ovarian ablation or suppression. Tamoxifen is not recommended for non-invasive (ductal carcinoma *in situ*) early breast cancer. Premenopausal women with oestrogen-receptor-positive breast cancer who decline chemotherapy may benefit from treatment with goserelin p. 695 or ovarian ablation.

For postmenopausal women with oestrogen-receptor-positive early invasive breast cancer, not considered to be low risk, an aromatase inhibitor, such as anastrozole p. 880 or letrozole p. 881, is first-line therapy. Tamoxifen is an alternative if an aromatase inhibitor is not tolerated or is contra-indicated. An aromatase inhibitor should be given as initial adjuvant therapy for 5 years, or by switching to an aromatase inhibitor after 2–3 years of tamoxifen for a total of 5 years. Postmenopausal women who have already received tamoxifen for 5 years may be considered for extended therapy (5 years) with letrozole.

Adjuvant trastuzumab p. 823 is recommended as an option in patients with HER2 positive breast cancer following surgery, chemotherapy (neoadjuvant or adjuvant) and radiotherapy. Trastuzumab should not be given concurrently with anthracycline-containing regimens (because of the risk of congestive heart failure) but it may be given either concurrently with taxane-based regimens or sequentially. **A**

### Advanced breast cancer

Treatment of advanced breast cancer depends on the patient's drug history, disease severity, and oestrogen receptor and HER2 status.

**EvGr** For the majority of patients with oestrogen-receptor-positive advanced breast cancer, endocrine therapy is first-line treatment. Aromatase inhibitors, such as anastrozole, letrozole and exemestane p. 880, may be offered to patients

with no previous history of endocrine treatment or in those previously treated with tamoxifen.

Tamoxifen should be considered as first-line treatment for pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen. Ovarian suppression is used in pre- and perimenopausal women who have had disease progression despite treatment with tamoxifen.

In patients with advanced breast cancer that is imminently life-threatening or with visceral organ involvement, which requires early relief of symptoms, an anthracycline-based chemotherapy regimen is the preferred treatment. If anthracyclines are not suitable, the alternative is docetaxel monotherapy as first-line treatment, vinorelbine p. 860 or capecitabine p. 839 as second-line treatment or, for third-line treatment, whichever of the two drugs was not used second line. Gemcitabine p. 843 in combination with paclitaxel is recommended for the treatment of metastatic breast cancer only when docetaxel monotherapy or docetaxel with capecitabine are also considered appropriate.

Trastuzumab is recommended for the treatment of HER2-positive advanced breast cancer. It is used in combination with paclitaxel in those who have not received chemotherapy for metastatic breast cancer and as monotherapy for patients who have received at least two chemotherapy regimens for metastatic breast cancer (see trastuzumab *National funding/access decisions*). **A**

Lapatinib p. 905 in combination with an aromatase inhibitor, fulvestrant p. 878, trastuzumab emtansine p. 824, and toremifene p. 879 are all licensed for use in patients with metastatic breast cancer, however their use is not recommended (see drug monographs for *Indications and National funding/access decisions*).

The gonadorelin analogue, goserelin is licensed for advanced breast cancer in pre- and perimenopausal women suitable for hormone manipulation. Some progestogen preparations, such as medroxyprogesterone acetate p. 763, norethisterone p. 720, megestrol acetate p. 878 are also licensed for the treatment of breast cancer (see drug monographs).

**EvGr** The use of bisphosphonates in patients with metastatic breast cancer may reduce pain and prevent skeletal complications of bone metastases. **A**

### Familial breast cancer

**EvGr** Chemoprevention should be **offered** to all women who have been identified as **high-risk** of developing breast cancer. For women at **moderate-risk**, chemoprevention should only be **considered**. Other strategies should also be considered to reduce the risk.

Chemoprevention should not be given to patients at high-risk of developing breast cancer who have had a risk-reducing bilateral mastectomy. **A**

### Treatment options for chemoprevention

**EvGr** Chemoprevention should only be continued for 5 years.

Tamoxifen p. 879 [unlicensed indication] is recommended for *premenopausal* women who do not have a history or increased risk of thromboembolic disease or endometrial cancer.

In *post-menopausal* women (who do not have severe osteoarthritis), anastrozole p. 880 [unlicensed indication] is recommended. Women who have severe osteoarthritis, or who do not wish to take anastrozole, can be treated with tamoxifen provided there is no history or risk of thromboembolic disease or endometrial cancer. Alternatively, raloxifene hydrochloride p. 709 is an option [unlicensed indication] in *post-menopausal* women with a uterus who do not wish to take tamoxifen, unless there is a history or increased risk of thromboembolic disease. **A**

### Breast cancer in men

Breast cancer in men is rare. Although, not fully understood, risk factors may be associated with sex hormone metabolism,

including those acquired through liver disease or testicular trauma, environmental risk factors such as industrial exposure to heat, and genetic predisposition. Treatment is similar to that for women involving surgery, radiotherapy, drug therapy, or a combination of these.

## Prostate Cancer

31-May-2016

### Description of condition

Prostate cancer is the most common form of cancer affecting men. The main risk factors are age (most cases being diagnosed in men over 65 years of age), ethnicity (more common in black African-Caribbean men), and a familial component. Prostate cancer is usually slow-growing and asymptomatic at diagnosis, however, the presenting symptoms of advanced disease are usually urinary outflow obstruction, or, pelvic or back pain due to bone metastases. Treatment decisions are guided by baseline prostate specific antigen (PSA) levels, tumour grade (Gleason score), the stage of the tumour, the patient's life expectancy (based on age and comorbid conditions), treatment morbidity, and patient preference.

### Aims of treatment

In early or locally advanced prostate cancer, radical treatment aims to eliminate the malignancy. In metastatic disease, drug therapy is aimed at prolonging survival and reducing symptoms.

### Drug treatment

Treatment options for patients with prostate cancer include active monitoring, radical prostatectomy, external beam radiotherapy, and brachytherapy. Hormone therapy (androgen deprivation or anti-androgens) is the primary treatment for metastatic prostate cancer, but is also increasingly being used for patients with locally advanced, non-metastatic disease.

In patients with localised prostate cancer, the choice of treatment is guided by whether the disease is considered low, intermediate, or high risk according to the Gleason score, the serum PSA level, and the tumour stage.

#### Localised or locally advanced prostate cancer

**[EvGr]** In patients with **low-risk localised prostate cancer**, and those at **intermediate risk** who decline radical treatments (prostatectomy or radiotherapy), active monitoring is a suitable option. This involves close monitoring to avoid unnecessary treatment until disease progression occurs (or until the patient requests treatment).

In patients with **intermediate-risk or high-risk localised prostate cancer** (when there is a realistic prospect of long-term disease control) and in those with **locally advanced disease**, radical prostatectomy or radical radiotherapy should be offered. Other treatment options include a combination of radical radiotherapy and androgen deprivation therapy, consisting of 6 months of androgen deprivation therapy before, during or after radiotherapy. Pelvic radiotherapy should be considered in those with locally advanced prostate cancer who have a higher than 15% risk of pelvic lymph node involvement and are to receive neoadjuvant hormonal therapy.

Androgen deprivation therapy involves the use of a luteinising hormone-releasing hormone (LHRH) agonist (buserelin p. 694, goserelin p. 695, leuporelin acetate p. 696, or triptorelin p. 698), or bilateral orchidectomy, which removes the supply of endogenous hormone. Androgen deprivation therapy may be continued for up to 3 years in patients with high-risk localised prostate cancer.

Patients should be informed about the side-effects of treatment, particularly urinary and sexual dysfunction, loss of fertility, radiation-induced enteropathy, and hot flushes. Although there is limited evidence, intermittent therapy may be considered for patients who are having long-term androgen deprivation therapy, to reduce drug toxicity. Tumour flare, due to an initial surge in testosterone concentrations, has been reported in the initial stages of treatment with androgen deprivation therapy and prophylactic anti-androgen therapy (such as cyproterone acetate p. 725) may be added.

Medroxyprogesterone acetate p. 763 [unlicensed indication] can be used, initially for up to 10 weeks, to manage troublesome hot flushes caused by long-term androgen suppression; cyproterone acetate is an alternative if medroxyprogesterone acetate is not effective or not tolerated.

Patients who experience a reduction in libido and loss of sexual function should have access to specialist erectile dysfunction services and be considered for treatment with a phosphodiesterase type-5 inhibitor.

Osteoporosis and fatigue may also be a problem with androgen deprivation therapy. A bisphosphonate can be offered to men who have osteoporosis; denosumab p. 691 is an alternative if bisphosphonates are not appropriate. Gynaecomastia can occur with long-term (longer than 6 months) bicalutamide p. 874 treatment. Prophylactic radiotherapy (within the first month of treatment), or weekly tamoxifen p. 879 [unlicensed indication], if radiotherapy is unsuccessful, can be considered. **[A]**

#### Metastatic prostate cancer

**[EvGr]** Bilateral orchidectomy should be offered to all patients with **metastatic prostate cancer** as an alternative to continuous LHRH agonist treatment. Anti-androgen monotherapy with bicalutamide [unlicensed indication] can be offered to those who are willing to accept the adverse impact on overall survival and gynaecomastia in the hope of retaining sexual function. However, if satisfactory sexual function is not maintained, stop bicalutamide and start androgen deprivation therapy.

Abiraterone acetate p. 873 (in combination with prednisone p. 641 or prednisolone p. 639) and enzalutamide p. 874 are both recommended as options for the treatment of castration-resistant metastatic prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing p. 854 chemotherapy regimen.

In patients who develop **hormone-relapsed metastatic tumour**, chemotherapy with docetaxel can be used. It is recommended to stop the treatment with docetaxel after 10 cycles, or if severe adverse events occurred, or if there is evidence of disease progression.

Abiraterone acetate (in combination with prednisone or prednisolone) is also recommended as an option for treating

**metastatic hormone-relapsed prostate cancer** in patients who have no or mild symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated.

In patients with hormone-relapsed prostate cancer, a corticosteroid, such as dexamethasone p. 635, can be offered as third line therapy, after androgen deprivation therapy and anti-androgen therapy. [A](#)

## ANTINEOPLASTIC DRUGS > ANTI-ANDROGENS

### Abiraterone acetate

31-May-2016

#### ● INDICATIONS AND DOSE

**Metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with a docetaxel-containing chemotherapy regimen (in combination with prednisone or prednisolone) | Metastatic castration-resistant prostate cancer in patients who are asymptomatic or mildly symptomatic after failure of androgen deprivation therapy in whom chemotherapy is not yet clinically indicated (in combination with prednisone or prednisolone)**

#### ► BY MOUTH

- Adult: 1 g once daily, for dose of concurrent prednisone or prednisolone—consult product literature

- **CAUTIONS** Diabetes (increased risk of hyperglycaemia—monitor blood sugar frequently) · history of cardiovascular disease

#### CAUTIONS, FURTHER INFORMATION

- Cardiovascular disease Correct hypertension and hypokalaemia before treatment (if significant risk of congestive heart failure, such as history of cardiac failure, uncontrolled hypertension or cardiac events, consult product literature for management and increased monitoring).

- **INTERACTIONS** → Appendix 1: abiraterone

#### ● SIDE-EFFECTS

- **Common or very common** Angina · arrhythmia · atrial fibrillation · diarrhoea · dyspepsia · fractures · haematuria · heart failure · hepatotoxicity · hypertension · hypertriglyceridaemia · hypokalaemia · peripheral oedema · rash · sepsis · tachycardia · urinary tract infection
- **Uncommon** Adrenal insufficiency · myopathy · rhabdomyolysis
- **Rare** Allergic alveolitis

- **CONCEPTION AND CONTRACEPTION** Men should use condoms if their partner is pregnant, and use condoms in combination with another effective contraceptive method if their partner is of child-bearing potential—toxicity in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment and only if benefit clearly outweighs risk. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in severe impairment—no information available.

#### ● MONITORING REQUIREMENTS

- Monitor blood pressure, serum potassium concentration, and fluid balance before treatment, and at least monthly

during treatment—consult product literature for management of hypertension, hypokalaemia and oedema.

- Monitor liver function before treatment, then every 2 weeks for the first 3 months of treatment, then monthly thereafter—interrupt treatment if serum alanine aminotransferase or aspartate aminotransferase greater than 5 times the upper limit (consult product literature for details of restarting treatment at a lower dose) and discontinue permanently if 20 times the upper limit.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- Abiraterone for castration-resistant metastatic prostate cancer previously treated with a docetaxel-containing regimen (June 2012) NICE TA259

Abiraterone in combination with prednisone or prednisolone is recommended as an option for the treatment of castration-resistant metastatic prostate cancer only if:

- their disease has progressed on or after one docetaxel-containing chemotherapy regimen, **and**
- the manufacturer provides abiraterone with the discount agreed in the patient access scheme.

Patients currently receiving abiraterone in combination with prednisone or prednisolone whose disease does not meet the first criteria should be able to continue therapy until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA259](http://www.nice.org.uk/TA259)

- Abiraterone for treating metastatic hormone-relapsed prostate cancer before chemotherapy is indicated (April 2016) NICE TA387

Abiraterone, in combination with prednisone or prednisolone, is recommended as an option for treating metastatic hormone-relapsed prostate cancer in patients who have mild or no symptoms after androgen deprivation therapy has failed, and before chemotherapy is indicated. In addition, the manufacturer is required to rebate the cost of abiraterone from the 11th month until the end of treatment for patients who remain on treatment for more than 10 months.

[www.nice.org.uk/TA387](http://www.nice.org.uk/TA387)

#### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (July 2012) that abiraterone (Zytiga®), in combination with prednisone or prednisolone, is accepted for restricted use within NHS Scotland for the treatment of metastatic castration-resistant prostate cancer in patients whose disease has progressed during or after treatment with docetaxel-containing chemotherapy regimen, and have received only one prior chemotherapy regimen.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- **SIDE-EFFECTS** Arterial thrombosis · bone pain (in breast cancer) · feminising effects in men · fluid retention · gynaecomastia · hypercalcaemia (in breast cancer) · impotence · jaundice · nausea · sodium retention with oedema · thromboembolism · venous thrombosis · withdrawal bleeding
- **PREGNANCY** In first trimester, high doses associated with vaginal carcinoma, urogenital abnormalities, and reduced fertility in female offspring. Increased risk of hypospadias in male offspring.
- **HEPATIC IMPAIRMENT** Avoid. Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and liver tumours.

#### Tablet

##### ► Diethylstilbestrol (Non-proprietary)

Diethylstilbestrol 1 mg Diethylstilbestrol 1mg tablets | 28 tablet PoM £123.00 DT price = £120.34

Diethylstilbestrol 5 mg Diethylstilbestrol 5mg tablets | 28 tablet PoM £185.00–£208.00 DT price = £208.00

## PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > ANTI-GONADOTROPHIN-RELEASING HORMONES

## Degarelix

### ● INDICATIONS AND DOSE

**Advanced hormone-dependent prostate cancer**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: Initially 240 mg, to be administered as 2 injections of 120 mg, then 80 mg every 28 days, dose to be administered into the abdominal region

- **CAUTIONS** Diabetes · susceptibility to QT-interval prolongation
- **SIDE-EFFECTS**
  - **Common or very common** Asthenia · dizziness · drowsiness · headache · hot flushes · influenza-like symptoms · injection-site reactions · insomnia · nausea · night sweats · sweating · weight gain
  - **Uncommon** Abdominal discomfort · alopecia · anaemia · anorexia · anxiety · atrio-ventricular block · constipation · depression · diarrhoea · dry mouth · fainting · gynaecomastia · hypersensitivity reactions · hypertension · micturition urgency · musculoskeletal pain · oedema · pelvic pain · prostatitis · QT-interval prolongation · rash · renal impairment · sexual dysfunction · testicular pain · tinnitus · urticaria · vomiting
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Monitor bone density.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - Degarelix for treating advanced hormone-dependent prostate cancer (August 2016) NICE TA404

Degarelix is recommended as an option for treating advanced hormone-dependent prostate cancer in patients with spinal metastases, only if at least the same discounted drug cost which was available to the NHS in June 2016 is achieved by the commissioner.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

There can be variation in the licensing of different medicines containing the same drug.

**Powder and solvent for solution for injection**

#### ► Firmagon (Ferring Pharmaceuticals Ltd)

Degarelix (as Degarelix acetate) 80 mg Firmagon 80mg powder and solvent for solution for injection vials | 1 vial PoM £129.37

Degarelix (as Degarelix acetate) 120 mg Firmagon 120mg powder and solvent for solution for injection vials | 2 vial PoM £260.00

## PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOSTATIN ANALOGUES

### Somatostatin analogues, malignant disease

#### Overview

Lanreotide below, octreotide p. 877 and pasireotide p. 878 are analogues of the hypothalamic release-inhibiting hormone somatostatin. Lanreotide and octreotide are indicated for the relief of symptoms associated with neuroendocrine (particularly carcinoid) tumours and acromegaly. Additionally, lanreotide is licensed for the treatment of thyroid tumours and octreotide is also licensed for the prevention of complications following pancreatic surgery. Lanreotide (*Somatuline Autogel*®) is also licensed for the treatment of unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded. Octreotide long-acting depot injection is licensed for treatment of advanced neuroendocrine tumours of the midgut, or treatment where primary origin is not known but non-midgut sites of origin have been excluded. Octreotide may also be valuable in reducing vomiting in palliative care and in stopping variceal bleeding [unlicensed indication]—see also vasopressin p. 630 and terlipressin acetate p. 87. Pasireotide is licensed for the treatment of Cushing's disease when surgery has failed or is inappropriate.

### Somatostatin analogues

- **CAUTIONS** Diabetes mellitus (antidiabetic requirements may be reduced) · insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses) · may cause growth hormone-secreting pituitary tumour expansion during treatment (causing serious complications)
- **SIDE-EFFECTS**
  - ▶ **Rare** Pancreatitis (shortly after administration)
  - ▶ **Frequency not known** Abdominal pain · anorexia · bloating · diarrhoea · flatulence · gallstones (after long-term treatment) · gastro-intestinal disturbances · hyperglycaemia (with chronic administration) · hypoglycaemia · impaired postprandial glucose tolerance (with chronic administration) · irritation at the injection site · nausea · pain at the injection site · steatorrhoea · vomiting
- **MONITORING REQUIREMENTS**
  - ▶ Monitor for signs of tumour expansion (e.g. visual field defects).
  - ▶ Ultrasound examination of the gallbladder is recommended before treatment and at intervals of 6–12 months during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Injection sites should be rotated.

treated previously with somatostatin analogue, consult product literature for initial dose, dose to be given in the gluteal region

#### Neuroendocrine (particularly carcinoid) tumours

##### ▶ BY DEEP SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 60–120 mg every 28 days, adjusted according to response, dose to be given in the gluteal region

#### Unresectable locally advanced or metastatic gastroenteropancreatic neuroendocrine tumours of midgut, pancreatic or unknown origin where hindgut sites of origin have been excluded

##### ▶ BY DEEP SUBCUTANEOUS INJECTION

- ▶ **Adult:** 120 mg every 28 days

#### SOMATULINE LA®

#### Acromegaly and neuroendocrine (particularly carcinoid) tumours

##### ▶ BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** Initially 30 mg every 14 days, increased to 30 mg every 7–10 days, adjusted according to response

#### Thyroid tumours

##### ▶ BY INTRAMUSCULAR INJECTION

- ▶ **Adult:** Initially 30 mg every 14 days, increased to 30 mg every 10 days, adjusted according to response

- **CAUTIONS** Cardiac disorders (including bradycardia) · patients with carcinoid tumours—exclude the presence of an obstructive intestinal tumour before treatment
- **INTERACTIONS** → Appendix 1: lanreotide
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Alopecia · biliary dilatation · bradycardia · constipation · dizziness · dyspepsia · headache · lethargy · malaise · musculoskeletal pain · myalgia · raised bilirubin
  - ▶ **Uncommon** Hot flushes · insomnia
  - ▶ **Rare** Hypothyroidism
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor for hypothyroidism when clinically indicated.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ▶ Somatuline Autogel (Ipsen Ltd)

**Lanreotide (as Lanreotide acetate) 120 mg per 1 ml** Somatuline Autogel 60mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection [PoM] £551.00

**Lanreotide (as Lanreotide acetate) 180 mg per 1 ml** Somatuline Autogel 90mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection [PoM] £736.00

**Lanreotide (as Lanreotide acetate) 240 mg per 1 ml** Somatuline Autogel 120mg/0.5ml solution for injection pre-filled syringes with safety system | 1 pre-filled disposable injection [PoM] £937.00

#### Powder and solvent for suspension for injection

##### ▶ Somatuline LA (Ipsen Ltd)

**Lanreotide (as Lanreotide acetate) 30 mg** Somatuline LA 30mg powder and solvent for suspension for injection vials | 1 vial [PoM] £323.00

### Lanreotide

#### ● INDICATIONS AND DOSE

##### SOMATULINE AUTOGEL®

#### Acromegaly (if somatostatin analogue not given previously)

##### ▶ BY DEEP SUBCUTANEOUS INJECTION

- ▶ **Adult:** Initially 60 mg every 28 days, adjusted according to response, (consult product literature), for patients

17-Oct-2016

## Octreotide

### ● INDICATIONS AND DOSE

**Symptoms associated with carcinoid tumours with features of carcinoid syndrome, VIPomas, glucagonomas**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: Initially 50 micrograms 1–2 times a day, adjusted according to response; increased to 200 micrograms 3 times a day, higher doses may be required exceptionally; maintenance doses are variable; in carcinoid tumours, discontinue after 1 week if no effect, if rapid response required, initial dose may be given by intravenous injection (with ECG monitoring and after dilution)

**Acromegaly, short-term treatment before pituitary surgery or long-term treatment in those inadequately controlled by other treatment or until radiotherapy becomes fully effective**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: 100–200 micrograms 3 times a day, discontinue if no improvement within 3 months

**Prevention of complications following pancreatic surgery**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: (consult product literature)

**Test dose before use of depot preparation**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: Test dose 50–100 micrograms for 1 dose, test dose should be given if subcutaneous octreotide not previously given

**Acromegaly | Neuroendocrine (particularly carcinoid) tumour adequately controlled by subcutaneous octreotide**

#### ► BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION

- Adult: Initially 20 mg every 4 weeks for 3 months then adjusted according to response, increased if necessary up to 30 mg every 4 weeks, to be administered into the gluteal muscle, for *acromegaly*, start depot 1 day after the last dose of subcutaneous octreotide, for *neuroendocrine tumours*, continue subcutaneous octreotide for 2 weeks after first dose of depot octreotide

**Advanced neuroendocrine tumours of the midgut, or tumours of unknown primary origin where non-midgut sites of origin have been excluded**

#### ► BY DEEP INTRAMUSCULAR INJECTION USING DEPOT INJECTION

- Adult: 30 mg every 4 weeks

**Reduce intestinal secretions in palliative care | Reduce vomiting due to bowel obstruction in palliative care**

#### ► BY CONTINUOUS SUBCUTANEOUS INFUSION

- Adult: 0.25–0.5 mg/24 hours (max. per dose 0.75 mg/24 hours), occasionally doses higher than the maximum are sometimes required

### ● INTERACTIONS → Appendix 1: octreotide

- **SIDE-EFFECTS** Alopecia • arrhythmias • biliary colic (associated with abrupt withdrawal of subcutaneous octreotide) • bradycardia • dehydration • dizziness • dyspnoea • headache • hepatitis • pancreatitis (associated with abrupt withdrawal of subcutaneous octreotide) • rash

### SIDE-EFFECTS, FURTHER INFORMATION

- **Gastro-intestinal side-effects** Administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Adjustment of maintenance dose of non-depot preparations may be necessary in patients with liver cirrhosis.

### ● MONITORING REQUIREMENTS

- Monitor thyroid function on long-term therapy.
- Monitor liver function.
- With intravenous use ECG monitoring required with intravenous administration.

- **TREATMENT CESSATION** Avoid abrupt withdrawal of short-acting subcutaneous octreotide (associated with biliary colic and pancreatitis).

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection* or *intravenous infusion*, dilute with Sodium Chloride 0.9% to a concentration of 10–50%.

### ● PRESCRIBING AND DISPENSING INFORMATION

#### Palliative care

For further information on the use of octreotide in palliative care, see [www.palliativedrugs.com/formulary/en/octreotide.html](http://www.palliativedrugs.com/formulary/en/octreotide.html).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

##### ► Octreotide (Non-proprietary)

Octreotide (as Octreotide acetate) 50 microgram per

1 ml Octreotide 50micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £18.85 DT price = £18.85

Octreotide 50micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £14.85-£18.60

Octreotide 50micrograms/1ml solution for injection vials | 5 vial [PoM] £14.87-£22.00 DT price = £22.00

Octreotide (as Octreotide acetate) 100 microgram per

1 ml Octreotide 100micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £32.65 DT price = £27.97

Octreotide 100micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £28.90-£32.90

Octreotide 100micrograms/1ml solution for injection vials | 5 vial [PoM] £27.97-£32.65

Octreotide (as Octreotide acetate) 200 microgram per

1 ml Octreotide 1mg/5ml solution for injection vials | 1 vial [PoM] £65.00-£69.66

Octreotide (as Octreotide acetate) 500 microgram per

1 ml Octreotide 500micrograms/1ml solution for injection vials | 5 vial [PoM] £135.47-£158.25

Octreotide 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £169.35 DT price = £135.47

Octreotide 500micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £139.43-£169.00

##### ► Sandostatin (Novartis Pharmaceuticals UK Ltd)

Octreotide (as Octreotide acetate) 50 microgram per

1 ml Sandostatin 50micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £14.87

Octreotide (as Octreotide acetate) 100 microgram per

1 ml Sandostatin 100micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £27.97 DT price = £27.97

Octreotide (as Octreotide acetate) 200 microgram per

1 ml Sandostatin 1mg/5ml solution for injection vials | 1 vial [PoM] £55.73

Octreotide (as Octreotide acetate) 500 microgram per

1 ml Sandostatin 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £135.47 DT price = £135.47

### Powder and solvent for suspension for injection

#### ► Sandostatin LAR (Novartis Pharmaceuticals UK Ltd)

Octreotide (as Octreotide acetate) 10 mg Sandostatin LAR 10mg powder and solvent for suspension for injection vials | 1 vial [PoM] £549.71

Octreotide (as Octreotide acetate) 20 mg Sandostatin LAR 20mg powder and solvent for suspension for injection vials | 1 vial [PoM] £799.33

Octreotide (as Octreotide acetate) 30 mg Sandostatin LAR 30mg powder and solvent for suspension for injection vials | 1 vial [PoM] £998.41

## Pasireotide

### ● INDICATIONS AND DOSE

**Cushing's disease when surgery has failed or is inappropriate**

► BY SUBCUTANEOUS INJECTION

► Adult: Initially 600 micrograms twice daily for 2 months, then increased if necessary to 900 micrograms twice daily, consider discontinuation if no response within 2 months, for dose adjustment due to side effects—consult product literature

● **CAUTIONS** Cardiac disorders (including bradycardia) · susceptibility to QT-interval prolongation (including electrolyte disturbances)

● **INTERACTIONS** → Appendix 1: pasireotide

● **SIDE-EFFECTS** Adrenal insufficiency · alopecia · anaemia · arthralgia · bradycardia · decreased appetite · fatigue · headache · hyperglycaemia · hypotension · myalgia · pruritus · QT-interval prolongation

● **PREGNANCY** Avoid—toxicity in *animal* studies.

● **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Reduce initial dose to 300 micrograms twice daily (increased if necessary after 2 months to max. 600 micrograms twice daily) in moderate impairment. Avoid in severe impairment.

### ● MONITORING REQUIREMENTS

► Monitor liver function before treatment and after 1, 2, 4, 8, and 12 weeks of treatment.

► QT-interval prolongation Monitor ECG and electrolytes in patients susceptible to QT-prolongation before treatment, after one week, and periodically thereafter.

► Diabetes mellitus In diabetic patients, assess glycaemic status before treatment, weekly for the first 2–3 months of treatment, periodically thereafter, and 3 months after treatment is complete.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

► **Signifor** (Novartis Pharmaceuticals UK Ltd) ▼

**Pasireotide (as Pasireotide diaspertate) 300 microgram per 1 ml** Signifor 0.3mg/1ml solution for injection ampoules | 60 ampoule [PoM] £2,800.00

## PROGESTOGENS

## Megestrol acetate

### ● INDICATIONS AND DOSE

**Treatment of breast cancer**

► BY MOUTH

► Adult: 160 mg once daily

● **CONTRA-INDICATIONS** Acute porphyrias p. 969 · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis · history during pregnancy of severe pruritus · history of liver tumours · severe arterial disease · undiagnosed vaginal bleeding

● **CAUTIONS** Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

● **SIDE-EFFECTS** Acne · adrenal insufficiency · alopecia · anaphylactoid reactions · asthenia · bloating · breast tenderness · carpal tunnel syndrome · change in libido · constipation · Cushing's syndrome · depression · diarrhoea · dizziness · drowsiness · fluid retention · headache · hirsutism · indigestion · insomnia · jaundice · loss of vision during treatment (discontinue treatment if papilloedema or retinal vascular lesions) · menstrual disturbances · nausea · premenstrual-like syndrome · pruritus · rash · skin reactions · tumour flare (with or without hypercalcaemia) · urinary frequency · urticaria · vomiting · weight change · weight gain

● **PREGNANCY** Avoid. Reversible feminisation of male fetuses reported in *animal* studies. Risk of hypospadias in male fetuses and masculinisation of female fetuses.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

#### Oral suspension

► **Megestrol acetate (Non-proprietary)**

**Megestrol acetate 40 mg per 1 ml** Megestrol 200mg/5ml oral suspension | 240 ml [PoM] no price available | 480 ml [PoM] no price available

## 3.1 Hormone responsive breast cancer

### ANTINEOPLASTIC DRUGS > ANTI-OESTROGENS

## Fulvestrant

### ● INDICATIONS AND DOSE

**Treatment of oestrogen-receptor-positive metastatic or locally advanced breast cancer in postmenopausal women in whom disease progresses or relapses while on, or after, other anti-oestrogen therapy**

► BY DEEP INTRAMUSCULAR INJECTION

► Adult: 500 mg every 2 weeks for the first 3 doses, then 500 mg every month, to be administered into the buttock

● **INTERACTIONS** → Appendix 1: fulvestrant

### ● SIDE-EFFECTS

- **Common or very common** Anorexia · asthenia · back pain · diarrhoea · headache · hot flushes · hypersensitivity reactions · injection-site reactions · nausea · rash · urinary-tract infections · venous thromboembolism · vomiting
- **Uncommon** Leucorrhoea · vaginal candidiasis · vaginal haemorrhage

● **PREGNANCY** Manufacturer advises avoid—increased incidence of fetal abnormalities and death in *animal* studies.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 30 mL/minute—no information available.

● **DIRECTIONS FOR ADMINISTRATION** 500 mg dose should be administered as one 250-mg injection (slowly over 1–2 minutes) into each buttock.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Solution for injection**

► **Faslodex** (AstraZeneca UK Ltd)

**Fulvestrant 50 mg per 1 ml** Faslodex 250mg/5ml solution for injection pre-filled syringes | 2 pre-filled disposable injection [PoM] £522.41

## Tamoxifen

● **DRUG ACTION** An anti-oestrogen which induces gonadotrophin release by occupying oestrogen receptors in the hypothalamus, thereby interfering with feedback mechanisms; chorionic gonadotrophin is sometimes used as an adjunct in the treatment of female infertility.

### ● INDICATIONS AND DOSE

**Pre- and perimenopausal women with oestrogen-receptor-positive breast cancer not previously treated with tamoxifen**

► **BY MOUTH**

Adult: 20 mg daily

#### **Anovulatory infertility**

► **BY MOUTH**

Adult: Initially 20 mg daily on days 2, 3, 4 and 5 of cycle, if necessary the daily dose may be increased to 40 mg then 80 mg for subsequent courses; if cycles irregular, start initial course on any day, with subsequent course starting 45 days later or on day 2 of cycle if menstruation occurs

● **CONTRA-INDICATIONS** Treatment of infertility contra-indicated if personal or family history of idiopathic venous thromboembolism or genetic predisposition to thromboembolism

● **CAUTIONS** Porphyria

● **INTERACTIONS** → Appendix 1: tamoxifen

### ● SIDE-EFFECTS

- **Rare** Angioedema · bullous pemphigoid · cholestasis · fatty liver · hepatitis · hypersensitivity reactions · hypertriglyceridaemia · interstitial pneumonitis · neutropenia · Stevens-Johnson syndrome
- **Frequency not known** Alopecia · anaemia · cataracts · corneal changes · decreased platelet counts · endometrial changes · gastrointestinal disturbances · headache · hot flushes · hypercalcaemia if bony metastases · increased risk of thromboembolic events, especially when used with cytotoxics · leucopenia · light-headedness · liver enzyme

changes · occasional cystic ovarian swellings in premenopausal women · occasionally oedema · pancreatitis · pruritus vulvae · rashes · retinopathy · suppression of menstruation in some premenopausal women · thrombocytopenia · thromboembolic events · tumour flare · uterine fibroids · vaginal bleeding · vaginal discharge · visual disturbances

### SIDE-EFFECTS, FURTHER INFORMATION

- **Endometrial changes** Increased endometrial changes, including hyperplasia, polyps, cancer, and uterine sarcoma reported; prompt investigation required if abnormal vaginal bleeding including menstrual irregularities, vaginal discharge, and pelvic pain or pressure in those receiving (or who have received) tamoxifen.
- **Risk of thromboembolism** Tamoxifen can increase the risk of thromboembolism particularly during and immediately after major surgery or periods of immobility (consider interrupting treatment to initiate anticoagulant measures).
- **CONCEPTION AND CONTRACEPTION** Unless being used in the treatment of female infertility, effective contraception must be used during treatment and for 2 months after stopping. Patients being treated for infertility should be warned that there is a risk of multiple pregnancy (*rarely* more than twins).
- **PREGNANCY** Avoid—possible effects on fetal development.
- **BREAST FEEDING** Suppresses lactation. Avoid unless potential benefit outweighs risk.
- **PATIENT AND CARER ADVICE** Endometrial changes Patients should be informed of the risk of endometrial cancer and told to report relevant symptoms promptly. Thromboembolism Patients should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness and any pain in the calf of one leg.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

#### **Oral solution**

► **Tamoxifen (Non-proprietary)**

**Tamoxifen (as Tamoxifen citrate) 2 mg per 1 ml** Tamoxifen 10mg/5ml oral solution sugar free sugar-free | 150 ml [PoM] no price available DT price = £29.61

► **Soltamox** (Rosemont Pharmaceuticals Ltd)

**Tamoxifen (as Tamoxifen citrate) 2 mg per 1 ml** Soltamox 10mg/5ml oral solution sugar-free | 150 ml [PoM] £29.61 DT price = £29.61

#### **Oral suspension**

► **Tamoxifen (Non-proprietary)**

**Tamoxifen (as Tamoxifen citrate) 2 mg per 1 ml** Tamoxifen 10mg/5ml oral suspension | 150 ml [PoM] no price available

#### **Tablet**

► **Tamoxifen (Non-proprietary)**

**Tamoxifen (as Tamoxifen citrate) 10 mg** Tamoxifen 10mg tablets | 30 tablet [PoM] £61.12 DT price = £37.89

**Tamoxifen (as Tamoxifen citrate) 20 mg** Tamoxifen 20mg tablets | 30 tablet [PoM] £13.00 DT price = £2.88

**Tamoxifen (as Tamoxifen citrate) 40 mg** Tamoxifen 40mg tablets | 30 tablet [PoM] £54.75 DT price = £40.39

## Toremifene

### ● INDICATIONS AND DOSE

**Hormone-dependent metastatic breast cancer in postmenopausal women**

► **BY MOUTH**

Adult: 60 mg daily

● **CONTRA-INDICATIONS** Bradycardia · electrolyte disturbances (particularly uncorrected hypokalaemia) · endometrial hyperplasia · heart failure with reduced

left-ventricular ejection fraction · history of arrhythmias · QT prolongation

- **CAUTIONS** Avoid in acute porphyrias p. 969 · history of severe thromboembolic disease
- **INTERACTIONS** → Appendix 1: toremifene
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Depression · dizziness · fatigue · hot flushes · nausea · oedema · rash · sweating · vaginal bleeding · vaginal discharge · vomiting
  - ▶ **Uncommon** Anorexia · constipation · dyspnoea · endometrial hypertrophy · headache · increased weight · insomnia · thromboembolic events
  - ▶ **Very rare** Alopecia · jaundice · transient corneal opacity
  - ▶ **Frequency not known** Hypercalcaemia (especially if bone metastases and usually at beginning of treatment)

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Endometrial changes Increased endometrial changes, including hyperplasia, polyps and cancer reported. Abnormal vaginal bleeding including menstrual irregularities, vaginal discharge and symptoms such as pelvic pain or pressure should be promptly investigated.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Elimination decreased in hepatic impairment—avoid if severe.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- ▶ **Fareston** (Orion Pharma (UK) Ltd)  
Toremifene (as Toremifene citrate) 60 mg Fareston 60mg tablets | 30 tablet **[PoM]** £29.08

## HORMONE ANTAGONISTS AND RELATED AGENTS > AROMATASE INHIBITORS

### Anastrozole

#### ● INDICATIONS AND DOSE

**Adjuvant treatment of oestrogen-receptor-positive early invasive breast cancer in postmenopausal women | Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy | Advanced breast cancer in postmenopausal women which is oestrogen-receptor-positive or responsive to tamoxifen**

- ▶ **BY MOUTH**
- ▶ Adult: 1 mg daily

- **CONTRA-INDICATIONS** Not for premenopausal women
- **CAUTIONS** Susceptibility to osteoporosis
- **SIDE-EFFECTS**
  - ▶ **Very rare** Allergic reactions · anaphylaxis · angioedema
  - ▶ **Frequency not known** Anorexia · arthralgia · arthritis · asthenia · bone fractures · bone pain · cutaneous vasculitis · diarrhoea · drowsiness · hair thinning · headache · hot flushes · nausea · rash · slight increases in total cholesterol levels · Stevens-Johnson syndrome · vaginal bleeding · vaginal dryness · vomiting
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid in moderate to severe impairment.
- **RENAL IMPAIRMENT** Avoid if creatinine clearance less than 20 mL/minute.
- **PRE-TREATMENT SCREENING** Laboratory test for menopause if doubt.

#### ● MONITORING REQUIREMENTS

- ▶ Osteoporosis Assess bone mineral density before treatment and at regular intervals.

#### ● PATIENT AND CARER ADVICE

Driving and skilled tasks  
Asthenia and drowsiness may initially affect ability to drive or operate machinery.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### ARIMIDEX®

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2005 and October 2006) that anastrozole (*Arimidex*®) is accepted for restricted use within NHS Scotland, within the licensed indications, for early breast cancer and early invasive breast cancer.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

##### ▶ Anastrozole (Non-proprietary)

Anastrozole 1 mg Anastrozole 1mg tablets | 28 tablet **[PoM]** £65.13  
DT price = £1.08

##### ▶ Arimidex (AstraZeneca UK Ltd)

Anastrozole 1 mg Arimidex 1mg tablets | 28 tablet **[PoM]** £68.56 DT  
price = £1.08

### Exemestane

#### ● INDICATIONS AND DOSE

**Adjuvant treatment of oestrogen-receptor-positive early breast cancer in postmenopausal women following 2–3 years of tamoxifen therapy | Advanced breast cancer in postmenopausal women in whom anti-oestrogen therapy has failed**

- ▶ **BY MOUTH**
- ▶ Adult: 25 mg daily

- **CONTRA-INDICATIONS** Not indicated for premenopausal women

- **INTERACTIONS** → Appendix 1: exemestane

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · alopecia · anorexia · constipation · depression · dizziness · dyspepsia · fatigue · headache · hot flushes · insomnia · nausea · rash · sweating · vomiting
- ▶ **Uncommon** Asthenia · drowsiness · peripheral oedema
- ▶ **Rare** Leucopenia · thrombocytopenia

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

- **RENAL IMPAIRMENT** Manufacturer advises caution.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2005) that exemestane (*Aromasin*®) is accepted for restricted use within NHS Scotland as an adjuvant treatment in postmenopausal women with oestrogen-receptor-positive invasive early breast cancer, following 2–3 years of initial adjuvant tamoxifen therapy.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 21

##### ▶ Exemestane (Non-proprietary)

Exemestane 25 mg Exemestane 25mg tablets | 30 tablet **[PoM]**  
£88.80 DT price = £5.71 | 90 tablet **[PoM]** no price available

- ▶ **Aromasin** (Pfizer Ltd)  
Exemestane 25 mg Aromasin 25mg tablets | 30 tablet [PoM] £88.80  
DT price = £5.71

## Letrozole

### ● INDICATIONS AND DOSE

**First-line treatment in postmenopausal women with hormone-dependent advanced breast cancer | Adjuvant treatment of oestrogen-receptor-positive invasive early breast cancer in postmenopausal women | Advanced breast cancer in postmenopausal women (naturally or artificially induced menopause) in whom other anti-oestrogen therapy has failed | Extended adjuvant treatment of hormone-dependent invasive breast cancer in postmenopausal women who have received standard adjuvant tamoxifen therapy for 5 years | Neo-adjuvant treatment in postmenopausal women with localised hormone-receptor-positive, human epidermal growth factor-2 negative breast cancer where chemotherapy is not suitable and surgery not yet indicated**

▶ BY MOUTH

▶ Adult: 2.5 mg daily

- **CONTRA-INDICATIONS** Not indicated for premenopausal women
- **CAUTIONS** Susceptibility to osteoporosis
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · alopecia · anorexia · appetite increase · arthralgia · bone fracture · constipation · depression · diarrhoea · dizziness · dry skin · dyspepsia · fatigue · headache · hot flushes · hypercholesterolaemia · hypertension · increased sweating · musculoskeletal pain · nausea · osteoporosis · peripheral oedema · rash · vaginal bleeding · vomiting · weight changes
  - ▶ **Uncommon** Anxiety · arthritis · blurred vision · breast pain · cardiac events · cataract · cerebrovascular events · cough · dysaesthesia · dyspnoea · eye irritation · general oedema · insomnia · leucopenia · memory impairment · mucosal dryness · palpitation · pruritus · pyrexia · stomatitis · tachycardia · taste disturbance · thrombophlebitis · tumour pain · urinary frequency · urinary-tract infection · urticaria · vaginal discharge
  - ▶ **Rare** Arterial thrombosis · pulmonary embolism
  - ▶ **Frequency not known** Hepatitis · toxic epidermal necrolysis
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required until postmenopausal status fully established (return of ovarian function reported in postmenopausal women).
- **PREGNANCY** Avoid (isolated cases of birth defects reported).
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 10 mL/minute.
- **MONITORING REQUIREMENTS**
  - ▶ **Osteoporosis** Assess bone mineral density before treatment and at regular intervals.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

##### ▶ **Letrozole (Non-proprietary)**

**Letrozole 2.5 mg** Letrozole 2.5mg tablets | 14 tablet [PoM] £49.90  
DT price = £1.26 | 28 tablet [PoM] £73.24

##### ▶ **Femara** (Novartis Pharmaceuticals UK Ltd)

**Letrozole 2.5 mg** Femara 2.5mg tablets | 30 tablet [PoM] £90.92

## 4 Immunotherapy responsive malignancy

### ANTINEOPLASTIC DRUGS

#### Talimogene laherparepvec

10-Feb-2017

- **DRUG ACTION** Talimogene laherparepvec is an oncolytic immunotherapy derived from herpes simplex virus type-1 which causes tumour lysis and the release of tumour-derived antigens.

### ● INDICATIONS AND DOSE

**Unresectable metastatic melanoma with no bone, brain, or visceral disease**

▶ BY INTRALESIONAL INJECTION

▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Severely immunocompromised patients
- **CONTRA-INDICATIONS, FURTHER INFORMATION** Manufacturer advises avoid in patients who are severely immunocompromised, for example, those with severe congenital or acquired cellular and/or humoral immune deficiency—may be at increased risk of disseminated herpetic infection.
- **CAUTIONS** Administration of antivirals (may interfere with effectiveness of *Imlygic*®) · autoimmune disease · immunocompromised patients · multiple myeloma (risk of plasmacytoma at injection site)
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Immunocompromised patients Manufacturer advises caution in patients who are immunocompromised, for example, those with HIV/AIDS, leukaemia, lymphoma, common variable immunodeficiency, or in those who require chronic high-dose steroids or other immunosuppressive agents—risk of disseminated herpetic infection.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · anaemia · anxiety · arthralgia · cellulitis · confusion · constipation · cough · deep vein thrombosis · dehydration · depression · dermatitis · diarrhoea · dizziness · dyspnoea · flushing · glomerulonephritis · headache · hypertension · injection-site reactions · insomnia · malaise · myalgia · nausea · oral herpes infection · oropharyngeal pain · pain in extremity · peripheral oedema · pneumonitis · pyrexia · rash · tachycardia · tumour pain · upper respiratory tract infection · vasculitis · vitiligo · vomiting · worsening psoriasis
  - ▶ **Uncommon** Herpetic keratitis · plasmacytoma at injection site

### ● SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Injection-site reactions** Necrosis or ulceration of tumour tissue may occur, and impaired healing at the injection site has been reported. Manufacturer advises careful wound care and infection precautions; if persistent infection or delayed healing develops, the risks and benefits of continuing treatment should be considered.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises use of latex condoms.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION** Consult product literature for information on injection technique.
- **HANDLING AND STORAGE** Manufacturer advises caution in handling—risk of accidental exposure; avoid preparation

or administration if immunocompromised or pregnant. For further information, see the *Physician's Brochure* provided by the manufacturer. Store and transport frozen at -90°C to -70°C—consult product literature for further information on thawing and storage after thawing.

#### ● PATIENT AND CARER ADVICE

Provide patient alert card—record batch number for each administration of *Imlygic*®.

Manufacturer advises that patients and carers should be informed about the risks of treatment, advised to avoid touching or scratching injection sites, and to keep these sites covered with occlusive dressings. Close contacts should avoid direct contact with injected lesions or body fluids of treated patients during treatment and for up to 30 days after last treatment—if exposed, clean the affected area and seek medical attention if symptoms of herpetic infection develop; close contacts who are immunocompromised or pregnant should not be exposed to potentially contaminated materials. For further information, see the *Information for Patients and Close Contacts* provided by the manufacturer.

#### Driving and skilled tasks

Manufacturer advises that patients and their carers should be counselled on the effects on driving and performance of skilled tasks—risk of dizziness and confusion.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Talimogene laherparepvec for treating unresectable metastatic melanoma (September 2016)**  
Talimogene laherparepvec is recommended as an option for treating unresectable, regionally or distantly metastatic (Stage IIIB, IIIC or IVM1a) melanoma that has not spread to bone, brain or other internal organs, only if:
  - treatment with systemically administered immunotherapies is not suitable **and**,
  - the manufacturer provides talimogene laherparepvec with the discount agreed in the patient access scheme.
 Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.  
[www.nice.org.uk/TA410](http://www.nice.org.uk/TA410)

#### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

EXCIPIENTS: May contain Sorbitol

ELECTROLYTES: May contain Sodium

##### ▶ *Imlygic* (Amgen Ltd) ▼

**Talimogene laherparepvec 1 mega u per 1 ml** *Imlygic* 1million plaque forming units/1ml solution for injection vials | 1 vial [PoM]  
£1,670.00

**Talimogene laherparepvec 100 mega u per 1 ml** *Imlygic* 100million plaque forming units/1ml solution for injection vials | 1 vial [PoM]  
£1,670.00

## IMMUNOSTIMULANTS > INTERFERONS

### Interferon alfa

- **DRUG ACTION** Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

#### ● INDICATIONS AND DOSE

##### INTRONA® PEN

**Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymph or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma**

▶ BY SUBCUTANEOUS INJECTION

▶ Adult: (consult local protocol)

##### INTRONA® VIALS

**Chronic myelogenous leukaemia (as monotherapy or in combination with cytarabine) | Hairy cell leukaemia | Follicular lymphoma | Lymph or liver metastases of carcinoid tumour | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | Maintenance of remission in multiple myeloma**

▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION

▶ Adult: (consult local protocol)

##### ROFERON-A®

**Chronic myelogenous leukaemia | Hairy cell leukaemia | Chronic hepatitis B | Chronic hepatitis C | Adjunct to surgery in malignant melanoma | AIDS-related Kaposi's sarcoma | Advanced renal cell carcinoma | Progressive cutaneous T-cell lymphoma | Follicular non-Hodgkin's lymphoma**

▶ BY SUBCUTANEOUS INJECTION

▶ Adult: (consult local protocol)

- **CONTRA-INDICATIONS** For contra-indications consult product literature and local treatment protocol.
- **CAUTIONS** For cautions consult product literature and local treatment protocol.
- **INTERACTIONS** → Appendix 1: interferons
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anorexia · diarrhoea · influenza-like symptoms · lethargy · nausea
  - ▶ **Frequency not known** Alopecia · arrhythmias · cardiovascular problems · coma (usually with high doses in the elderly) · confusion · depression · hepatotoxicity · hyperglycaemia · hypersensitivity reactions · hypertension · hypertriglyceridaemia (sometimes severe) · hypotension · myelosuppression (particularly affecting granulocyte counts) · nephrotoxicity · ocular side-effects · palpitation · psoriasiform rash · seizures (usually with high doses in the elderly) · suicidal behaviour · thyroid abnormalities
- SIDE-EFFECTS, FURTHER INFORMATION**  
Consult product literature and local treatment protocols for information on side-effects
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).
- **BREAST FEEDING** Unlikely to be harmful.
- **HEPATIC IMPAIRMENT** Avoid in severe hepatic impairment. Close monitoring required in mild to moderate hepatic impairment.
- **RENAL IMPAIRMENT** Avoid in severe renal impairment. Close monitoring required in mild to moderate renal impairment.
- **MONITORING REQUIREMENTS** Monitoring of lipid concentration is recommended.

## ● DIRECTIONS FOR ADMINISTRATION

**ROFERON-A®** *Roferon-A®* injection for subcutaneous injection.

**INTRONA® VIALS** *IntronA®* injection vials for subcutaneous injection or intravenous infusion.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- ▶ Peginterferon alfa, interferon alfa, and ribavirin for moderate to severe chronic hepatitis C (January 2004 and September 2010) NICE TA200

Interferon alfa for either monotherapy or combined therapy should be used only if neutropenia and thrombocytopenia are a particular risk. Patients receiving interferon alfa may be switched to peginterferon alfa.

[www.nice.org.uk/TA200](http://www.nice.org.uk/TA200)

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **IntronA** (Merck Sharp & Dohme Ltd)

**Interferon alfa-2b 10 mega u per 1 ml** IntronA 10million units/1ml solution for injection vials | 1 vial [PoM] no price available  
IntronA 25million units/2.5ml solution for injection multidose vials | 1 vial [PoM] £103.94

**Interferon alfa-2b 15 mega u per 1 ml** IntronA 18million units/1.2ml solution for injection multidose pens | 1 pre-filled disposable injection [PoM] £74.83

**Interferon alfa-2b 25 mega u per 1 ml** IntronA 30million units/1.2ml solution for injection multidose pens | 1 pre-filled disposable injection [PoM] £124.72

**Interferon alfa-2b 50 mega u per 1 ml** IntronA 60million units/1.2ml solution for injection multidose pens | 1 pre-filled disposable injection [PoM] £249.45

- ▶ **Roferon-A** (Roche Products Ltd)

**Interferon alfa-2a 6 mega u per 1 ml** Roferon-A 3million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.20

**Interferon alfa-2a 9 mega u per 1 ml** Roferon-A 4.5million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £21.29

**Interferon alfa-2a 12 mega u per 1 ml** Roferon-A 6million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £28.37

**Interferon alfa-2a 18 mega u per 1 ml** Roferon-A 9million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £42.57

## Interferon gamma-1b

(Immune interferon)

### ● INDICATIONS AND DOSE

**To reduce the frequency of serious infection in chronic granulomatous disease**

- ▶ BY SUBCUTANEOUS INJECTION

Adult: 50 micrograms/m<sup>2</sup> 3 times a week

**To reduce the frequency of serious infection in severe malignant osteopetrosis**

- ▶ BY SUBCUTANEOUS INJECTION

Adult: 50 micrograms/m<sup>2</sup> 3 times a week

- **CONTRA-INDICATIONS** Simultaneous administration of foreign proteins including immunological products (such as vaccines)—risk of exaggerated immune response
- **CAUTIONS** Arrhythmias · cardiac disease · congestive heart failure · ischaemia · seizure disorders (including seizures associated with fever)
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · arthralgia · chills · depression · diarrhoea · fatigue · fever · headache · injection-site reactions · myalgia · nausea · rash · vomiting
  - ▶ **Rare** Confusion · systemic lupus erythematosus

- ▶ **Frequency not known** Neutropenia · proteinuria · raised liver enzymes · thrombocytopenia
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.
- **MONITORING REQUIREMENTS** Monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

- ▶ **Immukin** (Boehringer Ingelheim Ltd)

**Interferon gamma-1b (recombinant human) 200 microgram per 1 ml** Immukin 100micrograms/0.5ml solution for injection vials | 6 vial [PoM] £450.00

## IMMUNOSTIMULANTS > INTERLEUKINS

### Aldesleukin

- **DRUG ACTION** Aldesleukin produces tumour shrinkage in a small proportion of patients, but it has not been shown to increase survival.

### ● INDICATIONS AND DOSE

**Metastatic renal cell carcinoma (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature)

- **UNLICENSED USE** Aldesleukin is not licensed for use in patients in whom all three of the following prognostic factors are present: performance status of Eastern Co-operative Oncology Group of 1 or greater, more than one organ with metastatic disease sites, and a period of less than 24 months between initial diagnosis of primary tumour and date of evaluation of treatment.
- **CONTRA-INDICATIONS** Consult product literature for information about aldesleukin contra-indications.
- **CAUTIONS** Consult product literature for information about aldesleukin cautions.
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Bone-marrow toxicity · CNS toxicity · hepatic toxicity · renal toxicity · thyroid toxicity
  - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**  
Also consult product literature.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.
- **PREGNANCY** Use only if potential benefit outweighs risk (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **DIRECTIONS FOR ADMINISTRATION** Aldesleukin is now rarely given by intravenous infusion because of an increased risk of capillary leak syndrome, which can cause pulmonary oedema and hypotension.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for injection**

► **Proleukin** (Novartis Pharmaceuticals UK Ltd)

**Aldesleukin 18 mega u** Proleukin 18million unit powder for solution for injection vials | 1 vial [PoM] £112.00 | 10 vial [PoM] £1,036.00

## IMMUNOSTIMULANTS > OTHER

### Bacillus Calmette-Guérin

- **DRUG ACTION** Bacillus Calmette-Guérin is a live attenuated strain derived from *Mycobacterium bovis*.

#### • INDICATIONS AND DOSE

**Bladder instillation for the treatment of primary or recurrent bladder carcinoma and for the prevention of recurrence following transurethral resection**

- BY INTRAVESICAL INSTILLATION
- Adult: (consult product literature)

- **CONTRA-INDICATIONS** Fever of unknown origin · HIV infection · impaired immune response · severe haematuria · tuberculosis · urinary-tract infection
- **CAUTIONS** Bladder injury (delay administration until mucosal damage healed) · traumatic catheterisation (delay administration until mucosal damage healed) · urethral injury (delay administration until mucosal damage healed)

#### • SIDE-EFFECTS

- **Rare** Arthralgia · bladder contracture · hypersensitivity reactions · orchitis · rash · renal abscess · transient urethral obstruction
- **Frequency not known** Cystitis · dysuria · fever · haematuria · influenza-like syndrome · malaise · ocular symptoms · systemic BCG infection (with fatalities)—consult product literature · urinary frequency

#### • PREGNANCY

Avoid.

#### • BREAST FEEDING

Avoid.

- **PRE-TREATMENT SCREENING** Screen for active tuberculosis (contra-indicated if tuberculosis confirmed).

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for reconstitution for instillation**

► **ImmuCyst** (Alliance Pharmaceuticals Ltd)

**Connaught strain Bacillus of Calmette-Guérin 81 mg** ImmuCyst 81mg powder for reconstitution for instillation vials | 1 vial [PoM] £118.73 (Hospital only)

► **OncoTICE** (Merck Sharp & Dohme Ltd)

**TICE strain Bacillus of Calmette-Guérin 12.5 mg** OncoTICE 12.5mg powder for reconstitution for instillation vials | 1 vial [PoM] £71.61 (Hospital only)

#### • INDICATIONS AND DOSE

**Maintenance therapy, in combination with aldesleukin, in patients with acute myeloid leukaemia in first remission**

- BY SUBCUTANEOUS INJECTION
- Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Consult product literature for information about histamine dihydrochloride contra-indications.
- **CAUTIONS** Consult product literature for information about histamine dihydrochloride cautions.
- **INTERACTIONS** → Appendix 1: histamine
- **SIDE-EFFECTS** Consult product literature for side effects.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.

- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Increased risk of tachycardia and hypotension in moderate to severe impairment.
- **RENAL IMPAIRMENT** Increased risk of hypotension in severe impairment.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### **Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (December 2010) that histamine dihydrochloride (*Ceplene*®) is **not** recommended for use within NHS Scotland.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.  
No licensed medicines listed.

## Mifamurtide

#### • INDICATIONS AND DOSE

**Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)**

- BY INTRAVENOUS INFUSION
- Adult: Infusion to be given over 1 hour (consult product literature or local protocols)

- **UNLICENSED USE** Not licensed for use in patients over 30 years of age at initial diagnosis.
- **CAUTIONS** Asthma—consider prophylactic bronchodilator therapy · chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy · history of autoimmune disease · history of collagen disease · history of inflammatory disease
- **INTERACTIONS** → Appendix 1: mifamurtide
- **SIDE-EFFECTS** Abdominal pain · alopecia · anaemia · anorexia · anxiety · blurred vision · confusion · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry skin · dyspepsia · dyspnoea · dysuria · epistaxis · flushing · gastro-intestinal disturbances · granulocytopenia · haematuria · haemoptysis · headache · hearing loss · hypertension · hypoaesthesia · hypokalaemia · hypotension · insomnia · leucopenia · musculoskeletal pain · nausea · oedema · palpitations · paraesthesia · phlebitis · pleural effusion · pollakiuria · rash · respiratory disorders · sweating · tachycardia · tachypnoea · thrombocytopenia · tinnitus · tremor · vertigo · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution—no information available.
- **RENAL IMPAIRMENT** Use with caution—no information available.
- **MONITORING REQUIREMENTS**
  - Monitor renal function, hepatic function and clotting parameters.
  - Monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- **Mifamurtide for the treatment of osteosarcoma (October 2011) NICE TA235**  
Mifamurtide in combination with postoperative multi-agent chemotherapy is recommended (within its licensed indication), as an option for the treatment of high-grade resectable non-metastatic osteosarcoma after macroscopically complete surgical resection in children, adolescents and young adults and when mifamurtide is made available at a reduced cost to the NHS under the patient access scheme.  
[www.nice.org.uk/TA235](http://www.nice.org.uk/TA235)

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Powder for suspension for infusion

- **Mepact** (Takeda UK Ltd)  
**Mifamurtide 4 mg** Mepact 4mg powder for suspension for infusion vials | 1 vial **[PoM]** £2,375.00

## IMMUNOSUPPRESSANTS > THALIDOMIDE AND RELATED ANOLOGUES

### Lenalidomide

09-May-2016

- **DRUG ACTION** Lenalidomide is an immunomodulating drug with anti-neoplastic, anti-angiogenic, and pro-erythropoietic properties.

#### ● INDICATIONS AND DOSE

**Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with dexamethasone until disease progression**

- **BY MOUTH**
- **Adult:** 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature

**Multiple myeloma (newly diagnosed) in patients not eligible for transplant, given in combination with melphalan and prednisone followed by maintenance monotherapy**

- **BY MOUTH**
- **Adult:** 10 mg once daily for 21 consecutive days of repeated 28-day cycles for up to 9 cycles, for doses of melphalan and prednisone, and dose adjustments due to side-effects, consult product literature

**Multiple myeloma in patients who have received at least one prior therapy, given in combination with dexamethasone**

- **BY MOUTH**
- **Adult:** 25 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone, and dose adjustments due to side-effects, consult product literature

**Treatment of transfusion-dependent anaemia due to low- or intermediate-1-risk myelodysplastic syndromes (MDS) associated with an isolated deletion 5q cytogenetic abnormality when other treatment options are insufficient or inadequate**

- **BY MOUTH**
- **Adult:** 10 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustments due to side-effects, consult product literature

- **CAUTIONS** High tumour burden—risk of tumour lysis syndrome · patients with risk factors for myocardial infarction

## CAUTIONS, FURTHER INFORMATION

- **Thromboembolism** Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised and thromboprophylaxis should be considered in patients with multiple risk factors.
- **Second primary malignancy** Patients should be carefully evaluated before and during treatment with lenalidomide using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.

- **INTERACTIONS** → Appendix 1: lenalidomide

## ● SIDE-EFFECTS

- **Common or very common** Abdominal pain · anaemia · arrhythmias · arthralgia · ataxia · atrial fibrillation · bacterial infections · bradycardia · cardiac failure · cataract · cerebrovascular events · chest pain · cholestasis · constipation · decreased appetite · deep vein thrombosis · dehydration · depression · diarrhoea · dizziness · dry mouth · dyspepsia · dysphagia · dyspnoea · electrolyte disturbances · falls · flu-like illness · fungal infections · haematoma · haematuria · haemorrhagic disorders · headache · hearing disturbances · hyperglycaemia · hyperhidrosis · hypertension · hypotension · hypothyroidism · insomnia · iron-overload · lethargy · leucopenia · malaise · mood changes · musculoskeletal disorders · myalgia · myocardial infarction · nausea · oedema · peripheral neuropathy · pneumonia · pruritus · pulmonary embolism · pyrexia · rash · renal failure · respiratory distress · respiratory tract infections · sepsis · severe neutropenia · sexual dysfunction · sinusitis · skin disorders · stomatitis · syncope · tachycardia · taste disturbance · thrombocytopenia · tremor · urinary incontinence · urinary retention · vasculitis · viral infections · visual disturbances · vomiting
- **Uncommon** Acquired Fanconi syndrome · angioedema · blindness · caecitis · clotting disorders · colitis · haemolysis · hepatic failure · ischaemia · secondary malignancies
- **Rare** Stevens-Johnson syndrome · toxic epidermal necrolysis · tumour lysis syndrome
- **Frequency not known** Cholestatic hepatitis · cytolytic hepatitis · interstitial pneumonitis · leukocytoclastic vasculitis · pancreatitis · toxic hepatitis

## SIDE-EFFECTS, FURTHER INFORMATION

For information on side effects consult product literature.

- **Rash** If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation.  
Discontinue permanently if angioedema, exfoliative or bullous rash, or if Stevens-Johnson syndrome or toxic epidermal necrolysis is suspected.

- **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before starting treatment with lenalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer's Pregnancy Prevention Programme.

- **PREGNANCY** **Important: teratogenic risk.** Lenalidomide is structurally related to thalidomide and there is a risk of teratogenesis.

- **BREAST FEEDING** Discontinue breast-feeding—no information available.

- **RENAL IMPAIRMENT** Reduce dose in moderate to severe impairment—consult product literature.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor full blood count (including differential white cell count, platelet count, haemoglobin, and haematocrit) and liver function before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia, thrombocytopenia or impaired liver function develop—consult product literature).

- ▶ Monitor for arterial or venous thromboembolism (if thromboembolic event occurs, discontinue lenalidomide and treat with standard anticoagulation therapy; lenalidomide may be restarted with continued anticoagulation therapy once thromboembolic event resolved—consult product literature).
- ▶ Monitor thyroid function.
- ▶ Monitor for signs and symptoms of peripheral neuropathy.
- ▶ Monitor visual ability regularly (risk of cataract).
- ▶ Hepatic disorders Liver function should be monitored particularly when there is history of, or concurrent viral liver infection, or when lenalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).

- **PRESCRIBING AND DISPENSING INFORMATION** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

#### ● PATIENT AND CARER ADVICE

**Thromboembolism** Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

**Neutropenia and thrombocytopenia** Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

**Patient advice required around conception and contraception**

**Pregnancy and contraception** Patient counselling is advised for lenalidomide capsules (pregnancy and contraception).

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### **NICE technology appraisals (TAs)**

- ▶ **Lenalidomide for treating myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality (September 2014)** NICE TA322  
Lenalidomide is recommended as an option, within its marketing authorisation, for treating transfusion-dependent anaemia caused by low or intermediate-1-risk myelodysplastic syndromes associated with an isolated deletion 5q cytogenetic abnormality when other therapeutic options are insufficient or inadequate, with the following condition:
  - the drug cost of lenalidomide (excluding any related costs) for people who remain on treatment for more than 26 cycles (each of 28 days; normally a period of 2 years) will be met by the company.

[www.nice.org.uk/TA322](http://www.nice.org.uk/TA322)

- ▶ **Lenalidomide for the treatment of multiple myeloma (June 2009)** NICE TA171  
Lenalidomide in combination with dexamethasone is an option for the treatment of multiple myeloma in patients who have received two or more prior therapies. The drug cost of lenalidomide will be met by the manufacturer for patients who remain on treatment for more than 26 cycles.  
[www.nice.org.uk/TA171](http://www.nice.org.uk/TA171)

##### **Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (April 2010) that lenalidomide, in combination with dexamethasone, is accepted for restricted use within NHS Scotland for

patients with multiple myeloma who have received at least two prior therapies and (March 2014) for those who have received prior treatment with bortezomib and for whom thalidomide has not been tolerated or is contra-indicated.

The *Scottish Medicines Consortium* has advised (December 2015) that lenalidomide is accepted for restricted use within NHS Scotland for patients with previously untreated multiple myeloma who are not eligible for transplant and when thalidomide-containing regimens are unsuitable.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Pomalidomide

02-Jun-2017

- **DRUG ACTION** Pomalidomide is structurally related to thalidomide and has immunomodulatory properties and direct anti-myeloma tumoricidal activity.

#### ● INDICATIONS AND DOSE

**Treatment of relapsed and refractory multiple myeloma in patients who have received at least two prior treatment regimens, including both lenalidomide and bortezomib, and who have had disease progression during the last treatment (in combination with dexamethasone)**

##### ▶ BY MOUTH

- ▶ Adult: 4 mg once daily for 21 consecutive days of repeated 28-day cycles, for doses of dexamethasone and dose adjustment due to side effects—consult product literature

#### **DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises halve dose with concurrent use of potent inhibitors of CYP1A2 and ciprofloxacin.

#### **IMPORTANT SAFETY INFORMATION**

##### **MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B REACTIVATION**

An EU wide review has concluded that pomalidomide can cause hepatitis B reactivation; the MHRA recommends to establish hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Cardiac disease · cardiac risk factors · hepatitis B infection · high tumour burden—risk of tumour lysis syndrome · interstitial lung disease—discontinue if suspected · peripheral neuropathy

#### **CAUTIONS, FURTHER INFORMATION**

- ▶ **Thromboembolism** Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis should be considered, particularly in patients with additional risk factors.
- ▶ **Second primary malignancy** Patients should be carefully evaluated before and during treatment with pomalidomide

using routine cancer screening for occurrence of second primary malignancy and treatment should be instituted as indicated.

- ▶ **Hepatitis B infection** The MHRA advises that those with a history of hepatitis B infection should be closely monitored for signs and symptoms of active infection throughout treatment; expert advice should be sought for patients who test positive for active infection.

● **INTERACTIONS** → Appendix 1: pomalidomide

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · bone pain · cardiac failure · confusion · constipation · cough · decreased appetite · diarrhoea · dizziness · dyspnoea · febrile neutropenia · hyperkalaemia · hyponatraemia · impaired consciousness · interstitial lung disease · leucopenia · malaise · muscle spasms · nasopharyngitis · nausea · neutropenia · neutropenic sepsis · pelvic pain · peripheral neuropathy · peripheral oedema · pneumonia · pruritus · pyrexia · rash · renal failure · respiratory tract infection · thrombocytopenia · thromboembolic events · tremor · urinary retention · vertigo · vomiting
- ▶ **Uncommon** Hepatitis
- ▶ **Frequency not known** Atrial fibrillation · hepatitis B reactivation · pulmonary oedema

● **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before starting treatment with pomalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer's Pregnancy Prevention Programme.

● **PREGNANCY Important: teratogenic risk.**

● **BREAST FEEDING** Avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

● **MONITORING REQUIREMENTS**

- ▶ Manufacturer advises monitor full blood count before treatment, then every week for the first 8 weeks, then monthly thereafter (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).
- ▶ Manufacturer advises monitor for arterial or venous thromboembolism.
- ▶ Manufacturer advises monitor for signs and symptoms of cardiac failure.
- ▶ Manufacturer advises monitor for acute onset or unexplained worsening of respiratory symptoms.
- ▶ Manufacturer advises monitor liver function for 6 months after initiation, then as clinically indicated.

● **PRESCRIBING AND DISPENSING INFORMATION** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription must be accompanied by a completed Prescription Authorisation Form.

● **PATIENT AND CARER ADVICE** Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

**Patient advice required around conception and contraception** Patient counselling is advised for pomalidomide capsules (pregnancy and contraception).

● **NATIONAL FUNDING/ACCESS DECISIONS**

● **NICE technology appraisals (TAs)**

- ▶ **Pomalidomide for multiple myeloma previously treated with lenalidomide and bortezomib (January 2017)** NICE TA427 Pomalidomide, in combination with low-dose dexamethasone, is recommended as an option for treating multiple myeloma in adults at third or subsequent relapse (that is, after three previous treatments including both lenalidomide and bortezomib), only when the manufacturer provides pomalidomide with the discount agreed in the patient access scheme. Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA427](http://www.nice.org.uk/TA427)

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

## Thalidomide

- **DRUG ACTION** Thalidomide has immunomodulatory and anti-inflammatory activity.

● **INDICATIONS AND DOSE**

**First-line treatment for untreated multiple myeloma, in patients aged 65 years and over, or for those not eligible for high-dose chemotherapy (for example, patients with significant co-morbidity such as cardiac risk factors) in combination with melphalan and prednisolone**

▶ **BY MOUTH**

▶ **Adult 18–75 years:** 200 mg once daily for 6–week cycle for a maximum of 12 cycles, dose to be taken at bedtime

▶ **Adult 76 years and over:** 100 mg once daily for 6–week cycle for a maximum of 12 cycles, dose to be taken at bedtime

- **CAUTIONS** High tumour burden—risk of tumour lysis syndrome · patients aged 76 years and over—increased risk of serious side-effects

**CAUTIONS, FURTHER INFORMATION**

- ▶ **Thromboembolism** Risk factors for thromboembolism (such as smoking, hypertension, hyperlipidaemia) should be minimised. Thromboprophylaxis is recommended for at least the first 5 months of treatment, especially in patients with additional thrombotic risk factors.
- ▶ **Second primary malignancy** Patients should be carefully evaluated before and during treatment with thalidomide using routine cancer screening for occurrence of second

primary malignancy and treatment should be instituted as indicated.

- ▶ **Peripheral neuropathy** Patients with pre-existing peripheral neuropathy should not be treated with thalidomide unless the potential clinical benefits outweigh the risk.

● **INTERACTIONS** → Appendix 1: thalidomide

● **SIDE-EFFECTS**

- ▶ **Common or very common** Anaemia · asthenia · bradycardia · cardiac failure · confusion · constipation · deep vein thrombosis · depression · dizziness · drowsiness · dry mouth · dysaesthesia · dyspepsia · dyspnoea · interstitial lung disease · leucopenia · lymphopenia · neutropenia · paraesthesia · peripheral neuropathy · peripheral oedema · pneumonia · pulmonary embolism · pyrexia · skin reactions · Stevens-Johnson syndrome · syncope · thrombocytopenia · tremor · vomiting

- ▶ **Frequency not known** Atrial fibrillation · atrioventricular block · cerebrovascular events · convulsions · gastro-intestinal haemorrhage · gastro-intestinal perforation · hearing loss · hepatic disorders · hypothyroidism · intestinal obstruction · menstrual disorders · myocardial infarction · renal failure · second primary malignancy · sexual dysfunction · toxic epidermal necrolysis · worsening of Parkinson's disease symptoms

**SIDE-EFFECTS, FURTHER INFORMATION**

- ▶ **Rash** If rash occurs, treatment should be discontinued and only restarted following appropriate clinical evaluation.
- ▶ **Peripheral neuropathy** If symptoms suggestive of peripheral neuropathy develop (such as paraesthesia, abnormal coordination, or weakness) dose reduction, dose interruption, or treatment discontinuation may be necessary—consult product literature.

- **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before starting treatment with thalidomide (perform pregnancy test on initiation or within 3 days prior to initiation). Women must practise effective contraception at least 1 month before, during, and for at least 1 month after treatment, including during dose interruptions (oral combined hormonal contraceptives and copper-releasing intra-uterine devices not recommended) and men should use condoms during treatment, during dose interruption, and for at least 1 week after stopping if their partner is pregnant or is of childbearing potential and not using effective contraception. Patients, prescribers and pharmacists must comply with pregnancy prevention measures as specified in the manufacturer's Pregnancy Prevention Programme.

- **PREGNANCY Important: teratogenic risk.**

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.

- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

● **MONITORING REQUIREMENTS**

- ▶ Monitor white blood cell count (including differential count) and platelet count (reduce dose or interrupt treatment if neutropenia or thrombocytopenia develop—consult product literature).
- ▶ Monitor for arterial or venous thromboembolism.
- ▶ Monitor patients for signs and symptoms of peripheral neuropathy.
- ▶ Hepatic disorder Liver function should be monitored, particularly when there is history of, or concurrent viral liver infection, or when thalidomide is combined with drugs known to be associated with liver dysfunction (e.g. paracetamol).
- **PRESCRIBING AND DISPENSING INFORMATION** Patient, prescriber, and supplying pharmacy must comply with a pregnancy prevention programme. Every prescription

must be accompanied by a complete Prescription Authorisation Form.

- **PATIENT AND CARER ADVICE** Patients and their carers should be made aware of the symptoms of thromboembolism and advised to report sudden breathlessness, chest pain, or swelling of a limb.

Patients and their carers should be made aware of the symptoms of neutropenia and advised to seek medical advice if symptoms suggestive of neutropenia (such as fever, sore throat) or of thrombocytopenia (such as bleeding) develop.

Patients and their carers should be advised to seek medical advice if symptoms of peripheral neuropathy such as paraesthesia, abnormal coordination, or weakness develop.

**Patient advice required around conception and contraception**  
Patient counselling advised for thalidomide capsules (pregnancy and contraception).

● **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

- ▶ **Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011)** NICE TA228  
Thalidomide in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma in people for whom high-dose chemotherapy with stem cell transplantation is considered inappropriate.  
[www.nice.org.uk/TA228](http://www.nice.org.uk/TA228)

## 5 Photodynamic therapy responsive malignancy

### PHOTOSENSITISERS

#### Porfimer sodium

- **DRUG ACTION** Porfimer sodium accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

● **INDICATIONS AND DOSE**

**Photodynamic therapy of non-small cell lung cancer and obstructing oesophageal cancer**

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyrias p. 969 · broncho-oesophageal fistula · tracheo-oesophageal fistula

- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · constipation · extravasation · hyperuricaemia · nausea · oral mucositis · photosensitivity (sunscreens offer no protection) · thromboembolism · tumour lysis syndrome · vomiting

- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** No information available—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

## ● PATIENT AND CARER ADVICE

**Photosensitivity** Avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 30 days.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Powder for solution for injection

- ▶ **Photofrin** (Axcan Pharma Inc, Pinnacle Biologics BV)

**Porfimer sodium 15 mg** Photofrin 15mg powder for solution for injection vials | 1 vial [PoM] no price available (Hospital only)

**Porfimer sodium 75 mg** Photofrin 75mg powder for solution for injection vials | 1 vial [PoM] £1,011.00 (Hospital only)

## Temoporfin

- **DRUG ACTION** Temoporfin accumulates in malignant tissue and is activated by laser light to produce a cytotoxic effect.

### ● INDICATIONS AND DOSE

**Photodynamic therapy of advanced head and neck squamous cell carcinoma refractory to, or unsuitable for, other treatments**

- ▶ BY SLOW INTRAVENOUS INJECTION
- ▶ Adult: (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyrias p. 969 · concomitant photosensitising treatment · diseases exacerbated by light · elective surgery · ophthalmic slit-lamp examination for 30 days after administration
- **SIDE-EFFECTS** Alopecia · blistering · bone-marrow suppression · constipation · dysphagia · erythema · extravasation · facial pain · giddiness · haemorrhage · hyperpigmentation · hyperuricaemia · injection site pain · nausea · oedema · oral mucositis · photosensitivity (sunscreens ineffective) · scarring · skin necrosis · thromboembolism · trismus · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid pregnancy for at least 3 months after treatment.
- **PREGNANCY** Toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 month after treatment—no information available.
- **PATIENT AND CARER ADVICE**  
Photosensitivity Avoid exposure of skin and eyes to direct sunlight or bright indoor light for at least 15 days after administration.  
Avoid prolonged exposure of injection site arm to direct sunlight for 6 months after administration.  
If extravasation occurs protect area from light for at least 3 months.

## ● MEDICINAL FORMS

### Solution for injection

- ▶ **Foscan** (Biolitec Pharma Ltd)

**Temoporfin 1 mg per 1 ml** Foscan 3mg/3ml solution for injection vials | 1 vial [PoM] £1,800.00 (Hospital only)

Foscan 6mg/6ml solution for injection vials | 1 vial [PoM] £3,400.00 (Hospital only)

## 6 Targeted therapy responsive malignancy

### ANTINEOPLASTIC DRUGS > PROTEASOME INHIBITORS

## Bortezomib

14-Apr-2016

- **DRUG ACTION** Bortezomib is a proteasome inhibitor.

### ● INDICATIONS AND DOSE

**Treatment of multiple myeloma that has progressed despite the use of at least one therapy, and where the patient has already had, or is unable to have, haematopoietic stem cell transplantation (either as monotherapy, or in combination with pegylated liposomal doxorubicin or dexamethasone)** | **Treatment of previously untreated multiple myeloma in patients who are not eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with melphalan and prednisolone)** | **Induction treatment of previously untreated multiple myeloma in patients who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation (in combination with dexamethasone, or with dexamethasone and thalidomide)**

- ▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Adult: (consult local protocol)

### IMPORTANT SAFETY INFORMATION

Bortezomib injection is for **intravenous or subcutaneous administration** only. Inadvertent intrathecal administration with fatal outcome has been reported.

- **CONTRA-INDICATIONS** Acute diffuse infiltrative pulmonary disease · pericardial disease
- **CAUTIONS** Amyloidosis · cardiovascular disease · consider antiviral prophylaxis for herpes zoster infection · dehydration · diabetes (may affect blood glucose) · history of syncope · pulmonary disease (discontinue if interstitial lung disease develops) · risk factors for seizures · risk of neuropathy—consult product literature
- **INTERACTIONS** → Appendix 1: bortezomib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Constipation (cases of ileus reported) · decreased appetite · diarrhoea · dyspnoea · fatigue · headache · herpes zoster · hypotension · myalgia · paraesthesia · peripheral neuropathy · pyrexia · rash · reactivation of herpes zoster · sensory neuropathy
  - ▶ **Uncommon** Acute diffuse infiltrative pulmonary disorders · heart failure · posterior reversible encephalopathy syndrome (discontinue treatment) · pulmonary hypertension · seizures
  - ▶ **Rare** Autonomic neuropathy
  - ▶ **Very rare** Progressive multifocal leucoencephalopathy
  - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**  
For further information on side-effects, consult product literature.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 3 months after treatment in men or women.
- **PREGNANCY** Toxicity in *animal* studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Reduce dose in moderate to severe impairment—consult product literature.
- **RENAL IMPAIRMENT** No information available for creatinine clearance less than 20 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor blood-glucose concentration in patients on oral antidiabetics.
  - ▶ Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological signs or symptoms)—discontinue treatment if diagnosed.
  - ▶ Chest x-ray recommended before treatment to monitor for pulmonary disease—discontinue if interstitial lung disease develops.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - ▶ Bortezomib for previously untreated mantle cell lymphoma (December 2015) NICE TA370  
Bortezomib is recommended as an option for the treatment of previously untreated mantle cell lymphoma in adults for whom haematopoietic stem cell transplantation is unsuitable.  
[www.nice.org.uk/TA370](http://www.nice.org.uk/TA370)
    - ▶ Bortezomib for induction therapy in multiple myeloma before high-dose chemotherapy and autologous stem cell transplantation (April 2014) NICE TA311  
Bortezomib is recommended as an option within its marketing authorisation, in combination with dexamethasone, or with dexamethasone and thalidomide, for the induction treatment of adults with previously untreated multiple myeloma, who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.  
[www.nice.org.uk/TA311](http://www.nice.org.uk/TA311)
    - ▶ Bortezomib and thalidomide for the first-line treatment of multiple myeloma (July 2011) NICE TA228  
Bortezomib in combination with an alkylating drug and a corticosteroid is recommended as an option for the first-line treatment of multiple myeloma if:
      - high-dose chemotherapy with stem cell transplantation is considered inappropriate **and**
      - the person is unable to tolerate or has contra-indications to thalidomide.[www.nice.org.uk/TA228](http://www.nice.org.uk/TA228)
    - ▶ Bortezomib monotherapy for relapsed multiple myeloma (October 2007) NICE TA129  
Bortezomib monotherapy is an option for the treatment of progressive multiple myeloma in patients who are at first relapse having received one prior therapy and who have undergone, or are unsuitable for, bone-marrow transplantation, under the following circumstances:
      - the response to bortezomib is measured using serum M protein after a maximum of four cycles of treatment, and treatment is continued only in patients who have a reduction in serum M protein of 50% or more (where serum M protein is not measurable, an appropriate alternative biochemical measure of response should be used) **and**
      - the manufacturer rebates the full cost of bortezomib if there is an inadequate response (as defined above) after four cycles of treatment.[www.nice.org.uk/TA129](http://www.nice.org.uk/TA129)
  - **Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium*, has advised (December 2013) that bortezomib (Velcade®) is accepted for restricted use within NHS Scotland in combination with dexamethasone and thalidomide for the induction treatment of adults with previously untreated multiple myeloma who are eligible for high-dose chemotherapy with haematopoietic stem cell transplantation.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Powder for solution for injection

▶ **Velcade** (Janssen-Cilag Ltd)

**Bortezomib 3.5 mg** Velcade 3.5mg powder for solution for injection vials | 1 vial (PoM) £762.38 (Hospital only)

## Carfilzomib

17-Mar-2017

- **DRUG ACTION** Carfilzomib is an irreversible selective proteasome inhibitor that disrupts tumour cell turnover and induces apoptosis.
- **INDICATIONS AND DOSE**
  - **Treatment of multiple myeloma in patients who have received at least one prior therapy (in combination with dexamethasone, or with dexamethasone and lenalidomide) (specialist use only)**
    - ▶ BY INTRAVENOUS INFUSION
    - ▶ Adult: (consult product literature or local protocols)
- **CAUTIONS** Elderly (over 75 years)—higher incidence of adverse effects · ensure adequate hydration · infusion-related reactions · recent history of myocardial infarction · risk of cardiac failure · risk of herpes zoster reactivation · uncontrolled angina · uncontrolled arrhythmias
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Infusion-related reactions Manufacturer advises premedication with dexamethasone to reduce incidence and severity of infusion-related reactions.
  - ▶ Risk of herpes zoster reactivation Manufacturer advises consider antiviral prophylaxis for herpes zoster infection.
- **INTERACTIONS** → Appendix 1: carfilzomib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · anxiety · atrial fibrillation · blood disorders · blurred vision · cardiac failure · cataract · constipation · decreased appetite · deep vein thrombosis · dehydration · diarrhoea · dizziness · dyspepsia · dyspnoea · electrolyte disturbances · epistaxis · erythema · flushing · headache · hyperbilirubinaemia · hyperglycaemia · hyperhidrosis · hypertension · hypoesthesia · hypoalbuminaemia · hypotension · infection · infusion-related reactions · insomnia · muscle spasm · muscular weakness · musculoskeletal pain · nausea · oropharyngeal pain · palpitations · paraesthesia · peripheral neuropathy · pruritus · pulmonary embolism · pulmonary hypertension · pulmonary oedema · renal failure · sepsis · tachycardia · vomiting
  - ▶ **Uncommon** Acute respiratory distress syndrome · cardiac arrest · cerebrovascular accident · cholestasis · ejection fraction decreased · gastro-intestinal perforation · haemolytic uraemic syndrome · haemorrhage · hepatic failure · hypertensive crisis · interstitial lung disease · myocardial infarction · myocardial ischaemia · pericardial effusion · pericarditis · pneumonitis · tumour lysis syndrome
  - ▶ **Rare** Posterior reversible encephalopathy syndrome · thrombotic microangiopathy
  - ▶ **Frequency not known** QT-interval prolongation
- **SIDE-EFFECTS, FURTHER INFORMATION**  
For further information on side-effects, including management of specific side-effects, consult product literature.
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception during and for 1 month after treatment in women of childbearing potential; efficacy of oral contraceptives may be reduced, and hormonal contraceptives associated with a risk of thrombosis should be avoided. Male patients should use effective contraception during and for 3 months after

treatment if their partner is pregnant or of childbearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid during and for at least 2 days after treatment—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild-to-moderate impairment (increased incidence of adverse effects), and in severe impairment (no information available).
- **RENAL IMPAIRMENT** Manufacturer advises caution—increased incidence of adverse effects.
- **MONITORING REQUIREMENTS** Manufacturer advises monitoring of the following patient parameters: serum potassium concentration at least monthly; signs and symptoms of fluid overload, especially in those at risk of cardiac failure; renal function at treatment initiation and at least monthly during treatment—consider dose modification; hepatic function at treatment initiation and monthly during treatment—consider dose modification; platelet count and blood pressure. Also monitor for signs and symptoms of thrombotic microangiopathy.
- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C.
- **PATIENT AND CARER ADVICE**  
Manufacturer advises that patients and carers are warned to report signs and symptoms of thromboembolism (such as dyspnoea, chest pain, arm or leg swelling or pain).  
**Driving and skilled tasks**  
Patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of dizziness, hypotension and blurred vision.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (January 2017) that carfilzomib (*Kyprolis*®) in combination with lenalidomide and dexamethasone is **not** recommended for use within NHS Scotland for the treatment of adult patients with multiple myeloma who have received at least one prior therapy as the economic case was not demonstrated.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for infusion**

ELECTROLYTES: May contain Sodium

- ▶ **Kyprolis** (Amgen Ltd) ▼

**Carfilzomib 60 mg** Kyprolis 60mg powder for solution for infusion vials | 1 vial [PoM] £1,056.00

## Ixazomib

16-May-2017

- **DRUG ACTION** Ixazomib is a proteasome inhibitor.

#### ● INDICATIONS AND DOSE

**Multiple myeloma in patients who have received at least one prior therapy, in combination with lenalidomide and dexamethasone (specialist use only)**

- ▶ **BY MOUTH**
- ▶ **Adult:** 4 mg once weekly on days 1, 8, and 15 of a 28-day treatment cycle, for dose adjustments due to side-effects, consult product literature

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Risk of herpes zoster reactivation  
**CAUTIONS, FURTHER INFORMATION**
  - ▶ Herpes zoster reactivation Manufacturer advises consider concomitant antiviral prophylaxis to decrease the risk of herpes zoster reactivation.
- **INTERACTIONS** → Appendix 1: ixazomib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Back pain · constipation · diarrhoea · nausea · neutropenia · peripheral neuropathy (monitor for symptoms) · peripheral oedema · rash · thrombocytopenia · vomiting
  - ▶ **Uncommon** Hepatotoxicity
  - ▶ **Rare** Acute febrile neutrophilic dermatosis (Sweet's syndrome) · pneumonia (including fatal cases) · posterior reversible encephalopathy syndrome (PRES)—discontinue treatment · Stevens-Johnson syndrome · thrombotic thrombocytopenic purpura · transverse myelitis · tumour lysis syndrome
  - ▶ **Frequency not known** Blurred vision · dry eye
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of child-bearing potential and in men with a partner of child-bearing potential, during treatment and for at least 90 days after stopping treatment; additional barrier method recommended in women using hormonal contraceptives.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises reduce dose to 3 mg in moderate-to-severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises reduce dose to 3 mg in severe impairment (creatinine clearance less than 30 mL/min).
- **MONITORING REQUIREMENTS** Manufacturer advises to monitor hepatic function regularly and adjust dose accordingly—consult product literature.
- **PATIENT AND CARER ADVICE**  
**Missed doses**  
Manufacturer advises if less than 72 hours remain before the next scheduled dose, the missed dose should not be taken and the next dose should be taken at the normal time.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ixazomib (as Ixazomib citrate) 4 mg Ninlaro 4mg capsules | 3 capsule [PoM] £6,336.00

## ANTINEOPLASTIC DRUGS > PROTEIN KINASE INHIBITORS

### Afinib

- **DRUG ACTION** Afinib is a protein kinase inhibitor.

#### ● INDICATIONS AND DOSE

**Treatment of locally advanced or metastatic non-small cell lung cancer with activating epidermal growth factor receptor (EGFR) mutations, in patients who have not previously been treated with EGFR tyrosine kinase inhibitor**

##### ► BY MOUTH

- Adult: 40 mg once daily; increased if tolerated to up to 50 mg once daily, dose increase may be considered after 3 weeks at initial dose; consult product literature for details on dosing and dose adjustment due to side effects

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Cardiac risk factors · conditions which may affect left ventricular ejection fraction—consider cardiac monitoring, including assessment of left ventricular ejection fraction, at baseline and during treatment · diarrhoea—proactive management recommended (consult product literature) · exposure to sun (protect skin from exposure to sun) · history of keratitis · new pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded · severe dry eyes · signs and symptoms of keratitis—promptly refer to ophthalmologist for assessment · signs and symptoms of skin reaction—treat promptly and interrupt afinib treatment if severe or if Stevens-Johnson syndrome suspected (consult product literature) · ulcerative keratitis · use of contact lenses · worsening pulmonary symptoms (including dyspnoea, cough, fever)—interrupt treatment until interstitial lung disease is excluded

- **INTERACTIONS** → Appendix 1: afinib

#### ● SIDE-EFFECTS

- **Common or very common** Acne · conjunctivitis · cystitis · decreased appetite · dehydration · diarrhoea · dry eyes · dry skin · dysgeusia · dyspepsia · epistaxis · hand-foot syndrome · hypokalaemia · muscle spasms · paronychia · pruritus · pyrexia · rash (see Cautions) · renal failure · rhinorrhoea · weight loss

- **Uncommon** Interstitial lung disease · keratitis

- **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least one month after treatment in women of childbearing potential.

- **PREGNANCY** Manufacturer advises avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Monitor hepatic function regularly and consult product literature for dose adjustment in worsening liver function. Manufacturer advises avoid in severe hepatic impairment.

- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe renal impairment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken whole on an empty stomach. Food should not be consumed for at least 3 hours before and at least 1 hour after each dose.

*Giotrif*® tablets may be dispersed in approximately 100 mL of noncarbonated water by stirring occasionally for up to 15 minutes (must not be crushed). The dispersion should be swallowed immediately, and the glass rinsed with the same volume of water which should also be swallowed. The dispersion can also be administered via a gastric tube.

- **PATIENT AND CARER ADVICE**

Patient counselling advised (administration).

#### Driving and skilled tasks

Ocular adverse reactions may affect performance of skilled tasks e.g. driving.

- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAs)

- **Afinib for treating epidermal growth factor receptor mutation-positive locally advanced or metastatic non-small-cell lung cancer (April 2014)** NICE TA310

Afinib is recommended as an option, within its marketing authorisation, for treating locally advanced or metastatic non-small-cell lung cancer in adults:

- whose tumour tests positive for the epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation, **and**
- who have not previously had an EGFR-TK inhibitor, **and**
- if the manufacturer provides afinib with the discount agreed in the patient access scheme.

### Axitinib

- **DRUG ACTION** Axitinib is a tyrosine kinase inhibitor.

#### ● INDICATIONS AND DOSE

**Treatment of advanced renal cell carcinoma following failure of previous treatment with sunitinib or a cytokine (aldesleukin or interferon alfa)**

##### ► BY MOUTH

- Adult: (consult product literature)

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Recent active gastro-intestinal bleeding · untreated brain metastases
- **CAUTIONS** Hypertension (blood pressure should be well-controlled before starting and monitored during treatment)
- **INTERACTIONS** → Appendix 1: axitinib
- **SIDE-EFFECTS**
- **Common or very common** Abdominal pain · anal fistula · arthralgia · asthenia · cerebral haemorrhage · constipation · cough · decreased appetite · dehydration · diarrhoea · dizziness · dry skin · dysgeusia · dyspepsia · dysphonia · dyspnoea · erythema · fatigue · flatulence · gastro-intestinal haemorrhage · gastro-intestinal perforation ·

haemoptysis · haemorrhage · haemorrhoids · hand-foot syndrome · headache · hypercalcaemia · hyperkalaemia · hypertension · hyperthyroidism · hypothyroidism · myalgia · proteinuria · pruritus · rash · renal failure · tinnitus · weight loss

► **Uncommon** Hypertensive crisis · polycythaemia · posterior reversible encephalopathy syndrome

► **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for up to 1 week after treatment.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **HEPATIC IMPAIRMENT** Reduce starting dose in moderate impairment. Avoid in severe impairment—no information available.

#### ● **MONITORING REQUIREMENTS**

- Monitor for thyroid dysfunction.
- Monitor haemoglobin or haematocrit before and during treatment.
- Monitor for symptoms of gastro-intestinal perforation.
- Monitor for symptoms of fistula.
- Monitor for proteinuria before and during treatment.
- Monitor liver function before and during treatment.

#### ● **NATIONAL FUNDING/ACCESS DECISIONS**

##### **NICE technology appraisals (TAs)**

► **Axitinib** for treating advanced renal cell carcinoma after failure of prior systemic treatment (February 2015) NICE TA333

Axitinib is recommended as an option for treating adults with advanced renal cell carcinoma after failure of treatment with a first-line tyrosine kinase inhibitor or a cytokine, **only** if the company provides axitinib with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA333](http://www.nice.org.uk/TA333)

#### ● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Axitinib 7 mg** Inlyta 7mg tablets | 56 tablet **[PoM]** £4,923.80 (Hospital only)

## **Bosutinib**

28-Nov-2016

#### ● **INDICATIONS AND DOSE**

**Treatment of chronic, accelerated and blast phase Philadelphia chromosome-positive chronic myeloid leukaemia, in those previously treated with one or more tyrosine kinase inhibitors, and for whom imatinib, nilotinib and dasatinib are not clinically appropriate**

► **BY MOUTH**

- **Adult:** 500 mg once daily, consult product literature for dose adjustment due to side effects, or incomplete haematologic response by week 8, or incomplete cytogenetic response by week 12

#### **IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

#### **MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that bosutinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Cardiac disease · hepatitis B infection · history of pancreatitis—withhold treatment if lipase elevated and abdominal symptoms occur · history of QT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · recent cardiac event—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · risk factors for QT prolongation—monitor ECG and correct hypokalaemia and hypomagnesaemia before and during treatment · significant gastrointestinal disorder

#### **CAUTIONS, FURTHER INFORMATION**

- **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- **INTERACTIONS** → Appendix 1: bosutinib

#### ● **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · abnormal liver function · acne · arthralgia · biochemical disturbances · cough · decreased appetite · dehydration · diarrhoea · dizziness · dysgeusia · dyspnoea · electrolyte disturbances · gastritis · headache · hepatotoxicity · infection · malaise · myalgia · oedema · pericardial effusion · pleural effusion · pruritus · pyrexia · QT prolongation · rash · renal failure · renal impairment · urticaria
- **Uncommon** Gastric haemorrhage · pancreatitis · pericarditis · pulmonary hypertension · pulmonary oedema · respiratory failure · tinnitus
- **Frequency not known** Alopecia · bone-marrow suppression · hepatic failure (fatal cases reported) · hepatitis · hepatitis B reactivation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment in women.

● **PREGNANCY** Avoid—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Caution—no information available.

#### ● **MONITORING REQUIREMENTS**

- Manufacturer advises monitor liver function before treatment initiation, then monthly for the first 3 months and thereafter as clinically indicated—consult product literature for management of raised transaminases.
- Manufacturer advises monitor full blood count weekly for the first month and then monthly thereafter or as clinically indicated.
- Manufacturer advises monitor for signs and symptoms of fluid retention (including pericardial effusion, pleural effusion and pulmonary oedema).

#### ● **NATIONAL FUNDING/ACCESS DECISIONS**

##### **NICE technology appraisals (TAs)**

► **Bosutinib** for previously treated chronic myeloid leukaemia (August 2016) NICE TA401

Bosutinib is recommended as a treatment option, within its marketing authorisation, for chronic, accelerated and blast phase Philadelphia-chromosome-positive CML in adults, when:

- they have previously been treated with 1 or more tyrosine kinase inhibitor, **and**

- imatinib, nilotinib and dasatinib are not appropriate, and
- the manufacturer provides bosutinib with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA401](http://www.nice.org.uk/TA401)

## Cabozantinib

- **DRUG ACTION** Cabozantinib is an inhibitor of several protein kinases.

#### • INDICATIONS AND DOSE

**Treatment of progressive, unresectable locally advanced or metastatic medullary thyroid carcinoma**

##### ► BY MOUTH

- Adult: 140 mg once daily, for dose adjustment or treatment interruption due to side effects, consult product literature (closely monitor for first 8 weeks of therapy)

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Reversible Posterior Leukoencephalopathy Syndrome
- **CAUTIONS** Hypertension—discontinue treatment if uncontrolled despite medical intervention . palmar-plantar erythrodysesthesia syndrome—consider treatment interruption if severe and restart at a lower dose when resolved to grade 1 . patients at increased risk of fistulas—consult product literature . patients at increased risk of gastro-intestinal perforation—consult product literature . patients at increased risk of intra-abdominal abscess—consult product literature . patients at risk of haemorrhage (including tumour involvement of the trachea or bronchi)—discontinue if symptoms develop . patients at risk of thromboembolic events including myocardial infarction—discontinue if symptoms develop . risk of osteonecrosis of the jaw . susceptibility to QT-interval prolongation (e.g. cardiac disease, electrolyte disturbances, bradycardia, concomitant use of drugs that prolong the QT interval)—monitor ECG and electrolytes periodically
- **CAUTIONS, FURTHER INFORMATION**
  - Elective surgery Withhold treatment for at least 28 days before elective surgery and restart only if adequate wound healing—discontinue in patients with wound healing complications requiring medical intervention.
  - Risk of osteonecrosis of the jaw Discontinue treatment at least 28 days before elective invasive dental procedures—monitor for symptoms before and during treatment and discontinue if osteonecrosis develops.
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain . abnormal hair growth . abscess . acne . alopecia . anal fissure . anxiety . arthralgia . aspiration . atrial fibrillation . blurred vision . cheilitis . chills . cholelithiasis . constipation . decreased appetite . dehydration . depression . diarrhoea . dizziness . dry skin . dysgeusia . dyspepsia . dysphagia . dysphonia . dysuria . erythema . face oedema . folliculitis . fungal

infection . gastro-intestinal perforation . gastrointestinal haemorrhage . glossodynia . haematuria . haemorrhoids . hair colour changes . headache . hyperbilirubinaemia . hyperkeratosis . hypertension . hypoalbuminaemia . hypocalcaemia . hypokalaemia . hypophosphataemia . hypotension . hypothyroidism . impaired wound healing . lymphopenia . mucosal inflammation . muscle spasms . musculoskeletal chest pain . nausea . neutropenia . non-gastro-intestinal fistula . oropharyngeal pain . osteonecrosis of jaw . pallor . palmar-plantar erythrodysesthesia syndrome . pancreatitis . paraesthesia . peripheral coldness . peripheral neuropathy . platelet disorders . pneumonia . proteinuria . pulmonary embolism . rash . respiratory tract haemorrhage . skin exfoliation . skin hypopigmentation . stomatitis . tinnitus . tremor . venous thrombosis . vomiting

- **Uncommon** Hypoaacusis . acute renal failure . amenorrhoea . angina . arterial thrombosis . aspergilloma . ataxia . atelectasis . cataract . conjunctivitis . cyst . delirium . facial pain . gastro-intestinal fistula . hepatic encephalopathy . loss of consciousness . oesophagitis . pharyngeal oedema . pneumonitis . posterior reversible encephalopathy syndrome . rhabdomyolysis . skin ulcer . speech disorder . supraventricular tachycardia . telangiectasia . transient ischaemic attack . vaginal haemorrhage

- **Frequency not known** Bone-marrow suppression . hyperuricaemia . oral mucositis . thromboembolism . tumour lysis syndrome

- **CONCEPTION AND CONTRACEPTION** Patients and their sexual partners must use effective contraception (in addition to barrier method) during treatment and for at least 4 months after the last dose.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding during treatment and for at least 4 months after the last dose.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Manufacturer advises caution in renal impairment. Avoid in severe impairment.
- **MONITORING REQUIREMENTS** Monitor urine protein regularly and discontinue if nephrotic syndrome develops.
- **PATIENT AND CARER ADVICE**

Food should not be consumed for at least 2 hours before and at least 1 hour after each dose.

#### Driving and skilled tasks

Fatigue and weakness may affect performance of skilled tasks e.g. driving.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 25

##### ► Cometriq (IpSEN Ltd) ▼

**Cabozantinib (as Cabozantinib s-malate) 20 mg** Cometriq 20mg capsules | 7 capsule [PoM] no price available | 21 capsule [PoM] no price available | 84 capsule [PoM] £4,800.00

**Cabozantinib (as Cabozantinib s-malate) 80 mg** Cometriq 80mg capsules | 7 capsule [PoM] no price available

## Ceritinib

28-Nov-2016

- **DRUG ACTION** Ceritinib is a tyrosine kinase inhibitor, with particular activity against anaplastic lymphoma kinase (ALK).

### ● INDICATIONS AND DOSE

**Treatment of anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer previously treated with crizotinib**

#### ► BY MOUTH

- **Adult:** 750 mg once daily, dose should be taken at the same time every day, temporary dose interruption or dose reduction may be required based on tolerability—consult product literature; discontinue treatment if patient unable to tolerate at least 300 mg daily

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce the dose by one-third (rounded to the nearest multiple of the 150 mg dosage form).

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Diabetes mellitus · history or susceptibility to QT-interval prolongation
- **CAUTIONS, FURTHER INFORMATION**
  - QT-interval prolongation QT-interval prolongation has been observed in clinical studies, which may lead to an increased risk for ventricular tachyarrhythmias (e.g. torsade de pointes) or sudden death. Risk factors include pre-existing bradycardia, other relevant pre-existing cardiac disease or electrolyte disturbances; manufacturer advises to monitor ECG and electrolytes periodically.
- **INTERACTIONS** → Appendix 1: ceritinib
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · anaemia · bradycardia · constipation · decreased appetite · diarrhoea · dyspepsia · dysphagia · fatigue · gastro-oesophageal reflux disease · hyperglycaemia · hypophosphataemia · nausea · pericarditis · pneumonitis · QT-interval prolongation · rash · renal failure · renal impairment · visual disorders · vomiting
  - **Uncommon** Hepatotoxicity · pancreatitis
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - Gastro-intestinal effects Manufacturer advises monitor for signs of gastro-intestinal toxicity and consider dose reduction or discontinuation of treatment.
  - Interstitial lung disease Manufacturer advises monitor patients who exhibit pulmonary symptoms and consider dose reduction or discontinuation of treatment.
- **CONCEPTION AND CONTRACEPTION** Manufacturer recommends effective contraception in women of childbearing potential during treatment and for up to 3 months after discontinuation of treatment.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in moderate to severe impairment—no information available but extensively metabolised by the liver.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

### ● MONITORING REQUIREMENTS

- Manufacturer advises to monitor fasting blood glucose concentration prior to initiation of treatment and periodically thereafter. Also monitor for amylase and lipase elevations periodically during treatment. Consider dose reduction, interruption or discontinuation of treatment if outside of normal range.
- In addition, manufacturer advises measure baseline liver function, then monitor every 2 weeks for the first month and monthly thereafter; consider discontinuation if severe changes in liver function occur—increased risk of hepatotoxicity. Monitor heart rate and blood pressure regularly; consider dose reduction or discontinuation if bradycardia is reported—consult product literature.

### ● DIRECTIONS FOR ADMINISTRATION

Capsules should be taken on an empty stomach—no food should be eaten for 2 hours before or after dose.

### ● PATIENT AND CARER ADVICE

Patients and carers should be counselled on the administration of capsules.

#### Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

#### Driving and skilled tasks

Manufacturer advises patients and their carers should be counselled on the effects on driving and skilled tasks—increased risk of fatigue and vision disorders.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- Ceritinib for previously treated anaplastic lymphoma kinase-positive non small cell lung cancer (June 2016) NICE TA395 Ceritinib is recommended, within its marketing authorisation, as an option for treating advanced anaplastic lymphoma kinase-positive non-small cell lung cancer in adults previously treated with crizotinib; only if the manufacturer provides the discount agreed in the patient access scheme.  
[www.nice.org.uk/guidance/ta395](http://www.nice.org.uk/guidance/ta395)

## Cobimetinib

12-Jun-2017

- **DRUG ACTION** Cobimetinib is a mitogen-activated protein kinase (MAPK) inhibitor.

### ● INDICATIONS AND DOSE

**Treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma (in combination with vemurafenib) (specialist use only)**

#### ► BY MOUTH

- **Adult:** 60 mg once daily for 21 days; subsequent cycles repeated after a 7-day interval, for dose adjustment due to side-effects—consult product literature

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Left ventricular dysfunction · risk factors for bleeding
- **INTERACTIONS** → Appendix 1: cobimetinib

### • SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · basal cell carcinoma · blurred vision · chills · cutaneous squamous cell carcinoma · decreased ejection fraction · dermatitis acneiform · diarrhoea · haemorrhage · hyperkeratosis · hypertension · keratoacanthoma · nausea · photosensitivity · pneumonitis · pyrexia · raised liver enzymes · rash · serious retinopathy · visual impairment · vomiting
- ▶ **Uncommon** Rhabdomyolysis

▶ **CONCEPTION AND CONTRACEPTION** Manufacturer advises use of two effective contraceptive methods during treatment and for at least 3 months after stopping treatment.

▶ **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

▶ **BREAST FEEDING** Manufacturer advises avoid—no information available.

▶ **HEPATIC IMPAIRMENT** Manufacturer advises caution.

▶ **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—limited information available.

### • MONITORING REQUIREMENTS

- ▶ **Creatine kinase elevation** Manufacturer advises baseline creatine kinase and creatinine levels should be measured before starting treatment, and then at monthly intervals during treatment or as clinically indicated—consult product literature if elevated.
- ▶ **Left ventricular function** Manufacturer advises ejection fraction should be evaluated before initiation of treatment, then after the first month of treatment and at least every 3 months thereafter (or as clinically indicated) until treatment discontinuation.
- ▶ **Liver function** Manufacturer advises liver function should be evaluated before initiation of treatment and monthly thereafter (or more frequently as clinically indicated).
- ▶ **Visual disturbances** Manufacturer advises assess for new or worsening visual disturbances at each visit; if symptoms of new or worsening visual disturbances are identified, an ophthalmologic examination is recommended.

### • PATIENT AND CARER ADVICE

**Vomiting** Manufacturer advises if vomiting occurs after taking tablets, no additional dose should be taken on that day and the next dose should be taken at the usual time.

#### Missed doses

Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

#### Driving and skilled tasks

Manufacturer advises patients should be counselled on the effects on driving and performance of skilled tasks—increased risk of visual disturbances.

### • NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ **Cobimetinib in combination with vemurafenib for treating unresectable or metastatic BRAF V600 mutation-positive melanoma (October 2016)** NICE TA414  
Cobimetinib in combination with vemurafenib is **not** recommended within its marketing authorisation for treating unresectable or metastatic melanoma with a BRAF V600 mutation.

Patients currently receiving cobimetinib may continue without change to prior funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA414](http://www.nice.org.uk/TA414)

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

**Cobimetinib (as Cobimetinib hemifumarate) 20 mg** Cotellic 20mg tablets | 63 tablet [POM] £4,275.67

## Crizotinib

10-Feb-2017

- **DRUG ACTION** Crizotinib is a tyrosine kinase inhibitor.

### • INDICATIONS AND DOSE

**Treatment of previously treated anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer | First-line treatment of anaplastic lymphoma kinase (ALK)-positive advanced non-small cell lung cancer**

#### ▶ BY MOUTH

- ▶ **Adult:** 250 mg twice daily, consult product literature for information on dose adjustments based on individual patient safety and tolerability

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

**MHRA/CHM ADVICE (NOVEMBER 2015): RISK OF CARDIAC FAILURE**  
Severe, sometimes fatal cases of cardiac failure have been reported in patients treated with crizotinib. The MHRA has issued the following advice:

- Monitor all patients for signs and symptoms of heart failure (including dyspnoea, oedema, or rapid weight gain from fluid retention)
- Consider reducing the dose, or interrupting or stopping treatment if symptoms of heart failure occur

- **CAUTIONS** History of diverticulitis (risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs) · metastases of gastrointestinal tract (risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs) · patients with susceptibility to QT-prolongation (including bradycardia, history of cardiac disease, concomitant use of drugs that prolong QT interval, and electrolyte disturbances)—periodic renal monitoring required · risk of gastro-intestinal perforation—discontinue treatment if gastrointestinal perforation occurs · vision disorders reported—consider full ophthalmological evaluation if vision disorder worsens or persists

### CAUTIONS, FURTHER INFORMATION

- ▶ **Fatal interstitial lung disease and pneumonitis** Fatal interstitial lung disease and pneumonitis reported (monitor patients with pulmonary symptoms, withdraw treatment if suspected, and permanently discontinue treatment if diagnosed).

- **INTERACTIONS** → Appendix 1: crizotinib

### • SIDE-EFFECTS

- ▶ **Common or very common** Bone-marrow suppression · bradycardia · cardiac failure · constipation · decreased appetite · diarrhoea · dizziness · dyspepsia · fatigue · hypophosphataemia · interstitial lung disease · nausea · neuropathy · oedema · pneumonitis · pneumonitis · QT-interval prolongation · rash · renal cyst · syncope · taste disturbance · vision disorder · vomiting
- ▶ **Uncommon** Gastrointestinal perforation (fatalities reported) · hepatotoxicity (including fatal hepatic failure)
- ▶ **Frequency not known** Alopecia · hyperuricaemia · oral mucositis · thromboembolism · tumour lysis syndrome

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Cardiac failure** Consider reducing the dose, or interrupting or stopping treatment if symptoms of cardiac failure occur.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 90 days after treatment.
- **PREGNANCY** Avoid (toxicity in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose to 250 mg once daily in severe impairment not requiring peritoneal dialysis or hemodialysis, may be increased to 200 mg twice daily after at least 4 weeks, based on individual assessment of safety and tolerability.

#### ● MONITORING REQUIREMENTS

- ▶ Monitor liver function once a week during the first 2 months of treatment, then at least monthly thereafter and as clinically indicated.
- ▶ Monitor ECG and electrolytes (correct if abnormal) in all patients before starting treatment, then periodically and as clinically indicated thereafter.
- ▶ Monitor for signs and symptoms of treatment emergent bradycardia (including syncope, dizziness and hypotension)—monitor blood pressure and heart rate regularly.

#### ● PATIENT AND CARER ADVICE

Counsel all patients on the early signs and symptoms of gastrointestinal perforation—advice to seek immediate medical attention.

##### Driving and skilled tasks

Symptomatic bradycardia (including syncope, dizziness and hypotension), vision disorder and fatigue may affect performance of skilled tasks (e.g. driving or operating machinery).

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Crizotinib for untreated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer (September 2016)** NICE TA406

Crizotinib is recommended, within its marketing authorisation, as an option for untreated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme. [www.nice.org.uk/TA406](http://www.nice.org.uk/TA406)

- ▶ **Crizotinib for previously treated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer (December 2016)** NICE TA422

Crizotinib is recommended, within its marketing authorisation, as an option for previously treated anaplastic lymphoma kinase-positive advanced non-small-cell lung cancer in adults, only if the manufacturer provides it with the discount agreed in the patient access scheme.

## Dabrafenib

21-Feb-2017

- **DRUG ACTION** Dabrafenib is a BRAF kinase inhibitor, which inhibits BRAF V600 mutation-positive melanoma cell growth.

#### ● INDICATIONS AND DOSE

**Unresectable or metastatic melanoma with a BRAF V600 mutation (as monotherapy or in combination with trametinib)**

- ▶ **BY MOUTH**
- ▶ **Adult:** 150 mg every 12 hours, for dose adjustments due to side-effects, consult product literature

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** BRAF wild-type melanoma
- **CAUTIONS** Elderly (more frequent dose adjustments may be required) · prior or concurrent cancer associated with RAS mutations—risk of secondary or recurrent malignancy
- **INTERACTIONS** → Appendix 1: dabrafenib

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Actinic keratosis · alopecia · arthralgia · basal cell carcinoma · constipation · cough · cutaneous squamous cell carcinoma · decreased appetite · decreased left ventricular ejection fraction · diarrhoea · dry skin · erythema · hand-foot syndrome · headache · hyperglycaemia · hyperkeratosis · hypophosphataemia · influenza-like symptoms · malaise · myalgia · nausea · papilloma · pruritus · pyrexia · rash · seborrhoeic keratosis · skin lesions · skin tags · vomiting
- ▶ **Uncommon** Nephritis · new primary melanoma · pancreatitis · panniculitis · QT-interval prolongation · renal failure · uveitis
- ▶ **Frequency not known** Thromboembolism

#### SIDE-EFFECTS, FURTHER INFORMATION

Additional side-effects reported when used in combination with trametinib include dizziness, hyperhidrosis, hyponatraemia, hypotension, leucopenia, muscle spasms, myocarditis, neutropenia, night sweats, and thrombocytopenia.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use effective non-hormonal contraception during and for 4 weeks after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

#### ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises assess for cutaneous squamous cell carcinoma and new primary melanoma before treatment, monthly during treatment, and for 6 months after discontinuation or until initiation of alternative treatment; assess and monitor for non-cutaneous secondary or recurrent malignancy before, during, and for 6 months after discontinuation or until initiation of alternative treatment—consult product literature.
- ▶ Monitor full blood count as clinically indicated.
- ▶ Monitor for ophthalmologic reactions including uveitis, iridocyclitis and iritis.
- ▶ Monitor serum creatinine.

### ● PATIENT AND CARER ADVICE

Manufacturer advises patients should be informed to immediately report new skin lesions—risk of cutaneous squamous cell carcinoma and new primary melanoma.

#### Missed doses

Manufacturer advises if a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

#### Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of ocular adverse reactions.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ **Dabrafenib for treating unresectable or metastatic BRAF V600 mutation-positive melanoma (October 2014)** NICE TA321 Dabrafenib is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic BRAF V600 mutation-positive melanoma only if the manufacturer provides dabrafenib with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA321](http://www.nice.org.uk/TA321)

- ▶ **Trametinib in combination with dabrafenib for treating unresectable or metastatic melanoma (June 2016)** NICE TA396 Trametinib in combination with dabrafenib is recommended within its marketing authorisation, as an option for treating unresectable or metastatic melanoma in adults with a BRAF V600 mutation, only when the company provides trametinib and dabrafenib with the discounts agreed in the patient access schemes.

[www.nice.org.uk/TA396](http://www.nice.org.uk/TA396)

#### Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (February 2015) that dabrafenib (*Tafinlar*®) is accepted for restricted use within NHS Scotland, as monotherapy, for the treatment of unresectable or metastatic BRAFV600 mutation-positive melanoma in patients who have received no prior therapy.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 3, 23, 25

## Dasatinib

22-Mar-2017

- **DRUG ACTION** Dasatinib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

#### Chronic phase chronic myeloid leukaemia (consult product literature for details)

##### ▶ BY MOUTH

- ▶ Adult: 100 mg once daily, then increased if necessary up to 140 mg once daily

#### Accelerated and blast phase chronic myeloid leukaemia (consult product literature for details) | Acute lymphoblastic leukaemia (consult product literature for details)

##### ▶ BY MOUTH

- ▶ Adult: 140 mg once daily, then increased if necessary up to 180 mg once daily

### IMPORTANT SAFETY INFORMATION

#### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 825.

### MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS

#### REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS

An EU wide review has concluded that dasatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Hepatitis B infection · risk of cardiac dysfunction (monitor closely) · susceptibility to QT-interval prolongation (correct hypokalaemia or hypomagnesaemia before starting treatment)
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ **Pulmonary arterial hypertension** Patients should be evaluated for signs and symptoms of underlying cardiopulmonary disease before starting treatment; echocardiography should be performed at the start of treatment in patients with symptoms of cardiac disease and considered for patients with risk factors for cardiac or pulmonary disease. Treatment should be interrupted or the dose reduced in patients who develop dyspnoea or fatigue, while they are evaluated for common aetiologies (e.g. pleural effusion, pulmonary oedema, anaemia or lung infiltration); pulmonary arterial hypertension should be considered in the absence of these conditions, and if there is no improvement following dose reduction or interruption. If pulmonary arterial hypertension is confirmed, dasatinib should be permanently discontinued.
  - ▶ **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- **INTERACTIONS** → Appendix 1: dasatinib

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · acne · anorexia · arrhythmias · chest pain · CNS haemorrhage · colitis · congestive heart failure · constipation · cough · depression · dermatitis · diarrhoea · dizziness · dry skin · dyspepsia · dyspnoea · flushing · gastritis · gastro-intestinal haemorrhage · haemorrhage · headache · hypertension · influenza-like symptoms · insomnia · musculoskeletal pain · neuropathy · oedema (more common in patients over 65 years old) · palpitation · pleural effusion · pruritus · pulmonary hypertension · sweating · taste disturbance · tinnitus · urticaria · visual disturbances · weight changes
- ▶ **Uncommon** Amnesia · asthma · cholecystitis · cholestasis · drowsiness · erythema nodosum · gynaecomastia · hepatitis · hypersensitivity reactions · hypocalcaemia · hypotension · irregular menstruation · nail disorders · oesophagitis · pancreatitis · photosensitivity · pigmentation · proteinuria · rhabdomyolysis · seizures · syncope · thrombophlebitis · transient ischaemic attack · tremor · urinary frequency
- ▶ **Rare** Cor pulmonale
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hepatic failure (fatal cases reported) · hepatitis B reactivation · hyperuricaemia · interstitial lung disease · nausea · oral mucositis · thromboembolism · thrombosis · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic impairment.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- ▶ **Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016)** NICE TA426  
Dasatinib is recommended, within its marketing authorisation, as an option for untreated chronic phase Philadelphia-chromosome-positive CML, only if the manufacturer provides it with the discount agreed in the patient access scheme.  
[www.nice.org.uk/TA426](http://www.nice.org.uk/TA426)

- ▶ **Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016)** NICE TA425  
Dasatinib is recommended as an option for treating chronic or accelerated phase Philadelphia-chromosome-positive CML in adults, if they cannot have imatinib, or their disease is imatinib-resistant **and** the manufacturer provides dasatinib with the discount agreed in the patient access scheme.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA425](http://www.nice.org.uk/TA425)

### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2016) that dasatinib (Sprycel®) is accepted for use within NHS Scotland for the treatment of adults with chronic, accelerated or blast phase chronic myelogenous leukaemia (CML) with resistance or intolerance to prior therapy including imatinib mesilate, only if the manufacturer provides dasatinib with the discount agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

The *Scottish Medicines Consortium* has advised (September 2016) that dasatinib (Sprycel®) is accepted for use within NHS Scotland for the treatment of adults with newly diagnosed Philadelphia chromosome positive (Ph+) chronic myelogenous leukaemia (CML) in the chronic phase, only if the manufacturer provides dasatinib with the discount agreed in the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Tablet

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Sprycel** (Bristol-Myers Squibb Pharmaceuticals Ltd)

**Dasatinib 20 mg** Sprycel 20mg tablets | 60 tablet PoM £1,252.48

**Dasatinib 50 mg** Sprycel 50mg tablets | 60 tablet PoM £2,504.96

**Dasatinib 80 mg** Sprycel 80mg tablets | 30 tablet PoM £2,504.96

£2,504.96

## Erlotinib

18-Apr-2016

- **DRUG ACTION** Erlotinib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

**Treatment of locally advanced or metastatic non-small cell lung cancer after failure of previous chemotherapy | Monotherapy for maintenance treatment of locally advanced or metastatic non-small cell lung cancer with stable disease after four cycles of platinum-based chemotherapy**

- ▶ BY MOUTH

- ▶ Adult: 150 mg once daily

### Treatment of metastatic pancreatic cancer (in combination with gemcitabine)

- ▶ BY MOUTH

- ▶ Adult: 100 mg once daily

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, increase dose to 300 mg daily, if well tolerated for more than 2 weeks, further increase to 450 mg daily could be considered with close monitoring.

### IMPORTANT SAFETY INFORMATION

**EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)**

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

### ● CAUTIONS

#### CAUTIONS, FURTHER INFORMATION

- ▶ **Smoking** Dose adjustment may be necessary if smoking started or stopped during treatment.
- **INTERACTIONS** → Appendix 1: erlotinib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · anorexia · conjunctivitis · depression · diarrhoea · dry skin · dyspepsia · fatigue · flatulence · headache · neuropathy · pruritus · rigor
  - ▶ **Uncommon** Eyelash changes · gastro-intestinal perforation · interstitial lung disease—discontinue if unexplained symptoms such as dyspnoea, cough or fever occur
  - ▶ **Rare** Hepatic failure
  - ▶ **Very rare** Corneal perforation · corneal ulceration · Stevens-Johnson syndrome · toxic epidermal necrolysis
  - ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 2 weeks after treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. Monitor liver function in pre-existing liver disease.

- **RENAL IMPAIRMENT** Manufacturer advises avoid in severe impairment.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ Erlotinib monotherapy for maintenance treatment of non-small-cell lung cancer (June 2011) NICE TA227  
Erlotinib monotherapy is **not** recommended for maintenance treatment in patients with locally advanced

or metastatic non-small-cell lung cancer who have stable disease after platinum-based first-line chemotherapy.

[www.nice.org.uk/TA227](http://www.nice.org.uk/TA227)

- ▶ **Erlotinib for the first-line treatment of locally advanced or metastatic EGFR-TK mutation-positive non-small-cell lung cancer (June 2012) NICE TA258**

Erlotinib is recommended as an option in patients for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if:

- they test positive for the epidermal growth factor tyrosine kinase (EGFR-TK) mutation **and**
- the manufacturer provides erlotinib at the discounted price agreed under the patient access scheme (as revised in 2012).

[www.nice.org.uk/TA258](http://www.nice.org.uk/TA258)

- ▶ **Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy (December 2015) NICE TA374**

Erlotinib is recommended as an option for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours of unknown epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation status, only if all of the following criteria are met:

- the result of an EGFR-TK mutation diagnostic test is unobtainable because of an inadequate tissue sample or poor-quality DNA,
- the treating clinician considers that the tumour is very likely to be EGFR-TK mutation-positive,
- the patient's condition responds to the first 2 cycles of treatment with erlotinib, **and**,
- the manufacturer provides erlotinib with the discount agreed in the patient access scheme.

Erlotinib is **not** recommended for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours that are EGFR-TK mutation-negative.

Patients who are already receiving erlotinib should continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA374](http://www.nice.org.uk/TA374)

## Everolimus

09-Jun-2017

- **DRUG ACTION** Everolimus is a protein kinase inhibitor.

#### ● INDICATIONS AND DOSE

##### AFINITOR®

**Treatment of advanced renal cell carcinoma when the disease has progressed despite treatment with vascular endothelial growth factor-targeted therapy | Treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin | Treatment of hormone-receptor-positive, human epidermal growth factor-2 (HER-2) negative advanced breast cancer, in combination with exemestane, in postmenopausal women without symptomatic visceral disease after recurrence or progression following a non-steroidal aromatase inhibitor**

- ▶ BY MOUTH

▶ Adult: 10 mg once daily

##### CERTICAN®

##### Liver transplantation

- ▶ BY MOUTH

▶ Adult: Initially 1 mg twice daily, to be started approximately 4 weeks after transplantation; maintenance, dose adjusted according to response and whole blood everolimus concentration; dose adjustments can be made every 4–5 days

##### Renal transplantation | Heart transplantation

- ▶ BY MOUTH

▶ Adult: Initially 750 micrograms twice daily, to be started as soon as possible after transplantation; maintenance, dose adjusted according to response and whole blood everolimus concentration; dose adjustments can be made every 4–5 days

##### VOTUBIA® DISPERSIBLE TABLETS

**Subependymal giant cell astrocytoma associated with tuberous sclerosis complex**

- ▶ BY MOUTH

▶ Adult: (consult product literature)

**Adjunctive treatment of refractory partial-onset seizures, with or without secondary generalisation, associated with tuberous sclerosis complex**

- ▶ BY MOUTH

▶ Adult: (consult product literature)

##### VOTUBIA® TABLETS

**Subependymal giant cell astrocytoma associated with tuberous sclerosis complex**

- ▶ BY MOUTH

▶ Adult: (consult product literature)

**Renal angiomyolipoma associated with tuberous sclerosis complex**

- ▶ BY MOUTH

▶ Adult: (consult product literature)

#### IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 825.

- **CAUTIONS** History of bleeding disorders
- **INTERACTIONS** → Appendix 1: everolimus
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · anorexia · arthralgia · asthenia · chest pain · convulsions · dehydration · diarrhoea · dry mouth · dysphagia · electrolyte disturbance · epistaxis · eyelid oedema · fatigue · hand-foot syndrome · headache · hypercholesterolaemia · hyperglycaemia · hyperlipidaemia · hypertension · hypoglycaemia · increased susceptibility to aspergillosis · increased susceptibility to candidiasis · increased

susceptibility to infections · increased susceptibility to pneumonia · insomnia · interstitial lung disease · irritability · nail disorders · peripheral oedema · pneumonitis · renal failure · skin disorders · taste disturbance

- ▶ **Uncommon** Aggression · agitation · congestive heart failure · flushing · impaired wound healing · rhabdomyolysis
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · haemorrhage · hepatitis B reactivation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

Reduce dose or discontinue if severe side-effects occur—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during and for up to 8 weeks after treatment.
- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Consult product literature.
- **MONITORING REQUIREMENTS**
  - ▶ For *Votubia*<sup>®</sup> preparations: manufacturer advises everolimus blood concentration monitoring is required—consult product literature.
  - ▶ For *Certican*<sup>®</sup>: manufacturer advises pre-dose ('trough') whole blood everolimus concentration should be 3–8 nanograms/mL; monitoring should be performed every 4–5 days (using **chromatographic** assay) after initiation or dose adjustment until 2 consecutive stable concentrations; monitor patients with hepatic impairment taking concomitant strong CYP3A4 inducers and inhibitors when switching formulation, and/or if concomitant ciclosporin dose is reduced.
  - ▶ Monitor blood-glucose concentration, serum-triglycerides and serum-cholesterol before treatment and periodically thereafter.
  - ▶ Monitor renal function before treatment and periodically thereafter.

#### ● DIRECTIONS FOR ADMINISTRATION

**VOTUBIA<sup>®</sup> DISPERSIBLE TABLETS** Manufacturer advises tablets must be dispersed in water before administration—consult product literature for details.

**VOTUBIA<sup>®</sup> TABLETS** Tablets may be dispersed in approximately 30 mL of water by gently stirring, immediately before drinking. After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed.

- **PRESCRIBING AND DISPENSING INFORMATION** *Votubia*<sup>®</sup> is available as both *tablets* and *dispersible tablets*. These formulations vary in their licensed indications and are not interchangeable—consult product literature for information on switching between formulations.

#### ● PATIENT AND CARER ADVICE

Pneumonitis Non-infectious pneumonitis reported. Patients should be advised to seek urgent medical advice if new or worsening respiratory symptoms occur.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- ▶ **Everolimus with exemestane for treating advanced breast cancer after endocrine therapy (December 2016)** NICE TA421 Everolimus, in combination with exemestane, is recommended within its marketing authorisation for treating advanced human epidermal growth factor receptor 2 (HER2)-negative, hormone-receptor-positive breast cancer in postmenopausal women without symptomatic visceral disease that has recurred or progressed following treatment with a non-steroidal aromatase inhibitor. Everolimus is recommended only if

the manufacturer provides it with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA421](http://www.nice.org.uk/TA421)

- ▶ **Everolimus for advanced renal cell carcinoma after previous treatment (February 2017)** NICE TA432 Everolimus is recommended within its marketing authorisation as an option for treating advanced renal cell carcinoma that has progressed during or after treatment with vascular endothelial growth factor targeted therapy. Everolimus is only recommended if the manufacturer provides it with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA432](http://www.nice.org.uk/TA432)

#### CERTICAN<sup>®</sup>

- ▶ **Everolimus for preventing organ rejection in liver transplantation (July 2015)** NICE TA348 Everolimus (*Certican*<sup>®</sup>) is **not** recommended within its marketing authorisation for preventing organ rejection in patients who have undergone a liver transplant. Patients currently receiving everolimus for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA348](http://www.nice.org.uk/TA348)

#### AFINITOR<sup>®</sup>

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2012) that everolimus (*Afinitor*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic, well- or moderately-differentiated neuroendocrine tumours of pancreatic origin (pNET) in adults with progressive disease.

The *Scottish Medicines Consortium* has advised (February 2017) that everolimus (*Afinitor*<sup>®</sup>) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic, well-differentiated (Grade 1 or Grade 2) non-functional neuroendocrine tumours of gastrointestinal or lung origin in adults with progressive disease. The advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Gefitinib

27-May-2016

- **DRUG ACTION** Gefitinib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

**Treatment of locally advanced or metastatic non-small cell lung cancer with activating mutations of epidermal growth factor receptor**

- BY MOUTH
- Adult: 250 mg once daily

### IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: EPIDERMAL GROWTH FACTOR RECEPTOR (EGFR) INHIBITORS: SERIOUS CASES OF KERATITIS AND ULCERATIVE KERATITIS (MAY 2012)

Keratitis and ulcerative keratitis have been reported following treatment with epidermal growth factor receptor (EGFR) inhibitors for cancer (cetuximab, erlotinib, gefitinib and panitumumab). In rare cases, this has resulted in corneal perforation and blindness. Patients undergoing treatment with EGFR inhibitors who present with acute or worsening signs and symptoms suggestive of keratitis should be referred promptly to an ophthalmology specialist. Treatment should be interrupted or discontinued if ulcerative keratitis is diagnosed.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **INTERACTIONS** → Appendix 1: gefitinib
- **SIDE-EFFECTS**
  - **Common or very common** Acne · anorexia · asthenia · blepharitis · conjunctivitis · diarrhoea · dry eye · dry mouth · dry skin · epistaxis · haematuria · interstitial lung disease—discontinue if confirmed · nail disorder · proteinuria · pruritus · pyrexia · rash · skin reactions
  - **Uncommon** Corneal erosion · pancreatitis
  - **Rare** Hepatitis · toxic epidermal necrolysis
  - **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment due to cirrhosis.
- **RENAL IMPAIRMENT** Manufacturer advises caution if creatinine clearance less than 20 mL/minute.
- **MONITORING REQUIREMENTS**
  - Monitor for worsening of dyspnoea, cough and fever—discontinue if interstitial lung disease confirmed.
  - Monitor liver function—consider discontinuing if severe changes in liver function occur.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**
  - Gefitinib for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer (July 2010) NICE TA192 Gefitinib is recommended as an option for the first-line treatment of locally advanced or metastatic non-small-cell lung cancer if the patient tests positive for the epidermal growth factor receptor tyrosine kinase (EGFR-TK) mutation and the manufacturer provides gefitinib at the fixed price agreed under the patient access scheme.  
[www.nice.org.uk/TA192](http://www.nice.org.uk/TA192)

- Erlotinib and gefitinib for treating non-small-cell lung cancer that has progressed after prior chemotherapy (December 2015) NICE TA374

Gefitinib is **not** recommended for treating locally advanced or metastatic non-small-cell lung cancer that has progressed after non-targeted chemotherapy in patients with tumours that are EGFR-TK mutation-positive.

Patients who are already receiving gefitinib should continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA374](http://www.nice.org.uk/TA374)

### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (December 2015) that gefitinib (*Iressa*®) is accepted for restricted use within NHS Scotland for the treatment of adult patients with previously untreated locally advanced or metastatic non-small cell lung cancer (NSCLC) with activating mutations of epidermal growth factor receptor tyrosine kinase (EGFR-TK).

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

- **Iressa** (AstraZeneca UK Ltd)  
Gefitinib 250 mg Iressa 250mg tablets | 30 tablet (PoM) £2,167.71

## Ibrutinib

06-Jun-2017

- **DRUG ACTION** Ibrutinib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

**Treatment of relapsed or refractory mantle cell lymphoma**

- BY MOUTH
- Adult: 560 mg once daily, for dose adjustments due to side effects consult product literature

**Treatment of chronic lymphocytic leukaemia, in patients who have received at least one prior therapy, or as first-line treatment in patients with 17p deletion or TP53 mutation who are unsuitable for chemo-immunotherapy | Treatment of Waldenström's macroglobulinaemia, in patients who have received at least one prior therapy, or as first-line treatment in patients who are unsuitable for chemo-immunotherapy**

- BY MOUTH
- Adult: 420 mg once daily, for dose adjustments due to side effects consult product literature

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises if concurrent use of moderate inhibitors of CYP3A4 or ciprofloxacin is unavoidable, reduce dose to 140 mg once daily. Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 140 mg once daily, or withhold ibrutinib for up to 7 days.

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Family history of congenital short QT syndrome · increased lymphocytes—increased risk of leukostasis, consider withholding treatment temporarily and monitor closely · patients at risk from further shortening of QTc interval · personal history of congenital short QT syndrome · risk of haemorrhagic events—withhold ibrutinib treatment for at least 3 to 7 days before and after surgery depending on risk of bleeding
- **INTERACTIONS** → Appendix 1: ibrutinib

**• SIDE-EFFECTS**

- ▶ **Common or very common** Arthralgia · atrial fibrillation · blurred vision · bruising · constipation · dehydration · diarrhoea · dizziness · dry mouth · epistaxis · haemorrhage · headache · musculoskeletal pain · peripheral oedema · petechiae · pyrexia · rash · respiratory tract infection · sepsis · sinusitis · skin infection · subdural haematoma · urinary tract infection
- ▶ **Uncommon** Leukostasis
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Highly effective contraception (must include a non-hormonal method) required during and for 3 months after stopping treatment.

• **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

• **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—no information available.

• **HEPATIC IMPAIRMENT** Reduce dose to 280 mg daily in mild impairment and reduce dose to 140 mg daily in moderate impairment—monitor for toxicity and adjust dose if necessary (consult product literature). Avoid in severe impairment.

• **RENAL IMPAIRMENT** Use in severe impairment only if benefit outweighs risk and with close monitoring for toxicity. Maintain hydration and monitor serum creatinine periodically in mild to moderate renal impairment.

**• MONITORING REQUIREMENTS**

- ▶ Monitor full blood count once a month.
- ▶ Monitor for atrial fibrillation (increased risk in cardiac risk factors, acute infections and history of atrial fibrillation), monitor all patients periodically and complete ECG if arrhythmic symptoms or dyspnoea develop—consult product literature for treatment options.

**• NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

- ▶ **Ibrutinib** for previously treated chronic lymphocytic leukaemia and untreated chronic lymphocytic leukaemia with 17p deletion or TP53 mutation (January 2017) NICE TA429 Ibrutinib is recommended within its marketing authorisation as an option for treating chronic lymphocytic leukaemia in adults who have had at least one prior therapy or who have a 17p deletion or TP53 mutation, and in whom chemo-immunotherapy is unsuitable, only when the manufacturer provides ibrutinib with the discount agreed in the patient access scheme. [www.nice.org.uk/TA429](http://www.nice.org.uk/TA429)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (April 2017) that ibrutinib (*Imbruvica*®) is accepted for restricted use within NHS Scotland for the treatment of relapsed or refractory chronic lymphocytic leukaemia in adults who have received at least one prior therapy and for whom fludarabine-based regimens are inappropriate. This advice is contingent upon the continuing availability of the Patient Access Scheme in NHS Scotland or a list price that is equivalent or lower.

**• MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 25

**Ibrutinib 140 mg** Imbruvica 140mg capsules | 90 capsule [PoM]  
£4,599.00 | 120 capsule [PoM] £6,132.00

**Idelalisib**

16-Nov-2016

- **DRUG ACTION** Idelalisib is a protein kinase inhibitor.

**• INDICATIONS AND DOSE**

**Treatment of chronic lymphocytic leukaemia in patients who have received at least one previous therapy, or as first-line treatment in the presence of 17p deletion or TP53 mutation in patients who are not eligible for any other therapies (in combination with rituximab) | Treatment of follicular lymphoma refractory to two lines of treatment (monotherapy)**

- ▶ **BY MOUTH**

- ▶ **Adult:** 150 mg twice daily, for dose adjustment due to side effects, consult product literature

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

**MHRA/CHM ADVICE: IDELALISIB (ZYDELIG®): UPDATED INDICATIONS AND ADVICE ON MINIMISING THE RISK OF INFECTION (SEPTEMBER 2016)**

In light of a recent safety review the indications for idelalisib have been updated. Manufacturer recommendations regarding monitoring for infection and prophylaxis of *Pneumocystis jirovecii* pneumonia have also been updated. Patients should be advised on the risk of serious or fatal infections during treatment, and idelalisib should not be initiated in patients with any evidence of infection.

- **CAUTIONS** Active hepatitis · diarrhoea—symptomatic management recommended (consult product literature) · pneumonitis—withdraw treatment (consult product literature)
- **INTERACTIONS** → Appendix 1: idelalisib
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · diarrhoea · hyperuricaemia · infections · nausea · neutropenia · oral mucositis · pneumonitis · pyrexia · rash · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Highly effective contraception (in addition to barrier method) required during and for one month after treatment.
- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in hepatic impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Manufacturer advises monitor liver function—consult product literature.
  - ▶ Manufacturer advises monitor for signs and symptoms of infection, including *cytomegalovirus* infection and respiratory infections; new symptoms should be reported promptly. Neutrophil count should be monitored in all patients every 2 weeks for the first 6 months of treatment; patients with neutrophil count <1000 per mm<sup>3</sup> should be monitored weekly.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**
  - ▶ **Idelalisib** for treating chronic lymphocytic leukaemia (October 2015) NICE TA359  
Idelalisib, in combination with rituximab, is recommended as an option for treatment in adults:
    - who have untreated chronic lymphocytic leukaemia or
    - who have chronic lymphocytic leukaemia when the disease has been treated but has relapsed within 24 months and

- if the manufacturer provides idelalisib with the discount agreed in the simple discount agreement. Patients who are already receiving idelalisib should continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/guidance/TA359](http://www.nice.org.uk/guidance/TA359)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2015) that idelalisib (Zydelig®) is accepted for restricted use within NHS Scotland, in combination with rituximab, for the treatment of relapsed chronic lymphocytic leukaemia in patients who are unsuitable for chemotherapy and treatment naïve patients with 17p deletion or TP53 mutation who are unsuitable for chemotherapy, only whilst idelalisib is available at the price agreed in the patient access scheme.

#### All Wales Medicines Strategy Group (AWMSG) Decisions

The *All Wales Medicines Strategy Group* has advised (April 2017) that idelalisib (Zydelig®) is recommended as an option for use within NHS Wales as monotherapy for the treatment of patients with follicular lymphoma, that is refractory to two prior lines of treatment. The recommendation applies only if the approved Wales Patient Access Scheme (WPAS) is used or where the list price is equivalent or lower.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

## Imatinib

21-Jul-2016

- **DRUG ACTION** Imatinib is a tyrosine kinase inhibitor.

#### • INDICATIONS AND DOSE

##### Treatment of chronic myeloid leukaemia in chronic phase after failure with interferon alfa

► BY MOUTH

► Adult: 400 mg once daily, increased if necessary up to 800 mg daily in 2 divided doses

##### Treatment of chronic myeloid leukaemia in accelerated phase, or in blast crisis

► BY MOUTH

► Adult: 600 mg once daily, then increased if necessary up to 800 mg daily in 2 divided doses

##### Treatment of newly diagnosed acute lymphoblastic leukaemia (in combination with other chemotherapy) | Monotherapy for relapsed or refractory acute lymphoblastic leukaemia

► BY MOUTH

► Adult: 600 mg once daily

##### Treatment of c-kit (CD117)-positive unresectable or metastatic malignant gastro-intestinal stromal tumours (GIST) | Adjuvant treatment following resection of c-kit (CD117)-positive GIST, in patients at significant risk of relapse | Treatment of myelodysplastic/myeloproliferative diseases associated with platelet-derived growth factor receptor gene rearrangement

► BY MOUTH

► Adult: 400 mg once daily

#### Treatment of unresectable dermatofibrosarcoma protuberans | Recurrent or metastatic dermatofibrosarcoma protuberans, in patients who cannot have surgery

► BY MOUTH

► Adult: 800 mg daily in 2 divided doses

#### Treatment of advanced hypereosinophilic syndrome and chronic eosinophilic leukaemia

► BY MOUTH

► Adult: 100–400 mg once daily

#### IMPORTANT SAFETY INFORMATION

##### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 825.

##### MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS

An EU wide review has concluded that imatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Cardiac disease · hepatitis B infection · history of renal failure · risk factors for heart failure

##### CAUTIONS, FURTHER INFORMATION

- Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- **INTERACTIONS** → Appendix 1: imatinib

##### • SIDE-EFFECTS

- **Common or very common** Abdominal pain · appetite changes · arthralgia · ascites · conjunctivitis · constipation · cough · cramps · diarrhoea · dizziness · dry eyes · dry mouth · dry skin · dyspnoea · epistaxis · fatigue · flatulence · flushing · gastro-oesophageal reflux · haemorrhage · headache · hypoaesthesia · increased lacrimation · influenza-like symptoms · insomnia · oedema · paraesthesia · photosensitivity · pleural effusion · pruritus · pulmonary oedema · rash · sweating · taste disturbance · visual disturbances · weight changes
- **Uncommon** Acute respiratory failure · anxiety · cold extremities · cough · depression · drowsiness · dysphagia · electrolyte disturbances · gastric ulceration · gout · gynaecomastia · haematoma · hearing loss · heart failure · hepatic dysfunction · hepatitis · hypertension · hypotension · impaired memory · irregular menstruation · menorrhagia · migraine · palpitation · pancreatitis · peripheral neuropathy · renal failure · sexual dysfunction · skin hyperpigmentation · syncope · tachycardia · tinnitus · tremor · urinary frequency · vertigo
- **Rare** Angina · angioedema · arrhythmia · aseptic necrosis of bone · atrial fibrillation · cataract · confusion · convulsions · exfoliative dermatitis · gastro-intestinal perforation · glaucoma · haemolytic anaemia · hepatic failure · hepatic failure (fatal cases reported) · hepatic necrosis · increased intracranial pressure · inflammatory bowel disease · intestinal obstruction · myocardial infarction · myopathy · pulmonary fibrosis · pulmonary hypertension · rhabdomyolysis · Stevens-Johnson syndrome
- **Frequency not known** Alopecia · bone-marrow suppression · drug rash with eosinophilia and systemic symptoms (DRESS) · growth retardation in children · hepatitis B reactivation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Max. 400 mg daily; reduce dose further if not tolerated.
- **RENAL IMPAIRMENT** Maximum starting dose 400 mg daily if creatinine clearance less than 60 mL/minute; reduce dose further if not tolerated.
- **MONITORING REQUIREMENTS**
  - Monitor for gastrointestinal haemorrhage.
  - Monitor complete blood counts regularly.
  - Monitor for fluid retention.
  - Monitor liver function.
  - Monitor growth in children (may cause growth retardation).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water or apple juice.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer imatinib tablets.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - **Imatinib for the adjuvant treatment of gastro-intestinal stromal tumours (November 2014)** NICE TA326  
Imatinib is recommended as an option for adjuvant treatment of adult patients who are at high risk of relapse after surgery for KIT (CD117)-positive gastro-intestinal stromal tumours, as defined by the Miettinen 2006 criteria (based on tumour size, location, and mitotic rate), for up to 3 years.  
Patients currently receiving treatment initiated within the NHS with imatinib that is not recommended for them by NICE in this guidance should be able to continue treatment until they and their NHS clinician consider it appropriate to stop.  
[www.nice.org.uk/TA326](http://www.nice.org.uk/TA326)
  - **Imatinib for chronic myeloid leukaemia (updated January 2016)** NICE TA70  
Imatinib is recommended as an option for patients with Philadelphia-chromosome-positive chronic myeloid leukaemia who initially present in the accelerated phase or with blast crisis. Imatinib is also recommended as an option for patients who present in the chronic phase and then progress to the accelerated phase or blast crisis if they have not received imatinib previously.  
[www.nice.org.uk/TA70](http://www.nice.org.uk/TA70)
  - **Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (October 2004)** NICE TA86  
Imatinib 400 mg daily is recommended as first-line management of KIT (CD117)-positive unresectable or metastatic, or both, gastro-intestinal stromal tumours. Continued therapy is recommended only if a response to initial treatment [as defined by Southwest Oncology Group criteria available at [www.nice.org.uk/TA86](http://www.nice.org.uk/TA86)] is achieved within 12 weeks. Patients who have responded should be assessed at 12-week intervals. Discontinue if tumour ceases to respond.  
[www.nice.org.uk/TA86](http://www.nice.org.uk/TA86)
  - **Imatinib for the treatment of unresectable and/or metastatic gastro-intestinal stromal tumours (November 2010)** NICE TA209  
Imatinib 600 mg daily or 800 mg daily is **not** recommended for unresectable or metastatic, or both, gastro-intestinal stromal tumours whose disease has progressed after treatment with imatinib 400 mg daily.  
[www.nice.org.uk/TA209](http://www.nice.org.uk/TA209)

- **Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016)** NICE TA426  
Imatinib is recommended as an option for untreated chronic phase Philadelphia-chromosome-positive CML in adults.  
[www.nice.org.uk/TA426](http://www.nice.org.uk/TA426)
  - **Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016)** NICE TA425  
High-dose imatinib (600 mg in the chronic phase or 800 mg in the accelerated and blast-crisis phases) is **not** recommended for treating Philadelphia-chromosome-positive CML in adults whose disease is imatinib-resistant.  
Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.  
[www.nice.org.uk/TA425](http://www.nice.org.uk/TA425)
- Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (March 2002) that imatinib (*Glivec*®) should be used for chronic myeloid leukaemia only under specialist supervision in accordance with British Society of Haematology guidelines (November 2001).  
The *Scottish Medicines Consortium* has also advised (February 2012) that imatinib (*Glivec*®) is accepted for restricted use within NHS Scotland for the treatment of adult patients who are at significant risk of relapse following resection of a KIT (CD117) positive gastrointestinal stromal tumour (GIST) and who are at high risk of recurrence following complete resection (according to the Armed Forces Institute of Pathology (AFIP) risk criteria).

## Lapatinib

- **DRUG ACTION** Lapatinib is a tyrosine kinase inhibitor.

#### ● INDICATIONS AND DOSE

**Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2) with hormone-receptor-negative disease who have had previous treatment with trastuzumab in combination with chemotherapy (in combination with trastuzumab)**

- BY MOUTH
- Adult: 1 g once daily

continued →

**Treatment of advanced or metastatic breast cancer in patients with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for patients who have had previous treatment with an anthracycline, a taxane, and trastuzumab (in combination with capecitabine)**

- BY MOUTH
- Adult: 1.25 g once daily

**Treatment of advanced or metastatic breast cancer with tumours that overexpress human epidermal growth factor receptor-2 (HER2), for postmenopausal women with hormone-receptor-positive disease (in combination with an aromatase inhibitor)**

- BY MOUTH
- Adult: 1.5 g once daily

#### IMPORTANT SAFETY INFORMATION

##### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 825.

- **CAUTIONS** Diarrhoea—withhold treatment if severe (consult product literature) · low gastric pH (reduced absorption) · susceptibility to QT-interval prolongation (including electrolyte disturbances)
- **INTERACTIONS** → Appendix 1: lapatinib
- **SIDE-EFFECTS**
  - **Common or very common** Anorexia · cardiac failure (fatal cases reported) · decreased left ventricular ejection fraction · diarrhoea (treat promptly) · hepatotoxicity (discontinue permanently if severe) · hyperbilirubinaemia · malaise · nail disorders · rash
  - **Uncommon** Interstitial lung disease
  - **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · respiratory failure (including fatal cases) · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in moderate to severe impairment—metabolism reduced.
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
  - Monitor left ventricular function.
  - Monitor for pulmonary toxicity.
  - Monitor liver function before treatment and at monthly intervals.
- **DIRECTIONS FOR ADMINISTRATION** Always take at the same time in relation to food: either one hour before or one hour after food.
- **PATIENT AND CARER ADVICE** Counselling advised (administration). Patients should be advised to report any unexpected changes in bowel habit.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - Lapatinib or trastuzumab in combination with an aromatase inhibitor for the first-line treatment of metastatic hormone-receptor-positive breast cancer that overexpresses HER2 (June 2012) NICE TA257

Lapatinib or trastuzumab in combination with an aromatase inhibitor is **not** recommended for first-line treatment in postmenopausal women of metastatic hormone-receptor-positive breast cancer that

overexpresses human epidermal growth factor receptor 2 (HER2).

Postmenopausal women currently receiving lapatinib or trastuzumab in combination with an aromatase inhibitor for this indication should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA257](http://www.nice.org.uk/TA257)

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

- **Tyverb** (Novartis Pharmaceuticals UK Ltd)

## Lenvatinib

18-Apr-2017

- **DRUG ACTION** Lenvatinib is a multireceptor tyrosine kinase inhibitor.

#### • INDICATIONS AND DOSE

##### KISPLYX®

**Advanced renal cell carcinoma following one prior vascular endothelial growth factor-targeted therapy (in combination with everolimus) (specialist use only)**

- BY MOUTH
- Adult: 18 mg once daily, dose should be taken at the same time every day, for dose adjustment due to side-effects—consult product literature

##### LENVIMA®

**Progressive, locally advanced, or metastatic, differentiated thyroid carcinoma that is refractory to radioactive iodine (specialist use only)**

- BY MOUTH
- Adult: 24 mg once daily, dose should be taken at the same time every day, for dose adjustments due to side-effects—consult product literature

#### IMPORTANT SAFETY INFORMATION

##### RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Fistulae
- **CAUTIONS** Arterial thromboembolism within the previous 6 months · elderly (75 years and over)—reduced tolerability · hypertension—blood pressure should be well-controlled prior to treatment
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · alopecia · anal fistula · arthralgia · asthenia · back pain · cardiac failure · cerebrovascular accident · constipation · decreased appetite · dehydration · diarrhoea · dizziness · dry mouth · dysgeusia · dyspepsia · dyspnoea · electrolyte disturbances · fatigue · flatulence · haemorrhage (including fatal cases of intracranial haemorrhage) · hand-foot syndrome · headache · hepatotoxicity · hypercholesterolaemia · hyperkeratosis · hypertension · hypotension · hypothyroidism · insomnia · lymphopenia · malaise · musculoskeletal pain · myalgia · myocardial infarction · nausea · oral inflammation and pain · pain in extremity · peripheral oedema · prolonged QT interval · proteinuria · pulmonary embolism · rash · reduced ejection fraction · renal failure · renal impairment · thrombocytopenia · urinary tract infection · vomiting · weight loss
  - **Uncommon** Hepatitis · hepatocellular damage · paresis · perineal abscess · posterior reversible encephalopathy syndrome · splenic infarction · transient ischaemic attack
  - **Frequency not known** Gastro-intestinal perforation · non-gastrointestinal fistula

**SIDE-EFFECTS, FURTHER INFORMATION**

For further information on side-effects in special populations—consult product literature.

- Renal impairment and failure Manufacturer advises gastrointestinal toxicity should be actively managed—dehydration and/or hypovolaemia caused by gastrointestinal toxicity are identified as primary risk factors for renal impairment or failure.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use highly effective contraception during treatment and for 1 month after the last dose, an additional barrier method of contraception should be used in women using oral hormonal contraceptives. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—teratogenic in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT**  
**KISPLYX**® Manufacturer advises reduce dose to 10 mg once daily in severe impairment; further dose adjustments may be necessary based on individual tolerability—consult product literature. Manufacturer advises use only if potential benefit outweighs risk in severe impairment.  
**LENVIMA**® Manufacturer advises reduce dose to 14 mg once daily in severe impairment; further dose adjustments may be necessary based on tolerability—consult product literature.

● **RENAL IMPAIRMENT**

**KISPLYX**® Manufacturer advises reduce dose to 10 mg once daily in severe impairment; further dose adjustments may be necessary based on individual tolerability—consult product literature. Manufacturer advises avoid in end-stage renal disease.

**LENVIMA**® Manufacturer advises reduce dose to 14 mg once daily in severe impairment; further dose adjustments may be necessary based on tolerability—consult product literature. Manufacturer advises avoid in end-stage renal disease.

● **MONITORING REQUIREMENTS**

- Manufacturer advises monitor blood pressure after 1 week of treatment, then every 2 weeks for the first 2 months, and then monthly thereafter; monitor for signs and symptoms of cardiac decompensation (adjust dose as necessary—consult product literature).
- Manufacturer advises monitor liver function before treatment, then every 2 weeks for the first 2 months, and then monthly thereafter; monitor urine protein regularly.
- Manufacturer advises monitor ECG and electrolytes before and periodically during treatment (calcium levels should be monitored at least monthly), correct electrolyte abnormalities prior to treatment; monitor thyroid function before and regularly during treatment.

● **DIRECTIONS FOR ADMINISTRATION**

**KISPLYX**® Manufacturer advises capsules should be swallowed whole, or alternatively, capsules may be dissolved in a tablespoon of water or apple juice (do not break or crush capsules), allow to sit for at least 10 minutes for capsule shell to dissolve.

● **PATIENT AND CARER ADVICE****Missed doses**

Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

**Driving and skilled tasks**

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—increased risk of fatigue and dizziness.

● **NATIONAL FUNDING/ACCESS DECISIONS****LENVIMA**®**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (October 2016) that lenvatinib (*Lenvima*®) is accepted for use within NHS Scotland for treatment of adults with progressive, locally advanced or metastatic, differentiated (papillary/follicular/Hürthle cell) thyroid carcinoma, refractory to radioactive iodine. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Nilotinib**

27-Jul-2016

- **DRUG ACTION** Nilotinib is a tyrosine kinase inhibitor.

● **INDICATIONS AND DOSE****Treatment of newly diagnosed chronic myeloid leukaemia in the chronic phase**➤ **BY MOUTH**

➤ Adult: 300 mg twice daily

**Treatment of chronic and accelerated phase chronic myeloid leukaemia in patients who have resistance to or intolerance of previous therapy, including imatinib**➤ **BY MOUTH**

➤ Adult: 400 mg twice daily

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES** See Cytotoxic drugs p. 825.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that nilotinib can cause hepatitis B virus reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

- **CAUTIONS** Hepatitis B infection · history of pancreatitis · susceptibility to QT-interval prolongation (including electrolyte disturbances)

**CAUTIONS, FURTHER INFORMATION**

- Hepatitis B infection The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- **INTERACTIONS** → Appendix 1: nilotinib

### ● SIDE-EFFECTS

- **Common or very common** Abdominal pain · anorexia · arthralgia · asthenia · blood glucose changes · bone pain · constipation · cough · diarrhoea · dizziness · dry skin · dyspepsia · dysphonia · dyspnoea · erythema · fatigue · flatulence · flushing · headache · hyperhidrosis · hyperkalaemia · hypertension · hypomagnesaemia · insomnia · muscle spasm · oedema · palpitation · paraesthesia · pruritus · QT-interval prolongation · rash · urticaria · vertigo · weight changes
- **Uncommon** Anxiety · arrhythmias · bradycardia · breast pain · cardiac failure · cardiac murmur · cardiomegaly · chest pain · conjunctivitis · coronary artery disease · decreased visual acuity · dehydration · depression · dry eyes · dry mouth · dysuria · ecchymosis · epistaxis · erectile dysfunction · gynaecomastia · haematoma · haemorrhage · hepatitis · hyperaesthesia · hypertensive crisis · hyperthyroidism · hypoaesthesia · hypocalcaemia · hypokalaemia · hyponatraemia · hypophosphataemia · influenza-like symptoms · interstitial lung disease · melana · migraine · pancreatitis · pericardial effusion · pleural effusion · tremor · urinary frequency
- **Frequency not known** Alopecia · bone-marrow suppression · hepatic failure (fatal cases reported) · hepatitis B reactivation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

● **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

● **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- **Dasatinib, nilotinib and imatinib for untreated chronic myeloid leukaemia (CML) (December 2016)** NICE TA426 Nilotinib is recommended, within its marketing authorisation, as an option for untreated chronic phase Philadelphia-chromosome-positive CML, only if the manufacturer provides it with the discount agreed in the patient access scheme.  
[www.nice.org.uk/TA426](http://www.nice.org.uk/TA426)
- **Dasatinib, nilotinib and high-dose imatinib for treating imatinib-resistant or intolerant chronic myeloid leukaemia (CML) (December 2016)** NICE TA425 Nilotinib is recommended as an option for treating chronic or accelerated phase Philadelphia-chromosome-positive CML in adults, if they cannot have imatinib, or their disease is imatinib-resistant **and** the manufacturer provides nilotinib with the discount agreed in the patient access scheme.  
[www.nice.org.uk/TA425](http://www.nice.org.uk/TA425)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* (SMC) has advised (February 2008) that nilotinib (*Tasigna*®) is accepted for restricted use within NHS Scotland for the treatment of chronic-phase chronic myeloid leukaemia in adults resistant to or intolerant of at least one previous therapy, including imatinib, and (July 2011) for the treatment of adults with newly diagnosed chronic myeloid leukaemia in the chronic phase.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 23, 25, 27

► **Tasigna** (Novartis Pharmaceuticals UK Ltd)

Nilotinib (as Nilotinib hydrochloride monohydrate)

150 mg Tasigna 150mg capsules | 112 capsule [PoM] £2,432.85

Nilotinib (as Nilotinib hydrochloride monohydrate)

200 mg Tasigna 200mg capsules | 112 capsule [PoM] £2,432.85

## Osimertinib

21-Apr-2017

● **DRUG ACTION** Osimertinib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

**Locally advanced or metastatic epidermal growth factor receptor T790M mutation-positive non-small-cell lung cancer (specialist use only)**

► BY MOUTH

► **Adult:** 80 mg once daily, for dose adjustment due to side-effects—consult product literature

### IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Congenital long QT syndrome
- **CAUTIONS** Elderly (more frequent dose adjustments may be required) · history of interstitial lung disease · radiation pneumonitis requiring steroid treatment · risk factors for QTc interval prolongation
- **INTERACTIONS** → Appendix 1: osimertinib
- **SIDE-EFFECTS**
  - **Common or very common** Diarrhoea · dry skin disorders · interstitial lung disease (including pneumonitis) · nail disorders · pruritus · rash · stomatitis
  - **Uncommon** QTc interval prolongation
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises use of effective, non-hormonal, contraception during and for 2 months after treatment in women, and 4 months after treatment in men.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—may be present in milk based on *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment. Avoid in moderate and severe impairment—limited information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe and end-stage impairment—limited information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor ECG and electrolytes periodically in patients with risk factors for QTc interval prolongation; dose adjustment is advised if QTc interval is more than 500 milliseconds on at least 2 separate ECGs—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Manufacturer advises tablet may be dispersed in 50 mL of non-carbonated water, by stirring until dispersed and swallowed immediately (do not crush). The residue must then be re-dispersed in an additional half a glass of water and immediately swallowed. Manufacturer advises if administration via a nasogastric tube is required, the tablet may be dispersed in 15 mL of non-carbonated water, by stirring until dispersed and the residue re-dispersed in an additional 15 mL of water (do not crush). The total 30 mL of liquid should then be administered as per the nasogastric tube manufacturer's instructions with appropriate water flushes; the solution should be administered within 30 minutes of adding the tablets to water.
- **PATIENT AND CARER ADVICE**
  - Missed doses**  
Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- ▶ **Osimertinib** for treating locally advanced or metastatic EGFR T790M mutation-positive non-small-cell lung cancer (October 2016) NICE TA416

Osimertinib is recommended as an option, for use within the Cancer Drugs Fund, for treating locally advanced or metastatic epidermal growth factor receptor (EGFR) T790M mutation-positive non-small-cell lung cancer in adults whose disease has progressed only:

- after first-line treatment with an EGFR tyrosine kinase inhibitor, **and**
- if the conditions in the managed access agreement for osimertinib are followed.

Patients whose treatment was started within the NHS before this guidance was published should have the option to continue treatment, without change to their funding arrangements, until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA416](http://www.nice.org.uk/TA416)

### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2017) that osimertinib (*Tagrisso*®) is accepted for restricted use within NHS Scotland for the treatment of adult patients with locally advanced or metastatic epidermal growth factor receptor (EGFR) T790M mutation-positive non-small-cell lung cancer, only in patients who have received previous treatment with an EGFR tyrosine kinase inhibitor. This advice is contingent upon the continuing availability of the patient access scheme in NHS Scotland or a list price that is equivalent or lower.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Tablet

- ▶ **Tagrisso** (AstraZeneca UK Ltd) ▼

Osimertinib (as Osimertinib mesylate) 40 mg Tagrisso 40mg tablets | 30 tablet [PoM](#) £5,770.00

Osimertinib (as Osimertinib mesylate) 80 mg Tagrisso 80mg tablets | 30 tablet [PoM](#) £5,770.00

## Palbociclib

24-May-2017

- **DRUG ACTION** Palbociclib is a highly selective inhibitor of cyclin-dependent kinases 4 and 6, which leads to disruption of cancer cell proliferation.

### ● INDICATIONS AND DOSE

**Locally advanced or metastatic breast cancer in patients with hormone-receptor positive, HER2-negative tumours, in combination with an aromatase inhibitor or fulvestrant (specialist use only)**

- ▶ BY MOUTH

- ▶ Adult: 125 mg once daily for 21 consecutive days of repeated 28 day cycles, for dose adjustments due to side-effects—consult product literature

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

If concomitant use with potent CYP3A4 inhibitors (such as clarithromycin, indinavir, itraconazole, ketoconazole, lopinavir boosted with ritonavir, posaconazole, saquinavir, telaprevir, or voriconazole) is unavoidable, reduce palbociclib dose to 75 mg once daily. If the CYP3A4 inhibitor is stopped, increase the palbociclib dose (after 3–5 half lives of the inhibitor) to the dose used before starting the CYP3A4 inhibitor.

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **INTERACTIONS** → Appendix 1: palbociclib

## ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anaemia · asthenia · blurred vision · decreased appetite · diarrhoea · dry eye · dry skin · dysgeusia · epistaxis · fatigue · Increased lacrimation · infections · leukopenia · nausea · neutropenia · pyrexia · rash · stomatitis · thrombocytopenia · vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

Side-effects are reported when used in combination with letrozole or fulvestrant.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception in women of childbearing potential during treatment and for at least 3 weeks after completing treatment. Male patients should use effective contraception during treatment and for at least 14 weeks after completing treatment if their partner is of childbearing potential. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also Pregnancy and reproductive function in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate-to-severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor full blood count prior to starting therapy, at the start of each cycle, on day 14 of the first 2 cycles and as clinically indicated.
- **PATIENT AND CARER ADVICE**

### Missed doses

Manufacturer advises to take palbociclib at the same time each day; if a dose is missed, the missed dose should not be taken and the next dose should be taken at the usual time.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Pazopanib

02-Jun-2017

- **DRUG ACTION** Pazopanib is a tyrosine kinase inhibitor.

### ● INDICATIONS AND DOSE

**First-line treatment of advanced renal cell carcinoma | Treatment of advanced renal cell carcinoma in patients who have had previous treatment with cytokine therapy**

- ▶ BY MOUTH

- ▶ Adult: 800 mg daily, adjust dose in steps of 200 mg according to tolerability; maximum 800 mg per day

**Treatment of selective subtypes of advanced soft-tissue sarcoma**

- ▶ BY MOUTH

- ▶ Adult: (consult product literature)

continued →

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 400 mg daily.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Cerebral haemorrhage · clinically significant gastro-intestinal haemorrhage · haemoptysis in the past 6 months
- **CAUTIONS** Cardiac disease · increased risk of gastro-intestinal fistulas · increased risk of gastro-intestinal perforation · increased risk of haemorrhage · increased risk of thrombotic microangiopathy—permanently discontinue if symptoms develop · ischaemic stroke · myocardial infarction · risk of thrombotic events · susceptibility to QT-interval prolongation (including electrolyte disturbances) · transient ischaemic attack
- **CAUTIONS, FURTHER INFORMATION**
  - ▶ Elective surgery Discontinue treatment 7 days before elective surgery and restart only if adequate wound healing.
  - ▶ Blood pressure Blood pressure must be controlled before initiating treatment.
- **INTERACTIONS** → Appendix 1: pazopanib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal distension · abdominal pain · anorexia · blood disorders · blurred vision · chest pain · cough · dehydration · diarrhoea · dizziness · dry mouth · dry skin · dyspepsia · dyspnoea · epistaxis · flatulence · flushing · hair discoloration · headache · hepatic dysfunction · hiccups · hyperalbuminaemia · hyperbilirubinaemia · hypertension · hypothyroidism · increased amylase · insomnia · malaise · muscle spasm · myalgia · nail disorders · oedema · paraesthesia · pneumothorax · proteinuria (discontinue if grade 4) · skin discoloration · skin reactions · sweating · taste disturbance · thrombocytopenia · venous thromboembolic events · voice changes · weight loss
  - ▶ **Uncommon** Arthralgia · bradycardia · cardiac dysfunction · fistula · gastro-intestinal perforation · haemorrhage · hepatic failure · hypertensive crisis · hypomagnesaemia · menstrual disturbances · myocardial infarction · myocardial ischaemia · oropharyngeal pain · pancreatitis · peripheral neuropathy · peritonitis · photosensitivity reactions · pulmonary embolism · QT-interval prolongation · stroke · transient ischaemic attack
  - ▶ **Rare** Thrombotic microangiopathy
  - ▶ **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception advised during treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose to 200 mg once daily in moderate impairment. Use with caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution if creatinine clearance less than 30 mL/minute—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor liver function before treatment and at weeks 3, 5, 7, and 9, then at months 3 and 4, and periodically

thereafter as clinically indicated—consult product literature if elevated liver enzymes observed.

- ▶ Monitor blood pressure within 1 week of treatment initiation, then frequently throughout treatment (consider dose reduction or interruption if hypertension uncontrolled despite anti-hypertensive therapy; discontinue if blood pressure persistently elevated despite anti-hypertensive therapy and pazopanib dose reduction—consult product literature).
- ▶ Monitor for signs or symptoms of congestive heart failure—monitor left ventricular ejection fraction in patients at risk of heart failure before and during treatment.
- ▶ Monitor for proteinuria.
- ▶ Monitor thyroid function.
- ▶ Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including headache, hypertension, seizure, lethargy, confusion, visual and neurological disturbances)—permanently discontinue treatment if symptoms occur.
- **PATIENT AND CARER ADVICE** Patients should be advised not to take antacids for at least 1 hour before or 2 hours after pazopanib.
- **NATIONAL FUNDING/ACCESS DECISIONS**

**NICE technology appraisals (TAs)**

  - ▶ **Pazopanib for the first-line treatment of advanced renal cell carcinoma (updated August 2013)** NICE TA215  
Pazopanib is recommended as a first-line treatment option for people with advanced renal cell carcinoma:
    - who have not received prior cytokine therapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1 **and**
    - if the manufacturer provides pazopanib at the discounted price agreed under the patient access scheme.

[www.nice.org.uk/TA215](http://www.nice.org.uk/TA215)

**Scottish Medicines Consortium (SMC) Decisions**  
The *Scottish Medicines Consortium* has advised (February 2011) that pazopanib (*Votrient*®) is accepted for restricted use within NHS Scotland for the first-line treatment of advanced renal cell carcinoma and (December 2012) is **not** recommended for use within NHS Scotland for the treatment of selective subtypes of advanced soft tissue sarcoma in patients who have received prior chemotherapy for metastatic disease, or who have progressed within 12 months after neoadjuvant therapy.

**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

CAUTIONARY AND ADVISORY LABELS 23, 25

▶ **Votrient** (Novartis Pharmaceuticals UK Ltd)

**Pazopanib (as Pazopanib hydrochloride) 200 mg** *Votrient* 200mg tablets | 30 tablet (POM) £560.50

**Pazopanib (as Pazopanib hydrochloride) 400 mg** *Votrient* 400mg tablets | 30 tablet (POM) £1,121.00

## Ponatinib

21-Jul-2016

### ● INDICATIONS AND DOSE

**Treatment of chronic, accelerated, or blast phase chronic myeloid leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib or nilotinib, and for whom subsequent treatment with imatinib is not clinically appropriate | Treatment of Philadelphia chromosome-positive acute lymphoblastic leukaemia in patients who have the T315I mutation or who have resistance to or intolerance of dasatinib, and for whom subsequent treatment with imatinib is not clinically appropriate**

#### ► BY MOUTH

- Adult: 45 mg once daily, for dose adjustments due to side-effects or dose reduction due to risk of vascular occlusive events, consult product literature

### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises consider a reduced initial dose of 30 mg daily with concurrent use of potent inhibitors of CYP3A4.

### IMPORTANT SAFETY INFORMATION

**MHRA/CHM ADVICE: PONATINIB: RISK OF VASCULAR OCCLUSIVE EVENTS—UPDATED ADVICE ON POSSIBLE DOSE REDUCTION (UPDATED APRIL 2017)**

The benefits and risks of ponatinib were reviewed by the European Medicines Agency's Committee on Medicinal Products for Human Use in 2014, which recommended that strengthened warnings should be added to the product information aimed at minimising the risk of blood clots and blockages in the arteries. Additional long-term follow-up data are now available that supports new advice on dose modification to reduce this risk. The MHRA advise that although the recommended starting dose of ponatinib remains unchanged, prescribers should consider reducing the dose for patients with chronic phase chronic myeloid leukaemia (CP-CML) who have achieved a major cytogenetic response while on treatment. The following factors should be taken into account in the individual patient assessment:

- cardiovascular risk;
- side-effects of ponatinib therapy (including cardiovascular and other dose-related toxicity);
- time to cytogenetic response;
- BCR-ABL transcript levels.

The MHRA recommends close monitoring of response, if dose reduction is undertaken.

**MHRA/CHM ADVICE (MAY 2016): RISK OF HEPATITIS B VIRUS REACTIVATION WITH BCR-ABL TYROSINE KINASE INHIBITORS**

An EU wide review has concluded that ponatinib can cause hepatitis B reactivation; the MHRA recommends establishing hepatitis B virus status in all patients before initiation of treatment.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Alcohol abuse—increased risk of pancreatitis · current severe hypertriglyceridaemia—increased risk of pancreatitis · discontinue treatment if a complete haematologic response has not occurred within 3 months · hepatitis B infection · history of myocardial infarction—do not use unless potential benefit outweighs potential risk · history of pancreatitis · history of stroke—do not use unless potential benefit outweighs potential risk · hypertension—medically control during treatment and interrupt treatment if uncontrolled

#### CAUTIONS, FURTHER INFORMATION

- **Cardiovascular status** Assess cardiovascular status before treatment—manage cardiovascular risk factors before and during treatment.

- **Hepatitis B infection** The MHRA advises that patients who are carriers of hepatitis B virus should be closely monitored for signs and symptoms of active infection throughout treatment and for several months after stopping treatment; expert advice should be sought for patients who test positive for hepatitis B virus and in those with active infection.

- **INTERACTIONS** → Appendix 1: ponatinib

#### ● SIDE-EFFECTS

- **Common or very common** Abdominal discomfort · altered sensations · arthralgia · atrial fibrillation · biochemistry disturbances · blurred vision · bruising · cardiac disorders · cardiac events · cerebrovascular events · constipation · cough · decreased appetite · dehydration · diarrhoea · dizziness · dry eyes · dry mouth · dry skin · dyspepsia · dysphonia · dyspnoea · electrolyte disturbances · epistaxis · erectile dysfunction · exfoliative dermatitis · flushing · gastro-oesophageal reflux disease · headache · hyperhidrosis · hypertension · infection · insomnia · intermittent claudication · malaise · muscle spasms · musculoskeletal pain · oedema · pancreatitis · pericardial effusion · peripheral neuropathy · pleural effusion · pruritus · pyrexia · rash · thromboembolic events · vascular occlusion · weight loss
- **Uncommon** Atrial flutter · cerebral artery stenosis · cerebral infarction · gastric haemorrhage · hepatotoxicity · jaundice · retinal vein occlusion · retinal vein thrombosis · visual impairment
- **Frequency not known** Alopecia · bone-marrow suppression · hepatic failure (fatal cases reported) · hepatitis · hepatitis B reactivation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women; effectiveness of hormonal contraception unknown—alternative or additional methods of contraception should be used.
- **PREGNANCY** Avoid—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises discontinue breastfeeding—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution if creatinine clearance less than 50 mL/minute.
- **MONITORING REQUIREMENTS**
  - Manufacturer advises monitor serum lipase every 2 weeks for the first 2 months and periodically thereafter—withhold treatment if lipase elevated and abdominal symptoms occur.
  - Manufacturer advises a full blood count every 2 weeks for the first 3 months and then monthly thereafter or as clinically indicated.
  - Manufacturer advises monitor liver function periodically.
  - Manufacturer advises monitor for vascular occlusion or thromboembolism—interrupt treatment immediately if this occurs.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 3, 25

- **Iclusig** (Incyte Biosciences UK Ltd) ▼

**Ponatinib (as Ponatinib hydrochloride) 15 mg** Iclusig 15mg tablets | 60 tablet **[PoM]** £5,050.00

## Regorafenib

- **DRUG ACTION** Regorafenib is an inhibitor of several protein kinases.

### ● INDICATIONS AND DOSE

**Treatment of metastatic colorectal cancer in patients who have previously been treated with, or who are unsuitable for standard treatment including fluoropyrimidine-based chemotherapy, a vascular endothelial growth factor inhibitor, and an epidermal growth factor receptor inhibitor | Treatment of unresectable or metastatic gastrointestinal stromal tumours in patients who progressed on or are intolerant to previous treatment with imatinib and sunitinib.**

#### ► BY MOUTH

- Adult: 160 mg once daily for 21 consecutive days of repeated 28-day cycles, for dose adjustment due to side effects—consult product literature

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Ensure measures to prevent hand-foot skin reaction · Gilbert's syndrome—risk of hyperbilirubinaemia · history of ischaemic heart disease—monitor for signs and symptoms of myocardial ischaemia and interrupt treatment if signs of ischaemia or infarction develop · hypertension—control blood pressure before treatment initiation and monitor as clinically indicated during treatment (review dose and consider treatment interruption if severe or persistent hypertension develops; discontinue treatment if hypertensive crisis occurs) · may impair wound healing— withhold treatment for major surgical procedures · predisposition to bleeding

- **INTERACTIONS** → Appendix 1: regorafenib

### ● SIDE-EFFECTS

- **Common or very common** Abnormal international normalised ratio · biochemical disturbances · decreased appetite · diarrhoea · dry mouth · dry skin · dysphonia · electrolyte disturbances · gastro-enteritis · gastro-oesophageal reflux · haemorrhage (including fatal) · hand-foot skin reaction · headache · hypertension · hypothyroidism · infection · malaise · mucosal inflammation · musculoskeletal stiffness · nail disorder · pain · pyrexia · rash · taste disorders · tremor · weight loss
- **Uncommon** Gastro-intestinal perforation (including fatal cases) and fistula—discontinue treatment · hypertensive crisis · myocardial infarction · myocardial ischaemia · severe (including fatal) liver injury
- **Rare** Keratoacanthoma · posterior reversible encephalopathy syndrome · squamous cell carcinoma of the skin · Stevens-Johnson syndrome · toxic epidermal necrolysis
- **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

- Hand-foot skin reaction Consult product literature if signs or symptoms develop.

- **CONCEPTION AND CONTRACEPTION** Women of childbearing potential and men must use effective contraception during treatment and up to 8 weeks after last dose.

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Avoid—present in milk in *animal* studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

### ● MONITORING REQUIREMENTS

- Monitor blood count and coagulation parameters and consider permanent discontinuation in event of severe bleeding.
- Monitor hepatic function before treatment, then at least every two weeks for the first 2 months, then at least monthly thereafter and as clinically indicated—consult product literature if changes in liver function observed.
- Monitor for signs and symptoms of posterior reversible encephalopathy syndrome (including seizure, headache, altered mental status, visual disturbances or cortical blindness, with or without hypertension)—discontinue treatment if symptoms occur.
- Monitor biochemical, electrolyte and metabolic parameters during treatment; ensure measures to prevent hand-foot skin reaction—consult product literature if signs or symptoms develop.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be taken at the same time each day, swallowed whole with water after a light meal that contains less than 30% fat.

- **PATIENT AND CARER ADVICE** Counselling advised (administration).

## Ruxolitinib

02-Jun-2016

- **DRUG ACTION** Ruxolitinib is a selective inhibitor of the Janus-associated tyrosine kinases JAK1 and JAK2.

### ● INDICATIONS AND DOSE

**Treatment of disease-related splenomegaly or symptoms in patients with primary myelofibrosis, post-polycythaemia vera myelofibrosis, or post-essential thrombocythaemia myelofibrosis**

#### ► BY MOUTH

- Adult: (consult product literature or local protocols)

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Assess risk of developing infection before treatment—do not initiate until active serious infections are resolved

#### CAUTIONS, FURTHER INFORMATION

- **Tuberculosis** Patients should be evaluated for latent and active tuberculosis before starting treatment and monitored for signs and symptoms of tuberculosis during treatment.

- **INTERACTIONS** → Appendix 1: ruxolitinib

### ● SIDE-EFFECTS

- **Common or very common** Dizziness · flatulence · headache · hypercholesterolaemia · weight gain
- **Uncommon** Tuberculosis
- **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · progressive multifocal leucoencephalopathy · thromboembolism · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Avoid—toxicity in *animal studies*.
- **BREAST FEEDING** Avoid—present in milk in *animal studies*.
- **HEPATIC IMPAIRMENT** Reduce dose (consult product literature).
- **RENAL IMPAIRMENT** Reduce dose in severe impairment (consult product literature).
- **MONITORING REQUIREMENTS**
  - ▶ Monitor full blood count (including differential white cell count) before treatment, then every 2–4 weeks until dose stabilised, then as clinically indicated.
  - ▶ Monitor for infection during treatment.
  - ▶ Monitor for symptoms of progressive multifocal leucoencephalopathy (presenting as new or worsening neurological, cognitive or psychiatric signs or symptoms)—withhold treatment if suspected.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - ▶ **Ruxitinib for treating disease-related splenomegaly or symptoms in adults with myelofibrosis (March 2016)**  
NICE TA386  
Ruxitinib is recommended as an option for treating disease-related splenomegaly or symptoms in patients with primary myelofibrosis (also known as chronic idiopathic myelofibrosis), post polycythaemia vera myelofibrosis or post essential thrombocythaemia myelofibrosis, only if the patient has intermediate-2 or high-risk disease, **and** if the manufacturer provides ruxitinib with the discount agreed in the patient access scheme.  
Patients currently receiving ruxitinib whose disease does not meet the above criteria should have the option to continue their treatment until they and their clinician consider it appropriate to stop.  
[www.nice.org.uk/TA386](http://www.nice.org.uk/TA386)

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Tablet

- ▶ **Jakavi** (Novartis Pharmaceuticals UK Ltd) ▼  
**Ruxitinib (as Ruxitinib phosphate) 5 mg** Jakavi 5mg tablets | 56 tablet [PoM] £1,428.00  
**Ruxitinib (as Ruxitinib phosphate) 10 mg** Jakavi 10mg tablets | 56 tablet [PoM] £2,856.00  
**Ruxitinib (as Ruxitinib phosphate) 15 mg** Jakavi 15mg tablets | 56 tablet [PoM] £2,856.00  
**Ruxitinib (as Ruxitinib phosphate) 20 mg** Jakavi 20mg tablets | 56 tablet [PoM] £2,856.00

## Sorafenib

27-May-2016

- **DRUG ACTION** Sorafenib is an inhibitor of multiple kinases.

### ● INDICATIONS AND DOSE

**Treatment of advanced renal cell carcinoma when treatment with interferon alfa or interleukin-2 has failed or is unsuitable | Treatment of progressive, locally advanced, or metastatic, differentiated thyroid carcinoma that is refractory to radioactive iodine | Treatment of hepatocellular carcinoma**

#### ▶ BY MOUTH

- ▶ Adult: 400 mg twice daily, for dose adjustments due to side effects, consult product literature

### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CAUTIONS** Cardiac ischaemia • major surgical procedures • potential risk of bleeding—treat tracheal, bronchial, or oesophageal infiltration with localised therapy before initiating sorafenib in patients with differentiated thyroid carcinoma (DTC) and consider permanent withdrawal of sorafenib in any patient that requires medical intervention for bleeding • susceptibility to QT-interval prolongation
- **INTERACTIONS** → Appendix 1: sorafenib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Acne • anorexia • arthralgia • asthenia • congestive heart failure • constipation • depression • dermatitis • desquamation • diarrhoea • dry skin • dysgeusia • dyspepsia • dysphagia • dysphonia • electrolyte disturbances • erectile dysfunction • erythema • fatigue • fever • flushing • gastro-oesophageal reflux disease • haemorrhage • hand-foot skin reaction • hoarseness • hyperkeratosis • hypertension • hypophosphataemia • hypophosphataemia • keratoacanthoma • malaise • muscle spasms • myalgia • myocardial infarction • myocardial ischaemia • peripheral neuropathy • proteinuria • pruritus • rash • renal failure • rhinorrhoea • thyroid dysfunction • tinnitus
  - ▶ **Uncommon** Altered INR • altered prothrombin time • cholangitis • cholecystitis • dehydration • eczema • erythema multiforme • gastritis • gastro-intestinal perforations • gynaecomastia • hypertensive crisis • interstitial lung disease-like events • pancreatitis • posterior reversible encephalopathy syndrome
  - ▶ **Rare** Hepatitis • leucocytoclastic vasculitis • nephrotic syndrome • QT-interval prolongation • rhabdomyolysis • Stevens-Johnson syndrome • toxic epidermal necrolysis
  - ▶ **Frequency not known** Alopecia • bone-marrow suppression • hyperuricaemia • nausea • oral mucositis • thromboembolism • tumour lysis syndrome • vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal studies*. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Consider periodic monitoring of ECG and electrolytes in patients susceptible to QT-interval prolongation.
  - ▶ Monitor blood pressure regularly and consider permanent discontinuation of sorafenib if resistant to antihypertensive therapy.
  - ▶ Monitor plasma-calcium concentration (increased risk of hypocalcaemia if history of hypoparathyroidism).
  - ▶ Monitor thyroid stimulating hormone in patients with differentiated thyroid carcinoma.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - ▶ **Sorafenib for the treatment of advanced hepatocellular carcinoma (May 2010)** NICE TA189  
Sorafenib is **not** recommended for the treatment of advanced hepatocellular carcinoma in patients for whom surgical or locoregional therapies have failed or are unsuitable.  
[www.nice.org.uk/TA189](http://www.nice.org.uk/TA189)
    - ▶ **Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009)** NICE TA178  
Bevacizumab, sorafenib, and temsirolimus are **not** recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma.

Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma.

[www.nice.org.uk/TA178](http://www.nice.org.uk/TA178)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (January 2016) that sorafenib (*Nexavar*®) is accepted for restricted use within NHS Scotland for the treatment of advanced hepatocellular carcinoma in patients where surgical or loco-regional therapies have failed or are unsuitable.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Tablet

CAUTIONARY AND ADVISORY LABELS 23

##### ► Nexavar (Bayer Plc)

**Sorafenib (as Sorafenib tosylate) 200 mg** Nexavar 200mg tablets  
| 112 tablet [PoM] £3,576.56

## Sunitinib

#### • DRUG ACTION Sunitinib is a tyrosine kinase inhibitor.

#### • INDICATIONS AND DOSE

**Treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours, after failure of imatinib | Treatment of advanced or metastatic renal cell carcinoma**

##### ► BY MOUTH

► Adult: 50 mg once daily for 4 weeks, followed by a 2-week treatment-free period to complete 6-week cycle, adjusted in steps of 12.5 mg, doses adjusted according to tolerability; usual dose 25–75 mg daily

**Treatment of unresectable or metastatic pancreatic neuroendocrine tumours**

##### ► BY MOUTH

► Adult: 37.5 mg once daily without treatment-free period; adjusted in steps of 12.5 mg, doses adjusted according to tolerability; maximum 50 mg per day

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Manufacturer advises if concurrent use of potent inducers of CYP3A4 is unavoidable, dose may need to be increased in steps of 12.5 mg to a max. dose of 87.5 mg per day for gastro-intestinal stromal tumours or renal cell carcinoma, or to a max. dose of 62.5 mg per day for pancreatic neuroendocrine tumours.

Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, dose may need to be decreased to a minimum of 37.5 mg per day for gastrointestinal stromal tumours or renal cell carcinoma, or to a minimum of 25 mg per day for pancreatic neuroendocrine tumours.

#### IMPORTANT SAFETY INFORMATION

##### RISK OF OSTEONECROSIS OF THE JAW (JANUARY 2011)

Treatment with sunitinib may be a risk factor for the development of osteonecrosis of the jaw.

Patients treated with sunitinib, who have previously received bisphosphonates, or are treated concurrently with bisphosphonates, may be particularly at risk.

Dental examination and appropriate preventive dentistry should be considered before treatment with sunitinib.

If possible, invasive dental procedures should be avoided in patients treated with sunitinib who have previously received, or who are currently receiving, intravenous bisphosphonates.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

• **CAUTIONS** Cardiovascular disease—discontinue if congestive heart failure develops • hypertension • increased risk of bleeding • susceptibility to QT-interval prolongation

• **INTERACTIONS** → Appendix 1: sunitinib

#### • SIDE-EFFECTS

► **Rare** Nephrotic syndrome

► **Frequency not known** Abdominal pain • alopecia • anorexia • arthralgia • bone-marrow suppression • constipation • cough • dehydration • diarrhoea • dizziness • dry skin • dyspnoea • epistaxis • fatigue • fistula formation (interrupt treatment if occurs) • gastro-intestinal perforation • hair discoloration • hand-foot syndrome • headache • hepatic failure • hypertension • hyperuricaemia • hypothyroidism • increased lacrimation • insomnia • myalgia • nausea • oedema • oral mucositis • osteonecrosis of the jaw • pancreatitis • paraesthesia • peripheral neuropathy • proteinuria • rash • seizures • skin discoloration • taste disturbance • thromboembolism • tumour lysis syndrome • urine discoloration • vomiting

• **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

• **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

• **BREAST FEEDING** Discontinue breast-feeding.

• **MONITORING REQUIREMENTS** Monitor for thyroid dysfunction.

#### • NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

► **Sunitinib for advanced or metastatic renal cell carcinoma (March 2009)** NICE TA169

Sunitinib is recommended as first-line treatment for advanced or metastatic renal cell carcinoma in patients who are suitable for immunotherapy and have an Eastern Cooperative Oncology Group performance status of 0 or 1. [www.nice.org.uk/TA169](http://www.nice.org.uk/TA169)

► **Sunitinib for the treatment of gastrointestinal stromal tumours (September 2009)** NICE TA179

Sunitinib is recommended as an option for treatment in patients with unresectable or metastatic gastrointestinal tumours if imatinib treatment has failed because of resistance or intolerance, and the cost of sunitinib for the first treatment cycle is met by the manufacturer. [www.nice.org.uk/TA179](http://www.nice.org.uk/TA179)

► **Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009)** NICE TA178

Sorafenib and sunitinib are not recommended as second-line treatments for people with advanced or metastatic renal cell carcinoma. [www.nice.org.uk/TA178](http://www.nice.org.uk/TA178)

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (October 2009 and April 2011) that sunitinib (*Sutent*®) is accepted for restricted use within NHS Scotland for the treatment of unresectable or metastatic malignant gastro-intestinal stromal tumours after failure of imatinib and for unresectable or metastatic pancreatic neuroendocrine tumours.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

CAUTIONARY AND ADVISORY LABELS 14

##### ► Sutent (Pfizer Ltd)

**Sunitinib (as Sunitinib malate) 12.5 mg** Sutent 12.5mg capsules | 28 capsule [PoM] £784.70

**Sunitinib (as Sunitinib malate) 25 mg** Sutent 25mg capsules | 28 capsule **[PoM]** £1,569.40  
**Sunitinib (as Sunitinib malate) 50 mg** Sutent 50mg capsules | 28 capsule **[PoM]** £3,138.80

## Temsirolimus

- **DRUG ACTION** Temsirolimus is a protein kinase inhibitor.

### ● INDICATIONS AND DOSE

**First-line treatment of advanced renal cell carcinoma | Treatment of relapsed or refractory mantle cell lymphoma**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: (consult product literature or local protocols)

- **INTERACTIONS** → Appendix 1: temsirolimus

### ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · acne · anorexia · anxiety · arthralgia · asthenia · bowel perforation · chest pain · cough · depression · diarrhoea · dizziness · drowsiness · dysphagia · dyspnoea · epistaxis · eye disorders · folliculitis · gastro-intestinal haemorrhage · hypercholesterolaemia · hyperglycaemia · hyperlipidaemia · hypersensitivity reactions · hypertension · hypokalaemia · hypophosphataemia · impaired wound healing · increased susceptibility to infection · increased susceptibility to pneumonia · increased susceptibility to urinary-tract infection · insomnia · interstitial lung disease · myalgia · oedema · paraesthesia · pyrexia · rash · renal failure · rhinitis · skin disorders · taste disturbance · thrombophlebitis · thrombosis
- ▶ **Uncommon** Intracerebral bleeding
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting

### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hypersensitivity reactions** Hypersensitivity reactions, including some life-threatening and rare fatal reactions, are associated with temsirolimus therapy, usually during administration of the first dose. Symptoms include flushing, chest pain, dyspnoea, apnoea, hypotension, loss of consciousness, and anaphylaxis. Where possible, patients should receive an intravenous dose of antihistamine 30 minutes before starting the temsirolimus infusion. The infusion may have to be stopped temporarily for the treatment of infusion-related effects—consult product literature for appropriate management. If adverse reactions are not managed with dose delays, a dose reduction should be considered—consult product literature.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men and women.

- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Manufacturer advises discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** In renal cell carcinoma, reduce dose in severe impairment (consult product literature). Use with caution.

In mantle cell lymphoma, avoid in moderate or severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

### ● MONITORING REQUIREMENTS

- ▶ Monitor respiratory function.
- ▶ Monitor blood lipids.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- ▶ Bevacizumab (first-line), sorafenib (first- and second-line), sunitinib (second-line) and temsirolimus (first-line) for the treatment of advanced or metastatic renal cell carcinoma (August 2009) NICE TA178  
 Bevacizumab, sorafenib, and temsirolimus are **not** recommended as first-line treatments for people with advanced or metastatic renal cell carcinoma.  
[www.nice.org.uk/TA178](http://www.nice.org.uk/TA178)

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for infusion

EXCIPIENTS: May contain Ethanol, propylene glycol

- ▶ **Torisel** (Pfizer Ltd)

**Temsirolimus 25 mg per 1 ml** Torisel 30mg/1.2ml concentrate for solution for infusion vials and diluent | 1 vial **[PoM]** £620.00 (Hospital only)

## Trametinib

04-May-2017

- **DRUG ACTION** Trametinib is a protein kinase inhibitor.

### ● INDICATIONS AND DOSE

**Unresectable or metastatic melanoma with a BRAF V600 mutation (as monotherapy or in combination with dabrafenib)**

- ▶ BY MOUTH

- ▶ Adult: 2 mg once daily, when used in combination with dabrafenib, the dose should be taken at the same time each day with *either* the morning or evening dose of dabrafenib, for dose adjustments due to side-effects, consult product literature

## IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2016): TRAMETINIB: RISK OF GASTROINTESTINAL PERFORATION AND COLITIS

A review by EU medicines regulators has concluded that trametinib can cause gastrointestinal perforation or colitis.

Trametinib should be used with caution in patients with risk factors for gastrointestinal perforation, such as gastrointestinal metastases, diverticulitis, or use of concomitant medicines that can cause gastrointestinal perforation. Prescribers should be vigilant for signs and symptoms of gastrointestinal perforation and should advise patients to seek urgent medical attention if they develop severe abdominal pain.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
 See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** History of retinal vein occlusion
- **CAUTIONS** Concomitant antiplatelet or anticoagulant therapy—increased risk of haemorrhage · conditions that could impair left ventricular function · elderly (more frequent dose adjustments may be required) · impaired left ventricular function · predisposing factors for retinal vein occlusion · risk factors for gastrointestinal perforation
- **INTERACTIONS** → Appendix 1: trametinib
- **SIDE-EFFECTS**
- ▶ **Common or very common** Abdominal pain · alopecia · anaemia · bradycardia · cellulitis · constipation · cough · dehydration · dermatitis acneiform · diarrhoea · dry mouth · dry skin · dyspnoea · erythema · folliculitis · haemorrhage · hand-foot syndrome · hypertension · left ventricular dysfunction · lymphoedema · malaise · mucosal inflammation · nausea · oedema · paronychia · periorbital oedema · pneumonitis · pruritus · pyrexia · rash · skin fissures · stomatitis · visual disturbances · vomiting

- **Uncommon** Cardiac failure · chorioretinopathy · colitis · gastrointestinal perforation · interstitial lung disease · papilloedema · retinal detachment · retinal vein occlusion · rhabdomyolysis

- **Frequency not known** Thromboembolism

#### SIDE-EFFECTS, FURTHER INFORMATION

Additional side-effects reported when used in combination with dabrafenib include dizziness, hyperhidrosis, hyponatraemia, hypotension, leucopenia, muscle spasms, myocarditis, neutropenia, night sweats, and thrombocytopenia.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises women of child-bearing potential should use highly effective non-hormonal contraception during, and for 4 months after stopping treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.
- **MONITORING REQUIREMENTS**
  - Manufacturer advises measure blood pressure at baseline and monitor during treatment; evaluate left ventricular ejection fraction before treatment, after one month of treatment, and then approximately every 3 months thereafter.
  - Monitor liver function every 4 weeks for 6 months after treatment initiation, and thereafter as clinically indicated.
- **HANDLING AND STORAGE** Manufacturer advises store in refrigerator (2–8 °C); once opened, bottle may be stored for 30 days at not more than 30 °C.

#### PATIENT AND CARER ADVICE

Manufacturer advises patients and their carers should be told to seek immediate medical attention if symptoms of pulmonary embolism or deep vein thrombosis occur; patients and their carers should also be advised to report new visual disturbances.

#### Missed doses

Manufacturer advises if a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

#### Driving and skilled tasks

Manufacturer advises patients and carers should be counselled on the effects on driving and performance of skilled tasks—risk of dizziness and visual disturbances.

#### NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- **Trametinib in combination with dabrafenib for treating unresectable or metastatic melanoma (June 2016)** NICE TA396  
Trametinib in combination with dabrafenib is recommended, within its marketing authorisation, as an option for treating unresectable or metastatic melanoma in adults with a BRAF V600 mutation only when the company provides trametinib and dabrafenib with the discounts agreed in the patient access schemes.  
[www.nice.org.uk/TA396](http://www.nice.org.uk/TA396)

#### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (August 2016) that trametinib (*Mekinist*®), in combination with dabrafenib, is accepted for restricted use within NHS Scotland for first-line treatment of adult patients with unresectable or metastatic melanoma with a BRAF V600 mutation.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Tablet

CAUTIONARY AND ADVISORY LABELS 3, 23, 25

- **Mekinist** (Novartis Pharmaceuticals UK Ltd) ▼

**Trametinib 500 microgram** Mekinist 0.5mg tablets | 7 tablet [PoM](#)  
£280.00 | 30 tablet [PoM](#) £1,200.00

**Trametinib 2 mg** Mekinist 2mg tablets | 7 tablet [PoM](#) £1,120.00 | 30 tablet [PoM](#) £4,800.00

## Vandetanib

- **DRUG ACTION** Vandetanib is a tyrosine kinase inhibitor.

#### INDICATIONS AND DOSE

**Treatment of aggressive and symptomatic medullary thyroid cancer in patients with unresectable locally advanced or metastatic disease**

- **BY MOUTH**

- **Adult:** 300 mg once daily, for dose adjustment due to side effects—consult product literature

#### IMPORTANT SAFETY INFORMATION

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Congenital long QT syndrome · QT interval greater than 480 milliseconds
- **CAUTIONS** Brain metastases (intracranial haemorrhage reported) · electrolyte disturbances · history of torsades de pointes · hypertension · phototoxicity reactions reported (wear protective clothing and/or sunscreen) · susceptibility to QT-prolongation
- **INTERACTIONS** → Appendix 1: vandetanib
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal pain · alopecia · anxiety · asthenia · balance disorders · blurred vision · cholelithiasis · colitis · conjunctivitis · constipation · corneal changes (including opacity) · corneal deposits · decreased appetite · dehydration · depression · diarrhoea · dizziness · dry eye · dry mouth · dysaesthesia · dyspepsia · dysphagia · dysuria · electrolyte disturbances · epistaxis · gastritis · gastrointestinal haemorrhage · glaucoma · haematuria · haemoptysis · halo vision · hand-foot syndrome · headache · hyperglycaemia · hypertension · hypothyroidism · insomnia · ischaemic cerebrovascular conditions · keratopathy · lethargy · loss of consciousness · micturition urgency · nephrolithiasis · oedema · pain · paraesthesia · photopsia · photosensitivity reactions · pneumonitis · pollakiuria · proteinuria · pyrexia · QT-interval prolongation · taste disturbance · tremor
  - **Uncommon** Accommodation disorders · anuria · aspiration pneumonia · brain oedema · bullous dermatitis · cardiac arrest · cardiac conduction disorders · cardiac rate disorders · cardiac rhythm disorders · cataract · chromaturia · clonus · convulsions · erythema multiforme · faecal incontinence · heart failure · ileus · impaired healing · increased haemoglobin · interstitial lung disease (sometimes fatal) · intestinal perforation · pancreatitis · peritonitis · posterior reversible encephalopathy syndrome · respiratory failure · Stevens-Johnson syndrome · ventricular arrhythmia
  - **Frequency not known** Alopecia · bone-marrow suppression · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 4 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. Most cytotoxic drugs are

teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment (serum bilirubin greater than 1.5 times the upper limit of normal).
- **RENAL IMPAIRMENT** Reduce dose to 200 mg if creatinine clearance 30–49 mL/minute. Avoid if creatinine clearance less than 30 mL/minute.
- **MONITORING REQUIREMENTS** Monitor ECG, serum potassium, calcium, magnesium and thyroid stimulating hormone before treatment, then 1, 3, 6 and 12 weeks after starting treatment and following dose adjustment or interruption, then every 3 months for at least 1 year.
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in half a glass of water by stirring until dispersed (approximately 10 minutes), immediately before drinking (do not crush). After solution has been swallowed, any residue must be re-dispersed in the same volume of water and swallowed. The solution can also be administered via nasogastric or gastrostomy tubes.
- **PATIENT AND CARER ADVICE** Alert card should be provided. Patients or carers should be given advice on how to administer vandetanib tablets. Phototoxicity reactions Patients should be advised to wear protective clothing and/or sunscreen.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Vemurafenib

- **DRUG ACTION** Vemurafenib is a BRAF kinase inhibitor.

#### ● INDICATIONS AND DOSE

**Monotherapy for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma**

- ▶ **BY MOUTH**
- ▶ **Adult:** 960 mg twice daily, for dose adjustment due to side effects—consult product literature

#### IMPORTANT SAFETY INFORMATION

##### DRUG RASH WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS SYNDROME)

DRESS syndrome has been reported in patients taking vemurafenib. DRESS syndrome starts with rash, fever, swollen glands, and increased white cell count, and it can affect the liver, kidneys and lungs; DRESS can also be fatal.

Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops. Treatment with vemurafenib should not be restarted.

##### MHRA/CHM ADVICE (NOVEMBER 2015): RISK OF POTENTIATION OF RADIATION TOXICITY

Potentiation of radiation toxicity has been reported in patients treated with vemurafenib before, during, or after radiotherapy—use with caution.

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **CONTRA-INDICATIONS** Wild-type BRAF malignant melanoma
- **CAUTIONS** Electrolyte disturbances · prior or concurrent cancer associated with RAS mutation—increased risk of tumour progression · susceptibility to QT-prolongation
- **INTERACTIONS** → Appendix 1: vemurafenib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Actinic keratosis · alopecia · arthralgia · arthritis · asthenia · basal cell carcinoma · Bell's palsy · constipation · cough · cutaneous squamous cell carcinoma · decreased appetite · diarrhoea · dizziness · dry skin · erythema · erythema nodosum · fatigue · folliculitis · hand-foot syndrome · headache · hyperkeratosis · keratosis pilaris · musculoskeletal pain · myalgia · new primary melanoma · pain in extremities · peripheral oedema · photosensitivity reactions · pyrexia · QT-interval prolongation · seborrhoeic keratosis · skin papilloma · taste disturbance · uveitis
  - ▶ **Uncommon** Non-cutaneous squamous cell carcinoma · peripheral neuropathy · retinal vein occlusion · Stevens-Johnson syndrome · toxic epidermal necrolysis · vasculitis
  - ▶ **Rare** Progression of pre-existing NRAS mutated chronic myelomonocytic leukaemia
  - ▶ **Frequency not known** Alopecia · bone-marrow suppression · hypersensitivity reactions · hyperuricaemia · nausea · oral mucositis · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during for at least 6 months after treatment.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises more frequent monitoring in moderate to severe hepatic impairment (including monthly ECG monitoring during first 3 months of treatment).
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor ECG and electrolytes before treatment, after one month and following dose adjustment (treatment not recommended if QT interval greater than 500 milliseconds at baseline).
  - ▶ Monitor liver function before treatment and periodically thereafter.
  - ▶ Monitor for uveitis, iritis and retinal vein occlusion.
  - ▶ Monitor for cutaneous and non-cutaneous squamous cell carcinoma and new primary melanoma before, during and for up to 6 months after treatment—consult product literature.
- **DIRECTIONS FOR ADMINISTRATION** Food may affect absorption (take at the same time with respect to food).
- **PATIENT AND CARER ADVICE** Counselling advised (administration). Drug rash with eosinophilia and systemic symptoms (DRESS syndrome) Patients should be advised to stop taking vemurafenib and consult their doctor immediately if skin rash develops.
- **NATIONAL FUNDING/ACCESS DECISIONS**
  - **NICE technology appraisals (TAs)**
    - ▶ **Vemurafenib for treating locally advanced or metastatic BRAF V600 mutation-positive malignant melanoma** (December 2012) NICE TA269  
Vemurafenib is recommended as an option for the treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma only if the manufacturer provides

vemurafenib with the discount agreed in the patient access scheme.

[www.nice.org.uk/TA269](http://www.nice.org.uk/TA269)

### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2013) that vemurafenib (*Zelboraf*®) is accepted for restricted use within NHS Scotland as monotherapy for the first-line treatment of BRAF V600 mutation-positive unresectable or metastatic melanoma.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

► **Common or very common** Epistaxis · weight loss

#### VARGATEF®

► **Common or very common** Abscesses · bleeding · dehydration · electrolyte imbalance · mucositis · neutropenia · peripheral neuropathy · venous thromboembolism

► **Uncommon** Gastrointestinal perforation

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with peanut or soya hypersensitivity.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises exclude pregnancy before treatment and ensure effective contraception (in addition to barrier method) during treatment and for at least 3 months after last dose.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

**VARGATEF®** See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Consult product literature for dose adjustment in worsening liver function. Manufacturer advises avoid in moderate to severe impairment—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

- **MONITORING REQUIREMENTS** For *Vargatef®*, monitor full blood count and hepatic function before each treatment cycle and regularly thereafter, monitor prothrombin time and INR if used concomitantly with anticoagulants and monitor for signs and symptoms of cerebral bleeding.

### • PRESCRIBING AND DISPENSING INFORMATION

**VARGATEF®** Not to be taken on the same day as docetaxel therapy.

### • NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- Nintedanib for previously treated locally advanced, metastatic, or locally recurrent non-small cell lung cancer (July 2015) NICE TA347  
Nintedanib (*Vargatef®*), in combination with docetaxel is recommended as an option for the treatment of patients with locally advanced, metastatic, or locally recurrent non-small cell lung cancer of adenocarcinoma histology, that has progressed after first-line chemotherapy, only if the manufacturer provides nintedanib with the discount agreed in the patient access scheme.  
[www.nice.org.uk/TA347](http://www.nice.org.uk/TA347)

- Nintedanib for treating idiopathic pulmonary fibrosis (January 2016) NICE TA379

Nintedanib is recommended as an option for treating idiopathic pulmonary fibrosis, only if:

- the patient has a forced vital capacity (FVC) between 50% and 80% of predicted,
- the manufacturer provides nintedanib with the discount agreed in the patient access scheme, **and**,
- treatment is stopped if disease progresses (a confirmed decline in percent predicted FVC of 10% or more) in any 12-month period.

[www.nice.org.uk/TA379](http://www.nice.org.uk/TA379)

### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2015) that nintedanib (*Ofev*®) is accepted for restricted use within NHS Scotland for the treatment of idiopathic pulmonary fibrosis in patients with a predicted forced vital capacity less than or equal to 80%.

### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

CAUTIONARY AND ADVISORY LABELS 25

EXCIPIENTS: May contain Lecithin

► **Ofev** (Boehringer Ingelheim Ltd) ▼

**Nintedanib (as Nintedanib esilate) 100 mg** Ofev 100mg capsules | 60 capsule **[PoM]** £2,151.10 (Hospital only)

## ANTINEOPLASTIC DRUGS &gt; OTHER

## Olaparib

14-Dec-2016

- **DRUG ACTION** Olaparib is a PARP inhibitor. PARP are enzymes that repair damaged DNA in cancer cells and, in the absence of functional BRCA, inhibition of PARP results in an inability of cancer cells to repair. Therefore inhibition of PARP results in an antineoplastic effect.

● **INDICATIONS AND DOSE**

**Monotherapy for the maintenance treatment of patients with platinum-sensitive relapsed BRCA-mutated (germline and/or somatic) high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete response or partial response) to platinum-based chemotherapy (initiated under specialist supervision)**

▶ **BY MOUTH**

- **Adult:** 400 mg twice daily; reduced if not tolerated to 200 mg twice daily, then reduced if not tolerated to 100 mg twice daily, take at least 1 hour after food and avoid food for 2 hours after taking, patients should start treatment within 8 weeks of receiving the final dose of their platinum-containing chemotherapy regimen

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Manufacturer advises if concurrent use of moderate inhibitors of CYP3A4 is unavoidable, reduce dose to 200 mg twice daily.

Manufacturer advises if concurrent use of potent inhibitors of CYP3A4 is unavoidable, reduce dose to 150 mg twice daily.

**PHARMACOKINETICS**

Peak plasma concentrations are typically achieved 1 to 3 hours after dosing; steady-state is achieved within 3 to 4 days.

**IMPORTANT SAFETY INFORMATION**

**RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**  
See Cytotoxic drugs p. 825.

- **INTERACTIONS** → Appendix 1: olaparib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · decreased appetite · diarrhoea · dizziness · dysgeusia · dyspepsia · fatigue · headache · lymphopaemia · nausea · neutropenia · stomatitis · thrombocytopaenia · upper abdominal pain · vomiting
  - ▶ **Frequency not known** Pneumonitis (occasionally fatal)
- **SIDE-EFFECTS, FURTHER INFORMATION**
  - ▶ **Haematological toxicity** Withhold treatment if severe haematological toxicity develops; further analysis recommended if toxicity still present 4 weeks after treatment withdrawal.
  - ▶ **Pneumonitis** If dyspnoea, cough and fever, or radiological abnormalities develop, withhold treatment and investigate; if pneumonitis confirmed, discontinue.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during treatment and for 1 month after receiving the last dose. Consider an additional non-hormonal method of contraception.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid during treatment and for 1 month after last dose—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if creatinine clearance less than 50 mL/minute/1.73m<sup>2</sup> unless benefit outweighs potential risk—limited information available.

- **MONITORING REQUIREMENTS** Manufacturer advises monitor full blood count every month for the first 12 months of treatment and periodically thereafter.

● **PATIENT AND CARER ADVICE****Missed doses**

If a dose is missed, the missed dose should not be taken and the next dose should be taken at the usual time.

**Driving and skilled tasks**

Malaise and dizziness may affect performance of skilled tasks e.g. driving or operating machinery.

● **NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

- ▶ **Olaparib for maintenance treatment of relapsed, platinum-sensitive, BRCA mutation-positive ovarian, fallopian tube and peritoneal cancer after response to second-line or subsequent platinum-based chemotherapy (January 2016)** NICE TA381  
Olaparib is recommended as an option for treating adults with relapsed, platinum sensitive ovarian, fallopian tube or peritoneal cancer who have BRCA1 or BRCA2 mutations and whose disease has responded to platinum based chemotherapy only if:

- they have had 3 or more courses of platinum-based chemotherapy and;
- the drug cost of olaparib for people who remain on treatment after 15 months will be met by the company.

[www.nice.org.uk/guidance/ta381](http://www.nice.org.uk/guidance/ta381)

**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (November 2016) that olaparib (*Lynparza*®) is accepted for use within NHS Scotland as monotherapy for the maintenance treatment of adults with platinum-sensitive relapsed BRCA-mutated (germline and/or somatic) high grade serous epithelial ovarian, fallopian tube, or primary peritoneal cancer who are in response (complete response or partial response) to platinum-based chemotherapy.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

**Olaparib 50 mg** Lynparza 50mg capsules | 448 capsule [PoM]  
£3,550.00

## Venetoclax

16-May-2017

- **DRUG ACTION** Venetoclax is a potent, selective inhibitor of B-cell lymphoma-2 (BCL-2).

● **INDICATIONS AND DOSE**

**Chronic lymphocytic leukaemia in the presence of 17p deletion or TP53 mutation when a B-cell receptor pathway inhibitor is unsuitable or ineffective (specialist use only) | Chronic lymphocytic leukaemia in the absence of 17p deletion or TP53 mutation when both chemo-immunotherapy and a B-cell receptor pathway inhibitor has been ineffective (specialist use only)**

▶ **BY MOUTH**

- **Adult:** Initially 20 mg once daily for 7 days, then increased to 50 mg once daily for 7 days, then increased to 100 mg once daily for 7 days, then increased to 200 mg once daily for 7 days, then maintenance 400 mg once daily, dose to be taken in the morning during dose-titration phase; dose should be taken at the same time every day, for dose adjustment due to side effects—consult product literature

continued →

**DOSE ADJUSTMENTS DUE TO INTERACTIONS**

Avoid concomitant use of potent or moderate CYP3A4 inhibitors during initiation and dose-titration; once stable reduce dose by 75% with concomitant use of potent CYP3A4 inhibitors and by 50% with concomitant use of moderate CYP3A4 inhibitors.

**IMPORTANT SAFETY INFORMATION****RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

- **CAUTIONS** Ensure adequate hydration
- **INTERACTIONS** → Appendix 1: venetoclax
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Anaemia · constipation · diarrhoea · fatigue · febrile neutropenia · hyperkalaemia · hyperphosphataemia · hyperuricaemia · hypocalcaemia · lymphopenia · nausea · neutropenia · pneumonia · tumour lysis syndrome · upper respiratory tract infection · urinary tract infection · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises ensure effective, non-hormonal contraception during and for 30 days after treatment in women of child-bearing potential. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 825.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises close monitoring during initiation and dose titration in moderate impairment (increased risk of toxicity); avoid in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises close monitoring (increased risk of tumour lysis syndrome); use only if potential benefit outweighs risk in severe impairment—no information available.
- **MONITORING REQUIREMENTS** Manufacturer advises monitor renal function before starting treatment.
- **PATIENT AND CARER ADVICE**

**Hydration** Manufacturer advises patients should drink 1.5–2 L of water daily, starting 2 days before and throughout the dose-titration phase; intravenous fluids should be administered for those who cannot maintain an adequate level of oral hydration with consideration of overall risk of tumour lysis syndrome.

**Vomiting** Manufacturer advises that if vomiting occurs following dose administration, no additional doses should be taken on that day and the next dose should be taken at the normal time.

**Missed doses** Manufacturer advises that if a dose is more than 8 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Vismodegib**

- **DRUG ACTION** Vismodegib is a hedgehog pathway inhibitor.

• **INDICATIONS AND DOSE**

**Symptomatic metastatic basal cell carcinoma | Locally advanced basal cell carcinoma not appropriate for surgery or radiotherapy**

▶ **BY MOUTH**

▶ **Adult:** 150 mg once daily

**IMPORTANT SAFETY INFORMATION****RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES**

See Cytotoxic drugs p. 825.

- **INTERACTIONS** → Appendix 1: vismodegib
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal pain · abnormal hair growth · alopecia · amenorrhoea · arthralgia · constipation · decreased appetite · dehydration · diarrhoea · dyspepsia · hyponatraemia · malaise · muscle spasms · musculoskeletal pain · nausea · pruritus · rash · taste disturbances · vomiting · weight loss
- **CONCEPTION AND CONTRACEPTION** For women of child-bearing potential, pregnancy must be excluded before initiation of treatment, and monthly during treatment. Women must use two contraceptive methods (including one highly effective method and one barrier method) during treatment and for 24 months after the final dose of vismodegib. Men must use a condom during treatment and for 2 months after the final dose.
- **PREGNANCY Important: teratogenic risk**—may cause severe birth defects and embryo-foetal death.
- **BREAST FEEDING** Avoid during treatment and for 24 months after final dose.
- **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution in moderate to severe impairment.
- **RENAL IMPAIRMENT** No information available—manufacturer advises caution in severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Prescribers and pharmacists must comply with prescribing and dispensing restrictions as specified in the manufacturer's Pregnancy Prevention Programme, and ensure that the patient fully acknowledges the programme's pregnancy prevention measures—consult product literature for further information.
- **PATIENT AND CARER ADVICE**

**Patient advice required around conception and contraception** Counselling on pregnancy and contraception advised. Patients must comply with the manufacturer's pregnancy prevention programme.

## ANTINEOVASCULARISATION DRUGS > VASCULAR ENDOTHELIAL GROWTH FACTOR INHIBITORS

### Aflibercept

- **DRUG ACTION** Aflibercept is a recombinant fusion protein that acts as a soluble decoy receptor and binds to vascular endothelial growth factors A and B (VEGF-A, VEGF-B) and placental growth factor (PlGF). Aflibercept inhibits the activation of VEGF receptors and the proliferation of endothelial cells, thereby inhibiting the growth of new vessels that supply tumours with oxygen and nutrients.

#### ● INDICATIONS AND DOSE

**In combination with irinotecan, fluorouracil and folinic acid (FOLFIRI) chemotherapy, in metastatic colorectal cancer that is resistant to, or has progressed after, an oxaliplatin-containing regimen**

- BY INTRAVENOUS INFUSION
- Adult: (consult local protocol)

- **CONTRA-INDICATIONS** Moderate or severe congestive heart failure · uncontrolled hypertension

- **CAUTIONS** Febrile neutropenia · history of cardiovascular disease (may be exacerbated by hypertension) · increased risk of haemorrhage (including fatal events) · increased risk of hypertension · increased risk of thromboembolic events (consult product literature if event occurs) · may impair wound healing—withdraw treatment for at least 4 weeks before elective surgery and for at least 4 weeks after major surgery, or until wound fully healed · neutropenic infection · risk of fistula formation (discontinue if fistula develops) · risk of neutropenia · risk of thrombocytopenia

- **INTERACTIONS** → Appendix 1: aflibercept

#### ● SIDE-EFFECTS

- **Common or very common** Abdominal pain · aphthous stomatitis · decreased appetite · dehydration · diarrhoea · dysphonia · dyspnoea · fistula · haemorrhage (including nasal, rectal and gastro-intestinal) · haemorrhoids · hand-foot syndrome · headache · hypertension · infection · leucopenia · malaise · nasopharyngitis · neutropenia (including febrile neutropenia) · oropharyngeal pain · proctalgia · proteinuria · rhinorrhoea · sepsis · skin hyperpigmentation · stomatitis · thrombocytopenia · thromboembolic events (arterial and venous) · toothache · urinary tract infection · weight loss
- **Uncommon** Gastro-intestinal perforation · impaired wound healing · nephrotic syndrome · posterior reversible encephalopathy syndrome · thrombotic microangiopathy
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment. Effective contraception required during and for at least 6 months after treatment in men and women. Contraceptive advice should be given to men and women before therapy begins (and should cover the duration of contraception required after therapy has ended).
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Caution in severe impairment—no information available.

#### ● MONITORING REQUIREMENTS

- Monitor blood pressure at initiation and at least fortnightly during treatment (do not initiate treatment if pre-existing hypertension is uncontrolled)—consult product literature if hypertension develops during treatment.
- Monitor for signs of gastro-intestinal perforation (discontinue if perforation develops).
- Monitor full blood count, including differential count and platelets at baseline and before each treatment cycle.
- Monitor for proteinuria before each treatment administration (consult product literature if symptoms develop).
- Monitor for signs and symptoms of diarrhoea and dehydration, particularly in elderly—consult product literature if severe diarrhoea occurs.
- Monitor for posterior reversible encephalopathy syndrome (presenting as seizures, altered mental status, nausea, vomiting, headache, or visual disturbance).

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### NICE technology appraisals (TAs)

- Aflibercept in combination with irinotecan and fluorouracil-based therapy for treating metastatic colorectal cancer that has progressed following prior oxaliplatin-based chemotherapy (March 2014) NICE TA307  
Aflibercept in combination with irinotecan and fluorouracil-based therapy is **not** recommended within its marketing authorisation for treating metastatic colorectal cancer that is resistant to or has progressed after an oxaliplatin-containing regimen.

## Blood and blood-forming organs

### 1 Anaemias

#### Anaemias

##### Initiation of treatment

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

##### Sickle-cell anaemia

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine and prophylactic penicillin reduce the risk of

infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. 863 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

##### G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed *favism* and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies;

thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;

- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

#### Drugs with definite risk of haemolysis in most G6PD-deficient individuals

- Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Methylthioninium chloride
- Niridazole [not on UK market]
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
- Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)
- Rasburicase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

#### Drugs with possible risk of haemolysis in some G6PD-deficient individuals

- Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
- Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
- Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
- Quinidine (acceptable in acute malaria) [not on UK market]
- Quinine (acceptable in acute malaria)
- Sulfonylureas

Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

#### Drugs used in hypoplastic, haemolytic, and renal anaemias

Anabolic steroids, pyridoxine hydrochloride p. 988, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

**Antilymphocyte immunoglobulin** given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired *aplastic anaemia*; the response rate may be increased when ciclosporin p. 788 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from 'special order' manufacturers or specialist importing companies) can be used in aplastic anaemia for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological effects. However, certain forms of *sideroblastic anaemia*

respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both *idiopathic acquired* and *hereditary sideroblastic anaemias*. Although complete cures have not been reported, some increase in haemoglobin can occur; the dose required is usually high. *Reversible sideroblastic anaemias* respond to treatment of the underlying cause but in pregnancy, haemolytic anaemias, and alcohol dependence, or during isoniazid p. 554 treatment, pyridoxine hydrochloride is also indicated.

**Corticosteroids** have an important place in the management of haematological disorders. They include conditions with an *autoimmune haemolytic anaemia*, *immune thrombocytopenias* and *neutropenias*, and *major transfusion reactions*. They are also used in chemotherapy schedules for many types of *lymphoma*, *lymphoid leukaemias*, and *paraproteinaemias*, including *multiple myeloma*.

#### Erythropoietins

**Epoetins** (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure, to increase the yield of autologous blood in normal individuals and to shorten the period of symptomatic anaemia in patients receiving cytotoxic chemotherapy.

Epoetin beta p. 927 is also used for the prevention of anaemia in preterm neonates of low birth-weight; only unpreserved formulations should be used in neonates because other preparations may contain benzyl alcohol.

Darbepoetin alfa p. 924 is a hyperglycosylated derivative of epoetin; it has a longer half life and can be administered less frequently than epoetin.

Methoxy polyethylene glycol-epoetin beta p. 929 is a continuous erythropoietin receptor activator that is licensed for the treatment of symptomatic anaemia associated with chronic kidney disease. It has a longer duration of action than epoetin.

## 1.1 Hypoplastic, haemolytic, and renal anaemias

## IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (DECEMBER 2007) ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

Overcorrection of haemoglobin concentration in patients with chronic kidney disease may increase the risk of death and serious cardiovascular events, and in patients with cancer may increase the risk of thrombosis and related complications:

- patients should not be treated with erythropoietins for the licensed indications in chronic kidney disease or cancer in patients receiving chemotherapy *unless* symptoms of anaemia are present
- the haemoglobin concentration should be maintained within the range 10–12 g/100 mL
- haemoglobin concentrations higher than 12 g/100 mL should be avoided
- the aim of treatment is to relieve symptoms of anaemia, and in patients with chronic kidney disease to avoid the need for blood transfusion; the haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia (in some patients, this may be achieved at concentrations lower than the recommended range)

MHRA/CHM ADVICE (DECEMBER 2007 AND JULY 2008)

ERYTHROPOIETINS—TUMOUR PROGRESSION AND SURVIVAL IN PATIENTS WITH CANCER

Clinical trial data show an unexplained excess mortality and increased risk of tumour progression in patients with anaemia associated with cancer who have been treated with erythropoietins. Many of these trials used erythropoietins outside of the licensed indications (i.e. overcorrected haemoglobin concentration or given to patients who have not received chemotherapy):

- erythropoietins licensed for the treatment of *symptomatic* anaemia associated with cancer, are licensed only for patients who are receiving chemotherapy
- the decision to use erythropoietins should be based on an assessment of the benefits and risks for individual patients; blood transfusion may be the preferred treatment for anaemia associated with cancer chemotherapy, particularly in those with a good cancer prognosis

- **CONTRA-INDICATIONS** Patients unable to receive thromboprophylaxis · pure red cell aplasia following erythropoietin therapy · uncontrolled hypertension
- **CAUTIONS** Aluminium toxicity (can impair the response to erythropoietin) · concurrent infection (can impair the response to erythropoietin) · correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment · during dialysis (increase in unfractionated or low molecular weight heparin dose may be needed) · epilepsy · inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled · ischaemic vascular disease · malignant disease · other inflammatory disease (can impair the response to erythropoietin) · risk of thrombosis may be increased when used for anaemia before orthopaedic surgery—avoid in cardiovascular disease including recent myocardial infarction or cerebrovascular accident · risk of thrombosis may be increased when used for anaemia in adults receiving cancer chemotherapy · sickle-cell disease (lower target haemoglobin concentration may be appropriate) · sudden stabbing migraine-like pain (warning of a hypertensive

crisis) · thrombocytosis (monitor platelet count for first 8 weeks)

## • SIDE-EFFECTS

- ▶ **Common or very common** Aggravation of hypertension (dose-dependent) · cardiovascular events · diarrhoea · dose-dependent increase in platelet count regressing during treatment (but thrombocytosis rare) · headache · hypertensive crisis (in isolated patients with normal or low blood pressure) · increase in blood pressure (dose-dependent) · influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes) · nausea · shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications · vomiting
- ▶ **Very rare** Sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure
- ▶ **Frequency not known** Anaphylaxis · angioedema · hyperkalaemia · hypersensitivity reactions · injection-site reactions · peripheral oedema · skin reactions

## SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hypertensive crisis** In isolated patients with normal or low blood pressure, hypertensive crisis with encephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.
- ▶ **Pure red cell aplasia** There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should **not** be switched to another form of erythropoietin.

## • MONITORING REQUIREMENTS

- ▶ Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.
- ▶ Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients.

▶ above

## Darbepoetin alfa

## • INDICATIONS AND DOSE

**Symptomatic anaemia associated with chronic renal failure in patients on dialysis**

- ▶ **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**
- ▶ **Adult:** Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

**Symptomatic anaemia associated with chronic renal failure in patients not on dialysis**

- ▶ **BY SUBCUTANEOUS INJECTION**
- ▶ **Adult:** Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by

approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

#### Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

##### ► BY INTRAVENOUS INJECTION

- Adult: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

#### Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy

##### ► BY SUBCUTANEOUS INJECTION

- Adult: Initially 6.75 micrograms/kg every 3 weeks, alternatively initially 2.25 micrograms/kg once weekly, if response inadequate after 9 weeks further treatment may not be effective; if adequate response obtained then reduce dose by 25–50%, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

- **INTERACTIONS** → Appendix 1: darbopoetin alfa
- **SIDE-EFFECTS** Injection-site pain • oedema
- **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises caution.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **NATIONAL FUNDING/ACCESS DECISIONS**

#### NICE technology appraisals (TAS)

- Erythropoiesis-stimulating agents (epoetin and darbopoetin) for treating anaemia in people with cancer having chemotherapy (November 2014) NICE TA323
- Erythropoiesis-stimulating agents (epoetin alfa, beta, theta and zeta, and darbopoetin alfa) are recommended, within their marketing authorisations, as options for treating anaemia in people with cancer who are having chemotherapy.

If different erythropoiesis-stimulating agents are equally suitable, the product with the lowest acquisition cost for the course of treatment should be used.

## Epoetin alfa

#### ● INDICATIONS AND DOSE

##### BINOCRIT® PRE-FILLED SYRINGES

#### Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

##### ► BY INTRAVENOUS INJECTION

- Adult: Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 25–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds

continued →

2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

#### **Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis**

##### ► BY INTRAVENOUS INJECTION

- Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

#### **Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis**

##### ► BY INTRAVENOUS INJECTION

- Adult: Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, adjusted according to response, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

#### **Symptomatic anaemia in adults receiving cancer chemotherapy**

##### ► BY SUBCUTANEOUS INJECTION

- Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

#### **To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery**

##### ► BY INTRAVENOUS INJECTION

- Adult: 600 units/kg twice weekly for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores, intravenous injection to be given over 1–5 minutes

#### **Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable**

##### ► BY SUBCUTANEOUS INJECTION

- Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

#### **EPREX® PRE-FILLED SYRINGES**

#### **Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis**

##### ► BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

- Adult: Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, maintenance dose can be given as a single dose or in divided doses, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

#### **Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis**

##### ► BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

- Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

#### **Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis**

##### ► BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

- Adult: Initially 50 units/kg 3 times a week, increased in steps of 25 units/kg 3 times a week, adjusted according to response, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous route preferred, intravenous injection to be given over 1–5 minutes, subcutaneous injection, maximum 1 mL per injection site, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

#### **Symptomatic anaemia in adults receiving cancer chemotherapy**

##### ► BY SUBCUTANEOUS INJECTION

- Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, increased if

appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, subcutaneous injection maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

**To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery**

► BY INTRAVENOUS INJECTION

- Adult: 600 units/kg twice weekly for 3 weeks before surgery, consult product literature for details and advice on ensuring high iron stores, intravenous injection to be given over 1–5 minutes

**Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable**

► BY SUBCUTANEOUS INJECTION

- Adult: 600 units/kg once weekly for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, consult product literature for details, subcutaneous injection maximum 1 mL per injection site

- **INTERACTIONS** → Appendix 1: epoetin alfa
- **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.
- **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.
- **HEPATIC IMPAIRMENT** Manufacturers advise caution in chronic hepatic failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Epoetin alfa is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1.

● **INDICATIONS AND DOSE**

**Symptomatic anaemia associated with chronic renal failure**

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

► BY INTRAVENOUS INJECTION

- Adult: Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

**Symptomatic anaemia in adults with non-myeloid malignancies receiving chemotherapy**

► BY SUBCUTANEOUS INJECTION

- Adult: Initially 450 units/kg once weekly for 4 weeks, dose to be given weekly as a single dose or in 3–7 divided doses, increase dose after 4 weeks (if a rise in haemoglobin of at least 1 g/100 mL not achieved), increased to 900 units/kg once weekly, continued →

dose to be given weekly as a single dose or in 3–7 divided doses, if adequate response obtained reduce dose by 25–50%, discontinue treatment if haemoglobin concentration does not increase by at least 1 g/100 mL after 8 weeks of therapy (response unlikely). Reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy; maximum 60 000 units per week

**To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia when blood-conserving procedures are insufficient or unavailable**

## Epoetin zeta

### ● INDICATIONS AND DOSE

#### **Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis**

- BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, dose to be adjusted at intervals of at least 4 weeks; maintenance 25–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

#### **Symptomatic anaemia associated with chronic renal failure in adults on peritoneal dialysis**

- BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: Initially 50 units/kg twice weekly; maintenance 25–50 units/kg twice weekly, intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

#### **Severe symptomatic anaemia of renal origin in adults with renal insufficiency not yet on dialysis**

- BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION
- Adult: Initially 50 units/kg 3 times a week, adjusted according to response, adjusted in steps of 25 units/kg 3 times a week, dose to be increased at intervals of at least 4 weeks; maintenance 17–33 units/kg 3 times a week (max. per dose 200 units/kg 3 times a week), intravenous injection to be given over 1–5 minutes, if given by subcutaneous injection, a maximum of 1 mL can be given per injection site, avoid increasing haemoglobin concentration at a rate exceeding 2 g/100 mL over 4 weeks

#### **Symptomatic anaemia in adults receiving cancer chemotherapy**

- BY SUBCUTANEOUS INJECTION
- Adult: Initially 150 units/kg 3 times a week, alternatively initially 450 units/kg once weekly, increased to 300 units/kg 3 times a week, only increase dose if appropriate rise in haemoglobin (or reticulocyte count) not achieved after 4 weeks; discontinue if inadequate response after 4 weeks at higher dose, maximum 1 mL per injection site, reduce dose by approximately 25–50% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose. Discontinue approximately 4 weeks after ending chemotherapy

#### **To increase yield of autologous blood (to avoid homologous blood) in predonation programme in moderate anaemia either when large volume of blood required or when sufficient blood cannot be saved for elective major surgery**

- BY INTRAVENOUS INJECTION
- Adult: 600 units/kg twice weekly for 3 weeks before surgery, intravenous injection to be given over

1–5 minutes, consult product literature for details and advice on ensuring high iron stores

**Moderate anaemia (haemoglobin concentration 10–13 g/100 mL) before elective orthopaedic surgery in adults with expected moderate blood loss to reduce exposure to allogeneic blood transfusion or if autologous transfusion unavailable**

► BY SUBCUTANEOUS INJECTION

- Adult: 600 units/kg every week for 3 weeks before surgery and on day of surgery, alternatively 300 units/kg daily for 15 days starting 10 days before surgery, maximum 1 mL per injection site, consult product literature for details

- **INTERACTIONS** → Appendix 1: epoetin zeta
- **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.
- **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.
- **HEPATIC IMPAIRMENT** Manufacturers advise caution in chronic hepatic failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Epoetin zeta is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**NICE technology appraisals (TAs)**  
► Erythropoiesis-stimulating agents (epoetin and darbepoetin) for treating anaemia in people with cancer having chemotherapy (November 2014) NICE TA323  
Erythropoiesis-stimulating agents (epoetin alfa, beta, theta and zeta, and darbepoetin alfa) are recommended, within their marketing authorisations, as options for treating anaemia in people with cancer who are having chemotherapy.  
If different erythropoiesis-stimulating agents are equally suitable, the product with the lowest acquisition cost for the course of treatment should be used.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

EXCIPIENTS: May contain Phenylalanine

► **Retacrit** (Pfizer Ltd)

**Epoetin zeta 3333 unit per 1 mL** Retacrit 2,000units/0.6mL solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £57.70 (Hospital only)

Retacrit 3,000units/0.9mL solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £86.55 (Hospital only)

Retacrit 1,000units/0.3mL solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £28.85 (Hospital only)

**Epoetin zeta 10000 unit per 1 mL** Retacrit 6,000units/0.6mL solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £173.09 (Hospital only)

Retacrit 10,000units/1mL solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £288.48 (Hospital only)

Retacrit 8,000units/0.8mL solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £230.79 (Hospital only)

Retacrit 4,000units/0.4mL solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £115.40 (Hospital only)

Retacrit 5,000units/0.5mL solution for injection pre-filled syringes | 6 pre-filled disposable injection [PoM] £144.25 (Hospital only)

**Epoetin zeta 40000 unit per 1 mL** Retacrit 20,000units/0.5mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £96.16 (Hospital only)

Retacrit 40,000units/1mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £193.32 (Hospital only)

Retacrit 30,000units/0.75mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £144.25 (Hospital only)

## Methoxy polyethylene glycol-epoetin beta

● **INDICATIONS AND DOSE**

**Symptomatic anaemia associated with chronic kidney disease in patients on dialysis and not currently treated with erythropoietins**

► BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION

- Adult: Initially 600 nanograms/kg every 2 weeks, dose to be adjusted according to response at intervals of at least 4 weeks, maintenance dose of double the previous fortnightly dose may be given every 4 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks; or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

**Symptomatic anaemia associated with chronic kidney disease in patients not on dialysis and not currently treated with erythropoietins**

► INITIALLY BY SUBCUTANEOUS INJECTION

- Adult: Initially 1.2 micrograms/kg every 4 weeks, alternatively (by subcutaneous injection or by intravenous injection) initially 600 nanograms/kg every 2 weeks, dose to be adjusted according to response at intervals of at least 4 weeks, patients treated once every 2 weeks may be given a maintenance dose of double the previous fortnightly dose every 4 weeks, subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks; or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

**Symptomatic anaemia associated with chronic kidney disease in patients currently treated with erythropoietins**

► BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION

- Adult: (consult product literature)

● **SIDE-EFFECTS** Hot flushes

- **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises caution.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Solution for injection**

► **Mircera** (Roche Products Ltd)

**Methoxy polyethylene glycol-epoetin beta 100 microgram per 1 mL** Mircera 30micrograms/0.3mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £44.05

**Methoxy polyethylene glycol-epoetin beta 166.667 microgram per 1 mL** Mircera 50micrograms/0.3mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £73.41

**Methoxy polyethylene glycol-epoetin beta 250 microgram per 1 mL** Mircera 75micrograms/0.3mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £110.11

**Methoxy polyethylene glycol-epoetin beta 333.333 microgram per 1 mL** Mircera 100micrograms/0.3mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £146.81

**Methoxy polyethylene glycol-epoetin beta 400 microgram per 1 ml** Mircer 120micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £176.18  
**Methoxy polyethylene glycol-epoetin beta 500 microgram per 1 ml** Mircer 150micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £220.22  
**Methoxy polyethylene glycol-epoetin beta 600 microgram per 1 ml** Mircer 360micrograms/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £528.56  
**Methoxy polyethylene glycol-epoetin beta 666.667 microgram per 1 ml** Mircer 200micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £293.62  
**Methoxy polyethylene glycol-epoetin beta 833.333 microgram per 1 ml** Mircer 250micrograms/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £367.03

## 1.1a Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria

### IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

#### Eculizumab

- **DRUG ACTION** Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

#### ● INDICATIONS AND DOSE

**Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)**

##### ► BY INTRAVENOUS INFUSION

- Adult: Initially 600 mg once weekly for 4 weeks, then increased to 900 mg once weekly for 1 week; maintenance 900 mg every 12–16 days

**Reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS) (specialist use only)**

##### ► BY INTRAVENOUS INFUSION

- Adult: Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week; maintenance 1.2 g every 12–16 days

- **CONTRA-INDICATIONS** Patients unvaccinated against *Neisseria meningitidis* · unresolved *Neisseria meningitidis* infection

- **CAUTIONS** Active systemic infection

#### CAUTIONS, FURTHER INFORMATION

- Meningococcal infection Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date.

- **INTERACTIONS** → Appendix 1: monoclonal antibodies

#### ● SIDE-EFFECTS

- **Common or very common** Alopecia · arthralgia · blood disorders · cough · dizziness · dysgeusia · dysuria · fatigue · gastro-intestinal disturbances · headache · infection (including meningococcal infection) · influenza-like symptoms · infusion-related reactions · leucopenia · myalgia · nasopharyngitis · oedema · paraesthesia · pruritus · rash · spontaneous erection · thrombocytopenia · vertigo

- **Uncommon** Anorexia · anxiety · chest pain · depression · epistaxis · gingival pain · Graves' disease · haematoma · hot flushing · hyperhidrosis · hypotension · jaundice · malignant melanoma · menstrual disorders · mood changes · muscle spasms · myelodysplastic syndrome · palpitation · petechiae · renal impairment · skin depigmentation · sleep disturbances · syncope · tinnitus · tremor · visual disturbances

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 5 months after treatment.

- **PREGNANCY** No information available—use only if potential benefit outweighs risk. Human IgG antibodies known to cross placenta.

- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment.

#### ● MONITORING REQUIREMENTS

- Monitor for 1 hour after infusion.
- For *paroxysmal nocturnal haemoglobinuria*, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.
- For *atypical haemolytic uraemic syndrome*, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Soliris*®), give intermittently in Glucose 5% or Sodium chloride 0.9%. Dilute requisite dose to a concentration of 5 mg/mL and mix gently; give over 25–45 minutes (infusion time may be increased to 2 hours if infusion-related reactions occur).

- **PRESCRIBING AND DISPENSING INFORMATION** Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.

- **PATIENT AND CARER ADVICE** A patient information card should be provided. Patient or carers should be advised to report promptly any signs of meningococcal infection.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Solution for infusion**

**ELECTROLYTES:** May contain Sodium

- **Soliris** (Alexion Pharma UK Ltd)

**Eculizumab 10 mg per 1 ml** Soliris 300mg/30ml concentrate for solution for infusion vials | 1 vial [PoM] £3,150.00 (Hospital only)

## 1.2 Iron deficiency anaemia

### Anaemia, iron deficiency

#### Treatment and prophylaxis

*Treatment* with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastric erosion, gastrointestinal cancer).

*Prophylaxis* with an iron preparation may be appropriate in malabsorption, menorrhagia, pregnancy, after subtotal or total gastrectomy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

#### Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by the incidence of side-effects and cost.

The oral dose of elemental iron for iron-deficiency anaemia should be 100 to 200 mg daily. It is customary to give this as dried ferrous sulfate; for prophylaxis of iron-deficiency anaemia, ferrous sulfate may be effective.

#### Iron content of different iron salts

Iron salt/amount	Content of ferrous iron
ferrous fumarate 200 mg	65 mg
ferrous gluconate 300 mg	35 mg
ferrous sulfate 300 mg	60 mg
ferrous sulfate, dried 200 mg	65 mg

#### Compound preparations

Preparations containing iron and folic acid p. 937 are used during pregnancy in women who are at high risk of developing iron and folic acid deficiency; they should be distinguished from those used for the prevention of neural tube defects in women planning a pregnancy.

It is important to note that the small doses of folic acid contained in these preparations are inadequate for the treatment of megaloblastic anaemias.

Some oral preparations contain ascorbic acid p. 991 to aid absorption of the iron but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B group of vitamins** (except folic acid for pregnant women).

#### Modified-release preparations

Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

#### Parenteral iron

Iron can be administered parenterally as iron dextran p. 932, iron sucrose p. 933, ferric carboxymaltose below, or iron isomaltoside 1000 p. 932. Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the patient cannot tolerate oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption. Parenteral iron may also have a role in the management of chemotherapy-induced anaemia, when given with erythropoietins, in specific patient groups (see NICE guidance).

Many patients with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of patients with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the patient's body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

## MINERALS AND TRACE ELEMENTS > IRON, INJECTABLE

### Iron (injectable)

#### IMPORTANT SAFETY INFORMATION

##### MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered where appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

#### • SIDE-EFFECTS Hypersensitivity reactions

##### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Anaphylactic reactions Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available.

#### Overdose

For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1249.

### Ferric carboxymaltose

#### • INDICATIONS AND DOSE

##### Iron-deficiency anaemia

- ▶ BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Adult: Dose calculated according to body-weight and iron deficit (consult product literature)

- **CAUTIONS** Allergic disorders · asthma · eczema · hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available · infection (discontinue if ongoing bacteraemia) · oral iron should not be given until 5 days after last injection

- **INTERACTIONS** → Appendix 1: iron (injectable)

#### • SIDE-EFFECTS

- ▶ **Common or very common** Dizziness · gastro-intestinal disturbances · headache · injection-site reactions · rash
- ▶ **Uncommon** Anaphylaxis · arthralgia · back pain · chest pain · fatigue · flushing · hypertension · hypotension · malaise · myalgia · paraesthesia · peripheral oedema · pruritus · pyrexia · rigors · urticaria
- ▶ **Rare** Dyspnoea

- **PREGNANCY** Avoid in first trimester; crosses the placenta in animal studies. May influence skeletal development.
- **HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Ferinject®), give intermittently in Sodium chloride 0.9%, dilute 200–500 mg in up to 100 mL infusion fluid and give over at least 6 minutes; dilute 0.5–1 g in up to 250 mL infusion fluid and give over at least 15 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

ELECTROLYTES: May contain Sodium

- Ferinject (Vifor Pharma UK Ltd) ▼

**Iron (as Ferric carboxymaltose) 50 mg per 1 ml** Ferinject 100mg/20ml solution for injection vials | 1 vial [PoM] £154.23  
Ferinject 100mg/2ml solution for injection vials | 5 vial [PoM] £81.18  
Ferinject 500mg/10ml solution for injection vials | 5 vial [PoM] £405.88

931

## Iron dextran

#### ● INDICATIONS AND DOSE

##### Iron-deficiency anaemia

- BY DEEP INTRAMUSCULAR INJECTION

Adult: Intramuscular injection to be administered into the gluteal muscle, doses calculated according to body-weight and iron deficit (consult product literature)

- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

Adult: Doses calculated according to body-weight and iron deficit (consult product literature)

- **CONTRA-INDICATIONS** Active rheumatoid arthritis · asthma · eczema · history of allergic disorders · infection
- **CAUTIONS** Hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available · oral iron should not be given until 5 days after last injection
- **INTERACTIONS** → Appendix 1: iron (injectable)
- **SIDE-EFFECTS**
  - **Uncommon** Abdominal pain · anaphylaxis · blurred vision · cramps · dyspnoea · flushing · nausea · numbness · pruritus · rash · vomiting
  - **Rare** Angioedema · arrhythmias · arthralgia · chest pain · diarrhoea · dizziness · fatigue · hypotension · impaired consciousness · injection-site reactions · myalgia · restlessness · seizures · sweating · tachycardia · tremor
  - **Very rare** Haemolysis · headache · hypertension · palpitation · paraesthesia · transient deafness
- **PREGNANCY** Avoid in first trimester.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Avoid in acute renal failure.
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use For intravenous infusion (Cosmofer®), give intermittently in Glucose 5% or Sodium chloride 0.9%, dilute 100–200 mg in 100 mL infusion fluid; give 25 mg over 15 minutes initially, then give at a rate not exceeding 6.67 mg/minute; total dose infusion diluted in 500 mL infusion fluid and given over 4–6 hours (initial dose 25 mg over 15 minutes).
- **PRESCRIBING AND DISPENSING INFORMATION** A complex of ferric hydroxide with dextran containing 5% (50 mg/mL) of iron.

#### ● MEDICINAL FORMS

Monofer 1g/10ml solution for injection vials | 2 vial [PoM] no price available

## Iron sucrose

### ● INDICATIONS AND DOSE

#### Iron-deficiency anaemia

- BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Adult: Doses calculated according to body-weight and iron deficit (consult product literature)

- **CONTRA-INDICATIONS** Anaphylaxis · asthma · eczema · history of allergic disorders
- **CAUTIONS** Hypersensitivity reactions can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available · infection (discontinue if ongoing bacteraemia · oral iron should not be given until 5 days after last injection)
- **INTERACTIONS** → Appendix 1: iron (injectable)
- **SIDE-EFFECTS**
  - **Common or very common** Taste disturbances
  - **Uncommon** Abdominal pain · bronchospasm · chest pain · diarrhoea · dizziness · dyspnoea · fever · flushing · headache · hypotension · injection-site reactions · myalgia · nausea · palpitation · pruritus · rash · tachycardia · vomiting
  - **Rare** Anaphylaxis · asthenia · fatigue · hypertension · paraesthesia · peripheral oedema
  - **Frequency not known** Arthralgia · bradycardia · confusion · increased sweating
- **PREGNANCY** Avoid in first trimester.
- **HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Venofer*®), give intermittently in Sodium chloride 0.9%, dilute 100 mg in up to 100 mL infusion fluid; give 25 mg over 15 minutes initially, then give at a rate not exceeding 3.33 mg/minute.
- **PRESCRIBING AND DISPENSING INFORMATION** A complex of ferric hydroxide with sucrose containing 2% (20 mg/mL) of iron.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

- **Venofer** (Vifor Pharma UK Ltd, Imported (United States)) ▼  
**Iron (as iron sucrose) 20 mg per 1 mL** Venofer 100mg/5mL solution for injection vials | 5 vial **[PoM]** £43.52  
 Venofer 50mg/2.5mL solution for injection vials | 5 vial **[PoM]** no price available

## MINERALS AND TRACE ELEMENTS > IRON, ORAL

## Iron (oral)

- **SIDE-EFFECTS** Constipation · diarrhoea · epigastric pain (dose related) · faecal impaction · gastro-intestinal irritation · nausea (dose related)
  - **SIDE-EFFECTS, FURTHER INFORMATION**
    - Managing side-effects If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulfate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.
    - Altered bowel habit Iron preparations taken orally can be constipating and occasionally lead to faecal impaction.
- Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory

bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

The relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear than for nausea and epigastric pain.

### Overdose

For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 1249.

- In children Iron preparations are an important cause of accidental overdose in children and as little as 20 mg/kg of elemental iron can lead to symptoms of toxicity.

### ● MONITORING REQUIREMENTS

- **Therapeutic response** The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

### ● PRESCRIBING AND DISPENSING INFORMATION

- In children Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered. The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.

- **PATIENT AND CARER ADVICE** Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discolour stools.

## Ferric maltol

above

20-Mar-2017

### ● INDICATIONS AND DOSE

#### Treatment of iron-deficiency anaemia in patients with inflammatory bowel disease

- BY MOUTH
- Adult: 30 mg twice daily continued until iron stores are replenished; usual duration at least 12 weeks

- **CONTRA-INDICATIONS** Exacerbation of inflammatory bowel disease · haemochromatosis · haemoglobin less than 9.5 g/dL · iron overload syndromes · repeated blood transfusions
- **INTERACTIONS** → Appendix 1: iron (oral)
- **SIDE-EFFECTS**
  - **Common or very common** Abdominal distention · abdominal pain · flatulence
  - **Uncommon** Acne · erythema · headache · joint stiffness · pain in extremity · thirst · vomiting
- **NATIONAL FUNDING/ACCESS DECISIONS**

**Scottish Medicines Consortium (SMC) Decisions**  
 The *Scottish Medicines Consortium* has advised (December 2016) that ferric maltol (*Feracru*®) is **not** recommended for use within NHS Scotland for the treatment of iron deficiency anaemia in adults with inflammatory bowel disease as the economic case was not demonstrated.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

- **Feracru** (Shield Therapeutics (UK) Ltd)  
**Iron (as Ferric maltol) 30 mg** Feracru 30mg capsules | 56 capsule **[PoM]** £47.60

## Ferrous fumarate

### ● INDICATIONS AND DOSE

#### Iron-deficiency anaemia (prophylactic)

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 210 mg 1–2 times a day
- ▶ Adult: 210 mg 1–2 times a day
- ▶ BY MOUTH USING SYRUP
- ▶ Child 12–17 years: 140 mg twice daily
- ▶ Adult: 140 mg twice daily

#### Iron-deficiency anaemia (therapeutic)

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 210 mg 2–3 times a day
- ▶ Adult: 210 mg 2–3 times a day
- ▶ BY MOUTH USING SYRUP
- ▶ Child 12–17 years: 280 mg twice daily
- ▶ Adult: 280 mg twice daily

#### FERSADAY®

#### Iron-deficiency anaemia (prophylactic)

- ▶ BY MOUTH
- ▶ Adult: 322 mg daily

#### Iron-deficiency anaemia (therapeutic)

- ▶ BY MOUTH
- ▶ Adult: 322 mg twice daily

#### GALFER® CAPSULES

#### Iron-deficiency anaemia (prophylactic)

- ▶ BY MOUTH
- ▶ Child 12–17 years: 305 mg daily
- ▶ Adult: 305 mg daily

#### Iron-deficiency anaemia (therapeutic)

- ▶ BY MOUTH
- ▶ Child 12–17 years: 305 mg twice daily
- ▶ Adult: 305 mg twice daily

#### GALFER® SYRUP

#### Iron-deficiency anaemia (prophylaxis)

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 0.25 mL/kg twice daily, the total daily dose may alternatively be given in 3 divided doses, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established; maximum 20 mL per day
- ▶ Child 12–17 years: 10 mL once daily
- ▶ Adult: 10 mL once daily

#### Iron-deficiency anaemia (therapeutic)

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 0.25 mL/kg twice daily, the total daily dose may alternatively be given in 3 divided doses; maximum 20 mL per day
- ▶ Child 12–17 years: 10 mL 1–2 times a day
- ▶ Adult: 10 mL 1–2 times a day

- **INTERACTIONS** → Appendix 1: iron (oral)
- **PRESCRIBING AND DISPENSING INFORMATION** Non-proprietary ferrous fumarate tablets may contain 210 mg (68 mg iron), syrup may contain approx. 140 mg (45 mg iron)/5 mL; *Galfer*® capsules contain ferrous fumarate 305 mg (100 mg iron); *Fersaday*® tablets contain ferrous fumarate 322 mg (100 mg iron).

## Ferrous sulfate

### ● INDICATIONS AND DOSE

#### Iron-deficiency anaemia (prophylactic)

##### ► BY MOUTH USING TABLETS

- Child 6–17 years: 200 mg daily
- Adult: 200 mg daily

#### Iron-deficiency anaemia (therapeutic)

##### ► BY MOUTH USING TABLETS

- Child 6–17 years: 200 mg 2–3 times a day
- Adult: 200 mg 2–3 times a day

### FEOSPAN®

#### Iron-deficiency anaemia

##### ► BY MOUTH

- Child 1–17 years: 1 capsule daily, capsule can be opened and sprinkled on food
- Adult: 1–2 capsules daily, capsule can be opened and sprinkled on food

### FERROGRAD®

#### Iron-deficiency anaemia (prophylactic and therapeutic)

##### ► BY MOUTH

- Child 12–17 years: 1 tablet daily
- Adult: 1 tablet daily

### IRONORM® DROPS

#### Iron-deficiency anaemia (prophylactic)

##### ► BY MOUTH

- Adult: 2.4–4.8 mL daily

#### Iron-deficiency anaemia (therapeutic)

##### ► BY MOUTH

- Adult: 4 mL 1–2 times a day

## ● INTERACTIONS → Appendix 1: iron (oral)

## ● PRESCRIBING AND DISPENSING INFORMATION

Iron content Ferrous sulfate 200 mg is equivalent to 65 mg iron; *Ironorm*® drops contain ferrous sulfate 125 mg (equivalent to 25 mg iron)/mL; *Feospan*® spansules contain ferrous sulfate 150 mg (47 mg iron) (spansule (= capsules m/r)); *Ferrograd*® tablets contain ferrous sulfate 325 mg (105 mg iron).

- With oral use in adults Modified-release preparations of iron are licensed for once-daily dosage, but have no therapeutic advantage and should not be used. These preparations are formulated to release iron gradually; the low incidence of side-effects may reflect the small amounts of iron available for absorption as the iron is carried past the first part of the duodenum into an area of the gut where absorption may be poor.

## ● PATIENT AND CARER ADVICE

**Sodium feredetate 38 mg per 1 mL** Sytron oral solution sugar-free | 500 mL **P** £14.95 DT price = £14.95

## 1.3 Megaloblastic anaemia

### Anaemia, megaloblastic

#### Overview

Most megaloblastic anaemias result from a lack of either vitamin B<sub>12</sub> or folate, and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

One cause of megaloblastic anaemia in the UK is *pernicious anaemia* in which lack of gastric intrinsic factor resulting from an autoimmune gastritis causes malabsorption of vitamin B<sub>12</sub>.

Vitamin B<sub>12</sub> is also needed in the treatment of megaloblastosis caused by *prolonged nitrous oxide anaesthesia*, which inactivates the vitamin, and in the rare syndrome of *congenital transcobalamin II deficiency*.

Vitamin B<sub>12</sub> should be given prophylactically after *total gastrectomy* or *total ileal resection* (or after *partial gastrectomy* if a vitamin B<sub>12</sub> absorption test shows vitamin B<sub>12</sub> malabsorption).

Apart from dietary deficiency, all other causes of vitamin B<sub>12</sub> deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B<sub>12</sub> orally and none for vitamin B<sub>12</sub> intrinsic factor complexes given by mouth. Vitamin B<sub>12</sub> in larger oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 938 has completely replaced cyanocobalamin p. 938 as the form of vitamin B<sub>12</sub> of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B<sub>12</sub> neuropathy.

Folic acid p. 937 has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B<sub>12</sub> is

administered concurrently otherwise neuropathy may be precipitated.

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores.

For prophylaxis in *chronic haemolytic states*, *malabsorption*, or in *renal dialysis*, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in severe Crohn's disease, rheumatic disease, and severe psoriasis.

Folinic acid p. 869 is also effective in the treatment of folate deficient megaloblastic anaemia but it is generally used in association with cytotoxic drugs; it is given as calcium folinate.

There is **no** justification for prescribing multiple ingredient vitamin preparations containing vitamin B<sub>12</sub> or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. .

## VITAMINS AND TRACE ELEMENTS > FOLATES

### Folic acid

09-Jun-2016

#### ● INDICATIONS AND DOSE

##### Folate-deficient megaloblastic anaemia

###### ► BY MOUTH

- Child 1-11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, doses up to 10 mg daily may be required in malabsorption states
- Child 1-17 years: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states
- Adult: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

##### Prevention of neural tube defects (in those at a low risk of conceiving a child with a neural tube defect see p. 997)

###### ► BY MOUTH

- Females of childbearing potential: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy

##### Prevention of neural tube defects (in those in the high-risk group who wish to become pregnant or who are at risk of becoming pregnant see p. 997)

###### ► BY MOUTH

- Females of childbearing potential: 5 mg daily, to be taken before conception and until week 12 of pregnancy

##### Prevention of neural tube defects (in those with sickle-cell disease)

###### ► BY MOUTH

- Females of childbearing potential: 5 mg daily, patient should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) before conception and continue this throughout pregnancy

##### Prevention of methotrexate-induced side-effects in rheumatic disease

###### ► BY MOUTH

- Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

##### Prevention of methotrexate side-effects in severe Crohn's disease | Prevention of methotrexate side-effects in severe psoriasis

###### ► BY MOUTH

- Adult: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

#### Prophylaxis in chronic haemolytic states

##### ► BY MOUTH

- Adult: 5 mg every 1-7 days, frequency dependent on underlying disease

#### Prophylaxis of folate deficiency in dialysis

##### ► BY MOUTH

- Child 1 month-11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
- Child 12-17 years: 5-10 mg once daily
- Adult: 5 mg every 1-7 days

#### Prophylaxis of folate deficiency in patients receiving parenteral nutrition

##### ► BY INTRAVENOUS INFUSION

- Adult: 15 mg 1-2 times a week, usually given by *intravenous infusion* in the parenteral nutrition solution

- **UNLICENSED USE** Not licensed for prevention of methotrexate-induced side-effects in severe Crohn's disease. Not licensed for prevention of methotrexate-induced side-effects in rheumatic disease. Not licensed for prevention of methotrexate-induced side-effects in severe psoriasis.

- **CAUTIONS** Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord)

- **INTERACTIONS** → Appendix 1: folates

#### ● SIDE-EFFECTS

- Rare Gastro-intestinal disturbances

#### ● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Folic acid for megaloblastic anaemia caused by folate deficiency and haemolytic anaemia [www.medicinesforchildren.org.uk/folic-acid-megaloblastic-anaemia-caused-folate-deficiency-and-haemolytic-anaemia](http://www.medicinesforchildren.org.uk/folic-acid-megaloblastic-anaemia-caused-folate-deficiency-and-haemolytic-anaemia)

#### ● EXCEPTIONS TO LEGAL CATEGORY

- With oral use Can be sold to the public provided daily doses do not exceed 500 micrograms.

#### ● MEDICINAL FORMS

## VITAMINS AND TRACE ELEMENTS > VITAMIN B GROUP

### Cyanocobalamin

#### • INDICATIONS AND DOSE

##### Vitamin B<sub>12</sub> deficiency of dietary origin

- BY MOUTH
  - Adult: 50–150 micrograms daily, dose to be taken between meals
- BY INTRAMUSCULAR INJECTION
  - Adult: Initially 1 mg every 2–3 days for 11 doses; maintenance 1 mg every month

- PRESCRIBING AND DISPENSING INFORMATION** The BP directs that when vitamin B<sub>12</sub> injection is prescribed or demanded hydroxocobalamin injection shall be dispensed or supplied.

Currently available brands of the tablet may not be suitable for vegans.

- NATIONAL FUNDING/ACCESS DECISIONS**

**NHS restrictions** Cyanocobalamin liquid, *Cytacon*® tablets, and *Cytamen*® injection are not available on prescription under the NHS.

- LESS SUITABLE FOR PRESCRIBING** Cyanocobalamin is less suitable for prescribing.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

##### Tablet

- Cyanocobalamin (Non-proprietary)**
  - Cyanocobalamin 50 microgram Cyanocobalamin 50microgram tablets | 50 tablet [P] £6.24 DT price = £8.99
- Cytacon** (AMCo)
  - Cyanocobalamin 50 microgram Cytacon 50microgram tablets | 50 tablet [P] £8.99 DT price = £8.99

##### Solution for injection

- Cytamen** (Focus Pharmaceuticals Ltd)
  - Cyanocobalamin 1 mg per 1 ml Cytamen 1000micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £14.50 DT price = £14.50

##### Oral solution

- Cyanocobalamin (Non-proprietary)**
  - Cyanocobalamin 7 microgram per 1 ml Cyanocobalamin 35micrograms/5ml oral solution | 200 ml [P] £8.75

### Hydroxocobalamin

#### • INDICATIONS AND DOSE

##### Prophylaxis of macrocytic anaemias associated with vitamin B<sub>12</sub> deficiency

- BY INTRAMUSCULAR INJECTION
  - Adult: 1 mg every 2–3 months

##### Pernicious anaemia and other macrocytic anaemias without neurological involvement

- BY INTRAMUSCULAR INJECTION
  - Adult: Initially 1 mg 3 times a week for 2 weeks, then 1 mg every 3 months

##### Pernicious anaemia and other macrocytic anaemias with neurological involvement

- BY INTRAMUSCULAR INJECTION
  - Adult: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months

##### Tobacco amblyopia

- BY INTRAMUSCULAR INJECTION
  - Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

#### Leber's optic atrophy

- BY INTRAMUSCULAR INJECTION
  - Adult: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

#### CYANOKIT®

##### Poisoning with cyanides

- BY INTRAVENOUS INFUSION
  - Child (body-weight 5 kg and above): Initially 70 mg/kg (max. per dose 5 g), to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability
  - Adult: Initially 5 g, to be given over 15 minutes, then 5 g if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

#### • CAUTIONS

- With intramuscular use or oral use Should not be given before diagnosis fully established

#### • SIDE-EFFECTS

##### GENERAL SIDE-EFFECTS

Dizziness · headache · pruritus

##### SPECIFIC SIDE-EFFECTS

- With intramuscular use Hypokalaemia (during initial treatment) · injection-site reactions · rash · thrombocytosis (during initial treatment)
- With intramuscular use or oral use Chromaturia · fever · hypersensitivity reactions · nausea
- With intravenous use Dyspnoea · eye disorders · gastro-intestinal disturbances · hot flush · lymphocytopenia · memory impairment · peripheral oedema · pustular rashes · red coloration of urine · restlessness · reversible red coloration of skin and mucous membranes · throat disorders · transient hypertension

- BREAST FEEDING** Present in milk but not known to be harmful.

#### • EFFECT ON LABORATORY TESTS

- With intravenous use Deep red colour of hydroxocobalamin may interfere with laboratory tests.

#### • DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intravenous infusion (*Cyanokit*)®, given intermittently in Sodium chloride 0.9%, reconstitute 5 g vial with 200 mL Sodium Chloride 0.9%; gently invert vial for at least 1 minute to mix (do not shake).

#### • PRESCRIBING AND DISPENSING INFORMATION

- With intramuscular use The BP directs that when vitamin B<sub>12</sub> injection is prescribed or demanded, hydroxocobalamin injection shall be dispensed or supplied.

Poisoning by cyanides

- With intravenous use *Cyanokit*® is the only preparation of hydroxocobalamin that is suitable for use in victims of smoke inhalation who show signs of significant cyanide poisoning.

#### • NATIONAL FUNDING/ACCESS DECISIONS

**NHS restrictions** *Cobalin-H*® is not prescribable under National Health Service (NHS).

*Neo-Cytamen*® is not prescribable under National Health Service (NHS).

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for injection

###### Hydroxocobalamin (Non-proprietary)

**Hydroxocobalamin 1 mg per 1 ml** Hydroxocobalamin 1mg/1ml solution for injection ampoules | 5 ampoule [PoM] £12.49 DT price = £7.12

**Hydroxocobalamin 2.5 mg per 1 ml** Hepavit 5mg/2ml solution for injection ampoules | 2 ampoule [PoM] no price available

Hydroxocobalamin 5 mg per 1 ml Megamilbedoce 10mg/2ml solution for injection ampoules | 10 ampoule [PoM] no price available

• **Cobalin** (AMCO)

Hydroxocobalamin 1 mg per 1 ml Cobalin-H 1mg/1ml solution for injection ampoules | 5 ampoule [PoM] £9.50 DT price = £7.12

• **Neo-Cytamen** (Focus Pharmaceuticals Ltd)

Hydroxocobalamin 1 mg per 1 ml Neo-Cytamen 1000micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £12.49 DT price = £7.12

**Powder for solution for infusion**

• **Cyanokit** (Swedish Orphan Biovitrum Ltd)

Hydroxocobalamin 5 gram Cyanokit 5g powder for solution for infusion vials | 1 vial [PoM] no price available

## 2 Iron overload

### Iron overload

#### Overview

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 941 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is **not** added to the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by administration of ascorbic acid p. 991 (vitamin C) daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to patients with cardiac dysfunction; in patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

Desferrioxamine mesilate infusion can be used to treat *aluminium overload* in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

### ANTIDOTES AND CHELATORS > IRON CHELATORS

#### Deferasirox

14-Jun-2017

• **DRUG ACTION** Deferasirox is an oral iron chelator.

• **INDICATIONS AND DOSE**

**Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)**

► BY MOUTH USING DISPERSIBLE TABLETS

- Adult: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 40 mg/kg per day; Usual maximum 30 mg/kg

**Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) (specialist use only) | Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias (specialist use only)**

► BY MOUTH USING DISPERSIBLE TABLETS

- Adult: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 40 mg/kg per day; Usual maximum 30 mg/kg

**Chronic iron overload when desferrioxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)**

► BY MOUTH USING DISPERSIBLE TABLETS

- Adult: Initially 10 mg/kg once daily, then adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 20 mg/kg per day

**Transfusion-related chronic iron overload in patients with beta thalassaemia major who receive frequent blood transfusions (7 mL/kg/month or more of packed red blood cells) (specialist use only)**

► BY MOUTH USING FILM-COATED TABLETS

- Adult: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

**Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with beta thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells) (specialist use only) | Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients with other anaemias (specialist use only)**

► BY MOUTH USING FILM-COATED TABLETS

- Adult: Initially 7–21 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 28 mg/kg per day; Usual maximum 21 mg/kg

**Chronic iron overload when desferrioxamine is contra-indicated or inadequate in non-transfusion-dependent thalassaemia syndromes (specialist use only)**

► BY MOUTH USING FILM-COATED TABLETS

- Adult: Initially 7 mg/kg once daily, then adjusted in steps of 3.5–7 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 14 mg/kg per day

**DOSE EQUIVALENCE AND CONVERSION**

- The bioavailability of dispersible tablets is lower than that of film-coated tablets; dispersible tablets are not interchangeable with film-coated tablets on a milligram-for-milligram basis—consult product literature for information on switching between formulations.

- **CAUTIONS** Elderly (increased risk of side-effects) • history of liver cirrhosis • not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) • platelet count less than  $50 \times 10^9$ /litre • risk of gastro-intestinal ulceration and haemorrhage • unexplained cytopenia—consider treatment interruption
- **INTERACTIONS** → Appendix 1: deferasirox
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal distension • abdominal pain • constipation • diarrhoea • dyspepsia • gastro-intestinal haemorrhage (including fatal cases) • gastro-intestinal ulceration • headache • nausea • proteinuria • pruritus • raised serum creatinine • raised transaminases • rash • vomiting
  - ▶ **Uncommon** Anxiety • cataract • cholelithiasis • disturbances of hearing and vision • dizziness • fatigue • gastritis • glucosuria • hepatitis • laryngeal pain • maculopathy • oedema • pyrexia • renal tubulopathy • skin pigmentation • sleep disorder
  - ▶ **Rare** Oesophagitis • optic neuritis
  - ▶ **Frequency not known** Acute pancreatitis • acute renal failure • alopecia • anaphylaxis • angioedema • blood disorders • erythema multiforme • hepatic failure • hypersensitivity reactions • hypersensitivity vasculitis • metabolic acidosis • nephrolithiasis • Stevens-Johnson syndrome • toxic epidermal necrolysis • tubulointerstitial nephritis • urticaria
- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Use with caution in moderate impairment, reduce dose considerably then gradually increase to max. 50% of normal dose. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises reduce dose if creatinine clearance less than 90 mL/minute and serum creatinine increased by more than 33% of baseline measurement on 2 consecutive occasions—consult product literature. Manufacturer advises avoid if estimated creatinine clearance less than 60 mL/minute.
- **MONITORING REQUIREMENTS** Manufacturer advises monitoring of the following patient parameters: baseline serum creatinine twice and creatinine clearance once before initiation of treatment, weekly in the first month after treatment initiation or modification, then monthly thereafter; proteinuria before treatment initiation then monthly thereafter, and other markers of renal tubular function as needed; liver function before treatment initiation, every 2 weeks during the first month of treatment, then monthly thereafter; eye and ear examinations before treatment and annually during treatment; serum-ferritin concentration monthly.
- **DIRECTIONS FOR ADMINISTRATION** For *dispersible tablets*, manufacturer advises tablets should be dispersed in 100–200 mL of water, orange juice, or apple juice; if necessary any residue should be resuspended in a small volume of water or juice then administered; do not chew or swallow whole. For *film-coated tablets*, manufacturer advises tablets may be crushed and sprinkled on to soft food (yoghurt or apple sauce), then administered immediately.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer deferasirox dispersible tablets.
- **NATIONAL FUNDING/ACCESS DECISIONS**  
**Scottish Medicines Consortium (SMC) Decisions**  
 The *Scottish Medicines Consortium* has advised (January 2007) that deferasirox is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload

associated with the treatment of rare acquired or inherited anaemias requiring recurrent blood transfusions. It is not recommended for patients with myelodysplastic syndromes.

The *Scottish Medicines Consortium* has advised (January 2017) that deferasirox (*Exjade*®) is accepted for restricted use within NHS Scotland for the treatment of chronic iron overload due to blood transfusions when deferoxamine treatment is contra-indicated or inadequate, in adult and paediatric patients aged 2 years and older with rare acquired or inherited anaemias. This advice relates only for use in patients with myelodysplastic syndrome with an International Prognostic Scoring System score of low or intermediate -1 risk.

## • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 13, 22

#### ▶ *Exjade* (Novartis Pharmaceuticals UK Ltd) ▼

Deferasirox 125 mg *Exjade* 125mg dispersible tablets sugar-free | 28 tablet [PoM] £117.60

Deferasirox 250 mg *Exjade* 250mg dispersible tablets sugar-free | 28 tablet [PoM] £235.20

Deferasirox 500 mg *Exjade* 500mg dispersible tablets sugar-free | 28 tablet [PoM] £470.40

### Tablet

CAUTIONARY AND ADVISORY LABELS 25

#### ▶ *Exjade* (Novartis Pharmaceuticals UK Ltd) ▼

Deferasirox 90 mg *Exjade* 90mg tablets | 30 tablet [PoM] £126.00

Deferasirox 180 mg *Exjade* 180mg tablets | 30 tablet [PoM] £252.00

Deferasirox 360 mg *Exjade* 360mg tablets | 30 tablet [PoM] £504.00

## Deferiprone

- **DRUG ACTION** Deferiprone is an oral iron chelator.

### • INDICATIONS AND DOSE

**Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate**

#### ▶ BY MOUTH

- ▶ Adult: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

- **CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia
- **INTERACTIONS** → Appendix 1: deferiprone
- **SIDE-EFFECTS** Agranulocytosis • arthropathy • blood dyscrasias • gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance) • headache • increased appetite • neutropenia • red-brown urine discoloration • zinc deficiency
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid before intended conception—teratogenic and embryotoxic in *animal* studies. Contraception advised in females of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.
  - ▶ Monitor plasma-zinc concentration.

## ● PATIENT AND CARER ADVICE

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

### Oral solution

CAUTIONARY AND ADVISORY LABELS 14

- ▶ **Ferriprox** (Swedish Orphan Biovitrum Ltd)

**Desferiprone 100 mg per 1 ml** Ferriprox 100mg/ml oral solution sugar-free | 500 ml [PoM] £152.39 DT price = £152.39

### Tablet

CAUTIONARY AND ADVISORY LABELS 14

- ▶ **Ferriprox** (Swedish Orphan Biovitrum Ltd)

**Desferiprone 500 mg** Ferriprox 500mg tablets | 100 tablet [PoM] £152.39 DT price = £152.39

**Desferiprone 1 gram** Ferriprox 1000mg tablets | 50 tablet [PoM] £175.25 DT price = £175.25

## Desferrioxamine mesilate

### (Deferoxamine Mesilate)

## ● INDICATIONS AND DOSE

### Iron poisoning

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION

▶ **Adult:** Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service

### Aluminium overload in dialysis patients

- ▶ BY INTRAVENOUS INFUSION

▶ **Adult:** (consult product literature or local protocols)

### Chronic iron overload (low iron overload)

- ▶ BY SUBCUTANEOUS INFUSION

▶ **Adult:** The dose should reflect the degree of iron overload

### Chronic iron overload (established overload)

- ▶ BY SUBCUTANEOUS INFUSION

▶ **Adult:** 20–50 mg/kg daily

- **CAUTIONS** Aluminium-related encephalopathy (may exacerbate neurological dysfunction)

- **INTERACTIONS** → Appendix 1: desferrioxamine

## ● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · arthralgia · bone disorders · growth retardation · headache · hearing disturbances · injection-site reactions · myalgia · nausea · pyrexia · vomiting
- ▶ **Rare** Anaphylaxis · blood dyscrasias · bone pain · diarrhoea · hepatic impairment · hypotension (especially when given too rapidly by intravenous injection) · leg cramps · lens opacity · leucopenia · rash · retinopathy · thrombocytopenia · visual disturbances · Yersinia and mucormycosis infections
- ▶ **Very rare** Acute respiratory distress · convulsions · dizziness · neurological disturbances · neuropathy · paraesthesia · renal impairment
- ▶ **Frequency not known** Muscle spasms
- **PREGNANCY** Teratogenic in *animal* studies. Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT** Use with caution.

## ● MONITORING REQUIREMENTS

- ▶ Eye and ear examinations before treatment and at 3-month intervals during treatment.

- **DIRECTIONS FOR ADMINISTRATION** For full details and warnings relating to administration, consult product literature.

For intravenous infusion (Desferal<sup>®</sup>), give continuously or intermittently in Glucose 5% or Sodium chloride 0.9%. Reconstitute with water for injections to a concentration of 100 mg/mL; dilute with infusion fluid.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Powder for solution for injection

- ▶ **Desferrioxamine mesilate (Non-proprietary)**

**Desferrioxamine mesilate 500 mg** Desferrioxamine 500mg powder for solution for injection vials | 10 vial [PoM] £39.90–£50.00

**Desferrioxamine mesilate 2 gram** Desferrioxamine 2g powder for solution for injection vials | 1 vial [PoM] £17.95–£20.00

- ▶ **Desferal** (Novartis Pharmaceuticals UK Ltd)

**Desferrioxamine mesilate 500 mg** Desferal 500mg powder for solution for injection vials | 10 vial [PoM] £46.63

**Desferrioxamine mesilate 2 gram** Desferal 2g powder for solution for injection vials | 1 vial [PoM] £18.66

## 3 Neutropenia and stem cell mobilisation

### 3.1 Neutropenia

## Neutropenia

### Management

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival. Filgrastim p. 942 (unglycosylated rhG-CSF) and lenograstim p. 943 (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Pegfilgrastim p. 944 is a polyethylene glycol-conjugated ('pegylated') derivative of filgrastim; pegylation increases the duration of filgrastim activity. Lipefilgrastim p. 943 is a polyethylene glycol-conjugated via a glycine linker derivative of filgrastim.

Granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

## IMMUNOSTIMULANTS > GRANULOCYTE-COLONY STIMULATING FACTORS

## Granulocyte-colony stimulating factors

- **DRUG ACTION** Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.

- **CAUTIONS** Malignant myeloid conditions · pre-malignant myeloid conditions · risk of splenomegaly and rupture—spleen size should be monitored · sickle-cell disease

### CAUTIONS, FURTHER INFORMATION

- ▶ Acute respiratory distress syndrome There have been reports of pulmonary infiltrates leading to acute respiratory

distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk.

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anorexia · asthenia · bone pain · chest pain · fever · gastro-intestinal disturbances · headache · injection-site reactions · leucocytosis · musculoskeletal pain · rash · thrombocytopenia
- ▶ **Rare** Acute febrile neutrophilic dermatosis · cutaneous vasculitis · pulmonary side-effects (particularly interstitial pneumonia)

#### SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Pulmonary infiltration** Treatment should be withdrawn in patients who develop signs of pulmonary infiltration.
- **PREGNANCY** There have been reports of toxicity in *animal* studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.
- **BREAST FEEDING** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.
- **MONITORING REQUIREMENTS**
  - ▶ Full blood counts including differential white cell and platelet counts should be monitored.
  - ▶ Spleen size should be monitored during treatment—risk of splenomegaly and rupture.

941

## Filgrastim

(Recombinant human granulocyte-colony stimulating factor; G-CSF)

#### ● INDICATIONS AND DOSE

**Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ **Adult:** 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes

**Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)**

- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION
- ▶ **Adult:** 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route

**Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)**

- ▶ BY SUBCUTANEOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion

**Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing

chemotherapy, for timing of leucopheresis, consult product literature

**Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult 18–59 years:** 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature

**Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

**Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

**Persistent neutropenia in HIV infection (specialist use only)**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ **Adult:** Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day

- **CONTRA-INDICATIONS** Severe congenital neutropenia (Kostmann's syndrome) with abnormal cytogenetics
- **CAUTIONS** Osteoporotic bone disease (monitor bone density if given for more than 6 months) · secondary acute myeloid leukaemia

#### ● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · dysuria · epistaxis · exacerbation of rheumatoid arthritis · haematuria · hepatomegaly · mucositis · osteoporosis · proteinuria · pseudogout · raised uric acid · splenic enlargement · transient decrease in blood glucose · transient hypotension · urinary abnormalities
- ▶ **Uncommon** Capillary leak syndrome (including fatal cases)
- ▶ **Rare** Splenic rupture

- **MONITORING REQUIREMENTS** Regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).

#### ● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion (Neupogen®; Nivestim®; (Ratiograstim®); (Zarzio®)* give continuously or intermittently in Glucose 5%; for a filgrastim concentration of less than 1 500 000 units/mL (15 micrograms/mL) albumin solution (human albumin solution) is added to produce a final albumin concentration of 2 mg/mL; should not be diluted to a filgrastim concentration of less than 200 000 units/mL (2 micrograms/mL) and should not be diluted with sodium chloride solution.

- **PRESCRIBING AND DISPENSING INFORMATION** Filgrastim is a biological medicine. Biological medicines must be prescribed and dispensed by brand name, see *Biological medicines and Biosimilar medicines*, under Guidance on prescribing p. 1.

1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Solution for injection

#### Accofil (Accord Healthcare Ltd) ▼

**Filgrastim 60 mega u per 1 ml** Accofil 30million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £284.20

**Filgrastim 96 mega u per 1 ml** Accofil 48million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £455.70

#### Neupogen (Amgen Ltd)

**Filgrastim 30 mega u per 1 ml** Neupogen 30million units/1ml solution for injection vials | 5 vial [PoM] £263.52

#### Neupogen Singleject (Amgen Ltd)

**Filgrastim 60 mega u per 1 ml** Neupogen Singleject 30million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £52.70

**Filgrastim 96 mega u per 1 ml** Neupogen Singleject 48million units/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £84.06

#### Nivestim (Pfizer Ltd)

**Filgrastim 60 mega u per 1 ml** Nivestim 30million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £246.50 (Hospital only)

**Nivestim 12million units/0.2ml solution for injection pre-filled syringes** | 5 pre-filled disposable injection [PoM] £153.00 (Hospital only)

**Filgrastim 96 mega u per 1 ml** Nivestim 48million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £395.25 (Hospital only)

#### Zarzio (Sandoz Ltd)

**Filgrastim 60 mega u per 1 ml** Zarzio 30million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £250.75

**Filgrastim 96 mega u per 1 ml** Zarzio 48million units/0.5ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £399.50

941

## Lenograstim

(Recombinant human granulocyte-colony stimulating factor; rHuG-CSF)

### INDICATIONS AND DOSE

**Reduction in the duration of neutropenia and associated complications following bone-marrow transplantation for non-myeloid malignancy (specialist use only)**

**Reduction in the duration of neutropenia and associated complications following peripheral stem cells transplantation for non-myeloid malignancy (specialist use only)**

#### BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION

- Adult: 150 micrograms/m<sup>2</sup> daily until neutrophil count stable in acceptable range (max. 28 days), to be started the day after transplantation. Intravenous infusion to be given over 30 minutes

**Reduction in the duration of neutropenia and associated complications following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia (specialist use only)**

#### BY SUBCUTANEOUS INJECTION

- Adult: 150 micrograms/m<sup>2</sup> daily until neutrophil count stable in acceptable range (max. 28 days), to be started on the day after completion of chemotherapy

**Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion, used alone (specialist use only)**

#### BY SUBCUTANEOUS INJECTION

- Adult: 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors)

**Mobilisation of peripheral blood progenitor cells, used following adjunctive myelosuppressive chemotherapy (to improve yield) (specialist use only)**

#### BY SUBCUTANEOUS INJECTION

- Adult: 150 micrograms/m<sup>2</sup> daily until neutrophil count stable in acceptable range, to be started 1–5 days after completion of chemotherapy, for timing of leucopheresis, consult product literature

- SIDE-EFFECTS** Mucositis · splenic rupture · toxic epidermal necrolysis

### DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intravenous infusion (*Granocyte*®), give intermittently in Sodium chloride 0.9%; initially reconstitute with 1 mL water for injection provided (do not shake vigorously) then dilute with up to 50 mL infusion fluid for each vial of *Granocyte*-13 or up to 100 mL infusion fluid for *Granocyte*-34; give over 30 minutes.

- PRESCRIBING AND DISPENSING INFORMATION** *Granocyte*® solution for injection contains 105 micrograms of lenograstim per 13.4 mega unit vial and 263 micrograms lenograstim per 33.6 mega unit vial.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Power and solvent for solution for injection

EXCIPIENTS: May contain Phenylalanine

#### Granocyte (Chugai Pharma UK Ltd)

**Lenograstim 13.4 mega u** *Granocyte*-13 powder and solvent for solution for injection vials | 1 vial [PoM] £40.11 | 5 vial [PoM] £200.55

**Lenograstim 33.6 mega u** *Granocyte*-34 powder and solvent for solution for injection vials | 1 vial [PoM] £62.54 | 5 vial [PoM] £312.69

941

## Lipegfilgrastim

(Glycopegylated recombinant methionyl human granulocyte-colony stimulating factor)

### INDICATIONS AND DOSE

**Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes)**

#### BY SUBCUTANEOUS INJECTION

- Adult (specialist use only): 6 mg, for each chemotherapy cycle, given approximately 24 hours after chemotherapy, dose expressed as filgrastim

- CAUTIONS** Myelosuppressive chemotherapy

- SIDE-EFFECTS** Hypokalaemia

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Solution for injection

#### Lonquex (Teva UK Ltd) ▼

**Lipegfilgrastim 10 mg per 1 ml** Lonquex 6mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £652.06

## Pegfilgrastim

(Pegylated recombinant methionyl human granulocyte-colony stimulating factor)

### ● INDICATIONS AND DOSE

**Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: 6 mg for each chemotherapy cycle, to be given at least 24 hours after chemotherapy, dose is expressed as filgrastim

- **CAUTIONS** Acute leukaemia · myelosuppressive chemotherapy

### ● SIDE-EFFECTS

- Rare Capillary leak syndrome (including fatal cases)
- Very rare Splenic rupture

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Solution for injection**

- **Neulasta** (Amgen Ltd)

## 3.2 Stem cell mobilisation

### IMMUNOSTIMULANTS > CHEMOKINE RECEPTOR ANTAGONISTS

## Plerixafor

- **DRUG ACTION** Plerixafor is a chemokine receptor antagonist.

### ● INDICATIONS AND DOSE

**Mobilise haematopoietic stem cells to peripheral blood for collection and subsequent autologous transplantation in patients with lymphoma or multiple myeloma (specialist use only)**

#### ► BY SUBCUTANEOUS INJECTION

- Adult: 240 micrograms/kg daily usually for 2–4 days (max 7 days), to be administered 6–11 hours before initiation of apheresis, dose to be given following 4 days treatment with a granulocyte-colony stimulating factor

### ● SIDE-EFFECTS

- **Common or very common** Arthralgia · dizziness · dry mouth · erythema · fatigue · gastro-intestinal disturbances · headache · injection-site reactions · insomnia · musculoskeletal pain · oral hypoaesthesia · sweating
- **Uncommon** Dyspnoea · hypersensitivity reactions · periorbital swelling

- **CONCEPTION AND CONTRACEPTION** Use effective contraception during treatment—teratogenic in *animal* studies.

- **PREGNANCY** Manufacturer advises avoid unless essential—teratogenic in *animal* studies.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Reduce dose to 160 micrograms/kg daily if creatinine clearance 20–50 mL/minute. No information available if creatinine clearance less than 20 mL/minute.

- **MONITORING REQUIREMENTS** Monitor platelets and white blood cell count.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Solution for injection**

- **Mozobil** (Sanofi)

**Plerixafor 20 mg per 1 ml** Mozobil 24mg/1.2ml solution for injection vials | 1 vial **[PoM]** £4,882.77

## 4 Platelet disorders

### Platelet disorders

#### Idiopathic thrombocytopenic purpura

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. In adults, idiopathic thrombocytopenic purpura can be treated with a **corticosteroid**, e.g. prednisolone p. 639, gradually reducing the dose over several weeks. Splenectomy is considered if a satisfactory platelet count is not achieved or if there is a relapse on reducing the dose of corticosteroid or withdrawing it.

**Immunoglobulin** preparations, are also used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are also used for children often in preference to a corticosteroid. Anti-D (Rh<sub>0</sub>) immunoglobulin p. 1185 is effective in raising the platelet count in about 80% of unsplenectomised rhesus-positive individuals; its effects may last longer than normal immunoglobulin p. 1186 for intravenous use, but further doses are usually required.

Other therapy that has been tried in refractory idiopathic thrombocytopenic purpura includes azathioprine p. 787, cyclophosphamide p. 830, vincristine sulfate p. 858, ciclosporin p. 788, and danazol p. 699. Rituximab p. 820 may also be effective and in some cases induces prolonged remission. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid p. 107 may be given to reduce the severity of haemorrhage.

Eltrombopag p. 945 and romiplostim p. 947 are thrombopoietin receptor agonists licensed for the treatment of chronic idiopathic thrombocytopenic purpura in splenectomised patients refractory to other treatments, such as corticosteroids or immunoglobulins, or as a second-line treatment in non-splenectomised patients when surgery is contra-indicated (see also NICE guidance). Eltrombopag is an oral preparation and romiplostim is an injection which is made biosynthetically by recombinant DNA technology; they should both be used under the supervision of a specialist.

#### Essential thrombocythaemia

Anagrelide p. 945 inhibits platelet formation. It is licensed for essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs. An at risk patient is defined by one or more of the following features: over 60 years of age, or a platelet count greater than  $1000 \times 10^9/L$  or history of thrombo-haemorrhagic events. Anagrelide should be initiated under specialist supervision.

## 4.1 Essential thrombocythaemia

### ANTITHROMBOTIC DRUGS > CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

#### Anagrelide

##### ● INDICATIONS AND DOSE

**Essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)**

##### ► BY MOUTH

- Adult: Initially 500 micrograms twice daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

- **CAUTIONS** Cardiovascular disease—assess cardiac function before and regularly during treatment • concomitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment • risk factors for QT-interval prolongation—assess cardiac function before and regularly during treatment

- **INTERACTIONS** → Appendix 1: anagrelide

##### ● SIDE-EFFECTS

- **Common or very common** Anaemia • dizziness • fatigue • fluid retention • gastro-intestinal disturbances • headache • palpitation • rash • tachycardia
- **Uncommon** Alopecia • amnesia • anorexia • arrhythmias • arthralgia • back pain • blood disorders • chest pain • confusion • congestive heart failure • depression • dry mouth • dyspnoea • ecchymosis • epistaxis • fever • gastro-intestinal haemorrhage • haemorrhage • hypertension • hypoaesthesia • impotence • malaise • myalgia • nervousness • oedema • pancreatitis • paraesthesia • pneumonia pleural effusion • pruritus • skin discoloration • sleep disturbances • syncope • weight changes
- **Rare** Angina • asthenia • cardiomegaly • cardiomyopathy • colitis • dry skin • dysarthria • gastritis • gingival bleeding • impaired coordination • migraine • myocardial infarction • nocturia • pericardial effusion • postural hypotension • pulmonary hypertension • pulmonary infiltrates • renal failure • somnolence • tinnitus • vasodilatation • visual disturbances
- **Frequency not known** Hepatitis • interstitial lung disease • Torsade de pointes • tubulointerstitial nephritis

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment. Avoid in moderate to severe impairment.

- **RENAL IMPAIRMENT** Manufacturer advises avoid if eGFR less than 50 mL/minute/1.73 m<sup>2</sup>.

##### ● MONITORING REQUIREMENTS

- Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).
- Monitor liver function.
- Monitor serum creatinine.
- Monitor urea.
- Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.

##### ● PATIENT AND CARER ADVICE

Driving and skilled tasks

Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

## 4.2 Idiopathic thrombocytopenic purpura

### ANTIHAEMORRHAGICS > THROMBOPOIETIN RECEPTOR AGONISTS

#### Eltrombopag

09-Jun-2017

##### ● INDICATIONS AND DOSE

**Chronic immune (idiopathic) thrombocytopenic purpura in patients refractory to other treatments (such as corticosteroids or immunoglobulins) (under expert supervision)**

##### ► BY MOUTH

- Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of  $50 \times 10^9$ /litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day
- Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of  $50 \times 10^9$ /litre or more—consult product literature for dose adjustments, discontinue if inadequate response after 4 weeks treatment at maximum dose; maximum 75 mg per day.

**Treatment of thrombocytopenia associated with chronic hepatitis C infection, where the degree of thrombocytopenia is the main factor preventing the initiation or limiting the ability to maintain optimal interferon-based therapy (under expert supervision)**

##### ► BY MOUTH

- Adult: Initially 25 mg once daily, dose to be adjusted to achieve a platelet count sufficient to initiate antiviral therapy then a platelet count of  $50\text{--}75 \times 10^9$ /litre during antiviral therapy—consult product literature for dose adjustments, discontinue if inadequate response after 2 weeks treatment at maximum dose; maximum 100 mg per day

**Acquired severe aplastic anaemia in patients either refractory to or heavily pretreated with prior immunosuppressive therapy and are unsuitable for haematopoietic stem cell transplantation (under expert supervision)**

##### ► BY MOUTH

- Adult: Initially 50 mg once daily, dose to be adjusted to achieve a platelet count of  $50 \times 10^9$ /litre or more—consult product literature for dose adjustments, discontinue if no haematological response after 16 weeks treatment; maximum 150 mg per day
- Adult (patients of East Asian origin): Initially 25 mg once daily, dose to be adjusted to achieve a platelet count of  $50 \times 10^9$ /litre or more—consult product literature for dose adjustments, discontinue if no haematological response after 16 weeks treatment; maximum 150 mg per day.

- **CAUTIONS** Patients of East Asian origin · risk factors for thromboembolism
- **INTERACTIONS** → Appendix 1: eltrombopag
- **SIDE-EFFECTS**
  - ▶ **Common or very common** Abdominal discomfort · abdominal distention · abdominal pain · alopecia · anaemia · anxiety · arthralgia · ascites · asthenia · blood disorders · bone pain · bronchitis · cataract · changes in appetite · changes in weight · chest pain · chromaturia · confusion · constipation · cough · depression · diarrhoea · disturbance in attention · dizziness · dry eye · dry mouth · dyspepsia · dysphagia · dyspnoea (including on exertion) · ecchymosis · eczema · epistaxis · erythema · eye disorders · faeces discoloured · fatigue · febrile neutropenia · flatulence · gastritis · gastro-oesophageal reflux disease · gastroenteritis · gingival bleeding · haemorrhoids · headache · hepatic encephalopathy · hepatobiliary disorders · hepatotoxicity including drug-induced liver injury · hyperglycaemia · hyperhidrosis · hypoglycaemia · influenza · insomnia · iron overload · irritability · jaundice · lymphopenia · malaise · malignant hepatic neoplasm · memory impairment · menorrhagia · mood disturbances · mouth ulceration · muscle spasms · musculoskeletal pain · myalgia · nasopharyngitis · nausea · neutropenia · night sweats · oedema · oesophageal varices including haemorrhage · oral herpes · oral pain · oropharyngeal pain · palpitation · paraesthesia · pharyngitis · pruritus · pyrexia · rash · respiratory tract infection · rhinorrhoea · skin lesions · sleep disorders · splenic infarction · stomatitis · swollen tongue · syncope · taste disturbances · toothache · urinary tract infections · vertigo · visual disturbances · vomiting
  - ▶ **Uncommon** Acute myocardial infarction · anorexia · balance disorder · blood uric acid increased · cardiovascular disorders · cholestasis · cyanosis · dysaesthesia · dysuria · ear pain · electrolyte disturbances · flushing · frequent bowel movements · gingivitis · glossodynia · gout · haematemesis · haematoma · hemiparesis · hepatic lesion · hepatitis · hypoaesthesia · lupus nephritis · migraine · muscular weakness · nasal discomfort · nocturia · oral discomfort · oropharyngeal blistering · peripheral neuropathy · QT-interval prolongation · rectosigmoid cancer · renal failure · sinus disorder · skin discolouration · skin infection · speech disorder · tachycardia · thromboembolic events · toxic neuropathy · tremor
  - ▶ **Frequency not known** Increased bone marrow reticulin—discontinue
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** For *idiopathic thrombocytopenic purpura*, manufacturer advises avoid unless potential benefit outweighs risk—reduce initial dose to 25 mg once daily and wait at least 3 weeks before upwards titration of dose.
 

For *severe aplastic anaemia*, manufacturer advises reduce initial dose to 25 mg once daily and wait at least 2 weeks before upwards titration of dose.

For *thrombocytopenia associated with chronic hepatitis C infection*, manufacturer advises reduce initial dose to 25 mg once daily and wait at least 2 weeks before upwards titration of dose in moderate-to-severe impairment. For *thrombocytopenia associated with chronic hepatitis C infection*, manufacturer advises use only if potential benefit outweighs risk in severe impairment and monitor closely—increased risk of hepatic decompensation and thromboembolic events.
- **RENAL IMPAIRMENT** Use with caution.
- **PRE-TREATMENT SCREENING** For *severe aplastic anaemia*, manufacturer advises do not initiate if patients have existing cytogenetic abnormalities of chromosome 7.

## ● MONITORING REQUIREMENTS

- ▶ Manufacturer advises monitor liver function before treatment, every two weeks when adjusting the dose, and monthly thereafter.
- ▶ Manufacturer advises regular ophthalmological examinations for cataract formation.
- ▶ Manufacturer advises peripheral blood smear prior to initiation to establish baseline level of cellular morphologic abnormalities; once stabilised, full blood count with white blood cell count differential should be performed monthly.
- ▶ For *idiopathic thrombocytopenic purpura*, manufacturer advises monitor full blood count including platelet count and peripheral blood smears every week during treatment until a stable platelet count is reached ( $50 \times 10^9/\text{litre}$  or more for at least 4 weeks), then monthly thereafter; monitor platelet count weekly for 4 weeks following treatment discontinuation.
- ▶ For *severe aplastic anaemia*, manufacturer advises bone marrow examination with aspirations for cytogenetics prior to initiation, at 3 months of treatment and 6 months thereafter.
- ▶ For *thrombocytopenia associated with chronic hepatitis C infection*, manufacturer advises monitor platelet count every week before and during antiviral treatment until a stable platelet count is reached ( $50\text{--}75 \times 10^9/\text{litre}$ ), then monitor full blood count including platelet count and peripheral blood smears monthly thereafter.

- **DIRECTIONS FOR ADMINISTRATION** Each dose should be taken at least 4 hours before or after any dairy products (or foods containing calcium), indigestion remedies, or medicines containing aluminium, calcium, iron, magnesium, zinc, or selenium to reduce possible interference with absorption.

- **PATIENT AND CARER ADVICE** Patient counselling is advised on how to administer eltrombopag tablets.

## ● NATIONAL FUNDING/ACCESS DECISIONS

### NICE technology appraisals (TAs)

- ▶ **Eltrombopag for treating chronic immune (idiopathic) thrombocytopenic purpura (July 2013)** NICE TA293  
Eltrombopag is recommended for the treatment of chronic immune (idiopathic) thrombocytopenic purpura in splenectomised adults refractory to other treatments, or as a second-line treatment in non-splenectomised adults when surgery is contra-indicated, only if:

- the manufacturer provides eltrombopag at the agreed discount as part of the patient access scheme *and*
- their condition is refractory to standard active treatments and rescue therapies *or*
- they have severe disease and a high risk of bleeding that needs frequent courses of rescue therapies.

Patients currently receiving eltrombopag whose disease does not meet these criteria should have the option to continue treatment until they and their clinician consider it appropriate to stop.

[www.nice.org.uk/TA293](http://www.nice.org.uk/TA293)

### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2010) that eltrombopag (*Revolade*®) is accepted for restricted use within NHS Scotland for the treatment of both splenectomised and non-splenectomised patients with severe symptomatic immune (idiopathic) thrombocytopenic purpura or a high risk of bleeding.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Nutrition and metabolic disorders

### 1 Fluid and electrolyte imbalances

#### Fluids and electrolytes

##### Electrolyte replacement therapy

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

##### Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

##### Oral potassium

Compensation for potassium loss is especially necessary:

- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias;
- in patients in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, cirrhosis of the liver, the nephrotic syndrome, and severe heart failure;
- in patients with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse.

Measures to compensate for potassium loss may also be required in the elderly since they frequently take inadequate amounts of potassium in the diet (but see **warning on renal insufficiency**). Measures may also be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 221 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the prevention of hypokalaemia, then doses of potassium chloride daily (in divided doses) by mouth are suitable in patients taking a normal diet. *Smaller doses* must be used if there is **renal insufficiency (common in the elderly)** to reduce the **risk of hyperkalaemia**.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness; when appropriate, potassium-sparing diuretics are preferable.

When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with

chloride depletion and with metabolic alkalosis, and these disorders require correction.

### Management of hyperkalaemia

**Acute severe hyperkalaemia** (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes) calls for urgent treatment with calcium gluconate 10% p. 959 by slow intravenous injection, titrated and adjusted to ECG improvement, to temporarily protect against myocardial excitability. An intravenous injection of soluble insulin (5–10 units) with 50 mL glucose 50% p. 955 given over 5–15 minutes, reduces serum-potassium concentration; this is repeated if necessary or a continuous infusion instituted. Salbutamol p. 244 [unlicensed indication], by nebulisation or slow intravenous injection may also reduce plasma-potassium concentration; it should be used with caution in patients with cardiovascular disease. The correction of causal or compounding acidosis with sodium bicarbonate infusion p. 950 should be considered (**important:** preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; occasionally haemodialysis is needed.

Ion-exchange resins may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyperkalaemia* when there are no ECG changes.

### Oral sodium and water

Sodium chloride p. 953 is indicated in states of sodium depletion and usually needs to be given intravenously. In chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride or sodium bicarbonate, according to the acid-base status of the patient, may be sufficient.

### Oral rehydration therapy (ORT)

As a worldwide problem *diarrhoea* is by far the most important indication for fluid and electrolyte replacement. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through *diarrhoea* can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalinising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic *diarrhoea*;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration salts formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na<sup>+</sup> 75 mmol, K<sup>+</sup> 20 mmol, Cl<sup>-</sup> 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children's fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hyponatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breastfeeding or formula feeds should be offered between oral rehydration drinks.

### Oral bicarbonate

Sodium bicarbonate is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously.

Sodium bicarbonate may also be used to increase the pH of the urine; it is also used in dyspepsia.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Where *hyperchloraemic acidosis* is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

## Parenteral preparations for fluid and electrolyte imbalance

### Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses, when the patient is nauseated or vomiting and is unable to take adequate amounts by mouth. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 953 or glucose 5% p. 955) can also be given by subcutaneous infusion (hypodermoclysis).

The nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical investigations. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, e.g. 20% glucose, are best given through an indwelling catheter positioned in a large vein.

### Intravenous sodium

Sodium chloride in isotonic solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*, which can arise from such conditions as gastro-enteritis, diabetic ketoacidosis, ileus, and ascites. In a severe deficit of 4 to 8 litres, 2 to 3 litres of isotonic sodium chloride may be given over 2 to 3 hours; thereafter the infusion can usually be at a slower rate.

Chronic hyponatraemia arising from inappropriate secretion of antidiuretic hormone should ideally be corrected by fluid restriction. However, if sodium chloride is required for acute or chronic hyponatraemia, regardless of the cause, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome and the rise in plasma-sodium concentration should not exceed 10 mmol/litre in 24 hours. In severe hyponatraemia, sodium chloride 1.8% may be used cautiously.

**Compound sodium lactate** (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded; it may reduce the risk of hyperchloraemic acidosis.

Sodium chloride with glucose p. 954 solutions are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the

## Fluids and electrolytes

### Electrolyte concentrations—intravenous fluids

	Millimoles per litre

Pancreatic	-	120–140	5–15	70–110	40–80
Small bowel	-	120–140	5–15	20–40	90–130

sodium salt with a volume of water determined by the normal plasma Na<sup>+</sup> remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

#### Intravenous glucose

Glucose solutions (5%) are used mainly to replace water deficit. Average water requirements in a healthy adult are 1.5 to 2.5 litres daily and this is needed to balance unavoidable losses of water through the skin and lungs and to provide sufficient for urinary excretion. Water depletion (dehydration) tends to occur when these losses are not matched by a comparable intake, as may occur in coma or dysphagia or in the elderly or apathetic who may not drink enough water on their own initiative.

Excessive loss of water without loss of electrolytes is uncommon, occurring in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder, but usually lies within the range of 2 to 6 litres.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given in regimens with calcium and insulin for the emergency management of *hyperkalaemia*. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuing insulin infusion.

#### Intravenous potassium

Potassium chloride with sodium chloride intravenous infusion p. 953 is the initial treatment for the correction of severe *hypokalaemia* and when sufficient potassium cannot be taken by mouth.

Repeated measurement of plasma-potassium concentration is necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should **not** involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

#### Bicarbonate and lactate

Sodium bicarbonate p. 950 is used to control severe *metabolic acidosis* (pH<7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anaemia or hypovolaemia, sodium bicarbonate (1.26%) can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium or volume depletion; in these circumstances sodium bicarbonate is best given as a small volume of hypertonic solution, such as 50 mL of 8.4% solution intravenously.

Sodium lactate intravenous infusion is no longer used in metabolic acidosis because of the risk of producing lactic

acidosis, particularly in seriously ill patients with poor tissue perfusion or impaired hepatic function.

For *chronic acidotic states*, sodium bicarbonate can be given by mouth.

#### Plasma and plasma substitutes

Plasma and plasma substitutes ('colloids') contain large molecules that do not readily leave the intravascular space where they exert osmotic pressure to maintain circulatory volume. Compared to fluids containing electrolytes such as sodium chloride and glucose ('crystalloids'), a smaller volume of colloid is required to produce the same expansion of blood volume, thereby shifting salt and water from the extravascular space. If resuscitation requires a volume of fluid that exceeds the maximum dose of the colloid then crystalloids can be given; packed red cells may also be required.

Albumin solution p. 960, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness, to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution (20%) can be used under specialist supervision in patients with an intravascular fluid deficit and oedema because of interstitial fluid overload, to restore intravascular plasma volume with less exacerbation of the salt and water overload than isotonic solutions. Concentrated albumin solution p. 960 may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in hepatic cirrhosis).

Recent evidence does not support the previous view that the use of albumin increases mortality.

#### Plasma substitutes

Dextran, gelatin p. 961, and the hydroxyethyl starch, tetraastarch, are macromolecular substances which are metabolised slowly. Dextran and gelatin may be used at the outset to expand and maintain blood volume in shock arising from conditions such as burns or septicaemia; they may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Dextran and gelatin are rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion.

Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

## BICARBONATE

### Sodium bicarbonate

#### ● INDICATIONS AND DOSE

**Alkalinisation of urine | Relief of discomfort in mild urinary-tract infections**

##### ► BY MOUTH

- Adult: 3 g every 2 hours until urinary pH exceeds 7, to be dissolved in water

#### Maintenance of alkaline urine

##### ► BY MOUTH

- Adult: 5–10 g daily, to be dissolved in water

#### Chronic acidotic states such as uraemic acidosis or renal tubular acidosis

##### ► BY MOUTH

- Adult: 4.8 g daily, (57 mmol each of  $\text{Na}^+$  and  $\text{HCO}_3^-$ ), higher doses may be required and should be adjusted according to response

#### Severe metabolic acidosis

##### ► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Adult: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%)

#### ● CONTRA-INDICATIONS

- With oral use Salt restricted diet

- **CAUTIONS** Avoid prolonged use in urinary conditions - cardiac disease - elderly - patients on sodium-restricted diet - respiratory acidosis

- **INTERACTIONS** → Appendix 1: sodium bicarbonate

#### ● SIDE-EFFECTS

- When used for alkalinisation of urine Alkalosis on prolonged use - eructation
- When used for chronic acidotic states such as uraemic acidosis or renal tubular acidosis Fluid retention (in those at risk) - hypokalaemia may be exacerbated - increase blood pressure - pulmonary oedema (in those at risk)
- When used for maintenance of alkaline urine Fluid retention (in those at risk) - hypokalaemia may be exacerbated - increase blood pressure - pulmonary oedema (in those at risk)
- When used for relief of discomfort in mild urinary-tract infections Alkalosis on prolonged use - eructation

#### ● PREGNANCY

- With oral use Use with caution in urinary conditions.

- **HEPATIC IMPAIRMENT** In patients with fluid retention, avoid large amounts of sodium.

#### ● RENAL IMPAIRMENT

- With oral use Avoid (except for specialised role in some forms of renal disease).

#### ● MONITORING REQUIREMENTS

- With intravenous use Plasma-pH and electrolytes should be monitored.

#### ● DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *slow intravenous injection* use a small volume of hypertonic solution (such as 50 mL of 8.4%). For *continuous intravenous infusion* a weaker solution of 1.26% solution can be infused over 3–4 hours.
- With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

#### ● PRESCRIBING AND DISPENSING INFORMATION

- With oral use *Sodium bicarbonate* 500mg capsules contain approximately 6 mmol each of  $\text{Na}^+$  and  $\text{HCO}_3^-$ ; *Sodium bicarbonate* 600mg capsules contain approximately 7 mmol each of  $\text{Na}^+$  and  $\text{HCO}_3^-$ . Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.
- With intravenous use Usual strength Sodium bicarbonate 1.26% (12.6 g, 150 mmol each of  $\text{Na}^+$  and  $\text{HCO}_3^-$ /litre), various other strengths available.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for injection, liquid

### Tablet

#### ► Sodium bicarbonate (Non-proprietary)

**Sodium bicarbonate 600 mg** Sodium bicarbonate 600mg tablets | 100 tablet [GSL] £29.75 DT price = £26.52

### Solution for injection

#### ► Sodium bicarbonate (Non-proprietary)

**Sodium bicarbonate 84 mg per 1 ml** Sodium bicarbonate 8.4% (1mmol/ml) solution for injection 10ml ampoules | 10 ampoule [PoM] £81.27  
**Sodium bicarbonate 8.4% (1mmol/ml) solution for injection 250ml bottles** | 10 bottle [PoM] £65.34  
**Sodium bicarbonate 8.4% (1mmol/ml) solution for injection 100ml bottles** | 10 bottle [PoM] £62.04

### Oral solution

#### ► Thamicarb (Thame Laboratories Ltd)

**Sodium bicarbonate 84 mg per 1 ml** Thamicarb 84mg/1ml oral solution sugar-free | 100 ml [P] £39.80 DT price = £39.80 sugar-free | 500 ml [P] £199.20 DT price = £199.20

### Capsule

#### ► Sodium bicarbonate (Non-proprietary)

**Sodium bicarbonate 500 mg** Sodium bicarbonate 500mg capsules | 56 capsule [P] £17.56 DT price = £2.01 | 100 capsule [PoM] no price available

### Infusion

#### ► Sodium bicarbonate (Non-proprietary)

**Sodium bicarbonate 12.6 mg per 1 ml** Polyfusor BC sodium bicarbonate 1.26% infusion 500ml bottles | 1 bottle [PoM] £9.86 | 12 bottle [PoM] no price available  
**Sodium bicarbonate 14 mg per 1 ml** Polyfusor BD sodium bicarbonate 1.4% infusion 500ml bottles | 1 bottle [PoM] £9.86 | 12 bottle [PoM] no price available  
**Sodium bicarbonate 27.4 mg per 1 ml** Polyfusor V sodium bicarbonate 2.74% infusion 500ml bottles | 1 bottle [PoM] £9.86 | 12 bottle [PoM] no price available  
**Sodium bicarbonate 42 mg per 1 ml** Polyfusor BE sodium bicarbonate 4.2% infusion 500ml bottles | 1 bottle [PoM] £9.86 | 12 bottle [PoM] no price available  
**Sodium bicarbonate 84 mg per 1 ml** Polyfusor B sodium bicarbonate 8.4% infusion 200ml bottles | 1 bottle [PoM] £9.86 | 12 bottle [PoM] no price available

## ELECTROLYTES AND MINERALS > POTASSIUM

### Potassium chloride with calcium chloride and sodium chloride and sodium lactate

(Sodium Lactate Intravenous Infusion, Compound; Compound, Hartmann's Solution for Injection; Ringer-Lactate Solution for Injection)

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 968, sodium chloride p. 953, calcium chloride p. 959.

#### ● INDICATIONS AND DOSE

**For prophylaxis, and replacement therapy, requiring the use of sodium chloride and lactate, with minimal amounts of calcium and potassium**

- BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

● **INTERACTIONS** → Appendix 1: calcium salts, potassium chloride

● **PRESCRIBING AND DISPENSING INFORMATION** Compound sodium lactate intravenous infusion contains Na<sup>+</sup> 131 mmol, K<sup>+</sup> 5 mmol, Ca<sup>2+</sup> 2 mmol, HCO<sub>3</sub><sup>-</sup> (as lactate) 29 mmol, Cl<sup>-</sup> 111 mmol/litre.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Infusion

#### ► Potassium chloride with calcium chloride and sodium chloride and sodium lactate (Non-proprietary)

**Calcium chloride 270 microgram per 1 ml, Potassium chloride 400 microgram per 1 ml, Sodium lactate 3.17 mg per 1 ml, Sodium chloride 6 mg per 1 ml** Sodium lactate compound infusion 1litre Macoflex N bags | 1 bag [PoM] no price available | 10 bag [PoM] no price available  
**Sodium lactate compound infusion 1litre Vialflex bags** | 1 bag [PoM] no price available | 10 bag [PoM] no price available  
**Sodium lactate compound infusion 1litre Macoflex bags** | 1 bag [PoM] no price available | 12 bag [PoM] no price available  
**Sodium lactate compound infusion 1litre Vialfo bags** | 1 bag [PoM] no price available | 10 bag [PoM] no price available  
**Ringer lactate infusion 1litre Vialfo bags** | 1 bag [PoM] no price available | 10 bag [PoM] no price available

### Potassium chloride with calcium chloride dihydrate and sodium chloride

(Ringer's solution)

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 968, sodium chloride p. 953.

#### ● INDICATIONS AND DOSE

##### Electrolyte imbalance

- BY INTRAVENOUS INFUSION
- Adult: Dosed according to the deficit or daily maintenance requirements (consult product literature)

● **INTERACTIONS** → Appendix 1: potassium chloride

● **PRESCRIBING AND DISPENSING INFORMATION** Ringer's solution for injection provides the following ions (in mmol/litre), Ca<sup>2+</sup> 2.2, K<sup>+</sup> 4, Na<sup>+</sup> 147, Cl<sup>-</sup> 156.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

### Infusion

#### ► Potassium chloride with calcium chloride dihydrate and sodium chloride (Non-proprietary)

**Potassium chloride 300 microgram per 1 ml, Calcium chloride 320 microgram per 1 ml, Sodium chloride 8.6 mg per 1 ml** Polyfusor C ringers infusion 500ml bottles | 1 bottle [PoM] £2.95 | 12 bottle [PoM] no price available  
**Steriflex No.9 ringers infusion 1litre bags** | 1 bag [PoM] £2.22 | 10 bag [PoM] no price available  
**Steriflex No.9 ringers infusion 500ml bags** | 1 bag [PoM] £1.96 | 15 bag [PoM] no price available

### Potassium chloride with glucose

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 968, glucose p. 955.

#### ● INDICATIONS AND DOSE

##### Electrolyte imbalance

- BY INTRAVENOUS INFUSION
- Adult: Dosed according to the deficit or daily maintenance requirements

● **INTERACTIONS** → Appendix 1: glucose, potassium chloride

● **PRESCRIBING AND DISPENSING INFORMATION** Potassium chloride 0.3% contains 40 mmol each of K<sup>+</sup> and Cl<sup>-</sup>/litre or 0.15% contains 20 mmol each of K<sup>+</sup> and Cl<sup>-</sup>/litre with 5% of anhydrous glucose.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

### Infusion

#### ► Potassium chloride with glucose (Non-proprietary)

**Potassium chloride 3 mg per 1 ml, Glucose anhydrous 50 mg per 1 ml** Potassium chloride 0.3% (potassium 40mmol/1litre) / Glucose 5% infusion 1litre Macoflex bags | 1 bag [PoM] no price available

## ELECTROLYTES AND MINERALS > SODIUM CHLORIDE

### Sodium chloride

#### ● INDICATIONS AND DOSE

##### Prophylaxis of sodium chloride deficiency

- ▶ BY MOUTH
- ▶ Adult: 4–8 tablets daily, to be taken with water, up to maximum 20 tablets daily in severe depletion

##### Chronic renal salt wasting

- ▶ BY MOUTH
- ▶ Adult: Up to 20 tablets daily, to be taken with appropriate fluid intake

##### Management of diabetic ketoacidosis (to restore circulating volume if systolic blood pressure is below 90 mmHg and adjusted for age, sex, and medication as appropriate)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: 500 mL, sodium chloride 0.9% to be given over 10–15 minutes, repeat if blood pressure remains below 90 mmHg and seek senior medical advice, when blood pressure is over 90 mmHg, sodium chloride 0.9% should be given by intravenous infusion at a rate that replaces deficit and provides maintenance, management regimen also includes administration of potassium chloride, soluble insulin, long acting insulin analogues and glucose 10% solution

##### Diluent for instillation of drugs to the bladder

- ▶ BY INTRAVESCAL INSTILLATION
- ▶ Adult: (consult product literature)

#### ● CAUTIONS

- ▶ With intravenous use Avoid excessive administration · cardiac failure · dilutional hyponatraemia especially in the elderly · hypertension · peripheral oedema · pulmonary oedema · restrict intake in impaired renal function · toxemia of pregnancy

#### ● SIDE-EFFECTS

- ▶ With intravenous use Administration of large doses may give rise to sodium accumulation · hyperchloraemic acidosis · oedema

#### ● MONITORING REQUIREMENTS

- ▶ With intravenous use The jugular venous pressure should be assessed, the bases of the lungs should be examined for crepitations, and in elderly or seriously ill patients it is often helpful to monitor the right atrial (central) venous pressure.

#### ● PRESCRIBING AND DISPENSING INFORMATION

Sodium chloride 0.9% intravenous infusion contains Na<sup>+</sup> and Cl<sup>-</sup> each 150 mmol/litre. The term 'normal saline' should not be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).

Each *Slow Sodium*<sup>®</sup> tablet contains approximately 10 mmol each of Na<sup>+</sup> and Cl<sup>-</sup>; tablets can be crushed before administration.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, infusion, solution for infusion

##### Modified-release tablet

**Combinations available:** *Potassium chloride with calcium chloride and sodium chloride and sodium lactate*, p. 951 • *Potassium chloride with calcium chloride dihydrate and sodium chloride*, p. 951 • *Potassium chloride with glucose and sodium chloride*, p. 952 • *Potassium chloride with sodium chloride*, p. 953

**Sodium chloride with glucose**

The properties listed below are those particular to the combination only. For the properties of the components please consider, sodium chloride p. 953, glucose p. 955.

● **INDICATIONS AND DOSE****Combined water and sodium depletion**

- BY INTRAVENOUS INFUSION
- Adult: (consult product literature)

- **INTERACTIONS** → Appendix 1: glucose

- **MONITORING REQUIREMENTS** Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

## NUTRIENTS > SUGARS

### Glucose

#### (Dextrose Monohydrate)

#### ● INDICATIONS AND DOSE

##### Establish presence of gestational diabetes

###### ▶ BY MOUTH

- ▶ Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

##### Oral glucose tolerance test

###### ▶ BY MOUTH

- ▶ Adult: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

##### Hypoglycaemia

###### ▶ BY INTRAVENOUS INFUSION

- ▶ Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs
- ▶ Adult: 10 g, to be administered as Glucose 20% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

#### Energy source

##### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 1–3 litres daily, solution concentration of 20–50% to be administered

#### Water replacement

##### ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: The volume of glucose solution needed to replace deficits may vary (consult product literature)

#### Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)

##### ▶ BY INTRAVENOUS INFUSION

- ▶ Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

#### Management of diabetic ketoacidosis

##### ▶ BY INTRAVENOUS INFUSION

- ▶ Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre
- ▶ Adult: Glucose 10% should be given once blood-glucose concentration falls below 14 mmol/litre, to be administered into a large vein through a large-gauge needle at a rate of 125 mL/hour, in addition to the sodium chloride 0.9% infusion

#### DOSE EQUIVALENCE AND CONVERSION

- ▶ 75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

- **CAUTIONS** Do not give alone except when there is no significant loss of electrolytes - prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances
- **INTERACTIONS** → Appendix 1: glucose
- **SIDE-EFFECTS** Glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ In children Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.
- **PRESCRIBING AND DISPENSING INFORMATION** Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose monohydrate, potency being expressed in terms of anhydrous glucose.
- **EXCEPTIONS TO LEGAL CATEGORY**
  - ▶ With intravenous use Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

## ORAL REHYDRATION SALTS

### Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride

(Formulated as oral rehydration salts)

#### ● INDICATIONS AND DOSE

##### Fluid and electrolyte loss in diarrhoea

###### ► BY MOUTH

- Child 1-11 months: 1–1½ times usual feed volume to be given
- Child 1-11 years: 200 mL, to be given after every loose motion
- Child 12-17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss
- Adult: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na<sup>+</sup> 60 mmol, K<sup>+</sup> 20 mmol, Cl<sup>-</sup> 60 mmol, citrate 10 mmol, and glucose 90 mmol.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include black currant, citrus, or natural.

- **PATIENT AND CARER ADVICE** After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

Medicines for Children leaflet: Oral rehydration

salts [www.medicinesforchildren.org.uk/oral-rehydration-salts](http://www.medicinesforchildren.org.uk/oral-rehydration-salts)

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder**

##### ► Dioralyte (Sanofi)

**Potassium chloride 300 mg, Sodium chloride 470 mg, Disodium hydrogen citrate 530 mg, Glucose 3.56 gram** Dioralyte oral powder sachets citrus | 20 sachet (P) £6.72  
Dioralyte oral powder sachets plain | 20 sachet (P) £6.72  
Dioralyte oral powder sachets blackcurrant | 20 sachet (P) £6.72

### Potassium chloride with rice powder, sodium chloride and sodium citrate

(Formulated as oral rehydration salts)

#### ● INDICATIONS AND DOSE

##### Fluid and electrolyte loss in diarrhoea

###### ► BY MOUTH

- Adult: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water

provide  $\text{Na}^+$  60 mmol,  $\text{K}^+$  20 mmol,  $\text{Cl}^-$  50 mmol and citrate 10 mmol.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include apricot, black currant, or raspberry.

- **PATIENT AND CARER ADVICE** Patients and carers should be advised how to reconstitute *Dioralyte*® Relief oral powder. After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### **Powder**

EXCIPIENTS: May contain Aspartame

##### ► *Dioralyte Relief* (Sanofi)

Potassium chloride 300 mg, Sodium chloride 350 mg, Sodium citrate 580 mg, Rice powder pre-cooked 6 gram *Dioralyte Relief* oral powder sachets raspberry sugar-free | 6 sachet GSL £2.50  
*Dioralyte Relief* oral powder sachets blackcurrant sugar-free | 20 sachet P £7.13

## 1.1 Calcium imbalance

### Calcium

#### Calcium supplements

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand, and in old age, due to impaired absorption. In osteoporosis, a calcium intake which is double the recommended amount reduces the rate of bone loss. If the actual dietary intake is less than the recommended amount, a supplement of as much as 40 mmol is appropriate.

In severe acute hypocalcaemia or hypocalcaemic tetany, an initial slow intravenous injection of calcium gluconate injection 10% p. 959 should be given, with plasma-calcium and ECG monitoring (risk of arrhythmias if given too rapidly), and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence. Calcium chloride injection p. 959 is also available, but is more irritant; care should be taken to prevent extravasation. Oral supplements of calcium and vitamin D may also be required in persistent hypocalcaemia. Concurrent hypomagnesaemia should be corrected with magnesium sulfate p. 963.

See the role of calcium gluconate in temporarily reducing the toxic effects of hyperkalaemia.

#### Severe hypercalcaemia

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 953. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If *severe hypercalcaemia persists* drugs which inhibit mobilisation of calcium from the skeleton may be required. The **bisphosphonates** are useful and pamidronate disodium p. 686 is probably the most effective.

**Corticosteroids** are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon) p. 689 can be used for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment* is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be useful.

#### Hyperparathyroidism

Paricalcitol p. 995 is licensed for the prevention and treatment of secondary hyperparathyroidism associated with chronic renal failure.

Parathyroidectomy may be indicated for hyperparathyroidism.

#### Hypercalciuria

Hypercalciuria should be investigated for an underlying cause, which should be treated. Where a cause is not identified (idiopathic hypercalciuria), the condition is managed by increasing fluid intake and giving bendroflumethiazide p. 161. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

## 1.1a Hypercalcaemia and hypercalciuria

### CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

#### Cinacalcet

- **DRUG ACTION** Cinacalcet reduces parathyroid hormone which leads to a decrease in serum calcium concentrations.

#### ● INDICATIONS AND DOSE

**Secondary hyperparathyroidism in patients with end-stage renal disease on dialysis**

##### ► BY MOUTH

- Adult: Initially 30 mg once daily, dose to be adjusted every 2–4 weeks; maximum 180 mg per day

**Treatment of hypercalcaemia in parathyroid carcinoma | Primary hyperparathyroidism in patients where parathyroidectomy is inappropriate**

##### ► BY MOUTH

- Adult: Initially 30 mg twice daily (max. per dose 90 mg 4 times a day), dose to be adjusted every 2–4 weeks according to response

#### DOSE ADJUSTMENTS DUE TO INTERACTIONS

Dose adjustment may be necessary if smoking started or stopped during treatment.

- **CAUTIONS** Treatment should not be initiated in patients with hypocalcaemia
- **INTERACTIONS** → Appendix 1: cinacalcet
- **SIDE-EFFECTS**
  - **Common or very common** Anorexia · asthenia · dizziness · myalgia · nausea · paraesthesia · rash · reduced testosterone concentrations · vomiting
  - **Uncommon** Diarrhoea · dyspepsia · seizures
  - **Frequency not known** Allergic reactions · angioedema · heart failure · hypotension
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate to severe impairment. Monitor closely in hepatic impairment especially when increasing dose.

### ● MONITORING REQUIREMENTS

- ▶ Measure serum-calcium concentration before initiation of treatment and within 1 week after starting treatment or adjusting dose, then monthly for secondary hyperparathyroidism, and every 2–3 months for primary hyperparathyroidism and parathyroid carcinoma.
- ▶ In secondary hyperparathyroidism measure parathyroid hormone concentration 1–4 weeks after starting treatment or adjusting dose, then every 1–3 months.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### NICE technology appraisals (TAs)

- ▶ Cinacalcet for the treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy (January 2007) NICE TA117 Cinacalcet is not recommended for the routine treatment of secondary hyperparathyroidism in patients with end-stage renal disease on maintenance dialysis therapy.

Cinacalcet is recommended for the treatment of refractory secondary hyperparathyroidism in patients with end-stage renal disease (including those with calciphylaxis) **only** in those:

- who have 'very uncontrolled' plasma concentration of intact parathyroid hormone (defined as greater than 85 picomol/litre) refractory to standard therapy, and a normal or high adjusted serum calcium concentration, **and**
- in whom surgical parathyroidectomy is contra-indicated, in that the risks of surgery outweigh the benefits.

Response to treatment should be monitored regularly and treatment should be continued only if a reduction in the plasma concentration of intact parathyroid hormone of 30% or greater is seen within 4 months of treatment.

## Calcium chloride

### INDICATIONS AND DOSE

#### Severe acute hypocalcaemia or hypocalcaemic tetany

► BY INTRAVENOUS INJECTION

► Adult: Dose according to requirements

- **CAUTIONS** Avoid in respiratory acidosis . avoid in respiratory failure
- **INTERACTIONS** → Appendix 1: calcium salts
- **DIRECTIONS FOR ADMINISTRATION** Care should be taken to avoid extravasation.
- **PRESCRIBING AND DISPENSING INFORMATION** Non-proprietary *Calcium chloride dihydrate* 7.35% (calcium 20 mg or  $\text{Ca}^{2+}$  500 micromol/mL); *Calcium chloride dihydrate* 10% (calcium 27.3 mg or  $\text{Ca}^{2+}$  680 micromol/mL); *Calcium chloride dihydrate* 14.7% (calcium 40.1 mg or  $\text{Ca}^{2+}$  1000 micromol/mL).

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

### Solution for injection

► **Calcium chloride (Non-proprietary)**

**Calcium chloride dihydrate 73.5 mg per 1 ml** Calcium chloride 7.35% solution for injection 10ml ampoules | 10 ampoule **£**66.38

**Calcium chloride dihydrate 100 mg per 1 ml** Calcium chloride 10% solution for injection 10ml pre-filled syringes | 1 pre-filled disposable injection **£**9.42 DT price = £9.42

**Calcium chloride dihydrate 147 mg per 1 ml** Calcium chloride 14.7% solution for injection 5ml ampoules | 10 ampoule **£**99.98  
Calcium chloride 14.7% solution for injection 10ml ampoules | 10 ampoule **£**67.29-£68.93 DT price = £67.29

958

## Calcium gluconate

### INDICATIONS AND DOSE

#### Severe acute hypocalcaemia or hypocalcaemic tetany

► INITIALLY BY SLOW INTRAVENOUS INJECTION

► Adult: Initially 10–20 mL, calcium gluconate injection 10% (providing approximately 2.25–4.5 mmol of calcium) should be administered with plasma-calcium and ECG monitoring, and either repeated as required or, if only temporary improvement, followed by a continuous intravenous infusion to prevent recurrence, alternatively (by continuous intravenous infusion), initially 50 mL/hour, adjusted according to response, infusion to be administered using 100 mL of calcium gluconate 10% diluted in 1 litre of glucose 5% or sodium chloride 0.9%

#### Acute severe hyperkalaemia (plasma-potassium concentration above 6.5 mmol/litre or in the presence of ECG changes)

► BY SLOW INTRAVENOUS INJECTION

► Adult: 10–20 mL, calcium gluconate 10% should be administered, dose titrated and adjusted to ECG improvement

## Calcium deficiency | Mild asymptomatic hypocalcaemia

► BY MOUTH

► Adult: Dose according to requirements

### DOSE EQUIVALENCE AND CONVERSION

► 0.11 mmol/kg is equivalent to 0.5 mL/kg of calcium gluconate 10%.

## IMPORTANT SAFETY INFORMATION

The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended.

● **INTERACTIONS** → Appendix 1: calcium salts

### MONITORING REQUIREMENTS

► With intravenous use Plasma-calcium and ECG monitoring required for administration by slow intravenous injection (risk of arrhythmias if given too rapidly).

### DIRECTIONS FOR ADMINISTRATION

► With intravenous use For continuous intravenous infusion, dilute 100 mL of calcium gluconate 10% in 1 litre of glucose 5% or sodium chloride 0.9% and give at an initial rate of 50 mL/hour adjusted according to response. Avoid bicarbonates, phosphates, or sulfates.

● **PRESCRIBING AND DISPENSING INFORMATION** Calcium gluconate 1 g contains calcium 89 mg or  $\text{Ca}^{2+}$  2.23 mmol.

## MEDICINAL FORMS

No licensed medicines listed.

## 1.2 Low blood volume

### BLOOD AND RELATED PRODUCTS > PLASMA PRODUCTS

#### Albumin solution

(Human Albumin Solution)

##### INDICATIONS AND DOSE

**Acute or sub-acute loss of plasma volume e.g. in burns, pancreatitis, trauma, and complications of surgery (with isotonic solutions) | Plasma exchange (with isotonic solutions) | Severe hypalbuminaemia associated with low plasma volume and generalised oedema where salt and water restriction with plasma volume expansion are required (with concentrated solutions 20%) | Paracentesis of large volume ascites associated with portal hypertension (with concentrated solutions 20%)**

► BY INTRAVENOUS INFUSION

► Adult: (consult product literature)

- **CONTRA-INDICATIONS** Cardiac failure · severe anaemia

- **CAUTIONS** Correct dehydration when administering concentrated solution · history of cardiac disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · history of circulatory disease (administer slowly to avoid rapid rise in blood pressure and cardiac failure, and monitor cardiovascular and respiratory function) · increased capillary permeability

- **SIDE-EFFECTS** Anaphylaxis · chills · fever · hypersensitivity reactions · hypotension · increased salivation · nausea · tachycardia · vomiting

- **MONITORING REQUIREMENTS** Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

- **PRESCRIBING AND DISPENSING INFORMATION** A solution containing protein derived from plasma, serum, or normal placentas; at least 95% of the protein is albumin. The solution may be isotonic (containing 3.5–5% protein) or concentrated (containing 15–25% protein).

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Albumin solution human 45 mg per 1 ml** Zenalb 4.5% solution for infusion 250ml bottles | 1 bottle [PoM] £27.51  
Zenalb 4.5% solution for infusion 500ml bottles | 1 bottle [PoM] £55.02

**Albumin solution human 200 mg per 1 ml** Zenalb 20% solution for infusion 100ml bottles | 1 bottle [PoM] £54.00  
Zenalb 20% solution for infusion 50ml bottles | 1 bottle [PoM] £27.00

### PLASMA SUBSTITUTES

#### Dextran 70 with sodium chloride

##### INDICATIONS AND DOSE

**Initial treatment of hypovolaemia with hypotension induced by traumatic injury**

► BY INTRAVENOUS INFUSION

► Adult: 250 mL, to be given over 2–5 minutes using *RescueFlow*®, followed immediately by administration of isotonic fluids.

- **CAUTIONS** Cardiac disease · hyperosmolality · severe hypoglycaemia · severe liver disease

##### SIDE-EFFECTS

- **Rare** Severe anaphylactic reactions
- **Frequency not known** Hypersensitivity reactions · transient increase in bleeding time

- **PREGNANCY** Avoid—reports of anaphylaxis in mother causing fetal anoxia, neurological damage and death.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution.

##### MONITORING REQUIREMENTS

- Where possible, monitor central venous pressure.
- Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
- Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

- **EFFECT ON LABORATORY TESTS** Can interfere with some laboratory tests—dextran may interfere with blood group cross-matching or biochemical measurements, and these should be carried out before infusion is begun.

- **PRESCRIBING AND DISPENSING INFORMATION** Dextran 70 is dextran with an average molecular weight of about '70 000'.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

- ▶ **RescueFlow** (Pharmacosmos UK Ltd)

**Dextran 70 60 mg per 1 mL, Sodium chloride 75 mg per 1 mL** RescueFlow 6% infusion 250mL bags | 1 bag [PoM] no price available (Hospital only)

**Gelatin****INDICATIONS AND DOSE**

**Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Adult: Initially 500–1000 mL, use 3.5–4% solution

- **CAUTIONS** Cardiac disease · severe liver disease

**SIDE-EFFECTS**

- ▶ **Rare** Severe anaphylactic reactions
- ▶ **Frequency not known** Hypersensitivity reactions · transient increase in bleeding time

- **PREGNANCY** Manufacturer of *Geloplasma*® advises avoid at the end of pregnancy.

- **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

- **RENAL IMPAIRMENT** Use with caution in renal impairment.

**MONITORING REQUIREMENTS**

- ▶ Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
- ▶ Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

- **PRESCRIBING AND DISPENSING INFORMATION** The gelatin is partially degraded.

*Gelaspan*® contains succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g, Na<sup>+</sup> 151 mmol, K<sup>+</sup> 4 mmol, Mg<sup>2+</sup> 1 mmol, Cl<sup>-</sup> 103 mmol, Ca<sup>2+</sup> 1 mmol, acetate 24 mmol/litre; *Gelofusine*® contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na<sup>+</sup> 154 mmol, Cl<sup>-</sup> 124 mmol/litre; *Geloplasma*® contains partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na<sup>+</sup> 150 mmol, K<sup>+</sup> 5 mmol, Mg<sup>2+</sup> 1.5 mmol, Cl<sup>-</sup> 100 mmol, lactate 30 mmol/litre; *Isoplex*® contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na<sup>+</sup> 145 mmol, K<sup>+</sup> 4 mmol, Mg<sup>2+</sup> 0.9 mmol, Cl<sup>-</sup> 105 mmol, lactate 25 mmol/litre; *Volplex*® contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na<sup>+</sup> 154 mmol, Cl<sup>-</sup> 125 mmol/litre.

**MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

**Infusion**

- ▶ **Gelaspan** (B.Braun Medical Ltd)

**Gelatin 40 mg per 1 mL** Gelaspan 4% infusion 500mL Ecobags | 1 bag [PoM] £5.78 (Hospital only)

- ▶ **Gelofusine** (B.Braun Medical Ltd)

**Gelatin 40 mg per 1 mL** Gelofusine 4% infusion 1litre Ecobags | 1 bag [PoM] £4.65 | 10 bag [PoM] no price available  
Gelofusine 4% infusion 500mL Ecobags | 1 bag [PoM] £4.83

- ▶ **Geloplasma** (Fresenius Kabi Ltd)

**Gelatin 30 mg per 1 mL** Geloplasma 3% infusion 500mL Freeflex bags | 20 bag [PoM] no price available

**Gelatin 40 mg per 1 mL** Isoplex 4% infusion 500mL bags | 10 bag [PoM] £75.30 (Hospital only)

- ▶ **Volplex** (Beacon Pharmaceuticals Ltd)

**Gelatin 40 mg per 1 mL** Volplex 4% infusion 500mL bags | 10 bag [PoM] £47.00 (Hospital only)  
Volplex 4% infusion 1litre bags | 6 bag [PoM] £54.54 (Hospital only)

**Tetrastarch****INDICATIONS AND DOSE****VOLULYTE® INFUSION**

**Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient**

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 10–20 mL, then increased to up to 30 mL/kilogram daily for a maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

**VOLUVEN® INFUSION**

**Treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient**

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 10–20 mL, then increased to up to 30 mL/kilogram daily for maximum duration of treatment of 24 hours, the initial dose must be given slowly and with careful monitoring of the patient to allow any anaphylactic reaction to be detected as early as possible

- **CONTRA-INDICATIONS** Burns · cerebral haemorrhage · critically ill patients · dehydration · hyperhydration · intracranial haemorrhage · pulmonary oedema · sepsis · severe coagulopathy

- **CAUTIONS** Cardiac disease · care should be taken to avoid haematocrit concentration from falling below 25–30% · children · renal impairment · severe liver disease · surgery · trauma

**SIDE-EFFECTS**

- ▶ **Rare** Severe anaphylactic reactions
- ▶ **Frequency not known** Hypersensitivity reactions · pruritus · raised serum amylase · transient increase in bleeding time

- **HEPATIC IMPAIRMENT** Avoid in severe impairment.

- **RENAL IMPAIRMENT** Avoid.

**MONITORING REQUIREMENTS**

- ▶ Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times. Treatment with hydroxyethyl starches should be guided by continuous haemodynamic monitoring so that the infusion is stopped as soon as appropriate haemodynamic goals have been achieved.

- ▶ Monitor renal function.
- ▶ Monitor for hypersensitivity reactions.
- ▶ Urine output should be monitored.

**PRESCRIBING AND DISPENSING INFORMATION**

Hydroxyethyl starch is composed of more than 90% of amylopectin that has been etherified with hydroxyethyl groups; the term tetrastarch reflects the degree of etherification. Hydroxyethyl starches should only be used for the treatment of hypovolaemia due to acute blood loss when crystalloids alone are not sufficient; they should be used at the lowest effective dose for the first 24 hours of fluid resuscitation.

*Volulyte*® contains hydroxyethyl starch 6% (average molecular weight 130 000) in sodium chloride intravenous

infusion 0.6%, containing Na<sup>+</sup> 137 mmol, K<sup>+</sup> 4 mmol, Mg<sup>2+</sup> 1.5 mmol, Cl<sup>-</sup> 110 mmol, acetate 34 mmol/litre.

## 1.3 Magnesium imbalance

### Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant *hypermagnesaemia* (causing muscle weakness and arrhythmias) is rare.

#### *Hypomagnesaemia*

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of *hypomagnesaemia*; deficiency may also occur in alcoholism or as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia, and also hypokalaemia and hyponatraemia.

Symptomatic *hypomagnesaemia* is associated with a deficit of 0.5–1 mmol/kg; up to 160 mmol Mg<sup>2+</sup> over up to 5 days may be required to replace the deficit (allowing for urinary losses). Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth, but there is limited evidence of benefit. Magnesium aspartate powder for oral solution below is available as a licensed preparation and, magnesium glycerophosphate tablets p. 963 and liquid [unlicensed] are available from 'special-order' manufacturers or specialist importing companies.

#### *Arrhythmias*

Magnesium sulfate injection has also been recommended for the emergency treatment of *serious arrhythmias*, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de pointes*.

#### *Myocardial infarction*

Limited evidence that magnesium sulfate prevents arrhythmias and reperfusion injury in patients with suspected myocardial infarction has not been confirmed by large studies. Routine use of magnesium sulfate for this purpose is not recommended.

#### *Eclampsia and pre-eclampsia*

Magnesium sulfate injection is the drug of choice for the treatment of seizures and the prevention of recurrent seizures in women with *eclampsia*. Regimens may vary between hospitals. Calcium gluconate injection is used for the management of magnesium toxicity.

Magnesium sulfate injection is also of benefit in women with *pre-eclampsia* in whom there is concern about developing eclampsia. The patient should be monitored carefully.

## 1.3a Hypomagnesaemia

### ELECTROLYTES AND MINERALS > MAGNESIUM

#### Magnesium aspartate

##### • INDICATIONS AND DOSE

##### Treatment and prevention of magnesium deficiency

##### ► BY MOUTH

- Adult: 10–20 mmol daily, taken as 1–2 sachets of *Magnaspartate*® powder.

##### • CONTRA-INDICATIONS Disorders of cardiac conduction

##### • INTERACTIONS → Appendix 1: magnesium

##### • SIDE-EFFECTS

##### ► Uncommon Diarrhoea

##### ► Rare Hypermagnesaemia

- Frequency not known Dental caries (on long term use) - gastrointestinal irritation

##### SIDE-EFFECTS, FURTHER INFORMATION

Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

##### Overdose

Symptoms of hypermagnesaemia may include nausea, vomiting, flushing of the skin, thirst, hypotension due to peripheral vasodilatation, drowsiness, confusion, loss of tendon reflexes and respiratory depression due to neuromuscular blockade, slurred speech, double vision, muscle weakness, bradycardia, cardiac arrhythmias, coma, and cardiac arrest.

##### • RENAL IMPAIRMENT Avoid in severe impairment (eGFR less than 30 mL/minute/1.73<sup>2</sup>).

##### • DIRECTIONS FOR ADMINISTRATION Dissolve sachet contents in 50–200 mL water, tea or orange juice and take immediately.

##### • PRESCRIBING AND DISPENSING INFORMATION

*Magnaspartate*® contains magnesium aspartate 6.5 g (10 mmol Mg<sup>2+</sup>)/sachet.

##### • PATIENT AND CARER ADVICE Patients and carers should be given advice on how to administer magnesium aspartate powder.

##### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder

EXCIPIENTS: May contain Sucrose

##### ► Magnaspartate (KoRa Healthcare)

Magnesium (as Magnesium aspartate) 243 mg Magnaspartate 243mg (magnesium 10mmol) oral powder sachets | 10 sachet [PoM] £8.95

## Magnesium glycerophosphate

02-Jun-2016

### ● INDICATIONS AND DOSE

#### Prevent recurrence of magnesium deficit

- BY MOUTH
- Adult: 24 mmol daily in divided doses, dose expressed as  $Mg^{2+}$

#### DOSE EQUIVALENCE AND CONVERSION

- Magnesium glycerophosphate 1 g is approximately equivalent to  $Mg^{2+}$  4 mmol or magnesium 97 mg.

- **UNLICENSED USE** Not licensed for use.
- **INTERACTIONS** → Appendix 1: magnesium
- **SIDE-EFFECTS** Arrhythmias · colic · coma · confusion · diarrhoea · drowsiness · flushing of skin · hypermagnesaemia associated side-effects · hypotension · loss of tendon reflexes · muscle weakness · nausea · respiratory depression · thirst · vomiting
- **RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity.
- **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, capsule, oral suspension, oral solution, powder

#### Tablet

- **Magnesium glycerophosphate (Non-proprietary)**  
Magnesium (as Magnesium glycerophosphate) 97.2 mg  $Mg$ -4 (magnesium 97.2mg (4mmol)) tablets | 30 tablet £84.50

#### Oral solution

- **LiquaMag GP** (Fontus Health Ltd)  
Magnesium (as Magnesium glycerophosphate) 24.25 mg per 1 ml LiquaMag GP (magnesium 121.25mg/5ml (5mmol/5ml)) oral solution sugar-free | 200 ml £49.99 sugar-free | 250 ml £55.00

#### Chewable tablet

- **MagnaPhate** (Arjun Products Ltd)  
Magnesium (as Magnesium glycerophosphate) 97.2 mg MagnaPhate (magnesium 97.2mg (4mmol)) chewable tablets sugar-free | 50 tablet £22.64

#### Capsule

- **Magnesium glycerophosphate (Non-proprietary)**  
Magnesium (as Magnesium glycerophosphate) 48.6 mg  $Mg$ -4 (magnesium 48.6mg (2mmol)) capsules | 30 capsule £85.70  
MagnaPhos 48.6mg (2mmol) capsules | 50 capsule £35.87  
Magnesium (as Magnesium glycerophosphate) 97.2 mg  $Mg$ -4 (magnesium 97.2mg (4mmol)) capsules | 30 capsule £89.30  
MagnaPhos 97.2mg (4mmol) capsules | 50 capsule £37.87

## Magnesium sulfate

### ● INDICATIONS AND DOSE

#### Severe acute asthma | Continuing respiratory deterioration in anaphylaxis

- BY INTRAVENOUS INFUSION
- Child 2–17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes
- Adult: 1.2–2 g, to be given over 20 minutes

#### Prevention of seizures in pre-eclampsia

- INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours, if seizure occurs, additional dose of 2 g by intravenous injection to be administered

### Treatment of seizures and prevention of seizure recurrence in eclampsia

- INITIALLY BY INTRAVENOUS INJECTION
- Adult: Initially 4 g, to be given over 5–15 minutes, followed by (by intravenous infusion) 1 gram/hour for 24 hours after seizure or delivery (whichever is later), if seizure recurs, increase the infusion rate to 1.5–2 g/hour or give an additional dose of 2 g by intravenous injection

### Hypomagnesaemia

- BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- Adult: Up to 40 g, given over a period of up to 5 days, dose given depends on the amount required to replace the deficit (allowing for urinary losses)

### Hypomagnesaemia maintenance (e.g. in intravenous nutrition)

- BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- Adult: 2.5–5 g daily, usual dose 3 g daily

### Emergency treatment of serious arrhythmias

- BY INTRAVENOUS INJECTION
- Adult: 2 g, to be given over 10–15 minutes, dose may be repeated once if necessary

### Rapid bowel evacuation (acts in 2–4 hours)

- BY MOUTH
- Adult: 5–10 g, dose to be mixed in a glass of water, taken preferably before breakfast

### DOSE EQUIVALENCE AND CONVERSION

- Magnesium sulfate heptahydrate 1 g equivalent to  $Mg^{2+}$  approx. 4 mmol.

- **UNLICENSED USE** Unlicensed indication in severe acute asthma. Continuing respiratory deterioration in anaphylaxis.
- **CONTRA-INDICATIONS**
  - With oral use in rapid bowel evacuation—acute gastrointestinal conditions (in adults)
- **CAUTIONS**
  - With oral use in rapid bowel evacuation—elderly and debilitated patients (in adults)
- **INTERACTIONS** → Appendix 1: magnesium
- **SIDE-EFFECTS**  
**GENERAL SIDE-EFFECTS**  
Arrhythmias · coma · confusion · drowsiness · flushing of skin · hypermagnesaemia associated side-effects · hypotension · loss of tendon reflexes · muscle weakness · nausea · respiratory depression · thirst · vomiting  
**SPECIFIC SIDE-EFFECTS**
  - With oral use Colic · diarrhoea
- **PREGNANCY**
  - When used for Hypomagnesaemia or Arrhythmias or Prevention of seizures in pre-eclampsia or Treatment of seizures and prevention of seizure recurrence in eclampsia or Severe acute asthma or Continuing respiratory deterioration in anaphylaxis. Not known to be harmful for short-term intravenous administration in eclampsia, but excessive doses in third trimester cause neonatal respiratory depression.
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
- **RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity.
- **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).
- **DIRECTIONS FOR ADMINISTRATION**
  - With intravenous use In severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump). For intravenous injection, in

arrhythmias, hypomagnesaemia, eclampsia, and pre-eclampsia, give continuously in Glucose 5% or Sodium chloride 0.9%. Concentration of magnesium sulfate heptahydrate should not exceed 20% (200 mg/mL or 0.8 mmol/mL  $\text{Mg}^{2+}$ ); dilute 1 part of magnesium sulfate injection 50% with at least 1.5 parts of water for injections. Max. rate 150 mg/minute (0.6 mmol/minute  $\text{Mg}^{2+}$ ).

#### ● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intramuscular use or intravenous use The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions ( $\text{Mg}^{2+}$ ) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

#### ● EXCEPTIONS TO LEGAL CATEGORY

- ▶ With oral use in adults Magnesium sulfate is on sale to the public as Epsom Salts.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, solution for injection, infusion, solution for infusion

#### Solution for injection

##### ▶ Magnesium sulfate (Non-proprietary)

**Magnesium sulfate heptahydrate 500 mg per 1 ml** Magnesium sulfate 50% (magnesium 2mmol/ml) solution for injection 10ml ampoules | 10 ampoule [PoM] £11.85-£35.25  
**Magnesium sulfate 50%** (magnesium 2mmol/ml) solution for injection 20ml vials | 10 vial [PoM] £46.40  
**Magnesium sulfate 50%** (magnesium 2mmol/ml) solution for injection 5ml ampoules | 10 ampoule [PoM] £21.80-£61.26  
**Magnesium sulfate 50%** (magnesium 2mmol/ml) solution for injection 2ml ampoules | 10 ampoule [PoM] £11.72-£17.90 DT price = £11.85

#### Solution for infusion

##### ▶ Magnesium sulfate (Non-proprietary)

**Magnesium sulfate heptahydrate 100 mg per 1 ml** Magnesium sulfate 10% (magnesium 0.4mmol/ml) solution for injection 10ml ampoules | 10 ampoule [PoM] £59.98-£60.50  
**Magnesium sulfate heptahydrate 500 mg per 1 ml** Magnesium sulfate 50% (magnesium 2mmol/ml) solution for infusion 50ml vials | 10 vial [PoM] £63.70

#### Powder

##### ▶ Magnesium sulfate (Non-proprietary)

**Magnesium sulfate dried 1 mg per 1 mg** Numark Epsom Salts | 200 gram [GSL] £1.00  
**Magnesium sulfate powder** | 300 gram [GSL] £1.91-£2.09 | 500 gram [GSL] £3.20 DT price = £3.20 | 2000 gram [GSL] £5.60 | 5000 gram [GSL] £11.49  
 ▶ Brands may include Epsom salts

Sevelamer p. 966 is licensed for the treatment of hyperphosphataemia in patients on haemodialysis or peritoneal dialysis. Sevelamer carbonate is also licensed for the treatment of patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more.

Lanthanum p. 965 is licensed for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD), and in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet.

Sucroferric oxyhydroxide p. 966 is licensed for the control of hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis. It is used as part of a multiple therapeutic approach to control the development of renal bone disease; this could include the concomitant use of a calcium supplement, a vitamin D analogue or calcimimetics.

## 1.4a Hyperphosphataemia

### ELECTROLYTES AND MINERALS > ALUMINIUM

## Aluminium hydroxide

#### ● INDICATIONS AND DOSE

##### Hyperphosphataemia in renal failure

###### ▶ BY MOUTH USING CAPSULES

- ▶ Adult: 4–20 capsules daily in divided doses, to be taken with meals

##### Antacid

###### ▶ BY MOUTH USING CAPSULES

- ▶ Adult: 475 mg 5 times a day, last dose to be taken at bedtime

#### ● CONTRA-INDICATIONS Hypophosphataemia

#### ● INTERACTIONS → Appendix 1: antacids

#### ● SIDE-EFFECTS Constipation · hyperalbuminaemia

#### ● HEPATIC IMPAIRMENT Avoid; can cause constipation which can precipitate coma.

#### ● RENAL IMPAIRMENT There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Capsule

###### ▶ Alu-Cap (Meda Pharmaceuticals Ltd)

**Aluminium hydroxide 475 mg** Alu-Cap 475mg capsules | 120 capsule [P] £13.71 DT price = £13.71

### ELECTROLYTES AND MINERALS >

#### CALCIUM

## Calcium acetate

#### ● INDICATIONS AND DOSE

##### PHOSEX<sup>®</sup> TABLETS

##### Hyperphosphataemia

###### ▶ BY MOUTH

- ▶ Adult: Initially 1 tablet 3 times a day, to be taken with meals, dose to be adjusted according to serum-phosphate concentration, usual dose 4–6 tablets

## 1.4 Phosphate imbalance

## Phosphorus

### Phosphate supplements

Oral phosphate supplements p. 967 may be required in addition to vitamin D in a small minority of patients with hypophosphataemic vitamin D-resistant rickets.

Phosphate infusion is occasionally needed in alcohol dependence or in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis.

For phosphate requirements in total parenteral nutrition regimens, see Intravenous nutrition p. 979.

### Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate binding agents and can cause aluminium accumulation.

daily in divided doses, (1 or 2 tablets with each meal); maximum 12 tablets per day

### RENACET® TABLETS

#### Hyperphosphataemia

##### ► BY MOUTH

- Adult: 475–950 mg, to be taken with breakfast and with snacks, 0.95–2.85 g, to be taken with main meals and 0.95–1.9 g, to be taken with supper, dose to be adjusted according to serum-phosphate concentration; maximum 6.65 g per day

- **INTERACTIONS** → Appendix 1: calcium salts

#### ● DIRECTIONS FOR ADMINISTRATION

**PHOSEX® TABLETS** Phosex® tablets are taken with meals. Tablets can be broken to aid swallowing, but not chewed (bitter taste).

**RENACET® TABLETS** Manufacturer advises that other drugs should be taken 1 to 2 hours before or after Renacet® to reduce the possible interference with absorption of other drugs. Renacet® tablets are taken with meals.

- **PRESCRIBING AND DISPENSING INFORMATION** PhosLo® capsules contain calcium acetate (anhydrous) 667 mg (equivalent to calcium 169 mg or  $\text{Ca}^{2+}$  4.2 mmol); Renacet® tablets contain calcium acetate 475 mg (equivalent to calcium 120.25 mg or  $\text{Ca}^{2+}$  3 mmol); Phosex® tablets contain calcium acetate 1 g (equivalent to calcium 250 mg or  $\text{Ca}^{2+}$  6.2 mmol).

#### ● PATIENT AND CARER ADVICE

**PHOSEX® TABLETS** Patients or carers should be given advice on how to administer Phosex® tablets.

**RENACET® TABLETS** Patients or carers should be given advice on how to administer Renacet® tablets.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

## Lanthanum

#### ● INDICATIONS AND DOSE

**Hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis (CAPD) | Hyperphosphataemia in patients with chronic kidney disease not on dialysis who have a serum-phosphate concentration of 1.78 mmol/litre or more that cannot be controlled by a low-phosphate diet**

##### ► BY MOUTH

- Adult: 1.5–3 g daily in divided doses, dose to be adjusted according to serum-phosphate concentration every 2–3 weeks, to be taken with or immediately after meals

- **CAUTIONS** Acute peptic ulcer · bowel obstruction · Crohn's disease · ulcerative colitis

- **INTERACTIONS** → Appendix 1: lanthanum

#### ● SIDE-EFFECTS

- **Common or very common** Gastro-intestinal disturbances · headache · hypocalcaemia
- **Uncommon** Alopecia · anorexia · arthralgia · asthenia · chest pain · dizziness · dry mouth · eosinophilia · hypercalcaemia · hyperglycaemia · hyperparathyroidism · hypophosphataemia · increased appetite · malaise · myalgia · osteoporosis · peripheral oedema · stomatitis · sweating · taste disturbances · thirst · vertigo
- **Frequency not known** Accumulation of lanthanum in bone · transient changes in QT interval

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **BREAST FEEDING** Manufacturer advises caution—no information available.

- **HEPATIC IMPAIRMENT** Lanthanum excreted in bile—possible accumulation in obstructive jaundice.

- **DIRECTIONS FOR ADMINISTRATION** Tablets are to be chewed. Each sachet of powder to be mixed with soft food and consumed within 15 minutes.

- **PATIENT AND CARER ADVICE** Patient and carers should be given advice on how to administer lanthanum tablets and powder.

#### ● NATIONAL FUNDING/ACCESS DECISIONS

##### Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2007) that lanthanum (*Fosrenol*®) is accepted for restricted use within NHS Scotland for the control of hyperphosphataemia in patients with chronic renal failure on haemodialysis or continuous ambulatory peritoneal dialysis, as a second-line agent, where a non-aluminium, non-calcium phosphate binder is required.

## PHOSPHATE BINDERS

### Calcium acetate with magnesium carbonate

The properties listed below are those particular to the combination only. For the properties of the components please consider, calcium acetate p. 964, magnesium carbonate p. 69.

#### ● INDICATIONS AND DOSE

##### Hyperphosphataemia

##### ► BY MOUTH

- Adult: Initially 1 tablet 3 times a day, adjusted according to serum-phosphate concentration, to be taken with food; usual dose 3–10 tablets daily; maximum 12 tablets per day

- **CONTRA-INDICATIONS** Hypercalcaemia · hypermagnesaemia · myasthenia gravis · third-degree AV block

- **INTERACTIONS** → Appendix 1: antacids, calcium salts

## Sucroferric oxyhydroxide

16-Feb-2016

### INDICATIONS AND DOSE

**Hyperphosphataemia in patients with chronic kidney disease on haemodialysis or peritoneal dialysis**

► BY MOUTH

► Adult: Initially 1.5 g daily in 3 divided doses, dose to be taken with meals, then adjusted in steps of 500 mg every 2–4 weeks, dose adjusted according to serum-phosphate concentration; maintenance 1.5–2 g daily in divided doses; maximum 3 g per day

● **CONTRA-INDICATIONS** Haemochromatosis · iron accumulation disorders

● **CAUTIONS** Gastric disorders · hepatic disorders · major gastrointestinal surgery · peritonitis in the last 3 months

#### SIDE-EFFECTS

► **Common or very common** Abdominal pain · constipation · diarrhoea · discoloured faeces · dyspepsia · flatulence · nausea · taste disturbance · tooth discolouration · vomiting

► **Uncommon** Abdominal discomfort · abdominal distension · dysphagia · dyspnoea · fatigue · gastritis · gastro-oesophageal reflux disease · headache · hypercalcaemia · hypocalcaemia · rash · tongue discolouration

#### SIDE-EFFECTS, FURTHER INFORMATION

► Discoloured faeces Discoloured faeces may mask the visual signs of gastrointestinal bleeding.

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **DIRECTIONS FOR ADMINISTRATION** *Velphoro*® tablets must be chewed or crushed, not swallowed whole.

● **PATIENT AND CARER ADVICE** Patients or carers should be counselled on administration of sucroferric oxyhydroxide tablets and advised that this medication can cause discoloured black stools.

## MEDICINAL FORMS

### Chewable tablet

- ▶ **Velphoro** (Vifor Fresenius Medical Care Renal Pharma UK Ltd) ▼  
Iron (as Sucroferric oxyhydroxide) 500 mg Velphoro 500mg chewable tablets | 90 tablet [PoM] £179.00

## 1.4b Hypophosphataemia

### ELECTROLYTES AND MINERALS > PHOSPHATES

## Phosphate

### INDICATIONS AND DOSE

#### Treatment of moderate to severe hypophosphataemia

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: (consult product literature)

#### For established hypophosphataemia (with monobasic potassium phosphate)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Adult: 9 mmol every 12 hours, increased if necessary up to 0.5 mmol/kg (max. per dose 50 mmol), dose only increased in critically ill patients; dose in critically ill patients is approximately equivalent to 30 mmol in adults, dose to be infused over 6–12 hours, according to severity

#### Vitamin D-resistant hypophosphataemic osteomalacia

- ▶ BY MOUTH USING EFFERVESCENT TABLETS

- ▶ Adult: 4–6 tablets daily, using *Phosphate Sandoz*®.

### SIDE-EFFECTS

- ▶ Common or very common Diarrhoea
- ▶ Frequency not known Acute renal failure · hypocalcaemia · hypotension · metastatic calcification · nausea · oedema · phlebitis · tissue necrosis on extravasation

### SIDE-EFFECTS, FURTHER INFORMATION

Diarrhoea is a common side-effect and should prompt a reduction in dosage.

- **RENAL IMPAIRMENT** Reduce dose. Monitor closely in renal impairment.

- **MONITORING REQUIREMENTS** It is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.

- **PRESCRIBING AND DISPENSING INFORMATION** *Phosphate Sandoz*® contains sodium dihydrogen phosphate anhydrous (anhydrous sodium acid phosphate) 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na<sup>+</sup> 20.4 mmol), potassium 123 mg (K<sup>+</sup> 3.1 mmol); *Polyfusor NA*® contains Na<sup>+</sup> 162 mmol/litre, K<sup>+</sup> 19 mmol/litre, PO<sub>4</sub><sup>3-</sup> 100 mmol/litre; non-proprietary *potassium dihydrogen phosphate injection* (potassium acid phosphate) 13.6% may contain 1 mmol/mL phosphate, 1 mmol/mL potassium.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

#### Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13

- ▶ **Phosphate Sandoz** (HK Pharma Ltd)

Sodium dihydrogen phosphate anhydrous 1.936 gram Phosphate Sandoz effervescent tablets | 100 tablet [P] £16.43

#### Solution for infusion

- ▶ **Phosphate (Non-proprietary)**

Potassium dihydrogen phosphate 136 mg per 1 ml Potassium dihydrogen phosphate 13.6% (potassium 10mmol/10ml) solution for

infusion 10ml ampoules | 10 ampoule [PoM] £80.25–£85.00 DT price = £84.63

### Infusion

- ▶ **Phosphate (Non-proprietary)**

Potassium dihydrogen phosphate 1.295 gram per 1 litre, Disodium hydrogen phosphate anhydrous 5.75 gram per 1 litre Polyfusor NA phosphates infusion 500ml bottles | 1 bottle [PoM] £5.15

## 1.5 Potassium imbalance

### 1.5a Hyperkalaemia

**Other drugs used for Hyperkalaemia** Calcium gluconate, p. 959 · Insulin, p. 673

### ANTIDOTES AND CHELATORS > CATION EXCHANGE RESINS

## Calcium polystyrene sulfonate

### INDICATIONS AND DOSE

#### Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

- ▶ BY MOUTH

- ▶ Adult: 15 g 3–4 times a day

- ▶ BY RECTUM

- ▶ Adult: 30 g, retained for 9 hours followed by irrigation to remove resin from colon

#### SORBISTERIT® POWDER

#### Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

- ▶ BY MOUTH

- ▶ Adult: 20 g 1–3 times a day

- ▶ BY RECTUM

- ▶ Adult: 40 g 1–3 times a day, retained for 6 hours followed by irrigation to remove resin from colon

- **CONTRA-INDICATIONS** Hyperparathyroidism · metastatic carcinoma · multiple myeloma · obstructive bowel disease · sarcoidosis

- **INTERACTIONS** → Appendix 1: polystyrene sulfonate

- **SIDE-EFFECTS**

#### GENERAL SIDE-EFFECTS

Anorexia · constipation (discontinue treatment—avoid magnesium-containing laxatives) · diarrhoea · gastric irritation · gastro-intestinal obstruction · hypercalcaemia (including in dialysed patients and occasionally in those with renal impairment) · hypomagnesaemia · intestinal necrosis (reported with concomitant sorbitol) · ischaemic colitis · nausea · necrosis · ulceration · vomiting

#### SPECIFIC SIDE-EFFECTS

- ▶ With oral use Gastro-intestinal concretions
- ▶ With rectal use Faecal impaction

- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.

- **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

- **DIRECTIONS FOR ADMINISTRATION**

- ▶ With rectal use Mix each 30 g of resin with 150 mL of water or 10% glucose.

**SORBISTERIT® POWDER** By mouth, administer in a small amount of water or soft drink—do not give with fruit juice or squash, which have a high potassium content. By rectum, mix each 40 g of resin with 150 mL of 5% glucose.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema

#### Powder

CAUTIONARY AND ADVISORY LABELS 13, 21 (Sorbisterit<sup>®</sup> powder only)

EXCIPIENTS: May contain Sucrose

► **Calcium Resonium** (Sanofi)

**Calcium polystyrene sulfonate 999.34 mg per 1 gram** Calcium Resonium powder sugar-free | 300 gram  £82.16

## Sodium polystyrene sulfonate

### INDICATIONS AND DOSE

**Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients**

► BY MOUTH

► Adult: 15 g 3–4 times a day

► BY RECTUM

► Adult: 30 g, retain for 9 hours followed by irrigation to remove resin from colon

• **CONTRA-INDICATIONS** Obstructive bowel disease

• **CAUTIONS** Congestive heart failure · hypertension · oedema

• **INTERACTIONS** → Appendix 1: polystyrene sulfonate

### SIDE-EFFECTS

#### GENERAL SIDE-EFFECTS

Anorexia · constipation (discontinue treatment—avoid magnesium-containing laxatives) · diarrhoea · gastric irritation · gastro-intestinal obstruction · hypocalcaemia · hypomagnesaemia · intestinal necrosis (reported with concomitant use of sorbitol) · ischaemic colitis · nausea · necrosis · sodium retention · ulceration · vomiting

#### SPECIFIC SIDE-EFFECTS

► With oral use Gastro-intestinal concretions

► With rectal use Faecal impaction

• **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.

• **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.

• **RENAL IMPAIRMENT** Use with caution.

• **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).

### DIRECTIONS FOR ADMINISTRATION

► With rectal use Mix each 30 g of resin with 150 mL of water or 10% glucose.

► With oral use Administer dose (powder) in a small amount of water or honey—do not give with fruit juice or squash, which have a high potassium content.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

#### Powder

CAUTIONARY AND ADVISORY LABELS 13

► **Resonium A** (Sanofi)

**Sodium polystyrene sulfonate 999.34 mg per 1 gram** Resonium A powder sugar-free | 454 gram  £81.11

## 1.5b Hypokalaemia

### ELECTROLYTES AND MINERALS > POTASSIUM

## Potassium bicarbonate with potassium acid tartrate

### INDICATIONS AND DOSE

**Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastrointestinal disorders)**

► BY MOUTH

► Adult: (consult product literature)

• **CONTRA-INDICATIONS** Hypochloraemia · plasma-potassium concentration above 5 mmol/litre

• **CAUTIONS** Cardiac disease · elderly

• **SIDE-EFFECTS** Abdominal pain · diarrhoea · flatulence · nausea · vomiting

• **RENAL IMPAIRMENT** Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

• **DIRECTIONS FOR ADMINISTRATION** To be dissolved in water before administration.

• **PRESCRIBING AND DISPENSING INFORMATION** These tablets do not contain chloride.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

► **Potassium bicarbonate with potassium acid tartrate (Non-proprietary)**

**Potassium acid tartrate 300 mg, Potassium bicarbonate 500 mg** Potassium (potassium 6.5mmol) effervescent tablets BPC 1968 | 56 tablet  £77.77-£99.15 DT price = £92.02

## Potassium chloride

### INDICATIONS AND DOSE

**Prevention of hypokalaemia (patients with normal diet)**

► BY MOUTH

► Adult: 2–4 g daily in divided doses

#### Electrolyte imbalance

► BY INTRAVENOUS INFUSION

► Adult: Dose dependent on deficit or the daily maintenance requirements

### IMPORTANT SAFETY INFORMATION

#### SAFE PRACTICE

Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium chloride concentrate should be followed.

• **CONTRA-INDICATIONS** Plasma-potassium concentration above 5 mmol/litre

### CAUTIONS

► With intravenous use seek specialist advice in very severe potassium depletion or difficult cases

► With oral use Cardiac disease · elderly · hiatus hernia (*with modified-release preparations*) · history of peptic ulcer (*with modified-release preparations*) · intestinal stricture (*with modified-release preparations*)

- **INTERACTIONS** → Appendix 1: potassium chloride
- **SIDE-EFFECTS**
  - ▶ **Common or very common**
    - ▶ With oral use Abdominal pain · diarrhoea · flatulence · nausea · vomiting
  - ▶ **Frequency not known**
    - ▶ With intravenous use Heart toxicity (with rapid infusion)
  - ▶ With oral use Bleeding (*with modified-release preparations*) · gastro-intestinal obstruction (*with modified-release preparations*) · ulceration (*with modified-release preparations*)
- **RENAL IMPAIRMENT** Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia. Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **MONITORING REQUIREMENTS**
  - ▶ Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.
  - ▶ With intravenous use ECG monitoring should be performed in difficult cases.
- **DIRECTIONS FOR ADMINISTRATION**
  - ▶ With oral use Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to *hyperchloraemic* states).
  - ▶ With intravenous use Potassium chloride concentrate must be diluted with **not less** than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and **mixed well**.  
Ready-mixed infusion solutions should be used where possible; alternatively, potassium chloride concentrate as ampoules containing 1.5 g (K<sup>+</sup> 20 mmol) in 10 mL, is **thoroughly mixed** with 500 mL of sodium chloride 0.9% intravenous infusion and given slowly over 2 to 3 hours with specialist advice and ECG monitoring in difficult cases. For *peripheral intravenous infusion*, the concentration of potassium should not usually exceed 40 mmol/L. Higher concentrations of potassium chloride may be given in very severe depletion, but require specialist advice.
- **PRESCRIBING AND DISPENSING INFORMATION** Kay-Cee-L<sup>®</sup> contains 1 mmol/mL each of K<sup>+</sup> and Cl<sup>-</sup>. Potassium Tablets  
Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer potassium chloride modified-release tablets.  
Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. *LoSalt<sup>®</sup>* and *Ruthmol<sup>®</sup>*). These should not be used by patients with renal failure as potassium intoxication may result.
- **LESS SUITABLE FOR PRESCRIBING** Modified-release tablets are less suitable for prescribing. Modified-release preparations should be avoided unless effervescent tablets or liquid preparations inappropriate.

## MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, oral solution, solution for injection, infusion, solution for infusion

### Solution for infusion

#### ▶ Potassium chloride (Non-proprietary)

**Potassium chloride 150 mg per 1 mL** Potassium chloride 15% (potassium 20mmol/10mL) solution for infusion 10mL ampoules | 10 ampoule [PoM] £6.50 | 20 ampoule [PoM] £6.50

**Potassium chloride 15% (potassium 20mmol/10mL) solution for infusion 10mL Mini-Plasco ampoules** | 20 ampoule [PoM] £10.70

**Potassium chloride 200 mg per 1 mL** Potassium chloride 20% (potassium 13.3mmol/5mL) solution for infusion 5mL ampoules | 10 ampoule [PoM] £3.84-£4.00

**Potassium chloride 20% (potassium 27mmol/10mL) solution for infusion 10mL ampoules** | 10 ampoule [PoM] £121.25

### Oral solution

CAUTIONARY AND ADVISORY LABELS 21

#### ▶ Kay-Cee-L (Geistlich Sons Ltd)

**Potassium chloride 75 mg per 1 mL** Kay-Cee-L syrup sugar-free | 500 mL [P] £7.95

## 2 Metabolic disorders

### 2.1 Acute porphyrias

#### Acute porphyrias

##### Overview

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate p. 971 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke's Hospital, and King's College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

#### Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered **safe** in acute porphyrias is available at

[www.mmc.wales.nhs.uk/specialist-services/drugs-in-porphyria/](http://www.mmc.wales.nhs.uk/specialist-services/drugs-in-porphyria/).

Further information may be obtained from:

[www.porphyria-europe.org](http://www.porphyria-europe.org) and also from:

Welsh Medicines Information Centre  
University Hospital of Wales  
CF14 4XW  
Cardiff  
(029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

### Unsafe Drug Groups (check first)

- Alkylating drugs (contact Welsh Medicines Information Centre for further advice)
- Anabolic steroids
- Antidepressants (includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe)
- Antihistamines (alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe)
- Barbiturates (includes primidone and thiopental)
- Calcium channel blockers (amlodipine, felodipine, and nifedipine thought to be safe)
- Contraceptives, hormonal (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should **never** be used in those at risk of acute porphyria.)
- Ergot derivatives (includes ergometrine (oxytocin probably safe) and pergolide)
- Hormone replacement therapy (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should **never** be used in those at risk of acute porphyria.)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact Welsh Medicines Information Centre for further advice)
- Progestogens (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in women who have had a previous attack or are aged under 30 years. Long-acting progestogen preparations should **never** be used in those at risk of acute porphyria.)
- Protease inhibitors (contact Welsh Medicines Information Centre for further advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonyleureas (glipizide and glimepiride are thought to be safe)
- Taxanes (contact Welsh Medicines Information Centre for further advice)
- Thiazolidinediones (contact Welsh Medicines Information Centre for further advice)

- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)

### Unsafe Drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant (contact Welsh Medicines Information Centre for further advice)
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Bromocriptine
- Buspirone
- Cabergoline
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clindamycin
- Cocaine
- Colistimethate sodium
- Danazol
- Dapsone
- Dexfenfluramine
- Disopyramide
- Disulfiram
- Erythromycin
- Etamsylate
- Ethosuximide
- Etomidate
- Fenfluramine
- Flupentixol
- Flutamide
- Fosaprepitant (contact Welsh Medicines Information Centre for further advice)
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Indapamide
- Isometheptene mucate
- Isoniazid (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Ketamine
- Mefenamic acid (may be used with caution if safer alternative not available)
- Meprobamate
- Methyl dopa
- Metolazone
- Metyrapone
- Mifepristone
- Minoxidil (may be used with caution if safer alternative not available)
- Mitotane
- Nalidixic acid
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxybutynin
- Pentazocine (buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphine, oxycodone, pethidine, and tramadol are thought to be safe)
- Pentoxifylline
- Phenoxybenzamine
- Phenytoin
- Pivmecillinam
- Porfimer
- Raloxifene

- Rifabutin (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Rifampicin
- Riluzole
- Risperidone
- Selegiline
- Spironolactone
- Sulfinpyrazone
- Tamoxifen
- Telithromycin
- Temoporfin
- Tiagabine
- Tibolone
- Tinidazole
- Topiramate
- Toremifene
- Trimethoprim
- Valproate
- Xipamide
- Zidovudine (contact Welsh Medicines Information Centre for further advice)
- Zuclopenthixol

## BLOOD AND RELATED PRODUCTS > HAEM DERIVATIVES

### Haem arginate

(Human hemin)

#### • INDICATIONS AND DOSE

**Acute porphyrias | Acute intermittent porphyria | Porphyria variegata | Hereditary coproporphyria**

▶ BY INTRAVENOUS INFUSION

- ▶ Adult: Initially 3 mg/kg once daily for 4 days, if response inadequate, repeat 4-day course with close biochemical monitoring; maximum 250 mg per day

#### • SIDE-EFFECTS

- ▶ **Common or very common** Pain at injection site · thrombophlebitis at injection site
- ▶ **Rare** Fever · hypersensitivity reactions
- ▶ **Frequency not known** Headache

• **PREGNANCY** Manufacturer advises avoid unless essential.

• **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

• **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Normosang<sup>®</sup>), give intermittently in Sodium chloride 0.9%; dilute requisite dose in 100 mL infusion fluid in glass bottle and give over at least 30 minutes through a filter *via* large antebachial or central vein; administer within 1 hour after dilution.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

▶ **Normosang** (Orphan Europe (UK) Ltd)

**Haem arginate 25 mg per 1 mL** Normosang 250mg/10ml solution for infusion ampoules | 4 ampoule [PoM] £1,737.00

## 2.2 Carnitine deficiency

### AMINO ACIDS AND DERIVATIVES

#### Levocarnitine

(Carnitine)

#### • INDICATIONS AND DOSE

**Primary carnitine deficiency due to inborn errors of metabolism**

▶ BY MOUTH

- ▶ Adult: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day

▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

**Secondary carnitine deficiency in haemodialysis patients**

▶ INITIALLY BY SLOW INTRAVENOUS INJECTION

- ▶ Adult: 20 mg/kg, to be administered over 2–3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course

• **CAUTIONS** Diabetes mellitus

• **SIDE-EFFECTS** Abdominal pain · body odour · diarrhoea · nausea · vomiting

#### SIDE-EFFECTS, FURTHER INFORMATION

Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.

• **PREGNANCY** Appropriate to use; no evidence of teratogenicity in *animal* studies.

• **RENAL IMPAIRMENT** Accumulation of metabolites may occur with chronic oral administration in severe impairment.

#### • MONITORING REQUIREMENTS

- ▶ Monitoring of free and acyl carnitine in blood and urine recommended.

#### • MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

##### Solution for injection

▶ **Carnitor** (Logixx Pharma Solutions Ltd)

**L-Carnitine 200 mg per 1 mL** Carnitor 1g/5ml solution for injection ampoules | 5 ampoule [PoM] £59.50

##### Oral solution

▶ **Levocarnitine (Non-proprietary)**

**L-Carnitine 300 mg per 1 mL** Levocarnitine 1.5g/5ml (30%) oral solution paediatric | 20 mL [PoM] £71.40 DT price = £71.40

▶ **Carnitor** (Logixx Pharma Solutions Ltd)

**L-Carnitine 100 mg per 1 mL** Carnitor oral single dose 1g solution sugar-free | 10 unit dose [PoM] £35.00

##### Chewable tablet

▶ **Carnitor** (Logixx Pharma Solutions Ltd)

**L-Carnitine 1 gram** Carnitor 1g chewable tablets | 10 tablet [PoM] £35.00

##### Capsule

▶ **Levocarnitine (Non-proprietary)**

**L-Carnitine 250 mg** Bio-Carnitine 250mg capsules | 125 capsule £11.06

**L-Carnitine 500 mg** Lamberts L-Carnitine 500mg capsules | 60 capsule £11.14

## 2.3 Fabry's disease

### ENZYMES

#### Agalsidase alfa

- **DRUG ACTION** Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

#### ● INDICATIONS AND DOSE

##### Fabry's disease (specialist use only)

- BY INTRAVENOUS INFUSION
- Adult: 200 micrograms/kg every 2 weeks

- **INTERACTIONS** → Appendix 1: agalsidase

#### ● SIDE-EFFECTS

- **Common or very common** Acne · angioedema · arthralgia · asthenia · bradycardia · chest pain · cough · dizziness · dyspnoea · eye irritation · fatigue · flushing · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypertension · hypotension · influenza-like symptoms · muscle spasms · myalgia · nasopharyngitis · neuropathic pain · oedema · palpitation · paraesthesia · pruritus · rash · rhinorrhoea · sleep disturbances · syncope · tachycardia · taste disturbances · tinnitus · tremor · urticaria
  - **Uncommon** Cold extremities · ear pain · ear swelling · injection-site reactions · parosmia · skin discoloration
- SIDE-EFFECTS, FURTHER INFORMATION**
- Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Administration for *intravenous infusion*, give intermittently in sodium chloride 0.9%; dilute requisite dose with 100 mL infusion fluid and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

#### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

- **Replagal** (Shire Pharmaceuticals Ltd)

Agalsidase alfa 1 mg per 1 mL Replagal 3.5mg/3.5mL solution for infusion vials | 1 vial [PoM](#) £1,068.64

#### Agalsidase beta

- **DRUG ACTION** Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

#### ● INDICATIONS AND DOSE

##### Fabry's disease (specialist use only)

- BY INTRAVENOUS INFUSION
- Adult: 1 mg/kg every 2 weeks

- **INTERACTIONS** → Appendix 1: agalsidase

#### ● SIDE-EFFECTS

- **Common or very common** Acne · angioedema · arthralgia · asthenia · bradycardia · chest pain · cough · dizziness ·

dyspnoea · eye irritation · fatigue · flushing · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypertension · hypotension · influenza-like symptoms · muscle spasms · myalgia · nasopharyngitis · neuropathic pain · oedema · palpitation · paraesthesia · pruritus · rash · rhinorrhoea · sleep disturbances · syncope · tachycardia · taste disturbances · tinnitus · tremor · urticaria

- **Uncommon** Cold extremities · ear pain · ear swelling · injection-site reactions · parosmia · skin discoloration

#### SIDE-EFFECTS, FURTHER INFORMATION

- Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution—no information available.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, given intermittently in Sodium chloride 0.9%, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

#### ● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Powder for solution for infusion

- **Fabrazyme** (Genzyme Therapeutics Ltd)

Agalsidase beta 5 mg Fabrazyme 5mg powder for solution for infusion vials | 1 vial [PoM](#) £315.08

Agalsidase beta 35 mg Fabrazyme 35mg powder for solution for infusion vials | 1 vial [PoM](#) £2,196.59

## 2.4 Gaucher's disease

Other drugs used for Gaucher's disease Miglustat, p. 976

### ENZYMES

#### Imiglucerase

- **DRUG ACTION** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

#### ● INDICATIONS AND DOSE

##### Non-neurological manifestations of type I Gaucher's disease (specialist use only) | Non-neurological manifestations of type III Gaucher's disease (specialist use only)

- BY INTRAVENOUS INFUSION

- Adult: Initially 60 units/kg every 2 weeks; maintenance, adjusted according to response, doses as low as 15 units/kg once every 2 weeks may improve haematological parameters and organomegaly

### ● SIDE-EFFECTS

- **Common or very common** Angioedema · backache · cyanosis · flushing · hypersensitivity reactions · hypotension · paraesthesia · tachycardia · urticaria
- **Uncommon** Abdominal cramps · arthralgia · diarrhoea · dizziness · fatigue · fever · headache · injection-site reactions · nausea · vomiting

● **PREGNANCY** Manufacturer advises use with caution—limited information available.

● **BREAST FEEDING** No information available.

### ● MONITORING REQUIREMENTS

- Monitor for immunoglobulin G (IgG) antibodies to imiglucerase.
- When stabilised, monitor all parameters and response to treatment at intervals of 6–12 months.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Cerezyme<sup>®</sup>), give intermittently in Sodium chloride 0.9%; initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for infusion**

ELECTROLYTES: May contain Sodium

- **Cerezyme** (Genzyme Therapeutics Ltd)

**Imiglucerase 400 unit** Cerezyme 400unit powder for solution for infusion vials | 1 vial [PoM] £1,071.29

## Velaglucerase alfa

● **DRUG ACTION** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

### ● INDICATIONS AND DOSE

#### **Type I Gaucher's disease (specialist use only)**

- **BY INTRAVENOUS INFUSION**

► **Adult:** Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

● **SIDE-EFFECTS** Abdominal pain · arthralgia · back pain · bone pain · dizziness · flushing · headache · hypersensitivity reactions · hypertension · hypotension · malaise · nausea · pyrexia · rash · tachycardia · urticaria

### SIDE-EFFECTS, FURTHER INFORMATION

- **Infusion-related reactions** Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

● **PREGNANCY** Manufacturer advises use with caution—limited information available.

● **BREAST FEEDING** Manufacturer advises use with caution—no information available.

● **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (VPRIV<sup>®</sup>), give intermittently in Sodium chloride 0.9%; reconstitute each 400-unit vial with 4.3 mL water for injections to produce a 100 units/mL solution; dilute requisite dose in 100 mL infusion fluid; give over

60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### **Powder for solution for infusion**

ELECTROLYTES: May contain Sodium

- **VPRIV** (Shire Pharmaceuticals Ltd)

**Velaglucerase alfa 400 unit** VPRIV 400units powder for solution for infusion vials | 1 vial [PoM] £1,410.20

## 2.5 Homocystinuria

### METHYL DONORS

## Betaine

### ● INDICATIONS AND DOSE

**Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)**

- **BY MOUTH**

► **Adult:** 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day

### ● SIDE-EFFECTS

- **Uncommon** Agitation · alopecia · anorexia · depression · gastro-intestinal disorders · personality disorder · reversible cerebral oedema · sleep disturbances · urinary incontinence · urticaria

● **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

● **BREAST FEEDING** Manufacturer advises caution—no information available.

● **MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.

● **DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of Cystadane<sup>®</sup> powder.

● **PRESCRIBING AND DISPENSING INFORMATION** Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B<sub>12</sub>, pyridoxine, and folate under specialist advice.

### ● NATIONAL FUNDING/ACCESS DECISIONS

#### **Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (July 2010) that betaine anhydrous (Cystadane<sup>®</sup>) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution

#### **Powder**

- **Cystadane** (Orphan Europe (UK) Ltd)

**Betaine 1 gram per 1 gram** Cystadane oral powder | 180 gram [PoM] £347.00

## 2.6 Mucopolysaccharidosis

### ENZYMES

#### Elosulfase alfa

01-Sep-2016

- **DRUG ACTION** Elosulfase alfa is an enzyme produced by recombinant DNA technology that provides replacement therapy in conditions caused by N-acetylgalactosamine-6-sulfatase (GALNS) deficiency.

#### ● INDICATIONS AND DOSE

##### Mucopolysaccharidosis IVA (specialist use only)

- BY INTRAVENOUS INFUSION
- Adult: 2 mg/kg once weekly

- **CAUTIONS** Elderly—no information available · infusion-related reactions

#### CAUTIONS, FURTHER INFORMATION

- Infusion-related reactions Infusion-related reactions can occur; manufacturer advises these may be minimised by pre-treatment with an antihistamine and antipyretic, given 30–60 minutes before treatment. If reaction is severe, stop infusion and start appropriate treatment. Caution and close monitoring is advised during re-administration following a severe reaction.

#### ● SIDE-EFFECTS

- **Common or very common** Abdominal pain · chills · diarrhoea · dizziness · dyspnoea · headache · hypersensitivity · infusion-related reactions · myalgia · nausea · oropharyngeal pain · pyrexia · vomiting
- **Uncommon** Anaphylaxis

- **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Vimizim®), give intermittently in Sodium chloride 0.9%; body-weight under 25 kg, dilute requisite dose to final volume of 100 mL infusion fluid and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 3 mL/hour, then increase to a rate of 6 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 6 mL/hour to max. 36 mL/hour; body-weight 25 kg or over, dilute requisite dose to final volume of 250 mL and mix gently, give over 4 hours through in-line filter (0.2 micron) initially at a rate of 6 mL/hour, then increase to a rate of 12 mL/hour after 15 minutes, then increase gradually if tolerated every 15 minutes by 12 mL/hour to max. 72 mL/hour.

- **HANDLING AND STORAGE** Manufacturer advises store in a refrigerator at 2–8°C. After dilution use immediately or, if necessary, store at 2–8°C for max. 24 hours, followed by up to 24 hours at 23–27°C.

#### ● PATIENT AND CARER ADVICE

##### Driving and skilled tasks

Manufacturer advises patients and carers should be counselled about the effects on driving and performance of skilled tasks—increased risk of dizziness.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

EXCIPIENTS: May contain Polysorbates, sorbitol

ELECTROLYTES: May contain Sodium

- **Vimizim** (BioMarin Europe Ltd) ▼

**Elosulfase alfa 1 mg per 1 mL** Vimizim 5mg/5mL concentrate for solution for infusion vials | 1 vial [PoM] £750.00

## Galsulfase

- **DRUG ACTION** Galsulfase is a recombinant form of human N-acetylgalactosamine-4-sulfatase.

#### ● INDICATIONS AND DOSE

##### Mucopolysaccharidosis VI (specialist use only)

- BY INTRAVENOUS INFUSION
- Adult: 1 mg/kg once weekly

- **CAUTIONS** Acute febrile illness (consider delaying treatment) · acute respiratory illness (consider delaying treatment) · infusion-related reactions can occur · respiratory disease

- **SIDE-EFFECTS** Abdominal pain · apnoea · areflexia · chest pain · conjunctivitis · corneal opacity · dyspnoea · ear pain · facial oedema · gastroenteritis · hypertension · infusion-related reactions · malaise · nasal congestion · pharyngitis · rigors · umbilical hernia

#### SIDE-EFFECTS, FURTHER INFORMATION

- Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Naglazyme®), give intermittently in Sodium chloride 0.9%; dilute requisite dose with infusion fluid to final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL infusion fluid and give over at least 4 hours.

#### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

- **Naglazyme** (BioMarin Europe Ltd) ▼

**Galsulfase 1 mg per 1 mL** Naglazyme 5mg/5mL solution for infusion vials | 1 vial [PoM] £982.00

## Idursulfase

- **DRUG ACTION** Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

#### ● INDICATIONS AND DOSE

##### Mucopolysaccharidosis II (specialist use only)

- BY INTRAVENOUS INFUSION
- Adult: 500 micrograms/kg once weekly

- **CAUTIONS** Acute febrile respiratory illness (consider delaying treatment) · infusion-related reactions can occur · severe respiratory disease

#### ● SIDE-EFFECTS

- **Common or very common** Arrhythmia · arthralgia · bronchospasm · chest pain · cough · cyanosis · dizziness · dyspnoea · erythema · facial oedema · flushing · gastrointestinal disturbances · headache · hypertension · hypotension · hypoxia · infusion-site swelling · peripheral oedema · pruritus · pyrexia · rash · swollen tongue · tachycardia · tachypnoea · tremor · urticaria · wheezing

- **Frequency not known** Anaphylaxis · infusion-related reactions · pulmonary embolism

#### SIDE-EFFECTS, FURTHER INFORMATION

- **Infusion-related reactions** Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Elaprase®), give intermittently in Sodium chloride 0.9%; dilute requisite dose in 100 mL infusion fluid and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions).

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

- **Elaprase** (Shire Pharmaceuticals Ltd) ▼  
Idursulfate 2 mg per 1 mL Elaprase 6mg/3mL concentrate for solution for infusion vials | 1 vial [PoM] £1,985.00

## Laronidase

- **DRUG ACTION** Laronidase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

#### INDICATIONS AND DOSE

##### Non-neurological manifestations of mucopolysaccharidosis I (specialist use only)

- **BY INTRAVENOUS INFUSION**
- **Adult:** 100 units/kg once weekly

- **CAUTIONS** Infusion-related reactions can occur

- **INTERACTIONS** → Appendix 1: laronidase

#### SIDE-EFFECTS

- **Common or very common** Abdominal pain · alopecia · anaphylaxis · angioedema · blood pressure changes · cold extremities · cough · diarrhoea · dizziness · dyspnoea · fatigue · flushing · headache · influenza-like symptoms · infusion-site reactions · musculoskeletal pain · nausea · pain in extremities · pallor · paraesthesia · pruritus · rash · restlessness · tachycardia · urticaria · vomiting
- **Frequency not known** Bronchospasm · infusion-related reactions · respiratory arrest

#### SIDE-EFFECTS, FURTHER INFORMATION

- **Infusion-related reactions** Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (Aldurazyme®), give intermittently in Sodium chloride 0.9%; body-weight under 20 kg, use 100 mL infusion fluid; body-weight over 20 kg use 250 mL infusion fluid; withdraw volume of infusion fluid equivalent to volume of laronidase concentrate being added; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour.

#### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Solution for infusion

ELECTROLYTES: May contain Sodium

- **Aldurazyme** (Genzyme Therapeutics Ltd)

Laronidase 100 unit per 1 mL Aldurazyme 500units/5mL solution for infusion vials | 1 vial [PoM] £444.70

## 2.7 Nephropathic cystinosis

### AMINO ACIDS AND DERIVATIVES

#### Mercaptamine

(Cysteamine)

#### INDICATIONS AND DOSE

##### Nephropathic cystinosis (specialist use only)

- **BY MOUTH**

- **Adult** (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses

##### DOSE EQUIVALENCE AND CONVERSION

- 1.3 g/m<sup>2</sup> is approximately equivalent to 50 mg/kg.

#### IMPORTANT SAFETY INFORMATION

##### SAFE PRACTICE

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS** Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine

#### SIDE-EFFECTS

- **Common or very common** Abdominal pain · anorexia · breath and body odour · diarrhoea · dyspepsia · encephalopathy · fever · gastroenteritis · headache · malaise · nausea · rash · vomiting
- **Uncommon** Drowsiness · gastro-intestinal ulcer · hallucinations · leucopenia · nephrotic syndrome · nervousness · seizures

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to penicillamine.

- **PREGNANCY** Avoid—teratogenic and toxic in *animal* studies.

- **BREAST FEEDING** Avoid.

- **MONITORING REQUIREMENTS** Leucocyte-cystine concentration and haematological monitoring required—consult product literature.

#### PRESCRIBING AND DISPENSING INFORMATION

Mercaptamine has a very unpleasant taste and smell, which can affect compliance.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Gastro-resistant capsule

► **ProcySbi** (Horizon Pharma Europe B.V.)

**Mercaptamine (as Mercaptamine bitartrate) 25 mg** ProcySbi  
25mg gastro-resistant capsules | 60 capsule [PoM] £335.97

**Mercaptamine (as Mercaptamine bitartrate) 75 mg** ProcySbi  
75mg gastro-resistant capsules | 250 capsule [PoM] £4,199.65

#### Capsule

CAUTIONARY AND ADVISORY LABELS 21

► **Cystagon** (Orphan Europe (UK) Ltd)

**Mercaptamine (as Mercaptamine bitartrate) 50 mg** Cystagon  
50mg capsules | 100 capsule [PoM] £70.00

**Mercaptamine (as Mercaptamine bitartrate) 150 mg** Cystagon  
150mg capsules | 100 capsule [PoM] £190.00

## 2.8 Niemann-Pick type C disease

### ENZYME INHIBITORS > GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

#### Miglustat

- **DRUG ACTION** Miglustat is an inhibitor of glucosylceramide synthase.

#### INDICATIONS AND DOSE

**Mild to moderate type I Gaucher's disease for whom enzyme replacement therapy is unsuitable (under expert supervision)**

► BY MOUTH

► Adult: 100 mg 3 times a day, reduced if not tolerated to 100 mg 1–2 times a day

**Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)**

► BY MOUTH

► Adult: 200 mg 3 times a day

- **SIDE-EFFECTS** Abdominal pain · amnesia · anorexia · ataxia · chills · constipation · decreased libido · depression · diarrhoea · dizziness · dyspepsia · flatulence · headache · hypoaesthesia · insomnia · malaise · muscle spasm · muscle weakness · nausea · paraesthesia · peripheral neuropathy · thrombocytopenia · tremor · vomiting · weight changes
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution.
- **RENAL IMPAIRMENT** For Gaucher's disease initially 100 mg twice daily if eGFR 50–70 mL/minute/1.73 m<sup>2</sup>. Initially 100 mg once daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. For Niemann-Pick type C disease, initially 200 mg twice daily if eGFR 50–70 mL/minute/1.73 m<sup>2</sup>. Initially 100 mg twice daily if eGFR 30–50 mL/minute/1.73 m<sup>2</sup>. Avoid if eGFR less than 30 mL/minute/1.73 m<sup>2</sup>.
- **MONITORING REQUIREMENTS**
  - Monitor cognitive and neurological function.
  - Monitor growth and platelet count in Niemann-Pick type C disease.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Capsule

► **Zavesca** (Actelion Pharmaceuticals UK Ltd)

**Miglustat 100 mg** Zavesca 100mg capsules | 84 capsule [PoM]  
£3,934.17 (Hospital only)

## 2.9 Pompe disease

### ENZYMES

#### Alglucosidase alfa

- **DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

#### INDICATIONS AND DOSE

**Pompe disease (specialist use only)**

► BY INTRAVENOUS INFUSION

► Adult: 20 mg/kg every 2 weeks

- **CAUTIONS** Cardiac dysfunction · infusion-related reactions—consult product literature · respiratory dysfunction
- **SIDE-EFFECTS**
  - Common or very common Agitation · anaphylaxis · antibody formation · blood pressure changes · bronchospasm · chest discomfort · cold extremities · cough · cyanosis · diarrhoea · dizziness · facial oedema · fatigue · flushing · headache · hypersensitivity reactions · injection-site reactions · irritability · muscle spasm · myalgia · nausea · paraesthesia · pruritus · pyrexia · rash · restlessness · sweating · tachycardia · tachypnoea · tremor · urticaria · vomiting
  - Frequency not known Infusion-related reactions · necrotising skin lesions · severe skin reactions · ulcerative skin lesions

#### SIDE-EFFECTS, FURTHER INFORMATION

- Infusion-related reactions Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.
- **PREGNANCY** Toxicity in animal studies, but treatment should not be withheld.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS**
  - Monitor closely if cardiac dysfunction.
  - Monitor closely if respiratory dysfunction.
  - Monitor immunoglobulin G (IgG) antibody concentration.
- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion (Myozyme<sup>®</sup>), give intermittently in Sodium chloride 0.9%; reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with infusion fluid to give a final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

### MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

#### Powder for solution for infusion

► **Myozyme** (Genzyme Therapeutics Ltd)

**Alglucosidase alfa 50 mg** Myozyme 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £356.06 (Hospital only)

## 2.10 Tyrosinaemia type I

### ENZYME INHIBITORS >

#### 4-HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS

### Nitisinone

#### (NTBC)

##### ● INDICATIONS AND DOSE

**Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)**

- ▶ BY MOUTH
- ▶ Adult: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day

##### ● INTERACTIONS → Appendix 1: nitisinone

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Conjunctivitis · corneal opacity · eye pain · granulocytopenia · keratitis · leucopenia · photophobia · thrombocytopenia
- ▶ **Uncommon** Blepharitis · erythematous rash · exfoliative dermatitis · leucocytosis · pruritus
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—adverse effects in *animal* studies.
- **PRE-TREATMENT SCREENING** Slit-lamp examination of eyes recommended before treatment.
- **MONITORING REQUIREMENTS**
  - ▶ Monitor liver function regularly.
  - ▶ Monitor platelet and white blood cell count every 6 months.
- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Oral suspension

- ▶ **Orfadin** (Swedish Orphan Biovitrum Ltd)  
Nitisinone 4 mg per 1 mL Orfadin 4mg/1mL oral suspension sugar-free | 90 mL [PoM] £1,692.00

##### Capsule

- ▶ **Orfadin** (Swedish Orphan Biovitrum Ltd)  
Nitisinone 2 mg Orfadin 2mg capsules | 60 capsule [PoM] £564.00  
Nitisinone 5 mg Orfadin 5mg capsules | 60 capsule [PoM] £1,127.00  
Nitisinone 10 mg Orfadin 10mg capsules | 60 capsule [PoM] £2,062.00  
Nitisinone 20 mg Orfadin 20mg capsules | 60 capsule [PoM] £4,512.00

## 2.11 Urea cycle disorders

### AMINO ACIDS AND DERIVATIVES

### Carglumic acid

##### ● INDICATIONS AND DOSE

**Hyperammonaemia due to N-acetylglutamate synthase deficiency (under expert supervision)**

- ▶ BY MOUTH
- ▶ Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma–ammonia concentration; maintenance

5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses

#### Hyperammonaemia due to organic acidaemia (under expert supervision)

- ▶ BY MOUTH
- ▶ Adult: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma–ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses

#### IMPORTANT SAFETY INFORMATION

##### EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at [www.bimdg.org.uk](http://www.bimdg.org.uk).

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Sweating
- ▶ **Uncommon** Bradycardia · diarrhoea · pyrexia · vomiting
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **DIRECTIONS FOR ADMINISTRATION** Dispersible tablets must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube.

##### ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

##### Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 13

- ▶ **Carbaglu** (Orphan Europe (UK) Ltd)

**Carglumic acid 200 mg** Carbaglu 200mg dispersible tablets sugar-free | 5 tablet [PoM] £299.00 sugar-free | 60 tablet [PoM] £3,499.00

### DRUGS FOR METABOLIC DISORDERS > AMMONIA LOWERING DRUGS

### Sodium phenylbutyrate

##### ● INDICATIONS AND DOSE

**Long-term treatment of urea cycle disorders (as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy) (under expert supervision)**

- ▶ BY MOUTH
- ▶ Adult: 9.9–13 g/m<sup>2</sup> daily in divided doses, with meals; maximum 20 g per day

#### IMPORTANT SAFETY INFORMATION

##### EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at [www.bimdg.org.uk](http://www.bimdg.org.uk).

- **CAUTIONS** Congestive heart failure (preparations contain significant amounts of sodium)

##### ● SIDE-EFFECTS

- ▶ **Common or very common** Alkalosis · blood disorders · body odour · decreased appetite · depression · gastro-intestinal disturbances · headache · irritability · menstrual disorders · metabolic acidosis · oedema · rash · renal tubular acidosis · syncope · taste disturbance · weight gain
- ▶ **Uncommon** Arrhythmias · pancreatitis · peptic ulcer · rectal bleeding

## SIDE-EFFECTS, FURTHER INFORMATION

Gastro-intestinal side-effects may be reduced by giving smaller doses more frequently.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during administration in women of child-bearing potential.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution.
- **RENAL IMPAIRMENT** Manufacturer advises use with caution (preparations contain significant amounts of sodium).
- **DIRECTIONS FOR ADMINISTRATION** Granules should be mixed with food before taking. *Pheburane*® granules must not be administered by nasogastric or gastrostomy tubes.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for infusion

**Granules**

- ▶ **Ammonaps** (Swedish Orphan Biovitrum Ltd)  
Sodium phenylbutyrate 940 mg per 1 gram Ammonaps 940mg/g granules sugar-free | 266 gram [PoM] £860.00
- ▶ **Pheburane** (Lucane Pharma Ltd)  
Sodium phenylbutyrate 483 mg per 1 gram Pheburane 483mg/g granules | 174 gram [PoM] £331.00

**Tablet**

- ▶ **Ammonaps** (Swedish Orphan Biovitrum Ltd)  
Sodium phenylbutyrate 500 mg Ammonaps 500mg tablets | 250 tablet [PoM] £493.00

## 2.12 Wilson's disease

**Other drugs used for Wilson's disease** Penicillamine, p. 1002

ANTIDOTES AND CHELATORS > COPPER  
ABSORPTION INHIBITORS

## Zinc acetate

- **DRUG ACTION** Zinc prevents the absorption of copper in Wilson's disease.

## ● INDICATIONS AND DOSE

**Wilson's disease (initiated under specialist supervision)**

- ▶ **BY MOUTH**
- ▶ **Adult:** 50 mg 3 times a day (max. per dose 50 mg 5 times a day), adjusted according to response

**DOSE EQUIVALENCE AND CONVERSION**

- ▶ Doses expressed as elemental zinc.

**PHARMACOKINETICS**

Symptomatic Wilson's disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

- **CAUTIONS** Portal hypertension (risk of hepatic decompensation when switching from chelating agent)
- **INTERACTIONS** → Appendix 1: zinc
- **SIDE-EFFECTS**
- ▶ **Common or very common** Gastric irritation (usually transient)
- ▶ **Uncommon** Leucopenia · sideroblastic anaemia

## SIDE-EFFECTS, FURTHER INFORMATION

Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.

- **PREGNANCY** Reduce dose to 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.
- **BREAST FEEDING** Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.
- **MONITORING REQUIREMENTS** Monitor full blood count and serum cholesterol.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 23

- ▶ **Wilzin** (Orphan Europe (UK) Ltd)

**Zinc (as Zinc acetate) 25 mg** Wilzin 25mg capsules | 250 capsule [PoM] £132.00

**Zinc (as Zinc acetate) 50 mg** Wilzin 50mg capsules | 250 capsule [PoM] £242.00

ANTIDOTES AND CHELATORS > COPPER  
CHELATORS

## Trientine dihydrochloride

## ● INDICATIONS AND DOSE

**Wilson's disease in patients intolerant of penicillamine**

- ▶ **BY MOUTH**

▶ **Adult:** 1.2–2.4 g daily in 2–4 divided doses, adjusted according to response, to be taken before food

- **INTERACTIONS** → Appendix 1: trientine
- **SIDE-EFFECTS**
- ▶ **Common or very common** Nausea · rash
- ▶ **Very rare** Anaemia
- ▶ **Frequency not known** Colitis · duodenitis
- **PREGNANCY** Teratogenic in *animal* studies—use only if benefit outweighs risk. Monitor maternal and neonatal serum-copper concentrations.
- **PRESCRIBING AND DISPENSING INFORMATION** Trientine is **not** an alternative to penicillamine for rheumatoid arthritis or cystinuria. Penicillamine-induced systemic lupus erythematosus may not resolve on transfer to trientine.

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Capsule**

CAUTIONARY AND ADVISORY LABELS 6, 22

- ▶ **Trientine dihydrochloride (Non-proprietary)**

**Trientine dihydrochloride 300 mg** Trientine dihydrochloride 300mg capsules | 100 capsule [PoM] £3,090.00 DT price = £3,090.00

3 Mineral and trace elements  
deficiencies

## 3.1 Selenium deficiency

## Selenium

Selenium deficiency can occur as a result of inadequate diet or prolonged parenteral nutrition. A selenium supplement should not be given unless there is good evidence of deficiency.

## VITAMINS AND TRACE ELEMENTS

## Selenium

## ● INDICATIONS AND DOSE

**Selenium deficiency**

- ▶ BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Adult: 100–500 micrograms daily

## ● INTERACTIONS → Appendix 1: selenium

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

**Tablet**

- ▶ **SelenoPrecise** (Pharma Nord (UK) Ltd)  
Selenium (as L-Selenomethionine) 100 microgram SelenoPrecise 100microgram tablets | 60 tablet £4.02  
L-Selenomethionine 200 microgram SelenoPrecise 200microgram tablets | 60 tablet £4.02 | 150 tablet £8.01

**Solution for injection**

- ▶ **Selenase** (Baxter Healthcare Ltd)  
Selenium (as Sodium selenite) 50 microgram per 1 ml Selenase 100micrograms/2ml solution for injection ampoules | 10 ampoule [PbM] no price available  
Selenase 500micrograms/10ml solution for injection vials | 10 vial [PbM] no price available

**Oral solution**

- ▶ **Selenase** (Baxter Healthcare Ltd)  
Selenium (as Sodium selenite) 50 microgram per 1 ml Selenase 100micrograms/2ml oral solution 2ml unit dose ampoules | 20 unit dose [P] no price available  
Selenase 500micrograms/10ml oral solution unit dose vials | 10 unit dose [P] no price available

**Capsule**

- ▶ **Selenium (Non-proprietary)**  
L-Selenomethionine 200 microgram Selenium 200microgram capsules | 30 capsule £3.20 | 60 capsule £5.79

## 3.2 Zinc deficiency

## Zinc

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disorders, or in zinc-losing states.

Zinc is used in the treatment of Wilson's disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc. If necessary, further zinc can be added to intravenous feeding regimens.

## ELECTROLYTES AND MINERALS &gt; ZINC

## Zinc sulfate

## ● INDICATIONS AND DOSE

**Zinc deficiency or supplementation in zinc-losing conditions**

- ▶ BY MOUTH USING EFFERVESCENT TABLETS
- ▶ Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

- ▶ Child (body-weight 10–30 kg): 22.5 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- ▶ Child (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- ▶ Adult (body-weight 31 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

**Additional elemental zinc for intravenous nutrition**

- ▶ BY INTRAVENOUS INJECTION
- ▶ Adult: 6.5 mg daily (Zn<sup>2+</sup> 100 micromol)

- **UNLICENSED USE** *Solvazinc*<sup>®</sup> is not licensed for use in acrodermatitis enteropathica.
- **INTERACTIONS** → Appendix 1: zinc
- **SIDE-EFFECTS** Abdominal pain · diarrhoea · dyspepsia · gastric irritation · gastritis · headache · irritability · lethargy · nausea · vomiting
- **PREGNANCY** Crosses placenta; risk theoretically minimal, but no information available.
- **BREAST FEEDING** Present in milk; risk theoretically minimal, but no information available.
- **RENAL IMPAIRMENT** Accumulation may occur in acute renal failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Each *Solvazinc*<sup>®</sup> tablet contains zinc sulfate monohydrate 125 mg (45 mg zinc).

## ● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

**Effervescent tablet**

CAUTIONARY AND ADVISORY LABELS 13, 21

- ▶ **Solvazinc** (Galen Ltd)  
Zinc sulfate monohydrate 125 mg Solvazinc 125mg effervescent tablets sugar-free | 90 tablet [P] £16.45 DT price = £16.45

## 4 Nutrition (intravenous)

## Intravenous nutrition

## Overview

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion. This may be in addition to ordinary oral or tube feeding—**supplemental parenteral nutrition**, or may be the sole source of nutrition—**total parenteral nutrition (TPN)**. Indications for this method include preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; severe or prolonged disorders of the gastro-intestinal tract; major surgery, trauma, or burns; prolonged coma or refusal to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations available is given under Proprietary Infusion Fluids for Parenteral Feeding p. 980.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, fat, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of a 3-litre bag. A single dose of vitamin B<sub>12</sub>, as hydroxocobalamin p. 938, is given by intramuscular injection; regular vitamin B<sub>12</sub> injections are not usually required unless total parenteral nutrition continues for many months. Folic acid p. 937 is given in a dose of 15 mg once or twice each week, usually in the
