- **SIDE-EFFECTS**
 - ▶ **Common or very common**
 - ▶ With intravenous use Flatulence · pain at injection site · phlebitis at injection site
 - ▶ With oral use Flatulence
 - ▶ **Rare** Abnormal dreams · chest pain · dysphagia · dyspnoea · erythema nodosum · hot flushes · hyperglycaemia · hypoglycaemia · oedema · pancreatitis · sweating · syncope · tachycardia
 - ▶ **Very rare** Intracranial hypertension · movement disorders · tenosynovitis · tinnitus · vasculitis
 - ▶ **Frequency not known** Peripheral neuropathy · polyneuropathy
- **PREGNANCY** A single dose of ciprofloxacin may be used for the prevention of a secondary case of meningococcal meningitis.
- **BREAST FEEDING** Amount too small to be harmful but manufacturer advises avoid.
- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m²—consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks
May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol.
Medicines for Children leaflet: Ciprofloxacin for bacterial infections www.medicinesforchildren.org.uk/ciprofloxacin-bacterial-infections-0

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 25

▶ Ciprofloxacin (Non-proprietary)

Ciprofloxacin (as Ciprofloxacin hydrochloride)

100 mg Ciprofloxacin 100mg tablets | 6 tablet [PoM] £4.50 DT price = £1.86

Ciprofloxacin (as Ciprofloxacin hydrochloride)

250 mg Ciprofloxacin 250mg tablets | 10 tablet [PoM] £7.25 DT price = £0.75 | 20 tablet [PoM] £11.20 | 100 tablet [PoM] no price available

Ciprofloxacin (as Ciprofloxacin hydrochloride)

500 mg Ciprofloxacin 500mg tablets | 10 tablet [PoM] £14.00 DT price = £0.92 | 20 tablet [PoM] £21.23 | 100 tablet [PoM] no price available

Ciprofloxacin (as Ciprofloxacin hydrochloride)

750 mg Ciprofloxacin 750mg tablets | 10 tablet [PoM] £20.00 DT price = £8.00 | 20 tablet [PoM] no price available

▶ Ciproxin (Bayer Plc)

Ciprofloxacin (as Ciprofloxacin hydrochloride) 250 mg Ciproxin 250mg tablets | 10 tablet [PoM] £6.59 DT price = £0.75

Ciprofloxacin (as Ciprofloxacin hydrochloride) 500 mg Ciproxin 500mg tablets | 10 tablet [PoM] £12.49 DT price = £0.92

Ciprofloxacin (as Ciprofloxacin hydrochloride) 750 mg Ciproxin 750mg tablets | 10 tablet [PoM] £17.78 DT price = £8.00

Oral suspension

CAUTIONARY AND ADVISORY LABELS 7, 9, 25

▶ Ciproxin (Bayer Plc)

Ciprofloxacin 50 mg per 1 ml Ciproxin 250mg/5ml oral suspension | 100 ml [PoM] £19.80 DT price = £19.80

Infusion

▶ Ciprofloxacin (Non-proprietary)

Ciprofloxacin (as Ciprofloxacin lactate) 2 mg per

1 ml Ciprofloxacin 200mg/100ml infusion bags | 10 bag [PoM] £100.00

Ciprofloxacin 400mg/200ml infusion bags | 10 bag [PoM] £200.00 | 15 bag [PoM] £64.35

Solution for infusion

ELECTROLYTES: May contain Sodium

▶ Ciprofloxacin (Non-proprietary)

Ciprofloxacin (as Ciprofloxacin lactate) 2 mg per

1 ml Ciprofloxacin 200mg/100ml solution for infusion vials | 1 vial [PoM] £14.45

Ciprofloxacin 400mg/200ml solution for infusion vials | 1 vial [PoM] £19.79 (Hospital only) | 1 vial [PoM] £19.59

Ciprofloxacin 100mg/50ml solution for infusion vials | 1 vial [PoM] £7.57

▶ Ciproxin (Bayer Plc)

Ciprofloxacin (as Ciprofloxacin lactate) 2 mg per 1 ml Ciproxin

Infusion 100mg/50ml solution for infusion bottles | 1 bottle [PoM] £7.61 (Hospital only)

Ciproxin Infusion 400mg/200ml solution for infusion bottles | 5 bottle [PoM] £114.23 (Hospital only)

Ciproxin Infusion 200mg/100ml solution for infusion bottles | 5 bottle [PoM] £75.06 (Hospital only)

£ 328

Nalidixic acid

● INDICATIONS AND DOSE

Treatment of urinary tract infection resistant to other antibiotics

▶ BY MOUTH

- ▶ Child 3 months–11 years: 12.5 mg/kg 4 times a day for 7 days, then reduced to 7.5 mg/kg 4 times a day for prolonged therapy in chronic infections
- ▶ Child 12–17 years: 900 mg 4 times a day for 7 days, then reduced to 600 mg 4 times a day for prolonged therapy in chronic infections

Prophylaxis of urinary tract infections resistant to other antibiotics

▶ BY MOUTH

- ▶ Child 3 months–11 years: 15 mg/kg twice daily

- **UNLICENSED USE** Not licensed for use in children under 3 months of age.
- **CAUTIONS** Acute myocardial infarction (risk factor for QT interval prolongation) · avoid in Acute porphyrias p. 562 · bradycardia (risk factor for QT interval prolongation) · congenital long QT syndrome (risk factor for QT interval prolongation) · electrolyte disturbances (risk factor for QT interval prolongation) · heart failure with reduced left ventricular ejection fraction (risk factor for QT interval prolongation) · history of symptomatic arrhythmias (risk factor for QT interval prolongation)
- **INTERACTIONS** Caution if concomitant use with other drugs known to prolong the QT interval.
- **SIDE-EFFECTS** Cranial nerve palsy · increased intracranial pressure · metabolic acidosis · peripheral neuropathy · toxic psychosis
- **BREAST FEEDING** Risk to infant very small but one case of haemolytic anaemia reported.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in liver disease.
- **RENAL IMPAIRMENT** Use with caution; avoid if estimated glomerular filtration rate less than 20 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor blood counts, renal and liver function if treatment exceeds 2 weeks.

- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry and strawberry.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

ANTIBACTERIALS > SULFONAMIDES

Co-trimoxazole

- **DRUG ACTION** Sulfamethoxazole and trimethoprim are used in combination (as **co-trimoxazole**) because of their synergistic activity (the importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic).

● INDICATIONS AND DOSE

Treatment of susceptible infections

► BY MOUTH

- Child 6 weeks–5 months: 120 mg twice daily, alternatively 24 mg/kg twice daily
- Child 6 months–5 years: 240 mg twice daily, alternatively 24 mg/kg twice daily
- Child 6–11 years: 480 mg twice daily, alternatively 24 mg/kg twice daily
- Child 12–17 years: 960 mg twice daily

► BY INTRAVENOUS INFUSION

- Child 6 weeks–17 years: 18 mg/kg every 12 hours; increased to 27 mg/kg every 12 hours (max. per dose 1.44 g), increased dose used in severe infection

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature)

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: 120 mg/kg daily in 2–4 divided doses for 14–21 days, oral route preferred for children

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) infections

► BY MOUTH

- Child: 450 mg/m² twice daily (max. per dose 960 mg twice daily) for 3 days of the week (either consecutively or on alternate days), dose regimens may vary, consult local guidelines

DOSE EQUIVALENCE AND CONVERSION

480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg.

- **UNLICENSED USE** Not licensed for *Burkholderia cepacia* infections in cystic fibrosis. Not licensed for *Stenotrophomonas maltophilia* infections. Not licensed for use in children under 6 weeks.

IMPORTANT SAFETY INFORMATION

RESTRICTIONS ON THE USE OF CO-TRIMOXAZOLE

Co-trimoxazole is the drug of choice in the prophylaxis and treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia; it is also indicated for nocardiosis, *Stenotrophomonas maltophilia* infection [unlicensed indication], and toxoplasmosis. It should only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it. Co-trimoxazole is also used for the

treatment of infections caused by *Burkholderia cepacia* in cystic fibrosis [unlicensed indication].

- **CONTRA-INDICATIONS** Acute porphyrias p. 562
- **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia) because of the risk of kernicterus · G6PD deficiency (risk of haemolytic anaemia) · maintain adequate fluid intake · predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1 (trimethoprim, sulfamethoxazole).
- **SIDE-EFFECTS**
 - **Common or very common** Diarrhoea · headache · hyperkalaemia · nausea · rash
 - **Uncommon** Vomiting
 - **Rare** Agranulocytosis · bone marrow depression
 - **Very rare** Anorexia · antibiotic-associated colitis · arthralgia · aseptic meningitis · ataxia · blood disorders · convulsions · cough · depression · eosinophilia · glossitis · hallucinations · hepatic necrosis · hypoglycaemia · hyponatraemia · interstitial nephritis · jaundice · leucopenia · liver damage · megaloblastic anaemia · myalgia · myocarditis · pancreatitis · peripheral neuropathy · photosensitivity · pulmonary infiltrates · renal disorders · shortness of breath · Stevens-Johnson syndrome · stomatitis · systemic lupus erythematosus · thrombocytopenia · tinnitus · toxic epidermal necrolysis · uveitis · vasculitis · vertigo
 - **Frequency not known** Rhabdomyolysis reported in HIV-infected patients
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - Blood disorders or rash Co-trimoxazole is associated with rare but serious side effects. Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity) develop.
- **PREGNANCY** Teratogenic risk in first trimester (trimethoprim a folate antagonist). Neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants (due to sulfamethoxazole).
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe liver disease.
- **RENAL IMPAIRMENT** Use half normal dose if estimated glomerular filtration rate 15–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² and if plasma-sulfamethoxazole concentration cannot be monitored. Plasma concentration monitoring may be required in patients with moderate to severe renal impairment; seek expert advice.
- **MONITORING REQUIREMENTS**
 - Plasma concentration monitoring may be required with high doses; seek expert advice.
 - Monitor blood counts on prolonged treatment.
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use For intermittent intravenous infusion, may be further diluted in glucose 5% and 10% or sodium chloride 0.9%. Dilute contents of 1 ampoule (5 mL) to 125 mL, 2 ampoules (10 mL) to 250 mL or 3 ampoules (15 mL) to 500 mL; suggested duration of infusion 60–90 minutes (but may be adjusted according to fluid requirements); if fluid restriction necessary, 1 ampoule (5 mL) may be diluted with 75 mL glucose 5% and the required dose infused over max. 60 minutes; check container for haze or precipitant during administration. In

severe fluid restriction may be given undiluted via a central venous line.

- **PRESCRIBING AND DISPENSING INFORMATION** Co-trimoxazole is a mixture of trimethoprim and sulfamethoxazole (sulphamethoxazole) in the proportions of 1 part to 5 parts.
- ▶ With oral use Flavours of oral liquid formulations may include banana, or vanilla.

Sulfadiazine

(Sulphadiazine)

- **DRUG ACTION** Sulfadiazine is a short-acting sulphonamide with bacteriostatic activity against a broad spectrum of organisms. The importance of the sulfonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

● INDICATIONS AND DOSE

Toxoplasmosis in pregnancy (in combination with pyrimethamine and folinic acid)

▶ BY MOUTH

▶ Child 12-17 years: 1 g 3 times a day until delivery

Congenital toxoplasmosis (in combination with pyrimethamine and folinic acid)

▶ BY MOUTH

▶ Neonate: 50 mg/kg twice daily for 12 months.

- **UNLICENSED USE** Not licensed for use in toxoplasmosis.
- **CONTRA-INDICATIONS** Acute porphyrias p. 562
- **CAUTIONS** Asthma • avoid in blood disorders (unless under specialist supervision) • avoid in infants under 6 weeks (except for treatment or prophylaxis of *pneumocystis pneumonia*) because of the risk of kernicterus • G6PD deficiency (risk of haemolytic anaemia) • maintain adequate fluid intake • predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1 (sulfonamides).

● SIDE-EFFECTS

- ▶ **Common or very common** Diarrhoea • headache • hyperkalaemia • nausea • rash
- ▶ **Uncommon** Vomiting
- ▶ **Rare** Agranulocytosis • bone marrow depression
- ▶ **Very rare** Anorexia • antibiotic-associated colitis • arthralgia • aseptic meningitis • ataxia • blood disorders • convulsions • cough • depression • eosinophilia • glossitis • hallucinations • hepatic necrosis • hypoglycaemia • hyponatraemia • interstitial nephritis • jaundice • leucopenia • liver damage • megaloblastic anaemia • myalgia • myocarditis • pancreatitis • peripheral neuropathy • photosensitivity • pulmonary infiltrates • renal disorders • shortness of breath • Stevens-Johnson syndrome • stomatitis • systemic lupus erythematosus • thrombocytopenia • tinnitus • toxic epidermal necrolysis • uveitis • vasculitis • vertigo
- ▶ **Frequency not known** Benign intracranial hypertension • hypothyroidism • optic neuropathy • rhabdomyolysis reported in HIV-infected patients

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Blood disorders or rash** Discontinue immediately if blood disorders (including leucopenia, thrombocytopenia, megaloblastic anaemia, eosinophilia) or rash (including Stevens-Johnson syndrome, toxic epidermal necrolysis, photosensitivity) develop.
- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinemia in third trimester; fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate impairment; avoid in severe impairment; high risk of crystalluria.
- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.

Sulfadiazine 500 mg Sulfadiazine 500mg tablets | 56 tablet [PoM] £85.55 DT price = £81.99

ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS

Tetracyclines

Overview

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. In children over 12 years of age they are useful for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever), brucella (doxycycline p. 332 with either streptomycin p. 293 or rifampicin p. 342), and the spirochaete, *Borrelia burgdorferi* (See Lyme disease). They are also used in respiratory and genital mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic respiratory diseases (because of their activity against *Haemophilus influenzae*), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin p. 310).

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline

p. 333 which has a broader spectrum; it is active against *Neisseria meningitidis* and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo. Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Tetracyclines have a role in the management of meticillin-resistant *Staphylococcus aureus* (MRSA) infections.

Tetracyclines

- **CONTRA-INDICATIONS** Children under 12 years (deposition in growing bone and teeth, by binding to calcium, causes staining and occasionally dental hypoplasia)
- **CAUTIONS** Myasthenia gravis (muscle weakness may be increased) · systemic lupus erythematosus (may be exacerbated)
- **INTERACTIONS** → Appendix 1 (tetracyclines). Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines. Use with caution in those receiving potentially hepatotoxic drugs.
- **SIDE-EFFECTS**
 - ▶ **Rare** Anaphylaxis · angioedema · blood disorders · exfoliative dermatitis · hepatotoxicity · hypersensitivity reactions · pancreatitis · pericarditis · photosensitivity (particularly with demeclocycline) · rash · Stevens-Johnson syndrome · urticaria
 - ▶ **Frequency not known** Antibiotic-associated colitis · benign intracranial hypertension · bulging fontanelles (in infants) · diarrhoea · dysphagia · headache · nausea · oesophageal irritation · visual disturbances · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - ▶ Benign intracranial hypertension Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment).
- **PREGNANCY** Should **not** be given to pregnant women; effects on skeletal development have been documented in the first trimester in *animal* studies. Administration during the second or third trimester may cause discoloration of the child's teeth, and maternal hepatotoxicity has been reported with large parenteral doses.
- **BREAST FEEDING** Should **not** be given to women who are breast-feeding (although absorption and therefore discoloration of teeth in the infant is probably usually prevented by chelation with calcium in milk).
- **HEPATIC IMPAIRMENT** Should be avoided or used with caution in patients with hepatic impairment.

Demeclocycline hydrochloride

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- ▶ BY MOUTH
- ▶ Child 12-17 years: 150 mg 4 times a day, alternatively 300 mg twice daily

- **CAUTIONS** Photosensitivity more common than with other tetracyclines
- **INTERACTIONS** Milk reduces absorption.
- **SIDE-EFFECTS** Acute renal failure · reversible nephrogenic diabetes insipidus
- **HEPATIC IMPAIRMENT** Max. 1 g daily in divided doses.
- **RENAL IMPAIRMENT** May exacerbate renal failure and should **not** be given to patients with renal impairment.

- **PATIENT AND CARER ADVICE** Patients should be advised to avoid exposure to sunlight or sun lamps.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Doxycycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: Initially 200 mg daily for 1 dose, then maintenance 100 mg once daily

Severe infections (including refractory urinary-tract infections)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 200 mg daily

Acne

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg once daily

Early syphilis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 14 days

Late latent syphilis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 28 days

Uncomplicated genital chlamydia | Non-gonococcal urethritis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 7 days

Pelvic inflammatory disease

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 14 days

Lyme disease (under expert supervision)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg twice daily for 10–14 days (for 28 days in Lyme arthritis)

Anthrax (treatment or post-exposure prophylaxis)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 1 month-11 years: 2.5 mg/kg twice daily (max. per dose 100 mg twice daily), only to be used in children under 12 years if alternative antibacterial cannot be given
- ▶ Child 12-17 years: 100 mg twice daily

Prophylaxis of malaria

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 100 mg once daily, to be started 1–2 days before entering endemic area and continued for 4 weeks after leaving, can be used for up to 2 years

Adjunct to quinine in treatment of *Plasmodium falciparum* malaria

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 200 mg daily for 7 days

Periodontitis (as an adjunct to gingival scaling and root planing)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 12-17 years: 20 mg twice daily for 3 months

- **UNLICENSED USE** Not licensed for use in children under 12 years. Doxycycline doses in BNF Publications may differ from those in product literature. Not licensed for severe recurrent aphthous ulceration. Not licensed for malaria prophylaxis during pregnancy. Not licensed for treatment or post-exposure prophylaxis of anthrax.
- **CAUTIONS** Alcohol dependence
- **INTERACTIONS** The metabolism of doxycycline may be influenced by antiepileptics.
- **SIDE-EFFECTS** Anorexia · anxiety · dry mouth · flushing · fungal superinfection (when used for periodontitis) · tinnitus
- **PREGNANCY** When travel to malarious areas is unavoidable during pregnancy, doxycycline can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation.
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **MONITORING REQUIREMENTS** When used for periodontitis, monitor for superficial fungal infection, particularly if predisposition to oral candidiasis.
- **DIRECTIONS FOR ADMINISTRATION** Capsules and Tablets should be swallowed whole with plenty of fluid, while sitting or standing. Capsules should be taken during meals.
- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture). Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary
Doxycycline Capsules 100 mg may be prescribed.
Dispersible tablets may be prescribed as Dispersible Doxycycline Tablets. Tablets may be prescribed as Doxycycline Tablets 20 mg.

Minocycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12-17 years: 100 mg twice daily

Acne

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
- ▶ Child 12-17 years: 100 mg once daily, alternatively 50 mg twice daily
- ▶ **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- ▶ Child 12-17 years: 100 mg daily

- **CAUTIONS** Systemic lupus erythematosus

● SIDE-EFFECTS

- ▶ **Rare** Acute renal failure · alopecia · anorexia · hyperaesthesia · impaired hearing · paraesthesia · pigmentation (sometimes irreversible) · tinnitus
- ▶ **Very rare** Discoloration of conjunctiva · discoloration of sweat · discoloration of tears · systemic lupus erythematosus
- ▶ **Frequency not known** Dizziness (more common in women) · vertigo (more common in women)

- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).

- **MONITORING REQUIREMENTS** If treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens.

- **DIRECTIONS FOR ADMINISTRATION** Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing.

- **PATIENT AND CARER ADVICE** Counselling on administration advised (posture).

- **LESS SUITABLE FOR PRESCRIBING** Less suitable for prescribing (compared with other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome; it sometimes causes irreversible pigmentation).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 6, 9

► Minocycline (Non-proprietary)

Minocycline (as Minocycline hydrochloride) 50 mg Minocycline 50mg tablets | 28 tablet [PoM] £8.50 DT price = £6.19

Minocycline (as Minocycline hydrochloride) 100 mg Minocycline 100mg tablets | 28 tablet [PoM] £14.50 DT price = £14.01

Capsule

CAUTIONARY AND ADVISORY LABELS 6, 9

► Aknemin (Almirall Ltd)

Minocycline (as Minocycline hydrochloride) 50 mg Aknemin 50 capsules | 56 capsule [PoM] £15.27 DT price = £15.27

Minocycline (as Minocycline hydrochloride) 100 mg Aknemin 100mg capsules | 28 capsule [PoM] £13.09 DT price = £13.09

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 6, 25

► Minocycline (Non-proprietary)

Minocycline (as Minocycline hydrochloride) 100 mg Minocycline 100mg modified-release capsules | 56 capsule [PoM] £24.00 DT price = £20.08

► Acnamino MR (Almus Pharmaceuticals Ltd, Dexcel-Pharma Ltd)

Minocycline (as Minocycline hydrochloride) 100 mg Acnamino MR 100mg capsules | 56 capsule [PoM] £21.14 DT price = £20.08

► Minocin MR (Meda Pharmaceuticals Ltd)

Minocycline (as Minocycline hydrochloride) 100 mg Minocin MR 100mg capsules | 56 capsule [PoM] £20.08 DT price = £20.08

332

Oxytetracycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia and mycoplasma)

► BY MOUTH

► Child 12-17 years: 250–500 mg 4 times a day

Acne

► BY MOUTH

► Child 12-17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

● INTERACTIONS Milk reduces absorption.

● RENAL IMPAIRMENT May exacerbate renal failure and should **not** be given to patients with renal impairment.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Oxytetracycline Tablets may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 23

► Oxytetracycline (Non-proprietary)

Oxytetracycline (as Oxytetracycline dihydrate)

250 mg Oxytetracycline 250mg tablets | 28 tablet [PoM] £12.50 DT price = £0.91 | 1000 tablet [PoM] no price available

332

Tetracycline

● INDICATIONS AND DOSE

Susceptible infections (e.g. chlamydia, rickettsia, mycoplasma)

► BY MOUTH

► Child 12-17 years: 250 mg 4 times a day, increased if necessary to 500 mg 3–4 times a day, increased dose used in severe infections

Acne

► BY MOUTH

► Child 12-17 years: 500 mg twice daily for at least 3 months, if there is no improvement after the first 3 months another oral antibacterial should be used, maximum improvement usually occurs after 4 to 6 months but in more severe cases treatment may need to be continued for 2 years or longer

Non-gonococcal urethritis

► BY MOUTH

► Child 12-17 years: 500 mg 4 times a day for 7–14 days (21 days if failure or relapse after first course)

● INTERACTIONS Milk reduces absorption.

● SIDE-EFFECTS Acute renal failure - skin discoloration

● HEPATIC IMPAIRMENT Max. 1 g daily in divided doses.

● RENAL IMPAIRMENT May exacerbate renal failure and should **not** be given to patients with renal impairment.

● DIRECTIONS FOR ADMINISTRATION Tablets should be swallowed whole with plenty of fluid while sitting or standing.

● PATIENT AND CARER ADVICE Counselling on administration advised.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Tetracycline Tablets may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 7, 9, 23

► Tetracycline (Non-proprietary)

Tetracycline hydrochloride 250 mg Tetracycline 250mg tablets | 28 tablet [PoM] £25.65 DT price = £2.04

ANTIBACTERIALS > OTHER

Chloramphenicol

● DRUG ACTION Chloramphenicol is a potent broad-spectrum antibiotic.

● INDICATIONS AND DOSE

Life threatening infections particularly those caused by *Haemophilus influenzae* | Typhoid fever

► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Child: 12.5 mg/kg every 6 hours, dose may be doubled in severe infections such as septicaemia, meningitis and epiglottitis providing plasma-chloramphenicol concentrations are measured and high doses reduced as soon as indicated

► BY INTRAVENOUS INJECTION

► Neonate up to 14 days: 12.5 mg/kg twice daily, doses should be checked carefully as overdosage can be fatal.

► Neonate 14 days to 28 days: 12.5 mg/kg 2–4 times a day, doses should be checked carefully as overdosage can be fatal.

Cystic fibrosis for the treatment of respiratory *Burkholderia cepacia* infection resistant to other antibacterials

- BY MOUTH, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- Child: (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyrias p. 562
- **CAUTIONS** Avoid repeated courses and prolonged treatment
- **INTERACTIONS** → Appendix 1 (chloramphenicol).
- **SIDE-EFFECTS** Blood disorders · depression · diarrhoea · dry mouth · erythema multiforme · glossitis · headache · nausea · nocturnal haemoglobinuria · optic neuritis · peripheral neuritis · reversible and irreversible aplastic anaemia (with reports of resulting leukaemia) · stomatitis · urticaria · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
 - With intravenous use in neonates Grey syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism.
 - With intravenous use or oral use Associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections.
- **PREGNANCY** Manufacturer advises avoid; neonatal 'grey-baby syndrome' if used in third trimester.
- **BREAST FEEDING** Manufacturer advises avoid; use another antibiotic; may cause bone-marrow toxicity in infant; concentration in milk usually insufficient to cause 'grey syndrome'.
- **HEPATIC IMPAIRMENT** Avoid if possible—increased risk of bone-marrow depression. Reduce dose and monitor plasma-chloramphenicol concentration in hepatic impairment.
- **RENAL IMPAIRMENT** Avoid in severe renal impairment unless no alternative; dose-related depression of haematopoiesis.
- **MONITORING REQUIREMENTS**
 - Plasma concentration monitoring preferred in those under 4 years of age.
 - Recommended peak plasma concentration (approx. 2 hours after administration by mouth, intravenous injection or infusion) 10–25 mg/litre; pre-dose ('trough') concentration should not exceed 15 mg/litre. Blood counts required before and periodically during treatment.
 - In neonates use Plasma concentration monitoring required in neonates. Grey baby syndrome may follow excessive doses in neonates with immature hepatic metabolism.
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use Displacement value may be significant for injection, consult local guidelines. For intermittent intravenous infusion, dilute reconstituted solution further in glucose 5% or sodium chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

► Chloramphenicol (Non-proprietary)

Chloramphenicol 250 mg Chloramphenicol 250mg capsules | 60 capsule [PbM] £377.00 DT price = £377.00

Powder for solution for injection

ELECTROLYTES: May contain Sodium

► Kemiketine (Pfizer Ltd)

Chloramphenicol (as Chloramphenicol sodium succinate)
1 gram Kemiketine 1g powder for solution for injection vials | 1 vial [PbM] £1.39

Fosfomycin

- **DRUG ACTION** Fosfomycin, a phosphonic acid antibacterial, is active against a range of Gram-positive and Gram-negative bacteria including *Staphylococcus aureus* and Enterobacteriaceae.

● INDICATIONS AND DOSE

Osteomyelitis when first-line treatments are inappropriate or ineffective | Hospital-acquired lower respiratory-tract infections when first-line treatments are inappropriate or ineffective

► BY INTRAVENOUS INFUSION

- Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
- Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.
- Child 1–11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- Child 1–11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- Child 12–17 years (body-weight 40 kg and above): 12–24 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Complicated urinary-tract infections when first-line treatment ineffective or inappropriate

► BY INTRAVENOUS INFUSION

- Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
- Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.
- Child 1–11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- Child 1–11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- Child 12–17 years (body-weight 40 kg and above): 12–16 g daily in 2–3 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

Bacterial meningitis when first-line treatment ineffective or inappropriate

► BY INTRAVENOUS INFUSION

- Neonate up to 40 weeks corrected gestational age: 100 mg/kg daily in 2 divided doses.
- Neonate 40 weeks to 44 weeks corrected gestational age: 200 mg/kg daily in 3 divided doses.
- Child 1–11 months (body-weight up to 10 kg): 200–300 mg/kg daily in 3 divided doses, consider using the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms
- Child 1–11 years (body-weight 10–39 kg): 200–400 mg/kg daily in 3–4 divided doses, consider using continued →

the high-dose regimen in severe infection, particularly when suspected or known to be caused by less sensitive organisms

- ▶ Child 12–17 years (body-weight 40 kg and above): 16–24 g daily in 3–4 divided doses (max. per dose 8 g), use the high-dose regimen in severe infection suspected or known to be caused by less sensitive organisms

- **CAUTIONS** Cardiac insufficiency · hyperaldosteronism · hypernatraemia · hypertension · pulmonary oedema

- **INTERACTIONS** → Appendix 1 (fosfomycin).

● **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Gastro-intestinal disturbances · rash

- ▶ **Uncommon** Diarrhoea · nausea · vomiting

- ▶ **Frequency not known** Abdominal pain

SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon** Decreased appetite · dyspnoea · fatigue · headache · hypernatraemia · hypokalaemia · taste disturbances · vertigo

- ▶ **Rare** Aplastic anaemia · blood disorders · eosinophilia

- ▶ **Very rare** Fatty liver · visual impairment

- ▶ **Frequency not known** Antibiotic-associated colitis · bronchospasm · confusion · hepatitis · jaundice · tachycardia

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk.

- **RENAL IMPAIRMENT** Age under 12 years (body-weight under 40 kg)—no information available. Age 12–17 years (body-weight over 40 kg)—use with caution if estimated glomerular filtration rate 40–80 mL/minute/1.73 m², and consult product literature for dose if estimated glomerular filtration rate less than 40 mL/minute/1.73 m².

● **MONITORING REQUIREMENTS**

- ▶ Monitor electrolytes and fluid balance.

- **DIRECTIONS FOR ADMINISTRATION** Displacement value may be significant when reconstituting injection, consult local guidelines. Reconstitute each 2-g vial with 50 mL Glucose 5% or Glucose 10% or Water for Injections; do not exceed infusion rate of 133 mg/minute.

- **PRESCRIBING AND DISPENSING INFORMATION** Doses expressed as fosfomycin base.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (February 2015) that Fosfomycin (*Fomicyt*®) is accepted for restricted use within NHS Scotland; initiation should be restricted to microbiologists or infectious disease specialists.

● **MEDICAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Fomicyt** (Nordic Pharma Ltd)

Fosfomycin (as Fosfomycin sodium) 2 gram Fomicyt 2g powder for solution for infusion vials | 10 vial [POM] £150.00

Fosfomycin (as Fosfomycin sodium) 4 gram Fomicyt 4g powder for solution for infusion vials | 10 vial [POM] £300.00

Fusidic acid

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

● **INDICATIONS AND DOSE**

Staphylococcal skin infection

- ▶ **TO THE SKIN**

- ▶ Child: Apply 3–4 times a day usually for 7 days

- ▶ **BY MOUTH USING TABLETS**

- ▶ Child 12–17 years: 250 mg every 12 hours for 5–10 days

Penicillin-resistant staphylococcal infection including osteomyelitis | Staphylococcal endocarditis in combination with other antibacterials

- ▶ **BY MOUTH USING ORAL SUSPENSION**

- ▶ Neonate: 15 mg/kg 3 times a day.

- ▶ Child 1–11 months: 15 mg/kg 3 times a day

- ▶ Child 1–4 years: 250 mg 3 times a day

- ▶ Child 5–11 years: 500 mg 3 times a day

- ▶ Child 12–17 years: 750 mg 3 times a day

- ▶ **BY MOUTH USING TABLETS**

- ▶ Child 12–17 years: 500 mg every 8 hours, increased to 1 g every 8 hours, increased dose can be used for severe infections

DOSE EQUIVALENCE AND CONVERSION

- ▶ With oral use Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets.

● **CAUTIONS**

- ▶ With topical use Avoid contact of cream or ointment with eyes

● **CAUTIONS, FURTHER INFORMATION**

- ▶ Avoiding resistance

- ▶ With topical use To avoid the development of resistance, fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital.

- **INTERACTIONS** → Appendix 1 (fusidic acid).

● **SIDE-EFFECTS**

- ▶ **Common or very common**

- ▶ With oral use Abdominal pain · diarrhoea · dizziness · drowsiness · dyspepsia · nausea · vomiting

- ▶ **Uncommon**

- ▶ With oral use Anorexia · headache · malaise · pruritus · rash

- ▶ **Rare**

- ▶ With topical use Hypersensitivity reactions

- ▶ **Frequency not known**

- ▶ With oral use Acute renal failure (usually with jaundice) · blood disorders · reversible jaundice especially after high dosage (withdraw therapy if persistent)

● **PREGNANCY**

- ▶ With oral use Not known to be harmful; manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING**

- ▶ With oral use Present in milk—manufacturer advises caution.

● **HEPATIC IMPAIRMENT**

- ▶ With oral use Impaired biliary excretion; possibly increased risk of hepatotoxicity; avoid or reduce dose. Elimination may be reduced in hepatic impairment or biliary disease or biliary obstruction. Monitor liver function in hepatic impairment.

● **MONITORING REQUIREMENTS**

- ▶ With oral use Monitor liver function with high doses or on prolonged therapy.

● **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ With oral use Flavours of oral liquid formulations may include banana and orange.

● PROFESSION SPECIFIC INFORMATION**Dental practitioners' formulary**

- ▶ With topical use May be prescribed as Sodium Fusidate ointment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9

- ▶ **Fucidin (Sodium fusidate)** (LEO Pharma)

Sodium fusidate 250 mg Fucidin 250mg tablets | 10 tablet [PoM]
£6.02 DT price = £6.02 | 100 tablet [PoM] £54.99

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 21

- ▶ **Fucidin (Fusidic acid)** (LEO Pharma)

Fusidic acid 50 mg per 1 ml Fucidin 250mg/5ml oral suspension | 50 ml [PoM] £6.73

Cream

EXCIPIENTS: May contain Butylated hydroxyanisole, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Fusidic acid (Non-proprietary)**

Fusidic acid 20 mg per 1 gram Fusidic acid 2% cream | 15 gram [PoM] £1.92 DT price = £1.92 | 30 gram [PoM] £3.59 DT price = £3.59

- ▶ **Fucidin (Fusidic acid)** (LEO Pharma)

Fusidic acid 20 mg per 1 gram Fucidin 20mg/g cream | 15 gram [PoM] £1.92 DT price = £1.92 | 30 gram [PoM] £3.59 DT price = £3.59

Ointment

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), wool fat and related substances including lanolin

- ▶ **Fucidin (Sodium fusidate)** (LEO Pharma)

Sodium fusidate 20 mg per 1 gram Fucidin 20mg/g ointment | 15 gram [PoM] £2.68 DT price = £2.68 | 30 gram [PoM] £4.55 DT price = £4.55

Linezolid

- **DRUG ACTION** Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including methicillin-resistant *Staphylococcus aureus* (MRSA), and glycopeptide-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is **not** active against common Gram-negative organisms; it must be given in combination with other antibacterials for mixed infections that also involve Gram-negative organisms.

● INDICATIONS AND DOSE

Pneumonia (when other antibacterials e.g. a glycopeptide, such as vancomycin, cannot be used) (initiated under specialist supervision) | Complicated skin and soft-tissue infections caused by Gram-positive bacteria, when other antibacterials cannot be used (initiated under specialist supervision)

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 7 days: 10 mg/kg every 12 hours, increased if necessary to 10 mg/kg every 8 hours, increased dose can be used if poor response.
- ▶ Neonate 7 days to 28 days: 10 mg/kg every 8 hours.
- ▶ Child 1 month–11 years: 10 mg/kg every 8 hours (max. per dose 600 mg)
- ▶ Child 12–17 years: 600 mg every 12 hours

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION**CHM ADVICE (OPTIC NEUROPATHY)**

Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

BLOOD DISORDERS

Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
 - have pre-existing myelosuppression;
 - are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
 - have severe renal impairment.
- If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

- **CAUTIONS** Acute confusional states · bipolar depression · carcinoid tumour · phaeochromocytoma · schizophrenia · thyrotoxicosis · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

- ▶ Close observation Unless close observation and blood pressure monitoring possible, linezolid should be avoided in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states.
- **INTERACTIONS** → Appendix 1 (MAOIs).
- ▶ **Monoamine oxidase inhibition** Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, 5HT₂ agonists ('triptans'), tricyclic antidepressants, sympathomimetics, dopaminergics, buspirone, pethidine and possibly other opioid analgesics.

● SIDE-EFFECTS**GENERAL SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea · eosinophilia · headache · nausea · taste disturbances · vomiting
- ▶ **Uncommon** Abdominal pain · blurred vision · constipation · diaphoresis · dizziness · dry mouth · dyspepsia · electrolyte disturbances · fatigue · fever · gastritis · glossitis · hypertension · hypoaesthesia · insomnia · leucopenia · pancreatitis · paraesthesia · polyuria · pruritus · rash · stomatitis · thirst · thrombocytopenia · tinnitus · tongue discoloration
- ▶ **Rare** Renal failure · tachycardia · transient ischaemic attacks
- ▶ **Frequency not known** Anaemia · antibiotic-associated colitis · convulsions · hyponatraemia · lactic acidosis · optic neuropathy reported on prolonged therapy · pancytopenia · peripheral neuropathy reported on prolonged therapy · Stevens-Johnson syndrome · tooth discoloration · toxic epidermal necrolysis

SPECIFIC SIDE-EFFECTS

- ▶ **Uncommon**
- ▶ With intravenous use Injection-site reactions

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **HEPATIC IMPAIRMENT** No dose adjustment necessary but in severe hepatic impairment use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** No dose adjustment necessary but metabolites may accumulate if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor full blood count (including platelet count) weekly.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use Infusion to be administered over 30–120 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
There is limited information on use in children and expert advice should be sought.
- **PATIENT AND CARER ADVICE** Patients should be advised to read the patient information leaflet given with linezolid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 10

▶ Linezolid (Non-proprietary)

Linezolid 600 mg Linezolid 600mg tablets | 10 tablet [PoM] £228.86–£445.00

▶ Zyvox (Pfizer Ltd)

Linezolid 600 mg Zyvox 600mg tablets | 10 tablet [PoM] £445.00

Oral suspension

CAUTIONARY AND ADVISORY LABELS 9, 10

EXCIPIENTS: May contain Aspartame

▶ Zyvox (Pfizer Ltd)

Linezolid 20 mg per 1 mL Zyvox 100mg/5mL granules for oral suspension | 150 mL [PoM] £222.50

Infusion

EXCIPIENTS: May contain Glucose

ELECTROLYTES: May contain Sodium

▶ Linezolid (Non-proprietary)

Linezolid 2 mg per 1 mL Linezolid 600mg/300mL infusion bags | 10 bag [PoM] £445.00 (Hospital only)

▶ Zyvox (Pfizer Ltd)

Linezolid 2 mg per 1 mL Zyvox 600mg/300mL infusion bags | 10 bag [PoM] £445.00

Trimethoprim

INDICATIONS AND DOSE

Urinary-tract infections | Respiratory tract infections

▶ BY MOUTH

- ▶ Neonate: Initially 3 mg/kg for 1 dose, then 1–2 mg/kg twice daily.
- ▶ Child 4–5 weeks: 4 mg/kg twice daily (max. per dose 200 mg)
- ▶ Child 6 weeks–5 months: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 25 mg twice daily
- ▶ Child 6 months–5 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 50 mg twice daily
- ▶ Child 6–11 years: 4 mg/kg twice daily (max. per dose 200 mg), alternatively 100 mg twice daily
- ▶ Child 12–17 years: 200 mg twice daily

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

▶ BY MOUTH

- ▶ Neonate: 2 mg/kg once daily, dose to be taken at night.
- ▶ Child 4–5 weeks: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night
- ▶ Child 6 weeks–5 months: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 12.5 mg once daily, dose to be taken at night
- ▶ Child 6 months–5 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 25 mg once daily, dose to be taken at night
- ▶ Child 6–11 years: 2 mg/kg once daily (max. per dose 100 mg), dose to be taken at night, alternatively 50 mg once daily, dose to be taken at night
- ▶ Child 12–17 years: 100 mg once daily, dose to be taken at night

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients who cannot tolerate co-trimoxazole (in combination with dapsone)

▶ BY MOUTH

- ▶ Child: 5 mg/kg every 6–8 hours

Shigellosis | Invasive salmonella infection

▶ BY MOUTH

- ▶ Child: (consult product literature)

- **UNLICENSED USE** Not licensed for treatment of pneumocystis pneumonia.
Not licensed for use in children under 6 weeks.
- **CONTRA-INDICATIONS** Blood dyscrasias
- **CAUTIONS** Acute porphyrias p. 562 · neonates (specialist supervision required) · predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1 (trimethoprim).
- **SIDE-EFFECTS**
 - ▶ **Rare** Allergic reactions · anaphylaxis · angioedema · erythema multiforme · photosensitivity · toxic epidermal necrolysis
 - ▶ **Frequency not known** Aseptic meningitis · depression of haematopoiesis · gastro-intestinal disturbances · hyperkalaemia · nausea · pruritus · rashes · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
Trimethoprim has side-effects similar to co-trimoxazole but they are less severe and occur less frequently.
- **PREGNANCY** Teratogenic risk in first trimester (folate antagonist). Manufacturers advise avoid during pregnancy.
- **BREAST FEEDING** Present in milk—short-term use not known to be harmful.
- **RENAL IMPAIRMENT** Use half normal dose after 3 days if estimated glomerular filtration rate 15–30 mL/minute/1.73 m². Use half normal dose if estimated glomerular filtration rate less than 15 mL/minute/1.73 m². Monitor plasma-trimethoprim concentration if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Manufacturer recommends blood counts on long-term therapy (but evidence of practical value unsatisfactory).
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Trimethoprim for bacterial infections www.medicinesforchildren.org.uk/trimethoprim-for-bacterial-infections
Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 9

▶ Trimethoprim (Non-proprietary)

2.1 ANTHRAX

Anthrax

Treatment and post-exposure prophylaxis

Inhalation or gastro-intestinal anthrax should be treated initially with either ciprofloxacin p. 328 or, in patients over 12 years, doxycycline p. 332 [unlicensed indication] combined with one or two other antibacterials (such as amoxicillin p. 320, benzylpenicillin sodium p. 318, chloramphenicol p. 334, clarithromycin p. 309, clindamycin p. 307, imipenem with cilastatin p. 295, rifampicin p. 342 [unlicensed indication], and vancomycin p. 305). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

Cutaneous anthrax should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] for 7 days. Treatment may be switched to amoxicillin if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for *post-exposure prophylaxis*. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax may allow the duration of antibacterial prophylaxis to be shortened.

2.2 Lyme disease

Lyme disease

Treatment

Lyme disease should generally be treated by those experienced in its management. Amoxicillin p. 320 [unlicensed indication], cefuroxime p. 300 (as cefuroxime axetil) or doxycycline p. 332 are the antibacterials of choice for *early Lyme disease* or *Lyme arthritis* but doxycycline should only be used in children over 12 years of age. If these antibacterials are contra-indicated, a **macrolide** (e.g. clarithromycin p. 309) can be used for early Lyme disease.

Intravenous administration of ceftriaxone p. 302, cefotaxime p. 301, or benzylpenicillin sodium p. 318 is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

2.3 Methicillin-resistant staphylococcus aureus

MRSA

Management

Infection from *Staphylococcus aureus* strains resistant to methicillin [now discontinued] (methicillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin p. 325 can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin p. 342 or fusidic acid p. 336 should **not** be used alone because resistance may develop rapidly. Clindamycin p. 307 alone or a combination of rifampicin and fusidic acid can be used for *skin and soft-tissue infections* caused by MRSA; a **tetracycline** is an alternative in children over 12 years of age. A **glycopeptide** (e.g. vancomycin p. 305) can be used for severe skin and soft-tissue infections associated with MRSA. A combination of a glycopeptide and fusidic acid or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial. Linezolid p. 337 should be reserved for skin and soft-tissue infections that have not responded to other antibacterials or for children who cannot tolerate other antibacterials.

A **glycopeptide** can be used for *pneumonia* associated with MRSA. Linezolid should be reserved for hospital-acquired pneumonia that has not responded to other antibacterials or for children who cannot tolerate other antibacterials.

Trimethoprim p. 338 or nitrofurantoin p. 347 can be used for *urinary-tract infections* caused by MRSA; a **tetracycline** is an alternative in children over 12 years of age. A **glycopeptide** can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A **glycopeptide** can be used for septicæmia associated with MRSA.

See the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA.

Prophylaxis with vancomycin or teicoplanin p. 305 (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient's MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

It is important that hospitals have infection control guidelines to minimise MRSA transmission, including policies on isolation and treatment of MRSA carriers and on hand hygiene. See eradication of nasal carriage of MRSA in Nose p. 648.

2.4 Tuberculosis

Tuberculosis

Treatment phases, overview

Tuberculosis is treated in two phases—an *initial phase* using 4 drugs and a *continuation phase* using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge and supervision, particularly where the disease involves resistant organisms or non-respiratory organs.

There are two regimens recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen should be used; the two regimens should **not** be used concurrently. Compliance with therapy is a major determinant of its success. Treatment needs to be carefully monitored in families in whom concordance may be problematic.

Initial phase

The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations, provided the respective dose of each drug is appropriate, unless the child is unable to swallow the tablets or one of the components cannot be given because of resistance or intolerance. The treatment of choice for the initial phase is the daily use of isoniazid p. 345, rifampicin p. 342, pyrazinamide p. 346 and ethambutol hydrochloride p. 345. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for *M. tuberculosis* has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol hydrochloride should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin p. 293 is rarely used in the UK although it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced and ethambutol hydrochloride is contra-indicated.

Continuation phase

After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment

The following regimen should be used for those who are likely to take antituberculous drugs reliably **without supervision** by a healthcare worker. Children and families who are unlikely to comply with daily administration of antituberculous drugs should be treated with the regimen described under Supervised Treatment.

Pregnancy and breast-feeding

The standard unsupervised 6-month treatment regimen may be used during pregnancy. Streptomycin should not be given in pregnancy.

The standard unsupervised 6-month treatment regimen may be used during breast-feeding.

Neonates

Congenital tuberculosis is acquired from maternal extrapulmonary sites at birth, particularly the genital tract; if infection is suspected, the baby will require treatment with isoniazid, rifampicin, pyrazinamide, and ethambutol hydrochloride. Isoniazid, rifampicin, pyrazinamide, and ethambutol hydrochloride are used for 2 months during the initial phase of treatment. After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin.

Supervised treatment

Drug administration needs to be **fully supervised** by a healthcare worker (directly observed therapy, DOT) in children or families who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol hydrochloride (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

Immunocompromised patients

Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised children. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, children should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a HIV-positive individual; care is required in choosing the regimen and in avoiding potentially serious interactions. Starting antiretroviral treatment in the first 2 months of antituberculosis treatment increases the risk of immune reconstitution syndrome.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex in which case specialist advice on management is needed.

Corticosteroids

A corticosteroid should be given (in addition to antituberculous therapy) for meningeal or pericardial tuberculosis.

Prevention of tuberculosis

Chemoprophylaxis may be required in children who are close contacts of a case of smear-positive pulmonary tuberculosis and who are severely immunosuppressed (including congenital immunodeficiencies, cytotoxic or immunosuppressive therapy) and in those who have evidence of latent tuberculosis and require treatment with immunosuppressants; expert advice should be sought.

Chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months.

See prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive. See advice on immunisation against tuberculosis and tuberculin testing.

Treatment failure

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the child or their carer. Monthly tablet counts and urine examination (rifampicin imparts an orange-red coloration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be specialised by a specialist paediatrician.

Recommended dosage for standard unsupervised 6-month treatment

Isoniazid	Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)
Rifampicin	Child: ► body-weight up to 50 kg: 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day; ► body-weight 50 kg and above: 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day
Pyrazinamide	Child: ► body-weight up to 50 kg: 35 mg/kg once daily for 2 months (initial phase); maximum 1.5 g per day; ► body-weight 50 kg and above: 35 mg/kg once daily for 2 months (initial phase); maximum 2 g per day
Ethambutol hydrochloride	Child: 20 mg/kg once daily for 2 months (initial phase)

In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (*Rifater*[®], *Rifinah*[®]) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

Recommended dosage for intermittent supervised 6-month treatment

Isoniazid	Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
Rifampicin	Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)
Pyrazinamide	Child: ► body-weight up to 50 kg: 50 mg/kg 3 times a week (max. per dose 2 g 3 times a week) for 2 months (initial phase); ► body-weight 50 kg and above: 50 mg/kg 3 times a week (max. per dose 2.5 g 3 times a week) for 2 months (initial phase)
Ethambutol hydrochloride	Child: 30 mg/kg 3 times a week for 2 months (initial phase)

In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. The exception is ethambutol hydrochloride due to the risk of toxicity. Doses may also need to be recalculated to allow for weight gain in younger children. The fixed-dose combination preparations (*Rifater*[®], *Rifinah*[®]) are unlicensed for use in children. Consideration may be given to use of these preparations in older children, provided the respective dose of each drug is appropriate for the weight of the child.

Antituberculosis drugs

Isoniazid is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication.

Rifampicin, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication.

During the first two months ('initial phase') of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease.

On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients.

Rifabutin below is licensed in adults for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis. There is limited experience in children.

Pyrazinamide is a bactericidal drug only active against intracellular dividing forms of *Mycobacterium tuberculosis*; it exerts its main effect only in the first two or three months. It is particularly useful in tuberculous meningitis because of good meningeal penetration. It is not active against *M. bovis*.

Ethambutol hydrochloride p. 345 is included in a treatment regimen if isoniazid p. 345 resistance is suspected; it can be omitted if the risk of resistance is low.

Streptomycin p. 293 [unlicensed] is now rarely used in the UK except for resistant organisms.

Drug-resistant tuberculosis should be treated by a specialist paediatrician with experience in such cases, and where appropriate facilities for infection-control exist. Second-line drugs available for infections caused by resistant organisms, or when first-line drugs cause unacceptable side-effects, include amikacin p. 292, capreomycin, cycloserine p. 344, newer macrolides (e.g. azithromycin p. 308 and clarithromycin p. 309), quinolones

(e.g. moxifloxacin p. 631) and protonamide (prothionamide; no longer on UK market). Availability of suitable formulations may limit choice in children.

ANTIMYCOBACTERIALS > RIFAMYCINS**Rifabutin****● INDICATIONS AND DOSE****Prophylaxis of *Mycobacterium avium* complex infections in immunosuppressed patients with low CD4 count**

- BY MOUTH
- Child 1 month–11 years: 5 mg/kg once daily (max. per dose 300 mg), also consult product literature
- Child 12–17 years: 300 mg once daily, also consult product literature

Treatment of non-tuberculous mycobacterial disease, in combination with other drugs

- BY MOUTH
- Child 1 month–11 years: 5 mg/kg once daily for up to 6 months after cultures negative
- Child 12–17 years: 450–600 mg once daily for up to 6 months after cultures negative

Treatment of pulmonary tuberculosis, in combination with other drugs

- BY MOUTH
- Child 12–17 years: 150–450 mg once daily for at least 6 months

● **UNLICENSED USE** Not licensed for use in children.

● **CAUTIONS** Acute porphyrias p. 562 · discolours soft contact lenses

● **INTERACTIONS** → Appendix 1 (rifamycins).

● SIDE-EFFECTS

► **Common or very common** Anaemia · blood disorders · leucopenia · myalgia · nausea · pyrexia · rash · thrombocytopenia

- **Uncommon** Arthralgia · body secretions coloured orange-red · bronchospasm · corneal deposits · eosinophilia · hypersensitivity reactions · jaundice · raised liver enzymes · saliva coloured orange-red · skin coloured orange-red · urine coloured orange-red · uveitis (especially following high doses or concomitant use with drugs that increase plasma concentration) · vomiting

- **Rare** Haemolysis

- **Frequency not known** Chest pain · dyspnoea · hepatitis · influenza-like symptoms

SIDE-EFFECTS, FURTHER INFORMATION

Discontinue permanently if serious side-effects develop.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.
- **CONCEPTION AND CONTRACEPTION**
Important Rifabutin induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced; alternative family planning advice should be offered.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Reduce dose in severe impairment. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.
- **RENAL IMPAIRMENT** Use half normal dose if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - **Renal function** should be checked before treatment.
 - **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, hepatic function should be monitored on prolonged therapy.
 - Blood counts should be monitored on prolonged therapy.
- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.
- **PATIENT AND CARER ADVICE**
Soft contact lenses Patients or their carers should be advised that rifabutin discolours soft contact lenses.
Hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- BY MOUTH

- **Child:** 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- BY MOUTH

- **Child (body-weight up to 50 kg):** 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 450 mg per day
- **Child (body-weight 50 kg and above):** 15 mg/kg once daily for 6 months (initial and continuation phases); maximum 600 mg per day

Congenital tuberculosis

- BY MOUTH

- **Neonate:** 15 mg/kg once daily for 6 months (initial and continuation phases).

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, in combination with isoniazid

- BY MOUTH

- **Child 1 month–11 years (body-weight up to 50 kg):** 15 mg/kg daily for 3 months; maximum 450 mg per day
- **Child 1 month–11 years (body-weight 50 kg and above):** 15 mg/kg daily for 3 months; maximum 600 mg per day
- **Child 12–17 years (body-weight up to 50 kg):** 450 mg daily for 3 months
- **Child 12–17 years (body-weight 50 kg and above):** 600 mg daily for 3 months

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive, who are isoniazid-resistant

- BY MOUTH

- **Child 1 month–11 years (body-weight up to 50 kg):** 15 mg/kg daily for 6 months; maximum 450 mg per day
- **Child 1 month–11 years (body-weight 50 kg and above):** 15 mg/kg daily for 6 months; maximum 600 mg per day
- **Child 12–17 years (body-weight up to 50 kg):** 450 mg daily for 6 months
- **Child 12–17 years (body-weight 50 kg and above):** 600 mg daily for 6 months

Prevention of secondary case of *Haemophilus influenzae* type b disease

- BY MOUTH

- **Child 1–2 months:** 10 mg/kg once daily for 4 days
- **Child 3 months–11 years:** 20 mg/kg once daily (max. per dose 600 mg) for 4 days
- **Child 12–17 years:** 600 mg once daily for 4 days

Prevention of secondary case of meningococcal meningitis

► BY MOUTH

► Neonate: 5 mg/kg every 12 hours for 2 days.

- Child 1–11 months: 5 mg/kg every 12 hours for 2 days
- Child 1–11 years: 10 mg/kg every 12 hours (max. per dose 600 mg), for 2 days
- Child 12–17 years: 600 mg every 12 hours for 2 days

Pruritus due to cholestasis

► BY MOUTH

► Child: 5–10 mg/kg once daily (max. per dose 600 mg)

- **UNLICENSED USE** Not licensed for use in children for pruritus due to cholestasis.
- **CONTRA-INDICATIONS** Acute porphyrias p. 562 • jaundice
- **CAUTIONS** Discolours soft contact lenses
- **INTERACTIONS** → Appendix 1 (rifamycins). Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens, corticosteroids, phenytoin, sulfonylureas, and anticoagulants.

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

Acute renal failure • adrenal insufficiency • alterations of liver function • anorexia • antibiotic-associated colitis • body secretions coloured orange-red • collapse and shock • diarrhoea • disseminated intravascular coagulation • drowsiness • eosinophilia • exfoliative dermatitis • flushing • gastro-intestinal symptoms • haemolytic anaemia • headache • influenza-like symptoms (with chills, fever, dizziness, bone pain) • jaundice • leucopenia • menstrual disturbances • muscular weakness • myopathy • nausea • oedema • pemphigoid reactions • psychoses • rashes • respiratory symptoms • saliva coloured orange-red • shortness of breath • Stevens-Johnson syndrome • thrombocytopenic purpura • toxic epidermal necrolysis • urine coloured orange-red • urticaria • vomiting

SPECIFIC SIDE-EFFECTS

- With intravenous use Thrombophlebitis reported if infusion used for prolonged period

SIDE-EFFECTS, FURTHER INFORMATION

Discontinue permanently if serious side-effects develop.

- Intermittent therapy Side-effects that mainly occur with intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with rifamycin hypersensitivity.

● **CONCEPTION AND CONTRACEPTION**

Important. Effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered.

- **PREGNANCY** Manufacturers advise very high doses teratogenic in *animal* studies in first trimester; risk of neonatal bleeding may be increased in third trimester.

- **BREAST FEEDING** Amount too small to be harmful.

- **HEPATIC IMPAIRMENT** Avoid or do not exceed 8 mg/kg daily. Impaired elimination. In patients with pre-existing liver disease or hepatic impairment, monitor liver function regularly and particularly frequently in the first 2 months; blood counts should also be monitored in these patients.

- **RENAL IMPAIRMENT** Use with caution if doses above 10 mg/kg daily.

● **MONITORING REQUIREMENTS**

- **Renal function** should be checked before treatment.
- **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. However, liver function should be monitored on prolonged therapy.
- Blood counts should be monitored in patients on prolonged therapy.

● **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use Displacement value may be significant, consult local reconstitution guidelines; reconstitute with solvent provided. May be further diluted with Glucose 5% or Sodium chloride 0.9% to a final concentration of 1.2 mg/mL. Infuse over 2–3 hours.

- **PRESCRIBING AND DISPENSING INFORMATION** If treatment interruption occurs, re-introduce with low dosage and increase gradually.

- With oral use In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet. Doses may also need to be recalculated to allow for weight gain in younger children. Flavours of syrup may include raspberry.

Tuberculosis resistant to first-line drugs, in combination with other drugs

► BY MOUTH

- Child 2–11 years: Initially 5 mg/kg twice daily (max. per dose 250 mg), then increased if necessary up to 10 mg/kg twice daily (max. per dose 500 mg), dose to be increased according to blood concentration and response
- Child 12–17 years: Initially 250 mg every 12 hours for 2 weeks, then increased if necessary up to 500 mg every 12 hours, dose to be increased according to blood concentration and response

PHARMACOKINETICS

Cycloserine penetrates the CNS.

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

- **CONTRA-INDICATIONS** Alcohol dependence · depression · epilepsy · psychotic states · severe anxiety

- **INTERACTIONS** → Appendix 1 (cycloserine).

- **SIDE-EFFECTS** Allergic dermatitis · changes in liver function tests · confusion · convulsions · depression · dizziness · drowsiness · headache · heart failure at high doses · megaloblastic anaemia · psychosis · rashes · tremor · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- CNS toxicity Discontinue or reduce dose if symptoms of CNS toxicity occur.
- Rashes or allergic dermatitis Discontinue or reduce dose if rashes or allergic dermatitis develops.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—crosses the placenta.
- **BREAST FEEDING** Present in milk—amount too small to be harmful.

- **RENAL IMPAIRMENT** Increase interval between doses if creatinine clearance less than 50 mL/minute/1.73 m². Monitor blood-cycloserine concentration if creatinine clearance less than 50 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- Blood concentration should not exceed a peak concentration of 30 mg/litre (measured 3–4 hours after the dose).
- Monitor haematological, renal, and hepatic function.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 2, 8

► *Cycloserine* (Non-proprietary)

Cycloserine 250 mg *Cycloserine* 250mg capsules | 100 capsule [PoM] £402.63 DT price = £402.63

Ethambutol hydrochloride

● INDICATIONS AND DOSE

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

► BY MOUTH

- Child: 20 mg/kg once daily for 2 months (initial phase)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

► BY MOUTH

- Child: 30 mg/kg 3 times a week for 2 months (initial phase)

Congenital tuberculosis, in combination with other drugs

► BY MOUTH

- Neonate: 20 mg/kg once daily for 2 months (initial phase).

- **CONTRA-INDICATIONS** Optic neuritis · poor vision

- **CAUTIONS** Young children

CAUTIONS, FURTHER INFORMATION

- Understanding warnings Patients who cannot understand warnings about visual side-effects should, if possible, be given an alternative drug. In particular, ethambutol should be used with caution in children until they are at least 5 years old and capable of reporting symptomatic visual changes accurately.

- **INTERACTIONS** → Appendix 1 (ethambutol).

● **SIDE-EFFECTS**

- **Rare** Pruritus · rash · thrombocytopenia · urticaria

- **Frequency not known** Colour blindness · loss of visual acuity · optic neuritis · peripheral neuritis · red/green colour blindness · restriction of visual fields · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- **Ocular toxicity** Ocular toxicity is more common where excessive dosage is used or if the patient's renal function is impaired. Early discontinuation of the drug is almost always followed by recovery of eyesight.

- **PREGNANCY** Not known to be harmful.

- **BREAST FEEDING** Amount too small to be harmful.

- **RENAL IMPAIRMENT** If creatinine clearance less than 30 mL/minute/1.73 m², use 15–25 mg/kg (max. 2.5 g) 3 times a week. Risk of optic nerve damage. Should preferably be avoided in patients with renal impairment. If creatinine clearance less than 30 mL/minute/1.73 m², monitor plasma-ethambutol concentration.

● **MONITORING REQUIREMENTS**

- 'Peak' concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–22 micromol/litre); 'trough' (pre-dose) concentration should be less than 1 mg/litre (4 micromol/litre).

- Renal function should be checked before treatment.

- Visual acuity should be tested by Snellen chart before treatment with ethambutol.

- In young children, routine ophthalmological monitoring recommended.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Ethambutol for the treatment of tuberculosis

www.medicinesforchildren.org.uk/ethambutol-for-the-treatment-of-tuberculosis

Ocular toxicity The earliest features of ocular toxicity are subjective and patients should be advised to discontinue therapy immediately if they develop deterioration in vision and promptly seek further advice.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

● **INDICATIONS AND DOSE**

Tuberculosis, in combination with other drugs (standard unsupervised 6-month treatment)

- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Child: 10 mg/kg once daily (max. per dose 300 mg) for 6 months (initial and continuation phases)

Tuberculosis, in combination with other drugs (intermittent supervised 6-month treatment) (under expert supervision)

- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Child: 15 mg/kg 3 times a week (max. per dose 900 mg) for 6 months (initial and continuation phases)

Congenital tuberculosis, in combination with other drugs

- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Neonate: 10 mg/kg daily for 6 months (initial and continuation phases).

Prevention of tuberculosis in susceptible close contacts or those who have become tuberculin positive

- BY MOUTH, OR BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- Neonate: 10 mg/kg daily for 6 months.

- Child 1 month–11 years: 10 mg/kg daily (max. per dose 300 mg) for 6 months, alternatively 10 mg/kg daily (max. per dose 300 mg) for 3 months, to be taken in combination with rifampicin

- Child 12–17 years: 300 mg daily for 6 months, alternatively 300 mg daily for 3 months, to be taken in combination with rifampicin

- **CONTRA-INDICATIONS** Drug-induced liver disease

- **CAUTIONS** Acute porphyrias p. 562 · alcohol dependence · diabetes mellitus · epilepsy · history of psychosis · HIV infection · malnutrition · slow acetylator status (increased risk of side-effects)

CAUTIONS, FURTHER INFORMATION

- **Peripheral neuropathy** Peripheral neuropathy is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, pregnancy, malnutrition and HIV infection. In patients at increased risk of peripheral neuropathy, pyridoxine hydrochloride p. 585 should be given prophylactically from the start of treatment.

- **INTERACTIONS** → Appendix 1 (isoniazid).

When used with tyramine or histamine rich foods, tachycardia, palpitation, hypotension, flushing, headache, dizziness, and sweating reported.

• SIDE-EFFECTS

- **Common or very common** Peripheral neuropathy
- **Rare** Hepatitis · psychotic episodes
- **Frequency not known** Agranulocytosis · aplastic anaemia · blood disorders · constipation · convulsions · difficulty with micturition · dry mouth · fever · gynaecomastia · haemolytic anaemia · hearing loss (in patients with end-stage renal impairment) · hyperglycaemia · hyperreflexia · hypersensitivity reactions · interstitial pneumonitis · nausea · optic neuritis · pancreatitis · pellagra · peripheral neuritis with high doses · purpura · Stevens-Johnson syndrome · systemic lupus erythematosus-like syndrome · tinnitus (in patients with end-stage renal impairment) · vertigo · vomiting

- **PREGNANCY** Not known to be harmful; prophylactic pyridoxine recommended.

- **BREAST FEEDING** Theoretical risk of convulsions and neuropathy; prophylactic pyridoxine advisable in mother. In breast-feeding, monitor infant for possible toxicity.

- **HEPATIC IMPAIRMENT** Use with caution. In patients with pre-existing liver disease or hepatic impairment monitor liver function regularly and particularly frequently in the first 2 months.

- **RENAL IMPAIRMENT** Risk of ototoxicity and peripheral neuropathy; prophylactic pyridoxine hydrochloride p. 585 recommended.

● MONITORING REQUIREMENTS

- **Renal function** should be checked before treatment.
- **Hepatic function** should be checked before treatment. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment.

● PRESCRIBING AND DISPENSING INFORMATION

- Doses may need to be recalculated to allow for weight gain in younger children.
- **With oral use** In general, doses should be rounded up to facilitate administration of suitable volumes of liquid or an appropriate strength of tablet.

● PATIENT AND CARER ADVICE

2.5 Urinary tract infections

Urinary-tract infections

Overview

Urinary-tract infection is more common in adolescent girls than in boys; when it occurs in adolescent boys there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

Escherichia coli is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include *Proteus* and *Klebsiella* spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

A specimen of urine should be collected for culture and sensitivity testing before starting antibacterial therapy;

- in children under 3 years of age;
- in children with suspected upper urinary-tract infection, complicated infection, or recurrent infection;
- if resistant organisms are suspected;
- if urine dipstick testing gives a single positive result for leucocyte esterase or nitrite;
- if clinical symptoms are not consistent with results of dipstick testing;
- in pregnant women.

Treatment should not be delayed while waiting for results. The antibacterial chosen should reflect current local bacterial sensitivity to antibacterials.

Antibacterial therapy for urinary-tract infections

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring.

Children under 3 months of age should be transferred to hospital and treated initially with intravenous antibacterials such as amoxicillin p. 320 (or ampicillin p. 321) with gentamicin p. 293, or a cephalosporin (such as cefotaxime p. 301) alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Children over 3 months of age with uncomplicated lower urinary-tract infection, can be treated with trimethoprim p. 338 or nitrofurantoin below. Suggested duration of treatment 3 days. Re-assess child if they remain unwell 24–48 hours after initial assessment.

Alternatively, children over 3 months of age, with uncomplicated lower urinary-tract infection, may be treated with amoxicillin (or ampicillin) or oral first generation cephalosporin (e.g. cefalexin p. 298). Use amoxicillin only if

micro-organism sensitive. Suggested duration of treatment 3 days. Re-assess child if unwell 24–48 hours after initial assessment.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav p. 323 for 7–10 days.

If the patient is severely ill, then the infection is best treated initially by intravenous injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

Resistant infections

Widespread bacterial resistance to ampicillin, amoxicillin, and trimethoprim has been reported. Alternatives for resistant organisms include co-amoxiclav (amoxicillin with clavulanic acid), an oral cephalosporin, pivmecillinam hydrochloride p. 324, or a quinolone.

Antibacterial prophylaxis

Recurrent episodes of infection are an indication for imaging tests. Antibacterial prophylaxis with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage. Nitrofurantoin is contra-indicated in children under 3 months of age because of the theoretical possibility of haemolytic anaemia.

Pregnancy

Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulfonamides, quinolones, and tetracyclines should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

Renal impairment

In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine hippurate, and nitrofurantoin should be avoided altogether.

ANTIBACTERIALS > OTHER

Nitrofurantoin

● INDICATIONS AND DOSE

Acute uncomplicated urinary-tract infections

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - Child 3 months–11 years: 750 micrograms/kg 4 times a day for 3–7 days
 - Child 12–17 years: 50 mg 4 times a day for 3–7 days
- BY MOUTH USING MODIFIED-RELEASE MEDICINES
 - Child 12–17 years: 100 mg twice daily, dose to be taken with food

Severe chronic recurrent urinary-tract infections

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - Child 12–17 years: 100 mg 4 times a day for 3–7 days

Prophylaxis of urinary-tract infection (considered for recurrent infection, significant urinary-tract anomalies, or significant kidney damage)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
 - Child 3 months–11 years: 1 mg/kg once daily, dose to be taken at night
 - Child 12–17 years: 50–100 mg once daily, dose to be taken at night

continued →

Genito-urinary surgical prophylaxis

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12–17 years: 100 mg twice daily on day of procedure and for 3 days after

- **CONTRA-INDICATIONS** Acute porphyrias p. 562 • G6PD deficiency • infants less than 3 months old
- **CAUTIONS** Anaemia • diabetes mellitus • electrolyte imbalance • folate deficiency • pulmonary disease • susceptibility to peripheral neuropathy • urine may be coloured yellow or brown • vitamin B deficiency
- **INTERACTIONS** → Appendix 1 (nitrofurantoin).
- **SIDE-EFFECTS**
 - **Rare** Agranulocytosis • aplastic anaemia • arthralgia • benign intracranial hypertension • blood disorders • cholestatic jaundice • erythema multiforme • exfoliative dermatitis • hepatitis • pancreatitis • thrombocytopenia • transient alopecia
 - **Frequency not known** Acute pulmonary reactions • anaphylaxis • angioedema • anorexia • chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome) • diarrhoea • hypersensitivity reactions • nausea • peripheral neuropathy • pruritus • rash • sialadenitis • urticaria • vomiting
- **PREGNANCY** Avoid at term—may produce neonatal haemolysis.
- **BREAST FEEDING** Avoid; only small amounts in milk but enough to produce haemolysis in G6PD-deficient infants.
- **HEPATIC IMPAIRMENT** Use with caution; cholestatic jaundice and chronic active hepatitis reported.
- **RENAL IMPAIRMENT** Risk of peripheral neuropathy; antibacterial efficacy depends on renal secretion of the drug into urinary tract. Avoid if estimated glomerular filtration rate less than 45 mL/minute/1.73 m²; may be used with caution if estimated glomerular filtration rate 30–44 mL/minute/1.73 m² as a short-course only (3 to 7 days), to treat uncomplicated lower urinary-tract infection caused by suspected or proven multidrug resistant bacteria and only if potential benefit outweighs risk.
- **MONITORING REQUIREMENTS** On long-term therapy, monitor liver function and monitor for pulmonary symptoms (discontinue if deterioration in lung function).
- **EFFECT ON LABORATORY TESTS** False positive urinary glucose (if tested for reducing substances).
- **PATIENT AND CARER ADVICE**

3 Fungal infection

Antifungals, systemic use

Common fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. Local treatment is suitable for a number of fungal infections (genital, bladder, eye, ear, oropharynx, and skin).

Aspergillosis

Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the heart, brain, and skin. Voriconazole p. 355 is the treatment of choice for aspergillosis; liposomal amphotericin p. 351 is an alternative first-line treatment when voriconazole cannot be used. Caspofungin p. 350 or itraconazole p. 353 can be used in patients who are refractory to, or intolerant of voriconazole and liposomal amphotericin. Itraconazole is also used for the treatment of chronic pulmonary aspergillosis or as an adjunct in the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication].

Candidiasis

Many superficial candidal infections, including infections of the skin, are treated locally. Systemic antifungal treatment is required in widespread or intractable infection. Vaginal candidiasis can be treated with locally acting antifungals; alternatively, fluconazole p. 352 can be given by mouth.

Oropharyngeal candidiasis generally responds to topical therapy. Fluconazole is given by mouth for unresponsive infections; it is reliably absorbed and is effective. Itraconazole may be used for infections that do not respond to fluconazole. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

For *invasive or disseminated candidiasis*, either amphotericin by intravenous infusion or an **echinocandin** can be used. Fluconazole is an alternative for *Candida albicans* infection in clinically stable children who have not received an azole antifungal recently. Amphotericin should be considered for the initial treatment of CNS candidiasis. Voriconazole can be used for infections caused by fluconazole-resistant *Candida* spp. when oral therapy is required, or in children intolerant of amphotericin or an echinocandin. In refractory cases, flucytosine p. 356 can be used with intravenous amphotericin.

Cryptococcosis

Cryptococcosis is uncommon but infection in the immunocompromised, especially in HIV-positive patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is amphotericin by intravenous infusion and fluconazole by intravenous infusion for 2 weeks, followed by fluconazole by mouth for 8 weeks or until

cultures are negative. In cryptococcosis, fluconazole is sometimes given alone as an alternative in HIV-positive patients with mild, localised infections or in those who cannot tolerate amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

Histoplasmosis

Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. Itraconazole can be used for the treatment of immunocompetent patients with indolent non-meningeal infection, including chronic pulmonary histoplasmosis. Amphotericin by intravenous infusion is used for the initial treatment of fulminant or severe infections, followed by a course of itraconazole by mouth. Following successful treatment, itraconazole can be used for prophylaxis against relapse until immunity recovers.

Skin and nail infections

Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy. Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis).

Oral imidazole or triazole antifungals (particularly itraconazole) and terbinafine p. 680 are used more frequently than griseofulvin p. 357 because they have a broader spectrum of activity and require a shorter duration of treatment.

Tinea capitis is treated systemically; additional topical application of an antifungal may reduce transmission. Griseofulvin is used for tinea capitis in adults and children; it is effective against infections caused by *Trichophyton tonsurans* and *Microsporum* spp. Terbinafine is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of *Microsporum* infections is uncertain. Fluconazole or itraconazole are alternatives in the treatment of tinea capitis caused by *T. tonsurans* or *Microsporum* spp. [both unlicensed indications].

Pityriasis versicolor may be treated with itraconazole by mouth if topical therapy is ineffective; fluconazole by mouth is an alternative. Oral terbinafine is **not** effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. Terbinafine and itraconazole have largely replaced griseofulvin for the systemic treatment of onychomycosis, particularly of the toenail; they should be used under specialist advice in children. Although terbinafine is not licensed for use in children, it is considered to be the drug of choice for onychomycosis. Itraconazole can be administered as intermittent 'pulse' therapy. Topical antifungals also have a role in the treatment of onychomycosis.

Immunocompromised children

Immunocompromised children are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral triazole antifungals are the drugs of choice for prophylaxis. Fluconazole is more reliably absorbed than itraconazole, but fluconazole is not effective against *Aspergillus* spp. Itraconazole is preferred in patients at risk of invasive aspergillosis. Micafungin p. 350 can be used for prophylaxis of candidiasis in patients undergoing haematopoietic stem cell transplantation when fluconazole or itraconazole cannot be used.

Amphotericin by intravenous infusion or caspofungin is used for the empirical treatment of serious fungal infections in immunocompromised children; caspofungin is not effective against fungal infections of the CNS.

Triazole antifungals

Triazole antifungal drugs have a role in the prevention and systemic treatment of fungal infections.

Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis. Fluconazole is excreted largely unchanged in the urine and can be used to treat candiduria.

Itraconazole is active against a wide range of dermatophytes. There is limited information available on use in children. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

Voriconazole is a broad-spectrum antifungal drug which is licensed in adults for use in life-threatening infections.

Imidazole antifungals

The imidazole antifungals include clotrimazole p. 481, p. 678, econazole nitrate p. 481, p. 678, ketoconazole p. 414, p. 678, and tioconazole p. 679. They are used for the local treatment of vaginal candidiasis and for dermatophyte infections. Miconazole p. 663 can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

Polyene antifungals

The polyene antifungals include amphotericin and nystatin p. 663; neither drug is absorbed when given by mouth. Nystatin p. 663 is used for oral, oropharyngeal, and perioral infections by local application in the mouth. Nystatin is also used for *Candida albicans* infection of the skin.

Amphotericin p. 351 by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet*® and *AmBisome*®) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contra-indicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

Echinocandin antifungals

The echinocandin antifungals include caspofungin p. 350 and micafungin p. 350. They are only active against *Aspergillus* spp. and *Candida* spp.; however, micafungin is not used for the treatment of aspergillosis. Echinocandins are not effective against fungal infections of the CNS. Echinocandin antifungals have a role in the prevention and systemic treatment of fungal infections.

Other antifungals

Flucytosine p. 356 is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly in HIV-positive patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment. Flucytosine has a role in the treatment of systemic candidiasis and cryptococcal meningitis.

Griseofulvin p. 357 is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. Griseofulvin is used in the treatment of tinea capitis. It is the drug of choice for trichophyton infections in

children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine p. 680 is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

5 ANTIFUNGALS > ECHINOCANDIN ANTIFUNGALS

Caspofungin

● INDICATIONS AND DOSE

Invasive aspergillosis | Invasive candidiasis | Empirical treatment of systemic fungal infections in patients with neutropenia

► BY INTRAVENOUS INFUSION

► Neonate: 25 mg/m² once daily.

- Child 1-2 months: 25 mg/m² once daily
- Child 3-11 months: 50 mg/m² once daily
- Child 1-17 years: 70 mg/m² once daily (max. per dose 70 mg) for 1 day, then 50 mg/m² once daily (max. per dose 70 mg); increased to 70 mg/m² once daily (max. per dose 70 mg), dose may be increased if lower dose tolerated but inadequate response

● **INTERACTIONS** → Appendix 1 (caspofungin).

● SIDE-EFFECTS

- **Common or very common** Arthralgia · diarrhoea · dyspnoea · flushing · headache · hypokalaemia · hypomagnesaemia · hypotension · injection-site reactions · nausea · pruritus · rash · sweating · tachycardia · vomiting
- **Uncommon** Abdominal pain · anaemia · anorexia · anxiety · arrhythmia · ascites · blurred vision · bronchospasm · chest pain · cholestasis · constipation · cough · disorientation · dizziness · dry mouth · dyspepsia · dysphagia · erythema multiforme · fatigue · flatulence · heart failure · hepatic dysfunction · hyperglycaemia · hypertension · hypoaesthesia · hypocalcaemia · leucopenia · metabolic acidosis · muscular weakness · myalgia · palpitation · paraesthesia · renal failure · sleep disturbances · taste disturbances · thrombocytopenia · thrombophlebitis · tremor
- **Frequency not known** Acute respiratory distress syndrome · anaphylaxis · hypercalcaemia

● **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

● **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid.

● **HEPATIC IMPAIRMENT** Usual initial dose, then use 70% of normal maintenance dose in moderate impairment. No information available for severe impairment.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* (*Candidas*®), allow vial to reach room temperature; initially reconstitute 50 mg with 10.5 mL Water for Injections to produce a 5.2 mg/mL solution, or reconstitute 70 mg with 10.5 mL Water for Injections to produce a 7.2 mg/mL solution; mix gently to dissolve; dilute requisite dose to a final concentration not exceeding 500 micrograms/mL with Sodium Chloride 0.9%; give over 60 minutes; incompatible with glucose solutions.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► *Candidas* (Merck Sharp & Dohme Ltd)

Caspofungin (as Caspofungin acetate) 50 mg *Candidas* 50mg powder for solution for infusion vials | 1 vial [PoM](#) £327.67

Caspofungin (as Caspofungin acetate) 70 mg *Candidas* 70mg powder for solution for infusion vials | 1 vial [PoM](#) £416.78

Micafungin

● INDICATIONS AND DOSE

Invasive candidiasis

► BY INTRAVENOUS INFUSION

► Neonate (administered on expert advice): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate.

- Child (body-weight up to 40 kg): 2 mg/kg once daily for at least 14 days; increased if necessary to 4 mg/kg once daily, increase dose if response inadequate
- Child (body-weight 40 kg and above): 100 mg once daily for at least 14 days; increased if necessary to 200 mg once daily, increase dose if response inadequate

Oesophageal candidiasis

► BY INTRAVENOUS INFUSION

- Child 16-17 years (body-weight up to 40 kg): 3 mg/kg once daily
- Child 16-17 years (body-weight 40 kg and above): 150 mg once daily

Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days

► BY INTRAVENOUS INFUSION

► Neonate: 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range.

- Child (body-weight up to 40 kg): 1 mg/kg once daily continue for at least 7 days after neutrophil count is in desirable range
- Child (body-weight 40 kg and above): 50 mg once daily continue for at least 7 days after neutrophil count is in desirable range

● **INTERACTIONS** → Appendix 1 (micafungin).

Caution with concomitant use of other hepatotoxic drugs.

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · anaemia · blood pressure changes · diarrhoea · fever · headache · hepatomegaly · hypocalcaemia · hypokalaemia · hypomagnesaemia · leucopenia · nausea · phlebitis · rash · renal failure · tachycardia · thrombocytopenia · vomiting
- **Uncommon** Anorexia · anxiety · bradycardia · cholestasis · confusion · constipation · dizziness · dyspepsia · dyspnoea · eosinophilia · flushing · hepatitis · hyperhidrosis · hyperkalaemia · hyponatraemia · hypophosphataemia · palpitation · pancytopenia · pruritus · sleep disturbances · tachycardia · taste disturbances · tremor
- **Rare** Haemolytic anaemia
- **Frequency not known** Disseminated intravascular coagulation · hepatotoxicity (potentially life-threatening; more common in children under 1 year) · Stevens-Johnson syndrome · toxic epidermal necrolysis

● **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

● **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Use with caution; renal function may deteriorate.

● MONITORING REQUIREMENTS

- Monitor renal function.
- Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop.

● **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion* reconstitute each vial with 5 mL Glucose 5% or Sodium Chloride 0.9%; gently rotate vial, without shaking, to

dissolve; dilute requisite dose to a concentration of 0.5–2 mg/mL with Glucose 5% or Sodium Chloride 0.9%; protect infusion from light; give over 60 minutes.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- **Mycamine** (Astellas Pharma Ltd)

Micafungin (as Micafungin sodium) 50 mg Mycamine 50mg powder for solution for infusion vials | 1 vial [PoM] £196.08

Micafungin (as Micafungin sodium) 100 mg Mycamine 100mg powder for solution for infusion vials | 1 vial [PoM] £341.00

ANTIFUNGALS > POLYENE ANTIFUNGALS

Amphotericin

(Amphotericin B)

• INDICATIONS AND DOSE

ABELCET®

Severe invasive candidiasis | Severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphotericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients

- ▶ BY INTRAVENOUS INFUSION

- ▶ Child: Test dose 100 micrograms/kg (max. per dose 1 mg), then 5 mg/kg once daily

AMBISOME®

Severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin | Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials

- ▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 1 mg/kg once daily, increased if necessary to 3 mg/kg once daily; maximum 5 mg/kg per day.
- ▶ Child: Test dose 100 micrograms/kg (max. per dose 1 mg), to be given over 10 minutes, then 3 mg/kg once daily; maximum 5 mg/kg per day

Visceral leishmaniasis (unresponsive to the antimonial alone)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Child: 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, alternatively 3 mg/kg for 5 consecutive days, followed by 3 mg/kg after 6 days for 1 dose

FUNGIZONE®

Systemic fungal infections

- ▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 1 mg/kg once daily, increased if necessary to 1.5 mg/kg daily for 7 days, then reduced to 1–1.5 mg/kg once daily on alternate days if required.
- ▶ Child: Test dose 100 micrograms/kg (max. per dose 1 mg), included as part of first dose of 250 micrograms/kg daily, then increased if tolerated to 1 mg/kg daily, dose is gradually increased over 2–4 days; in severe infection max. 1.5 mg/kg daily or on alternate days. Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

• UNLICENSED USE

AMBISOME® Ambisome® not licensed for use in children under 1 month.

FUNGIZONE® Intravenous conventional formulation amphotericin (*Fungizone*®) is licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Avoid rapid infusion (risk of arrhythmias) · when given parenterally, toxicity common (close supervision necessary and close observation required for at least 30 minutes after test dose)

CAUTIONS, FURTHER INFORMATION

- ▶ **Anaphylaxis** Anaphylaxis can occur with any intravenous amphotericin product and a test dose is advisable before the first infusion in children over 1 month of age; the patient should be carefully observed for at least 30 minutes after the test dose. Prophylactic antipyretics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential).

- **INTERACTIONS** → Appendix 1 (amphotericin). Caution—corticosteroids (avoid except to control reactions).

• SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · abnormal liver function (discontinue treatment) · anaemia · arrhythmias · blood disorders · blood pressure changes · cardiovascular effects · chest pain · diarrhoea · disturbances in renal function · dyspnoea · electrolyte disturbances · febrile reactions · headache · hypokalaemia · hypomagnesaemia · nausea · rash · renal tubular acidosis · thrombocytopenia · vomiting
- ▶ **Uncommon** Anaphylactoid reactions · bronchospasm · convulsions · diplopia · encephalopathy · hearing loss · neurological disorders · peripheral neuropathy · tremor
- ▶ **Frequency not known** Anorexia · arthralgia · myalgia · Stevens-Johnson syndrome · toxic epidermal necrolysis

- **PREGNANCY** Not known to be harmful but manufacturers advise avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Use only if no alternative; nephrotoxicity may be reduced with use of lipid formulation.

- **MONITORING REQUIREMENTS** Hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required.

• DIRECTIONS FOR ADMINISTRATION

ABELCET® Amphotericin (lipid complex)

For intravenous infusion, allow suspension to reach room temperature, shake gently to ensure no yellow settlement, withdraw requisite dose (using 17–19 gauge needle) into one or more 20-mL syringes; replace needle on syringe with a 5-micron filter needle provided (fresh needle for each syringe) and dilute in Glucose 5% to a concentration of 2 mg/mL; preferably give via an infusion pump at a rate of 2.5 mg/kg/hour (initial test dose given over 15 minutes); an in-line filter (pore size no less than 15 micron) may be used; do not use sodium chloride or other electrolyte solutions—flush existing intravenous line with Glucose 5% or use separate line.

AMBISOME® Amphotericin (liposomal)

For intravenous infusion, reconstitute each vial with 12 mL Water for Injections and shake vigorously to produce a preparation containing 4 mg/mL; withdraw requisite dose from vial and introduce into Glucose 5% or 10% through the 5-micron filter provided, to produce a final concentration of 0.2–2 mg/mL; infuse over 30–60 minutes, or if non-anaphylactic infusion-related reactions occur infuse over 2 hours (initial test dose given over 10 minutes); an in-line filter (pore size no less than 1 micron) may be used; incompatible with sodium chloride solutions—flush existing intravenous line with Glucose 5% or 10%, or use separate line.

FUNGIZONE® Amphotericin (as sodium deoxycholate complex)

For *intravenous infusion*, reconstitute each vial with 10 mL Water for Injections and shake immediately to produce a 5 mg/mL colloidal solution; dilute further in Glucose 5% to a concentration of 100 micrograms/mL (in fluid-restricted children, up to 400 micrograms/mL given via a central line); pH of glucose solution must not be below 4.2 (check each container—consult product literature for details of buffer); infuse over 4–6 hours, or if tolerated over a minimum of 2 hours (initial test dose given over 20–30 minutes); begin infusion immediately after dilution and protect from light; incompatible with Sodium Chloride solutions—flush existing intravenous line with Glucose 5% or use separate line; an in-line filter (pore size no less than 1 micron) may be used.

- **PRESCRIBING AND DISPENSING INFORMATION** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should **not** be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

EXCIPIENTS: May contain Sucrose

ELECTROLYTES: May contain Sodium

- ▶ **AmBisome** (Gilead Sciences International Ltd)

Amphotericin B liposomal 50 mg AmBisome 50mg powder for solution for infusion vials | 10 vial [PoM] £821.87

- ▶ **Fungizone** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Amphotericin B 50 mg Fungizone Intravenous 50mg powder for solution for infusion vials | 1 vial [PoM] £3.88

Suspension for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Abelcet** (Teva UK Ltd)

Amphotericin B (as Amphotericin B phospholipid complex) 5 mg per 1 mL Abelcet 100mg/20mL concentrate for suspension for infusion vials | 10 vial [PoM] £775.04 (Hospital only)

ANTIFUNGALS > TRIAZOLE ANTIFUNGALS**Fluconazole**

- **INDICATIONS AND DOSE**

Candidal balanitis

- ▶ BY MOUTH

- ▶ Child 16–17 years: 150 mg for 1 dose

Vaginal candidiasis

- ▶ BY MOUTH

- ▶ Child 1 month–15 years: 150 mg for 1 dose, for use in patients who are post-puberty

- ▶ Child 16–17 years: 150 mg for 1 dose

Vulvovaginal candidiasis (recurrent)

- ▶ BY MOUTH

- ▶ Child: Initially 150 mg every 72 hours for 3 doses, then 150 mg once weekly for 6 months, for use in patients who are post-puberty

Mucosal candidiasis (except genital)

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 14 days: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg every 72 hours.

- ▶ Neonate 14 days to 28 days: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg every 48 hours.

- ▶ Child 1 month–11 years: 3–6 mg/kg, dose to be given on first day, then 3 mg/kg daily (max. per dose 100 mg) for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g.

oesophagitis, candiduria, non-invasive bronchopulmonary infections)

- ▶ Child 12–17 years: 50 mg daily for 7–14 days in oropharyngeal candidiasis (max. 14 days except in severely immunocompromised patients); for 14–30 days in other mucosal infections (e.g. oesophagitis, candiduria, non-invasive bronchopulmonary infections); increased to 100 mg daily, increased dose only for unusually difficult infections

Tinea capitis

- ▶ BY MOUTH

- ▶ Child 1–17 years: 6 mg/kg daily (max. per dose 300 mg) for 2–4 weeks

Tinea pedis, corporis, cruris, pityriasis versicolor | Dermal candidiasis

- ▶ BY MOUTH

- ▶ Child: 3 mg/kg daily (max. per dose 50 mg) for 2–4 weeks (for up to 6 weeks in tinea pedis); max. duration of treatment 6 weeks

Invasive candidal infections (including candidaemia and disseminated candidiasis) and cryptococcal infections (including meningitis)

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 14 days: 6–12 mg/kg every 72 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis).

- ▶ Neonate 14 days to 28 days: 6–12 mg/kg every 48 hours, treatment continued according to response (at least 8 weeks for cryptococcal meningitis).

- ▶ Child: 6–12 mg/kg daily (max. per dose 800 mg), treatment continued according to response (at least 8 weeks for cryptococcal meningitis)

Prevention of fungal infections in immunocompromised patients

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Neonate up to 14 days: 3–12 mg/kg every 72 hours, dose given according to extent and duration of neutropenia.

- ▶ Neonate 14 days to 28 days: 3–12 mg/kg every 48 hours, dose given according to extent and duration of neutropenia.

- ▶ Child: 3–12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range, dose given according to extent and duration of neutropenia

Prevention of fungal infections in immunocompromised patients (for patients with high risk of systemic infections e.g. following bone-marrow transplantation)

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child: 12 mg/kg daily (max. per dose 400 mg), commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range

Prevention of relapse of cryptococcal meningitis in HIV-infected patients after completion of primary therapy

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child: 6 mg/kg daily (max. per dose 200 mg)

- **UNLICENSED USE** Not licensed for tinea infections in children, or for vaginal candidiasis in girls under 16 years, or for prevention of relapse of cryptococcal meningitis after completion of primary therapy in children with HIV.

- **CONTRA-INDICATIONS** Acute porphyrias p. 562

- **CAUTIONS** Susceptibility to QT interval prolongation

- **INTERACTIONS** → Appendix 1 (antifungals, triazole); in general, fluconazole interactions in Appendix 1 relate to multiple-dose treatment.

Caution with concomitant use of hepatotoxic drugs.

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal discomfort · diarrhoea · flatulence · headache · nausea · rash
- ▶ **Uncommon** Alopecia · anaphylaxis · angioedema · dizziness · dyspepsia · hepatic disorders · hyperlipidaemia · pruritus · seizures · Stevens-Johnson syndrome · taste disturbance · toxic epidermal necrolysis · vomiting
- ▶ **Frequency not known** Hypokalaemia · leucopenia · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

If rash occurs, discontinue treatment (or monitor closely if infection invasive or systemic); severe cutaneous reactions are more likely in patients with AIDS.

- **PREGNANCY** Manufacturer advises avoid—multiple congenital abnormalities reported with long-term high doses.
- **BREAST FEEDING** Present in milk but amount probably too small to be harmful.
- **HEPATIC IMPAIRMENT** Toxicity with related drugs.
- **RENAL IMPAIRMENT** Usual initial dose then halve subsequent doses if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor liver function with high doses or extended courses—discontinue if signs or symptoms of hepatic disease (risk of hepatic necrosis).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous infusion*, give over 10–30 minutes; do not exceed an infusion rate of 5–10 mL/minute.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.
- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Fluconazole Capsules 50 mg may be prescribed.
Fluconazole Oral Suspension 50 mg/5 mL may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Fluconazole capsules can be sold to the public for vaginal candidiasis and associated candidal balanitis in those aged 16–60 years, in a container or packaging containing not more than 150 mg and labelled to show a max. dose of 150 mg.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

infusion vials | 1 vial [PoM] £29.28

Itraconazole

● INDICATIONS AND DOSE

Oropharyngeal candidiasis

▶ BY MOUTH

- ▶ Child 1 month-11 years: 3–5 mg/kg once daily for 15 days; maximum 100 mg per day
- ▶ Child 12-17 years: 100 mg once daily for 15 days

Oropharyngeal candidiasis in patients with AIDS or neutropenia

▶ BY MOUTH

- ▶ Child 1 month-11 years: 3–5 mg/kg once daily for 15 days; maximum 200 mg per day
- ▶ Child 12-17 years: 200 mg once daily for 15 days

Systemic candidiasis where other antifungal drugs inappropriate or ineffective

▶ BY MOUTH

- ▶ Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)

▶ BY INTRAVENOUS INFUSION

- ▶ Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

Pityriasis versicolor

▶ BY MOUTH

- ▶ Child 1 month-11 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 7 days
- ▶ Child 12-17 years: 200 mg once daily for 7 days

Tinea pedis | Tinea manuum

▶ BY MOUTH

- ▶ Child 1 month-11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 30 days
- ▶ Child 12-17 years: 100 mg once daily for 30 days, alternatively 200 mg twice daily for 7 days

Tinea corporis | Tinea cruris

▶ BY MOUTH

- ▶ Child 1 month-11 years: 3–5 mg/kg once daily (max. per dose 100 mg) for 15 days
- ▶ Child 12-17 years: 100 mg once daily for 15 days, alternatively 200 mg once daily for 7 days

Tinea capitis

▶ BY MOUTH

- ▶ Child 1-17 years: 3–5 mg/kg once daily (max. per dose 200 mg) for 2–6 weeks

Onychomycosis

▶ BY MOUTH

- ▶ Child 1-11 years: 5 mg/kg daily (max. per dose 200 mg) for 7 days, subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses
- ▶ Child 12-17 years: 200 mg once daily for 3 months, alternatively 200 mg twice daily for 7 days, continued →

subsequent courses repeated after 21-day intervals; fingernails 2 courses, toenails 3 courses

Systemic aspergillosis where other antifungal drugs inappropriate or ineffective

► BY INTRAVENOUS INFUSION

- Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

► BY MOUTH

- Child: 5 mg/kg once daily (max. per dose 200 mg), increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis

Histoplasmosis

► BY MOUTH

- Child: 5 mg/kg 1–2 times a day (max. per dose 200 mg)

Systemic cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective

► BY MOUTH

- Child: 5 mg/kg once daily (max. per dose 200 mg), dose increased in invasive or disseminated disease and in cryptococcal meningitis, increased to 5 mg/kg twice daily (max. per dose 200 mg)

► BY INTRAVENOUS INFUSION

- Child: 2.5 mg/kg every 12 hours (max. per dose 200 mg) for 2 days, then 2.5 mg/kg once daily (max. per dose 200 mg) for max. 12 days

Maintenance in HIV-infected patients to prevent relapse of underlying fungal infection and prophylaxis in neutropenia when standard therapy inappropriate

► BY MOUTH

- Child: 5 mg/kg once daily (max. per dose 200 mg), then increased to 5 mg/kg twice daily (max. per dose 200 mg), dose increased only if low plasma-itraconazole concentration

Prophylaxis of deep fungal infections (when standard therapy inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic

► BY MOUTH USING ORAL SOLUTION

- Child: 2.5 mg/kg twice daily, to be started before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers, safety and efficacy not established

- **UNLICENSED USE** Not licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

HEART FAILURE

Following reports of heart failure, caution is advised when prescribing itraconazole to patients at high risk of heart failure. Those at risk include:

- patients receiving high doses and longer treatment courses;
- older adults and those with cardiac disease;
- patients with chronic lung disease (including chronic obstructive pulmonary disease) associated with pulmonary hypertension;
- patients receiving treatment with negative inotropic drugs, e.g. calcium channel blockers.

Itraconazole should be avoided in patients with ventricular dysfunction or a history of heart failure unless the infection is serious.

- **CONTRA-INDICATIONS** Acute porphyrias p. 562
- **CAUTIONS** Active liver disease · history of hepatotoxicity with other drugs · susceptibility to congestive heart failure
- **INTERACTIONS** → Appendix 1 (antifungals, triazole).

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Abdominal pain · blood pressure changes · cough · diarrhoea · dyspnoea · headache · hepatitis · hypokalaemia · nausea · rash · taste disturbances · vomiting
- **Uncommon** Constipation · dizziness · dyspepsia · flatulence · menstrual disorder · myalgia · oedema · peripheral neuropathy (discontinue treatment)
- **Rare** Alopecia · deafness · erectile dysfunction · heart failure · hypertriglyceridaemia · leucopenia · pancreatitis · photosensitivity · Stevens-Johnson syndrome · tinnitus · toxic epidermal necrolysis · urinary frequency · visual disturbances
- **Frequency not known** Arthralgia · confusion · drowsiness · hepatotoxicity · renal impairment · thrombocytopenia · tremor

SPECIFIC SIDE-EFFECTS

- With intravenous use Hyperglycaemia

SIDE-EFFECTS, FURTHER INFORMATION

- **Hepatotoxicity** Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and until the next menstrual period following end of treatment.

- **PREGNANCY** Manufacturer advises use only in life-threatening situations (toxicity at high doses in *animal* studies).

- **BREAST FEEDING** Small amounts present in milk—may accumulate; manufacturer advises avoid.

- **HEPATIC IMPAIRMENT** Dose reduction may be necessary. Use only if potential benefit outweighs risk of hepatotoxicity.

- **RENAL IMPAIRMENT** Risk of congestive heart failure.

- With oral use Bioavailability of oral formulations possibly reduced.

- With intravenous use Use intravenous infusion with caution if estimated glomerular filtration rate 30–80 mL/minute/1.73 m² (monitor renal function); avoid intravenous infusion if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- Absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary).

- Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *intravenous infusion*, dilute 250 mg with 50 mL Sodium Chloride 0.9% and give requisite dose through an in-line filter (0.2 micron) over 60 minutes.
- With oral use For *oral liquid*, do not take with food; swish around mouth and swallow, do not rinse afterwards.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.

- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop.

- With oral use Patients or carers should be given advice on how to administer itraconazole oral liquid.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

CAUTIONARY AND ADVISORY LABELS 5, 9, 21, 25

▶ Itraconazole (Non-proprietary)

Itraconazole 100 mg Itraconazole 100mg capsules | 15 capsule [PoM] £21.50 DT price = £3.64 | 60 capsule [PoM] £56.21
Itraconazole 100mg Capsules | 15 capsule [PoM] £4.04 DT price = £3.64

▶ SporanoX (Janssen-Cilag Ltd)

Itraconazole 100 mg SporanoX-Pulse 100mg capsules | 28 capsule [PoM] £25.72
SporanoX 100mg capsules | 4 capsule [PoM] £3.67 | 15 capsule [PoM] £13.77 DT price = £3.64 | 60 capsule [PoM] £55.10

Oral solution

CAUTIONARY AND ADVISORY LABELS 9, 23

▶ Itraconazole (Non-proprietary)

▶ SporanoX (Janssen-Cilag Ltd)

Itraconazole 10 mg per 1 ml SporanoX 50mg/5ml oral solution sugar-free | 150 ml [PoM] £58.34 DT price = £58.34

Solution for infusion

EXCIPIENTS: May contain Propylene glycol

▶ SporanoX (Janssen-Cilag Ltd)

Itraconazole 10 mg per 1 ml SporanoX I.V. 250mg/25ml solution for infusion ampoules and diluent | 1 ampoule [PoM] £79.71

Voriconazole

● INDICATIONS AND DOSE

Invasive aspergillosis | Serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)

▶ BY MOUTH

- ▶ Child 2–11 years: Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required
- ▶ Child 12–14 years (body-weight up to 50 kg): Treatment should be initiated with intravenous regimen, and oral regimen should be considered only after there is a significant clinical improvement; maintenance 9 mg/kg every 12 hours, adjusted in steps of 1 mg/kg and increased if necessary up to 350 mg every 12 hours, then adjusted in steps of 50 mg as required
- ▶ Child 12–14 years (body-weight 50 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours
- ▶ Child 15–17 years (body-weight up to 40 kg): Initially 200 mg every 12 hours for 2 doses, then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours
- ▶ Child 15–17 years (body-weight 40 kg and above): Initially 400 mg every 12 hours for 2 doses, then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 2–11 years: Initially 9 mg/kg every 12 hours for 2 doses, then 8 mg/kg every 12 hours; adjusted in steps of 1 mg/kg as required; for max. 6 months
- ▶ Child 12–14 years (body-weight up to 50 kg): Initially 9 mg/kg every 12 hours for 2 doses, then 8 mg/kg every 12 hours; adjusted in steps of 1 mg/kg as required; for max. 6 months
- ▶ Child 12–14 years (body-weight 50 kg and above): Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every

12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

- ▶ Child 15–17 years: Initially 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours; reduced if not tolerated to 3 mg/kg every 12 hours; for max. 6 months

● CONTRA-INDICATIONS Acute porphyrias p. 562

- **CAUTIONS** Avoid exposure to sunlight · bradycardia · cardiomyopathy · electrolyte disturbances · history of QT interval prolongation · patients at risk of pancreatitis · symptomatic arrhythmias

- **INTERACTIONS** → Appendix 1 (antifungals, triazole). Caution with concomitant use with other drugs that prolong QT interval.

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · acute renal failure · agitation · alopecia · altered perception · anaemia · anxiety · asthenia · blood disorders · blurred vision · cheilitis · chest pain · confusion · depression · diarrhoea · dizziness · haematuria · hallucinations · headache · hypoglycaemia · hypokalaemia · hypotension · influenza-like symptoms · jaundice · leucopenia · nausea · oedema · pancytopenia · paraesthesia · photophobia · photosensitivity · pruritus · rash · respiratory distress syndrome · sinusitis · thrombocytopenia · tremor · visual disturbances · vomiting
- ▶ **Uncommon** Adrenocortical insufficiency · arrhythmias · arthritis · ataxia · blepharitis · cholecystitis · constipation · duodenitis · dyspepsia · flushing · fulminant hepatic failure · gingivitis · glossitis · hepatitis · hypersensitivity reactions · hypoaesthesia · hyponatraemia · nystagmus · optic neuritis · pancreatitis · psoriasis · QT interval prolongation · raised serum cholesterol · scleritis · Stevens-Johnson syndrome · syncope
- ▶ **Rare** Convulsions · discoid lupus erythematosus · extrapyramidal effects · hearing disturbances · hyperthyroidism · hypertension · hypothyroidism · insomnia · optic atrophy · pseudomembranous colitis · pseudoporphyria · retinal haemorrhage · taste disturbances (more common with oral suspension) · tinnitus · toxic epidermal necrolysis
- ▶ **Frequency not known** On long term treatment, squamous cell carcinoma of skin (particularly in presence of phototoxicity) · periostitis (particularly in transplant patients)

SPECIFIC SIDE-EFFECTS

▶ Common or very common

- ▶ With intravenous use Injection-site reactions

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hepatotoxicity** Hepatitis, cholestasis, and fulminant hepatic failure usually occur in the first 10 days; risk of hepatotoxicity increased in patients with haematological malignancy. Consider treatment discontinuation if severe abnormalities in liver function tests.
- ▶ **Phototoxicity** Phototoxicity occurs commonly. If phototoxicity occurs, consider treatment discontinuation; if treatment is continued, monitor for pre-malignant skin lesions and squamous cell carcinoma, and discontinue treatment if they occur.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Toxicity in *animal studies*—manufacturer advises avoid unless potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

● HEPATIC IMPAIRMENT

Child 12–17 years In mild to moderate hepatic cirrhosis use usual initial dose then halve subsequent doses. No information available for severe hepatic cirrhosis—

manufacturer advises use only if potential benefit outweighs risk.

● RENAL IMPAIRMENT

Child 2-12 years No information available.
Child 12-17 years Intravenous vehicle may accumulate if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—use intravenous infusion only if potential benefit outweighs risk, and monitor renal function; alternatively, use tablets or oral suspension (no dose adjustment required).

● MONITORING REQUIREMENTS

- ▶ Monitor renal function.
- ▶ Monitor liver function before starting treatment, then at least weekly for 1 month, and then monthly during treatment.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion*, reconstitute each 200 mg with 19 mL Water for Injections or Sodium Chloride 0.9% to produce a 10 mg/mL solution; dilute dose to concentration of 0.5–5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give intermittently at a rate not exceeding 3 mg/kg/hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include orange.

- **PATIENT AND CARER ADVICE** Patients and their carers should be advised to keep the alert card with them at all times.

Patients and their carers should be told how to recognise symptoms of liver disorder, and advised to seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Patients and their carers should be advised that patients should avoid intense or prolonged exposure to direct sunlight, and to avoid the use of sunbeds. In sunlight, patients should cover sun-exposed areas of skin and use a sunscreen with a high sun protection factor. Patients should seek medical attention if they experience sunburn or a severe skin reaction following exposure to light or sun.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 9, 11, 23

ANTIFUNGALS > OTHER

Flucytosine

● INDICATIONS AND DOSE

Systemic yeast and fungal infections | Adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections

▶ BY INTRAVENOUS INFUSION, OR BY MOUTH

▶ Neonate: 50 mg/kg every 12 hours.

▶ Child: Usual dose 50 mg/kg every 6 hours usually for not more than 7 days, alternatively 25–37.5 mg/kg every 6 hours usually for not more than 7 days, lower dose may be sufficient for sensitive organisms

Cryptococcal meningitis (adjunct to amphotericin)

▶ BY INTRAVENOUS INFUSION, OR BY MOUTH

▶ Neonate: 50 mg/kg every 12 hours.

▶ Child: 25 mg/kg every 6 hours for 2 weeks

- **UNLICENSED USE** Tablets not licensed.

- **CAUTIONS** Blood disorders

- **INTERACTIONS** → Appendix 1 (flucytosine).

- **SIDE-EFFECTS**

▶ **Common or very common** Diarrhoea · nausea · rashes · vomiting

▶ **Uncommon** Alterations in liver function tests · cardiotoxicity · confusion · convulsions · hallucinations · headache · sedation · toxic epidermal necrolysis · vertigo

▶ **Frequency not known** Aplastic anaemia · blood disorders · hepatic necrosis · hepatitis · leucopenia · thrombocytopenia

- **PREGNANCY** Teratogenic in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid.

- **RENAL IMPAIRMENT** Use normal dose every 12 hours if creatinine clearance 20–40 mL/minute; use normal dose every 24 hours if creatinine clearance 10–20 mL/minute; use initial normal dose if creatinine clearance less than 10 mL/minute and then adjust dose according to plasma-flucytosine concentration. In renal impairment liver- and kidney-function tests and blood counts required weekly.

● MONITORING REQUIREMENTS

▶ For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre).

▶ Liver- and kidney-function tests and blood counts required (weekly in blood disorders).

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, give over 20–40 minutes.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Ancotil** (Meda Pharmaceuticals Ltd)

Flucytosine 10 mg per 1 mL Ancotil 2.5g/250ml solution for infusion bottles | 5 bottle [PoM] £151.67 (Hospital only)

Griseofulvin

● INDICATIONS AND DOSE

Dermatophyte infections of the skin, scalp, hair and nails where topical therapy has failed or is inappropriate

► BY MOUTH

- Child 1 month–11 years: Usual dose 10 mg/kg daily (max. per dose 500 mg), increased if necessary to 20 mg/kg daily (max. per dose 1 g) for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses
- Child 12–17 years: 500 mg daily, increased if necessary to 1 g daily for severe infections; reduce dose when response occurs, daily dose may be taken once daily or in divided doses

Tinea capitis caused by *Trichophyton tonsurans*

► BY MOUTH

- Child 1 month–11 years: 15–20 mg/kg once daily (max. per dose 1 g), alternatively 15–20 mg/kg daily (max. per dose 1 g) in divided doses
- Child 12–17 years: 1 g once daily, alternatively 1 g daily in divided doses

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

● CONTRA-INDICATIONS

- With oral use Acute porphyrias p. 562 · systemic lupus erythematosus (risk of exacerbation)

- **INTERACTIONS** → Appendix 1 (griseofulvin).

● SIDE-EFFECTS

- **Rare** Erythema multiforme · toxic epidermal necrolysis

- **Very rare** Headache

- **Frequency not known** Abdominal pain · agitation · confusion · depression · diarrhoea · dizziness · dyspepsia · fatigue · glossitis · hepatotoxicity · impaired coordination · impaired hearing · leucopenia · menstrual disturbances · nausea · peripheral neuropathy · photosensitivity · rash · renal failure · sleep disturbances · systemic lupus erythematosus · taste disturbances · vomiting

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 1 month after administration to women (important: effectiveness of oral contraceptives may be reduced, additional contraceptive precautions e.g. barrier method, required). Men should avoid fathering a child during and for at least 6 months after administration

- **PREGNANCY** Avoid (fetotoxicity and teratogenicity in animals).

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Avoid in severe liver disease.

● PATIENT AND CARER ADVICE

Driving and skilled tasks

- With oral use May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced. Medicines for Children leaflet: Griseofulvin for fungal infections www.medicinesforchildren.org.uk/griseofulvin-for-fungal-infections

3.1 Pneumocystis pneumonia

Pneumocystis pneumonia

Overview

Pneumonia caused by *Pneumocystis jirovecii* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

Treatment

The recommended duration of treatment is generally 14–21 days.

Mild to moderate disease

Co-trimoxazole p. 330 in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone p. 358 or a combination of dapsone p. 358 with trimethoprim p. 338 is given by mouth for the treatment of mild to moderate disease [unlicensed indication] in children who cannot tolerate co-trimoxazole.

A combination of clindamycin p. 307 and primaquine p. 374 may be used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Severe disease

Co-trimoxazole in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate p. 358 given by intravenous infusion is an alternative for children who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion. If there is clinical improvement after 7–10 days of intravenous therapy with pentamidine isetionate, patients can be switched to oral treatment (e.g. atovaquone) to complete 21 days treatment.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia.

Adjunctive therapy

In moderate to severe pneumocystis infections associated with HIV infection, prednisolone p. 413 is given by mouth for 5 days (alternatively, hydrocortisone p. 411 may be given parenterally); the dose is then reduced over the next 16 days and then stopped. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

Prophylaxis

Prophylaxis against pneumocystis pneumonia should be given to all children with a history of this infection, and to all HIV-infected infants aged 1 month–1 year. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised children. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the child has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

Prophylaxis should also be given to infants aged 1 month–1 year who are suspected to be HIV-positive, or whose mothers had a viral load greater than 1000 HIV RNA copies/mL between 36 weeks' gestation and delivery; prophylaxis should be continued until HIV infection is excluded or until immunity recovers.

Co-trimoxazole by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. Co-trimoxazole may be used in infants born to mothers with a high risk of transmission of infection.

Inhaled pentamidine isetionate is better tolerated than parenteral pentamidine isetionate. Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in children unable to tolerate co-trimoxazole. It is effective but children may be prone to extrapulmonary infection. Alternatively, dapsone can be used.

ANTIPROTOZOALS

Atovaquone

• INDICATIONS AND DOSE

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole

► BY MOUTH

- Child 1–2 months: 15–20 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
- Child 3 months–1 year: 22.5 mg/kg twice daily for 14–21 days, dose to be taken with food, particularly high fat food
- Child 2–17 years: 15–20 mg/kg twice daily (max. per dose 750 mg) for 14–21 days, dose to be taken with food, particularly high fat food

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Other causes of pulmonary disease should be sought and treated · initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy)
- **INTERACTIONS** → Appendix 1 (atovaquone).
- **SIDE-EFFECTS** Anaemia · diarrhoea · fever · headache · hyponatraemia · insomnia · nausea · neutropenia · pruritus · rash · Stevens-Johnson syndrome · vomiting
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. Monitor more closely in hepatic impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution. Monitor more closely in renal impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral suspension

CAUTIONARY AND ADVISORY LABELS 21

► Wellvone (GlaxoSmithKline UK Ltd)

Atovaquone 150 mg per 1 mL Wellvone 750mg/5ml oral suspension sugar-free | 226 mL [PoM] £486.37

Dapsone

• INDICATIONS AND DOSE

Treatment of mild to moderate *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (in combination with trimethoprim)

► BY MOUTH

- Child 1 month–11 years: 2 mg/kg once daily (max. per dose 100 mg)
- Child 12–17 years: 100 mg once daily

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia

► BY MOUTH

- Child: 2 mg/kg once daily (max. per dose 100 mg)

- **UNLICENSED USE** Not licensed for treatment of pneumocystis (*P. jirovecii*) pneumonia. Monotherapy not licensed for children for prophylaxis of *P. jirovecii* pneumonia.
- **CAUTIONS** Anaemia (treat severe anaemia before starting) · avoid in Acute porphyrias p. 562 · cardiac disease · G6PD deficiency · pulmonary disease · susceptibility to haemolysis
- **INTERACTIONS** → Appendix 1 (dapsone).
- **SIDE-EFFECTS**
 - Rare Stevens-Johnson syndrome · toxic epidermal necrolysis
 - Frequency not known Agranulocytosis · allergic dermatitis · anorexia · dapsone syndrome · haemolysis · headache · hepatitis · insomnia · methaemoglobinaemia · nausea · neuropathy · psychosis · tachycardia · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - Dapsone syndrome If dapsone syndrome occurs (rash with fever and eosinophilia)—discontinue immediately (may progress to exfoliative dermatitis, hepatitis, hypoalbuminaemia, psychosis and death).
- **PREGNANCY** Folic acid p. 533 (higher dose) should be given to mother throughout pregnancy; neonatal haemolysis and methaemoglobinaemia reported in third trimester.
- **BREAST FEEDING** Haemolytic anaemia; although significant amount in milk, risk to infant very small unless infant is G6PD deficient.
- **PATIENT AND CARER ADVICE**
 - Blood disorders On long-term treatment, patients and their carers should be told how to recognise signs of blood disorders and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, purpura, bruising or bleeding develop.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 8

Dapsone 100 mg Dapsone 100mg tablets | 28 tablet [PoM] £117.80 DT price = £104.60

Pentamidine isetionate

• INDICATIONS AND DOSE

Treatment of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

► BY INTRAVENOUS INFUSION

- Child: 4 mg/kg once daily for at least 7–10 days

Prophylaxis of *Pneumocystis jirovecii* (*Pneumocystis carinii*) pneumonia (specialist use only)

► BY INHALATION OF NEBULISED SOLUTION

- Child 5–17 years: 300 mg every 4 weeks, alternatively 150 mg every 2 weeks, using suitable equipment—consult product literature

Visceral leishmaniasis (specialist use only)

► BY DEEP INTRAMUSCULAR INJECTION

- Child 1–17 years: 3–4 mg/kg once daily on alternate days, maximum total of 10 injections, course may be repeated if necessary

Cutaneous leishmaniasis (specialist use only)

► BY DEEP INTRAMUSCULAR INJECTION

- Child 1–17 years: 3–4 mg/kg 1–2 times a week until condition resolves

Trypanosomiasis (specialist use only)

► BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

- Child 1–17 years: 4 mg/kg once daily or on alternate days for a total of 7–10 injections

- **UNLICENSED USE** Not licensed for prevention of pneumocystis pneumonia in children.
- **CAUTIONS** Anaemia · bradycardia · coronary heart disease · history of ventricular arrhythmias · hyperglycaemia · hypertension · hypoglycaemia · hypokalaemia · hypomagnesaemia · hypotension · leucopenia · risk of severe hypotension following administration · thrombocytopenia
- **INTERACTIONS** → Appendix 1 (pentamidine isetionate). Caution with concomitant use of other drugs that prolong the QT interval.
- **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

Abnormal liver-function tests · acute renal failure · anaemia · arrhythmias (can be severe and sometimes fatal) · azotaemia · dizziness · flushing · hyperglycaemia · hyperkalaemia · hypocalcaemia · hypoglycaemia (can be severe and sometimes fatal) · hypotension (can be severe and sometimes fatal) · leucopenia · nausea · pancreatitis (can be severe and sometimes fatal) · rash · Stevens-Johnson syndrome · syncope · taste disturbances · thrombocytopenia · vomiting

SPECIFIC SIDE-EFFECTS

- When used by inhalation Bronchoconstriction (may be prevented by prior use of bronchodilators) · cough · shortness of breath
- With intramuscular use Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)
- With intravenous use Injection site reactions (muscle necrosis, discomfort, pain, induration, abscess formation)
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Reduce intravenous dose for pneumocystis pneumonia if creatinine clearance less than 10 mL/minute: in *life-threatening infection*, use 4 mg/kg once daily for 7–10 days, then 4 mg/kg on alternate days to complete course of at least 14 doses; in *less severe infection*, use 4 mg/kg on alternate days for at least 14 doses.
- **MONITORING REQUIREMENTS**
- Monitor blood pressure before starting treatment, during administration, and at regular intervals, until treatment concluded.
- Carry out laboratory monitoring according to product literature.
- **DIRECTIONS FOR ADMINISTRATION** Patient should be lying down when receiving drug parenterally. Direct intravenous injection should be avoided whenever possible and **never** given rapidly; intramuscular injections should be deep and preferably given into the buttock. For *intravenous infusion*, reconstitute 300 mg with 3–5 mL Water for Injections (displacement value may be significant), then dilute required dose with 50–250 mL Glucose 5% or Sodium Chloride 0.9%; give over at least 60 minutes.
Powder for injection (dissolved in water for injection) may be used for nebulisation.
- **HANDLING AND STORAGE** Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- **Pentacarinat** (Sanofi)

Pentamidine isetionate 300 mg Pentacarinat 300mg powder for solution for injection vials | 5 vial [PoM] £158.86

Drugs for threadworms

Anthelmintics are effective in threadworm (pinworms, *Enterobius vermicularis*) infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Washing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole p. 361 is the drug of choice for treating threadworm infection in patients of all ages over 6 months. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

Ascariides (common roundworm infections)

Mebendazole is effective against *Ascaris lumbricoides* and is generally considered to be the drug of choice.

Levamisole p. 361 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative when mebendazole cannot be used. It is very well tolerated.

Drugs for tapeworm infections**Taenidicids**

Niclosamide [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in *Taenia solium* infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel p. 362 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is as effective as niclosamide.

Hydatid disease

Cysts caused by *Echinococcus granulosus* grow slowly and asymptomatic patients do not always require treatment.

Surgical treatment remains the method of choice in many situations. Albendazole below [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to *E. multilocularis* is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

Drugs for hookworms

Hookworms (ancylostomiasis, necatoriasis) live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole has a useful broad-spectrum activity, and is effective against hookworms. Albendazole [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is an alternative. Levamisole is also effective in children.

Schistosomicides (bilharziasis)

Adult *Schistosoma haematobium* worms live in the genito-urinary veins and adult *S. mansoni* in those of the colon and mesentery. *S. japonicum* is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck Serono (Cysticide®) and is effective against all human schistosomes. No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Filaricides

Diethylcarbamazine [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions, treatment in adults and children over 1 month, is commenced with a dose of diethylcarbamazine citrate on the first day and increased gradually over 3 days. Length of treatment varies according to infection type, and usually gives a radical cure for these infections. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases specialist advice should be sought, and treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement.

Ivermectin p. 361 [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is very effective in *onchocerciasis* and it is now the drug of choice; reactions are usually slight. Diethylcarbamazine or suramin should no longer be used for *onchocerciasis* because of their toxicity.

Drugs for cutaneous larva migrans (creeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical tiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or **tiabendazole** (tiabendazole) by mouth [all unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

Drugs for strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) is the treatment of choice for chronic *Strongyloides* infection in adults and children over 5 years. Albendazole [unlicensed] (available from 'special order' manufacturers or specialist importing companies) is an alternative given to adults and children over 2 years.

ANTHELMINTICS

Albendazole

• INDICATIONS AND DOSE

Chronic *Strongyloides* infection

► BY MOUTH

- Child 2–17 years: 400 mg twice daily for 3 days, dose may be repeated after 3 weeks if necessary

Hydatid disease, in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases

► BY MOUTH

- Child 2–17 years: 7.5 mg/kg twice daily (max. per dose 400 mg twice daily) for 28 days followed by 14-day break, repeated for up to 2–3 cycles

Hookworm infections

► BY MOUTH

- Child 2–17 years: 400 mg for 1 dose

- **UNLICENSED USE** Albendazole is an unlicensed drug.

- **INTERACTIONS** → Appendix 1 (albendazole).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9

► Albendazole (Non-proprietary)

Albendazole 400 mg Eskazole 400mg tablets | 60 tablet [PoM] no price available

Chewable tablet

CAUTIONARY AND ADVISORY LABELS 9

► Albendazole (Non-proprietary)

Albendazole 200 mg Zentel 200mg chewable tablets | 6 tablet [PoM] no price available

Albendazole 400 mg Zentel 400mg chewable tablets | 1 tablet [PoM] no price available | 3 tablet [PoM] no price available

Diethylcarbamazine

• INDICATIONS AND DOSE

Wuchereria bancrofti infections | *Brugia malayi* infections

► BY MOUTH

- Child 1 month–9 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 3 mg/kg daily in divided doses, dose to be increased gradually over 3 days
- Child 10–17 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

Loa loa infections

► BY MOUTH

- Child 1 month–9 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 3 mg/kg daily in divided doses, dose to be increased gradually over 3 days

- ▶ Child 10–17 years: Initially 1 mg/kg daily in divided doses on the first day, then increased to 6 mg/kg daily in divided doses, dose to be increased gradually over 3 days

● **UNLICENSED USE** Diethylcarbamazine is an unlicensed drug.

● **INTERACTIONS** → Appendix 1 (diethylcarbamazine).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

Ivermectin

● INDICATIONS AND DOSE

Chronic *Strongyloides* infection

▶ BY MOUTH

▶ Child 5–17 years: 200 micrograms/kg daily for 2 days

Onchocerciasis

▶ BY MOUTH

▶ Child 5–17 years: 150 micrograms/kg for 1 dose, retreatment at intervals of 6 to 12 months may be required depending on symptoms

Scabies, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone

▶ BY MOUTH

▶ Child: (consult product literature)

● **UNLICENSED USE** Ivermectin is an unlicensed drug.

● **INTERACTIONS** → Appendix 1 (ivermectin).

● **SIDE-EFFECTS** Aggravation of itching · aggravation of rash

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

▶ **Ivermectin (Non-proprietary)**

Ivermectin 3 mg Stromectol 3mg tablets | 4 tablet [PoM] no price available | 20 tablet [PoM] no price available

Levamisole

● INDICATIONS AND DOSE

Roundworm infections

▶ BY MOUTH

▶ Child: 2.5–3 mg/kg (max. per dose 150 mg) for 1 dose

Hookworm infections

▶ BY MOUTH

▶ Child: 2.5 mg/kg (max. per dose 150 mg) for 1 dose, dose to be repeated after 7 days if severe

Nephrotic syndrome (initiated under specialist supervision)

▶ BY MOUTH

▶ Child: 2.5 mg/kg once daily on alternate days (max. per dose 150 mg)

● **UNLICENSED USE** Not licensed.

● **CONTRA-INDICATIONS** Blood disorders

● **CAUTIONS** Epilepsy · juvenile idiopathic arthritis · Sjögren's syndrome

● **INTERACTIONS** → Appendix 1 (levamisole).

● **SIDE-EFFECTS** Arthralgia (on *prolonged treatment*) · blood disorders (on *prolonged treatment*) · convulsions (on *prolonged treatment*) · diarrhoea · dizziness · headache · influenza-like syndrome (on *prolonged treatment*) · insomnia (on *prolonged treatment*) · myalgia (on *prolonged*

treatment) · nausea · rash (on *prolonged treatment*) · taste disturbances (on *prolonged treatment*) · vasculitis (on *prolonged treatment*) · vomiting

● **PREGNANCY** Embryotoxic in *animal* studies, avoid if possible.

● **BREAST FEEDING** No information available.

● **HEPATIC IMPAIRMENT** Use with caution—dose adjustment may be necessary.

***Schistosoma japonicum* worm infections**

- ▶ BY MOUTH
- ▶ Child 4-17 years: 20 mg/kg 3 times a day for 1 day

- **UNLICENSED USE** Praziquantel is an unlicensed drug.

- **INTERACTIONS** → Appendix 1 (praziquantel).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

- ▶ **Praziquantel (Non-proprietary)**
Praziquantel 150 mg Cesol 150mg tablets | 6 tablet [PoM] no price available
- Praziquantel 600 mg** Biltricide 600mg tablets | 6 tablet [PoM] no price available
- ▶ **Cysticide** (Imported (Germany))
Praziquantel 500 mg Cysticide 500mg tablets | 90 tablet [PoM] no price available

relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For *amoebic abscesses* of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with large volumes of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

Trichomonacides

Metronidazole is the treatment of choice for *Trichomonas vaginalis* infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole may be tried.

Antigiardial drugs

Metronidazole is the treatment of choice for *Giardia lamblia* infections. Tinidazole may be used as an alternative to metronidazole.

Leishmaniocides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate p. 363, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dosage varies with different geographical regions and expert advice should be obtained. Skin lesions can also be treated with sodium stibogluconate.

Amphotericin p. 351 is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*AmBisome*®). *Abelcet*®, a lipid formulation of amphotericin is also likely to be effective but less information is available.

Pentamidine isethionate p. 358 (pentamidine isethionate) has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies).

Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

Drugs for toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma chorioretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine p. 375 and sulfadiazine p. 331, given for several weeks (expert advice **essential**). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin p. 307 or clarithromycin p. 309 or azithromycin p. 308. Long-term

5 Protozoal infection**Antiprotozoal drugs****Amoebicides**

Metronidazole p. 313 is the drug of choice for *acute invasive amoebic dysentery* since it is very effective against vegetative forms of *Entamoeba histolytica* in ulcers. Tinidazole p. 315 is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate p. 281.

Diloxanide furoate is the drug of choice for asymptomatic patients with *E. histolytica* cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is

secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus; specialist advice should be sought on management. Spiramycin [unlicensed] (available from 'special-order' manufacturers or specialist importing companies) may reduce the risk of transmission of maternal infection to the fetus. When there is evidence of placental or fetal infection, pyrimethamine may be given with sulfadiazine and folic acid p. 515 after the first trimester.

In neonates without signs of toxoplasmosis, but born to mothers known to have become infected, spiramycin is given while awaiting laboratory results. If toxoplasmosis is confirmed in the infant, pyrimethamine and sulfadiazine are given for 12 months, together with folic acid.

5.1 Leishmaniasis

ANTIPROTOZOALS

Sodium stibogluconate

● INDICATIONS AND DOSE

Visceral leishmaniasis (specialist use only)

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 20 mg/kg daily for at least 20 days

● **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

● **CAUTIONS** Heart disease (withdraw if conduction disturbances occur) • mucocutaneous disease • predisposition to QT interval prolongation • treat intercurrent infection (e.g. pneumonia)

CAUTIONS, FURTHER INFORMATION

▶ **Mucocutaneous disease** Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid.

● **INTERACTIONS** → Appendix 1 (sodium stibogluconate). Caution with concomitant use of drugs that prolong QT interval.

● SIDE-EFFECTS

- ▶ **Rare** Bleeding from gums • bleeding from nose • fever • flushing • jaundice • rash • substernal pain • sweating • vertigo
- ▶ **Frequency not known** Abdominal pain • anaphylaxis • anorexia • arthralgia • coughing • diarrhoea • ECG changes • headache • lethargy • myalgia • nausea • pain on intramuscular injection • pain on intravenous administration • pancreatitis • thrombosis on intravenous administration • vomiting

● **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Amount probably too small to be harmful.

● **HEPATIC IMPAIRMENT** Use with caution.

● **RENAL IMPAIRMENT** Avoid in significant impairment.

● **MONITORING REQUIREMENTS** Monitor ECG before and during treatment.

● **DIRECTIONS FOR ADMINISTRATION** Intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain occur. Injection should be filtered immediately before administration using a filter of 5 microns or less.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

▶ **Pentostam** (GlaxoSmithKline UK Ltd)

Antimony pentavalent (as Sodium stibogluconate) 100 mg per 1 ml Pentostam 10g/100ml solution for injection vials | 1 vial [PoM] £66.43

5.2 Malaria

Antimalarials

Artemether with lumefantrine

Artemether with lumefantrine p. 370 is licensed for the treatment of acute non-complicated falciparum malaria.

Chloroquine

Chloroquine p. 372 is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant falciparum malaria is still low. It is also used with proguanil hydrochloride p. 375 when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see Recommended regimens for prophylaxis against malaria p. 366).

Chloroquine is **no longer recommended** for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is *not known* or if the infection is *mixed*; in these cases treatment should be with quinine p. 376, Malarone[®], or Riamet[®]. It is still recommended for the treatment of non-falciparum malaria.

Mefloquine

Mefloquine p. 373 is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine resistant falciparum malaria (for details, see Recommended regimens for prophylaxis against malaria p. 366).

Mefloquine is now rarely used for the treatment of falciparum malaria because of increased resistance. It is rarely used for the treatment of non-falciparum malaria because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

Piperaquine with arteminol

Arteminol with piperaquine phosphate p. 371 is not recommended for the first-line treatment of acute uncomplicated falciparum malaria because there is limited experience of its use in travellers who usually reside in areas where malaria is not endemic. Piperaquine has a long half-life.

Primaquine

Primaquine p. 374 is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment.

Proguanil

Proguanil hydrochloride is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria, (for details, see Recommended regimens for prophylaxis against malaria p. 366).

Proguanil hydrochloride used alone is not suitable for the treatment of malaria; however, Malarone[®] (a combination of atovaquone with proguanil hydrochloride p. 371) is licensed for the treatment of acute uncomplicated falciparum malaria. Malarone[®] is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Malarone[®] is also used as an alternative to mefloquine or doxycycline p. 332. Malarone[®] is particularly suitable for short trips to highly chloroquine-

resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

Pyrimethamine

Pyrimethamine p. 375 should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine p. 375 is not recommended for the *prophylaxis of malaria*, but can be used in the *treatment of falciparum malaria with (or following) quinine*.

Quinine

Quinine is not suitable for the *prophylaxis of malaria*.

Quinine is used for the *treatment of falciparum malaria* or if the infective species is *not known* or if the infection is mixed (for details see Malaria, treatment p. 365).

Tetracyclines

Doxycycline is used in adults and children over 12 years for the *prophylaxis of malaria* in areas of *widespread mefloquine or chloroquine resistance*. Doxycycline is also used as an alternative to mefloquine or *Malarone*® (for details, see Recommended regimens for prophylaxis against malaria p. 366).

Malaria, prophylaxis

Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria
- extent of drug resistance
- efficacy of the recommended drugs
- side-effects of the drugs
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen)

Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. **Weight is a better guide than age.** If in doubt obtain advice from specialist centre (see under Malaria, treatment p. 365).

Protection against bites

Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin provide the most effective barrier protection against insects (infants should sleep with a mosquito net stretched over the cot or baby carrier); mats and vaporised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. When sunscreen is also required, DEET should be applied after the sunscreen. DEET reduces the SPF of sunscreen, so a sunscreen of SPF 30–50 should be applied. Long sleeves and trousers worn after dusk also provide protection against bites.

Length of prophylaxis

In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (2–3 weeks in the case of mefloquine p. 373) before travel into an endemic area; *Malarone*® or doxycycline p. 332 prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for **4 weeks after leaving** (except for *Malarone*® prophylaxis which should be stopped 1 week after

leaving). For extensive journeys across different regions, the traveller must be protected in all areas of risk.

In those requiring long-term prophylaxis, chloroquine p. 372 and proguanil hydrochloride p. 375 may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although, if it is tolerated in the short term, there is no evidence of harm when it is used for up to 3 years). Doxycycline can be used for up to 2 years. *Malarone*® can be used for up to 1 year. Prophylaxis with mefloquine, doxycycline, or *Malarone*® may be considered for longer durations if it is justified by the risk of exposure to malaria. Specialist advice should be sought for long-term prophylaxis.

Return from malarial region

It is important to be aware that **any illness** that occurs within 1 year and **especially within 3 months of return might be malaria** even if all recommended precautions against malaria were taken. Travellers should be **warned of this** and told that if they develop any illness **particularly within 3 months** of their return they should go **immediately** to a doctor and specifically mention their exposure to malaria.

Epilepsy

Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a history of epilepsy. In areas *without chloroquine resistance* proguanil alone is recommended; in areas *with chloroquine resistance*, doxycycline or *Malarone*® may be considered.

Asplenia

Asplenic individuals (or those with severe splenic dysfunction) are at particular risk of severe malaria. If travel to malarious areas is unavoidable, rigorous precautions are required against contracting the disease.

Renal impairment

Avoidance (or dosage reduction) of proguanil hydrochloride is recommended since it is excreted by the kidneys. *Malarone*® should not be used for prophylaxis in patients with estimated glomerular filtration rate less than 30 mL/minute/1.73m². Chloroquine is only partially excreted by the kidneys and reduction of the dose for prophylaxis is not required except in severe impairment. Mefloquine is considered to be appropriate to use in renal impairment and does not require dosage reduction. Doxycycline is also considered to be appropriate.

Pregnancy

Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil hydrochloride can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil hydrochloride, folic acid p. 533 (in doses greater than standard pregnancy prophylaxis) should be given for at least the first trimester. The centres listed (see Malaria, treatment p. 365) should be consulted for advice on prophylaxis in chloroquine-resistant areas. Although the manufacturer advises that mefloquine should not be used during pregnancy, particularly in the first trimester, unless the potential benefit outweighs the risk, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy; however, it can be used for malaria prophylaxis if other regimens are unsuitable, and if the entire course of doxycycline can be completed before 15 weeks' gestation [unlicensed]. *Malarone*® should be avoided during pregnancy, however, it can be considered during the second and third trimesters if there is no suitable alternative.

Breast-feeding

Prophylaxis is required in **breast-fed infants**; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants

Travellers taking warfarin sodium p. 89 should begin chemoprophylaxis 2–3 weeks before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Standby treatment

Children and their carers visiting remote, malarious areas for prolonged periods should carry standby treatment if they are likely to be more than 24 hours away from medical care. Self-medication should be **avoided** if medical help is accessible.

In order to avoid excessive self-medication, the traveller should be provided with **written instructions** that urgent medical attention should be sought if fever (38°C or more) develops 7 days (or more) after arriving in a malarious area and that self-treatment is indicated if medical help is not available within 24 hours of fever onset.

In view of the continuing emergence of resistant strains and of the different regimens required for different areas expert advice should be sought on the best treatment course for an individual traveller. A drug used for chemoprophylaxis should not be considered for standby treatment for the same traveller.

Specific recommendations

Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice. See also *Recommended regimens for prophylaxis against malaria*.

Important

Settled immigrants (or long-term visitors) to the UK may be unaware that **any immunity they may have acquired while living in malarious areas is lost rapidly** after migration to the UK, or that any non-malarious areas where they lived previously **may now be malarious**.

Treatment

Recommendations on the prophylaxis and treatment of malaria reflect guidelines agreed by UK malaria specialists. Choice will depend on the age of the child.

If the infective species is **not known**, or if the infection is **mixed**, initial treatment should be as for *falciparum malaria* with quinine p. 376, *Malarone*® (atovaquone with proguanil hydrochloride p. 371), or *Riamet*® (artemether with lumefantrine p. 370). *Falciparum malaria* can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.

Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by *Plasmodium falciparum*. In most parts of the world *P. falciparum* is now resistant to chloroquine p. 372 which should not therefore be given for treatment. Quinine, *Malarone*® (atovaquone with proguanil hydrochloride), or *Riamet*® (artemether with lumefantrine) can be given by mouth if the child can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion if the child is seriously ill or unable to take tablets. Mefloquine p. 373 is now rarely used for treatment because of concerns about resistance.

Oral quinine is well tolerated by children although the salts are bitter. Quinine is given by mouth together with or followed by clindamycin p. 307 [unlicensed indication] or, in children over 12 doxycycline p. 332.

If the parasite is likely to be sensitive, pyrimethamine with sulfadoxine p. 375 as a single dose [unlicensed] may be given (instead of either clindamycin or doxycycline) together with, or after, a course of quinine.

Alternatively, *Malarone*®, or *Riamet*® may be given instead of quinine. It is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after *Malarone*® or *Riamet*® treatment.

If the child is seriously ill or unable to swallow tablets, or if more than 2% of red blood cell are parasitized, quinine should be given by *intravenous infusion* [unlicensed] (until patient can swallow tablets to complete the 7-day course *together with or followed by either* doxycycline in children over 12 years, or clindamycin).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous **artesunate** may be available for 'named-patient' use.

Pregnancy

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The treatment doses of oral and intravenous quinine (including the loading dose) can safely be given in pregnancy. Clindamycin [unlicensed indication] should be given for 7 days with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development in fetus); pyrimethamine with sulfadoxine, *Malarone*®, and *Riamet*® are also best avoided until more information is available. Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on optimal doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for 'named patient' use.

Non-falciparum malaria (treatment)

Non-falciparum malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. *P. knowlesi* is also present in the Asia-Pacific region. Chloroquine is the drug of choice for the treatment of non-falciparum malaria (but chloroquine-resistant *P. vivax* has been reported in the Indonesian archipelago, the Malay

Key to recommended regimens for prophylaxis against malaria

Codes for regimens	Details of regimens for prophylaxis against malaria
1	Chemoprophylaxis not recommended, but avoid mosquito bites and consider malaria if fever presents
2	Chloroquine only
3	Chloroquine with proguanil
4	Atovaquone with proguanil hydrochloride or doxycycline or mefloquine
5	Atovaquone with proguanil hydrochloride or doxycycline

Specific recommendations

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Afghanistan	Risk below 2000 m from May–November	3
	Low risk below 2000 m from December–April	1
Algeria	Very low risk in Illizi department only	1
Andaman and Nicobar Islands (India)	Risk present	1
Angola	High risk	4
Argentina	Low risk in low altitude areas of Salta provinces bordering Bolivia and in Chaco, Corrientes, and Misiones provinces close to border with Paraguay and Brazil	2
	No risk in Iguazu Falls and areas other than those above	1
Armenia	No risk	1
Azerbaijan	Low to no risk	1
Bangladesh	High risk in Chittagong Hill Tract districts (but not Chittagong city)	4
	Low to no risk in Chittagong city and other areas, except Chittagong Hill Tract districts	1
Belize	Low risk in rural areas	2
	No risk in Belize district (including Belize city and islands)	1
Benin	High risk	4
Bhutan	Risk in southern belt districts, along border with India: Chukha, Geyleg-phug, Samchi, Samdrup Jonkhar, and Shemgang	3
	Low to no risk in areas other than those above	1
Bolivia	High risk in Amazon basin	4
	Risk in rural areas below 2500 m (other than above)	2
	No risk above 2500 m	1
Botswana	High risk from November–June in northern half, including Okavango Delta area	4
	Low risk from July–October in northern half; low to no risk all year in southern half	1
Brazil	Risk in Amazon basin, including city of Manaus	4
	Very low risk in areas other than those above, and no risk in Iguazu Falls	1
Brunei Darussalam	Very low risk	1
Burkina Faso	High risk	4
Burundi	High risk	4
Cambodia	High risk, with widespread chloroquine and mefloquine resistance, in western provinces bordering Thailand	5
	High risk in areas other than those above and below	4
	Very low risk in Angkor Wat and Lake Tonle Sap, including Siem Reap; no risk in Phnom Penh	1
Cameroon	High risk	4
Cape Verde	Very low risk on island of Santiago (Sao Tiago) and Boa Vista	1
Central African Republic	High risk	4
Chad	High risk	4
China	High risk in Yunnan and Hainan provinces	4
	Very low risk in areas other than those above and below	1
	No risk in Hong Kong	–
Colombia	High risk in rural areas below 1600 m	4
	Low to no risk above 1600 m and in Cartagena	1
Comoros	High risk	4

Country	Comments on risk of malaria and regional or seasonal variation	Codes for regimens
Congo	High risk	4
Costa Rica	Risk in Limon province (but not city of Limon)	2
	Very low risk in areas other than those above	1
Cote d'Ivoire (Ivory Coast)	High risk	4
Democratic Republic of the Congo	High risk	4
Djibouti	High risk	4
Dominican Republic	Risk in all areas except cities of Santiago and Santo Domingo	2
	Cities of Santiago and Santo Domingo	1
East Timor (Timor-Leste)	High risk	4
Ecuador	Risk in areas below 1500 m including coastal provinces and Amazon basin (no risk in Galapagos islands or city of Guayaquil)	4
Egypt	No risk	1
El Salvador	Low risk in rural areas of Santa Ana, Ahuachapán, and La Unión provinces in western part of country; low to no risk in other areas	1
Equatorial Guinea	High risk	4
Eritrea	High risk below 2200 m	4
Ethiopia	High risk below 2000 m	4
French Guiana	High risk (particularly in border areas) except city of Cayenne or Devil's Island (Ile du Diable)	4
	No risk in city of Cayenne or Devil's Island (Ile du Diable)	1
Gabon	High risk	4
Gambia	High risk	4
Georgia	Very low risk in rural south east from June–October	1
Ghana	High risk	4
Guatemala	Low risk below 1500 m	2
	No risk in Guatemala City, Antigua, or Lake Atitlan	-
Guinea	High risk	4
Guinea-Bissau	High risk	4
Guyana	High risk in all interior regions	4
	Very low risk in Georgetown and coastal region	1
Haiti	Risk present	2
Honduras	Risk below 1000 m and in Roatán and other Bay Islands (no risk in San Pedro Sula or Tegucigalpa)	2
India	High risk in states of Assam and Orissa, districts of East Godavari, Srikakulam, Vishakhapatnam, and Vizianagaram in the state of Andhra Pradesh, and districts of Balaghat, Dindori, Mandla, and Seoni in the state of Madhya Pradesh	4
	Risk in areas other than those above or below (including Goa, Andaman and Nicobar islands)	1
	No risk in Lakshadweep islands	-
Indonesia	High risk in Lombok and Irian Jaya (Papua)	4
	Risk in areas other than those above or below	3
	Very low risk in Bali, and cities on islands of Java and Sumatra	1
	No risk in city of Jakarta	-
Indonesia (Borneo)	High risk	4
Iran	Risk from March–November in rural south eastern provinces and in north, along Azerbaijan border in Ardabil, and near Turkmenistan border in North Khorasan	3
	Low to no risk in areas other than those above	1
Iraq	Very low risk from May–November in rural northern area below 1500 m	1
Kenya	High risk below 2500 m (except city of Nairobi)	4
	Very low risk in the highlands above 2500 m and in city of Nairobi	1
Kyrgyzstan	Very low risk from June–October in southwest areas bordering Tajikistan and Uzbekistan	1

Peninsula, including Myanmar, and eastward to Southern Vietnam).

For the treatment of chloroquine-resistant non-falciparum malaria, *Malarone*® [unlicensed indication], quinine, or *Riamet*® [unlicensed indication] can be used; as with chloroquine, primaquine p. 374 should be given for radical cure.

Chloroquine alone is adequate for *P. malariae* and *P. knowlesi* infections but in the case of *P. vivax* and *P. ovale*, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine.

For a radical cure, primaquine [unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age.

Parenteral

If the child is unable to take oral therapy, quinine can be given by intravenous infusion, changed to oral chloroquine as soon as the patient's condition permits.

Pregnancy

Treatment doses of chloroquine can be given for non-falciparum malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be **postponed** until the pregnancy is over; instead chloroquine should be continued, given weekly, during the pregnancy.

ANTIPROTOZOALS > ANTIMALARIALS

Artemether with lumefantrine

● INDICATIONS AND DOSE

Treatment of acute uncomplicated falciparum malaria |

Treatment of chloroquine-resistant non-falciparum malaria

► BY MOUTH

- Child (body-weight 5–14 kg): Initially 1 tablet, followed by 1 tablet for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours)
- Child (body-weight 15–24 kg): Initially 2 tablets, followed by 2 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours)
- Child (body-weight 25–34 kg): Initially 3 tablets, followed by 3 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)
- Child 12–17 years (body-weight 35 kg and above): Initially 4 tablets, followed by 4 tablets for 5 doses each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours)

● **UNLICENSED USE** Use in treatment of non-falciparum malaria is an unlicensed indication.

● **CONTRA-INDICATIONS** Family history of congenital QT interval prolongation · family history of sudden death · history of arrhythmias · history of clinically relevant bradycardia · history of congestive heart failure accompanied by reduced left ventricular ejection fraction

● **CAUTIONS** Avoid in Acute porphyrias p. 562 · electrolyte disturbances

● **INTERACTIONS** → Appendix 1 (artemether with lumefantrine). Caution if concomitant use with other drugs known to cause QT-interval prolongation.

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · anorexia · arthralgia · asthenia · cough · diarrhoea · dizziness · headache · myalgia · nausea · palpitation · paraesthesia · prolonged QT interval · pruritus · rash · sleep disturbances · vomiting

► **Uncommon** Ataxia · clonus · hypoaesthesia

● **PREGNANCY** Toxicity in *animal* studies with artemether. Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises avoid breastfeeding for at least 1 week after last dose. Present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment. In severe renal impairment monitor ECG and plasma potassium concentration.

● **MONITORING REQUIREMENTS** Monitor patients unable to take food (greater risk of recrudescence).

● **DIRECTIONS FOR ADMINISTRATION** Tablets may be crushed just before administration.

● PATIENT AND CARER ADVICE

Driving and skilled tasks

Dizziness may affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

Artemether 20 mg, Lumefantrine 120 mg | Riamet tablets |

24 tablet | **[PoM]** £22.50

Artenimol with piperazine phosphate

(Piperazine tetraphosphate with dihydroartemisinin)

● INDICATIONS AND DOSE

Treatment of uncomplicated falciparum malaria

► BY MOUTH

► Child 6 months–17 years (body-weight 7–12 kg): 0.5 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

► Child 6 months–17 years (body-weight 13–23 kg): 1 tablet once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

► Child 6 months–17 years (body-weight 24–35 kg): 2 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

► Child 6 months–17 years (body-weight 36–74 kg): 3 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

► Child 6 months–17 years (body-weight 75–99 kg): 4 tablets once daily for 3 days, max. 2 courses in 12 months; second course given at least 2 months after first course

● **CONTRA-INDICATIONS** Acute myocardial infarction · bradycardia · congenital long QT syndrome · electrolyte disturbances · family history of sudden death · heart failure with reduced left ventricular ejection fraction · history of symptomatic arrhythmias · left ventricular hypertrophy · risk factors for QT interval prolongation · severe hypertension

● **INTERACTIONS** → Appendix 1 (artenimol with piperazine).

Piperaquine has a long half-life; there is a potential for drug interactions to occur for up to 3 months after treatment has been stopped. Concomitant use with other drugs known to prolong the QT interval contra-indicated.

● SIDE-EFFECTS

► **Common or very common** Abdominal pain · anaemia · blood disorders · conjunctivitis · cough · diarrhoea · irregular heart rate · leucopenia · malaise · QT interval prolonged · rash · thrombocytopenia · vomiting

► **Uncommon** Acanthosis · arrhythmias · arthralgia · convulsions · headache · heart murmur · hepatitis · hepatomegaly · influenza-like symptoms · jaundice · nausea · stomatitis

● **PREGNANCY** Teratogenic in *animal* studies—manufacturer advises use only if other antimalarials cannot be used.

● **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.

● **HEPATIC IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe hepatic impairment.

● **RENAL IMPAIRMENT** No information available in moderate to severe impairment. Manufacturer advises monitor ECG and plasma-potassium concentration in moderate to severe renal impairment.

● MONITORING REQUIREMENTS

► Consider obtaining ECG in all patients before third dose and 4–6 hours after third dose. If QT_c interval more than 500 milliseconds, discontinue treatment and monitor ECG for a further 24–48 hours.

► Obtain ECG as soon as possible after starting treatment then continue monitoring in those taking medicines that increase plasma-piperaquine concentration, in children who are vomiting or in females.

● **DIRECTIONS FOR ADMINISTRATION** Tablets to be taken at least 3 hours before and at least 3 hours after food. Tablets may be crushed and mixed with water immediately before administration.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer tablets containing piperazine phosphate with artenimol.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

CAUTIONARY AND ADVISORY LABELS 21

▶ **Malarone** (GlaxoSmithKline UK Ltd)

Proguanil hydrochloride 25 mg, Atovaquone 62.5 mg Malarone Paediatric tablets | 12 tablet (PoM) £6.26

Proguanil hydrochloride 100 mg, Atovaquone 250 mg Malarone tablets | 12 tablet (PoM) £25.21 DT price = £25.21

Chloroquine**● INDICATIONS AND DOSE****Prophylaxis of malaria**

- ▶ **INITIALLY BY MOUTH USING SYRUP**

- ▶ Child up to 6 weeks (body-weight up to 4.5 kg): 25 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 6 weeks–5 months (body-weight 4.5–7 kg): 50 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 6–11 months (body-weight 8–10 kg): 75 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 1–2 years (body-weight 11–14 kg): 100 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 3–4 years (body-weight 15–16.4 kg): 125 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 4–7 years (body-weight 16.5–24 kg): 150 mg once weekly, alternatively (by mouth using tablets) 155 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving
- ▶ Child 8–13 years (body-weight 25–44 kg): 225 mg once weekly, alternatively (by mouth using tablets) 232.5 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

- ▶ **INITIALLY BY MOUTH USING TABLETS**

- ▶ Child 14–17 years (body-weight 45 kg and above): 310 mg once weekly, alternatively (by mouth using syrup) 300 mg once weekly, started 1 week before entering endemic area and continued for 4 weeks after leaving

Treatment of non-falciparum malaria

- ▶ **BY MOUTH**

- ▶ Child: Initially 10 mg/kg (max. per dose 620 mg), then 5 mg/kg after 6–8 hours (max. per dose 310 mg), then 5 mg/kg daily (max. per dose 310 mg) for 2 days

P. vivax or P. ovale infection during pregnancy while radical cure is postponed

- ▶ **BY MOUTH**

- ▶ Child: 10 mg/kg once weekly (max. per dose 310 mg)

DOSE EQUIVALENCE AND CONVERSION

Doses expressed as chloroquine base. Chloroquine base 150 mg = chloroquine sulfate 200 mg = chloroquine phosphate 250 mg (approx).

- **UNLICENSED USE** Chloroquine doses for the treatment and prophylaxis of malaria in BNF publications may differ from those in product literature.

- **CAUTIONS** Acute porphyrias p. 562 · G6PD deficiency · long-term therapy (regular ophthalmic examination recommended by manufacturers) · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders, especially epilepsy (avoid for prophylaxis of

malaria if history of epilepsy) · severe gastro-intestinal disorders

- **INTERACTIONS** → Appendix 1 (chloroquine).
Avoid concurrent therapy with hepatotoxic drugs.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Gastro-intestinal disturbances · headache · pruritus · rashes · skin reactions
- ▶ **Uncommon** Convulsions · discoloration of mucous membranes · discoloration of nails · discoloration of skin · ECG changes · hair depigmentation · hair loss · keratopathy · ototoxicity · retinal damage · visual changes
- ▶ **Rare** Acute generalised exanthematous pustulosis · agranulocytosis · angioedema · aplastic anaemia · blood disorders · bone marrow suppression · cardiomyopathy · emotional disturbances · exfoliative dermatitis · hepatic damage · hypersensitivity reactions · mental changes · myopathy · neuromyopathy · photosensitivity · psychosis · Stevens-Johnson syndrome · thrombocytopenia · urticaria
- ▶ **Frequency not known** Bronchospasm · diffuse parenchymal lung disease · drug rash with eosinophilia and systemic symptoms · extrapyramidal symptoms (associated with use in malaria) · hypotension · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Malaria prophylaxis and treatment** Serious skin reactions, ECG changes, visual effects, ototoxicity, blood disorders, mental changes, myopathies and hepatic damage are not usually associated with malaria prophylaxis or treatment.

Overdose

Chloroquine is very toxic in overdose; overdose is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

- **PREGNANCY** Benefit of use in prophylaxis and treatment in malaria outweighs risk. For rheumatoid disease, it is not necessary to withdraw an antimalarial drug during pregnancy if the disease is well controlled.
- **BREAST FEEDING** Present in breast milk and breast-feeding should be avoided when used to treat rheumatic disease. Amount in milk probably too small to be harmful when used for malaria.
- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe impairment.
- **RENAL IMPAIRMENT** Only partially excreted by the kidneys and reduction of the dose is not required for prophylaxis of malaria except in severe impairment. For rheumatoid arthritis and lupus erythematosus, reduce dose. Manufacturers advise caution.
- **MONITORING REQUIREMENTS** Ophthalmic examination with long-term therapy.
- **PATIENT AND CARER ADVICE** Warn travellers going to malarious areas about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and **especially** within 3 months of return.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed
- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 5

- ▶ **Avlocor** (Alliance Pharmaceuticals Ltd)

Chloroquine phosphate 250 mg Avlocor 250mg tablets | 20 tablet [PoM] £7.95 DT price = £7.95

Oral solution

- ▶ **Malarivon** (Wallace Manufacturing Chemicals Ltd)

Chloroquine phosphate 16 mg per 1 ml Malarivon 80mg/5ml syrup | 75 ml [PoM] £30.00

Chloroquine with proguanil

The properties listed below are those particular to the combination only. For the properties of the components please consider, chloroquine p. 372, proguanil hydrochloride p. 375.

● **INDICATIONS AND DOSE**

Prophylaxis of malaria

- ▶ **BY MOUTH**
- ▶ Child: (consult product literature)

- **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Paludrine/Avlocor** (Alliance Pharmaceuticals Ltd)

Paludrine/Avlocor tablets anti-malarial travel pack | 112 tablet [P] £13.50

Mefloquine

● **INDICATIONS AND DOSE**

Treatment of malaria

- ▶ **BY MOUTH**
- ▶ Child: (consult product literature)

Prophylaxis of malaria

- ▶ **BY MOUTH**
- ▶ Child (body-weight 5–15 kg): 62.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 16–24 kg): 125 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 25–44 kg): 187.5 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving
- ▶ Child (body-weight 45 kg and above): 250 mg once weekly, dose to be started 2–3 weeks before entering endemic area and continued for 4 weeks after leaving

- **UNLICENSED USE** Mefloquine doses in BNF Publications may differ from those in product literature. Not licensed for use in children under 5 kg body-weight and under 3 months.
- **CONTRA-INDICATIONS** Avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions · avoid for standby treatment if history of convulsions · history of blackwater fever
- **CAUTIONS** Cardiac conduction disorders · epilepsy (avoid for prophylaxis) · not recommended in infants under 3 months (5 kg) · traumatic brain injury

CAUTIONS, FURTHER INFORMATION

- **Neuropsychiatric reactions** Mefloquine is associated with potentially serious neuropsychiatric reactions. Abnormal dreams, insomnia, anxiety, and depression occur commonly. Psychosis, suicidal ideation, and suicide have also been reported. Psychiatric symptoms such as nightmares, acute anxiety, depression, restlessness, or confusion should be regarded as potentially prodromal for a more serious event. If neuropsychiatric symptoms occur, patients should be advised to discontinue mefloquine and to seek immediate medical attention so that mefloquine can be replaced with an alternative antimalarial. Adverse reactions may occur and persist up to several months after discontinuation because mefloquine has a long half-life. Mefloquine is contra-indicated for malaria prophylaxis in those with a history of psychiatric disorders or convulsions.

● **INTERACTIONS** → Appendix 1 (mefloquine).

● **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · diarrhoea · dizziness · headache · nausea · neuropsychiatric reactions · pruritus · visual disturbances · vomiting
- **Very rare** Optic neuropathy
- **Frequency not known** Alopecia · amnesia · anorexia · arrhythmias · arthralgia · ataxia · blood disorders · bradycardia · cataract · chest pain · confusion · drowsiness · dyspepsia · dyspnoea · encephalopathy · fever · flushing · hepatic failure · hyperhidrosis · hypertension · hypotension · leucocytosis · leucopenia · malaise · motor neuropathies · muscle weakness · myalgia · oedema · palpitation · panic attacks · pneumonitis · rash · seizures · sensory neuropathies · speech disturbances · Stevens-Johnson syndrome · syncope · tachycardia · thrombocytopenia · tremor · vestibular disorders

● **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with hypersensitivity to quinine.

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during prophylaxis and for 3 months after stopping (teratogenicity in *animal* studies).

● **PREGNANCY** Manufacturer advises avoid (particularly in the first trimester) unless the potential benefit outweighs the risk; however, studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas.

● **BREAST FEEDING** Present in milk but risk to infant minimal.

● **HEPATIC IMPAIRMENT** Elimination may be prolonged; avoid in severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises caution.

● **DIRECTIONS FOR ADMINISTRATION** Tablet may be crushed and mixed with food such as jam or honey just before administration.

● **PATIENT AND CARER ADVICE**

Inform travellers about adverse reactions of mefloquine and, if they occur, to seek medical advice on alternative antimalarials before the next dose is due. Also warn travellers about **importance** of avoiding mosquito bites, **importance** of taking prophylaxis regularly, and **importance** of immediate visit to doctor if ill within 1 year and especially within 3 months of return.

Driving and skilled tasks

Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may occur and persist up to several months after stopping mefloquine.

● **NATIONAL FUNDING/ACCESS DECISIONS**

NHS restrictions Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 27

► **Lariam** (Roche Products Ltd)

Mefloquine (as Mefloquine hydrochloride) 250 mg Lariam 250mg tablets | 8 tablet **[POM]** £14.53

Primaquine● **INDICATIONS AND DOSE**

Adjunct in the treatment of non-falciparum malaria caused by *P.vivax* infection

► **BY MOUTH**

► Child 6 months–17 years: 500 micrograms/kg daily (max. per dose 30 mg) for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P.ovale* infection

► **BY MOUTH**

► Child 6 months–17 years: 250 micrograms/kg daily (max. per dose 15 mg) for 14 days

Adjunct in the treatment of non-falciparum malaria caused by *P.vivax* infection in patients with mild G6PD deficiency (administered on expert advice) | Adjunct in the treatment of non-falciparum malaria caused by *P.ovale* infection in patients with mild G6PD deficiency (administered on expert advice)

► **BY MOUTH**

► Child: 750 micrograms/kg once weekly for 8 weeks; maximum 45 mg per week

Treatment of mild to moderate pneumocystis infection (in combination with clindamycin)

► **BY MOUTH**

► Child: This combination is associated with considerable toxicity (consult product literature)

● **UNLICENSED USE** Not licensed.

● **CAUTIONS** G6PD deficiency · systemic diseases associated with granulocytopenia (e.g. juvenile idiopathic arthritis, rheumatoid arthritis, lupus erythematosus)

● **INTERACTIONS** → Appendix 1 (primaquine).

● **SIDE-EFFECTS**

► **Common or very common** Abdominal pain · anorexia · nausea · vomiting

► **Uncommon** Haemolytic anaemia especially in G6PD deficiency · leucopenia · methaemoglobinaemia

● **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinaemia in third trimester.

● **BREAST FEEDING** No information available; theoretical risk of haemolysis in G6PD-deficient infants.

● **PRE-TREATMENT SCREENING** Before starting primaquine, blood should be tested for glucose-6-phosphate dehydrogenase (G6PD) activity since the drug can cause haemolysis in G6PD-deficient patients. Specialist advice should be obtained in G6PD deficiency.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Pyrimethamine

● INDICATIONS AND DOSE

Toxoplasmosis in pregnancy (in combination with sulfadiazine and folic acid)

► BY MOUTH

- Child 12–17 years: 50 mg once daily until delivery

Congenital toxoplasmosis (in combination with sulfadiazine and folic acid)

► BY MOUTH

- Neonate: 1 mg/kg twice daily for 2 days, then 1 mg/kg once daily for 6 months, then 1 mg/kg 3 times a week for 6 months.

Malaria

► BY MOUTH

- Child: No dose stated because not recommended alone

- **UNLICENSED USE** Not licensed for use in children under 5 years.
- **CAUTIONS** History of seizures—avoid large loading doses · predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1 (pyrimethamine).
- **SIDE-EFFECTS**
 - **Common or very common** Anaemia (with high doses) · blood disorders (with high doses) · diarrhoea · dizziness · headache · leucopenia (with high doses) · nausea · rash · thrombocytopenia (with high doses) · vomiting
 - **Uncommon** Abnormal skin pigmentation · fever
 - **Very rare** Buccal ulceration · colic · convulsions
- **PREGNANCY** Theoretical teratogenic risk in *first trimester* (folate antagonist). Adequate folate supplements should be given to the mother.
- **BREAST FEEDING** Significant amount in milk—avoid administration of other folate antagonists to infant. Avoid breast-feeding during toxoplasmosis treatment.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **MONITORING REQUIREMENTS** Blood counts required with prolonged treatment.
- **LESS SUITABLE FOR PRESCRIBING** Pyrimethamine should not be used alone for malaria, but is used with sulfadoxine.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

► **Daraprim** (GlaxoSmithKline UK Ltd)

Adjunct to quinine in treatment of Plasmodium falciparum malaria

► BY MOUTH

- Child 1 month–4 years (body-weight 5 kg and above): 12.5/250 mg for 1 dose
- Child 5–6 years: 25/500 mg for 1 dose
- Child 7–9 years: 37.5/750 mg for 1 dose
- Child 10–13 years: 50/1000 mg for 1 dose
- Child 14–17 years: 75/1500 mg for 1 dose

Malaria prophylaxis

► BY MOUTH

- Child: Not recommended by UK malaria experts

continued →

DOSE EQUIVALENCE AND CONVERSION

Dose quantities are expressed in the form x/y where x and y are the strengths in milligrams of pyrimethamine and sulfadoxine respectively.

- **UNLICENSED USE** Not licensed for use in children of body-weight under 5 kg.
- **CONTRA-INDICATIONS** Acute porphyrias p. 562
- **CAUTIONS** Asthma · avoid in blood disorders (unless under specialist supervision) · avoid in infants under 6 weeks · G6PD deficiency · history of seizures—avoid large loading doses · not recommended for prophylaxis (severe side-effects on long-term use) · predisposition to folate deficiency
- **INTERACTIONS** → Appendix 1 (pyrimethamine, sulfonamides).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Diarrhoea · headache · hyperkalaemia · nausea · rash
 - ▶ **Uncommon** Vomiting
 - ▶ **Very rare** Anorexia · antibiotic-associated colitis · arthralgia · aseptic meningitis · ataxia · blood disorders · convulsions · cough · depression · eosinophilia · glossitis · hallucinations · hepatic necrosis · hypoglycaemia · hyponatraemia · interstitial nephritis · jaundice · leucopenia · liver damage · megaloblastic anaemia · myalgia · myocarditis · pancreatitis · peripheral neuropathy · photosensitivity · renal disorders · rhabdomyolysis reported in HIV-infected patients · shortness of breath · Stevens-Johnson syndrome · stomatitis · systemic lupus erythematosus · thrombocytopenia · tinnitus · toxic epidermal necrolysis · uveitis · vasculitis · vertigo
- ▶ **Frequency not known** Allergic alveolitis · eosinophilic alveolitis · pulmonary infiltrates

SIDE-EFFECTS, FURTHER INFORMATION

Discontinue immediately if blood disorders or rash occur. Discontinue if cough or shortness of breath occur.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with sulfonamide allergy.
- **PREGNANCY** Possible teratogenic risk in *first trimester* (pyrimethamine a folate antagonist); in *third trimester*—risk of neonatal haemolysis and methaemoglobinemia. Fear of increased risk of kernicterus in neonates appears to be unfounded.
- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants; risk of haemolysis in G6PD-deficient infants (due to sulfadoxine).
- **MONITORING REQUIREMENTS** Monitor blood counts on prolonged treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Also known as *Fansidar*®.
- **PATIENT AND CARER ADVICE** Patients should be advised to maintain adequate fluid intake.
- **MEDICAL FORMS** There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

Quinine**• INDICATIONS AND DOSE****Non-falciparum malaria****▶ BY INTRAVENOUS INFUSION**

- **Child:** 10 mg/kg every 8 hours (max. per dose 700 mg), infused over 4 hours, given if patient is unable to take oral therapy. Changed to oral chloroquine as soon as the patient's condition permits

Falciparum malaria**▶ BY MOUTH**

- **Child:** 10 mg/kg every 8 hours (max. per dose 600 mg) for 7 days, together with or followed by either doxycycline (in children over 12 years), or clindamycin

▶ BY INTRAVENOUS INFUSION

- **Neonate:** Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can tolerate oral medication to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by clindamycin.
- **Child:** Loading dose 20 mg/kg (max. per dose 1.4 g), infused over 4 hours, the loading dose of 20 mg/kg should **not** be used if the patient has received quinine or mefloquine during the previous 12 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline (in children over 12 years), or clindamycin

Falciparum malaria (in intensive care unit)**▶ BY INTRAVENOUS INFUSION**

- **Neonate:** Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by clindamycin.
- **Child:** Loading dose 7 mg/kg, infused over 30 minutes, followed immediately by 10 mg/kg, infused over 4 hours, then maintenance 10 mg/kg every 8 hours (max. per dose 700 mg) until patient can swallow tablets to complete the 7-day course, maintenance dose to be given 8 hours after the start of the loading dose and infused over 4 hours, the quinine should be given together with or followed by either doxycycline (in children over 12 years), or clindamycin

DOSE EQUIVALENCE AND CONVERSION

When using quinine for malaria, doses are valid for quinine hydrochloride, dihydrochloride, and sulfate; they are **not valid** for quinine bisulfate which contains a correspondingly smaller amount of quinine. Quinine (anhydrous base) 100 mg = quinine bisulfate 169 mg; quinine dihydrochloride 122 mg; quinine hydrochloride 122 mg; and quinine sulfate 121 mg. Quinine bisulfate 300 mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulfate.

- **UNLICENSED USE** Injection not licensed.
- **CONTRA-INDICATIONS** Haemoglobinuria · myasthenia gravis · optic neuritis · tinnitus
- **CAUTIONS** Atrial fibrillation (monitor ECG during parenteral treatment) · cardiac disease (monitor ECG during parenteral treatment) · conduction defects (monitor ECG during parenteral treatment) · G6PD deficiency · heart block (monitor ECG during parenteral treatment)
- **INTERACTIONS** → Appendix 1 (quinine).
- **SIDE-EFFECTS** Agitation · tinnitus · abdominal pain · acute renal failure · angioedema · blood disorders · cardiovascular effects · cinchonism · confusion · diarrhoea · dyspnoea ·

flushed skin · headache · hearing impairment · hot skin · hypersensitivity reactions · hypoglycaemia (especially after parenteral administration) · intravascular coagulation · muscle weakness · nausea · photosensitivity · rashes · temporary blindness · thrombocytopenia · vertigo · visual disturbances · vomiting

Overdose

Quinine is very toxic in overdosage; life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

For details on the management of poisoning, see Emergency treatment of poisoning p. 786.

- **PREGNANCY** High doses are teratogenic in *first trimester*, but in malaria benefit of treatment outweighs risk.

- **BREAST FEEDING** Present in milk but not known to be harmful.

● HEPATIC IMPAIRMENT

- ▶ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.

● RENAL IMPAIRMENT

- ▶ With intravenous use For treatment of malaria in severe impairment, reduce parenteral maintenance dose to 5–7 mg/kg of quinine salt.

● MONITORING REQUIREMENTS

- ▶ With intravenous use Monitor blood glucose and electrolyte concentration during parenteral treatment.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion*, dilute to a concentration of 2 mg/mL (max. 30 mg/mL in fluid restriction) with Glucose 5% or Sodium Chloride 0.9% and give over 4 hours.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intravenous use Intravenous injection of quinine is so hazardous that it has been superseded by infusion.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, solution for infusion

Tablet

- ▶ **Quinine (Non-proprietary)**

Quinine sulfate 200 mg Quinine sulfate 200mg tablets | 28 tablet [PoM] £6.05 DT price = £1.67

Oral solution

- ▶ **Spiramycin (Non-proprietary)**

Spiramycin 75000 unit per 1 ml Rovamycine 375,000units/5ml syrup | 150 ml [PoM] no price available

6 Viral infection

6.1 Hepatitis

Hepatitis

Overview

Treatment for viral hepatitis should be initiated by a specialist in hepatology or infectious diseases. The management of uncomplicated acute viral hepatitis is largely symptomatic. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. Active or passive immunisation against hepatitis A and B infections can be given.

Chronic hepatitis B

Interferon alfa p. 517, **peginterferon alfa-2a**, lamivudine p. 393, adefovir dipivoxil, entecavir, and tenofovir disoproxil p. 394 have a role in the treatment of chronic hepatitis B in adults, but their role in children has not been well established. Specialist supervision is required for the management of chronic hepatitis B.

Tenofovir disoproxil, or a combination of tenofovir disoproxil with either emtricitabine p. 392 or lamivudine, may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' in children who require treatment for both HIV and chronic hepatitis B. If children infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV. Management of these children should be co-ordinated between HIV and hepatology specialists.

Chronic hepatitis C

Treatment should be considered for children with moderate or severe liver disease. Specialist supervision is required and the regimen is chosen according to the genotype of the infecting virus and the viral load. A combination of ribavirin p. 378 with either interferon alfa or **peginterferon alfa-2b** is licensed for use in children over 3 years with chronic hepatitis C. A combination of peginterferon alfa p. 379 and ribavirin is preferred.

6.2 Hepatitis infections

6.2a Chronic hepatitis C

Drugs used for Chronic hepatitis C not listed below
Interferon alfa, p. 517 • Peginterferon alfa, p. 379

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Ribavirin

(Tribavirin)

● INDICATIONS AND DOSE

Bronchiolitis

- ▶ BY INHALATION OF AEROSOL, OR BY INHALATION OF NEBULISED SOLUTION
- ▶ Child 1–23 months: Inhale a solution containing 20 mg/mL for 12–18 hours for at least 3 days, maximum of 7 days, to be administered via small particle aerosol generator

Life-threatening RSV, parainfluenza virus, and adenovirus infection in immunocompromised children (administered on expert advice)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 33 mg/kg for 1 dose, to be administered over 15 minutes, then 16 mg/kg every 6 hours for 4 days, then 8 mg/kg every 8 hours for 3 days

REBETOL® CAPSULES

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation

- ▶ BY MOUTH
- ▶ Child 3–17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses
- ▶ Child 3–17 years (body-weight 47–49 kg): 200 mg, dose to be given in the morning and 400 mg, dose to be given in the evening
- ▶ Child 3–17 years (body-weight 50–64 kg): 400 mg twice daily
- ▶ Child 3–17 years (body-weight 65–80 kg): 400 mg, dose to be given in the morning and 600 mg, dose to be given in the evening
- ▶ Child 3–17 years (body-weight 81–104 kg): 600 mg twice daily
- ▶ Child 3–17 years (body-weight 105 kg and above): 600 mg, dose to be given in the morning and 800 mg, dose to be given in the evening

REBETOL® ORAL SOLUTION

Chronic hepatitis C (in combination with interferon alfa or peginterferon alfa) in previously untreated children without liver decompensation

- ▶ BY MOUTH
- ▶ Child 3–17 years (body-weight up to 47 kg): 15 mg/kg daily in 2 divided doses
- ▶ Child 3–17 years (body-weight 47–49 kg): 200 mg daily, dose to be given in the morning and 400 mg daily, dose to be given in the evening
- ▶ Child 3–17 years (body-weight 50–64 kg): 400 mg twice daily
- ▶ Child 3–17 years (body-weight 65–80 kg): 400 mg daily, dose to be given in the morning and 600 mg daily, dose to be given in the evening
- ▶ Child 3–17 years (body-weight 81–104 kg): 600 mg twice daily
- ▶ Child 3–17 years (body-weight 105 kg and above): 600 mg daily, dose to be given in the morning and 800 mg daily, dose to be given in the evening

● UNLICENSED USE

- ▶ When used by inhalation Inhalation licensed for use in children (age range not specified by manufacturer).
- ▶ With intravenous use Intravenous preparation not licensed.

● CONTRA-INDICATIONS

- ▶ With systemic use Active severe psychiatric condition • autoimmune disease • autoimmune hepatitis • consult product literature for specific contra-indications when ribavirin above used in combination with other medicinal products • haemoglobinopathies • history of severe psychiatric condition • severe debilitating medical conditions • severe, uncontrolled cardiac disease in children with chronic hepatitis C

● CAUTIONS

- ▶ When used by inhalation Maintain standard supportive respiratory and fluid management therapy
- ▶ With systemic use Cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration) • consult product literature for specific cautions when ribavirin above used in combination with other medicinal products • patients with a transplant—risk of rejection • risk of growth retardation the reversibility of which is uncertain—if possible, consider starting treatment after pubertal growth spurt

● INTERACTIONS → Appendix 1 (ribavirin).

● SIDE-EFFECTS

- ▶ When used by inhalation Bacterial pneumonia • haemolysis • non-specific anaemia • pneumothorax • worsening respiration
- ▶ With oral use Abdominal pain • abnormal dreams • acne • alopecia • anxiety • aplastic anaemia • arrhythmias • arthralgia • asthenia • ataxia • breast pain • cardiomyopathy • changes in blood pressure • cheilitis • chest pain • colitis • constipation • cough • dehydration • depression • diarrhoea • dizziness • dry eyes • dry mouth • dry skin • dyspepsia • dysphagia • dysphonia • dyspnoea • earache • epistaxis • eye pain • flatulence • flushing • gastro-intestinal bleeding • gastroesophageal reflux • gingivitis • glossitis • growth retardation (including decrease in height and weight) • haemolytic anaemia (anaemia may be improved by epoetin) • hallucination • headache • hearing impairment • hyperaesthesia • hyperglycaemia • hyperkinesia • hypertonia • hypertriglyceridaemia • hyperuricaemia • hypoaesthesia • hypocalcaemia • impaired concentration and memory • increased sweating • influenza-like symptoms • interstitial pneumonitis • leucopenia • loose stools • lymphadenopathy • menstrual disturbance • micturition disorders • mood disorders • mouth ulcers • musculoskeletal pain • myalgia • myocardial infarction • nasal congestion • nausea • neutropenia • optic neuropathy • oral candidiasis • pallor • palpitation • pancreatitis • panic attack • paraesthesia • peptic ulcer • pericarditis • peripheral ischaemia • peripheral neuropathy • peripheral oedema • photosensitivity • pruritus • psoriasis • psychotic disorders • pulmonary embolism • rash • renal failure • respiratory infections • retinal haemorrhage • rheumatoid arthritis • sarcoidosis • seizures • sexual dysfunction • sinus congestion • skin discoloration • sleep disturbances • sore throat • Stevens-Johnson syndrome • stomatitis • stroke • suicidal ideation • syncope • systemic lupus erythematosus • tachycardia • tachypnoea • taste disturbance • testicular pain • thrombocytopenia • thyroid disorders • tinnitus • tooth disorder • toxic epidermal necrolysis • urinary tract infections • vertigo • virilism • visual disturbances • vomiting • weight loss • wheezing

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ With oral use Side effects listed are reported when oral ribavirin is used in combination with peginterferon alfa or interferon alfa, consult product literature for details.

● CONCEPTION AND CONTRACEPTION

- ▶ With systemic use Exclude pregnancy before treatment in females of childbearing age. Effective contraception essential during treatment and for 4 months after treatment in females and for 7 months after treatment in males of childbearing age. Routine monthly pregnancy tests recommended. Condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen).
- ▶ When used by inhalation Women planning pregnancy should avoid exposure to aerosol.

● PREGNANCY Avoid; teratogenicity in *animal* studies.

- ▶ When used by inhalation Pregnant women should avoid exposure to aerosol.

● BREAST FEEDING Avoid—no information available.**● HEPATIC IMPAIRMENT** No dosage adjustment required. Avoid oral ribavirin in severe hepatic dysfunction or decompensated cirrhosis.**● RENAL IMPAIRMENT** Plasma-ribavirin concentration increased. Manufacturer advises avoid oral ribavirin if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²—monitor haemoglobin concentration closely.

Manufacturer advises use intravenous preparation with caution if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

- ▶ When used by inhalation Monitor electrolytes closely. Monitor equipment for precipitation.
- ▶ With systemic use Determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop (consult product literature). Test thyroid function before treatment and then every 3 months.
- ▶ With oral use Eye examination recommended before treatment. Eye examination also recommended during treatment if pre-existing ophthalmological disorder or if decrease in vision reported—discontinue treatment if ophthalmological disorder deteriorates or if new ophthalmological disorder develops.

● PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include bubble-gum.**● NATIONAL FUNDING/ACCESS DECISIONS****NICE technology appraisals (TAs)**

- ▶ **Peginterferon alfa and ribavirin for chronic hepatitis C (November 2003)** NICE TA300
Peginterferon alfa in combination with ribavirin is recommended (within the marketing authorisation) as an option for treating chronic hepatitis C in children.
www.nice.org.uk/TA300

● LESS SUITABLE FOR PRESCRIBING Ribavirin inhalation is less suitable for prescribing.**● MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. No licensed solution for injection listed.

Capsule

- ▶ **Rebetol** (Merck Sharp & Dohme Ltd)

Ribavirin 200 mg Rebetol 200mg capsules | 84 capsule [PoM](#) £160.69 | 140 capsule [PoM](#) £267.81 | 168 capsule [PoM](#) £321.38

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

- ▶ **Rebetol** (Merck Sharp & Dohme Ltd)

Ribavirin 40 mg per 1 mL Rebetol 40mg/mL oral solution | 100 mL [PoM](#) £67.08

IMMUNOSTIMULANTS > INTERFERONS**Peginterferon alfa**

- **DRUG ACTION** Polyethylene glycol-conjugated ('pegylated') derivatives of interferon alfa (**peginterferon alfa-2a** and **peginterferon alfa-2b**) are available; pegylation increases the persistence of the interferon in the blood.

● INDICATIONS AND DOSE**PEGASYS®****Chronic hepatitis C (in combination with ribavirin) in previously untreated children without liver decompensation**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 5–17 years: (consult product literature)

VIRAFERONPEG®**Chronic hepatitis C (in combination with ribavirin) in previously untreated children without liver decompensation**

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 3–17 years: (consult product literature)

- **CONTRA-INDICATIONS** Severe psychiatric illness

CONTRA-INDICATIONS, FURTHER INFORMATION

For contra-indications consult product literature.

- **CAUTIONS**

CAUTIONS, FURTHER INFORMATION

For cautions consult product literature.

- **INTERACTIONS** → Appendix 1 (interferons).

- **SIDE-EFFECTS**

- ▶ **Common or very common** Anorexia · influenza-like symptoms · lethargy · nausea
- ▶ **Frequency not known** Alopecia · arrhythmias · cardiovascular problems · coma · confusion · depression · hepatotoxicity · hyperglycaemia · hypersensitivity reactions · hypertension · hypertriglyceridaemia (sometimes severe) · hypotension · myelosuppression (particularly affecting granulocyte counts) · nephrotoxicity · ocular side-effects · pneumonia · pneumonitis · psoriasisiform rash · pulmonary infiltrates · reversible motor problems in young children · seizures · suicidal behaviour · thyroid abnormalities

SIDE-EFFECTS, FURTHER INFORMATION

For information on side effects consult product literature.

- ▶ **Respiratory symptoms** Respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired the discontinuation of peginterferon alfa should be considered.
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies).
- **BREAST FEEDING** Manufacturers advise avoid—no information available.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Reduce dose in moderate to severe impairment. For information on peginterferon alfa use in renal impairment consult product literature. Close monitoring required in renal impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitoring of lipid concentration is recommended.
 - ▶ Monitoring of hepatic function is recommended.

often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection.

In individuals with good immune function, mild infection of the eye (ocular herpes) and of the lips (herpes labialis or cold sores) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics. Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. After completing parenteral treatment of neonatal herpes simplex encephalitis, oral suppression therapy with aciclovir p. 381 for 6 months can be considered on specialist advice. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

Varicella-zoster infections

Regardless of immune function and the use of any immunoglobulins, neonates with *chickenpox* should be treated with a parenteral antiviral to reduce the risk of severe disease. Oral therapy in children is not recommended as absorption is variable. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

In pregnancy severe chickenpox may cause complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Neonates and children who have been exposed to chickenpox and are at special risk of complications may require prophylaxis with varicella-zoster immunoglobulin (see under Disease-specific Immunoglobulins). Prophylactic intravenous aciclovir should be considered for neonates whose mothers develop chickenpox 4 days before to 2 days after delivery.

In *herpes zoster* (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunocompromised patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed (postherpetic neuralgia) requires specific management.

Choice

Aciclovir is active against herpesviruses but does not eradicate them. Uses of aciclovir include systemic treatment of varicella–zoster and the systemic and topical treatment of herpes simplex infections of the skin and mucous membranes. It is used by mouth for severe herpetic stomatitis. Aciclovir eye ointment is used for herpes simplex infections of the eye; it is combined with systemic treatment for ophthalmic zoster.

Famciclovir, a prodrug of penciclovir, is similar to aciclovir and is licensed in adults for use in herpes zoster and genital herpes; there is limited information available on use in children.

Valaciclovir p. 383 is an ester of aciclovir, licensed in adults for herpes zoster and herpes simplex infections of the skin and mucous membranes (including genital herpes); it is

6.3 Herpesvirus infections

Herpesvirus infections

Herpes simplex and varicella–zoster infection

The two most important herpesvirus pathogens are herpes simplex virus (herpesvirus hominis) and varicella–zoster virus.

Herpes simplex infections

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most

also licensed in children over 12 years for preventing cytomegalovirus disease following solid organ transplantation. Valaciclovir may be used for the treatment of mild herpes zoster in immunocompromised children over 12 years; treatment should be initiated under specialist supervision.

Cytomegalovirus infection

Ganciclovir p. 383 is related to aciclovir but it is more active against cytomegalovirus (CMV); it is also much more toxic than aciclovir and should therefore be prescribed under specialist supervision and only when the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the *initial treatment* of CMV infection. The use of ganciclovir may also be considered for symptomatic congenital CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine p. 394; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration.

Valaciclovir is licensed for use in children over 12 years for prevention of cytomegalovirus disease following renal transplantation.

Foscarnet sodium p. 384 is also active against cytomegalovirus; it is toxic and can cause renal impairment. It is deposited in teeth, bone and cartilage, and *animal* studies have shown that deposition is greater in young animals. Its effect on skeletal development in children is not known. Foscarnet sodium should be prescribed under specialist supervision.

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Aciclovir

(Acyclovir)

● INDICATIONS AND DOSE

Herpes simplex, suppression

► BY MOUTH

- Child 12–17 years: 400 mg twice daily, alternatively 200 mg 4 times a day; increased to 400 mg 3 times a day, dose may be increased if recurrences occur on standard suppressive therapy or for suppression of genital herpes during late pregnancy (from 36 weeks gestation), therapy interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, prophylaxis in the immunocompromised

► BY MOUTH

- Child 1–23 months: 100–200 mg 4 times a day
- Child 2–17 years: 200–400 mg 4 times a day

Herpes Simplex, treatment

► BY MOUTH

- Child 1–23 months: 100 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- Child 2–17 years: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

► BY INTRAVENOUS INFUSION

- Neonate: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment).
- Child 1–2 months: 20 mg/kg every 8 hours for 14 days (for at least 21 days if CNS involvement—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)

- Child 3 months–11 years: 250 mg/m² every 8 hours usually for 5 days
- Child 12–17 years: 5 mg/kg every 8 hours usually for 5 days

Herpes Simplex, treatment, in immunocompromised or if absorption impaired

► BY MOUTH

- Child 1–23 months: 200 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)
- Child 2–17 years: 400 mg 5 times a day usually for 5 days (longer if new lesions appear during treatment or if healing incomplete)

Herpes Simplex, treatment, in immunocompromised or in simplex encephalitis

► BY INTRAVENOUS INFUSION

- Child 3 months–11 years: 500 mg/m² every 8 hours usually for 5 days (given for at least 21 days in encephalitis—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)
- Child 12–17 years: 10 mg/kg every 8 hours usually for 5 days (given for at least 14 days in encephalitis and for at least 21 days if also immunocompromised—confirm cerebrospinal fluid negative for herpes simplex virus before stopping treatment)

Varicella zoster (chickenpox), treatment | Herpes zoster (shingles), treatment

► BY MOUTH

- Child 1–23 months: 200 mg 4 times a day for 5 days
- Child 2–5 years: 400 mg 4 times a day for 5 days
- Child 6–11 years: 800 mg 4 times a day for 5 days
- Child 12–17 years: 800 mg 5 times a day for 7 days

► BY INTRAVENOUS INFUSION

- Neonate: 10–20 mg/kg every 8 hours for at least 7 days.

- Child 1–2 months: 10–20 mg/kg every 8 hours for at least 7 days
- Child 3 months–11 years: 250 mg/m² every 8 hours usually for 5 days
- Child 12–17 years: 5 mg/kg every 8 hours usually for 5 days

Varicella zoster (chickenpox), treatment in immunocompromised | Herpes zoster (shingles), treatment in immunocompromised

► BY INTRAVENOUS INFUSION

- Child 3 months–11 years: 500 mg/m² every 8 hours usually for 5 days
- Child 12–17 years: 10 mg/kg every 8 hours usually for 5 days

Herpes zoster (shingles), treatment in immunocompromised

► BY MOUTH

- Child 1–23 months: 200 mg 4 times a day continued for 2 days after crusting of lesions
- Child 2–5 years: 400 mg 4 times a day continued for 2 days after crusting of lesions
- Child 6–11 years: 800 mg 4 times a day continued for 2 days after crusting of lesions
- Child 12–17 years: 800 mg 5 times a day continued for 2 days after crusting of lesions

Herpes zoster, treatment in encephalitis | Varicella zoster, treatment in encephalitis

► BY INTRAVENOUS INFUSION

- Neonate: 10–20 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised.
- Child 1–2 months: 10–20 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised

continued →

- ▶ Child 3 months–11 years: 500 mg/m² every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised
- ▶ Child 12–17 years: 10 mg/kg every 8 hours given for 10–14 days in encephalitis, possibly longer if also immunocompromised

Varicella zoster (chickenpox), attenuation of infection if varicella-zoster immunoglobulin not indicated

▶ BY MOUTH

- ▶ Child: 10 mg/kg 4 times a day for 7 days, to be started 1 week after exposure

Varicella zoster (chickenpox), prophylaxis after delivery

▶ BY INTRAVENOUS INFUSION

- ▶ Neonate: 10 mg/kg every 8 hours continued until serological tests confirm absence of virus.

DOSES AT EXTREMES OF BODY-WEIGHT

- ▶ With intravenous use To avoid excessive dosage in obese patients parenteral dose should be calculated on the basis of ideal weight for height.

● **UNLICENSED USE**

- ▶ With oral use Tablets and suspension not licensed for suppression of herpes simplex or for treatment of herpes zoster in children (age range not specified by manufacturer). Aciclovir doses in BNF may differ from those in product literature. Attenuation of chickenpox is an unlicensed indication.
- ▶ With intravenous use Intravenous infusion not licensed for herpes zoster in children under 18 years.

- **CAUTIONS** Maintain adequate hydration (especially with infusion or high doses)

- **INTERACTIONS** → Appendix 1 (aciclovir).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · diarrhoea · fatigue · headache · nausea · photosensitivity · pruritus · rash · urticaria · vomiting

▶ **Very rare**

- ▶ With intravenous use Agitation · fever · psychosis · severe local inflammation (sometimes leading to ulceration) · tremors

- ▶ With systemic use Acute renal failure · anaemia · ataxia · confusion · convulsions · dizziness · drowsiness · dysarthria · dyspnoea · hallucinations · hepatitis · jaundice · leucopenia · neurological reactions · thrombocytopenia

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

● **RENAL IMPAIRMENT**

- ▶ With intravenous use Use *normal intravenous dose* every 12 hours if estimated glomerular filtration rate 25–50 mL/minute/1.73m² (every 24 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73m². Consult product literature for intravenous dose if estimated glomerular filtration rate less than 10 mL/minute/1.73².
- ▶ With oral use For *herpes zoster*, use *normal oral dose* every 8 hours if estimated glomerular filtration rate 10–25 mL/minute/1.73m² (every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73m². For *herpes simplex*, use *normal dose* every 12 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73².
- ▶ With systemic use Risk of neurological reactions increased. Maintain adequate hydration (especially during renal impairment).

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, reconstitute to 25 mg/mL with Water for Injections or Sodium Chloride 0.9% then dilute to

concentration of 5 mg/mL with Sodium Chloride 0.9% or Sodium Chloride and Glucose and give over 1 hour; alternatively, may be administered in a concentration of 25 mg/mL using a suitable infusion pump and central venous access and given over 1 hour.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid preparations may include banana, or orange.

● **PATIENT AND CARER ADVICE**

Valaciclovir

● INDICATIONS AND DOSE

Herpes zoster infection, treatment in immunocompromised patients

► BY MOUTH

- Child 12–17 years: 1 g 3 times a day for at least 7 days and continued for 2 days after crusting of lesions

Herpes simplex, treatment of first infective episode

► BY MOUTH

- Child 12–17 years: 500 mg twice daily for 5 days (longer if new lesions appear during treatment or healing is incomplete)

Herpes simplex infections treatment of first episode in immunocompromised or HIV-positive patients

► BY MOUTH

- Child 12–17 years: 1 g twice daily for 10 days

Herpes simplex, treatment of recurrent infections

► BY MOUTH

- Child 12–17 years: 500 mg twice daily for 3–5 days

Treatment of recurrent herpes simplex infections in immunocompromised or HIV-positive patients

► BY MOUTH

- Child 12–17 years: 1 g twice daily for 5–10 days

Herpes labialis treatment

► BY MOUTH

- Child 12–17 years: Initially 2 g, then 2 g after 12 hours

Herpes simplex, suppression of infections

► BY MOUTH

- Child 12–17 years: 500 mg daily in 1–2 divided doses, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Herpes simplex, suppression of infections in immunocompromised or HIV-positive patients

► BY MOUTH

- Child 12–17 years: 500 mg twice daily, therapy to be interrupted every 6–12 months to reassess recurrence frequency—consider restarting after two or more recurrences

Prevention of cytomegalovirus disease following solid organ transplantation when valganciclovir or ganciclovir cannot be used

► BY MOUTH

- Child 12–17 years: 2 g 4 times a day usually for 90 days, preferably starting within 72 hours of transplantation

- **UNLICENSED USE** Not licensed for treatment of herpes zoster in children. Not licensed for treatment or suppression of herpes simplex infection in immunocompromised or HIV-positive children.

- **CAUTIONS** Maintain adequate hydration (especially with high doses)

- **INTERACTIONS** → Appendix 1 (valaciclovir).

● SIDE-EFFECTS

- **Very rare** Acute renal failure · anaemia · ataxia · confusion · convulsions · dizziness · drowsiness · dysarthria · dyspnoea · hallucinations · hepatitis · jaundice · leucopenia · neurological reactions · thrombocytopenia
- **Frequency not known** Abdominal pain · diarrhoea · fatigue · headache · nausea · photosensitivity · pruritus · rash · urticaria · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Neurological reactions** Neurological reactions (including dizziness, confusion, hallucinations, convulsions, ataxia, dysarthria, and drowsiness) more frequent with higher doses.

- **PREGNANCY** Not known to be harmful—manufacturers advise use only when potential benefit outweighs risk.

- **BREAST FEEDING** Significant amount in milk after systemic administration—not known to be harmful but manufacturer advises caution.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution with high doses used for preventing cytomegalovirus disease—no information available in children.

- **RENAL IMPAIRMENT** For *herpes zoster*, 1 g every 12 hours if estimated glomerular filtration rate 30–50 mL/minute/1.73 m² (1 g every 24 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²; 500 mg every 24 hours if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²). For *treatment of herpes simplex*, 500 mg (1 g in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². For *treatment of herpes labialis*, if estimated glomerular filtration rate 30–50 mL/minute/1.73 m², initially 1 g, then 1 g 12 hours after initial dose (if estimated glomerular filtration rate 10–30 mL/minute/1.73 m², initially 500 mg, then 500 mg 12 hours after initial dose; if estimated glomerular filtration rate less than 10 mL/minute/1.73 m², 500 mg as a single dose). For *suppression of herpes simplex*, 250 mg (500 mg in immunocompromised or HIV-positive children) every 24 hours if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². Reduce dose according to estimated glomerular filtration rate for *cytomegalovirus prophylaxis* following solid organ transplantation (consult product literature). Maintain adequate hydration.

- **PRESCRIBING AND DISPENSING INFORMATION** Valaciclovir is a pro-drug of aciclovir.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 9

► Valaciclovir (Non-proprietary)

Valaciclovir (as Valaciclovir hydrochloride) 500 mg Valaciclovir 500mg tablets | 10 tablet [PoM] £20.59 DT price = £3.04 | 42 tablet [PoM] £86.30

► Valtrex (GlaxoSmithKline UK Ltd)

6.3a Cytomegalovirus infections

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Ganciclovir

● INDICATIONS AND DOSE

Prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation

► BY INTRAVENOUS INFUSION

- Child: 5 mg/kg every 12 hours for 7–14 days

Treatment of life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only

► BY INTRAVENOUS INFUSION

- Child: Initially 5 mg/kg every 12 hours for 14–21 days, followed by maintenance 6 mg/kg daily on 5 days of the week, alternatively 5 mg/kg daily until adequate recovery of immunity, maintenance only for patients at risk of relapse of retinitis, if retinitis progresses initial induction treatment may be repeated

continued →

Congenital cytomegalovirus infection of the CNS

► BY INTRAVENOUS INFUSION

► Neonate: 6 mg/kg every 12 hours for 6 weeks.

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Abnormally low haemoglobin count (consult product literature) · abnormally low neutrophil count (consult product literature) · abnormally low platelet count (consult product literature)
- **CAUTIONS** Children (possible risk of long-term carcinogenic or reproductive toxicity) · ensure adequate hydration · history of cytopenia · potential carcinogen · potential teratogen · radiotherapy · vesicant
- **INTERACTIONS** → Appendix 1 (ganciclovir). Increased risk of myelosuppression with other myelosuppressive drugs—consult product literature.
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · abnormal thinking · anaemia · anorexia · anxiety · arthralgia · chest pain · confusion · constipation · convulsions · cough · depression · dermatitis · diarrhoea · dizziness · dyspepsia · dysphagia · dyspnoea · ear pain · eye pain · fatigue · flatulence · headache · hepatic dysfunction · infection · injection-site reactions · insomnia · leucopenia · macular oedema · myalgia · nausea · night sweats · pancytopenia · peripheral neuropathy · pruritus · pyrexia · renal impairment · retinal detachment · taste disturbance · thrombocytopenia · vitreous floaters · vomiting · weight loss
 - **Uncommon** Alopecia · anaphylactic reactions · arrhythmias · disturbances in hearing and vision · haematuria · hypotension · male infertility · mouth ulcers · pancreatitis · psychosis · tremor
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients hypersensitive to valganciclovir, aciclovir, or valaciclovir.
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment.
- **PREGNANCY** Avoid—teratogenic risk.
- **BREAST FEEDING** Avoid—no information available.
- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 70 mL/minute/1.73 m²; consult product literature.
- **MONITORING REQUIREMENTS** Monitor full blood count closely (severe deterioration may require correction and possibly treatment interruption).
- **DIRECTIONS FOR ADMINISTRATION** Infuse into vein with adequate flow preferably using plastic cannula. For *intravenous infusion*, reconstitute with Water for Injections (500 mg/10 mL) then dilute to a concentration of not more than 10 mg/mL with Glucose 5% or Sodium Chloride 0.9% and give over 1 hour.
- **HANDLING AND STORAGE** Caution in handling Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

► **Cymevene** (Roche Products Ltd)**Ganciclovir (as Ganciclovir sodium) 500 mg** Cymevene 500mg powder for solution for infusion vials | 5 vial **[PoM]** £148.83**ANTIVIRALS > OTHER****Foscarnet sodium**● **INDICATIONS AND DOSE****Cytomegalovirus disease**

► BY INTRAVENOUS INFUSION

► Child (under expert supervision): Initially 60 mg/kg every 8 hours 2–3 weeks, then maintenance 60 mg/kg daily, increased if tolerated to 90–120 mg/kg daily, if disease progresses on maintenance dose, repeat induction regimen

Mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

► BY INTRAVENOUS INFUSION

► Child (under expert supervision): 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Ensure adequate hydration
- **INTERACTIONS** → Appendix 1 (foscarnet).
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · acute renal failure · aggression · agitation · anaemia · anorexia · anxiety · changes in blood pressure · changes in ECG · confusion · constipation · convulsions · depression · diarrhoea · dizziness · dyspepsia · dysuria · electrolyte disturbances · genital irritation and ulceration (due to high concentrations excreted in urine) · granulocytopenia · headache · hepatic dysfunction · hypocalcaemia · hypokalaemia · hypomagnesaemia · leucopenia · malaise · myalgia · nausea (reduce infusion rate) · neurological disorders · oedema · palpitation · pancreatitis · paraesthesia (reduce infusion rate) · polyuria · pruritus · rash · renal impairment · thrombocytopenia · thrombophlebitis if given undiluted by peripheral vein · tremor · vomiting
 - **Uncommon** Acidosis
 - **Frequency not known** Diabetes insipidus · myasthenia · myositis · oesophageal ulceration · rhabdomyolysis · ventricular arrhythmias
- **CONCEPTION AND CONTRACEPTION** Men should avoid fathering a child during and for 6 months after treatment.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** Reduce dose; consult product literature.
- **MONITORING REQUIREMENTS**
 - Monitor electrolytes, particularly calcium and magnesium.
 - Monitor serum creatinine every second day during induction and every week during maintenance.
- **DIRECTIONS FOR ADMINISTRATION** Avoid rapid infusion. For *intravenous infusion*, give undiluted solution via a central venous catheter; alternatively dilute to a concentration of 12 mg/mL with Glucose 5% or Sodium Chloride 0.9% for administration via a peripheral vein; give over at least 1 hour (give doses greater than 60 mg/kg over 2 hours).

● **MEDICINAL FORMS**

6.4 HIV infection

HIV infection

Overview

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) may be associated with serious side-effects. Although antiretrovirals increase life expectancy considerably and decrease the risk of complications associated with premature ageing, mortality and morbidity remain slightly higher than in uninfected individuals.

The natural progression of HIV disease is different in children compared to adults; drug treatment should only be undertaken by specialists within a formal paediatric HIV clinical network. Guidelines and dose regimens are under constant review and for this reason some dose recommendations have not been included in *BNF for Children*.

Further information on the management of children with HIV can be obtained from the Children's HIV Association (CHIVA) www.chiva.org.uk; and further information on antiretroviral use and toxicity can be obtained from the Paediatric European Network for Treatment of AIDS (PENTA) website www.pentatrials.org.

Principles of treatment

Treatment is aimed at suppressing viral replication for as long as possible; it should be started before the immune system is irreversibly damaged. The need for early drug treatment should, however, be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and the child's tolerance of treatment. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Initiation of treatment

Treatment is started in all HIV infected children under 1 year of age regardless of clinical and immunological parameters. In children over 1 year of age, treatment is based on the child's age, CD4 cell count, viral load, and symptoms. The choice of antiviral treatment for children should take into account the method and frequency of administration, risk of side-effects, compatibility of drugs with food, palatability, and the appropriateness of the formulation. Initiating treatment with a combination of drugs ('highly active antiretroviral therapy' which includes 2 nucleoside reverse transcriptase inhibitors with *either* a non-nucleoside reverse transcriptase inhibitor *or* a boosted protease inhibitor) is recommended. Abacavir p. 390 and lamivudine p. 393 are the nucleoside reverse transcriptase inhibitors of choice for initial therapy; however, zidovudine p. 394 and lamivudine are used in children who are positive for the HLA-B*5701 allele. Nevirapine p. 389 is the preferred non-nucleoside reverse transcriptase inhibitor in children under 3 years of age, but efavirenz p. 388 is preferred in older children. Lopinavir with ritonavir p. 397 is the preferred boosted protease inhibitor for initial therapy. The metabolism of many antiretrovirals varies in young children; it may therefore be necessary to adjust the dose according to the plasma-drug concentration. Children who require treatment for both HIV and chronic hepatitis B should receive antivirals that are active against both diseases.

Switching therapy

Deterioration of the condition (including clinical, virological changes, and CD4 cell changes) may require a complete change of therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance, and the possibility of cross-resistance.

Pregnancy

Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although information on the teratogenic potential of most antiretroviral drugs is limited), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. **All treatment options require careful assessment by a specialist.** Combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. However, it may be associated with a greater risk of preterm delivery. Local protocols and national guidelines (www.bhiva.org) should be consulted for recommendations on treatment during pregnancy and the perinatal period. Pregnancies in HIV-positive women and babies born to them should be reported prospectively to the National Study of HIV in Pregnancy and Childhood at www.ucl.ac.uk/nshpc/ and to the Antiretroviral Pregnancy Registry at www.apregistry.com.

Breast-feeding

Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

Post-exposure prophylaxis

Children exposed to HIV infection through needlestick injury or by another route should be sent immediately to an accident and emergency department for post-exposure prophylaxis [unlicensed indication]. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Recommendations have been developed by the Children's HIV Association, www.chiva.org.uk.

Drugs used for HIV infection

Zidovudine, a nucleoside reverse transcriptase inhibitor (or 'nucleoside analogue'), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine p. 392, emtricitabine p. 392, lamivudine, stavudine p. 393, and tenofovir disoproxil p. 394. There are concerns about renal toxicity and effects on bone mineralisation when tenofovir disoproxil is used in prepubertal children.

The protease inhibitors include atazanavir p. 396, darunavir p. 396, fosamprenavir p. 397 (a pro-drug of amprenavir), indinavir, lopinavir (available as lopinavir with ritonavir), ritonavir p. 397, and tipranavir p. 398. Indinavir is no longer recommended because it is associated with nephrolithiasis. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, lopinavir (available as lopinavir with ritonavir), and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects.

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine p. 389, and nevirapine are active against the subtype HIV-1 but not HIV-2, a subtype that is rare in the UK. These drugs may interact with a number of drugs metabolised in the liver. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and rarely fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz. CNS disturbances are often self-limiting and can be reduced by taking the dose

at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz has also been associated with an increased plasma cholesterol concentration. Etravirine is used in regimens containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide below, which inhibits the fusion of HIV to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs.

Enfuvirtide should be combined with other potentially active antiretroviral drugs; it is given by subcutaneous injection.

Maraviroc p. 399 is an antagonist of the CCR5 chemokine receptor. It is used in patients exclusively infected with CCR5–tropic HIV.

Dolutegravir p. 387 and raltegravir p. 387 are inhibitors of HIV integrase. They are used for the treatment of HIV infection when non-nucleoside reverse transcriptase inhibitors or protease inhibitors cannot be used because of intolerance, drug interactions, or resistance.

Immune reconstitution syndrome

Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms; these reactions may occur within the first few weeks or months of initiating treatment. Autoimmune disorders (such as Graves' disease) have also been reported many months after initiation of treatment.

Lipodystrophy syndrome

Metabolic effects associated with antiretroviral treatment include *fat redistribution*, *insulin resistance*, and *dyslipidaemia*; collectively these have been termed *lipodystrophy syndrome*. Children should be encouraged to lead a healthy lifestyle that reduces their long-term cardiovascular risk. Plasma lipids and blood glucose should be measured before starting antiretroviral therapy, after 3–6 months of treatment, and then at least annually. Insulin resistance and hyperglycaemia occur only rarely in children.

Fat redistribution (with loss of subcutaneous fat, increased abdominal fat, 'buffalo hump' and breast enlargement) is associated with regimens containing protease inhibitors and nucleoside reverse transcriptase inhibitors. Stavudine, and to a lesser extent zidovudine, are associated with a higher risk of lipodystrophy and should be used only if alternative regimens are not suitable.

Dyslipidaemia is associated with antiretroviral treatment, particularly with protease inhibitors; in children, hypercholesterolaemia appears to be more common than hypertriglyceridaemia. Protease inhibitors and some nucleoside reverse transcriptase inhibitors are associated with insulin resistance and hyperglycaemia, but they occur rarely in children. Of the protease inhibitors, atazanavir and darunavir are less likely to cause dyslipidaemia, while atazanavir is less likely to impair glucose tolerance.

Osteonecrosis

Osteonecrosis has been reported in children with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

Neonates

In order to prevent transmission of infection, neonates born to HIV-positive mothers should be given post-exposure prophylaxis as soon as possible after birth, but starting no later than 72 hours after birth. Zidovudine p. 394 alone should be given to neonates whose mothers had a viral load less than 50 HIV RNA copies/mL between 36 weeks' gestation and delivery, or whose mothers underwent caesarean section while taking zidovudine monotherapy. Combination antiretroviral therapy should be given to neonates whose mothers had a viral load over 50 HIV RNA

copies/mL at delivery or whose mothers are found to be HIV positive after delivery. Prophylaxis is continued for 4 weeks.

ANTIVIRALS > HIV-FUSION INHIBITORS

Enfuvirtide

- **DRUG ACTION** Enfuvirtide inhibits the fusion of HIV to the host cell.

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

► BY SUBCUTANEOUS INJECTION

- Child 6–15 years: 2 mg/kg twice daily (max. per dose 90 mg)
- Child 16–17 years: 90 mg twice daily

- **INTERACTIONS** → Appendix 1 (enfuvirtide).

● SIDE-EFFECTS

- **Common or very common** Acne · anorexia · anxiety · asthenia · conjunctivitis · diabetes mellitus · dry skin · erythema · gastro-oesophageal reflux disease · haematuria · hypertriglyceridaemia · impaired concentration · influenza-like illness · injection-site reactions · irritability · lymphadenopathy · myalgia · nightmares · pancreatitis · peripheral neuropathy · pneumonia · renal calculi · sinusitis · skin papilloma · tremor · vertigo · weight loss
- **Uncommon** Hypersensitivity reactions
- **Frequency not known** Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

- **Hypersensitivity reactions** Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge.
- **Osteonecrosis** For further information see HIV infection p. 385.
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available; chronic hepatitis B or C (possibly greater risk of hepatic side-effects).
- **DIRECTIONS FOR ADMINISTRATION** For *subcutaneous injection*, reconstitute with 1.1 mL Water for Injections and allow to stand (for up to 45 minutes) to dissolve; **do not** shake or invert vial.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

ELECTROLYTES: May contain Sodium

► **Fuzeon** (Roche Products Ltd)

Enfuvirtide 108 mg Fuzeon 108mg powder and solvent for solution for injection vials | 60 vial (PoM) £1,081.57

ANTIVIRALS > HIV-INTEGRASE INHIBITORS**Dolutegravir**

- **DRUG ACTION** Dolutegravir is an inhibitor of HIV integrase.

● **INDICATIONS AND DOSE**

HIV infection without resistance to other inhibitors of HIV integrase, in combination with other antiretroviral drugs

► **BY MOUTH**

- Child 12–17 years (body-weight 40 kg and above): 50 mg once daily

HIV infection in combination with other antiretroviral drugs (with concomitant carbamazepine, efavirenz, etravirine (without boosted protease inhibitors, but see also Interactions), fosphenytoin, phenobarbital, phenytoin, primidone, nevirapine, oxcarbazepine, St John's wort, rifampicin, or tipranavir)

► **BY MOUTH**

- Child 12–17 years (body-weight 40 kg and above): 50 mg twice daily, avoid concomitant use with these drugs if resistance to other inhibitors of HIV integrase suspected

- **INTERACTIONS** → Appendix 1 (dolutegravir).

Caution—avoid concomitant use with etravirine, unless used in combination with atazanavir, darunavir, or lopinavir.

● **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · abnormal dreams · diarrhoea · dizziness · fatigue · flatulence · headache · insomnia · nausea · pruritus · raised creatine kinase · rash · vomiting

- **Uncommon** Hepatitis · hypersensitivity reactions

- **Frequency not known** Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

- **Hypersensitivity reactions** Hypersensitivity reactions (including severe rash, or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, oral lesions, conjunctivitis, angioedema, eosinophilia, or raised liver enzymes) reported uncommonly. Discontinue immediately if any sign or symptoms of hypersensitivity reactions develop.
- **Osteonecrosis** For further information see HIV infection p. 385.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available.

- **DIRECTIONS FOR ADMINISTRATION** Avoid antacids 6 hours before or 2 hours after taking dolutegravir.

● **PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer dolutegravir tablets.

Missed doses

If a dose is more than 20 hours late on the once daily regimen (or more than 8 hours late on the twice daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Tivicay** (ViiV Healthcare UK Ltd) ▼

Dolutegravir (as Dolutegravir sodium) 50 mg Tivicay 50mg tablets | 30 tablet (POM) £498.75

Combinations available: **Abacavir with dolutegravir and lamivudine**, p. 391

Raltegravir

- **DRUG ACTION** Raltegravir is an inhibitor of HIV integrase.

● **INDICATIONS AND DOSE**

HIV infection resistant to multiple antiretrovirals, in combination with other antiretroviral drugs

► **BY MOUTH USING TABLETS**

- Child 6–17 years (body-weight 25 kg and above): 400 mg twice daily

► **BY MOUTH USING CHEWABLE TABLETS**

- Child 2–11 years (body-weight 12–13 kg): 75 mg twice daily
- Child 2–11 years (body-weight 14–19 kg): 100 mg twice daily

- **Frequency not known** Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

- **Rash** Rash occurs commonly. Discontinue if severe rash or rash accompanied by fever, malaise, arthralgia, myalgia, blistering, mouth ulceration, conjunctivitis, angioedema, hepatitis, or eosinophilia.
- **Lipodystrophy syndrome** For further information see HIV infection p. 385.
- **Osteonecrosis** For further information see HIV infection p. 385.

- **PREGNANCY** Manufacturer advises avoid—toxicity in animal studies.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—no information available. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side-effects).

- **PRESCRIBING AND DISPENSING INFORMATION** Dispense raltegravir chewable tablets in original container (contains desiccant).

ANTIVIRALS > NON-NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS

Efavirenz

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

► BY MOUTH USING CAPSULES

- Child 3 months–17 years (body-weight 3.5–4 kg): 100 mg once daily
- Child 3 months–17 years (body-weight 5–7.4 kg): 150 mg once daily
- Child 3 months–17 years (body-weight 7.5–14 kg): 200 mg once daily
- Child 3 months–17 years (body-weight 15–19 kg): 250 mg once daily
- Child 3 months–17 years (body-weight 20–24 kg): 300 mg once daily
- Child 3 months–17 years (body-weight 25–32.4 kg): 350 mg once daily
- Child 3 months–17 years (body-weight 32.5–39 kg): 400 mg once daily
- Child 3 months–17 years (body-weight 40 kg and above): 600 mg once daily

► BY MOUTH USING TABLETS

- Child (body-weight 40 kg and above): 600 mg once daily

► BY MOUTH USING ORAL SOLUTION

- Child 3–4 years (body-weight 13–14 kg): 360 mg once daily
- Child 3–4 years (body-weight 15–19 kg): 390 mg once daily
- Child 3–4 years (body-weight 20–24 kg): 450 mg once daily
- Child 3–4 years (body-weight 25–32.5 kg): 510 mg once daily
- Child 5–17 years (body-weight 13–14 kg): 270 mg once daily
- Child 5–17 years (body-weight 15–19 kg): 300 mg once daily
- Child 5–17 years (body-weight 20–24 kg): 360 mg once daily
- Child 5–17 years (body-weight 25–32.4 kg): 450 mg once daily
- Child 5–17 years (body-weight 32.5–39 kg): 510 mg once daily
- Child 5–17 years (body-weight 40 kg and above): 720 mg once daily

DOSE EQUIVALENCE AND CONVERSION

The bioavailability of *Sustiva*® oral solution is lower than that of the capsules and tablets; the oral solution is **not** interchangeable with either capsules or tablets on a milligram-for-milligram basis.

- **UNLICENSED USE** Opening capsules and adding contents to food is an unlicensed method of administration.

- **CAUTIONS** Acute porphyrias p. 562 · history of psychiatric disorders · history of seizures

- **INTERACTIONS** → Appendix 1 (efavirenz).

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · abnormal dreams · anxiety · depression · diarrhoea · dizziness · fatigue · headache · impaired concentration · nausea · pruritus · rash · sleep disturbances · Stevens-Johnson syndrome · vomiting
- **Uncommon** Amnesia · ataxia · blurred vision · convulsions · flushing · gynaecomastia · hepatitis · hypersensitivity · mania · pancreatitis · psychosis · suicidal ideation · tinnitus · tremor · vertigo
- **Rare** Hepatic failure · photosensitivity · suicide
- **Frequency not known** Lipodystrophy syndrome · osteonecrosis · raised serum cholesterol

SIDE-EFFECTS, FURTHER INFORMATION

- **Rash** Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—usually resolves within 1 month.
- **CNS effects** Administration at bedtime especially in first 2–4 weeks reduces CNS effects.
- **Lipodystrophy syndrome** For further information see HIV infection p. 385.
- **Osteonecrosis** For further information see HIV infection p. 385.
- **Immune Reconstitution Syndrome** For further information see HIV infection p. 385.
- **PREGNANCY** Reports of neural tube defects when used in first trimester.
- **HEPATIC IMPAIRMENT** Greater risk of hepatic side-effects in chronic hepatitis B or C. Avoid in severe impairment. In mild to moderate liver disease, monitor for dose-related side-effects (e.g. CNS effects) and liver function.
- **RENAL IMPAIRMENT** Manufacturer advises caution in severe renal failure—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function if receiving other hepatotoxic drugs.
- **DIRECTIONS FOR ADMINISTRATION** Capsules may be opened and contents added to food (contents have a peppery taste).
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry and mint.
- **PATIENT AND CARER ADVICE** Psychiatric disorders Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur.

● MEDICINAL FORMS

Etravirine

● INDICATIONS AND DOSE

HIV infection resistant to other non-nucleoside reverse transcriptase inhibitor and protease inhibitors in combination with other antiretroviral drugs (including a boosted protease inhibitor)

► BY MOUTH

- Child 6–17 years (body-weight 16–19 kg): 100 mg twice daily
- Child 6–17 years (body-weight 20–24 kg): 125 mg twice daily
- Child 6–17 years (body-weight 25–29 kg): 150 mg twice daily
- Child 6–17 years (body-weight 30 kg and above): 200 mg twice daily

● **CONTRA-INDICATIONS** Acute porphyrias p. 562

● **INTERACTIONS** → Appendix 1 (etravirine).

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · anaemia · diabetes · flatulence · gastritis · gastro-oesophageal reflux · hyperlipidaemia · hypertension · Lipodystrophy Syndrome · nausea · peripheral neuropathy · rash · renal failure
- **Uncommon** Blurred vision · bronchospasm · chest pain · drowsiness · dry mouth · gynaecomastia · haematemesis · hepatitis · malaise · pancreatitis · sweating
- **Rare** Stevens-Johnson syndrome
- **Very rare** Toxic epidermal necrolysis
- **Frequency not known** Haemorrhagic stroke · hypersensitivity reactions · osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

- **Hypersensitivity reactions** Rash, usually in the second week, is the most common side-effect and appears more frequently in females. Life-threatening hypersensitivity reactions reported usually during week 3–6 of treatment and characterised by rash, eosinophilia, and systemic symptoms (including fever, general malaise, myalgia, arthralgia, blistering, oral lesions, conjunctivitis, and hepatitis). Discontinue permanently if hypersensitivity reaction or severe rash develop. If rash mild or moderate (without signs of hypersensitivity reaction), may continue without interruption—usually resolves within 2 weeks.
- **Lipodystrophy** For further information see HIV infection p. 385.
- **Osteonecrosis** For further information see HIV infection p. 385.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in moderate impairment; avoid in severe impairment—no information available; greater risk of hepatic side-effects in chronic hepatitis B or C.

● **DIRECTIONS FOR ADMINISTRATION** Patients with swallowing difficulties may disperse tablets in a glass of water just before administration.

● **PRESCRIBING AND DISPENSING INFORMATION** Dispense in original container (contains desiccant).

● PATIENT AND CARER ADVICE

Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to seek immediate medical attention if hypersensitivity reaction or severe rash develop.

Missed doses

If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

Etravirine 200 mg Intencele 200mg tablets | 60 tablet PoM £301.27

Nevirapine

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (initial dose)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child: Initially 150–200 mg/m² once daily (max. per dose 200 mg) for first 14 days, initial dose titration using 'immediate-release' preparation should not exceed 28 days; if rash occurs and is not resolved within 28 days, alternative treatment should be sought. If treatment interrupted for more than 7 days, restart using the lower dose of the 'immediate-release' preparation for the first 14 days as for new treatment

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 1 month–2 years: 150–200 mg/m² twice daily (max. per dose 200 mg), alternatively 300–400 mg/m² once daily (max. per dose 400 mg)
- Child 3–17 years: 150–200 mg/m² twice daily (max. per dose 200 mg)

HIV infection in combination with other antiretroviral drugs (maintenance dose following initial dose titration if no rash present)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 3–17 years (body surface area 0.58–0.83 m²): 200 mg once daily
- Child 3–17 years (body surface area 0.84–1.17 m²): 300 mg once daily
- Child 3–17 years (body surface area 1.18 m² and above): 400 mg once daily
- **BY MOUTH USING MODIFIED-RELEASE MEDICINES**
- Child 3–17 years (body surface area 0.58–0.83 m²): 200 mg once daily
- Child 3–17 years (body surface area 0.84–1.17 m²): 300 mg once daily
- Child 3–17 years (body surface area 1.18 m² and above): 400 mg once daily

● **UNLICENSED USE** 'Immediate-release' tablets not licensed for use in children weighing less than 50 kg or with body surface area less than 1.25 m²; 'immediate-release' tablets and suspension not licensed for once daily dose after the initial dose titration.

● **CONTRA-INDICATIONS** Acute porphyrias p. 562 · post-exposure prophylaxis

● **CAUTIONS** Females (at greater risk of hepatic side effects) · high CD4 cell count (at greater risk of hepatic side effects)

● **INTERACTIONS** → Appendix 1 (nevirapine).

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · diarrhoea · fatigue · fever · granulocytopenia · headache · hepatitis · hypersensitivity reactions (may involve hepatic reactions and rash) · nausea · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis · vomiting
- **Uncommon** Anaemia · arthralgia · myalgia
- **Frequency not known** Osteonecrosis

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hepatic effects** Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy, hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction.
- ▶ **Rash** Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually (after 14 days); Discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves.
- ▶ **Osteonecrosis** For more information see HIV infection p. 385.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available; use 'immediate-release' preparation with caution in moderate impairment and avoid in severe impairment. Use with caution in patients with chronic hepatitis B or C (at greater risk of hepatic side effects).
- **RENAL IMPAIRMENT** Manufacturer advises avoid modified-release preparation—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ **Hepatic disease** Close monitoring of liver function required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly.
 - ▶ **Rash** Monitor closely for skin reactions during first 18 weeks.
- **PATIENT AND CARER ADVICE** Hypersensitivity reactions Patients or carers should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet▶ **Nevirapine (Non-proprietary)**

Nevirapine 200 mg Nevirapine 200mg tablets | 60 tablet [PoM] £28.60–£170.00

▶ **Viramune** (Boehringer Ingelheim Ltd)

Nevirapine 200 mg Viramune 200mg tablets | 14 tablet [PoM] £39.67 | 60 tablet [PoM] £170.00

Oral suspension▶ **Viramune** (Boehringer Ingelheim Ltd)

Nevirapine (as Nevirapine hemihydrate) 10 mg per 1 ml Viramune 50mg/5ml oral suspension | 240 ml [PoM] £50.40

ANTIVIRALS > NUCLEOSIDE REVERSE TRANSCRIPTASE INHIBITORS**Nucleoside reverse transcriptase inhibitors**

- **CAUTIONS** Patients at risk of lactic acidosis

CAUTIONS, FURTHER INFORMATION

- ▶ **Lactic acidosis** Life-threatening lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with nucleoside reverse transcriptase inhibitors.

They should be used with caution in patients with hepatomegaly, hepatitis (especially hepatitis C treated with interferon alfa and ribavirin), liver-enzyme abnormalities and with other risk factors for liver disease and hepatic steatosis. Treatment with the nucleoside reverse transcriptase inhibitor should be **discontinued** in case of symptomatic hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function.

- **SIDE-EFFECTS** Abdominal pain • anaemia • anorexia • arthralgia • blood disorders • cough • diarrhoea • dizziness • dyspnoea • fatigue • fever • flatulence • gastro-intestinal disturbances • headache • insomnia • lactic acidosis • lipodystrophy (Lipodystrophy Syndrome) • liver damage • metabolic effects • myalgia • nausea • neutropenia • osteonecrosis • pancreatitis • rash • thrombocytopenia • urticaria • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Lipodystrophy syndrome** For further information see HIV infection p. 385.
- ▶ **Osteonecrosis** For further information see HIV infection p. 385.
- **PREGNANCY** Mitochondrial dysfunction has been reported in infants exposed to nucleoside reverse transcriptase inhibitors in utero; the main effects include haematological, metabolic, and neurological disorders; all infants whose mothers received nucleoside reverse transcriptase inhibitors during pregnancy should be monitored for relevant signs or symptoms.
- **HEPATIC IMPAIRMENT** Use with caution in children with hepatic impairment (greater risk of hepatic side effects). However, some nucleoside reverse transcriptase inhibitors are used in children who also have chronic hepatitis B.

F above

Abacavir**• INDICATIONS AND DOSE****HIV infection in combination with other antiretroviral drugs**▶ **BY MOUTH**

- ▶ **Child 3 months–11 years:** 8 mg/kg twice daily (max. per dose 300 mg), alternatively 16 mg/kg once daily (max. per dose 600 mg)
- ▶ **Child 3 months–11 years (body-weight 14–20 kg):** 150 mg twice daily, alternatively 300 mg once daily
- ▶ **Child 3 months–11 years (body-weight 21–29 kg):** 150 mg, taken in the morning and 300 mg, taken in the evening, alternatively 450 mg once daily
- ▶ **Child 3 months–11 years (body-weight 30 kg and above):** 300 mg twice daily, alternatively 600 mg once daily
- ▶ **Child 12–17 years:** 300 mg twice daily, alternatively 600 mg once daily

- **INTERACTIONS** → Appendix 1 (abacavir).

• SIDE-EFFECTS

- ▶ **Very rare** Stevens-Johnson syndrome • toxic epidermal necrolysis
- ▶ **Frequency not known** Hypersensitivity reactions

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hypersensitivity reactions** Life-threatening hypersensitivity reactions reported—characterised by fever or rash and possibly nausea, vomiting, diarrhoea, abdominal pain, dyspnoea, cough, lethargy, malaise, headache, and myalgia; less frequently mouth ulceration, oedema, hypotension, sore throat, acute respiratory distress syndrome, anaphylaxis, paraesthesia, arthralgia, conjunctivitis, lymphadenopathy, lymphocytopenia and renal failure; rarely myolysis; laboratory abnormalities may include raised liver function tests and creatine kinase;

symptoms usually appear in the first 6 weeks, but may occur at any time.

Discontinue immediately if any symptom of hypersensitivity develops and do not rechallenge (risk of more severe hypersensitivity reaction); discontinue if hypersensitivity cannot be ruled out, even when other diagnoses possible—if rechallenge necessary it must be carried out in hospital setting; if abacavir is stopped for any reason other than hypersensitivity, exclude hypersensitivity reaction as the cause and rechallenge only if medical assistance is readily available; care needed with concomitant use of drugs which cause skin toxicity.

- ▶ Gastro-intestinal disturbances More common in children.
- ▶ Rash More common in children.

● **ALLERGY AND CROSS-SENSITIVITY** Caution—increased risk of hypersensitivity reaction in presence of HLA-B*5701 allele.

● **HEPATIC IMPAIRMENT** Monitor closely in mild impairment (combination preparations not recommended as reduced abacavir dose may be required). Avoid in moderate impairment unless essential—close monitoring recommended. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Manufacturer advises avoid in end-stage renal disease.

● **PRE-TREATMENT SCREENING** Test for HLA-B*5701 allele before treatment or if restarting treatment and HLA-B*5701 status not known.

● **MONITORING REQUIREMENTS** Monitor for symptoms of hypersensitivity reaction every 2 weeks for 2 months.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana, or strawberry.

● **PATIENT AND CARER ADVICE** Patients should be provided with an alert card and advised to keep it with them at all times.

Patients and their carers should be told the importance of regular dosing (intermittent therapy may increase the risk of sensitisation), how to recognise signs of hypersensitivity, and advised to seek immediate medical attention if symptoms develop or before re-starting treatment.

● INDICATIONS AND DOSE

HIV infection (use only if patient is stabilised for 6–8 weeks on the individual components in the same proportions)

- ▶ BY MOUTH
- ▶ Child (body-weight 30 kg and above): 1 tablet twice daily

● **UNLICENSED USE** *Trizivir*® not licensed for use in children.

● **RENAL IMPAIRMENT** Avoid *Trizivir*® if estimated glomerular filtration rate less than 50 mL/minute/1.73 m².

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Trizivir** (ViiV Healthcare UK Ltd)
Lamivudine 150 mg, Abacavir (as Abacavir sulfate) 300 mg, Zidovudine 300 mg Trizivir tablets | 60 tablet [PoM] £432.70

Didanosine

(ddi; DDI)

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

► BY MOUTH

- Child 1–7 months: 50–100 mg/m² twice daily
- Child 8 months–17 years: 180–240 mg/m² once daily; usual dose 200 mg/m² once daily; maximum 400 mg per day

- **UNLICENSED USE** Tablets not licensed for use in children under 3 months. EC capsules not licensed for use in children under 6 years.

- **CAUTIONS** History of pancreatitis (preferably avoid, otherwise extreme caution) · hyperuricaemia · peripheral neuropathy

- **INTERACTIONS** → Appendix 1 (didanosine). Antacids in tablet formulation might affect absorption of other drugs—give at least 2 hours apart.

- **SIDE-EFFECTS** Acute renal failure · alopecia · anaphylactic reactions · diabetes mellitus · dry eyes · dry mouth · hyperuricaemia (suspend if raised significantly) · hypoglycaemia · liver failure · non-cirrhotic portal hypertension · optic nerve changes · pancreatitis (less common in children) · parotid gland enlargement · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · retinal changes · rhabdomyolysis · sialadenitis

SIDE-EFFECTS, FURTHER INFORMATION

- **Pancreatitis** Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isetionate); monitor closely if concomitant therapy unavoidable. Sign significant elevations of triglycerides cause pancreatitis monitor closely if elevated.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** In hepatic impairment, monitor for toxicity.

- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 60 mL/minute/1.73 m²; consult product literature.

- **MONITORING REQUIREMENTS** Ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur.

- **DIRECTIONS FOR ADMINISTRATION** Capsules should be swallowed whole and taken at least 2 hours before or 2 hours after food.

With chewable tablets, to ensure sufficient antacid, each dose to be taken as at least 2 tablets (child under 1 year 1 tablet) chewed thoroughly, crushed or dispersed in water; clear apple juice may be added for flavouring; tablets to be taken 2 hours after lopinavir with ritonavir capsules and oral solution or atazanavir with ritonavir.

- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer didanosine capsules and chewable tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

EPIVIR® ORAL SOLUTION

HIV infection in combination with other antiretroviral drugs

► BY MOUTH

- Child 1-2 months: 4 mg/kg twice daily
- Child 3 months-11 years (body-weight up to 14 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg)
- Child 3 months-11 years (body-weight 14-20 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg twice daily, alternatively 150 mg once daily
- Child 3 months-11 years (body-weight 21-29 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg daily, dose to be taken in the morning and 150 mg daily, dose to be taken in the evening, alternatively 225 mg once daily
- Child 3 months-11 years (body-weight 30 kg and above): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 150 mg twice daily, alternatively 300 mg once daily
- Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily

EPIVIR® TABLETS

HIV infection in combination with other antiretroviral drugs

► BY MOUTH

- Child 1-2 months: 4 mg/kg twice daily
- Child 3 months-11 years (body-weight up to 14 kg): 4 mg/kg twice daily, alternatively 8 mg/kg once daily
- Child 3 months-11 years (body-weight 14-20 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg twice daily, alternatively 150 mg once daily
- Child 3 months-11 years (body-weight 21-29 kg): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 75 mg daily, dose to be taken in the morning and 150 mg daily, dose to be taken in the evening, alternatively 225 mg once daily
- Child 3 months-11 years (body-weight 30 kg and above): 4 mg/kg twice daily (max. per dose 150 mg), alternatively 8 mg/kg once daily (max. per dose 300 mg), alternatively 150 mg twice daily, alternatively 300 mg once daily
- Child 12-17 years: 150 mg twice daily, alternatively 300 mg once daily

ZEFFIX®

Chronic hepatitis B infection either with compensated liver disease (with evidence of viral replication and histology of active liver inflammation or fibrosis) when first-line treatments cannot be used, or (in combination with another antiviral drug without cross-resistance to lamivudine) with decompensated liver disease

► BY MOUTH

- Child 2-11 years: 3 mg/kg once daily (max. per dose 100 mg), children receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

- Child 12-17 years: 100 mg once daily, patients receiving lamivudine for concomitant HIV infection should continue to receive lamivudine in a dose appropriate for HIV infection

● UNLICENSED USE

- **EPIVIR® ORAL SOLUTION** Not licensed for use in children under 3 months.

ZEFFIX® Not licensed for use in children.

- **EPIVIR® TABLETS** Not licensed for use in children under 3 months.

- **CAUTIONS** Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine

- **INTERACTIONS** → Appendix 1 (lamivudine).

- **SIDE-EFFECTS** Alopecia · muscle disorders · nasal symptoms · peripheral neuropathy · rhabdomyolysis

- **BREAST FEEDING** Can be used with caution in women infected with chronic hepatitis B alone, providing that adequate measures are taken to prevent hepatitis B infection in infants.

- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²; consult product literature.

- **MONITORING REQUIREMENTS** When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include banana and strawberry.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Epivir** (ViiV Healthcare UK Ltd)

Lamivudine 150 mg Epivir 150mg tablets | 60 tablet [PoM] £121.82

Lamivudine 300 mg Epivir 300mg tablets | 30 tablet [PoM] £133.89

- **Zeffix** (GlaxoSmithKline UK Ltd)

Lamivudine 10 mg per 1 ml Epivir 50mg/5ml oral solution |

240 ml [PoM] £33.16

£ 390

Stavudine (d4T)

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs when no suitable alternative available and when prescribed for shortest period possible

► BY MOUTH

- Child (body-weight up to 30 kg): 1 mg/kg twice daily, to be taken preferably at least 1 hour before food
- Child (body-weight 30-59 kg): 30 mg twice daily, to be taken preferably at least 1 hour before food
- Child (body-weight 60 kg and above): 40 mg twice daily, to be taken preferably at least 1 hour before food

- **UNLICENSED USE** Capsules not licensed for use in children under 3 months.

- **CAUTIONS** Excessive alcohol intake · higher risk of lactic acidosis than other nucleoside reverse transcriptase inhibitors (especially when used in combination with

didanosine)—use only if alternative regimens are not suitable · history of pancreatitis · history of peripheral neuropathy

- **INTERACTIONS** → Appendix 1 (stavudine). Caution with concomitant use of isoniazid—risk of peripheral neuropathy. Caution with concomitant use with other drugs associated with pancreatitis.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abnormal dreams · cognitive dysfunction · depression · drowsiness · peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops) · pruritus
 - ▶ **Uncommon** Anxiety · gynaecomastia
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **RENAL IMPAIRMENT** Reduce dose to 50% if estimated glomerular filtration rate 25–50 mL/minute/1.73 m²; reduce dose to 25% if estimated glomerular filtration rate less than 25 mL/minute/1.73 m². Risk of peripheral neuropathy.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include cherry.
- **LESS SUITABLE FOR PRESCRIBING** Stavudine (especially in combination with didanosine) is associated with a higher risk of lipatrophy and should be used only if alternative regimens are not suitable; it is considered to be less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Zerit** (Bristol-Myers Squibb Pharmaceuticals Ltd)
Stavudine 20 mg Zerit 20mg capsules | 56 capsule [PoM] £139.46 (Hospital only)
Stavudine 30 mg Zerit 30mg capsules | 56 capsule [PoM] £146.25 (Hospital only)
Stavudine 40 mg Zerit 40mg capsules | 56 capsule [PoM] £150.66 (Hospital only)

Oral solution

- ▶ **Zerit** (Bristol-Myers Squibb Pharmaceuticals Ltd)
Stavudine 1 mg per 1 ml Zerit 1mg/ml oral solution | 200 ml [PoM] £22.94 (Hospital only)

P 390

Tenofovir disoproxil

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs when first-line nucleoside reverse transcriptase inhibitors cannot be used because of resistance or contra-indications

- ▶ **BY MOUTH**
- ▶ Child 2–17 years: 6.5 mg/kg once daily (max. per dose 245 mg)
- ▶ Child 6–17 years (body-weight 17–21 kg): 123 mg once daily
- ▶ Child 6–17 years (body-weight 22–27 kg): 163 mg once daily
- ▶ Child 6–17 years (body-weight 28–34 kg): 204 mg once daily
- ▶ Child 6–17 years (body-weight 35 kg and above): 245 mg once daily

Chronic hepatitis B infection with compensated liver disease (with evidence of viral replication, and histology of active liver inflammation or fibrosis)

- ▶ **BY MOUTH**
- ▶ Child 12–17 years (body-weight 35 kg and above): 245 mg once daily

DOSE EQUIVALENCE AND CONVERSION

7.5 scoops of granules contains approx. 245 mg tenofovir disoproxil (as fumarate).

- **INTERACTIONS** → Appendix 1 (tenofovir). Use with caution if concomitant or recent use of nephrotoxic drugs.
- **SIDE-EFFECTS**
 - ▶ **Rare** Nephrogenic diabetes insipidus · proximal renal tubulopathy · renal failure
 - ▶ **Frequency not known** Hypophosphataemia · reduced bone density
- **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS**
 - ▶ Test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases.
 - ▶ When treating chronic hepatitis B with tenofovir, monitor liver function tests every 3 months and viral markers for hepatitis B every 3–6 months during treatment (continue monitoring for at least 1 year after discontinuation—recurrent hepatitis may occur on discontinuation).
- **DIRECTIONS FOR ADMINISTRATION** *Granules*: mix 1 scoop of granules with 1 tablespoon of soft food (e.g. yoghurt, apple sauce) and take immediately without chewing. Do **not** mix granules with liquids.
- **PATIENT AND CARER ADVICE**
 Patients or carers should be given advice on how to administer tenofovir granules.

Missed doses

If a dose is more than 12 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- CAUTIONARY AND ADVISORY LABELS 21
- ▶ **Viread** (Gilead Sciences International Ltd)

P 390

Zidovudine

(Azidothymidine; AZT)

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

- ▶ **BY MOUTH**
- ▶ Child: 180 mg/m² twice daily (max. per dose 300 mg)
- ▶ Child (body-weight 8–13 kg): 100 mg twice daily
- ▶ Child (body-weight 14–20 kg): 100 mg, to be taken in the morning and 200 mg, to be taken in the evening
- ▶ Child (body-weight 21–27 kg): 200 mg twice daily
- ▶ Child (body-weight 28–29 kg): 200–250 mg twice daily

- ▶ Child (body-weight 30 kg and above): 250–300 mg twice daily

HIV infection in combination with other antiretroviral drugs (dose expressed in mg/kg)

▶ BY MOUTH

- ▶ Child (body-weight 4–8 kg): 12 mg/kg twice daily
- ▶ Child (body-weight 9–29 kg): 9 mg/kg twice daily

Prevention of maternal-fetal HIV transmission

▶ BY MOUTH, OR BY INTRAVENOUS INFUSION

- ▶ Child: Seek specialist advice (combination therapy preferred) (consult local protocol)

HIV infection in combination with other antiretroviral drugs in patients temporarily unable to take zidovudine by mouth

▶ BY INTRAVENOUS INFUSION

- ▶ Child 3 months–11 years: 60–80 mg/m² every 6 hours usually for not more than 2 weeks, dose approximating to 9–12 mg/kg twice daily by mouth
- ▶ Child 12–17 years: 0.8–1 mg/kg every 4 hours usually for not more than 2 weeks, dose approximating to 1.2–1.5 mg/kg every 4 hours by mouth

- **CONTRA-INDICATIONS** Abnormally low haemoglobin concentration (consult product literature) · abnormally low neutrophil counts (consult product literature) · Acute porphyrias p. 562 · neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature)

- **CAUTIONS** Risk of haematological toxicity particularly with high dose and advanced disease · vitamin B₁₂ deficiency (increased risk of neutropenia)

- **INTERACTIONS** → Appendix 1 (zidovudine). Increased risk of toxicity with nephrotoxic and myelosuppressive drugs—for further details consult product literature.

- **SIDE-EFFECTS** Anaemia (may require transfusion) · anxiety · chest pain · convulsions · depression · dizziness · drowsiness · gynaecomastia · influenza-like symptoms · loss of mental acuity · myopathy · neuropathy · paraesthesia · pigmentation of nails · pigmentation of oral mucosa · pigmentation of skin · pruritus · sweating · taste disturbance · urinary frequency

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Anaemia and myelosuppression If anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment
- ▶ Lipoatrophy Zidovudine is associated with a higher risk of lipoatrophy than other antiretrovirals and should be used only if alternative regimens are not suitable.

- **HEPATIC IMPAIRMENT** Accumulation may occur.

- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m²—consult product literature.

- **MONITORING REQUIREMENTS** Monitor full blood count after 4 weeks of treatment, then every 3 months.

DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use *For intermittent intravenous infusion*, dilute to a concentration of 2 mg/mL or 4 mg/mL with Glucose 5% and give over 1 hour.
- **PRESCRIBING AND DISPENSING INFORMATION** The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Zidovudine (Non-proprietary)**

Zidovudine 100 mg Zidovudine 100mg capsules | 60 capsule **[PoM]** £40.41

Zidovudine 250 mg Zidovudine 250mg capsules | 60 capsule **[PoM]** £96.36

ANTIVIRALS > PROTEASE INHIBITORS, HIV

Protease inhibitors

- **CONTRA-INDICATIONS** Acute porphyrias p. 562

- **CAUTIONS** Diabetes · haemophilia (increased risk of bleeding)

- **SIDE-EFFECTS** Abdominal pain · anaemia · anaphylaxis · anorexia · blood disorders · diarrhoea · dizziness · fatigue · flatulence · gastro-intestinal disturbances · headache · hepatic dysfunction · hypersensitivity reactions · lipodystrophy · Lipodystrophy Syndrome · myalgia · myositis · nausea · neutropenia · osteonecrosis · pancreatitis · paraesthesia · pruritus · rash · rhabdomyolysis · sleep disturbances · Stevens-Johnson syndrome · taste disturbances · thrombocytopenia · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Lipodystrophy Syndrome** For further information see HIV infection p. 385.
- ▶ **Osteonecrosis** For further information see HIV infection p. 385.
- **HEPATIC IMPAIRMENT** Use with caution in patients with chronic hepatitis B or C (increased risk of hepatic side-effects).

Atazanavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

- ▶ **BY MOUTH**
- ▶ Child 6–17 years (body-weight 15–19 kg): 150 mg once daily
- ▶ Child 6–17 years (body-weight 20–39 kg): 200 mg once daily
- ▶ Child 6–17 years (body-weight 40 kg and above): 300 mg once daily

- **CAUTIONS** Cardiac conduction disorders · electrolyte disturbances · predisposition to QT interval prolongation

- **INTERACTIONS** → Appendix 1 (atazanavir).

Caution if concomitant use with drugs that prolong PR interval.

Caution with concomitant use of drugs that prolong QT interval.

- **SIDE-EFFECTS**

- ▶ **Common or very common** AV block
- ▶ **Uncommon** Abnormal dreams · alopecia · amnesia · anxiety · arthralgia · chest pain · cholelithiasis · depression · disorientation · dry mouth · dyspnoea · gynaecomastia · haematuria · hypertension · increased appetite · mouth ulcers · nephrolithiasis · peripheral neuropathy · proteinuria · syncope · torsade de pointes · urinary frequency · weight changes
- ▶ **Rare** Abnormal gait · cholecystitis · hepatosplenomegaly · oedema · palpitation

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Rash** Mild to moderate rash occurs commonly, usually within the first 3 weeks of therapy. Severe rash occurs less frequently and may be accompanied by systemic symptoms. Discontinue if severe rash develops.

- **PREGNANCY** Theoretical risk of hyperbilirubinaemia in neonate if used at term.

In pregnancy, monitor viral load and plasma-atazanavir concentration during third trimester.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate to severe impairment.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 5, 21

- ▶ **Reyataz** (Bristol-Myers Squibb Pharmaceuticals Ltd)

Atazanavir (as Atazanavir sulfate) 150 mg Reyataz 150mg capsules | 60 capsule [PoM] £303.38 (Hospital only)

Atazanavir (as Atazanavir sulfate) 300 mg Reyataz 300mg capsules | 30 capsule [PoM] £303.38 (Hospital only)

Darunavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretroviral therapy—with low-dose ritonavir

- ▶ **BY MOUTH**
- ▶ Child 3–17 years (body-weight 15–29 kg): 375 mg twice daily
- ▶ Child 3–17 years (body-weight 30–39 kg): 450 mg twice daily
- ▶ Child 3–17 years (body-weight 40 kg and above): 600 mg twice daily

- ▶ Child 12–17 years: 800 mg once daily, once daily dose only to be used if no resistance to darunavir, if plasma HIV-RNA concentration less than 100 000 copies/mL, and if CD4 cell count greater than 100 cells × 10⁶/litre

HIV infection in combination with other antiretroviral drugs in patients not previously treated with antiretroviral therapy—with low-dose ritonavir

- ▶ **BY MOUTH**
- ▶ Child 12–17 years (body-weight 40 kg and above): 800 mg once daily

- **INTERACTIONS** → Appendix 1 (darunavir).

- **SIDE-EFFECTS**

- ▶ **Common or very common** Peripheral neuropathy · rash
- ▶ **Uncommon** Abnormal dreams · acne · alopecia · anxiety · arthralgia · chest pain · conjunctival hyperaemia · cough · depression · dry eyes · dry mouth · dyspnoea · dysuria · eczema · erectile dysfunction · flushing · gynaecomastia · hypertension · hypothyroidism · increased appetite · increased sweating · memory impairment · myocardial infarction · nail discoloration · nephrolithiasis · osteoporosis · peripheral oedema · polyuria · pyrexia · QT interval prolongation · reduced libido · renal failure · severe skin rash · Stevens-Johnson syndrome · stomatitis · tachycardia · throat irritation · toxic epidermal necrolysis · weight changes
- ▶ **Rare** Bradycardia · confusion · convulsions · haematemesis · palpitation · rhinorrhoea · seborrhoeic dermatitis · syncope · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Rash** Mild to moderate rash occurs commonly, usually within the first 4 weeks of therapy and resolves without stopping treatment. Severe skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis) occurs less frequently and may be accompanied by fever, malaise, arthralgia, myalgia, oral lesions, conjunctivitis, hepatitis, or eosinophilia; treatment should be stopped if severe rash develops.

- **ALLERGY AND CROSS-SENSITIVITY** Use with caution in patients with sulfonamide sensitivity.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk; if required, use the twice daily dose regimen.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment; avoid in severe impairment—no information available.

- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

- **PATIENT AND CARER ADVICE**

Missed doses

If a dose is more than 6 hours late on the twice daily regimen (or more than 12 hours late on the once daily regimen), the missed dose should not be taken and the next dose should be taken at the normal time.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21

£ 395

Fosamprenavir

● **DRUG ACTION** Fosamprenavir is a pro-drug of amprenavir.

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs—with low-dose ritonavir

► BY MOUTH

- Child 6–17 years (body-weight 25–39 kg): 18 mg/kg twice daily (max. per dose 700 mg)
- Child 6–17 years (body-weight 40 kg and above): 700 mg twice daily

DOSE EQUIVALENCE AND CONVERSION

700 mg fosamprenavir is equivalent to approximately 600 mg amprenavir.

● **INTERACTIONS** → Appendix 1 (fosamprenavir).

● SIDE-EFFECTS

- **Rare** Stevens-Johnson syndrome
- **Frequency not known** Rash

SIDE-EFFECTS, FURTHER INFORMATION

- **Rash** Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—usually resolves within 2 weeks and may respond to antihistamines.
- **PREGNANCY** Toxicity in *animal* studies; manufacturer advises use only if potential benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Reduce dose in moderate to severe impairment. Manufacturer advises caution in mild impairment.

● **DIRECTIONS FOR ADMINISTRATION** In children, oral suspension should be taken with food.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include grape, bubblegum, or peppermint.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer fosamprenavir oral suspension.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

► **Telzir** (ViiV Healthcare UK Ltd)

Fosamprenavir (as Fosamprenavir calcium) 50 mg per 1 ml Telzir 50mg/ml oral suspension | 225 ml [PoM] £58.70

£ 395

Lopinavir with ritonavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs

► BY MOUTH USING TABLETS

- Child 2–17 years (body-weight up to 40 kg and body surface area 0.5–0.7 m²): 200/50 mg twice daily

- Child 2–17 years (body-weight up to 40 kg and body surface area 0.8–1.1 m²): 300/75 mg twice daily
- Child 2–17 years (body-weight 40 kg and above and body surface area 1.2 m² and above): 400/100 mg twice daily
- BY MOUTH USING ORAL SOLUTION
- Child 2–17 years: 2.9 mL/m² twice daily (max. per dose 5 mL), to be taken with food, oral solution contains 400 mg lopinavir, 100 mg ritonavir/5 mL

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · structural heart disease
- **INTERACTIONS** → Appendix 1 (lopinavir, ritonavir). Caution if concomitant use with drugs that prolong QT or PR interval.

● SIDE-EFFECTS

- **Common or very common** Amenorrhoea · anxiety · arthralgia · colitis · hypertension · menorrhagia · neuropathy · night sweats · sexual dysfunction · weight changes
- **Uncommon** Abnormal dreams · alopecia · arteriosclerosis · AV block · cerebrovascular accident · convulsions · deep vein thrombosis · dry mouth · gastro-intestinal ulcer · haematuria · nephritis · rectal bleeding · stomatitis · tinnitus · tremor · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- **Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed
- **PREGNANCY** Avoid oral solution due to high propylene glycol content; use tablets only if potential benefit outweighs risk (toxicity in *animal* studies).
- **HEPATIC IMPAIRMENT** Avoid oral solution due to propylene glycol content; manufacturer advises avoid tablets in severe impairment.
- **RENAL IMPAIRMENT** Avoid oral solution due to high propylene glycol content.
- **MONITORING REQUIREMENTS** Monitor liver function before and during treatment.
- **PATIENT AND CARER ADVICE** Oral solution tastes bitter.

Ritonavir

● INDICATIONS AND DOSE

HIV infection in combination with other antiretroviral drugs (high-dose ritonavir)

► BY MOUTH

- Child 2–17 years: Initially 250 mg/m² twice daily, increased in steps of 50 mg/m² every 2–3 days; increased to 350 mg/m² twice daily (max. per dose 600 mg twice daily), tolerability of this regimen is poor

continued →

Low-dose ritonavir to increase the effect of atazanavir

- BY MOUTH
- Child 6–17 years (body-weight 15–19 kg): 80–100 mg once daily
- Child 6–17 years (body-weight 20 kg and above): 100 mg once daily

Low-dose ritonavir to increase the effect of darunavir

- BY MOUTH
- Child 3–17 years (body-weight 15–29 kg): 50 mg twice daily
- Child 3–17 years (body-weight 30–39 kg): 60 mg twice daily
- Child 3–17 years (body-weight 40 kg and above): 100 mg twice daily
- Child 12–17 years (body-weight 40 kg and above): 100 mg once daily for use in patients taking darunavir once daily

Low-dose ritonavir to increase the effect of fosamprenavir

- BY MOUTH
- Child 6–17 years (body-weight 25–32 kg): 3 mg/kg twice daily
- Child 6–17 years (body-weight 33 kg and above): 100 mg twice daily

Low-dose ritonavir to increase the effect of tipranavir

- BY MOUTH
- Child 2–11 years: 150 mg/m² twice daily (max. per dose 200 mg)
- Child 12–17 years: 200 mg twice daily

- **CAUTIONS** Cardiac conduction disorders · pancreatitis · structural heart disease
- **INTERACTIONS** → Appendix 1 (ritonavir). Caution if concomitant use with drugs that prolong PR interval.
- **SIDE-EFFECTS**
 - **Common or very common** Acne · anxiety · arthralgia · blood pressure changes · blurred vision · confusion · cough · decreased blood thyroxine concentration · fever · flushing · gastro-intestinal haemorrhage · menorrhagia · mouth ulcers · oedema · peripheral neuropathy · pharyngitis · renal impairment · seizures · syncope
 - **Uncommon** Electrolyte disturbances · myocardial infarction
 - **Rare** Toxic epidermal necrolysis
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - Pancreatitis Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed.
- **PREGNANCY** Only use low-dose booster to increase the effect of other protease inhibitors.
- **HEPATIC IMPAIRMENT** Avoid in decompensated liver disease; in severe impairment without decompensation, use 'booster' doses with caution (avoid treatment doses).
- **DIRECTIONS FOR ADMINISTRATION** Bitter taste of oral solution can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer ritonavir oral solution.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

- **Norvir** (AbbVie Ltd)

Ritonavir 100 mg Norvir 100mg tablets | 30 tablet [PoM] £19.44

Oral solution

CAUTIONARY AND ADVISORY LABELS 21

EXCIPIENTS: May contain Alcohol, propylene glycol

- **Norvir** (AbbVie Ltd)

Ritonavir 80 mg per 1 ml Norvir 80mg/ml oral solution sugar-free | 450 ml [PoM] £403.20

Tipranavir**INDICATIONS AND DOSE**

HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals—with low-dose ritonavir

- BY MOUTH USING CAPSULES
- Child 12–17 years: 500 mg twice daily
- BY MOUTH USING ORAL SOLUTION
- Child 2–11 years: 375 mg/m² twice daily (max. per dose 500 mg)

DOSE EQUIVALENCE AND CONVERSION

The bioavailability of tipranavir oral solution is higher than that of the capsules; the oral solution is not interchangeable with the capsules on a milligram-for-milligram basis.

- **CAUTIONS** Patients at risk of increased bleeding from trauma, surgery or other pathological conditions
- **INTERACTIONS** → Appendix 1 (tipranavir). Caution with concomitant use of drugs that increase risk of bleeding.
- **SIDE-EFFECTS**
 - **Rare** Dehydration
 - **Frequency not known** Anorexia · dyspnoea · influenza-like symptoms · peripheral neuropathy · photosensitivity · renal impairment
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - Hepatotoxicity Potentially life-threatening hepatotoxicity reported. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature).
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—toxicity in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment; avoid in moderate or severe impairment—no information available.
- **MONITORING REQUIREMENTS** Monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include toffee and mint.
- **PATIENT AND CARER ADVICE** Patients or carers should be told to observe the oral solution for crystallisation; the bottle should be replaced if more than a thin layer of crystals form (doses should continue to be taken at the normal time until the bottle is replaced).

£441.27

6.5 Influenza

Influenza

Management

Oseltamivir below and zanamivir p. 401 are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; oseltamivir is licensed for use within 48 hours of the first symptoms while zanamivir is licensed for use within 36 hours of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days.

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. However, in children with severe influenza or in those who are immunocompromised, antivirals may still be effective after this time if viral shedding continues [unlicensed use]. Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not

cover the infecting strain) to prevent influenza in an epidemic.

There is evidence that some strains of influenza A virus have reduced susceptibility to oseltamivir, but may retain susceptibility to zanamivir. Resistance to oseltamivir may be greater in severely immunocompromised children.

Zanamivir should be reserved for patients who are severely immunocompromised, or when oseltamivir cannot be used, or when resistance to oseltamivir is suspected. For those unable to use the dry powder for inhalation, zanamivir is available as a solution that can be administered by nebuliser or intravenously [unlicensed].

Information on pandemic influenza, avian influenza, and swine influenza may be found at www.gov.uk/phe.

Immunisation against influenza is recommended for persons at high risk, and to reduce transmission of infection.

Oseltamivir in children under 1 year of age

Data on the use of oseltamivir in children under 1 year of age is limited. Furthermore, oseltamivir may be ineffective in neonates because they may not be able to metabolise oseltamivir to its active form. However, oseltamivir can be used (under specialist supervision) for the treatment or post-exposure prophylaxis of influenza in children under 1 year of age. The Department of Health has advised (May 2009) that during a pandemic, treatment with oseltamivir can be overseen by healthcare professionals experienced in assessing children.

Amantadine hydrochloride is licensed for prophylaxis and treatment of influenza A in children over 10 years of age, but it is no longer recommended.

ANTIVIRALS > NEURAMINIDASE INHIBITORS

Oseltamivir

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

● **INDICATIONS AND DOSE****Prevention of influenza**► **BY MOUTH**

- Neonate: 3 mg/kg once daily for 10 days for post-exposure prophylaxis.
- Child 1–11 months: 3 mg/kg once daily for 10 days for post-exposure prophylaxis
- Child 1–12 years (body-weight 10–15 kg): 30 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1–12 years (body-weight 15–23 kg): 45 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1–12 years (body-weight 23–40 kg): 60 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 1–12 years (body-weight 40 kg and above): 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic
- Child 13–17 years: 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic

Treatment of influenza► **BY MOUTH**

- Neonate: 3 mg/kg twice daily for 5 days.
- Child 1–11 months: 3 mg/kg twice daily for 5 days
- Child 1–12 years (body-weight 10–15 kg): 30 mg twice daily for 5 days
- Child 1–12 years (body-weight 15–23 kg): 45 mg twice daily for 5 days
- Child 1–12 years (body-weight 23–40 kg): 60 mg twice daily for 5 days

continued →

- ▶ Child 1–12 years (body-weight 40 kg and above): 75 mg twice daily for 5 days
- ▶ Child 13–17 years: 75 mg twice daily for 5 days

● **UNLICENSED USE** Not licensed for use in premature infants.

● **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · dyspepsia · headache · nausea · vomiting
- ▶ **Uncommon** Altered consciousness · arrhythmias · convulsions · eczema · rash
- ▶ **Rare** Gastro-intestinal bleeding · hepatitis · neuropsychiatric disorders · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · visual disturbances

● **PREGNANCY** Although safety data are limited, oseltamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

● **BREAST FEEDING** Although safety data are limited, oseltamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Oseltamivir is the preferred drug in women who are breast-feeding. Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

● **RENAL IMPAIRMENT** For *treatment*, use 40% of normal dose twice daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose once daily if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). For *prevention*, use 40% of normal dose once daily if estimated glomerular filtration rate 30–60 mL/minute/1.73 m² (40% of normal dose every 48 hours if estimated glomerular filtration rate 10–30 mL/minute/1.73 m²). Avoid for *treatment and prevention* if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².

● **DIRECTIONS FOR ADMINISTRATION** If suspension not available, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include tutti-frutti.

● **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Oseltamivir for influenza (flu) www.medicinesforchildren.org.uk/oseltamivir-for-influenza

● **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158**
Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.
 - Oseltamivir is **not** recommended for seasonal prophylaxis against influenza.
 - When influenza is circulating in the community, oseltamivir is a treatment option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
 - During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for post-exposure

prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients are those who have one or more of the following conditions:

- chronic respiratory disease (including asthma);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes children who are at risk of developing medical complications from influenza (treatment only) or females who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

www.nice.org.uk/TA158

▶ **Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2009) NICE TA168**

Oseltamivir is **not** a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- When influenza is circulating in the community, oseltamivir is an option recommended (in accordance with UK licensing) for the treatment of influenza in at-risk patients who can start treatment within 48 hours of the onset of symptoms. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, oseltamivir may be used for treatment in at-risk patients living in long-term residential or nursing homes.

At risk patients are those who have one or more of the following conditions:

- chronic respiratory disease (including asthma and chronic obstructive pulmonary disease);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

The Department of Health in England has advised (November 2010 and April 2011) that 'at risk patients' also includes children who are at risk of developing medical complications from influenza (treatment only) or females who are pregnant.

This guidance does not cover the circumstances of a pandemic, an impending pandemic, or a widespread epidemic of a new strain of influenza to which there is little or no immunity in the community.

Zanamivir

- **DRUG ACTION** Reduces replication of influenza A and B viruses by inhibiting viral neuraminidase.

● INDICATIONS AND DOSE

Post-exposure prophylaxis of influenza

► BY INHALATION OF POWDER

► Child 5–17 years: 10 mg once daily for 10 days

Prevention of influenza during an epidemic

► BY INHALATION OF POWDER

► Child 5–17 years: 10 mg once daily for up to 28 days

Treatment of influenza

► BY INHALATION OF POWDER

► Child 5–17 years: 10 mg twice daily for 5 days (for up to 10 days if resistance to oseltamivir suspected)

- **UNLICENSED USE** Use of zanamivir for up to 10 days if resistance to oseltamivir suspected is an unlicensed duration.
- **CAUTIONS** Asthma · chronic pulmonary disease · uncontrolled chronic illness
CAUTIONS, FURTHER INFORMATION
► Asthma and chronic pulmonary disease Risk of bronchospasm—short-acting bronchodilator should be available.
Avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm.

● SIDE-EFFECTS

- **Common or very common** Rash
- **Uncommon** Angioedema · bronchospasm · dyspnoea · urticaria
- **Rare** Neuropsychiatric disorders · Stevens-Johnson syndrome · toxic epidermal necrolysis

- **PREGNANCY** Although safety data are limited, zanamivir can be used in women who are pregnant when the potential benefit outweighs the risk (e.g. during a pandemic). Use only if potential benefit outweighs risk (e.g. during a pandemic).

- **BREAST FEEDING** Although safety data are limited, zanamivir can be used in women who are breast-feeding when the potential benefit outweighs the risk (e.g. during a pandemic). Amount probably too small to be harmful; use only if potential benefit outweighs risk (e.g. during a pandemic).

- **DIRECTIONS FOR ADMINISTRATION** Other inhaled drugs should be administered before zanamivir.

- **PRESCRIBING AND DISPENSING INFORMATION** Except for the treatment and prophylaxis of influenza as indicated in the NICE guidance; endorse prescription 'SLS'.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008) NICE TA158

Zanamivir is not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Zanamivir is not recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community, zanamivir is an option recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Zanamivir should be given within 36 hours of exposure to influenza. (National surveillance schemes, including those run by Public Health England, should be used to indicate when influenza is circulating in the community.)

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Inhalation powder

► **Relenza** (GlaxoSmithKline UK Ltd)

Zanamivir 5 mg Relenza 5mg inhalation powder blisters with Diskhaler | 20 blister (PoM) £16.36

6.6 Respiratory syncytial virus

Respiratory syncytial virus

Management

Ribavirin p. 378 inhibits a wide range of DNA and RNA viruses. It is licensed for administration by inhalation for the treatment of severe bronchiolitis caused by the respiratory syncytial virus (RSV) in infants, especially when they have other serious diseases. However, there is no evidence that ribavirin produces clinically relevant benefit in RSV bronchiolitis. Ribavirin is given by mouth with peginterferon alfa p. 379 or interferon alfa p. 517 for the treatment of chronic hepatitis C infection. Ribavirin is also effective in Lassa fever and has also been used parenterally in the treatment of life-threatening RSV, parainfluenza virus, and adenovirus infections in immunocompromised children [unlicensed indications].

Palivizumab below is a monoclonal antibody licensed for preventing serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease; it should be prescribed under specialist supervision and on the basis of the likelihood of hospitalisation. Palivizumab is recommended for:

- children under 9 months of age with chronic lung disease (defined as requiring oxygen for at least 28 days from birth) and who were born preterm;
- children under 6 months of age with haemodynamically significant, acyanotic congenital heart disease who were born preterm.

Palivizumab should be considered for:

- children under 2 years of age with severe combined immunodeficiency syndrome;
- children under 1 year of age who require long-term ventilation;
- children 1–2 years of age who require long-term ventilation and have an additional co-morbidity (including cardiac disease or pulmonary hypertension).

For details of the preterm age groups included in the recommendations, see *Immunisation against Infectious Disease* (2006), available at www.gov.uk/dh.

DRUGS FOR RESPIRATORY DISEASES > MONOCLONAL ANTIBODIES

Palivizumab

• INDICATIONS AND DOSE

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease (under expert supervision)

► BY INTRAMUSCULAR INJECTION

► Neonate: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk.

► Child 1–23 months: 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

Prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus in children at high risk of the disease and undergoing cardiac bypass surgery (under expert supervision)

► BY INTRAMUSCULAR INJECTION

► Child 1–23 months: Initially 15 mg/kg, to be administered as soon as stable after surgery, preferably in the anterolateral thigh, then 15 mg/kg once a month, preferably injected in the anterolateral thigh, to be administered during season of RSV risk, injection volume over 1 mL should be divided between 2 or more sites

• **UNLICENSED USE** Licensed for the prevention of serious lower respiratory-tract disease caused by respiratory syncytial virus (RSV) in children under 6 months of age (at the start of the RSV season) and born at less than 35 weeks corrected gestational age, or in children under 2 years of age who have received treatment for bronchopulmonary dysplasia in the last 6 months, or in children under 2 years of age with haemodynamically significant congenital heart disease.

• **CAUTIONS** Moderate to severe acute infection • moderate to severe febrile illness • serum-palivizumab concentration may be reduced after cardiac surgery • thrombocytopenia

• SIDE-EFFECTS

- **Common or very common** Fever • injection-site reactions • nervousness
- **Uncommon** Asthenia • constipation • cough • diarrhoea • drowsiness • haemorrhage • hyperkinesia • leucopenia • pain • rash • rhinitis • vomiting • wheeze
- **Frequency not known** Anaphylaxis • apnoea • convulsions • hypersensitivity reactions • thrombocytopenia
- **ALLERGY AND CROSS-SENSITIVITY** Hypersensitivity to humanised monoclonal antibodies.

• MEDICINAL FORMS

1 Antidiuretic hormone disorders

Posterior pituitary hormones and antagonists

Posterior pituitary hormones

Diabetes insipidus

Diabetes insipidus is caused by either a deficiency of anti-diuretic hormone (ADH, vasopressin p. 62) secretion (cranial, neurogenic, or pituitary diabetes insipidus) or by failure of the renal tubules to react to secreted antidiuretic hormone (nephrogenic diabetes insipidus).

Vasopressin (antidiuretic hormone, ADH) is used in the treatment of *pituitary diabetes insipidus* as its analogue desmopressin below. Dosage is tailored to produce a regular diuresis every 24 hours to avoid water intoxication. Treatment may be required permanently or for a limited period only in diabetes insipidus following trauma or pituitary surgery.

Desmopressin is more potent and has a longer duration of action than vasopressin; unlike vasopressin it has no vasoconstrictor effect. It is given by mouth or intranasally for maintenance therapy, and by injection in the postoperative period or in unconscious patients. Desmopressin is also used in the differential diagnosis of diabetes insipidus; following an intramuscular or intranasal dose, restoration of the ability to concentrate urine after water deprivation confirms a diagnosis of pituitary diabetes insipidus. Failure to respond suggests nephrogenic diabetes insipidus. Fluid input must be managed carefully to avoid hyponatraemia; this test is not usually recommended in young children.

In *hypogonadal and partial pituitary diabetes insipidus* benefit may be gained from the paradoxical antidiuretic effect of thiazides.

Other uses

Desmopressin is also used to boost factor VIII concentration in mild to moderate haemophilia and in von Willebrand's

disease; it is also used to test fibrinolytic response.

Desmopressin also has a role in nocturnal enuresis.

Vasopressin infusion is used to control variceal bleeding in portal hypertension, before introducing more definitive treatment. Terlipressin acetate, a derivative of vasopressin with reportedly less pressor and antidiuretic activity, and octreotide are used similarly but experience in children is limited.

1.1 Diabetes insipidus

Drugs used for Diabetes insipidus not listed below

Chlorothiazide, p. 103

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > VASOPRESSIN AND ANALOGUES

Desmopressin

- **DRUG ACTION** Desmopressin is an analogue of vasopressin.

● INDICATIONS AND DOSE

Diabetes insipidus, treatment

► BY MOUTH

- Neonate: Initially 1–4 micrograms 2–3 times a day, adjusted according to response.
- Child 1–23 months: Initially 10 micrograms 2–3 times a day, adjusted according to response; usual dose 30–150 micrograms daily
- Child 2–11 years: Initially 50 micrograms 2–3 times a day, adjusted according to response; usual dose 100–800 micrograms daily
- Child 12–17 years: Initially 100 micrograms 2–3 times a day, adjusted according to response; usual dose 0.2–1.2 mg daily

continued →

- ▶ BY SUBLINGUAL ADMINISTRATION
- ▶ Child 2–17 years: Initially 60 micrograms 3 times a day, adjusted according to response; usual dose 40–240 micrograms 3 times a day
- ▶ BY INTRANASAL ADMINISTRATION

- ▶ Neonate: Initially 100–500 nanograms, adjusted according to response; usual dose 1.25–10 micrograms daily in 1–2 divided doses.

- ▶ Child 1–23 months: Initially 2.5–5 micrograms 1–2 times a day, adjusted according to response
- ▶ Child 2–11 years: Initially 5–20 micrograms 1–2 times a day, adjusted according to response
- ▶ Child 12–17 years: Initially 10–20 micrograms 1–2 times a day, adjusted according to response
- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Neonate: Initially 100 nanograms once daily, adjusted according to response.

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 1 month–11 years: Initially 400 nanograms once daily, adjusted according to response
- ▶ Child 12–17 years: Initially 1–4 micrograms once daily, adjusted according to response

Primary nocturnal enuresis

- ▶ BY MOUTH
- ▶ Child 5–17 years: 200 micrograms once daily, only increased to 400 micrograms if lower dose not effective; withdraw for at least 1 week for reassessment after 3 months, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration
- ▶ BY SUBLINGUAL ADMINISTRATION
- ▶ Child 5–17 years: 120 micrograms once daily, increased if necessary to 240 micrograms once daily, dose to be taken at bedtime, limit fluid intake from 1 hour before to 8 hours after administration, dose to be increased only if lower dose not effective, reassess after 3 months by withdrawing treatment for at least 1 week

Diabetes insipidus, diagnosis (water deprivation test)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Neonate: Not recommended, use trial of treatment.
- ▶ Child 1–23 months: 5–10 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia, not usually recommended
- ▶ Child 2–11 years: 10–20 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia
- ▶ Child 12–17 years: 20 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia
- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Neonate: Not recommended, use trial of treatment.

- ▶ Child 1–23 months: 400 nanograms for 1 dose, manage fluid input carefully to avoid hyponatraemia, not usually recommended
- ▶ Child 2–11 years: 0.5–1 microgram for 1 dose, manage fluid input carefully to avoid hyponatraemia
- ▶ Child 12–17 years: 1–2 micrograms for 1 dose, manage fluid input carefully to avoid hyponatraemia

Renal function testing

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 1–11 months: 10 micrograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload
- ▶ Child 1–14 years: 20 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

- ▶ Child 15–17 years: 40 micrograms, empty bladder at time of administration and limit fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- ▶ Child 1–11 months: 400 nanograms, empty bladder at time of administration and restrict fluid intake to 50% at next 2 feeds to avoid fluid overload
- ▶ Child 1–17 years: 2 micrograms, empty bladder at time of administration and restrict fluid intake to 500 mL from 1 hour before until 8 hours after administration to avoid fluid overload

Mild to moderate haemophilia and von Willebrand's disease

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 1–17 years: 4 micrograms/kg for 1 dose, for pre-operative use give 2 hours before procedure
- ▶ BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: 300 nanograms/kg for 1 dose, to be administered immediately before surgery or after trauma; may be repeated at intervals of 12 hours if no tachycardia

Fibrinolytic response testing

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION
- ▶ Child 2–17 years: 300 nanograms/kg for 1 dose, blood to be sampled after 20 minutes for fibrinolytic activity

Assessment of antidiuretic hormone secretion (congenital deficiency suspected) (specialist use only)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 1–23 months: Initially 100–500 nanograms for 1 dose

Assessment of antidiuretic hormone secretion (congenital deficiency not suspected) (specialist use only)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 1–23 months: 1–5 micrograms for 1 dose

- **UNLICENSED USE** Consult product literature for individual preparations. Not licensed for assessment of antidiuretic hormone secretion. Oral use of *DDAVP* intravenous injection is not licensed.

- **CONTRA-INDICATIONS** Cardiac insufficiency · conditions treated with diuretics · polydipsia in alcohol dependence · psychogenic polydipsia

● CAUTIONS

GENERAL CAUTIONS

Asthma · avoid fluid overload · cardiovascular disease (not indicated for nocturnal enuresis or nocturia) · conditions which might be aggravated by water retention · cystic fibrosis · epilepsy · heart failure · hypertension (not indicated for nocturnal enuresis or nocturia) · migraine · nocturia—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards · nocturnal enuresis—limit fluid intake to minimum from 1 hour before dose until 8 hours afterwards

SPECIFIC CAUTIONS

- ▶ With intranasal use Should not be given intranasally for nocturnal enuresis due to an increased incidence of side-effects

- **INTERACTIONS** → Appendix 1 (desmopressin).

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Allergic reactions · emotional disturbance in children · epistaxis · fluid retention · headache · hyponatraemia (in more serious cases with convulsions) on administration without restricting fluid intake · nasal congestion · nausea · stomach pain · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ With intranasal use Rhinitis

SIDE-EFFECTS, FURTHER INFORMATION

- **Hyponatraemic convulsions** The risk of hyponatraemic convulsions can be minimised by keeping to the recommended starting doses and by avoiding concomitant use of drugs which increase secretion of vasopressin (e.g. tricyclic antidepressants).
- **PREGNANCY** Small oxytocic effect in third trimester; increased risk of pre-eclampsia.
- **BREAST FEEDING** Amount too small to be harmful.
- **RENAL IMPAIRMENT** Use with caution; antidiuretic effect may be reduced.
- **MONITORING REQUIREMENTS** In *nocturia*, periodic blood pressure and weight checks are needed to monitor for fluid overload.
- **DIRECTIONS FOR ADMINISTRATION** *DDAVP*® and *Desmotabs*® tablets may be crushed.
DDAVP® intranasal solution may be diluted with Sodium Chloride 0.9% to a concentration of 10 micrograms/mL.
DDAVP® injection may be administered orally.
Desmopressin oral lyophilisates are for sublingual administration.
- With intravenous use Higher doses of *DDAVP*® by intravenous infusion, used in mild to moderate haemophilia and von Willebrand's disease, may be diluted with 30–50 mL Sodium Chloride 0.9% intravenous infusion.
For intravenous infusion (*Octim*®), dilute with 50 mL of Sodium Chloride 0.9% and give over 20 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Oral, intranasal, intravenous, subcutaneous and intramuscular doses are expressed as desmopressin acetate; sublingual doses are expressed as desmopressin base.
Children requiring an intranasal dose of less than 10 micrograms should be given *DDAVP*® intranasal solution.
- **PATIENT AND CARER ADVICE**
Hyponatraemic convulsions Patients being treated for primary nocturnal enuresis should be warned to avoid fluid overload (including during swimming) and to stop taking desmopressin during an episode of vomiting or diarrhoea (until fluid balance normal).
Medicines for Children leaflet: Desmopressin for bedwetting www.medicinesforchildren.org.uk/desmopressin-bedwetting-0

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution, spray, nasal drops

Tablet

- **Desmopressin (Non-proprietary)**
Desmopressin acetate 100 microgram Desmopressin 100microgram tablets | 90 tablet [PoM] £76.62 DT price = £62.88
Desmopressin acetate 200 microgram Desmopressin 200microgram tablets | 30 tablet [PoM] £35.23 DT price = £7.58 | 90 tablet [PoM] £87.50
- **DDAVP** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 100 microgram DDAVP 0.1mg tablets | 90 tablet [PoM] £44.12 DT price = £62.88
Desmopressin acetate 200 microgram DDAVP 0.2mg tablets | 90 tablet [PoM] £88.23
- **Desmotabs** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 200 microgram Desmotabs 0.2mg tablets | 30 tablet [PoM] £29.43 DT price = £7.58

Oral solution

- **Desmopressin (Non-proprietary)**
Desmopressin (as Desmopressin acetate) 360 microgram per 1 ml Desmopressin 360micrograms/mL oral solution | 15 ml [PoM] £30.00

Oral lyophilisate

CAUTIONARY AND ADVISORY LABELS 26

- **Desmopressin (Non-proprietary)**
Desmopressin (as Desmopressin acetate)
120 microgram Desmopressin 120microgram oral lyophilisates sugar free sugar-free | 30 tablet [PoM] no price available DT price = £30.34
Desmopressin (as Desmopressin acetate)
240 microgram Desmopressin 240microgram oral lyophilisates sugar free sugar-free | 30 tablet [PoM] no price available DT price = £60.68
- **DDAVP** (Ferring Pharmaceuticals Ltd)
Desmopressin (as Desmopressin acetate) 60 microgram DDAVP Melt 60microgram oral lyophilisates sugar-free | 100 tablet [PoM] £50.53 DT price = £50.53
Desmopressin (as Desmopressin acetate) 120 microgram DDAVP Melt 120microgram oral lyophilisates sugar-free | 100 tablet [PoM] £101.07 DT price = £101.07
Desmopressin (as Desmopressin acetate) 240 microgram DDAVP Melt 240microgram oral lyophilisates sugar-free | 100 tablet [PoM] £202.14
- **DesmoMelt** (Ferring Pharmaceuticals Ltd)
Desmopressin (as Desmopressin acetate)
120 microgram DesmoMelt 120microgram oral lyophilisates sugar-free | 30 tablet [PoM] £30.34 DT price = £30.34
Desmopressin (as Desmopressin acetate)

Solution for injection

- **DDAVP** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 4 microgram per 1 ml DDAVP 4micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £13.16
- **Octim** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 15 microgram per 1 ml Octim 15micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £192.20

Spray

- **Desmopressin (Non-proprietary)**
Desmopressin acetate 2.5 microgram per 1 dose Minirin 2.5micrograms/dose nasal spray | 50 dose [PoM] no price available
Desmopressin acetate 10 microgram per 1 dose Desmopressin 10micrograms/dose nasal spray | 60 dose [PoM] £30.00 DT price = £12.41
- **Desmospray** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 2.5 microgram per 1 dose Desmospray 2.5micrograms/dose nasal spray | 50 dose no price available
Desmopressin acetate 10 microgram per 1 dose Desmospray 10micrograms/dose nasal spray | 60 dose [PoM] £25.02 DT price = £12.41
- **Octim** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 150 microgram per 1 dose Octim 150micrograms/dose nasal spray | 25 dose [PoM] £576.60

Nasal drops

- **DDAVP** (Ferring Pharmaceuticals Ltd)
Desmopressin acetate 100 microgram per 1 ml DDAVP 100micrograms/mL intranasal solution | 2.5 ml [PoM] £9.72 DT price = £9.72

2 Corticosteroid responsive conditions

CORTICOSTEROIDS

Corticosteroids, general use

Overview

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used typically for the treatment of inflammatory conditions of the skin. Corticosteroids should be avoided or used only under specialist supervision in psoriasis.

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn's disease.

Use can be made of the mineralocorticoid activity of fludrocortisone acetate p. 411 to treat postural hypotension in autonomic neuropathy.

High-dose corticosteroids should be avoided for the management of septic shock. However, low-dose hydrocortisone p. 411 can be used in septic shock that is resistant to volume expansion and catecholamines, and is accompanied by suspected or proven adrenal insufficiency.

The suppressive action of glucocorticoids on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most adults a single dose of dexamethasone at night is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the 'overnight dexamethasone suppression test' for diagnosing Cushing's syndrome.

Betamethasone p. 409 and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see Prescribing in palliative care p. 18); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should **not** be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions, such as angioedema of the upper respiratory tract and anaphylaxis, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline/epinephrine p. 128. In such cases hydrocortisone (as sodium succinate) by intravenous injection may be required.

In the management of asthma, corticosteroids are preferably used by inhalation but systemic therapy along with bronchodilators is required for the emergency treatment of severe acute asthma.

Betamethasone is used in women at risk of preterm delivery to reduce the incidence of neonatal respiratory distress syndrome [unlicensed use].

Dexamethasone should not be used routinely for the prophylaxis and treatment of chronic lung disease in neonates because of an association with adverse neurological effects.

Corticosteroids may be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis, and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia and thrombocytopenic purpura.

High doses of a corticosteroid (usually prednisolone p. 413) are used in the treatment of *glomerular kidney disease*, including *nephrotic syndrome*. The condition frequently recurs; a corticosteroid given in high doses and for prolonged periods may delay relapse but the higher incidence of adverse effects limits the overall benefit. Those who suffer frequent relapses may be treated with prednisolone given in a low dose (daily or on alternate days) for 3–6 months; the dose should be adjusted to minimise effects on growth and development. Other drugs used in the treatment of glomerular kidney disease include levamisole p. 361, cyclophosphamide p. 498, chlorambucil p. 498, and ciclosporin p. 486. *Congenital nephrotic syndrome* may be

resistant to corticosteroids and immunosuppressants; indometacin p. 611 and an ACE inhibitor such as captopril p. 103 have been used.

Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see: Prescribing in Palliative Care, immunosuppression, rheumatic diseases, eye, otitis externa, allergic rhinitis, and aphthous ulcers.

Side-effects

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side effects

- hypertension
- sodium retention
- water retention
- potassium loss
- calcium loss

Mineralocorticoid side effects are most marked with fludrocortisone acetate, but are significant with hydrocortisone, corticotropin, and tetracosactide p. 441. Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone p. 412, prednisolone, and triamcinolone.

Glucocorticoid side effects

- diabetes
- osteoporosis
- in addition high doses are associated with avascular necrosis of the femoral head.
- Muscle wasting (proximal myopathy) can also occur.
- Corticosteroid therapy is also weakly linked with peptic ulceration and perforation.
- Psychiatric reactions may also occur.

Managing side-effects

Side-effects can be minimised by using lowest effective dose for minimum period possible. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma. Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug.

Whenever possible *local treatment* with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to *systemic treatment*.

Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids, but adverse effects including adrenal suppression have been reported. Use of other corticosteroid therapy (including topical) or concurrent use of drugs which inhibit corticosteroid metabolism should be taken into account when assessing systemic risk. In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. Large-volume spacer devices should be used for administering inhaled

corticosteroids in children under 15 years; they are also useful in older children and adults, particularly if high doses are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

Corticosteroids, replacement therapy

Overview

The adrenal cortex normally secretes hydrocortisone p. 411 (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone and the mineralocorticoid fludrocortisone acetate p. 411; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In *Addison's disease* or following adrenalectomy, hydrocortisone by mouth is usually required. This is given in 2–3 divided doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone acetate.

In *acute adrenocortical insufficiency*, hydrocortisone is given intravenously (preferably as sodium succinate) every 6 to 8 hours in sodium chloride intravenous infusion 0.9%.

In *hypopituitarism*, glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levothyroxine sodium p. 454 and sex hormones should be given as indicated by the pattern of hormone deficiency.

In *congenital adrenal hyperplasia*, the pituitary gland increases production of corticotropin to compensate for reduced formation of cortisol; this results in excessive adrenal androgen production. Treatment is aimed at suppressing corticotropin using hydrocortisone. Careful and continual dose titration is required to avoid growth retardation and toxicity; for this reason potent, synthetic glucocorticoids such as dexamethasone are usually reserved for use in adolescents. The dose is adjusted according to clinical response and measurement of adrenal androgens and 17-hydroxyprogesterone. Salt-losing forms of congenital adrenal hyperplasia (where there is a lack of aldosterone production) also require mineralocorticoid replacement and salt supplementation (particularly in early life). The dose of mineralocorticoid is adjusted according to electrolyte concentration and plasma-renin activity.

Glucocorticoid therapy

Glucocorticoid and mineralocorticoid activity

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accompanied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids). The mineralocorticoid activity of fludrocortisone acetate p. 411 is so high that its anti-inflammatory activity is of no clinical relevance.

Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action

Prednisolone 1 mg	≡	Betamethasone 150 micrograms
	≡	Deflazacort 1.2 mg
	≡	Dexamethasone 150 micrograms
	≡	Hydrocortisone 4 mg
	≡	Methylprednisolone 800 micrograms
	≡	Triamcinolone 800 micrograms

The relatively high mineralocorticoid activity of hydrocortisone p. 411, and the resulting fluid retention, makes it unsuitable for disease suppression on a long-term basis. However, hydrocortisone can be used for adrenal replacement therapy. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked.

Prednisolone p. 413 has predominantly glucocorticoid activity and is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone p. 409 and dexamethasone p. 410 have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion.

Some esters of betamethasone and of beclomethasone dipropionate (beclomethasone) p. 652 exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort p. 409 has a high glucocorticoid activity; it is derived from prednisolone.

Corticosteroids (systemic)

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates (in neonates) • avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished) • systemic infection (unless specific therapy given)

CONTRA-INDICATIONS, FURTHER INFORMATION

- With intra-articular use or intradermal use or intralesional use For further information on contra-indications associated with intra-articular, intradermal and intralesional preparations, consult product literature.
- **CAUTIONS** Congestive heart failure • diabetes mellitus (including a family history of) • diverticulitis • epilepsy • glaucoma (including a family history of or susceptibility to) • history of steroid myopathy • history of tuberculosis or X-ray changes (frequent monitoring required) • hypertension • hypothyroidism • infection (particularly untreated) • myasthenia gravis • ocular herpes simplex (risk of corneal perforation) • osteoporosis • peptic ulcer • psychiatric reactions • recent intestinal anastomoses • recent myocardial infarction (rupture reported) • severe affective disorders (particularly if history of

steroid-induced psychosis) • should not be used long-term • thromboembolic disorders • ulcerative colitis

CAUTIONS, FURTHER INFORMATION

- ▶ With intra-articular use or intradermal use or intralesional use. For further information on cautions associated with intra-articular, intradermal and intralesional preparations, consult product literature.

- **INTERACTIONS** → Appendix 1 (corticosteroids).

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Abdominal distension • acute pancreatitis • aggravation of epilepsy • aggravation of schizophrenia • amenorrhoea • anaphylaxis • bruising • candidiasis • congestive heart failure • corneal thinning • Cushing's syndrome (with moon face, striae and acne) • dyspepsia • ecchymoses • exacerbation of ophthalmic fungal disease • exacerbation of ophthalmic viral disease • exophthalmos • facial erythema • glaucoma • headache • hiccups • hirsutism • hypercholesterolaemia • hyperglycaemia • hyperhidrosis • hyperlipidaemia • hypersensitivity reactions • impaired healing • increased appetite • increased intra-ocular pressure • increased intracranial pressure with papilloedema (usually after withdrawal) • increased susceptibility to and severity of infection • insomnia • leucocytosis • long bone fractures • malaise • menstrual irregularities • muscle weakness • myocardial rupture following recent myocardial infarction • nausea • negative calcium balance • negative nitrogen balance • oesophageal ulceration • petechiae • posterior subcapsular cataracts • potassium loss • psychological dependence • reactivation of dormant tuberculosis • scleral thinning • skin atrophy • sodium retention • suppression of growth • telangiectasia • tendon rupture • thromboembolism • urticaria • vertebral fractures • vertigo • water retention • weight gain

SPECIFIC SIDE-EFFECTS

- ▶ With intra-articular use. Flushing • may affect the hyaline cartilage

SIDE-EFFECTS, FURTHER INFORMATION

Side effects can be managed by choice of route and duration of course. For further detail see Corticosteroids, general use p. 405

- ▶ Adrenal suppression. During prolonged therapy with corticosteroids, particularly with systemic use, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension, or death.

To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists **must** know whether a patient is taking or has been taking a corticosteroid. A suitable regimen for corticosteroid replacement, in patients who have taken more than 10 mg prednisolone daily (or equivalent) within 3 months of surgery, is:

- Minor surgery under general anaesthesia—usual oral corticosteroid dose on the morning of surgery or hydrocortisone (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommended after surgery.
- Moderate or major surgery—usual oral corticosteroid dose on the morning of surgery and hydrocortisone intravenously at induction, followed by hydrocortisone 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommended on stopping hydrocortisone injections.

Patients on long-term corticosteroid treatment should carry a steroid treatment card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

- ▶ Infections. Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. *septicaemia* and *tuberculosis* may reach an advanced stage before being recognised, and *amoebiasis* or *strongyloidiasis* may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral *ocular infections* may also be exacerbated.
- ▶ Chickenpox. Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being *at risk of severe chickenpox* (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature.

Passive immunisation with varicella–zoster immunoglobulin is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment. Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

- ▶ Measles. Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin may be needed.
 - ▶ Psychiatric reactions. Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.
- Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

- **PREGNANCY** The benefit of treatment with corticosteroids during pregnancy outweighs the risk. Corticosteroid cover is required during labour. Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM (May 1998) concluded that corticosteroids vary in their ability to cross the placenta but there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip. When administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome). Any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important.

Pregnant women with fluid retention should be monitored closely when given systemic corticosteroids.

- **BREAST FEEDING** The benefit of treatment with corticosteroids during breast-feeding outweighs the risk.
- **HEPATIC IMPAIRMENT** The plasma-drug concentration may be increased (particularly on systemic use). Oral and parenteral use should be undertaken with caution.
- **RENAL IMPAIRMENT** Use by oral and injectable routes should be undertaken with caution.
- **MONITORING REQUIREMENTS** The height and weight of children receiving prolonged treatment with corticosteroids should be monitored annually; if growth is slowed, referral to a paediatrician should be considered.
- **EFFECT ON LABORATORY TESTS** Suppression of skin test reactions.
- **TREATMENT CESSATION** The magnitude and speed of dose reduction in corticosteroid withdrawal should be determined on a case-by-case basis, taking into consideration the underlying condition that is being treated, and individual patient factors such as the likelihood of relapse and the duration of corticosteroid treatment. *Gradual* withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- received more than 40 mg prednisolone (or equivalent) daily for more than 1 week or 2 mg/kg daily for 1 week or 1 mg/kg daily for 1 month;
- been given repeat doses in the evening;
- received more than 3 weeks' treatment;
- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse *and* who have received treatment for 3 weeks or less *and* who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 2–2.5 mg/m² daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

● PATIENT AND CARER ADVICE

Advice for patients Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

A patient information leaflet should be supplied to every patient when a systemic corticosteroid is prescribed. Patients should especially be advised of the following:

- **Immunosuppression** Prolonged courses of corticosteroids can increase susceptibility to infection and serious infections can go unrecognised. Unless already immune, patients are at risk of severe **chickenpox** and should avoid close contact with people who have chickenpox or shingles. Similarly, precautions should also be taken against contracting **measles**;
- **Adrenal suppression** If the corticosteroid is given for longer than 3 weeks, treatment must not be stopped abruptly. Adrenal suppression can last for a year or more after stopping treatment and the patient must mention the course of corticosteroid when receiving treatment for any illness or injury;
- **Mood and behaviour changes** Corticosteroid treatment, especially with high doses, can alter mood and behaviour early in treatment—the patient can become confused, irritable and suffer from delusion and suicidal thoughts. These effects can also occur when corticosteroid treatment is being withdrawn. Medical

advice should be sought if worrying psychological changes occur;

- **Other serious effects** Serious gastro-intestinal, musculoskeletal, and ophthalmic effects which require medical help can also occur.

Steroid treatment cards Steroid treatment cards should be issued where appropriate. Consider giving a 'steroid card' to support communication of the risks associated with treatment, and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation, to patients using greater than maximum licensed doses of inhaled corticosteroids. Steroid treatment cards are available for purchase from:

Gorse Street, Chadderton, Oldham, OL9 9QH
Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team Stores. NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com.

In **Scotland**, steroid treatment cards can be obtained from APS Group Scotland by emailing stockorders.dppas@theapsgroup.com or by fax on 0131 629 9967.

F 407

Betamethasone

● INDICATIONS AND DOSE

Suppression of inflammatory and allergic disorders | Congenital adrenal hyperplasia

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- Child 1–11 months: Initially 1 mg, repeated up to 4 times in 24 hours according to response
- Child 1–5 years: Initially 2 mg, repeated up to 4 times in 24 hours according to response
- Child 6–11 years: Initially 4 mg, repeated up to 4 times in 24 hours according to response
- Child 12–17 years: 4–20 mg, repeated up to 4 times in 24 hours according to response

- **PREGNANCY** Readily crosses the placenta. Transient effect on fetal movements and heart rate.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute with Glucose 5% or Sodium Chloride 0.9%.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

Deflazacort

● INDICATIONS AND DOSE

Inflammatory and allergic disorders

► BY MOUTH

- Child 1 month–11 years: 0.25–1.5 mg/kg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations
- Child 12–17 years: 3–18 mg once daily or on alternate days; increased if necessary up to 2.4 mg/kg daily (max. per dose 120 mg), in emergency situations continued →

Nephrotic syndrome

- BY MOUTH
- Child: Initially 1.5 mg/kg once daily (max. per dose 120 mg), reduced to the lowest effective dose for maintenance

- **RENAL IMPAIRMENT** Use with caution.

- **PATIENT AND CARER ADVICE** Patient counselling is advised for deflazacort tablets (steroid card).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Dexamethasone

6.6.2016

● **INDICATIONS AND DOSE****Physiological replacement**

- BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION
- Child: 250–500 micrograms/m² every 12 hours, adjusted according to response

Suppression of inflammatory and allergic disorders

- BY MOUTH
- Child: 10–100 micrograms/kg daily in 1–2 divided doses, adjusted according to response; up to 300 micrograms/kg daily may be required in emergency situations
- BY INTRAMUSCULAR INJECTION, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child 1 month–11 years: 83–333 micrograms/kg daily in 1–2 divided doses; maximum 20 mg per day
- Child 12–17 years: Initially 0.4–20 mg daily

Mild croup

- BY MOUTH
- Child: 150 micrograms/kg for 1 dose

Severe croup (or mild croup that might cause complications)

- INITIALLY BY MOUTH
- Child: Initially 150 micrograms/kg for 1 dose, to be given before transfer to hospital, then (by mouth or by intravenous injection) 150 micrograms/kg, then (by mouth or by intravenous injection) 150 micrograms/kg after 12 hours if required

Adjunctive treatment of bacterial meningitis (starting before or with first dose of antibacterial)

- BY SLOW INTRAVENOUS INJECTION
- Child 3 months–17 years: 150 micrograms/kg every 6 hours (max. per dose 10 mg) for 4 days

Life-threatening cerebral oedema

- BY INTRAVENOUS INJECTION
- Child (body-weight up to 35 kg): Initially 16.7 mg, then 3.3 mg every 3 hours for 3 days, then 3.3 mg every 6 hours for 1 day, then 1.7 mg every 6 hours for 4 days, then reduced in steps of 0.8 mg daily
- Child (body-weight 35 kg and above): Initially 20.8 mg, then 3.3 mg every 2 hours for 3 days, then 3.3 mg every 4 hours for 1 day, then 3.3 mg every 6 hours for 4 days, then reduced in steps of 1.7 mg daily

● **UNLICENSED USE**

- With intravenous use Consult product literature; not licensed for use in bacterial meningitis.

● **SIDE-EFFECTS**

- With intravenous use Perineal irritation may follow intravenous administration of the phosphate ester

- **PREGNANCY** Dexamethasone readily crosses the placenta.

● **DIRECTIONS FOR ADMINISTRATION**

- With oral use For administration *by mouth* tablets may be dispersed in water or injection solution given by mouth.
- With intravenous use For *intravenous infusion* dilute with Glucose 5% or Sodium Chloride 0.9%; give over 15–20 minutes.

● **PRESCRIBING AND DISPENSING INFORMATION**

Dexamethasone 3.8 mg/mL Injection has replaced Dexamethasone 4 mg/mL Injection. All dosage recommendations for intravenous, intramuscular, intrarticular use or local infiltration; are given in units of dexamethasone base.

Fludrocortisone acetate

● INDICATIONS AND DOSE

Mineralocorticoid replacement in adrenocortical insufficiency

► BY MOUTH

- **Neonate:** Initially 50 micrograms once daily, adjusted according to response; usual dose 50–200 micrograms once daily, higher doses may be required, dose adjustment may be required if salt supplements are administered.
- **Child:** Initially 50–100 micrograms once daily; maintenance 50–300 micrograms once daily, adjusted according to response, dose adjustment may be required if salt supplements are administered

- **HEPATIC IMPAIRMENT** Monitor patient closely in hepatic impairment.

● PATIENT AND CARER ADVICE

Hydrocortisone

● INDICATIONS AND DOSE

Acute adrenocortical insufficiency (Addisonian crisis)

► INITIALLY BY SLOW INTRAVENOUS INJECTION

- **Neonate:** Initially 10 mg, then (by continuous intravenous infusion) 100 mg/m² daily, alternatively (by intravenous infusion) 100 mg/m² daily in divided doses, to be given every 6–8 hours; adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose.

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

- **Child 1 month–11 years:** Initially 2–4 mg/kg, then 2–4 mg/kg every 6 hours, adjusted according to response, when stable reduce over 4–5 days to oral maintenance dose
- **Child 12–17 years:** 100 mg every 6–8 hours

Congenital adrenal hyperplasia

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- **Neonate:** 9–15 mg/m² in 3 divided doses, adjusted according to response.
- **Child:** 9–15 mg/m² in 3 divided doses, adjusted according to response

Adrenal hypoplasia | Addison's disease, chronic maintenance or replacement therapy

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- **Neonate:** 8–10 mg/m² daily in 3 divided doses, the larger dose to be given in the morning and the smaller in the evening, higher doses may be needed.

- **Child:** 8–10 mg/m² daily in 3 divided doses, the larger dose to be given in the morning and the smaller in the evening, higher doses may be needed

Inflammatory bowel disease—induction of remission

► BY INTRAVENOUS INJECTION

- **Child 2–17 years:** 2.5 mg/kg every 6 hours (max. per dose 100 mg)
- **BY CONTINUOUS INTRAVENOUS INFUSION**
- **Child 2–17 years:** 10 mg/kg daily; maximum 400 mg per day

Ulcerative colitis | Proctitis | Proctosigmoiditis

► BY RECTUM USING RECTAL FOAM

- **Child 2–17 years:** Initially 1 metered application 1–2 times a day for 2–3 weeks, then reduced to 1 metered application once daily on alternate days, to be inserted into the rectum

Acute hypersensitivity reactions | Angioedema

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- **Child 1–5 months:** Initially 25 mg 3 times a day, adjusted according to response
- **Child 6 months–5 years:** Initially 50 mg 3 times a day, adjusted according to response
- **Child 6–11 years:** Initially 100 mg 3 times a day, adjusted according to response
- **Child 12–17 years:** Initially 200 mg 3 times a day, adjusted according to response

Hypotension resistant to inotropic treatment and volume replacement (limited evidence)

► BY INTRAVENOUS INJECTION

- **Neonate:** Initially 2.5 mg/kg, then 2.5 mg/kg after 4 hours if required, followed by 2.5 mg/kg every 6 hours for 48 hours or until blood pressure recovers, dose to then be reduced gradually over at least 48 hours.

- **Child:** 1 mg/kg every 6 hours (max. per dose 100 mg)

Severe acute asthma | Life-threatening acute asthma

► BY INTRAVENOUS INJECTION

- **Child 1 month–1 year:** 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 25 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- **Child 2–4 years:** 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 50 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- **Child 5–11 years:** 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate
- **Child 12–17 years:** 4 mg/kg every 6 hours (max. per dose 100 mg), alternatively 100 mg every 6 hours until conversion to oral prednisolone is possible, dose given, preferably, as sodium succinate

- **UNLICENSED USE** Use of injection by mouth is unlicensed.

● CONTRA-INDICATIONS

- When used by ear Avoid alone in the presence of untreated infection (combine with suitable anti-infective)
- With rectal use Bowel perforation · extensive fistulas · intestinal obstruction · recent intestinal anastomoses

● CAUTIONS

- With rectal use Systemic absorption may occur

● SIDE-EFFECTS

- With intravenous use Phosphate ester associated with pain and paraesthesia (particularly in the perineal region)
- With rectal use Local irritation

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *intravenous administration*, dilute with Glucose 5% or Sodium Chloride 0.9%. For *intermittent infusion* give over 20–30 minutes.
- With oral use For administration *by mouth*, injection solution may be swallowed [unlicensed use] but consider phosphate content.

• PATIENT AND CARER ADVICE

- With systemic use Patient counselling is advised for hydrocortisone tablets and injections (steroid card).

• LESS SUITABLE FOR PRESCRIBING

- With intravenous use Hydrocortisone as the sodium phosphate is less suitable for prescribing as paraesthesia and pain (particularly in the perineal region) may follow intravenous injection.

• EXCEPTIONS TO LEGAL CATEGORY

- With intramuscular use or intravenous use Prescription only medicine restriction does not apply where administration is for saving life in emergency.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution **Tablet**

Methylprednisolone

• INDICATIONS AND DOSE

Inflammatory and allergic disorders

- BY MOUTH, OR BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: 0.5–1.7 mg/kg daily in 2–4 divided doses, divide doses depending on condition and response

Treatment of graft rejection reactions

- BY INTRAVENOUS INJECTION
- Child: 10–20 mg/kg once daily for 3 days, alternatively 400–600 mg/m² once daily (max. per dose 1 g) for 3 days

Severe erythema multiforme | Lupus nephritis | Systemic onset juvenile idiopathic arthritis

► BY INTRAVENOUS INJECTION

- Child: 10–30 mg/kg once daily or on alternate days (max. per dose 1 g) for up to 3 doses

DEPO-MEDRONE®

Suppression of inflammatory and allergic disorders

► BY DEEP INTRAMUSCULAR INJECTION

- Child: Seek specialist advice, to be injected into the gluteal muscle

• CAUTIONS

- With intravenous use Rapid intravenous administration of large doses associated with cardiovascular collapse

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use Intravenous injection given over 30 minutes. For intravenous infusion, may be diluted with sodium chloride intravenous infusion 0.9% or 0.45%, or glucose intravenous infusion 5% or 10%.

- PATIENT AND CARER ADVICE** Patient counselling is advised for methylprednisolone tablets and injections (steroid card).

Prednisolone

● INDICATIONS AND DOSE

Severe croup (before transfer to hospital) | Mild croup that might cause complications (before transfer to hospital)

- BY MOUTH
- Child: 1–2 mg/kg

Mild to moderate acute asthma (when oral corticosteroid taken for more than a few days) | Severe or life-threatening acute asthma (when oral corticosteroid taken for more than a few days)

- BY MOUTH
- Child 1 month–11 years: 2 mg/kg once daily (max. per dose 60 mg) for up to 3 days, longer if necessary

Mild to moderate acute asthma | Severe or life-threatening acute asthma

- BY MOUTH
- Child 1 month–11 years: 1–2 mg/kg once daily (max. per dose 40 mg) for up to 3 days, longer if necessary
- Child 12–17 years: 40–50 mg daily for at least 5 days

Autoimmune inflammatory disorders (including juvenile idiopathic arthritis, connective tissue disorders and systemic lupus erythematosus)

- BY MOUTH
- Child: Initially 1–2 mg/kg once daily, to be reduced after a few days if appropriate; maximum 60 mg per day

Autoimmune hepatitis

- BY MOUTH
- Child: Initially 2 mg/kg once daily, to then be reduced to minimum effective dose; maximum 40 mg per day

Corticosteroid replacement therapy

- BY MOUTH
- Child 12–17 years: 2–2.5 mg/m² daily in 1–2 divided doses, adjusted according to response

Infantile spasms

- BY MOUTH
- Child 1 month–1 year: Initially 10 mg 4 times a day for 14 days; increased to 20 mg 3 times a day for 7 days if seizures not controlled after initial 7 days, reduce dose gradually over 15 days until stopped

Infantile spasms (dose reduction in patient taking 40 mg daily)

- BY MOUTH
- Child 1 month–1 year: Reduced in steps of 10 mg every 5 days, reduce gradually over 20 days until stopped

Infantile spasms (dose reduction in patient taking 60 mg daily)

- BY MOUTH
- Child 1 month–1 year: Reduced to 40 mg daily for 5 days, then reduced to 20 mg daily for 5 days, then reduced to 10 mg daily for 5 days and then stop

Idiopathic thrombocytopenic purpura

- BY MOUTH
- Child 1–9 years: 1–2 mg/kg daily for maximum of 14 days, alternatively 4 mg/kg daily for a maximum of 4 days

Nephrotic syndrome

- BY MOUTH
- Child: Initially 60 mg/m² once daily for 4–6 weeks until proteinuria ceases, then reduced to 40 mg/m² once daily on alternate days for 4–6 weeks, then withdraw by reducing dose gradually; maximum 80 mg per day

Nephrotic syndrome (prevention of relapse)

- BY MOUTH
- Child: 0.5–1 mg/kg once daily or on alternate days for 3–6 months

Ulcerative colitis | Crohn's disease

- BY MOUTH
- Child 2–17 years: 2 mg/kg once daily (max. per dose 60 mg) until remission occurs, followed by reducing doses

Pneumocystis pneumonia in moderate to severe infections associated with HIV infection

- BY MOUTH
- Child: 2 mg/kg daily for 5 days, the dose is then reduced over the next 16 days and then stopped, corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards, the corticosteroid should be withdrawn before anti-pneumocystis treatment is complete; maximum 80 mg per day

Proctitis

- BY RECTUM USING RECTAL FOAM
- Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone
- BY RECTUM USING SUPPOSITORIES
- Child 2–17 years: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

Distal ulcerative colitis

- BY RECTUM USING RECTAL FOAM
- Child 12–17 years: 1 metered application 1–2 times a day for 2 weeks, continued for further 2 weeks if good response, to be inserted into the rectum, 1 metered application contains 20 mg prednisolone

Rectal complications of Crohn's disease

- BY RECTUM USING SUPPOSITORIES
- Child 2–17 years: 5 mg twice daily, to be inserted in to the rectum morning and night, after a bowel movement

● UNLICENSED USE

- With rectal use Prednisolone rectal foam not licensed for use in children (age range not specified by manufacturer).

● CONTRA-INDICATIONS

- With rectal use Bowel perforation • extensive fistulas • intestinal obstruction • recent intestinal anastomoses

● CAUTIONS

- With rectal use Systemic absorption may occur with rectal preparations
- With systemic use Duchenne's muscular dystrophy (possible transient rhabdomyolysis and myoglobinuria following strenuous physical activity)

- **PREGNANCY** As it crosses the placenta 88% of prednisolone is inactivated.

- With systemic use Pregnant women with fluid retention should be monitored closely.

- **BREAST FEEDING** Prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant.

- With systemic use Infant should be monitored for adrenal suppression if mother is taking a dose higher than 40 mg.

● PATIENT AND CARER ADVICE

- Prednisolone (oral) for nephrotic syndrome
- With oral use www.medicinesforchildren.org.uk/prednisolone-oral-for-nephrotic-syndrome Medicines for Children leaflet: Prednisolone for asthma
- With oral use www.medicinesforchildren.org.uk/prednisolone-for-asthma
- With oral use Patient counselling is advised for prednisolone tablets (steroid card).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, enema

Tablet

2.1 Cushing's syndrome and disease

Cushing's Syndrome

Management

Most types of *Cushing's syndrome* are treated surgically. Metyrapone p. 415 may be useful to control the symptoms of the disease or to prepare the child for surgery. The dosages of metyrapone used are either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed.

Ketoconazole below may have a direct effect on corticotrophic tumour cells in patients with Cushing's disease. It is used under specialist supervision in children over 12 years for treatment of endogenous Cushing's syndrome.

ENZYME INHIBITORS

Ketoconazole

● DRUG ACTION

▶ With oral use An imidazole derivative which acts as a potent inhibitor of cortisol and aldosterone synthesis by inhibiting the activity of 17 α -hydroxylase, 11-hydroxylation steps and at higher doses the cholesterol side-chain cleavage enzyme. It also inhibits the activity of adrenal C17-20 lyase enzymes resulting in androgen synthesis inhibition, and may have a direct effect on corticotrophic tumour cells in patients with Cushing's disease.

● INDICATIONS AND DOSE

Endogenous Cushing's syndrome (specialist use only)

▶ BY MOUTH

▶ Child 12-17 years: Initially 400–600 mg daily in 2–3 divided doses, increased to 800–1200 mg daily; maintenance 400–800 mg daily in 2–3 divided doses, for dose titrations in patients with established dose, adjustments in adrenal insufficiency, or concomitant corticosteroid replacement therapy, consult product literature; maximum 1200 mg per day

IMPORTANT SAFETY INFORMATION

CHMP ADVICE: KETOCONAZOLE (JULY 2013)

The CHMP has recommended that the marketing authorisation for oral ketoconazole to treat fungal infections should be suspended. The CHMP concluded that the risk of hepatotoxicity associated with oral ketoconazole is greater than the benefit in treating fungal infections. Doctors should review patients who are being treated with oral ketoconazole for fungal infections, with a view to stopping treatment or choosing an alternative treatment. Patients with a prescription of oral ketoconazole for fungal infections should be referred back to their doctors.

Oral ketoconazole for Cushing's syndrome and topical products containing ketoconazole are not affected by this advice.

● **CONTRA-INDICATIONS** Acquired QTc prolongation • avoid concomitant use of hepatotoxic drugs • congenital QTc prolongation

● **CAUTIONS** Risk of adrenal insufficiency

● **INTERACTIONS** → Appendix 1 (antifungals, imidazole).

• SIDE-EFFECTS

- **Common or very common** Abdominal pain · adrenal insufficiency · diarrhoea · hepatic enzymes increased · nausea · pruritus · rash · vomiting
- **Uncommon** Alopecia · dizziness · headache · malaise · somnolence · thrombocytopenia · urticaria
- **Rare** Hepatic failure · hepatitis · jaundice · liver damage
- **Very rare** Pyrexia
- **Frequency not known** Alcohol intolerance · anorexia · arthralgia · azoospermia · dermatitis · dry mouth · dysgeusia · dyspepsia · epistaxis · erectile dysfunction · erythema · flatulence · gynaecomastia · hot flush · increased appetite · insomnia · menstrual disorder · myalgia · nervousness · paraesthesia · peripheral oedema · photophobia · photosensitivity · raised intracranial pressure · reduced testosterone concentrations · tongue discoloration · xeroderma

SIDE-EFFECTS, FURTHER INFORMATION

- **Hepatotoxicity** Potentially life-threatening hepatotoxicity reported rarely.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used in women of child-bearing potential.
- **PREGNANCY** Manufacturer advises avoid—teratogenic in animal studies.
- **BREAST FEEDING** Manufacturer advises avoid—present in breast milk.
- **HEPATIC IMPAIRMENT** Avoid in acute or chronic impairment. Do not initiate treatment if liver enzymes greater than 2 times the normal upper limit.
- **MONITORING REQUIREMENTS**
 - Monitor ECG before and one week after initiation, and then as clinically indicated thereafter.
 - **Adrenal insufficiency** Monitor adrenal function within one week of initiation, then regularly thereafter. When cortisol levels are normalised or close to target and effective dose established, monitor every 3–6 months as there is a risk of autoimmune disease development or exacerbation after normalisation of cortisol levels. If symptoms suggestive of adrenal insufficiency such as fatigue, anorexia, nausea, vomiting, hypotension, hyponatraemia, hyperkalaemia, and/or hypoglycaemia occur, measure cortisol levels and discontinue treatment temporarily (can be resumed thereafter at lower dose) or reduce dose and if necessary, initiate corticosteroid substitution.
 - **Hepatotoxicity** Monitor liver function before initiation of treatment, then weekly for 1 month after initiation, then monthly for 6 months—more frequently if dose adjusted or abnormal liver function detected. Reduce dose if liver enzymes increase less than 3 times the normal upper limit—consult product literature; if liver enzymes are raised to 3 times or greater the normal upper limit, discontinue treatment permanently.
- **PATIENT AND CARER ADVICE** Dizziness and somnolence may affect the performance of skilled tasks (e.g. driving). Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, jaundice, abdominal pain, or dark urine develop. Patients or their carers should also be told how to recognise signs of adrenal insufficiency.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 5, 21

- **Ketoconazole (Non-proprietary)** ▼
Ketoconazole 200 mg Ketoconazole 200mg tablets | 60 tablet (PoM) £480.00

Metyrapone

- **DRUG ACTION** Metyrapone is a competitive inhibitor of 11 β -hydroxylation in the adrenal cortex; the resulting inhibition of cortisol (and to a lesser extent aldosterone) production leads to an increase in ACTH production which, in turn, leads to increased synthesis and release of cortisol precursors. Metyrapone may be used as a test of anterior pituitary function.

• INDICATIONS AND DOSE

Differential diagnosis of ACTH-dependent Cushing's syndrome (specialist supervision in hospital)

- **BY MOUTH**
 - Child: 15 mg/kg every 4 hours for 6 doses, alternatively 300 mg/m² every 4 hours for 6 doses; usual dose 250–750 mg every 4 hours

Management of Cushing's syndrome (specialist supervision in hospital)

- **BY MOUTH**
 - Child: Usual dose 0.25–6 g daily, dose to be tailored to cortisol production, dose is either low, and tailored to cortisol production, or high, in which case corticosteroid replacement therapy is also needed

- **CONTRA-INDICATIONS** Adrenocortical insufficiency
- **CAUTIONS** Avoid in Acute porphyrias p. 562 · gross hypopituitarism (risk of precipitating acute adrenal failure) · hypertension on long-term administration · hypothyroidism (delayed response)
- **INTERACTIONS** Many drugs interfere with diagnostic estimation of steroids.
- **SIDE-EFFECTS**
 - **Rare** Abdominal pain · allergic skin reactions · hirsutism · hypoadrenalism
 - **Frequency not known** Dizziness · headache · hypotension · nausea · sedation · vomiting
- **PREGNANCY** Avoid (may impair biosynthesis of fetal-placental steroids).
- **BREAST FEEDING** Avoid—no information available.
- **HEPATIC IMPAIRMENT** Use with caution in hepatic impairment (delayed response).
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks
Drowsiness may affect the performance of skilled tasks (e.g. driving).

3 Diabetes mellitus and hypoglycaemia

3.1 Diabetes mellitus

Diabetes

Overview

Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many

subtypes, the two principle classes of diabetes are type 1 diabetes and type 2 diabetes.

Type 1 diabetes, (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), is due to a deficiency of insulin following autoimmune destruction of pancreatic beta cells and is the most common form of diabetes in children. Children with type 1 diabetes require administration of insulin.

Type 2 diabetes, (formerly referred to as non-insulin dependent diabetes mellitus (NIDDM)), is rare in children but the incidence is increasing, particularly in adolescents, as obesity increases. It results from reduced secretion of insulin or from peripheral resistance to the action of insulin, or from a combination of both. Although children may be controlled on diet alone, many require oral antidiabetic drugs or insulin to maintain satisfactory control. There is limited information available on the use of oral antidiabetic drugs in children. In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity.

Genetic defects of beta-cell function (formerly referred to as maturity-onset diabetes of the young (MODY)), describes a number of rare disease states, characterised by onset of mild hyperglycaemia, generally before 25 years of age. A sulfonyleurea, such as gliclazide p. 421, may be effective in these patients.

Treatment of diabetes

Treatment should be aimed at alleviating symptoms and minimising the risk of long-term complications.

Diabetes is a strong risk factor for cardiovascular disease later in life. Other risk factors for cardiovascular disease (smoking, hypertension, obesity and hyperlipidaemia) should be addressed. The use of an ACE inhibitor and of a lipid-regulating drug can be beneficial in children with diabetes and a high cardiovascular disease risk. (ACE inhibitors may also have a role in the management of diabetic nephropathy).

Prevention of diabetic complications

Although rare, retinopathy, neuropathy and nephropathy can occur in children with diabetes. Screening for complications should begin 5 years after diagnosis of diabetes or from 12 years of age. Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy.

A measure of the total glycosylated (or glycated) haemoglobin (HbA_{1c}) or a specific fraction (HbA_{1c}) provides a good indication of long-term glycaemic control. Overall it is ideal to aim for an HbA_{1c} concentration of 48–59 mmol/mol or less (reference range 20–42 mmol/mol), but this cannot always be achieved and for those using insulin there is a significantly increased risk of disabling hypoglycaemia.

Measurement of HbA_{1c}

HbA_{1c} values are expressed in *mmol of glycosylated haemoglobin per mol of haemoglobin (mmol/mol)*, a standardised unit specific for HbA_{1c} created by the International Federation of Clinical Chemistry and Laboratory Medicine (IFCC). HbA_{1c} values were previously aligned to the assay used in the Diabetes Control and Complications Trial (DCCT) and expressed as a percentage.

Equivalent values

IFCC-HbA _{1c} (mmol/mol)	DCCT-HbA _{1c} (%)
42	6.0
48	6.5
53	7.0
59	7.5
64	8.0
75	9.0

Laboratory measurement of serum-fructosamine concentration is technically simpler and cheaper than the measurement of HbA_{1c} and can be used to assess control over short periods of time, particularly when HbA_{1c} monitoring is invalid (e.g. disturbed erythrocyte turnover or abnormal haemoglobin type).

Tight control of blood pressure in hypertensive children with type 2 diabetes may reduce mortality significantly and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photocoagulation).

Driving

Information on the requirements for driving vehicles by individuals receiving treatment for diabetes is available in the BNF or from the DVLA at www.gov.uk/government/publications/at-a-glance.

Diabetic nephropathy

Regular review of diabetic children over 12 years of age should include an annual test for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (*Micral-Test II*® or *Microbumintest*®) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Microalbuminuria can occur transiently during puberty; if it persists (at least 3 positive tests) treatment with an ACE inhibitor or an angiotensin-II receptor antagonist under specialist guidance should be considered; to minimise the risk of renal deterioration, blood pressure should be carefully controlled.

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in children with renal impairment.

See also treatment of hypertension in diabetes.

Neuropathy

Clinical neuropathy is rare in children whose diabetes is well controlled.

Diabetic ketoacidosis

Management

The management of diabetic ketoacidosis involves the replacement of fluid and electrolytes and the administration of insulin. Guidelines for the Management of Diabetic Ketoacidosis, published by the British Society of Paediatric Endocrinology and Diabetes, (available at www.bsped.org.uk) should be followed. Clinically well children with mild ketoacidosis who are dehydrated up to 5% usually respond to oral rehydration and subcutaneous insulin. For those who do not respond, or are clinically unwell, or are dehydrated by more than 5%, insulin and replacement fluids are best given by intravenous infusion.

- To restore circulating volume for children in *shock*, give 10 mL/kg **sodium chloride 0.9%** as a rapid infusion, repeat as necessary up to a maximum of 30 mL/kg.
- Further fluid should be given by intravenous infusion at a rate that replaces deficit and provides maintenance over

48 hours; initially use **sodium chloride 0.9%**, changing to **sodium chloride 0.45%** and **glucose 5%** after 12 hours if response is adequate and plasma-sodium concentration is stable.

- Include **potassium chloride** in the fluids unless anuria is suspected, adjust according to plasma-potassium concentration.
- Insulin infusion is necessary to switch off ketogenesis and reverse acidosis; it should not be started until at least 1 hour after the start of intravenous rehydration fluids.
- **Soluble insulin** should be diluted (and **mixed thoroughly**) with **sodium chloride 0.9%** intravenous infusion to a concentration of 1 unit/mL and infused at a rate of 0.1 units/kg/hour.
- **Sodium bicarbonate** infusion (1.26% or 2.74%) is rarely necessary and is used only in cases of extreme acidosis (blood pH less than 6.9) and shock, since the acid-base disturbance is normally corrected by treatment with insulin.
- Once blood glucose falls to 14 mmol/litre, **glucose intravenous infusion 5% or 10%** should be added to the fluids.
- The insulin infusion rate can be reduced to no less than 0.05 units/kg/hour when blood-glucose concentration has fallen to 14 mmol/litre and blood pH is greater than 7.3 and a glucose infusion has been started; it is continued until the child is ready to take food by mouth. Subcutaneous insulin can then be started.
- The insulin infusion should not be stopped until 1 hour after starting subcutaneous soluble or long acting insulin, or 10 minutes after starting subcutaneous insulin aspart p. 426, or insulin glulisine p. 427, or insulin lispro p. 427.

Hyperosmolar hyperglycaemic state or hyperosmolar hyperglycaemic nonketotic coma occurs rarely in children. Treatment is similar to that of diabetic ketoacidosis, although lower rates of insulin infusion and slower rehydration may be required.

Insulins and anti-diabetic drugs

Insulin

Insulin is a polypeptide hormone that plays a key role in the regulation of carbohydrate, fat, and protein metabolism. There are differences in the amino-acid sequence of animal insulins, human insulins, and the human insulin analogues. Human sequence insulin may be produced semisynthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, prb) or yeast (pyr).

Immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic than other insulin preparations, but no real advantage has been shown in trials.

Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the thighs, buttocks, or abdomen; absorption from a limb site can be increased if the limb is used in strenuous exercise after the injection. Generally, subcutaneous insulin injections cause few problems; lipodystrophy may occur and is a factor in poor glycaemic control. Lipodystrophy can be minimised by using different injection sites in rotation. Local allergic reactions are rare.

Insulin should be given to all children with type 1 diabetes; it may also be needed to treat type 2 diabetes either when other methods cannot control the condition or during periods of acute illness or peri-operatively. Insulin is required in all instances of ketoacidosis (see Diabetic ketoacidosis p. 416), which can develop rapidly in children.

Safe and Effective Use of Insulin in Hospitalised Patients (March 2010)

NHS diabetes guidance available at www.diabetes.nhs.uk.

Management of diabetes with insulin

The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the child or carer obsessional and to avoid disabling hypoglycaemia; close co-operation is needed between the child or carer and the medical team to achieve good control and thereby reduce the risk of complications.

Insulin preparations can be divided into 3 types:

- those of **short** duration which have a relatively rapid onset of action, namely soluble insulin and the rapid-acting insulin analogues, insulin aspart p. 426, insulin glulisine p. 427, and insulin lispro p. 427;
- those with an **intermediate** action, e.g. isophane insulin p. 423; and
- those whose action is slower in onset and lasts for **long** periods, e.g. protamine zinc insulin p. 425, insulin detemir p. 424, and insulin glargine p. 424.

The duration of action of a particular type of insulin can vary from one child to another, and needs to be assessed individually.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual child. Treatment should be started with several doses of short-acting insulin (soluble insulin or a rapid-acting insulin analogue) given throughout the day with a longer-acting insulin given once or twice daily. Alternatively, for those who have difficulty with, or prefer not to use, multiple daily injection regimens or in whom such regimens fail to achieve adequate glycaemic control, a mixture of premixed short- and intermediate-acting insulins (most commonly in a proportion of 30% soluble insulin and 70% isophane insulin) can be given twice daily. The dose of short-acting or rapid-acting insulin (or the proportion of the short-acting soluble insulin component in premixed insulin) can be increased in those with excessive postprandial hyperglycaemia. The dose of insulin is increased gradually according to the child's individual requirements, taking care to avoid troublesome hypoglycaemia.

Initiation of insulin may be followed by a partial remission phase or 'honeymoon period' when lower doses of insulin are required than are subsequently necessary to maintain glycaemic control.

Examples of insulin regimens

- Multiple injection regimen: short-acting insulin or rapid-acting insulin analogue, before meals. With intermediate-acting or long-acting insulin, once or twice daily;
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting insulin, twice daily (before breakfast and the main evening meal);
- Short-acting insulin or rapid-acting insulin analogue mixed with intermediate-acting insulin, before breakfast. With short-acting or rapid-acting insulin analogue alone, before afternoon snack or the main evening meal, and intermediate-acting insulin or long-acting insulin, at bedtime;
- Continuous subcutaneous insulin infusion.

Insulin requirements

Most prepubertal children require around 0.6–0.8 units/kg/day of insulin after the initial temporary remission phase. Unless the child has a very sedentary life-style, a requirement for higher doses may indicate poor compliance, poor absorption of insulin from the injection site (e.g. because of lipohypertrophic sites), or the beginning of puberty. During puberty up to 1.5–2 units/kg/day of insulin may be required, especially during growth spurts. Around 1 year after menarche or after the growth spurt in boys, the dose may need to be adjusted to avoid excessive weight gain. Insulin requirements can be *increased* by

infection, stress, and accidental or surgical trauma. Insulin requirements can be *reduced* in very active individuals, in those with certain endocrine disorders (e.g. Addison's disease, hypopituitarism), or in coeliac disease. Insulin requirements should be assessed frequently in all these circumstances.

Hypoglycaemia

Very tight control of glucose lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; an increase in the frequency of hypoglycaemic episodes may reduce the warning symptoms experienced by the child. Loss of warning of hypoglycaemia among insulin-treated children can be a serious hazard, especially for cyclists and drivers.

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjustment of insulin type, dose, and frequency, together with suitable timing and quantity of meals and snacks.

Diabetes and surgery

Children with type 1 diabetes should undergo surgery in centres with facilities for, and expertise in, the care of children with diabetes. Detailed local protocols should be available to all healthcare professionals involved in the treatment of these children.

Children with type 1 diabetes who require surgery:

- should be admitted to hospital for general anaesthesia;
- should receive insulin, even if they are fasting, to avoid ketoacidosis;
- should receive glucose infusion when fasting before an anaesthetic to prevent hypoglycaemia;
- should have careful monitoring of blood-glucose concentration because surgery may cause hyperglycaemia.

Elective surgery

Surgery in children with diabetes is best scheduled early on the list, preferably in the morning. If glycaemic control is poor it is advisable to admit the child well in advance of surgery. On the evening before surgery, blood-glucose should be measured frequently, especially before meals and snacks and at bedtime; urine should be tested for ketones. The usual evening or bedtime insulin and bedtime snack should be given. Ketosis or severe hypoglycaemia require correction, preferably by overnight intravenous infusion, and the surgery may need to be postponed.

For minor procedures that require fasting, a slight modification of the usual regimen may be all that is necessary e.g. for early morning procedures delay insulin and food until immediately after the procedure.

For other types of elective surgery, consult local treatment protocols.

Emergency surgery

Intravenous fluids and an insulin infusion should be started immediately. If ketoacidosis is present the recommendations for diabetic ketoacidosis should be followed.

Intravenous fluids and continuous insulin infusion

Blood-glucose and plasma-electrolyte concentrations must be measured frequently in a child receiving intravenous support. Intravenous infusion should be continued until after the child starts to eat and drink. The following infusions should be used and adjusted according to the child's fluid and electrolyte requirements:

- Constant infusion of sodium chloride 0.45% and glucose 5% intravenous infusion together with potassium chloride 20 mmol/litre (provided that plasma-potassium concentration is not raised) at a rate determined by factors such as volume depletion and age; the amount of potassium chloride infused is adjusted according to plasma electrolyte measurements;
- Constant infusion of soluble insulin 1 unit/mL in sodium chloride 0.9% intravenous infusion initially at a rate of 0.025 units/kg/hour (up to 0.05 units/kg/hour if the child is unwell), then adjusted according to blood-glucose

concentration (frequent monitoring necessary) in line with locally agreed protocols and the child's volume depletion and age;

- Blood-glucose concentration should be maintained between 5 and 10 mmol/litre. If the glucose concentration falls below 5 mmol/litre, glucose 10% intravenous infusion may be required; conversely, if the glucose concentration persistently exceeds 14 mmol/litre, sodium chloride 0.9% intravenous infusion should be substituted;
- The insulin infusion may be stopped temporarily for 10–15 minutes if blood-glucose concentration falls below 4 mmol/litre.

The usual subcutaneous insulin regimen should be started before the first meal (but the dose may need to be 10–20% higher than usual if the child is still bed bound or unwell) and the intravenous insulin infusion stopped 1 hour later. If glycaemic control is not adequately achieved, additional insulin can be given in the following ways:

- additional doses of soluble insulin at any of the 4 injection times (before meals or bedtime) *or*
- temporary addition of intravenous insulin infusion to subcutaneous regimen *or*
- complete reversion to intravenous insulin infusion (particularly if the child is unwell).

Short-acting insulins

Soluble insulin is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies and at the time of surgery. It can be given intravenously and intramuscularly, as well as subcutaneously.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 2 and 4 hours, and a duration of action of up to 8 hours.

When injected intravenously, soluble insulin has a very short half-life of only about 5 minutes and its effect disappears within 30 minutes.

The rapid-acting human insulin analogues, insulin aspart p. 426, insulin glulisine p. 427, and insulin lispro p. 427, have a faster onset (10–20 minutes) and shorter duration of action (2–5 hours) than soluble insulin; as a result, compared with soluble insulin, fasting and preprandial blood-glucose concentrations are a little higher, postprandial blood-glucose concentration is a little lower, and hypoglycaemia occurs slightly less frequently. These rapid-acting insulins are ideal for prandial dosing in a multiple injection regimen in combination with a long-acting insulin once or twice daily. Insulin aspart, insulin glulisine, and insulin lispro can be administered by subcutaneous infusion. Insulin aspart and insulin lispro can also be administered intravenously and can be used as alternatives to soluble insulin for diabetic emergencies and at the time of surgery.

Intermediate- and long-acting insulins

When given by subcutaneous injection, intermediate- and long-acting insulins have an onset of action of approximately 1–2 hours, a maximal effect at 4–12 hours, and a duration of 16–35 hours. Some are given twice daily in conjunction with short-acting (soluble) insulin, and others are given once daily. Soluble insulin can be mixed with intermediate and long-acting insulins (except insulin detemir p. 424, insulin glargine p. 424, and insulin degludec p. 424) in the syringe, essentially retaining the properties of the two components, although there may be some blunting of the initial effect of the soluble insulin component (especially on mixing with protamine zinc insulin p. 425).

Close monitoring of blood glucose is essential when introducing a change to the insulin regimen; the total daily dose as well as any concomitant treatment may need to be adjusted.

Isophane insulin p. 423 is a suspension of insulin with protamine; it is of particular value for initiation of twice-daily insulin regimens. Isophane can be mixed with soluble insulin before injection but ready-mixed preparations may be appropriate (biphasic isophane insulin p. 422, biphasic insulin aspart p. 423, or biphasic insulin lispro p. 423).

Insulin zinc suspension p. 425 (30% amorphous, 70% crystalline) has a more prolonged duration of action.

Protamine zinc insulin is usually given once daily with short-acting (soluble) insulin. It has the drawback of binding with the soluble insulin when mixed in the same syringe and is now rarely used.

Insulin detemir and insulin glargine are long-acting human insulin analogues with a prolonged duration of action; insulin detemir is given once or twice daily and insulin glargine is given once daily. These long-acting insulins are ideal for once or twice daily dosing in a multiple injection regimen in combination with a short-acting insulin before meals. NICE (December 2002) has recommended that insulin glargine should be available as an option for patients with type 1 diabetes.

NICE (May 2009) has recommended that, if insulin is required in patients with type 2 diabetes, insulin detemir or insulin glargine may be considered for those:

- who require assistance with injecting insulin *or*
- whose lifestyle is significantly restricted by recurrent symptomatic hypoglycaemia *or*
- who would otherwise need twice-daily basal insulin injections in combination with oral antidiabetic drugs *or*
- who cannot use the device needed to inject isophane insulin.

Insulin degludec is a long-acting human insulin analogue for once daily subcutaneous administration.

Biphasic insulins

Biphasic insulins are pre-mixed insulin preparations containing various combinations of short-acting (soluble) or rapid-acting (analogue) insulin and an intermediate-acting insulin.

The percentage of short-acting insulin varies from 10% to 50%. These preparations should be administered by subcutaneous injection up to 15 minutes before or soon after a meal.

Hypodermic equipment

Carers and children should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

Antidiabetic drugs

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the child fails to respond adequately to restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

In children, type 2 diabetes does not usually occur until adolescence and information on the use of oral antidiabetic drugs in children is limited. Treatment with oral antidiabetic drugs should be initiated under specialist supervision **only**; the initial dose should be at the lower end of the adult dose range and then adjusted according to response.

Metformin hydrochloride p. 420 is the oral antidiabetic drug of choice because there is most experience with this drug in children. If dietary changes and metformin hydrochloride do not control the diabetes adequately, either a sulfonylurea or insulin can be added.

Alternatively, oral therapy may be substituted with insulin.

When insulin is added to oral therapy, it is generally given at bedtime as isophane or long-acting insulin, and when

insulin replaces an oral regimen it may be given as twice-daily injections of a biphasic insulin (or isophane insulin p. 423 mixed with soluble insulin), or a multiple injection regimen. Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain can be reduced if the insulin is given in combination with metformin hydrochloride.

Pregnancy and breast-feeding

During pregnancy, women with *pre-existing diabetes* can be treated with metformin hydrochloride [unlicensed use], either alone or in combination with insulin p. 425. Metformin hydrochloride can be continued, or glibenclamide p. 421 resumed, during breast-feeding for those with pre-existing diabetes. Women with *gestational diabetes* may be treated, with or without concomitant insulin, with glibenclamide from 11 weeks gestation (after organogenesis) [unlicensed use] or with metformin hydrochloride [unlicensed use]. Women with gestational diabetes should discontinue hypoglycaemic treatment after giving birth.

Sulfonylureas

The sulfonylureas are not the first choice oral antidiabetics in children.

Sulfonylureas are considered for children in whom metformin hydrochloride is contra-indicated or not tolerated. Several sulfonylureas are available but experience in children is limited; choice is determined by side-effects and the duration of action as well as the child's age and renal function. Glibenclamide, a long-acting sulfonylurea, is associated with a greater risk of hypoglycaemia and for this reason is generally avoided in children. Shorter-acting alternatives, such as tolbutamide p. 421, may be preferred.

Insulin therapy should be instituted temporarily during intercurrent illness (such as coma, infection, and trauma). Sulfonylureas should be omitted on the morning of surgery; insulin is often required because of the ensuing hyperglycaemia in these circumstances.

Sulfonylureas can be useful in the management of certain forms of diabetes that result from genetic defects of beta-cell function; there is most experience with gliclazide p. 421.

Biguanides

Metformin hydrochloride, the only available biguanide, has a different mode of action from the sulfonylureas, and is not interchangeable with them.

Metformin hydrochloride is the drug of first choice in children with type 2 diabetes, in whom strict dieting has failed to control diabetes. When the combination of strict diet and metformin hydrochloride treatment fails, other options to be considered under specialist management only, include:

- combining with insulin but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night);
- combining with a sulfonylurea (reports of increased hazard with this combination remain unconfirmed).

Insulin treatment is almost always required in medical and surgical emergencies; insulin should also be substituted before elective surgery (omit metformin hydrochloride on the morning of surgery and give insulin if required).

Hypoglycaemia does not usually occur with metformin hydrochloride; other advantages are the lower incidence of weight gain and lower plasma-insulin concentration. It does not exert a hypoglycaemic action in non-diabetic subjects unless given in overdose.

Other antidiabetic drugs

There is little experience of the use of acarbose in children. It has been used in older children; therapy should be initiated by an appropriate expert.

The use of nateglinide in combination with a sulfonylurea is generally reserved for the management of some subtypes of diabetes resulting from genetic defects of beta-cell

function or other syndromes of diabetes and requires specialist management.

Insulin and glucose

Neonatal hyperglycaemia

Newborn babies are relatively intolerant of glucose, especially in the first week of life and if premature. If intravenous glucose is necessary e.g. for total parenteral nutrition, infuse at a lower rate for 6–12 hours and the glucose intolerance should resolve. Insulin is not needed for such transient glucose intolerance, but may be needed if blood-glucose concentration is persistently high.

Neonatal diabetes

Neonatal diabetes is a rare condition that presents with acidosis, dehydration, hyperglycaemia, and rarely ketosis; it responds to continuous insulin infusion. When the neonate is stable, treatment can be switched to subcutaneous insulin given once or twice a day. Treatment is normally required for 4–6 weeks in transient forms, but may be required permanently in some cases.

BLOOD GLUCOSE LOWERING DRUGS > BIGUANIDES

Metformin hydrochloride

- **DRUG ACTION** Metformin exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

● INDICATIONS AND DOSE

Diabetes mellitus

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 8–9 years (specialist use only): Initially 200 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day
- Child 10–17 years (specialist use only): Initially 500 mg once daily, dose to be adjusted according to response at intervals of at least 1 week, maximum daily dose to be given in 2–3 divided doses; maximum 2 g per day

- **UNLICENSED USE** Not licensed for use in children under 10 years.

- **CONTRA-INDICATIONS** Ketoacidosis · use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to baseline)

CONTRA-INDICATIONS, FURTHER INFORMATION

- Iodine-containing X-ray contrast media Intravascular administration of iodinated contrast agents can cause renal failure, which can increase the risk of lactic acidosis with metformin. Suspend metformin prior to the test; restart no earlier than 48 hours after the test if renal function has returned to baseline.

- **CAUTIONS** Can provoke lactic acidosis

- **INTERACTIONS** → Appendix 1 (antidiabetics).

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · anorexia · diarrhoea (usually transient) · nausea · taste disturbance · vomiting
- **Rare** Decreased vitamin-B₁₂ absorption · erythema · lactic acidosis (withdraw treatment) · pruritus · urticaria
- **Frequency not known** Hepatitis

SIDE-EFFECTS, FURTHER INFORMATION

- **Gastro-intestinal effects** Gastro-intestinal side-effects are initially common with metformin, and may persist in some patients, particularly when very high doses are given. A slow increase in dose may improve tolerability.

- **PREGNANCY** Can be used in pregnancy for both pre-existing and gestational diabetes. Women with gestational diabetes should discontinue treatment after giving birth.
- **BREAST FEEDING** May be used during breast-feeding in women with pre-existing diabetes.
- **HEPATIC IMPAIRMENT** Withdraw if tissue hypoxia likely.
- **RENAL IMPAIRMENT** Use with caution in renal impairment—increased risk of lactic acidosis. Lactic acidosis Withdraw or interrupt treatment in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment, or those who have recently had a myocardial infarction. Avoid in significant renal impairment.
- **MONITORING REQUIREMENTS** Determine renal function before treatment and at least annually (at least twice a year in patients with additional risk factors for renal impairment, or if deterioration suspected).
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Metformin for diabetes www.medicinesforchildren.org.uk/metformin-diabetes

● MEDICINAL FORMS

BLOOD GLUCOSE LOWERING DRUGS > SULFONYLUREAS

Sulfonylureas

- **DRUG ACTION** The sulfonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action.
- **CONTRA-INDICATIONS** Presence of ketoacidosis
- **CAUTIONS** Can encourage weight gain (should be prescribed only if poor control and symptoms persist despite adequate attempts at dieting) · G6PD deficiency
- **SIDE-EFFECTS**
 - **Uncommon** Hypoglycaemia
 - **Rare** Agranulocytosis · aplastic anaemia · blood disorders · cholestatic jaundice · haemolytic anaemia · hepatic failure · hepatitis · leucopenia · pancytopenia · thrombocytopenia
 - **Frequency not known** Allergic skin reactions (usually in the first 6–8 weeks of therapy) · constipation · diarrhoea ·

disturbance in liver function · erythema multiforme (usually in the first 6–8 weeks of therapy) · exfoliative dermatitis (usually in the first 6–8 weeks of therapy) · fever (usually in the first 6–8 weeks of therapy) · gastro-intestinal disturbances · hypersensitivity reactions (usually in the first 6–8 weeks of therapy) · jaundice (usually in the first 6–8 weeks of therapy) · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Hypoglycaemia** This is uncommon and usually indicates excessive dosage. Sulfonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.
- **HEPATIC IMPAIRMENT** Sulfonylureas should be avoided or a reduced dose should be used in severe hepatic impairment, because there is an increased risk of hypoglycaemia. Jaundice may occur.
- **RENAL IMPAIRMENT** Sulfonylureas should be used with care in those with mild to moderate renal impairment, because of the hazard of hypoglycaemia. Care is required to use the lowest dose that adequately controls blood glucose. Avoid where possible in severe renal impairment.
- **PATIENT AND CARER ADVICE**
Driving and skilled tasks
Driving Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

420

Glibenclamide

● INDICATIONS AND DOSE

Type 2 diabetes mellitus

► BY MOUTH

- Child 12–17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

Maturity-onset diabetes of the young (specialist use only)

► BY MOUTH

- Child 12–17 years: Initially 2.5 mg daily, adjusted according to response, dose to be taken with or immediately after breakfast; maximum 15 mg per day

- **UNLICENSED USE** Not licensed for use in breast feeding women with pre-existing diabetes. Not licensed for use in gestational diabetes.
Not licensed for use in children.
- **CONTRA-INDICATIONS** Avoid where possible in Acute porphyrias p. 562
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **PREGNANCY** The use of sulfonylureas in pregnancy should generally be avoided because of the risk of neonatal hypoglycaemia; however, glibenclamide can be used during the second and third trimesters of pregnancy in women with gestational diabetes.
- **BREAST FEEDING** Glibenclamide can be used during breast-feeding in women with pre-existing diabetes.

● MEDICINAL FORMS

INSULINS

Insulins

● SIDE-EFFECTS

- ▶ **Common or very common** Fat hypertrophy at injection site • local reactions at injection site • transient oedema
- ▶ **Rare** Hypersensitivity reactions • rash • urticaria

Overdose

Overdose causes hypoglycaemia.

- **PREGNANCY** During pregnancy, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy.

● BREAST FEEDING

During breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician.

- **HEPATIC IMPAIRMENT** Insulin requirements may be decreased in patients with hepatic impairment.

- **RENAL IMPAIRMENT** Insulin requirements may decrease in patients with renal impairment and therefore dose reduction may be necessary. The compensatory response to hypoglycaemia is impaired in renal impairment.

● MONITORING REQUIREMENTS

- ▶ Many patients now monitor their own blood-glucose concentrations; all carers and children need to be trained to do this.
- ▶ Since blood-glucose concentration varies substantially throughout the day, 'normoglycaemia' cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia.
- ▶ It is therefore best to recommend that children should maintain a blood-glucose concentration of between 4 and 10 mmol/litre for most of the time (4–8 mmol/litre before meals and less than 10 mmol/litre after meals).
- ▶ While accepting that on occasions, for brief periods, the blood-glucose concentration will be above these values; strenuous efforts should be made to prevent it from falling below 4 mmol/litre. Patients using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen. The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided.
- **DIRECTIONS FOR ADMINISTRATION** Insulin is generally given by *subcutaneous injection*; the injection site should be rotated to prevent lipodystrophy. Injection devices ('pens'), which hold the insulin in a cartridge and meter the required dose, are convenient to use. Insulin syringes (for use with needles) are required for insulins not available in cartridge form, but are less popular with children and carers. For intensive insulin regimens multiple subcutaneous injections (3 or more times daily) are usually recommended.

● PRESCRIBING AND DISPENSING INFORMATION

Units The word 'unit' should **not** be abbreviated.

Show container to patient or carer and confirm the expected version is dispensed.

- **PATIENT AND CARER ADVICE** Drivers need to be particularly careful to avoid hypoglycaemia and should be warned of the problems.

Insulin Passport Insulin Passports and patient information booklets should be offered to patients receiving insulin. The Insulin Passport provides a record of the patient's current insulin preparations and contains a section for emergency information. The patient information booklet provides advice on the safe use of insulin. They are available for purchase from:

3M Security Print and Systems Limited
Gorse Street, Chadderton
Oldham
OL9 9QH

Tel: 0845 610 1112

GP practices can obtain supplies through their Local Area Team stores.

NHS Trusts can order supplies from www.nhsforms.co.uk or by emailing nhsforms@mmm.com. Further information is available at www.npsa.nhs.uk.

Hypoglycaemia Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

INSULINS > INTERMEDIATE-ACTING

F above

Biphasic isophane insulin

(Biphasic Isophane Insulin Injection— intermediate acting)

● INDICATIONS AND DOSE

Diabetes mellitus

▶ BY SUBCUTANEOUS INJECTION

- ▶ Child: According to requirements

- **INTERACTIONS** → Appendix 1 (antidiabetics).

- **SIDE-EFFECTS** Protamine may cause allergic reactions

- **PRESCRIBING AND DISPENSING INFORMATION** A sterile buffered suspension of either porcine or human insulin complexed with protamine sulfate (or another suitable protamine) in a solution of insulin of the same species.

Check product container—the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

Suspension for injection

- ▶ **NovoMix 30 FlexPen** (Novo Nordisk Ltd)
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 FlexPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £29.89
- ▶ **NovoMix 30 PenFill** (Novo Nordisk Ltd)
Insulin aspart 30 unit per 1 ml, Insulin aspart (as Insulin aspart protamine) 70 unit per 1 ml NovoMix 30 PenFill 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £28.79

F 422

Biphasic insulin lispro

(Intermediate-acting insulin)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Administer up to 15 minutes before or soon after a meal, according to requirements

- **CAUTIONS** Children under 12 years (use only if benefit likely compared to soluble insulin)
- **INTERACTIONS** → Appendix 1 (antidiabetics).
- **SIDE-EFFECTS** Protamine may cause allergic reactions
- **PRESCRIBING AND DISPENSING INFORMATION** Check product container—the proportions of the two

components should be checked carefully (the order in which the proportions are stated may not be the same in other countries).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

► Humalog Mix25 (Eli Lilly and Company Ltd)

Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £16.61

Humalog Mix25 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46

► Humalog Mix25 KwikPen (Eli Lilly and Company Ltd)

Insulin lispro 25 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 75 unit per 1 ml Humalog Mix25 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £30.98

► Humalog Mix50 (Eli Lilly and Company Ltd)

Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 100units/ml suspension for injection 3ml cartridges | 5 cartridge [PoM] £29.46

► Humalog Mix50 KwikPen (Eli Lilly and Company Ltd)

Insulin lispro 50 unit per 1 ml, Insulin lispro (as Insulin lispro protamine) 50 unit per 1 ml Humalog Mix50 KwikPen 100units/ml suspension for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £30.98

INSULINS > LONG-ACTING

Insulin degludec

(Recombinant human insulin analogue—long acting)

INDICATIONS AND DOSE

Diabetes mellitus

► BY SUBCUTANEOUS INJECTION

- Child 1-17 years: Dose to be given according to requirements

- **INTERACTIONS** → Appendix 1 (antidiabetics).

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** Insulin degludec (*Tresiba*®) is available in strengths of 100 units/mL (allows 1-unit dose adjustment) and 200 units/mL (allows 2-unit dose adjustment)—ensure correct strength prescribed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Tresiba FlexTouch (Novo Nordisk Ltd) ▼

Insulin human (as Insulin degludec) 100 unit per 1 ml Tresiba FlexTouch 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £72.00

Insulin human (as Insulin degludec) 200 unit per 1 ml Tresiba FlexTouch 200units/ml solution for injection 3ml pre-filled pen | 3 pre-filled disposable injection [PoM] £86.40

► Tresiba Penfill (Novo Nordisk Ltd) ▼

Insulin human (as Insulin degludec) 100 unit per 1 ml Tresiba Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £72.00

Insulin detemir

(Recombinant human insulin analogue—long acting)

INDICATIONS AND DOSE

Diabetes mellitus

► BY SUBCUTANEOUS INJECTION

- Child 2-17 years: According to requirements

- **INTERACTIONS** → Appendix 1 (antidiabetics).

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 423 is recommended where longer-acting insulins are needed; insulin detemir may also be considered where longer-acting insulins are needed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

► Levemir FlexPen (Novo Nordisk Ltd)

Insulin human (as insulin detemir) 100 unit per 1 ml Levemir FlexPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £42.00

► Levemir InnoLet (Novo Nordisk Ltd)

Insulin human (as insulin detemir) 100 unit per 1 ml Levemir InnoLet 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £44.85

► Levemir Penfill (Novo Nordisk Ltd)

Insulin human (as insulin detemir) 100 unit per 1 ml Levemir Penfill 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £42.00

Insulin glargine

(Recombinant human insulin analogue—long acting)

INDICATIONS AND DOSE

Diabetes mellitus

► BY SUBCUTANEOUS INJECTION

- Child 2-17 years: According to requirements

- **INTERACTIONS** → Appendix 1 (antidiabetics).

- **PREGNANCY** Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin is recommended where longer-acting insulins are needed; insulin detemir may also be considered.

- **PRESCRIBING AND DISPENSING INFORMATION** Products containing insulin glargine are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name see *Biosimilar medicines*, under Guidance on prescribing p. 1. Dose adjustments and close metabolic monitoring is recommended if switching between insulin glargine preparations.

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised that *Lantus*® preparations (April 2013) and *Toujeo*® (August 2015) are accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
 - as a once daily insulin therapy for patients who require a carer to administer their insulin
- It is **not** recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent

episodes of hypoglycaemia or require assistance with their insulin injections.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Abasaglar** (Eli Lilly and Company Ltd) ▼
Insulin human (as Insulin glargine) 100 unit per 1 ml Abasaglar 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £35.28
- ▶ **Abasaglar KwikPen** (Eli Lilly and Company Ltd) ▼
Insulin human (as Insulin glargine) 100 unit per 1 ml Abasaglar KwikPen 100units/ml solution for injection 3ml pre-filled pen | 5 pre-filled disposable injection [PoM] £35.28
- ▶ **Lantus** (Sanofi)
Insulin human (as Insulin glargine) 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £41.50
Lantus 100units/ml solution for injection 10ml vials | 1 vial [PoM] £30.68
- ▶ **Lantus SoloStar** (Sanofi)
Insulin human (as Insulin glargine) 100 unit per 1 ml Lantus 100units/ml solution for injection 3ml pre-filled SoloStar pen | 5 pre-filled disposable injection [PoM] £41.50
- ▶ **Toujeo** (Sanofi)
Insulin human (as Insulin glargine) 300 unit per 1 ml Toujeo 300units/ml solution for injection 1.5ml pre-filled SoloStar pen | 3 pre-filled disposable injection [PoM] £33.13

£ 422

Insulin zinc suspension

(Insulin zinc suspension (mixed)—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements

● INTERACTIONS → Appendix 1 (antidiabetics).

● PREGNANCY Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane insulin p. 423 is recommended where longer-acting insulins are needed; insulin detemir p. 424 may also be considered.

● PRESCRIBING AND DISPENSING INFORMATION A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Hypurin Bovine Lente** (Wockhardt UK Ltd)
Insulin bovine (as Insulin zinc suspension mixed bovine) 100 unit per 1 ml Hypurin Bovine Lente 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72

£ 422

Protamine zinc insulin

(Protamine zinc insulin injection—long acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements

● INTERACTIONS → Appendix 1 (antidiabetics).

● SIDE-EFFECTS Protamine may cause allergic reactions

● PREGNANCY Evidence of the safety of long-acting insulin analogues in pregnancy is limited, therefore isophane

insulin p. 423 is recommended where longer-acting insulins are needed; insulin detemir p. 424 may also be considered.

● PRESCRIBING AND DISPENSING INFORMATION A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

- ▶ **Hypurin Bovine Protamine Zinc** (Wockhardt UK Ltd)
Insulin bovine (as Insulin protamine zinc bovine) 100 unit per 1 ml Hypurin Bovine Protamine Zinc 100units/ml suspension for injection 10ml vials | 1 vial [PoM] £27.72

INSULINS > RAPID-ACTING

£ 422

Insulin

(Insulin Injection; Neutral Insulin; Soluble Insulin—short acting)

● INDICATIONS AND DOSE

Diabetes mellitus

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: According to requirements

Hyperglycaemia during illness

- ▶ BY INTRAVENOUS INFUSION

▶ Neonate: 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.

▶ Child: 0.025–0.1 unit/kg/hour, dose to be adjusted according to blood-glucose concentration

Neonatal hyperglycaemia | Neonatal diabetes

- ▶ BY INTRAVENOUS INFUSION

▶ Neonate: 0.02–0.125 unit/kg/hour, dose to be adjusted according to blood-glucose concentration.

Diabetic ketoacidosis | Diabetes during surgery

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

● INTERACTIONS → Appendix 1 (antidiabetics).

● DIRECTIONS FOR ADMINISTRATION Short-acting injectable insulins can be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique can be useful for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team. Some insulin preparations are not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle—consult product literature.

- ▶ With intravenous use For intravenous infusion, dilute to a concentration of 1 unit/mL with Sodium Chloride 0.9% and mix thoroughly; insulin may be adsorbed by plastics, flush giving set with 5 mL of infusion fluid containing insulin. For intravenous infusion in neonatal intensive care, dilute 5 units to a final volume of 50 mL with Sodium Chloride 0.9% and mix thoroughly; an intravenous infusion rate of 0.1 mL/kg/hour provides a dose of 0.01 units/kg/hour.

● PRESCRIBING AND DISPENSING INFORMATION A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008) NICE TA151
Continuous subcutaneous insulin infusion is recommended as an option in children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, **or**
- whose glycaemic control remains inadequate (HbA_{1c} over 8.5% [69 mmol/mol]) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

www.nice.org.uk/TA151

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

▶ Insulin (Non-proprietary)

Insulin human 100 unit per 1 ml Humulin R 100units/ml solution for injection 10ml vials | 1 vial [PoM] no price available

Insulin human 500 unit per 1 ml Humulin R 500units/ml solution for injection 20ml vials | 1 vial [PoM] no price available

▶ Actrapid (Novo Nordisk Ltd)

Insulin human (as Insulin soluble human) 100 unit per 1 ml Actrapid 100units/ml solution for injection 10ml vials | 1 vial [PoM] £7.48

▶ Humulin S (Eli Lilly and Company Ltd)

Insulin human (as Insulin soluble human) 100 unit per 1 ml Humulin S 100units/ml solution for injection 10ml vials | 1 vial [PoM] £15.68
Humulin S 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £19.08

▶ Hypurin Bovine Neutral (Wockhardt UK Ltd)

Insulin bovine (as Insulin soluble bovine) 100 unit per 1 ml Hypurin Bovine Neutral 100units/ml solution for injection 10ml vials | 1 vial [PoM] £27.72
Hypurin Bovine Neutral 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £41.58

▶ Hypurin Porcine Neutral (Wockhardt UK Ltd)

Insulin porcine (as Insulin soluble porcine) 100 unit per 1 ml Hypurin Porcine Neutral 100units/ml solution for injection 10ml vials | 1 vial [PoM] £25.20
Hypurin Porcine Neutral 100units/ml solution for injection 3ml cartridges | 5 cartridge [PoM] £37.80

Solution for injection

- ▶ **Humalog** (Eli Lilly and Company Ltd)

Insulin lispro 100 unit per 1 mL Humalog 100units/mL solution for injection 10mL vials | 1 vial [POM] £16.61
Humalog 100units/mL solution for injection 3mL cartridges | 5 cartridge [POM] £28.31

- ▶ **Humalog KwikPen** (Eli Lilly and Company Ltd)

Insulin lispro 100 unit per 1 mL Humalog KwikPen 100units/mL solution for injection 3mL pre-filled pen | 5 pre-filled disposable injection [POM] £29.46

Insulin lispro 200 unit per 1 mL Humalog KwikPen 200units/mL solution for injection 3mL pre-filled pen | 5 pre-filled disposable injection [POM] £58.92

European countries units of mg/100 mL (or mg/dL) are commonly used.

It is advisable to check that the meter is pre-set in the correct units.

If the blood glucose level is high or if the child is unwell, blood **ketones** should be measured according to local guidelines in order to detect diabetic ketoacidosis. Children and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

Oral glucose tolerance test

The oral glucose tolerance test is used mainly for diagnosis of impaired glucose tolerance; it is not recommended or necessary for routine diagnostic use when severe symptoms of hyperglycaemia are present. However, it is used for the investigation of insulin resistance, glycogen storage disease, and excessive growth hormone secretion. In children who have less severe symptoms and blood-glucose concentrations that do not establish or exclude diabetes (e.g. impaired fasting glycaemia), an oral glucose tolerance test may be required. Glucose is used to establish the presence of gestational diabetes; this generally involves giving anhydrous glucose by mouth to the fasting patient, and measuring blood-glucose concentration at intervals. The appropriate amount of glucose should be given with 200–300 mL fluid. Alternatively anhydrous glucose can be given as 113 mL Polycal[®] with extra fluid to administer a total volume of 200–300 mL, or as Rapilose[®] OGTT oral solution.

3.1a Diabetes, diagnosis and monitoring

Diabetes mellitus, diagnostic and monitoring devices

Urinalysis

Reagent strips are available for measuring for glucose in the urine. Tests for ketones by patients are rarely required unless they become unwell—see Blood Monitoring.

Microalbuminuria can be detected with *Micral-Test II*[®] but this should be followed by confirmation in the laboratory, since false positive results are common.

Blood monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Carers and children should be properly trained in the use of blood glucose monitoring systems and the appropriate action to take on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

Children using multiple injection regimens should understand how to adjust their insulin dose according to their carbohydrate intake. With fixed-dose insulin regimens, the carbohydrate intake needs to be regulated, and should be distributed throughout the day to match the insulin regimen.

In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other

3.2 Hypoglycaemia

Hypoglycaemia

Treatment of hypoglycaemia

Prompt treatment of hypoglycaemia in children from any cause is essential as severe hypoglycaemia may cause subsequent neurological damage. Hyperinsulinism, fatty acid oxidation disorders and glycogen storage disease are less common causes of acute hypoglycaemia in children.

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from non-diet versions of *Lucozade® Energy Original* 55 mL, *Coca-Cola®* 100 mL, and *Ribena Blackcurrant* 19 mL (to be diluted), 2 teaspoons of sugar, and also from 3 sugar lumps. Proprietary products of quick-acting carbohydrate (e.g. *Glucogel®*, *DextroGel®*, *GSF-Syrup®*, *Rapilose®* gel) are available on prescription for the patient to keep to hand in case of hypoglycaemia. If necessary this can be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, or biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness or seizures is an emergency. Glucagon below, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases blood-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. Glucagon can be issued to parents or carers of insulin-treated children for emergency use in hypoglycaemic attacks. It is often advisable to prescribe it on an 'if necessary' basis for hospitalised insulin-treated children, so that it can be given rapidly by the nurses during a hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, glucose intravenous infusion 10% can be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Glucose intravenous infusion 50% is **not** recommended, as it is very viscous and hypertonic. Close monitoring is necessary, particularly in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Children whose hypoglycaemia is caused by an oral antidiabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs can persist for many hours.

Glucagon is not effective in the treatment of hypoglycaemia due to fatty acid oxidation or glycogen storage disorders.

Chronic hypoglycaemia

Diazoxide p. 434 is useful in the management of chronic hypoglycaemia due to excessive insulin secretion, either from a tumour involving the islets of Langerhans or from persisting hyperinsulinaemic hypoglycaemia of infancy (nesidioblastosis). Diazoxide has no place in the management of acute hypoglycaemia. Chlorothiazide p. 103 reduces diazoxide-induced sodium and water retention and

has the added benefit of potentiating the glycaemic effect of diazoxide.

If diazoxide and chlorothiazide fail to suppress excessive glucose requirements in chronic hypoglycaemia then octreotide p. 434 or nifedipine p. 100 can be added. Octreotide suppresses secretion of growth hormone, but growth is unlikely to be affected in the long term.

Neonatal hypoglycaemia

Neonatal hypoglycaemia at birth is treated with glucose **intravenous infusion 10%**. Mild asymptomatic persistent hypoglycaemia may respond to a single dose of glucagon. Glucagon has also been used in the short-term management of endogenous hyperinsulinism.

GLYCOGENOLYTIC HORMONES

Glucagon

● INDICATIONS AND DOSE

Insulin-induced hypoglycaemia

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

► Neonate: 20 micrograms/kg.

► Child 1 month-1 year: 500 micrograms

► Child 2-17 years (body-weight up to 25 kg): 500 micrograms, if no response within 10 minutes intravenous glucose must be given

► Child 2-17 years (body-weight 25 kg and above): 1 mg, if no response within 10 minutes intravenous glucose must be given

Endogenous hyperinsulinism

► BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

► Neonate: 200 micrograms/kg (max. per dose 1 mg) for 1 dose.

► Child 1 month-1 year: 1 mg for 1 dose

► BY CONTINUOUS INTRAVENOUS INFUSION

► Neonate: 1–18 micrograms/kg/hour (max. per dose 50 micrograms/kg/hour), adjusted according to response.

► Child 1 month-1 year: 1–10 micrograms/kg/hour, dose to be adjusted as necessary

Diagnosis of growth hormone secretion (specialist use only)

► BY INTRAMUSCULAR INJECTION

► Child: 100 micrograms/kg (max. per dose 1 mg) for 1 dose, dose may vary, consult local guidelines

Beta-blocker poisoning (cardiogenic shock unresponsive to atropine)

► INITIALLY BY INTRAVENOUS INJECTION

► Child: 50–150 micrograms/kg (max. per dose 10 mg), to be administered in glucose 5% (with precautions to protect the airway in case of vomiting), followed by (by intravenous infusion) 50 micrograms/kg/hour

DOSE EQUIVALENCE AND CONVERSION

1 unit of glucagon = 1 mg of glucagon.

● **UNLICENSED USE** Dose and indication for cardiogenic shock unresponsive to atropine in beta-blocker overdose not licensed. Unlicensed for growth hormone test and hyperinsulinism.

● **CONTRA-INDICATIONS** Pheochromocytoma

● **CAUTIONS** Glucagonoma • ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency • insulinoma • when used in the diagnosis of growth hormone secretion, delayed hypoglycaemia may result—deaths reported (ensure a meal is eaten before discharge)

● SIDE-EFFECTS

- ▶ **Rare** Hypersensitivity reactions
- ▶ **Frequency not known** Diarrhoea · hypokalaemia · nausea · vomiting

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use When administered by *continuous intravenous infusion*, do not add to infusion fluids containing calcium—precipitation may occur.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Glucagon for hypoglycaemia
www.medicinesforchildren.org.uk/glucagon-for-hypoglycaemia

- **EXCEPTIONS TO LEGAL CATEGORY** Prescription-only medicine restriction does not apply where administration is for saving life in emergency.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- ▶ **Glucagen Hypokit** (Novo Nordisk Ltd)

Glucagon hydrochloride 1 mg Glucagen Hypokit 1mg powder and solvent for solution for injection | 1 vial [PoM] £11.52 DT price = £11.52

cataracts · visual disturbances · voice changes (prolonged use) · vomiting

- **PREGNANCY** Use only if essential; alopecia and hypertrichosis reported in neonates with prolonged use; may inhibit uterine activity during labour.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **RENAL IMPAIRMENT** Dose reduction may be required.

● MONITORING REQUIREMENTS

- ▶ Monitor blood pressure.
- ▶ Monitor white cell and platelet count during prolonged use.
- ▶ Regularly assess growth, bone, and psychological development during prolonged use.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

- ▶ **Eudemine** (Focus Pharmaceuticals Ltd)

Diazoxide 50 mg Eudemine 50mg tablets | 100 tablet [PoM] £46.45

Capsule

- ▶ **Diazoxide (Non-proprietary)**

Diazoxide 25 mg Proglycem 25 capsules | 100 capsule [PoM] no price available

Oral suspension

- ▶ **Diazoxide (Non-proprietary)**

Diazoxide 50 mg per 1 ml Proglycem 250mg/5ml oral suspension | 30 ml [PoM] no price available DT price = £126.47

3.2a Chronic hypoglycaemia

GLYCOGENOLYTIC HORMONES

Diazoxide

● INDICATIONS AND DOSE

Resistant hypertension

- ▶ BY MOUTH

- ▶ **Neonate:** Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day.
- ▶ **Child:** Initially 1.7 mg/kg 3 times a day, adjusted according to response; maximum 15 mg/kg per day

Chronic intractable hypoglycaemia

- ▶ BY MOUTH

- ▶ **Neonate:** Initially 5 mg/kg twice daily, adjusted according to response, initial dose used to establish response; maintenance 1.5–3 mg/kg 2–3 times a day; increased if necessary up to 7 mg/kg 3 times a day, higher doses are unlikely to be beneficial, but may be required in some cases.
- ▶ **Child:** Initially 1.7 mg/kg 3 times a day, adjusted according to response; maintenance 1.5–3 mg/kg 2–3 times a day, increased if necessary up to 5 mg/kg 3 times a day, doses up to 5 mg/kg may be required in some cases, but higher doses are unlikely to be beneficial

- **UNLICENSED USE** Not licensed for resistant hypertension.

- **CAUTIONS** Aortic coarctation · aortic stenosis · arteriovenous shunt · heart failure · hyperuricaemia · impaired cardiac circulation · impaired cerebral circulation

- **INTERACTIONS** → Appendix 1 (diazoxide).

- **SIDE-EFFECTS** Taste disturbance · abdominal pain · anaemia · anorexia (prolonged use) · bleeding · constipation · decreased libido · dermatitis · diarrhoea · dizziness · dyspnoea · eosinophilia · extrapyramidal effects · galactorrhoea · headache · heart failure · hyperglycaemia · hyperosmolar non-ketotic coma · hypertrichosis · hyperuricaemia (prolonged use) · hypotension · ileus · lacrimation · leucopenia · lichenoid eruption · musculoskeletal pain · nausea · pancreatitis · pruritus · pulmonary hypertension · raised serum creatinine · raised serum urea · reversible nephritic syndrome · sodium and fluid retention · thrombocytopenia · tinnitus · transient

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOSTATIN ANALOGUES

Somatostatin analogues

- **CAUTIONS** Diabetes mellitus (antidiabetic requirements may be reduced) · insulinoma (increased depth and duration of hypoglycaemia may occur—observe patients and monitor blood glucose levels when initiating treatment and changing doses)

● SIDE-EFFECTS

- ▶ **Rare** Pancreatitis (shortly after administration)
- ▶ **Frequency not known** Abdominal pain · anorexia · bloating · diarrhoea · flatulence · gallstones (after long-term treatment) · gastro-intestinal disturbances · hyperglycaemia (with chronic administration) · hypoglycaemia · impaired postprandial glucose tolerance (with chronic administration) · irritation at the injection site · nausea · pain at the injection site · steatorrhoea · vomiting

- **DIRECTIONS FOR ADMINISTRATION** Injection sites should be rotated.

↗ above

Octreotide

● INDICATIONS AND DOSE

Persistent hyperinsulinaemic hypoglycaemia unresponsive to diazoxide and glucose

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ **Neonate:** Initially 2–5 micrograms/kg every 6–8 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required.

- ▶ **Child:** Initially 1–2 micrograms/kg every 4–6 hours, adjusted according to response; increased if necessary up to 7 micrograms/kg every 4 hours, dosing up to 7 micrograms/kg may rarely be required

Bleeding from oesophageal or gastric varices

► BY CONTINUOUS INTRAVENOUS INFUSION

- Child: 1 microgram/kg/hour, higher doses may be required initially, when no active bleeding reduce dose over 24 hours; Usual maximum 50 micrograms/hour

● **UNLICENSED USE** Not licensed in children.● **INTERACTIONS** → Appendix 1 (octreotide).

- **SIDE-EFFECTS** Alopecia · arrhythmias · biliary colic (associated with abrupt withdrawal of subcutaneous octreotide) · bradycardia · constipation · dizziness · dyspnoea · headache · hepatitis · pancreatitis (associated with abrupt withdrawal of subcutaneous octreotide) · rash · reduced bile flow · reduced gall bladder motility

SIDE-EFFECTS, FURTHER INFORMATION

- Gastro-intestinal side-effects Administering non-depot injections of octreotide between meals and at bedtime may reduce gastro-intestinal side-effects.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.

- **PREGNANCY** Possible effect on fetal growth; manufacturer advises use only if potential benefit outweighs risk.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

● **MONITORING REQUIREMENTS**

- Monitor thyroid function on long-term therapy.
- Monitor liver function.

- **TREATMENT CESSATION** Avoid abrupt withdrawal of short-acting subcutaneous octreotide (associated with biliary colic and pancreatitis).

- **DIRECTIONS FOR ADMINISTRATION** For intravenous injection or intravenous infusion, dilute with Sodium Chloride 0.9% to a concentration of 10–50%.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection► **Octreotide (Non-proprietary)**

Octreotide (as Octreotide acetate) 50 microgram per

1 ml Octreotide 50micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £15.85

Octreotide 50micrograms/1ml solution for injection vials | 5 vial [PoM] £14.87–£22.00

Octreotide 50micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £4.60–£18.60

Octreotide (as Octreotide acetate) 100 microgram per

1 ml Octreotide 100micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £7.24–£32.65

Octreotide 100micrograms/1ml solution for injection pre-filled syringes | 5 pre-filled disposable injection [PoM] £28.90

Octreotide 100micrograms/1ml solution for injection vials | 5 vial [PoM] £27.97–£32.65

1 ml Sandostatin 500micrograms/1ml solution for injection ampoules | 5 ampoule [PoM] £135.47 DT price = £135.47

Powder and solvent for suspension for injection► **Sandostatin LAR** (Novartis Pharmaceuticals UK Ltd)

Octreotide (as Octreotide acetate) 10 mg Sandostatin LAR 10mg powder and solvent for suspension for injection vials | 1 vial [PoM] £549.71

Octreotide (as Octreotide acetate) 20 mg Sandostatin LAR 20mg powder and solvent for suspension for injection vials | 1 vial [PoM] £799.33

Octreotide (as Octreotide acetate) 30 mg Sandostatin LAR 30mg powder and solvent for suspension for injection vials | 1 vial [PoM] £998.41

4 Disorders of bone metabolism

Bone metabolism

Disorders of bone metabolism

The two main disorders of bone metabolism that occur in children are rickets and osteoporosis. The two most common forms of rickets are Vitamin D deficiency rickets and hypophosphataemic rickets. See also calcium.

Osteoporosis

Osteoporosis in children may be primary (e.g. *osteogenesis imperfecta* and *idiopathic juvenile osteoporosis*), or secondary (e.g. due to inflammatory disorders, immobilisation, or corticosteroids); specialist management is required.

Corticosteroid-induced osteoporosis

To reduce the risk of osteoporosis doses of oral corticosteroids should be as low as possible and courses of treatment as short as possible.

Calcitonin

Calcitonin is involved with parathyroid hormone in the regulation of bone turnover and hence in the maintenance of calcium balance and homeostasis. Calcitonin (salmon) p. 439 (synthetic or recombinant salmon calcitonin) is used by specialists to lower the plasma-calcium concentration in children with hypercalcaemia associated with malignancy.

Bisphosphonates

A bisphosphonate such as pamidronate disodium p. 437 is used in the management of severe forms of *osteogenesis imperfecta* and other causes of osteoporosis in children to reduce the number of fractures; the long-term effects of bisphosphonates in children have not been established. Single doses of bisphosphonates are also used to manage hypercalcaemia. Treatment should be initiated under specialist advice only.

BISPHOSPHONATES

Bisphosphonates

- **DRUG ACTION** Bisphosphonates are adsorbed onto hydroxyapatite crystals in bone, slowing both their rate of growth and dissolution, and therefore reducing the rate of bone turnover.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: BISPHOSPHONATES: ATYPICAL FEMORAL FRACTURES (JUNE 2011)

Atypical femoral fractures have been reported rarely with bisphosphonate treatment, mainly in patients receiving long-term treatment for osteoporosis.

The need to continue bisphosphonate treatment for osteoporosis should be re-evaluated periodically based on an assessment of the benefits and risks of treatment for individual patients, particularly after 5 or more years of use.

Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Discontinuation of bisphosphonate treatment in patients suspected to have an atypical femoral fracture should be considered after an assessment of the benefits and risks of continued treatment.

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE JAW (NOVEMBER 2009) AND INTRAVENOUS BISPHOSPHONATES: OSTEONECROSIS OF THE JAW—FURTHER MEASURES TO MINIMISE RISK (JULY 2015)

The risk of osteonecrosis of the jaw is substantially greater for patients receiving intravenous bisphosphonates in the treatment of cancer than for patients receiving oral bisphosphonates for osteoporosis or Paget's disease.

Risk factors for developing osteonecrosis of the jaw that should be considered are: potency of bisphosphonate (highest for zoledronate), route of administration, cumulative dose, duration and type of malignant disease, concomitant treatment, smoking, comorbid conditions, and history of dental disease.

All patients should have a dental check-up (and any necessary remedial work should be performed) before bisphosphonate treatment, or as soon as possible after starting treatment. Patients should also maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms such as dental mobility, pain, or swelling, non-healing sores or discharge to a doctor and dentist during treatment.

Before prescribing an intravenous bisphosphonate, patients should be given a patient reminder card and informed of the risk of osteonecrosis of the jaw. Advise patients to tell their doctor if they have any problems with their mouth or teeth before starting treatment, and if the patient wears dentures, they should make sure their dentures fit properly. Patients should tell their doctor and dentist that they are receiving an intravenous bisphosphonate if they need dental treatment or dental surgery.

Guidance for dentists in primary care is included in *Oral Health Management of Patients Prescribed Bisphosphonates: Dental Clinical Guidance*, Scottish Dental Clinical Effectiveness Programme, April 2011 (available at www.sdcep.org.uk).

MHRA/CHM ADVICE: BISPHOSPHONATES: OSTEONECROSIS OF THE EXTERNAL AUDITORY CANAL (DECEMBER 2015)

Benign idiopathic osteonecrosis of the external auditory canal has been reported very rarely with bisphosphonate treatment, mainly in patients receiving long-term therapy (2 years or longer).

The possibility of osteonecrosis of the external auditory canal should be considered in patients receiving bisphosphonates who present with ear symptoms, including chronic ear infections, or suspected cholesteatoma.

Risk factors for developing osteonecrosis of the external auditory canal include: steroid use, chemotherapy, infection, an ear operation, or cotton-bud use.

Patients should be advised to report any ear pain, discharge from the ear, or an ear infection during treatment with a bisphosphonate.

● PATIENT AND CARER ADVICE

Atypical femoral fractures Patients should be advised to report any thigh, hip, or groin pain during treatment with a bisphosphonate.

Osteonecrosis of the jaw During bisphosphonate treatment patients should maintain good oral hygiene, receive routine dental check-ups, and report any oral symptoms. Osteonecrosis of the external auditory canal Patients should be advised to report any ear pain, discharge from ear or an ear infection during treatment with a bisphosphonate.

F 435

10.6.2016

Alendronic acid

(Alendronate)

● INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta and other causes) (initiated under specialist supervision)

Hypercalcaemia (initiated under specialist supervision)

► BY MOUTH

► Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Abnormalities of oesophagus · hypocalcaemia · other factors which delay emptying (e.g. stricture or achalasia)
- **CAUTIONS** Active gastro-intestinal bleeding · atypical femoral fractures · duodenitis · dysphagia · exclude other causes of osteoporosis · gastritis · history (within 1 year) of ulcers · surgery of the upper gastro-intestinal tract · symptomatic oesophageal disease · ulcers · upper gastro-intestinal disorders
- **INTERACTIONS** → Appendix 1 (bisphosphonates).
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal distension · abdominal pain · alopecia · asthenia · constipation · diarrhoea · dizziness · dyspepsia · flatulence · headache · joint swelling · musculoskeletal pain · oesophageal reactions · peripheral oedema · pruritus · regurgitation · vertigo
 - **Uncommon** Dysgeusia · episcleritis · erythema · gastritis · malaise (on initiation) · melena · myalgia (on initiation) · nausea · rash · scleritis · uveitis · vomiting
 - **Rare** Atypical femoral fractures with long-term use · fever (on initiation) · hypocalcaemia · osteonecrosis of the jaw · photosensitivity · severe skin reactions · Stevens-Johnson syndrome · toxic epidermal necrolysis
 - **Very rare** Osteonecrosis of the external auditory canal

SIDE-EFFECTS, FURTHER INFORMATION

- **Oesophageal reactions** Severe oesophageal reactions (oesophagitis, oesophageal ulcers, oesophageal stricture and oesophageal erosions) have been reported; patients should be advised to stop taking the tablets and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 35 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Correct disturbances of calcium and mineral metabolism (e.g. vitamin-D deficiency, hypocalcaemia) before starting treatment. Monitor serum-calcium concentration during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Tablets should be swallowed whole and oral solution should be swallowed as a single 100 mL dose. Doses should be taken with plenty of water while sitting or standing, on an empty stomach at least 30 minutes before breakfast (or another oral medicine); patient should stand or sit upright for at least 30 minutes after administration.

- **PATIENT AND CARER ADVICE** Patients or their carers should be given advice on how to administer alendronic acid tablets and oral solution. Oesophageal reactions. Patients (or their carers) should be advised to stop taking alendronic acid and to seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, new or worsening heartburn, pain on swallowing or retrosternal pain.

- **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2016) that alendronic acid (*Binosto*®) is accepted for restricted use within NHS Scotland for the treatment of postmenopausal osteoporosis where alendronic acid is the appropriate treatment choice, but the patient is unable to swallow tablets.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

- ▶ **Alendronic acid (Non-proprietary)**

Alendronic acid (as Alendronate sodium) 10 mg Alendronic acid 10mg tablets | 28 tablet [PoM] £3.25 DT price = £1.78

Alendronic acid (as Alendronate sodium) 70 mg Alendronic acid 70mg tablets | 4 tablet [PoM] £22.80 DT price = £0.79

- ▶ **Fosamax** (Merck Sharp & Dohme Ltd)

Alendronic acid (as Alendronate sodium) 10 mg Fosamax 10mg tablets | 28 tablet [PoM] £23.12 DT price = £1.78

Alendronic acid (as Alendronate sodium) 70 mg Fosamax Once Weekly 70mg tablets | 4 tablet [PoM] £22.80 DT price = £0.79

Effervescent tablet

- ▶ **Binosto** (Internis Pharmaceuticals Ltd)

Alendronic acid (as Alendronate sodium) 70 mg Binosto 70mg effervescent tablets sugar-free | 4 tablet [PoM] £22.80 DT price = £22.80

Oral solution

- ▶ **Alendronic acid (Non-proprietary)**

Alendronic acid 700 microgram per 1 ml Alendronic acid 70mg/100ml oral solution unit dose sugar free sugar-free | 4 unit dose [PoM] £27.36 DT price = £27.36

435

Pamidronate disodium

(Formerly called
aminohydroxypropylidenediphosphonate
disodium (APD))

- **INDICATIONS AND DOSE**

Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only) | Hypercalcaemia (specialist use only)

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ Child: (consult product literature)

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Atypical femoral fractures · cardiac disease · ensure adequate hydration · previous thyroid surgery (risk of hypocalcaemia)

- **INTERACTIONS** → Appendix 1 (bisphosphonates). Avoid concurrent use with other bisphosphonates.

- **SIDE-EFFECTS**

- ▶ **Common or very common** Arthralgia · bone pain · fever · headache · hypomagnesaemia · hypophosphataemia · influenza-like symptoms (sometimes accompanied by malaise, rigors, fatigue and flushes) · lymphocytopenia · myalgia · nausea · transient rise in body temperature · vomiting
- ▶ **Rare** Abdominal pain · acute renal failure · agitation · anaemia · anorexia · atypical femoral fractures · confusion · conjunctivitis · constipation · deterioration of renal disease · diarrhoea · dizziness · dyspepsia · haematuria ·

hallucinations · hyperkalaemia · hypernatraemia · hypertension · hypokalaemia · hypotension · insomnia · isolated cases of seizures · lethargy · leucopenia · muscle cramps · osteonecrosis of the jaw · other ocular symptoms · paraesthesia · pruritus · rash · somnolence · symptomatic hypocalcaemia · tetany · thrombocytopenia

- ▶ **Very rare** Osteonecrosis of the external auditory canal
- ▶ **Frequency not known** Atrial fibrillation · injection-site reactions · reactivation of herpes simplex · reactivation of herpes zoster

- **PREGNANCY** Avoid—toxicity in *animal* studies.

- **BREAST FEEDING** Avoid.

- **HEPATIC IMPAIRMENT** Caution in severe hepatic impairment—no information available.

- **RENAL IMPAIRMENT** Monitor renal function in renal disease or predisposition to renal impairment (e.g. in tumour-induced hypercalcaemia).

- **DIRECTIONS FOR ADMINISTRATION** For *slow intravenous infusion* (*Aredia*®, *Pamidronate disodium*, Hospira, Medac, Wockhardt), give intermittently in Glucose 5% or Sodium chloride 0.9%; give at a rate not exceeding 1 mg/minute; not to be given with infusion fluids containing calcium. For *Aredia*®, reconstitute initially with water for injections (15 mg in 5 mL, 30 mg or 90 mg in 10 mL), then dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL. For *Pamidronate disodium* (Medac, Hospira, Wockhardt) dilute with infusion fluid to a concentration of not more than 90 mg in 250 mL.

- **PATIENT AND CARER ADVICE**

Driving and skilled tasks

Patients should be warned against performing skilled tasks (e.g. cycling, driving or operating machinery) immediately after treatment (somnolence or dizziness can occur).

A patient reminder card should be provided (risk of osteonecrosis of the jaw).

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Pamidronate disodium (Non-proprietary)**

Pamidronate disodium 3 mg per 1 ml Pamidronate disodium 15mg/5ml solution for infusion vials | 1 vial [PoM] £27.50 (Hospital only) | 5 vial [PoM] £149.15

Pamidronate disodium 30mg/10ml solution for infusion vials |

1 vial [PoM] £55.00 (Hospital only) | 1 vial [PoM] £59.66

Pamidronate disodium 60mg/20ml solution for infusion vials |

1 vial [PoM] £110.00 (Hospital only)

Pamidronate disodium 90mg/30ml solution for infusion vials |

1 vial [PoM] £165.00 (Hospital only)

Pamidronate disodium 6 mg per 1 ml Pamidronate disodium

60mg/10ml solution for infusion vials | 1 vial [PoM] £115.25

Pamidronate disodium 9 mg per 1 ml Pamidronate disodium

90mg/10ml solution for infusion vials | 1 vial [PoM] £170.45

Pamidronate disodium 15 mg per 1 ml Pamidronate disodium

60mg/4ml solution for infusion ampoules | 1 ampoule [PoM] £119.32

Pamidronate disodium 15mg/1ml solution for infusion ampoules |

4 ampoule [PoM] £119.32

Pamidronate disodium 90mg/6ml solution for infusion ampoules |

1 ampoule [PoM] £170.46

Risedronate sodium

- **INDICATIONS AND DOSE**

Osteoporosis (due to osteogenesis imperfecta and other causes) (specialist use only) | Hypercalcaemia (specialist use only)

- ▶ **BY MOUTH**

- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Atypical femoral fractures • oesophageal abnormalities • other factors which delay transit or emptying (e.g. stricture or achalasia)
- **INTERACTIONS** → Appendix 1 (bisphosphonates).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain • constipation • diarrhoea • dyspepsia • headache • musculoskeletal pain • nausea
 - ▶ **Uncommon** Duodenitis • dysphagia • gastritis • oesophageal ulcer • oesophagitis • uveitis
 - ▶ **Rare** Atypical femoral fractures • glossitis • oesophageal stricture
 - ▶ **Very rare** Osteonecrosis of the external auditory canal
 - ▶ **Frequency not known** Cutaneous vasculitis • gastroduodenal ulceration • hair loss • hepatic disorders • osteonecrosis of the jaw • Stevens-Johnson syndrome • toxic epidermal necrolysis
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate is less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Correct hypocalcaemia before starting.
 - ▶ Correct other disturbances of bone and mineral metabolism (e.g. vitamin-D deficiency) at onset of treatment.
- **DIRECTIONS FOR ADMINISTRATION** Swallow tablets whole with full glass of water; on rising, take on an empty stomach at least 30 minutes before first food or drink of the day **or**, if taking at any other time of the day, avoid food and drink for at least 2 hours before or after risedronate (particularly avoid calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids); stand or sit upright for at least 30 minutes; do not take tablets at bedtime or before rising.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer risedronate sodium tablets. Oesophageal reactions. Patients should be advised to stop taking the tablets and seek medical attention if they develop symptoms of oesophageal irritation such as dysphagia, pain on swallowing, retrosternal pain, or heartburn.

Sodium clodronate

● INDICATIONS AND DOSE

Osteoporosis (due to osteogenesis imperfecta or other causes) (specialist use only) | Hypercalcaemia (specialist use only)

- ▶ **BY MOUTH**
- ▶ **Child:** (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Acute gastro-intestinal inflammatory conditions
- **CAUTIONS** Atypical femoral fractures • maintain adequate fluid intake during treatment
- **INTERACTIONS** → Appendix 1 (bisphosphonates). Renal dysfunction reported in patients receiving concomitant NSAIDs.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Bronchospasm • diarrhoea • nausea • skin reactions • vomiting
 - ▶ **Rare** Atypical femoral fractures
 - ▶ **Very rare** Osteonecrosis of the external auditory canal • osteonecrosis of the jaw
 - ▶ **Frequency not known** Renal impairment • uveitis
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **RENAL IMPAIRMENT** Reduce dose if estimated glomerular filtration rate 30–50 mL/minute/1.73 m². Use half normal dose if estimated glomerular filtration rate 10–30 mL/minute/1.73 m². Avoid if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor renal function, serum calcium and serum phosphate before and during treatment.
- **DIRECTIONS FOR ADMINISTRATION** Avoid food for 2 hours before and 1 hour after treatment, particularly calcium-containing products e.g. milk; also avoid iron and mineral supplements and antacids; maintain adequate fluid intake.
- **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer sodium clodronate capsules and tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

CALCIUM REGULATING DRUGS > BONE RESORPTION INHIBITORS

Calcitonin (salmon)

(Salcatonin)

● INDICATIONS AND DOSE

Hypercalcaemia (limited experience in children) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 2.5–5 units/kg every 12 hours (max. per dose 400 units every 6–8 hours), adjusted according to response, no additional benefit with doses over 8 units/kg every 6 hours
- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: 5–10 units/kg, to be administered by slow intravenous infusion over at least 6 hours

Osteoporosis (specialist use only)

- ▶ BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: Refer for specialist advice, experience very limited

- **UNLICENSED USE** Not licensed in children.
- **CONTRA-INDICATIONS** Hypocalcaemia
- **CAUTIONS** Heart failure · history of allergy (skin test advised) · risk of malignancy—avoid prolonged use (use lowest effective dose for shortest possible time)
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Abdominal pain · diarrhoea · dizziness · fatigue · flushing · headache · malignancy (with long-term use) · musculoskeletal pain · nausea · taste disturbances · vomiting
 - ▶ **Uncommon** Cough · hypersensitivity reactions · hypertension · injection-site reactions · oedema · polyuria · pruritus · rash · visual disturbances
 - ▶ **Frequency not known** Tremor
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in *animal studies*).
- **BREAST FEEDING** Avoid; inhibits lactation in *animals*.
- **RENAL IMPAIRMENT** Use with caution.
- **MONITORING REQUIREMENTS** Monitor bone growth.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute injection solution (e.g. 400 units in 500 mL) with Sodium Chloride 0.9% and give over at least 6 hours; glass or hard plastic containers should not be used; some loss of potency on dilution and administration—use diluted solution without delay.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Miacalcic** (Novartis Pharmaceuticals UK Ltd)
Calcitonin (salmon) 50 unit per 1 mL Miacalcic 50units/1mL solution for injection ampoules | 5 ampoule [PoM] £17.10
- Calcitonin (salmon) 100 unit per 1 mL Miacalcic 100units/1mL solution for injection ampoules | 5 ampoule [PoM] £34.21
- Calcitonin (salmon) 200 unit per 1 mL Miacalcic 400units/2mL multidose solution for injection vials | 1 vial [PoM] £24.60

5 Gonadotrophin responsive conditions

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > GONADOTROPIN-RELEASING HORMONES

Goserelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

ZOLADEX LA®

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 10.8 mg every 12 weeks, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases

ZOLADEX®

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 3.6 mg every 28 days, to be administered into the anterior abdominal wall, injections may be required more frequently in some cases

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding
- **CAUTIONS** Depression · patients with metabolic bone disease (decrease in bone mineral density can occur)
- **SIDE-EFFECTS** Anaphylaxis · asthma · breast tenderness · changes in blood pressure · changes in breast size · changes in scalp and body hair · depression · headache · hypersensitivity reactions · local reactions at injection site · mood changes · ovarian cysts (may require withdrawal) · paraesthesia · pruritus · rash · urticaria · vaginal bleeding · visual disturbances · weight change · withdrawal bleeding
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor bone mineral density.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Implant

- ▶ **Zoladex** (AstraZeneca UK Ltd)
Goserelin (as Goserelin acetate) 3.6 mg Zoladex 3.6mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [PoM] £65.00 DT price = £65.00
- ▶ **Zoladex LA** (AstraZeneca UK Ltd)
Goserelin (as Goserelin acetate) 10.8 mg Zoladex LA 10.8mg implant SafeSystem pre-filled syringes | 1 pre-filled disposable injection [PoM] £235.00 DT price = £235.00

Leuprorelin acetate

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

PROSTAP 3 DCS®

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 11.25 mg every 12 weeks, injections may be required more frequently in some cases

PROSTAP SR DCS®

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: 3.75 mg every 4 weeks, half this dose is sometimes used in children with body-weight under 20 kg, injections may be required more frequently in some cases

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding
- **CAUTIONS** Patients with metabolic bone disease (decrease in bone mineral density can occur)
- **SIDE-EFFECTS** Abdominal pain · acne · anaphylaxis · asthma · breast tenderness (males and females) · changes in blood pressure · changes in breast size · changes in scalp and body hair · depression · headache · hypersensitivity reactions · local reactions at injection site · mood changes · paraesthesia · pruritus · rash · urticaria · visual disturbances · weight changes · withdrawal bleeding
- **PREGNANCY** Avoid—teratogenic in *animal* studies.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor bone mineral density.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

- ▶ **Prostap 3 DCS** (Takeda UK Ltd)
Leuprorelin acetate 11.25 mg Prostap 3 DCS 11.25mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £225.72 DT price = £225.72
- ▶ **Prostap SR DCS** (Takeda UK Ltd)
Leuprorelin acetate 3.75 mg Prostap SR DCS 3.75mg powder and solvent for suspension for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £75.24 DT price = £75.24

Triptorelin

- **DRUG ACTION** Administration of gonadorelin analogues produces an initial phase of stimulation; continued administration is followed by down-regulation of gonadotrophin-releasing hormone receptors, thereby reducing the release of gonadotrophins (follicle stimulating hormone and luteinising hormone) which in turn leads to inhibition of androgen and oestrogen production.

● INDICATIONS AND DOSE

DECAPEPTYL® SR 11.25MG

Gonadotrophin-dependent precocious puberty

- ▶ BY INTRAMUSCULAR INJECTION
- ▶ Child: 11.25 mg every 3 months, discontinue when bone maturation consistent with age of 12 years in girls or 13–14 years in boys

GONAPEPTYL DEPOT®

Gonadotrophin-dependent precocious puberty

- ▶ BY SUBCUTANEOUS INJECTION, OR BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child (body-weight up to 20 kg): Initially 1.875 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 1.875 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys
- ▶ Child (body-weight 20–30 kg): Initially 2.5 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 2.5 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys
- ▶ Child (body-weight 31 kg and above): Initially 3.75 mg every 2 weeks for 3 doses, to be administered on days 0, 14, and 28 of treatment, then 3.75 mg every 3–4 weeks, discontinue when bone maturation consistent with age over 12 years in girls and over 13 years in boys

- **CONTRA-INDICATIONS** Undiagnosed vaginal bleeding
- **SIDE-EFFECTS** Anaphylaxis · arthralgia · asthenia · asthma · breast tenderness (males and females) · changes in blood pressure · changes in breast size · changes in scalp and body hair · depression · gastro-intestinal disturbances · headache · hypersensitivity reactions · local reactions at injection site · mood changes · ovarian cysts (may require withdrawal) · paraesthesia · pruritus · rash · urticaria · visual disturbances · weight changes · withdrawal bleeding (may occur in the first month of treatment)
- **CONCEPTION AND CONTRACEPTION** Non-hormonal, barrier methods of contraception should be used during entire treatment period. Pregnancy should be excluded before treatment, the first injection should be given during menstruation or shortly afterwards or use barrier contraception for 1 month beforehand.
- **PREGNANCY** Avoid.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Monitor bone mineral density.
- **DIRECTIONS FOR ADMINISTRATION** Rotate injection site to prevent atrophy and nodule formation.
- **PRESCRIBING AND DISPENSING INFORMATION**
DECAPEPTYL® SR 11.25MG Each vial includes an overage to allow accurate administration of an 11.25 mg dose.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for suspension for injection

Decapeptyl SR (Ipsen Ltd)

Triptorelin (as Triptorelin acetate) 11.25 mg Decapeptyl SR 11.25mg powder and solvent for suspension for injection vials | 1 vial [PoM] £207.00

Gonapeptyl Depot (Ferring Pharmaceuticals Ltd)

Triptorelin (as Triptorelin acetate) 3.75 mg Gonapeptyl Depot 3.75mg powder and solvent for suspension for injection pre-filled disposable devices | 1 pre-filled disposable injection [PoM] £81.69

6 Hypothalamic and anterior pituitary hormone related disorders

Hypothalamic and anterior pituitary hormones

Anterior pituitary hormones

Corticotrophins

Tetracosactide below (tetracosactrin), an analogue of corticotropin (adrenocorticotrophic hormone, ACTH), is used to test adrenocortical function; failure of plasma-cortisol concentration to rise after administration of tetracosactide indicates adrenocortical insufficiency. A low-dose test is considered by some clinicians to be more sensitive when used to confirm established, partial adrenal suppression.

Tetracosactide should be given only if no other ACTH preparations have been given previously. Tetracosactide depot injection (*Synacthen Depot*®) is also used in the treatment of infantile spasms but it is contra-indicated in neonates because of the presence of benzyl alcohol in the injection. Corticotropin-releasing factor, corticorelin p. 442, (also known as corticotropin-releasing hormone, CRH) is used to test anterior pituitary function and secretion of corticotropin.

Gonadotrophins

Gonadotrophins are occasionally used in the treatment of hypogonadotrophic hypogonadism and associated oligospermia. There is no justification for their use in primary gonadal failure.

Chorionic gonadotrophin p. 443 is used in the investigation of testicular function in suspected primary hypogonadism and incomplete masculinisation. It has also been used in delayed puberty in boys to stimulate endogenous testosterone production, but it has little advantage over testosterone.

Growth hormone

Growth hormone is used to treat proven deficiency of the hormone, Prader-Willi syndrome, Turner's syndrome, growth disturbance in children born small for corrected gestational age, chronic renal insufficiency, and short stature homeobox-containing gene (SHOX) deficiency. Growth hormone is also used in Noonan syndrome and idiopathic short stature [unlicensed indications] under specialist management. Treatment should be initiated and monitored by a paediatrician with expertise in managing growth-hormone disorders; treatment can be continued under a shared-care protocol by a general practitioner.

Growth hormone of human origin (HGH; somatotrophin) has been replaced by a growth hormone of human sequence, somatropin p. 443, produced using recombinant DNA technology.

Mecasermin p. 445, a human insulin-like growth factor-I (rhIGF-I), is licensed to treat growth failure in children with severe primary insulin-like growth factor-I deficiency.

Hypothalamic hormones

Gonadorelin p. 442 when injected intravenously in post-pubertal girls leads to a rapid rise in plasma concentrations of both luteinising hormone (LH) and follicle-stimulating hormone (FSH). It has not proved to be very helpful, however, in distinguishing hypothalamic from pituitary lesions. It is used in the assessment of delayed or precocious puberty.

Other growth hormone stimulation tests involve the use of insulin, glucagon p. 433, arginine p. 571, and clonidine hydrochloride p. 93 [all unlicensed uses]. The tests should be carried out in specialist centres.

6.1 Adrenocortical function testing

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > CORTICOTROPHINS

Tetracosactide

(Tetracosactrin)

INDICATIONS AND DOSE

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), standard-dose test

▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child: 145 micrograms/m² (max. per dose 250 micrograms) for 1 dose

Diagnosis of adrenocortical insufficiency (diagnostic 30-minute test), low-dose test

▶ BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION

- ▶ Child: 0.3 microgram/m² for 1 dose

Infantile spasm

▶ BY INTRAMUSCULAR INJECTION USING DEPOT INJECTION

- ▶ Child 1-23 months: Initially 500 micrograms once daily on alternate days, adjusted according to response

- **UNLICENSED USE** Not licensed for low-dose test for adrenocortical insufficiency. Not licensed for treatment of infantile spasms.

- **CONTRA-INDICATIONS** Acute psychosis · adrenogenital syndrome · allergic disorders · asthma · avoid injections containing benzyl alcohol in neonates · Cushing's syndrome · infectious diseases · peptic ulcer · primary adrenocortical insufficiency · refractory heart failure

- **CAUTIONS** Active infectious diseases (should not be used unless adequate disease-specific therapy is being given) · active systemic diseases (should not be used unless adequate disease-specific therapy is being given) · diabetes mellitus · diverticulitis · history of asthma · history of atopic allergy · history of eczema · history of hayfever · history of hypersensitivity · hypertension · latent amoebiasis (may become activated) · latent tuberculosis (may become activated) · myasthenia gravis · ocular herpes simplex · osteoporosis · predisposition to thromboembolic · psychological disturbances may be triggered · recent intestinal anastomosis · reduced immune response (should not be used unless adequate disease-specific therapy is being given) · ulcerative colitis

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of anaphylaxis Should only be administered under medical supervision. Consult product literature.

- ▶ **Hypertension** Patients already receiving medication for moderate to severe hypertension must have their dosage adjusted if treatment started.
- ▶ **Diabetes mellitus** Patients already receiving medication for diabetes mellitus must have their dosage adjusted if treatment started.
- **INTERACTIONS** → Appendix 1 (corticosteroids).
- **SIDE-EFFECTS** Abdominal distention • abscess • acne • anaphylactic shock • anaphylactoid reactions in children aged under 3 years (benzyl alcohol-containing injections) • angioneurotic oedema • aseptic necrosis of femoral and humeral heads • benign intracranial pressure increased with papilloedema • calcium deficiency • cardiac disorders • convulsions • Cushing's syndrome • decreased carbohydrate tolerance • dizziness • dyspnoea • ecchymosis • erythema • euphoria • fluid retention • flushing • glaucoma • growth retardation • headache • hirsutism • hyperglycaemia • hyperhidrosis • hypersensitivity reactions (tend to be more severe in patients susceptible to allergies, especially asthma) • hypertension • hypokalaemia • hypokalaemic alkalosis • impaired healing • increased appetite • increased intraocular pressure • infection susceptibility increased • insomnia • irregular menstruation • leukocytosis • malaise • manifestations of latent diabetes mellitus • mood swings • muscle atrophy • muscular weakness • myopathy • nausea • necrotising vasculitis • negative nitrogen balance • osteoporosis • pancreatitis • pathological fracture of long bones • peptic ulcer • personality changes • petechiae • posterior subcapsular cataracts • pruritus • psychotic manifestations • Quincke's oedema • secondary adrenocortical unresponsiveness • secondary pituitary unresponsiveness • severe depression • skin atrophy • skin hyperpigmentation • skin reactions at injection site • sodium retention • spinal compression fractures • tendon rupture • thromboembolism • toxic reactions in children aged under 3 years (benzyl alcohol-containing injections) • ulcerative oesophagitis • urticaria • vertigo • vomiting • weight increase
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with history of hypersensitivity to tetracosactide/corticotrophins or excipients.
- **PREGNANCY** Avoid (but may be used diagnostically if essential).
- **BREAST FEEDING** Avoid (but may be used diagnostically if essential).
- **HEPATIC IMPAIRMENT** An enhanced effect of tetracosactide therapy may occur in patients with cirrhosis of the liver. Use with caution in hepatic impairment. Monitor hepatic function closely during treatment.
- **RENAL IMPAIRMENT** Use with caution in patients with renal impairment.
- **EFFECT ON LABORATORY TESTS** May suppress skin test reactions.
Post administration total plasma cortisol levels during 30-minute test for diagnosis of adrenocortical insufficiency might be misleading due to altered cortisol binding globulin levels in some special clinical situations including, patients on oral contraceptives, post-operative patients, critical illness, severe liver disease and nephrotic syndrome.
- **DIRECTIONS FOR ADMINISTRATION** For intramuscular or intravenous injection, may be diluted in sodium chloride 0.9% to 250 nanograms/mL.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Synacthen** (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd)
Tetracosactide acetate 250 microgram per 1 ml Synacthen 250micrograms/1ml solution for injection ampoules | 1 ampoule [PoM] £38.00

Suspension for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Synacthen Depot** (Mallinckrodt Specialty Pharmaceuticals Ireland Ltd)
Tetracosactide acetate 1 mg per 1 ml Synacthen Depot 1mg/1ml suspension for injection ampoules | 1 ampoule [PoM] £346.28

6.2 Assessment of pituitary function

DIAGNOSTIC AGENTS

Corticotorelin

(Corticotrophin-releasing hormone; CRH)

● INDICATIONS AND DOSE

Test of anterior pituitary function

▶ BY INTRAVENOUS INJECTION

- ▶ Child: 1 microgram/kg (max. per dose 100 micrograms) for 1 dose, to be administered over 30 seconds

- **UNLICENSED USE** Not licensed.

- **SIDE-EFFECTS** Flushing of face • flushing of neck • flushing of upper body • hypotension • mild sensation of smell • mild sensation of taste

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

Gonadorelin

(Gonadotrophin-releasing hormone; GnRH; LH-RH)

● INDICATIONS AND DOSE

Assessment of anterior pituitary function | Assessment of delayed puberty

▶ BY INTRAVENOUS INJECTION, OR BY SUBCUTANEOUS INJECTION

- ▶ Child 1-17 years: 2.5 micrograms/kg (max. per dose 100 micrograms) for 1 dose

- **UNLICENSED USE** Not licensed for use in children under 1 year.

- **CAUTIONS** Pituitary adenoma

- **SIDE-EFFECTS** Abdominal pain • headache • hypersensitivity reaction on repeated administration of large doses • increased menstrual bleeding • irritation at injection site • nausea

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

EXCIPIENTS: May contain Benzyl alcohol

► **Gonadorelin (Non-proprietary)**

Gonadorelin (as Gonadorelin hydrochloride)

100 microgram Gonadorelin 100microgram powder and solvent for solution for injection vials | 1 vial **[PoM]** £75.00 (Hospital only)

6.3 Gonadotrophin replacement therapy

GONADOTROPHINS

Chorionic gonadotrophin

(Human chorionic gonadotrophin; HCG)

- **DRUG ACTION** A preparation of a glycoprotein fraction secreted by the placenta and obtained from the urine of pregnant women having the action of the pituitary luteinising hormone.

● **INDICATIONS AND DOSE**

Delayed puberty in the male to stimulate endogenous testosterone production

- BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION

- Child: (consult product literature)

Test of testicular function, short stimulation test

- BY INTRAMUSCULAR INJECTION

- Child: 1500–2000 units once daily for 3 days

Test of testicular function, prolonged stimulation test

- BY INTRAMUSCULAR INJECTION

- Child: 1500–2000 units twice weekly for 3 weeks

Hypogonadotrophic hypogonadism

- BY INTRAMUSCULAR INJECTION

- Child: 1000–2000 units twice weekly, adjusted according to response

Undescended testes

- BY INTRAMUSCULAR INJECTION

- Child 7–16 years: Initially 500 units 3 times a week, adjusted according to response to up to 4000 units 3 times a week continue for 1–2 months after testicular descent

- Child 17 years: Initially 1000 units twice weekly, adjusted according to response to up to 4000 units 3 times a week continue for 1–2 months after testicular descent

- **UNLICENSED USE** Unlicensed in children for test of testicular function.

- **CONTRA-INDICATIONS** Androgen-dependent tumours

- **CAUTIONS** Asthma · cardiac impairment · epilepsy · migraine · prepubertal boys (risk of premature epiphyseal closure or precocious puberty)

- **SIDE-EFFECTS** Gynaecomastia · headache · local reactions · mood changes · oedema (particularly in males—reduce dose) · tiredness

- **RENAL IMPAIRMENT** Use with caution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

- **Choragon** (Ferring Pharmaceuticals Ltd)

Chorionic gonadotrophin human 5000 unit Pregnyl 5,000unit powder and solvent for solution for injection ampoules |

1 ampoule **[PoM]** £3.15 **[CD4-2]**

6.4 Growth hormone disorders

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > HUMAN GROWTH HORMONES

Somatropin

(Recombinant Human Growth Hormone)

● **INDICATIONS AND DOSE**

Gonadal dysgenesis (Turner syndrome)

- BY SUBCUTANEOUS INJECTION

- Child: 1.4 mg/m² daily, alternatively

- 45–50 micrograms/kg daily

Deficiency of growth hormone

- BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Child: 23–39 micrograms/kg daily, alternatively 0.7–1 mg/m² daily

Growth disturbance in children born small for gestational age whose growth has not caught up by 4 years or later | Noonan syndrome

- BY SUBCUTANEOUS INJECTION

- Child 4–17 years: 35 micrograms/kg daily, alternatively 1 mg/m² daily

Prader-Willi syndrome, in children with growth velocity greater than 1 cm/year, in combination with energy-restricted diet

- BY SUBCUTANEOUS INJECTION

- Child: 1 mg/m² daily, alternatively 35 micrograms/kg daily; maximum 2.7 mg per day

Chronic renal insufficiency (renal function decreased to less than 50%)

- BY SUBCUTANEOUS INJECTION

- Child: 45–50 micrograms/kg daily, alternatively 1.4 mg/m² daily, higher doses may be needed, adjust if necessary after 6 months

SHOX deficiency

- BY SUBCUTANEOUS INJECTION

- Child: 45–50 micrograms/kg daily

DOSE EQUIVALENCE AND CONVERSION

Dose formerly expressed in units; somatropin 1 mg ≡ 3 units.

- **UNLICENSED USE** Not licensed for use in Noonan syndrome.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · evidence of tumour activity (complete antitumour therapy and ensure intracranial lesions inactive before starting) · not to be used after renal transplantation · not to be used for growth promotion in children with closed epiphyses (or near closure in Prader-Willi syndrome) · severe obesity in Prader-Willi syndrome · severe respiratory impairment in Prader-Willi syndrome

- **CAUTIONS** Diabetes mellitus (adjustment of antidiabetic therapy may be necessary) · disorders of the epiphysis of the hip (monitor for limping) · history of malignant disease · hypothyroidism—manufacturers recommend periodic thyroid function tests but limited evidence of clinical value · initiation of treatment close to puberty not recommended in child born small for corrected gestational age · papilloedema · relative deficiencies of other pituitary

hormones • resolved intracranial hypertension (monitor closely) • Silver-Russell syndrome

- **INTERACTIONS** → Appendix 1 (somatropin).
- **SIDE-EFFECTS** Antibody formation • arthralgia • benign intracranial hypertension • carpal tunnel syndrome • fluid retention (peripheral oedema) • headache • hyperglycaemia • hypoglycaemia • hypothyroidism • insulin resistance • leukaemia in children with growth hormone deficiency • myalgia • nausea • papilloedema • paraesthesia • reactions at injection site • visual problems • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Papilloedema** Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

- **PREGNANCY** Discontinue if pregnancy occurs—no information available.

- **BREAST FEEDING** No information available. Absorption from milk unlikely.

- **DIRECTIONS FOR ADMINISTRATION** Rotate subcutaneous injection sites to prevent lipatrophy.

NUTROPINAQ[®], GENOTROPIN[®], NORDITROPIN[®], OMNITROPE[®], SAIZEN[®] and ZOMACTON[®]

PREPARATIONS For use by subcutaneous injection.

HUMATROPE[®] Cartridges for use by subcutaneous injection. Powder for reconstitution for use by subcutaneous or intramuscular injection.

- **PRESCRIBING AND DISPENSING INFORMATION** Medicinal products containing somatropin are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name, see *Biosimilar medicines*, under Guidance on prescribing p. 1.

SAIZEN[®] SOLUTION FOR INJECTION For use with *cool.click[®]* needle-free autoinjector device or *easypod[®]* autoinjector device (non-NHS but available free of charge from clinics).

NUTROPINAQ[®] For use with *NutropinAq[®]* Pen device (non-NHS but available free of charge from clinics).

OMNITROPE[®] For use with *Omnitrope Pen 5[®]* and *Omnitrope Pen 10[®]* devices (non-NHS but available free of charge from clinics).

NORDITROPIN[®] PREPARATIONS Cartridges are for use with appropriate *NordiPen[®]* device (non-NHS but available free of charge from clinics).

Multidose disposable prefilled pens for use with *NovoFine[®]* or *NovoTwist[®]* needles.

ZOMACTON[®] 4 mg vial for use with *Zomafet 2[®] Vision* needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

10 mg vial for use with *Zomafet Vision X[®]* needle-free device (non-NHS but available free of charge from clinics) or with needles and syringes.

GENOTROPIN[®] PREPARATIONS Cartridges are for use with *Genotropin[®]* Pen device (non-NHS but available free of charge from clinics).

SAIZEN[®] POWDER AND SOLVENT FOR SOLUTION FOR INJECTION For use with *one.click[®]* autoinjector device or *cool.click[®]* needle-free autoinjector device or *easypod[®]* autoinjector device (non-NHS but available free of charge from clinics).

- **NATIONAL FUNDING/ACCESS DECISIONS**

NICE technology appraisals (TAs)

- ▶ **Somatropin for the treatment of growth failure in children (May 2010) NICE TA188**

Somatropin is recommended for children with growth failure who:

- have growth-hormone deficiency
- have Turner syndrome
- have Prader-Willi syndrome

- have chronic renal insufficiency
- are born small for gestational age with subsequent growth failure at 4 years of age or later
- have short stature homeobox-containing gene (SHOX) deficiency.

Treatment should be discontinued if growth velocity increases by less than 50% from baseline in the first year of treatment.

www.nice.org.uk/TA188

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Norditropin NordiFlex[®]** (Novo Nordisk Ltd)

Somatropin (rbe) 10 mg Zomacton 10mg powder and solvent for solution for injection vials | 1 vial [PoM] £199.23 [CD4-2]

• **CAUTIONS** Correct hypothyroidism before initiating treatment • diabetes mellitus (adjustment of antidiabetic therapy may be necessary) • papilloedema

• **SIDE-EFFECTS** Antibody formation • arthralgia • cardiomegaly • convulsions • dizziness • gynaecomastia • headache • hyperglycaemia • hypoglycaemia (especially in first month, and in younger children) • impaired hearing • injection-site reactions (rotate site) • myalgia • nausea • nervousness • night terrors • severe or recurrent headache • sleep apnoea • tachycardia • tonsillar hypertrophy • ventricular hypertrophy • visual disturbance • visual problems • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

► **Papilloedema** Funduscopy for papilloedema recommended if severe or recurrent headache, visual problems, nausea and vomiting occur—if papilloedema confirmed consider benign intracranial hypertension (rare cases reported).

• **CONCEPTION AND CONTRACEPTION** Contraception advised in women of child-bearing potential.

• **PREGNANCY** Avoid unless essential.

• **BREAST FEEDING** Avoid.

• **MONITORING REQUIREMENTS**

► Monitor ECG before and on termination of treatment (and during treatment if ECG abnormal).

► Monitor for disorders of the epiphysis of the hip (monitor for limping).

► Monitor for signs of tonsillar hypertrophy (snoring, sleep apnoea, and chronic middle ear effusions).

• **DIRECTIONS FOR ADMINISTRATION** Dose should be administered just before or after food.

• **PATIENT AND CARER ADVICE**

Patients or carers should be given advice on how to administer mecasermin injection.

Missed doses

Patients or carers should be advised not to increase dose if a dose is missed.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

► **Increlex** (Ipsen Ltd) ▼

Mecasermin 10 mg per 1 ml Increlex 40mg/4ml solution for injection vials | 1 vial [PoM] £605.00

6.4a Insulin-like growth factor-I deficiency

PITUITARY AND HYPOTHALAMIC HORMONES AND ANALOGUES > SOMATOMEDINS

Mecasermin

(Recombinant human factor-I; rhIGF-I)

• **DRUG ACTION** Somatomedins are a group of polypeptide hormones structurally related to insulin and commonly known as insulin-like growth factors (IGFs). Mecasermin, a human insulin-like growth factor-I (rhIGF-I), is the principal mediator of the somatotrophic effects of human growth hormone.

• **INDICATIONS AND DOSE**

Treatment of growth failure in children with severe primary insulin-like growth factor-I deficiency

► **BY SUBCUTANEOUS INJECTION**

► **Child 2-17 years:** Initially 40 micrograms/kg twice daily for 1 week, increased, if tolerated, in steps of 40 micrograms/kg (max. per dose 120 micrograms/kg twice daily), discontinue if no response within 1 year, reduce dose if hypoglycaemia occurs despite adequate food intake; withhold injection if patient unable to eat

• **CONTRA-INDICATIONS** Evidence of tumour activity (discontinue treatment)

7 Sex hormone responsive conditions

Sex hormones

Hormone replacement therapy

Sex hormone replacement therapy is indicated in children for the treatment of gonadotrophin deficiency, gonadal disorders, or delayed puberty that interferes with quality of life. Indications include constitutional delay in puberty, congenital or acquired hypogonadotrophic hypogonadism, hypergonadotrophic hypogonadism (Turner's syndrome, Klinefelter's syndrome), endocrine disorders (Cushing's syndrome or hyperprolactinaemia), and chronic illnesses, such as cystic fibrosis or sickle-cell disease, that may affect the onset of puberty.

Replacement therapy is generally started at the appropriate age for the development of puberty and should be managed by a paediatric endocrinologist. Patients with constitutional delay, chronic illness, or eating disorders may need only small doses of hormone supplements for 4 to 6 months to induce puberty and endogenous sex hormone

production, which is then sustained. Patients with organic causes of hormone deficiency will require life-long replacement, adjusted to allow normal development.

Inadequate treatment may lead to poor bone mineralisation, resulting in fractures and osteoporosis.

Female sex hormones

Oestrogens

Oestrogens are necessary for the development of female secondary sexual characteristics. If onset of puberty is delayed because of organic pathology, puberty can be induced with ethinylestradiol below in increasing doses, guided by breast staging and uterine scans. Cyclical progesterone replacement is added after 12–18 months of oestrogen treatment. Once the adult dosage of oestrogen has been reached, it may be more convenient to provide replacement either as a low-dose oestrogen containing oral contraceptive formulation [unlicensed indication] or as a combined oestrogen and progesterone hormone replacement therapy preparation [unlicensed indication]. There is limited experience in the use of transdermal patches or gels in children; compliance and skin irritation are sometimes a problem.

Ethinylestradiol is occasionally used, under **specialist supervision**, for the management of hereditary haemorrhagic telangiectasia (but evidence of benefit is limited), for the prevention of tall stature, and in tests of growth hormone secretion.

Topical oestrogen creams are used in the treatment of labial adhesions.

Progestogens

There are two main groups of progesterone, *progesterone and its analogues* (dydrogesterone and medroxyprogesterone acetate p. 478) and *testosterone analogues* (norethisterone p. 447 and norgestrel). The newer progestogens (desogestrel p. 474, norgestimate, and gestodene) are all derivatives of norgestrel; levonorgestrel p. 475 is the active isomer of norgestrel and has twice its potency. Progesterone and its analogues are less androgenic than the testosterone derivatives and neither progesterone nor dydrogesterone causes virilisation.

In delayed puberty cyclical progesterone is added after 12–18 months of oestrogen therapy to establish a menstrual cycle.

Norethisterone is also used to postpone menstruation during a cycle; treatment is started 3 days before the expected onset of menstruation.

7.1 Female sex hormone responsive conditions

OESTROGENS

Ethinylestradiol

(Ethinylloestradiol)

• INDICATIONS AND DOSE

Induction of sexual maturation in girls

► BY MOUTH

- Child (female): Initially 2 micrograms daily for 6 months, then increased to 5 micrograms daily for 6 months, then increased to 10 micrograms daily for 6 months, then increased to 20 micrograms daily, after 12–18 months of treatment give progesterone for 7 days of each 28-day cycle.

Maintenance of sexual maturation in girls

► BY MOUTH

- Child (female): 20 micrograms daily, to be given with cyclical progesterone for 7 days of each 28-day cycle.

Prevention of tall stature in girls

► BY MOUTH

- Child 2–11 years (female): 20–50 micrograms daily.

Pituitary priming before growth hormone secretion test in girls with bone age over 10 years

► BY MOUTH

- Child (female): 100 micrograms daily for 3 days before test.

- **UNLICENSED USE** Unlicensed for use in children.
- **CONTRA-INDICATIONS** Acute porphyrias p. 562 · cardiovascular disease (sodium retention with oedema) · family history of thromboembolism · gallstones · heart disease associated with pulmonary hypertension · heart disease associated with risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer · history of haemolytic uraemic syndrome · migraine with aura · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease · severe or multiple risk factors for venous thromboembolism · systemic lupus erythematosus · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding · venous thromboembolism, or history of recurrent venous thromboembolism (unless already on anticoagulant treatment)
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · Crohn's disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression (especially if induced by hormonal contraceptive) · hyperprolactinaemia (seek specialist advice) · inflammatory bowel disease · migraine (migraine-like headaches) · personal or family history of hypertriglyceridaemia (increased risk of pancreatitis) · risk factors for arterial disease · risk factors for migraine · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

- Other conditions The product literature advises caution in other conditions including hypertension, renal disease, asthma, epilepsy, sickle-cell disease, melanoma, otosclerosis, multiple sclerosis, and systemic lupus erythematosus (but care required if antiphospholipid antibodies present, see above). Evidence for caution in these conditions is unsatisfactory and many women with these conditions may stand to benefit from treatment.
- Risk of venous thromboembolism Use with **caution** if any of following factors present but **avoid** if two or more factors present:
 - family history of venous thromboembolism in first-degree relative aged under 45 years (avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
 - obesity—body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - long-term immobilisation e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
 - history of superficial thrombophlebitis;
 - age over 35 years (avoid if over 50 years);
 - smoking.

- **Risk factors for arterial disease** Use with **caution** if any one of following factors present but **avoid** if two or more factors present:
 - *family history of arterial disease* in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
 - *diabetes mellitus* (avoid if diabetes complications present);
 - *hypertension*—blood pressure above *systolic 140 mmHg* or *diastolic 90 mmHg* (avoid if blood pressure above *systolic 160 mmHg* or *diastolic 95 mmHg*); (In adolescents, avoid if blood pressure very high);
 - *smoking* (avoid if smoking 40 or more cigarettes daily);
 - *age* over 35 years (avoid if over 50 years);
 - *obesity* (avoid if body mass index $\geq 35 \text{ kg/m}^2$ unless no suitable alternative); (In adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - *migraine without aura* (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).
- **Migraine** Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

• **INTERACTIONS** → Appendix 1 (oestrogens).

• SIDE-EFFECTS

- **Rare** Gallstones · systemic lupus erythematosus
- **Frequency not known** Abdominal cramps · absence of withdrawal bleeding · amenorrhoea after discontinuation · breast enlargement · breast secretion · breast tenderness · cervical erosion · changes in libido · changes in lipid metabolism · changes in vaginal discharge · chloasma · chorea · contact lenses may irritate · depression · fluid retention · headache · hepatic tumours · hypertension · irritability · leg cramps (rule out venous thrombosis) · liver impairment · nausea · nervousness · photosensitivity · reduced menstrual loss · skin reactions · symptoms of endometriosis may be exacerbated · thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) · uterine fibroids may increase in size · visual disturbances · vomiting · weight changes · ‘spotting’ in early cycles

SIDE-EFFECTS, FURTHER INFORMATION

• **PREGNANCY** Avoid.

• **BREAST FEEDING** Avoid.

• **HEPATIC IMPAIRMENT** Avoid in liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), and jaundice.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet

• Ethinylestradiol (Non-proprietary)

Ethinylestradiol 10 microgram Ethinylestradiol 10 microgram tablets | 21 tablet **[PoM]** £200.00 DT price = £200.00

Ethinylestradiol 50 microgram Ethinylestradiol 50 microgram tablets | 21 tablet **[PoM]** £200.00 DT price = £200.00

Ethinylestradiol 1 mg Ethinylestradiol 1mg tablets | 28 tablet **[PoM]** £200.00 DT price = £200.00

PROGESTOGENS

Norethisterone

• INDICATIONS AND DOSE

Postponement of menstruation

► **BY MOUTH**

- Females of childbearing potential: 5 mg 3 times a day, to be started 3 days before expected onset (menstruation occurs 2–3 days after stopping)

Induction and maintenance of sexual maturation in females (combined with an oestrogen after 12–18 months oestrogen therapy)

► **BY MOUTH**

- Child: 5 mg once daily for the last 7 days of 28-day cycle

Short-term contraception

► **BY DEEP INTRAMUSCULAR INJECTION**

- Females of childbearing potential: 200 mg, to be administered within first 5 days of cycle or immediately after parturition (duration 8 weeks). To be injected into the gluteal muscle, then 200 mg after 8 weeks if required

Contraception

► **BY MOUTH**

- Females of childbearing potential: 350 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 3 hours or more it should be regarded as a ‘missed pill’

• UNLICENSED USE

- When used for induction and maintenance of sexual maturation in females or Postponement of menstruation Not licensed for use in children.
- When used for Contraception Consult product literature for the licensing status of individual preparations.

• CONTRA-INDICATIONS

GENERAL CONTRA-INDICATIONS

Avoid in patients with a history of liver tumours · breast cancer (unless progestogens are being used in the management of this condition) · genital cancer (unless progestogens are being used in the management of this condition) · history during pregnancy of idiopathic jaundice · history during pregnancy of pemphigoid gestationis (non-contraceptive indications) · history during pregnancy of severe pruritus (non-contraceptive indications) · when used as a contraceptive, history of breast cancer (can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable)

SPECIFIC CONTRA-INDICATIONS

- With oral use Acute porphyrias p. 562 · severe arterial disease · undiagnosed vaginal bleeding

• CAUTIONS

GENERAL CAUTIONS

Asthma · cardiac dysfunction · conditions that may worsen with fluid retention · diabetes (progestogens can decrease glucose tolerance—monitor patient closely) · epilepsy · history of depression · hypertension · migraine · susceptibility to thromboembolism (particular caution with high dose)

SPECIFIC CAUTIONS

- When used for contraception Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) anti-phospholipid antibodies

- ▶ With intramuscular use for contraception Disturbances of lipid metabolism · history during pregnancy of deterioration of atherosclerosis · history during pregnancy of pruritus · possible risk of breast cancer

CAUTIONS, FURTHER INFORMATION

- ▶ Use as a contraceptive in co-morbidities The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
- ▶ Breast cancer risk with contraceptive use There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

● INTERACTIONS → Appendix 1 (progestogens).

- ▶ With intramuscular use Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection is not affected by enzyme-inducing drugs and may be continued as normal during courses of these drugs.

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Acne · alopecia · anaphylactoid reactions · breast tenderness · change in libido · depression · disturbance of appetite · dizziness · fluid retention · headache · hirsutism · insomnia (non-contraceptive indications) · jaundice · menstrual disturbances · nausea · premenstrual-like syndrome · pruritus · rash · skin reactions · urticaria · vomiting · weight change

SPECIFIC SIDE-EFFECTS

- ▶ With intramuscular use Injection-site reactions

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Cervical cancer Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives (use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years). The risk of cervical cancer with other progestogen-only contraceptives is not yet known.
- **PREGNANCY** Not known to be harmful in contraceptive doses. Avoid in other indications.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- ▶ With intramuscular use Withhold breast-feeding for neonates with severe or persistent jaundice requiring medical treatment.
- **HEPATIC IMPAIRMENT** When used as a contraceptive; caution in severe liver disease and recurrent cholestatic jaundice, avoid in liver tumour. Caution when used for sexual maturation and to postpone menstruation; avoid if severe.
- **RENAL IMPAIRMENT** Use with caution in non-contraceptive indications.
- **PATIENT AND CARER ADVICE**

Missed doses

Missed oral contraceptive pill The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also

use another method, such as the condom, for the next 2 days.'

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting with oral contraceptives Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery. Starting routine for oral contraceptives One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if norethisterone is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days. Contraceptives by injection Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

7.2 Male sex hormone responsive conditions

Androgens, anti-androgens and anabolic steroids

Androgens

Androgens cause masculinisation; they are used as replacement therapy in androgen deficiency, in delayed puberty, and in those who are hypogonadal due to either pituitary or testicular disease.

When given to patients with hypopituitarism androgens can lead to normal sexual development and potency but not to fertility. If fertility is desired, the usual treatment is with gonadotrophins or pulsatile gonadotrophin-releasing hormone which stimulates spermatogenesis as well as androgen production.

Intramuscular depot preparations of **testosterone esters** are preferred for replacement therapy. Testosterone enantate or propionate or alternatively *Sustanon*®, which consists of a mixture of testosterone esters and has a longer duration of action, can be used. For induction of puberty, depot testosterone injections are given monthly and the doses increased every 6 to 12 months according to response. Single ester testosterone injections may need to be given more frequently.

Oral **testosterone undecanoate** is used for induction of puberty. An alternative approach that promotes growth rather than sexual maturation uses oral oxandrolone below.

Chorionic gonadotrophin has also been used in delayed puberty in the male to stimulate endogenous testosterone production, but has little advantage over testosterone.

Testosterone topical gel is also available but experience of use in children under 15 years is limited. Topical testosterone is applied to the penis in the treatment of micropallus; an extemporaneously prepared cream should be used because the alcohol in proprietary gel formulations causes irritation.

Anti-androgens and precocious puberty

The gonadorelin stimulation test is used to distinguish between *gonadotrophin-dependent (central) precocious puberty* and *gonadotrophin-independent precocious puberty*. Treatment requires specialist management.

Gonadorelin analogues, used in the management of gonadotrophin-dependent precocious puberty, delay development of secondary sexual characteristics and growth velocity.

Testolactone p. 451 and cyproterone acetate p. 450 are used in the management of gonadotrophin-independent precocious puberty, resulting from McCune-Albright syndrome, familial male precocious puberty (testotoxicosis), hormone-secreting tumours, and ovarian and testicular disorders. Testolactone inhibits the aromatisation of testosterone, the rate limiting step in oestrogen synthesis. Cyproterone acetate is a progestogen with anti-androgen properties.

Spironolactone is sometimes used in combination with testolactone because it has some androgen receptor blocking properties.

High blood concentration of sex hormones may activate release of gonadotrophin releasing hormone, leading to development of secondary, central gonadotrophin-dependent precocious puberty. This may require the addition of gonadorelin analogues to prevent progression of pubertal development and skeletal maturation.

Anabolic steroids have some androgenic activity but they cause less virilisation than androgens in girls. They are used in the treatment of some *aplastic anaemias*.

Oxandrolone is used to stimulate late pre-pubertal growth prior to induction of sexual maturation in boys with short stature and in girls with Turner's syndrome; specialist management is required.

ANABOLIC STEROIDS > ANDROSTAN DERIVATIVES

Oxandrolone

• INDICATIONS AND DOSE

Stimulation of late pre-pubertal growth in boys (of appropriate age) with short stature

- ▶ BY MOUTH
- ▶ Child 10–17 years (male): 1.25–2.5 mg daily for 3–6 months.

Stimulation of late pre-pubertal growth in girls with Turner's syndrome

- ▶ BY MOUTH
- ▶ Child (female): 0.625–2.5 mg daily, to be taken in combination with growth hormone.

- **CONTRA-INDICATIONS** History of primary liver tumours • hypercalcaemia • nephrosis
- **CAUTIONS** Cardiac impairment • diabetes mellitus • epilepsy • hypertension • migraine • skeletal metastases (risk of hypercalcaemia)
- **INTERACTIONS** → Appendix 1 (oxandrolone).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Virilism in females • acne • androgenic effects • anxiety • asthenia • changes in libido • cholestatic jaundice • depression • electrolyte disturbances • excessive duration of penile erection • excessive frequency of penile erection • gastro-intestinal bleeding • gynaecomastia • headache • hirsutism • hypercalcaemia • hypertension • increased bone growth • male-pattern baldness • nausea • oedema • paraesthesia • polycythaemia • precocious sexual development in pre-pubertal males • premature closure of epiphyses in pre-pubertal males • pruritus • seborrhoea • sodium retention • suppression of spermatogenesis in males • weight gain
 - ▶ **Rare** Liver tumours
 - ▶ **Frequency not known** Sleep apnoea
- **PREGNANCY** Avoid—causes masculinisation of female fetus.
- **BREAST FEEDING** Avoid; may cause masculinisation in the female infant or precocious development in the male infant. High doses suppress lactation.
- **HEPATIC IMPAIRMENT** Avoid if possible—fluid retention and dose-related toxicity.
- **RENAL IMPAIRMENT** Use with caution—potential for fluid retention.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet

Tablet

- ▶ **Oxandrolone (Non-proprietary)**

Oxandrolone 2.5 mg Oxandrin 2.5mg tablets | 100 tablet [PoM] no price available [CD4-2]

ANDROGENS

Androgens

- **CONTRA-INDICATIONS** Breast cancer in males · history of liver tumours · hypercalcaemia · prostate cancer
- **CAUTIONS** Cardiac impairment · diabetes mellitus · epilepsy · hypertension · migraine · pre-pubertal boys (fusion of epiphyses is hastened and may result in short stature)—statural growth and sexual development should be monitored · skeletal metastases—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored) · sleep apnoea · stop treatment or reduce dose if severe polycythaemia occurs · tumours—risk of hypercalcaemia or hypercalciuria (if this occurs, treat appropriately and restart treatment once normal serum calcium concentration restored)
- **INTERACTIONS** → Appendix 1 (testosterone).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Acne · androgenic effects (to be assessed regularly in women) · anxiety · asthenia · changes in libido · cholestatic jaundice · depression · electrolyte disturbances · excessive duration of penile erection · excessive frequency of penile erection · gastro-intestinal bleeding · gynaecomastia · headache · hirsutism · hypercalcaemia · hypertension · increased bone growth · male-pattern baldness · nausea · oedema · paraesthesia · polycythaemia · precocious sexual development in pre-pubertal males · premature closure of epiphyses in pre-pubertal males · pruritus · seborrhoea · sodium retention · suppression of virilism in women · weight gain
 - ▶ **Rare** Liver tumours
 - ▶ **Frequency not known** Sleep apnoea
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - ▶ Polycythaemia Stop treatment or reduce dose if severe polycythaemia occurs.
- **PREGNANCY** Avoid—causes masculinisation of female fetus.
- **BREAST FEEDING** Avoid.
- **HEPATIC IMPAIRMENT** Avoid if possible—fluid retention and dose-related toxicity.
- **RENAL IMPAIRMENT** Caution—potential for fluid retention.
- **MONITORING REQUIREMENTS** Monitor haematocrit and haemoglobin before treatment, every three months for the first year, and yearly thereafter.

Testosterone enantate

● INDICATIONS AND DOSE

Induction and maintenance of sexual maturation in males (specialist use only)

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Child 12–17 years: 25–50 mg/m² every 1 month, increase dose every 6–12 months according to response

- **UNLICENSED USE** Not licensed for use in children.

- **SIDE-EFFECTS** Suppression of spermatogenesis

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Testosterone enantate (Non-proprietary)**

Testosterone enantate 250 mg per 1 ml Testosterone enantate 250mg/1ml solution for injection ampoules | 3 ampoule [PoM] £72.50 DT price = £72.50 [CD4-2]

Testosterone propionate

● **INDICATIONS AND DOSE****Delayed puberty in males**

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Child: 50 mg once weekly

Treatment of microphallus (specialist use only)

- ▶ TO THE SKIN USING CREAM

- ▶ Child: Apply 3 times a day for 3 weeks

- **SIDE-EFFECTS** Suppression of spermatogenesis

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, cream

Testosterone undecanoate

● **INDICATIONS AND DOSE****Induction and maintenance of sexual maturation in males (specialist use only)**

- ▶ BY MOUTH

- ▶ Child 12–17 years: 40 mg once daily on alternate days, adjusted according to response to 120 mg daily

- **SIDE-EFFECTS** Suppression of spermatogenesis

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

- ▶ **Restandol** (Merck Sharp & Dohme Ltd)

Testosterone undecanoate 40 mg Restandol 40mg Testocaps | 30 capsule [PoM] £8.55 [CD4-2] | 60 capsule [PoM] £17.10 DT price = £17.10 [CD4-2]

7.2a Male sex hormone antagonism

ANTI-ANDROGENS

Cyproterone acetate

● **INDICATIONS AND DOSE****Gonadotrophin-independent precocious puberty (specialist use only)**

- ▶ BY MOUTH

- ▶ Child: Initially 25 mg twice daily, adjusted according to response

- **UNLICENSED USE** Unlicensed for use in children.

- **CONTRA-INDICATIONS** Dubin-Johnson syndrome · history of thromboembolic disorders · liver-disease · malignant diseases · meningioma or history of meningioma · previous or existing liver tumours · Rotor syndrome · severe depression · severe diabetes (with vascular changes) · sickle-cell anaemia · wasting diseases · youths under 18 years (may arrest bone maturation and testicular development)

- **CAUTIONS** Diabetes mellitus · in prostate cancer, severe depression · in prostate cancer, sickle-cell anaemia · ineffective for male hypersexuality in chronic alcoholism (relevance to prostate cancer not known)

- **SIDE-EFFECTS**

- ▶ **Rare** Hypersensitivity reactions · osteoporosis · rash

- ▶ **Frequency not known** Breathlessness · changes in hair pattern · fatigue · gynaecomastia (rarely leading to

galactorrhoea and benign breast nodules) · hepatic failure · hepatitis · hepatotoxicity · inhibition of spermatogenesis · jaundice · lassitude · reduced sebum production (may clear acne) · risk of recurrence of thromboembolic disease · weight changes

SIDE-EFFECTS, FURTHER INFORMATION

- **Hepatotoxicity** Direct hepatic toxicity including jaundice, hepatitis and hepatic failure have been reported (fatalities reported, usually after several months, at dosages of 100 mg and above). If hepatotoxicity is confirmed, cyproterone should normally be withdrawn unless the hepatotoxicity can be explained by another cause such as metastatic disease (in which case cyproterone should be continued only if the perceived benefit exceeds the risk).

- **HEPATIC IMPAIRMENT** Avoid—dose-related toxicity.

• MONITORING REQUIREMENTS

- Monitor blood counts initially and throughout treatment.
- Monitor adrenocortical function regularly.
- Monitor hepatic function regularly—liver function tests should be performed before and regularly during treatment and whenever symptoms suggestive of hepatotoxicity occur.

• PATIENT AND CARER ADVICE

Driving and skilled tasks

Fatigue and lassitude may impair performance of skilled tasks (e.g. driving).

• MEDICINAL FORMS

8 Thyroid disorders

8.1 Hyperthyroidism

Antithyroid drugs

Overview

Antithyroid drugs are used for hyperthyroidism either to prepare children for thyroidectomy or for long-term management. In the UK carbimazole p. 452 is the most commonly used drug. Propylthiouracil p. 452 should be reserved for children who are intolerant of, or for those who experience sensitivity reactions to carbimazole (sensitivity is not necessarily displayed to both drugs), and for whom other treatments are inappropriate. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

Treatment in children should be undertaken by a specialist.

Carbimazole or propylthiouracil are initially given in large doses to block thyroid function. This dose is continued until the child becomes euthyroid, usually after 4 to 8 weeks, and is then gradually reduced to a maintenance dose of 30–60% of the initial dose. Alternatively high-dose treatment is continued in combination with levothyroxine sodium p. 454 replacement (*blocking-replacement regimen*); this is particularly useful when dose adjustment proves difficult. Treatment is usually continued for 12 to 24 months. The blocking-replacement regimen is **not** suitable during pregnancy. Hypothyroidism should be avoided particularly during pregnancy as it can cause fetal goitre.

Iodine has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (^{131}I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

Propranolol hydrochloride p. 96 is useful for rapid relief of thyrotoxic symptoms and can be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supra-ventricular arrhythmias due to hyperthyroidism. Propranolol hydrochloride has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but atenolol is also used.

Thyrotoxic crisis ('thyroid storm') requires emergency treatment with intravenous administration of fluids, propranolol hydrochloride and hydrocortisone as sodium succinate, as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

7.2b Precocious puberty

Drugs used for Precocious puberty not listed below

Goserelin p. 439 · Leuprorelin acetate p. 440 · Triptorelin p. 440

HORMONE ANTAGONISTS AND RELATED AGENTS > AROMATASE INHIBITORS

Testolactone

• INDICATIONS AND DOSE

Gonadotrophin-independent precocious puberty (specialist use only)

► BY MOUTH

- Child: 5 mg/kg 3–4 times a day; increased if necessary up to 10 mg/kg 4 times a day

- **INTERACTIONS** → Appendix 1 (testolactone).

• SIDE-EFFECTS

- **Common or very common** Anorexia · changes in hair pattern · diarrhoea · hypertension · nausea · peripheral neuropathy · vomiting · weight changes

Pregnancy

Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate, therefore propylthiouracil remains the drug of choice during the first trimester of pregnancy. In the second trimester, consider switching to carbimazole because of the potential risk of hepatotoxicity with propylthiouracil. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).

Neonates

Neonatal hyperthyroidism is treated with carbimazole or propylthiouracil, usually for 8 to 12 weeks. In severe symptomatic disease iodine may be needed to block the thyroid and propranolol required to treat peripheral symptoms.

ANTITHYROID DRUGS > SULFUR-CONTAINING IMIDAZOLES

Carbimazole

● INDICATIONS AND DOSE

Hyperthyroidism (blocking-replacement regimen) in combination with levothyroxine

► BY MOUTH

- Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)

Hyperthyroidism (including Graves' disease)

► BY MOUTH

- Neonate: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses (up to 1 mg/kg daily) are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses.
- Child 1 month–11 years: Initially 750 micrograms/kg daily until patient is euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses; maximum 30 mg per day
- Child 12–17 years: Initially 30 mg daily until euthyroid, usually after 4–8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis, dose may be given in single or divided doses

DOSE EQUIVALENCE AND CONVERSION

When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

IMPORTANT SAFETY INFORMATION

NEUTROPENIA AND AGRANULOCYTOSIS

Doctors are reminded of the importance of recognising bone marrow suppression induced by carbimazole and the need to stop treatment promptly.

- Patient should be asked to report symptoms and signs suggestive of infection, especially sore throat.
- A white blood cell count should be performed if there is any clinical evidence of infection.

- Carbimazole should be stopped promptly if there is clinical or laboratory evidence of neutropenia.

- **INTERACTIONS** → Appendix 1 (carbimazole).

● SIDE-EFFECTS

- **Common or very common** Arthralgia · fever · headache · hepatic disorders · hepatitis · jaundice · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance
- **Rare** Agranulocytosis · alopecia · bone marrow suppression · hypersensitivity reactions · jaundice · myopathy · pancytopenia

SIDE-EFFECTS, FURTHER INFORMATION

Rashes and pruritus are common with carbimazole but they can be treated with antihistamines without discontinuing therapy; alternatively propylthiouracil can be substituted.

- **PREGNANCY** Carbimazole can be given but the blocking-replacement regimen is **not** suitable. Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate. Carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).
- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk may be sufficient to affect neonatal thyroid function therefore lowest effective dose should be used.
- **HEPATIC IMPAIRMENT** Use with caution in mild to moderate impairment. Avoid in severe impairment.
- **PATIENT AND CARER ADVICE** Warn patient or carers to tell doctor **immediately** if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

ANTITHYROID DRUGS > THIOURACILS

Propylthiouracil

● INDICATIONS AND DOSE

Hyperthyroidism (including Graves' disease)

► BY MOUTH

- Neonate: Initially 2.5–5 mg/kg twice daily until euthyroid, usually after 8 to 12 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis.
- Child 1–11 months: Initially 2.5 mg/kg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis
- Child 1–4 years: Initially 25 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis

- ▶ Child 5–11 years: Initially 50 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis
- ▶ Child 12–17 years: Initially 100 mg 3 times a day until euthyroid, usually after 4 to 8 weeks, then gradually reduce to a maintenance dose of 30–60% of the initial dose; higher initial doses are occasionally required, particularly in thyrotoxic crisis

DOSE EQUIVALENCE AND CONVERSION

When substituting, carbimazole 1 mg is considered equivalent to propylthiouracil 10 mg but the dose may need adjusting according to response.

- **UNLICENSED USE** Not licensed for use in children under 6 years of age.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Arthralgia · fever · headache · jaundice · leucopenia · malaise · mild gastro-intestinal disturbances · nausea · pruritus · rash · taste disturbance
 - ▶ **Rare** Agranulocytosis · alopecia · aplastic anaemia · bone marrow suppression · cutaneous vasculitis · encephalopathy · hepatic disorders · hepatic failure · hepatic necrosis · hepatitis · hypersensitivity reactions · hypoproteinaemia · jaundice · lupus erythematosus-like syndromes · myopathy · nephritis · pancytopenia · thrombocytopenia
- SIDE-EFFECTS, FURTHER INFORMATION**
 - ▶ **Hepatotoxicity** Severe hepatic reactions have been reported, including fatal cases and cases requiring liver transplant—discontinue if significant liver-enzyme abnormalities develop.
- **PREGNANCY** Propylthiouracil can be given but the blocking-replacement regimen is **not** suitable. Propylthiouracil crosses the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves' disease tend to fall during pregnancy).
- **BREAST FEEDING** Present in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used. Amount in milk probably too small to affect infant; high doses may affect neonatal thyroid function. Monitor infant's thyroid status.
- **HEPATIC IMPAIRMENT** Reduce dose.
- **RENAL IMPAIRMENT** Use 75% of normal dose if estimated glomerular filtration rate 10–50 mL/minute/1.73 m². Use 50% of normal dose if estimated glomerular filtration rate less than 10 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor for hepatotoxicity.
- **PATIENT AND CARER ADVICE** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, dark urine, or pruritus develop.

Iodine 50 mg per 1 mL, Potassium iodide 100 mg per 1 mL Iodine aqueous oral solution | 500 mL (P) £9.58

8.2 Hypothyroidism

Thyroid hormones

Overview

Thyroid hormones are used in hypothyroidism (juvenile myxoedema), and also in diffuse non-toxic goitre, congenital or neonatal hypothyroidism, and Hashimoto's thyroiditis (lymphadenoid goitre). Neonatal hypothyroidism requires prompt treatment to facilitate normal development.

Levothyroxine sodium p. 454 (thyroxine sodium) is the treatment of choice for *maintenance* therapy.

Doses for congenital hypothyroidism and juvenile myxoedema should be titrated according to clinical response, growth assessment, and measurement of plasma thyroxine and thyroid-stimulating hormone concentrations. In congenital hypothyroidism higher initial doses may normalise metabolism more quickly, with associated beneficial effects on mental development.

Liothyronine sodium p. 455 has a similar action to levothyroxine sodium but is more rapidly metabolised and has a more rapid effect. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in *severe hypothyroid states* when a rapid response is desired.

Liothyronine sodium by intravenous injection is the treatment of choice in *hypothyroid coma*. Adjunctive therapy includes intravenous fluids, hydrocortisone, and treatment of infection; assisted ventilation is often required.

THYROID HORMONES

Levothyroxine sodium

(Thyroxine sodium)

● INDICATIONS AND DOSE

Hypothyroidism

► BY MOUTH

• Neonate: Initially 10–15 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 5 micrograms/kg every 2 weeks, alternatively adjusted in steps of 5 micrograms/kg as required; maintenance 20–50 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time.

► Child 1 month–1 year: Initially 5 micrograms/kg once daily (max. per dose 50 micrograms); adjusted in steps of 10–25 micrograms every 2–4 weeks until metabolism normalised; maintenance

25–75 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

► Child 2–11 years: Initially 50 micrograms once daily; adjusted in steps of 25 micrograms every 2–4 weeks until metabolism normalised; maintenance 75–100 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

► Child 12–17 years: Initially 50 micrograms once daily; adjusted in steps of 25–50 micrograms every 3–4 weeks until metabolism normalised; maintenance 100–200 micrograms daily, levothyroxine should be taken at the same time each day, preferably 30 minutes before meals, caffeine-containing drinks, or other medicines; this could be before breakfast or another more convenient time

Hyperthyroidism (blocking-replacement regimen) in combination with carbimazole

► BY MOUTH

► Child: Therapy usually given for 12 to 24 months (consult product literature or local protocols)

● **CAUTIONS** Cardiac disorders (monitor ECG; start at low dose and carefully titrate) · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · long-standing hypothyroidism · panhypopituitarism (initiate corticosteroid therapy before starting levothyroxine) · predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine)

● **INTERACTIONS** → Appendix 1 (thyroid hormones).

● **SIDE-EFFECTS** Anginal pain (usually at excessive dosage) · arrhythmias (usually at excessive dosage) · benign intracranial hypertension (usually at excessive dosage) · craniosynostosis · diarrhoea (usually at excessive dosage) · eosinophilia · excitability (usually at excessive dosage) · fever · flushing · headache · heat intolerance · hypersensitivity reactions · insomnia (usually at excessive dosage) · liver dysfunction · menstrual irregularities · muscle cramp · muscular weakness · nervousness · oedema · palpitation (usually at excessive dosage) · premature closure of epiphyses · pruritus · rash · restlessness (usually at excessive dosage) · sweating · tachycardia (usually at excessive dosage) · transient hair loss · tremor (usually at

excessive dosage) · vomiting (usually at excessive dosage) · weight-loss

● **PREGNANCY** Levothyroxine requirement may increase during pregnancy. Levothyroxine may cross the placenta. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of levothyroxine).

● **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

● **PRESCRIBING AND DISPENSING INFORMATION**

Levothyroxine equivalent to 100 micrograms/m²/day can be used as a guide to the requirements in children.

● **PATIENT AND CARER ADVICE**

Levothyroxine sodium anhydrous 10 microgram per 1 ml Levothyroxine sodium 50micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £101.79 DT price = £97.52

Levothyroxine sodium anhydrous 20 microgram per 1 ml Levothyroxine sodium 100micrograms/5ml oral solution sugar free sugar-free | 100 ml [PoM] £165.00 DT price = £161.77

Liothyronine sodium

(L-Tri-iodothyronine sodium)

● INDICATIONS AND DOSE

Hypothyroidism

► BY MOUTH

- Child 12–17 years: Initially 10–20 micrograms daily; increased to 60 micrograms daily in 2–3 divided doses

Hypothyroid coma

► BY SLOW INTRAVENOUS INJECTION

- Child 12–17 years: 5–20 micrograms every 12 hours, increased to 5–20 micrograms every 4 hours if required, alternatively initially 50 micrograms for 1 dose, then 25 micrograms every 8 hours, reduced to 25 micrograms twice daily

Hypothyroidism (replacement for oral levothyroxine)

► BY SLOW INTRAVENOUS INJECTION

- Child: Convert daily levothyroxine dose to liothyronine and give in 2–3 divided doses, adjusted according to response

DOSE EQUIVALENCE AND CONVERSION

20–25 micrograms of liothyronine sodium is equivalent to approximately 100 micrograms of levothyroxine sodium.

Brands without a UK licence may not be bioequivalent and dose adjustment may be necessary.

- **CAUTIONS** Cardiac disorders (monitor ECG; start at low dose and carefully titrate) · diabetes insipidus · diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased) · prolonged hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency) · severe hypothyroidism (initiate corticosteroid therapy in adrenal insufficiency)

- **INTERACTIONS** → Appendix 1 (thyroid hormones).

- **SIDE-EFFECTS** Anginal pain (usually at excessive dosage) · arrhythmias (usually at excessive dosage) · diarrhoea (usually at excessive dosage) · excitability (usually at excessive dosage) · flushing · headache · muscle cramp · muscular weakness · palpitation (usually at excessive dosage) · restlessness (usually at excessive dosage) · sweating · tachycardia (usually at excessive dosage) · weight-loss

- **PREGNANCY** Liothyronine requirement may increase during pregnancy. Does not cross the placenta in significant amounts. Excessive or insufficient maternal thyroid hormones can be detrimental to fetus.

Assess maternal thyroid function before conception (if possible), at diagnosis of pregnancy, at antenatal booking, during both the second and third trimesters, and after delivery (more frequent monitoring required on initiation or adjustment of liothyronine).

- **BREAST FEEDING** Amount too small to affect tests for neonatal hypothyroidism.

● PRESCRIBING AND DISPENSING INFORMATION

Switching to a different brand Patients switched to a different brand should be monitored (particularly if pregnant or if heart disease present) as brands without a UK licence may not be bioequivalent. Pregnant women or those with heart disease should undergo an early review of thyroid status, and other patients should have thyroid function assessed if experiencing a significant change in symptoms. If liothyronine is continued long-term, thyroid function tests should be repeated 1–2 months after any change in brand.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension, oral solution, solution for injection

Tablet

► Liothyronine sodium (Non-proprietary)

Liothyronine sodium 5 microgram Cytomel 5microgram tablets | 100 tablet [PoM] no price available

Liothyronine sodium 20 microgram Liothyronine 20microgram tablets | 28 tablet [PoM] £258.20 DT price = £258.20

Liothyronine sodium 25 microgram Cytomel 25microgram tablets | 100 tablet [PoM] no price available

Powder for solution for injection

► Liothyronine sodium (Non-proprietary)

Liothyronine sodium 20 microgram Liothyronine 20microgram powder for solution for injection vials | 5 vial [PoM] £1,425.00

1 Bladder and urinary disorders

1.1 Urinary frequency, enuresis, and incontinence

Urinary frequency, enuresis and incontinence

Urinary incontinence

Antimuscarinic drugs reduce symptoms of urgency and urge incontinence and increase bladder capacity; oxybutynin hydrochloride p. 457 also has a direct relaxant effect on urinary smooth muscle. Oxybutynin hydrochloride can be considered first for children under 12 years. Side-effects limit the use of oxybutynin hydrochloride, but they may be reduced by starting at a lower dose and then slowly titrating upwards; alternatively oxybutynin hydrochloride can be given by intravesicular instillation. Tolterodine tartrate p. 458 is also effective for urinary incontinence; it can be considered for children over 12 years, or for younger children who have failed to respond to oxybutynin hydrochloride. Modified-release preparations of oxybutynin hydrochloride and tolterodine tartrate are available; they may have fewer side-effects. Antimuscarinic treatment should be reviewed soon after it is commenced, and then at regular intervals; a response generally occurs within 6 months but occasionally may take longer. Children with nocturnal enuresis may require specific additional measures if night-time symptoms also need to be controlled.

Nocturnal enuresis in children

Nocturnal enuresis is common in young children, but persists in a small proportion by 10 years of age. For children under 5 years, reassurance and advice on the management of nocturnal enuresis can be useful for some families. Treatment may be considered in children over 5 years depending on their maturity and motivation, the frequency of nocturnal enuresis, and the needs of the child and their family.

Initially, advice should be given on fluid intake, diet, toileting behaviour, and reward systems; for children who do not respond to this advice, further treatment may be necessary. An **enuresis alarm** should be first line treatment

for motivated, well-supported children; alarms have a lower relapse rate than drug treatment when discontinued. Treatment should be reviewed after 4 weeks, and, if there are early signs of response, continued until a minimum of 2 weeks' uninterrupted dry nights have been achieved. If complete dryness is not achieved after 3 months, only continue if the condition is still improving and the child remains motivated to use the alarm. If initial alarm treatment is unsuccessful, consider combination treatment with **desmopressin p. 403**, or desmopressin alone if the alarm is no longer appropriate or desirable.

Desmopressin is given by oral or by sublingual administration. Desmopressin alone can be offered to children over 5 years of age if an alarm is inappropriate or undesirable, or when rapid or short-term results are the priority (for example to cover periods away from home); desmopressin alone can also be used if there has been a partial response to a combination of desmopressin and an alarm following initial treatment with an alarm. Treatment should be assessed after 4 weeks and continued for 3 months if there are signs of response. Desmopressin should be withdrawn at regular intervals (for 1 week every 3 months) for full reassessment. When stopping treatment with desmopressin, gradual withdrawal should be considered.

Nocturnal enuresis associated with daytime symptoms (overactive bladder) can be managed with antimuscarinic drugs in combination with desmopressin. Treatment should be prescribed only after specialist assessment and should be continued for 3 months; the course can be repeated if necessary.

The tricyclic antidepressant imipramine hydrochloride p. 226 may be considered for children who have not responded to all other treatments and have undergone specialist assessment, however, behavioural disturbances can occur and relapse is common after withdrawal. Treatment should not normally exceed 3 months unless a physical examination is made and the child is fully reassessed; toxicity following overdosage with tricyclics is of particular concern.

ANTIMUSCARINICS**Antimuscarinics (systemic)**

- **CONTRA-INDICATIONS** Gastro-intestinal obstruction · intestinal atony · myasthenia gravis (but some antimuscarinics may be used to decrease muscarinic side-effects of anticholinesterases) · paralytic ileus · pyloric stenosis · severe ulcerative colitis · significant bladder outflow obstruction · toxic megacolon · urinary retention
- **CAUTIONS** Arrhythmias (may be worsened) · autonomic neuropathy · cardiac insufficiency (due to association with tachycardia) · cardiac surgery (due to association with tachycardia) · children (increased risk of side-effects) · conditions characterised by tachycardia · congestive heart failure (may be worsened) · coronary artery disease (may be worsened) · diarrhoea · gastro-oesophageal reflux disease · hiatus hernia with reflux oesophagitis · hypertension · hyperthyroidism (due to association with tachycardia) · individuals susceptible to angle-closure glaucoma · pyrexia · ulcerative colitis
- **INTERACTIONS** → Appendix 1 (antimuscarinics). Many drugs have antimuscarinic effects; concomitant use of two or more such drugs can increase side-effects such as dry mouth, urine retention, and constipation.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Constipation · dilation of pupils with loss of accommodation · dry mouth · photophobia · reduced bronchial secretions · skin dryness · skin flushing · transient bradycardia (followed by tachycardia, palpitation and arrhythmias) · urinary retention · urinary urgency
 - ▶ **Uncommon** Confusion · giddiness · nausea · vomiting
 - ▶ **Very rare** Angle-closure glaucoma
 - ▶ **Frequency not known** Angioedema · blurred vision · blurred vision · central nervous system stimulation · convulsion · diarrhoea · difficulty in micturition · disorientation · dizziness · drowsiness · dry eyes · euphoria · fatigue · flatulence · hallucinations · headache · impaired memory · palpitation · photosensitivity · rash · reduced sweating (may lead to heat sensations and fainting in hot environments or patients with fever) · restlessness · taste disturbances
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks**
Antimuscarinics can affect the performance of skilled tasks (e.g. driving).

ANTIMUSCARINICS

F above

Oxybutynin hydrochloride● **INDICATIONS AND DOSE**

Urinary frequency | Urinary urgency | Urinary incontinence | Neurogenic bladder instability

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
 - ▶ Child 2–4 years: 1.25–2.5 mg 2–3 times a day
 - ▶ Child 5–11 years: Initially 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day
 - ▶ Child 12–17 years: Initially 5 mg 2–3 times a day, increased if necessary up to 5 mg 4 times a day
- ▶ **BY INTRAVESICAL INSTILLATION**
 - ▶ Child 2–17 years: 5 mg 2–3 times a day
- ▶ **BY MOUTH USING MODIFIED-RELEASE TABLETS**
 - ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every 1 week, adjusted according to response; maximum 15 mg per day

Nocturnal enuresis associated with overactive bladder

- ▶ **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**
 - ▶ Child 5–17 years: 2.5–3 mg twice daily, increased to 5 mg 2–3 times a day, last dose to be taken before bedtime
- ▶ **BY MOUTH USING MODIFIED-RELEASE TABLETS**
 - ▶ Child 5–17 years: Initially 5 mg once daily, adjusted in steps of 5 mg every 1 week, adjusted according to response; maximum 15 mg per day

DOSE EQUIVALENCE AND CONVERSION

Patients taking immediate-release oxybutynin may be transferred to the nearest equivalent daily dose of *Lyrinel*® XL

- **UNLICENSED USE** Not licensed for use in children under 5 years. Intravesical instillation not licensed for use in children.
- **CAUTIONS** Acute porphyrias p. 562
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Anorexia · facial flushing
 - ▶ **Rare** Night terrors
- **PREGNANCY** Manufacturers advise avoid unless essential—toxicity in animal studies.
- **BREAST FEEDING** Manufacturers advise avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Manufacturer advises caution.
- **PRESCRIBING AND DISPENSING INFORMATION** The need for therapy for urinary indications should be reviewed soon after it has been commenced and then at regular intervals; a response usually occurs within 6 months but may take longer.
Intravesical instillation may be available from 'special-order' manufacturers or specialist importing companies.
- **PATIENT AND CARER ADVICE**

Tolterodine tartrate 4 mg Santizor XL 4mg capsules | 28 capsule [PoM] £25.78 DT price = £25.78

1.2 Urinary retention**Drugs for urinary retention****Overview**

Acute retention is painful and is treated by catheterisation.

Chronic retention is painless and often long-standing. Clean intermittent catheterisation may be considered. After the cause has been established and treated, drugs may be required to increase detrusor muscle tone.

Alpha-blockers such as doxazosin below and tamsulosin hydrochloride p. 459 can be used in some cases of dysfunctional voiding.

Alpha-blockers

The selective alpha-blockers doxazosin and tamsulosin hydrochloride can be used to improve bladder emptying in children with dysfunctional voiding where the post-void residual urine volume is significant; treatment should be under specialist advice only. Alpha-blockers can reduce blood pressure rapidly after the first dose and should be introduced with caution.

ALPHA-ADRENOCEPTOR BLOCKERS**Doxazosin**● **INDICATIONS AND DOSE****Hypertension**► **BY MOUTH USING IMMEDIATE-RELEASE MEDICINES**

► Child 6-11 years: Initially 500 micrograms once daily, then increased to 2–4 mg once daily, dose should be increased at intervals of 1 week

► Child 12-17 years: Initially 1 mg once daily for 1–2 weeks, then increased to 2 mg once daily, then increased if necessary to 4 mg once daily, rarely doses of up to 16 mg daily may be required

Dysfunctional voiding (initiated under specialist supervision)

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child 4–11 years: Initially 0.5 mg daily, adjusted according to response, dose should be increased at monthly intervals; maximum 2 mg per day
- Child 12–17 years: Initially 1 mg daily, adjusted according to response, dose may be doubled at intervals of 1 month; usual maintenance 2–4 mg daily; maximum 8 mg per day

DOSE EQUIVALENCE AND CONVERSION

Patients stabilised on immediate-release doxazosin can be transferred to the equivalent dose of modified-release doxazosin.

- **UNLICENSED USE** Not licensed for use in children.
 - **CONTRA-INDICATIONS** History of postural hypotension
 - **CAUTIONS** Care with initial dose (postural hypotension) · cataract surgery (risk of intra-operative floppy iris syndrome) · heart failure · pulmonary oedema due to aortic or mitral stenosis
 - **INTERACTIONS** → Appendix 1 (alpha-blockers).
 - **SIDE-EFFECTS**
 - **Common or very common** Anxiety · back pain · coughing · dyspnoea · fatigue · influenza-like symptoms · myalgia · paraesthesia · sleep disturbance · vertigo
 - **Uncommon** Agitation · angina · arthralgia · epistaxis · gout · hyposensitivity · impotence · micturition disturbance · myocardial infarction · purpura · tinnitus · tremor · weight changes
 - **Very rare** Abnormal ejaculation · alopecia · arrhythmias · bradycardia · bronchospasm · cholestasis · gynaecomastia · hepatitis · hot flushes · jaundice · leucopenia · thrombocytopenia
 - **Frequency not known** Asthenia · blurred vision · depression · dizziness · gastro-intestinal disturbances · headache · hypersensitivity · hypotension · oedema · palpitations · postural hypotension · priapism · pruritus · rash · rhinitis · syncope · tachycardia
 - **PREGNANCY** No evidence of teratogenicity; manufacturers advise use only when potential benefit outweighs risk.
 - **BREAST FEEDING** Accumulates in milk in *animal* studies—manufacturer advises avoid.
 - **HEPATIC IMPAIRMENT** Use with caution. Manufacturer advises avoid in severe impairment—no information available.
 - **PATIENT AND CARER ADVICE** Patient counselling is advised for doxazosin tablets (initial dose).
- Driving and skilled tasks**
May affect performance of skilled tasks e.g. driving.

ALKALISING DRUGS > ALKALISING DRUGS, URINARY**Citric acid with potassium citrate****• INDICATIONS AND DOSE****Relief of discomfort in mild urinary-tract infections | Alkalinisation of urine**

► BY MOUTH USING ORAL SOLUTION

- Child 1–5 years: 5 mL 3 times a day, diluted well with water
- Child 6–17 years: 10 mL 3 times a day, diluted well with water

- **CAUTIONS** Cardiac disease
- **INTERACTIONS** → Appendix 1 (potassium salts).
- **SIDE-EFFECTS** Hyperkalaemia on prolonged high dosage • mild diuresis
- **RENAL IMPAIRMENT** Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.
- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Potassium Citrate Mixture BP consists of potassium citrate 30%, citric acid monohydrate 5% in a suitable vehicle with a lemon flavour. Extemporaneous preparations should be recently prepared according to the following formula: potassium citrate 3 g, citric acid monohydrate 500 mg, syrup 2.5 mL, quillaia tincture 0.1 mL, lemon spirit 0.05 mL, double-strength chloroform water 3 mL, water to 10 mL. Contains about 28 mmol K⁺/10 mL.
- **EXCEPTIONS TO LEGAL CATEGORY** Proprietary brands of potassium citrate are on sale to the public for the relief of discomfort in mild urinary-tract infections.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Oral solution
CAUTIONARY AND ADVISORY LABELS 27
► **Citric acid with potassium citrate (Non-proprietary)**

1.3 Urological pain**Urological pain****Treatment**

Lidocaine hydrochloride gel p. 780 is a useful topical application in *urethral pain* or to relieve the discomfort of catheterisation.

Alkalinisation of urine

Alkalinisation of urine can be undertaken with potassium citrate. The alkalinising action may relieve the discomfort of *cystitis* caused by lower urinary tract infections.

2 Bladder instillations and urological surgery**Bladder instillations and urological surgery****Bladder infection**

Various solutions are available as irrigations or washouts.

Aqueous chlorhexidine p. 656 can be used in the management of common infections of the bladder but it is ineffective against most *Pseudomonas spp.* Solutions containing chlorhexidine 1 in 5000 (0.02%) are used but they may irritate the mucosa and cause burning and haematuria (in which case they should be discontinued); sterile sodium chloride solution 0.9% p. 547 (physiological saline) is usually adequate and is preferred as a mechanical irrigant.

Dissolution of blood clots

Clot retention is usually treated by irrigation with sterile sodium chloride solution 0.9% but sterile sodium citrate solution for bladder irrigation 3% may also be helpful.

Maintenance of indwelling urinary catheters

The deposition which occurs in catheterised patients is usually chiefly composed of phosphate and to minimise this the catheter (if latex) should be changed at least as often as every 6 weeks. If the catheter is to be left for longer periods a silicone catheter should be used together with the appropriate use of catheter maintenance solutions. Repeated blockage usually indicates that the catheter needs to be changed.

Catheter maintenance solutions

• CATHETER MAINTENANCE SOLUTIONS

OptiFlo R citric acid 6% catheter maintenance solution (Bard Ltd) 50 ml • NHS indicative price = £3.56 • Drug Tariff (Part IXa) 100 ml • NHS indicative price = £3.56 • Drug Tariff (Part IXa)

Uro-Tainer Twin Solutio R citric acid 6% catheter maintenance solution (B.Braun Medical Ltd) 60 ml • NHS indicative price = £4.81 • Drug Tariff (Part IXa)

OptiFlo S saline 0.9% catheter maintenance solution (Bard Ltd) **Sodium chloride 9 mg per 1 ml** 50 ml • NHS indicative price = £3.36 • Drug Tariff (Part IXa) 100 ml • NHS indicative price = £3.36 • Drug Tariff (Part IXa)

3 Contraception

Contraceptives, hormonal

Overview

The Fraser Guidelines (Department of Health Guidance (July 2004): Best practice guidance for doctors and other health professionals on the provision of advice and treatment to young people under 16 on contraception, sexual and reproductive health, available at www.tinyurl.com/bpg16) should be followed when prescribing contraception for women under 16 years. The UK Medical Eligibility Criteria for Contraceptive Use (available at www.fsrh.org) is published by the Faculty of Sexual and Reproductive Healthcare; it categorises the risks of using contraceptive methods with pre-existing medical conditions.

Hormonal contraception is the most effective method of fertility control, but can have major and minor side-effects, especially for certain groups of women. Hormonal contraception should only be used by adolescents after menarche.

Intra-uterine devices are a highly effective method of contraception but may produce undesirable local side-effects. They may be used in women of all ages irrespective of parity, but are less appropriate for those with an increased risk of pelvic inflammatory disease.

Barrier methods alone (condoms, diaphragms, and caps) are less effective but can be reliable for well-motivated couples if used in conjunction with a **spermicide**. Occasionally sensitivity reactions occur. A female condom (*Femidom*®) is also available; it is pre-lubricated but does not contain a spermicide.

Combined hormonal contraceptives

Oral contraceptives containing an oestrogen and a progestogen ('combined oral contraceptives') are effective

preparations for general use. Advantages of combined oral contraceptives include:

- reliable and reversible;
- reduced dysmenorrhoea and menorrhagia;
- reduced incidence of premenstrual tension;
- less symptomatic fibroids and functional ovarian cysts;
- less benign breast disease;
- reduced risk of ovarian and endometrial cancer;
- reduced risk of pelvic inflammatory disease.

Combined oral contraceptives containing a fixed amount of an oestrogen and a progestogen in each active tablet are termed 'monophasic'; those with varying amounts of the two hormones are termed 'phasic'. A transdermal patch and a vaginal ring, both containing an oestrogen with a progestogen, are also available.

Combined Oral Contraceptives Monophasic 21-day preparations

Oestrogen content	Progestogen content	Brand

Choice

The majority of combined oral contraceptives contain ethinylestradiol p. 446 as the oestrogen component; mestranol and estradiol are also used. The ethinylestradiol content of combined oral contraceptives ranges from 20 to 40 micrograms. Generally a preparation with the lowest oestrogen and progestogen content which gives good cycle control and minimal side-effects in the individual woman is chosen. It is recommended that combined hormonal contraceptives are not continued beyond 50 years of age since more suitable alternatives exist.

- *Low strength preparations* (containing ethinylestradiol 20 micrograms) are particularly appropriate for women with risk factors for circulatory disease, provided a combined oral contraceptive is otherwise suitable.
- *Standard strength preparations* (containing ethinylestradiol 30 or 35 micrograms or in 30–40 microgram *phased* preparations) are appropriate for standard use. Phased preparations are generally reserved for women who *either* do not have withdrawal bleeding or who have breakthrough bleeding with monophasic products.

The progestogens ethinylestradiol with desogestrel p. 467, ethinylestradiol with drospirenone p. 468, and ethinylestradiol with gestodene p. 469 may be considered for women who have side-effects (such as acne, headache, depression, breast symptoms, and breakthrough bleeding) with other progestogens. Drospirenone, a derivative of spironolactone, has anti-androgenic and anti-mineralocorticoid activity; it should be used with care if an increased plasma-potassium concentration might be hazardous.

Dienogest with estradiol valerate p. 467 is in the combined oral contraceptive *Qlaira*®. Nomegestrol is the progestogen contained in the combined oral contraceptive *Zoely*®, in combination with estradiol.

The progestogen norelgestromin is combined with ethinylestradiol in a transdermal patch (*Evra*®). The vaginal contraceptive ring contains the progestogen etonogestrel combined with ethinylestradiol (*NuvaRing*®).

Surgery

Oestrogen-containing contraceptives should preferably be discontinued (and adequate alternative contraceptive arrangements made) 4 weeks before major elective surgery and all surgery to the legs or surgery which involves prolonged immobilisation of a lower limb; they should normally be recommended at the first menses occurring at least 2 weeks after full mobilisation. A progestogen-only contraceptive may be offered as an alternative and the oestrogen-containing contraceptive restarted after mobilisation. When discontinuation of an oestrogen-containing contraceptive is not possible, e.g. after trauma or if a patient admitted for an elective procedure is still on an oestrogen-containing contraceptive, thromboprophylaxis (with unfractionated or low molecular weight heparin and graduated compression hosiery) is advised. These recommendations do not apply to minor surgery with short duration of anaesthesia, e.g. laparoscopic sterilisation or tooth extraction, or to women using oestrogen-free hormonal contraceptives.

Reason to stop immediately

Combined hormonal contraceptives or hormone replacement therapy (HRT) should be stopped (pending investigation and treatment), if any of the following occur:

- sudden severe chest pain (even if not radiating to left arm);
- sudden breathlessness (or cough with blood-stained sputum);
- unexplained swelling or severe pain in calf of one leg;
- severe stomach pain;
- serious neurological effects including unusual severe, prolonged headache especially if first time or getting

progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body;

- hepatitis, jaundice, liver enlargement;
- blood pressure above systolic 160 mmHg or diastolic 95 mmHg; (in adolescents stop if blood pressure very high);
- prolonged immobility after surgery or leg injury;
- detection of a risk factor which contra-indicates treatment.

Progestogen-only contraceptives

Oral progestogen-only contraceptives

Oral progestogen-only preparations alter cervical mucus to prevent sperm penetration and may inhibit ovulation in some women; oral desogestrel-only preparations consistently inhibit ovulation and this is their primary mechanism of action. There is insufficient clinical trial evidence to compare the efficacy of oral progestogen-only contraceptives with each other or with combined hormonal contraceptives. Progestogen-only contraceptives offer a suitable alternative to combined hormonal contraceptives when oestrogens are contra-indicated (including those with venous thrombosis or a past history or predisposition to venous thrombosis, heavy smokers, those with hypertension above systolic 160 mmHg or diastolic 95 mmHg, valvular heart disease, diabetes mellitus with complications, and migraine with aura).

Parenteral progestogen-only contraceptives

Medroxyprogesterone acetate (*Depo-Provera*®, *SAYANA PRESS*®) p. 478 is a long-acting progestogen given by injection; it is at least as effective as the combined oral preparations but because of its prolonged action it should never be given without *full counselling backed by the patient information leaflet*. It may be used as a short-term or long-term contraceptive for women who have been counselled about the likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility. Troublesome bleeding has been reported in patients given medroxyprogesterone acetate in the immediate puerperium; delaying the first injection until 6 weeks after birth may minimise bleeding problems. If the woman is not breast-feeding, the first injection may be given within 5 days postpartum (she should be warned that the risk of troublesome bleeding may be increased).

- In adolescents, medroxyprogesterone acetate (*Depo-Provera*®, *SAYANA PRESS*®) should be used only when other methods of contraception are inappropriate;
- in all women, the benefits of using medroxyprogesterone acetate beyond 2 years should be evaluated against the risks;
- in women with risk factors for osteoporosis, a method of contraception other than medroxyprogesterone acetate should be considered.

Norethisterone enantate (*Noristerat*®) is a long-acting progestogen given as an oily injection which provides contraception for 8 weeks; it is used as short-term interim contraception e.g. before vasectomy becomes effective.

An **etonogestrel-releasing implant** (*Nexplanon*®) is also available. It is a highly effective long-acting contraceptive, consisting of a single flexible rod that is inserted subdermally into the lower surface of the upper arm and provides contraception for up to 3 years. The manufacturer advises that in heavier women, blood-etonogestrel concentrations are lower and therefore the implant may not provide effective contraception during the third year; they advise that earlier replacement may be considered in such

patients—however, evidence to support this recommendation is lacking. Local reactions such as bruising and itching can occur at the insertion site. The contraceptive effect of etonogestrel is rapidly reversed on removal of the implant.

Intra-uterine progestogen-only device

The progestogen-only intra-uterine systems *Mirena*®, *Jaydess*® and *Levosert*® release levonorgestrel p. 475 directly into the uterine cavity. *Mirena*® is licensed for use as a contraceptive, for the treatment of primary menorrhagia and for the prevention of endometrial hyperplasia during oestrogen replacement therapy. *Jaydess*® and *Levosert*® are licensed for contraception, and *Levosert*® is additionally licensed for the treatment of menorrhagia. These may therefore be a contraceptive method of choice for women who have excessively heavy menses.

The effects of the progestogen-only intra-uterine system are mainly local and hormonal including prevention of endometrial proliferation, thickening of cervical mucus, and suppression of ovulation in some women (in some cycles). In addition to the progestogenic activity, the intra-uterine system itself may contribute slightly to the contraceptive effect. Return of fertility after removal is rapid and appears to be complete.

Advantages of the progestogen-only intra-uterine system over copper intra-uterine devices are that there may be an improvement in any dysmenorrhoea and a reduction in blood loss; there is also evidence that the frequency of pelvic inflammatory disease may be reduced (particularly in the youngest age groups who are most at risk).

In primary menorrhagia, menstrual bleeding is reduced significantly within 3–6 months of inserting the progestogen-only intra-uterine system, probably because it prevents endometrial proliferation. Another treatment should be considered if menorrhagia does not improve within this time.

Surgery

All progestogen-only contraceptives (including those given by injection) are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Emergency contraception

Hormonal methods

Hormonal emergency contraceptives include levonorgestrel and ulipristal acetate p. 473; either drug should be taken as soon as possible after unprotected intercourse to increase efficacy.

Levonorgestrel is effective if taken within 72 hours (3 days) of unprotected intercourse and may also be used between 72 and 96 hours after unprotected intercourse [unlicensed use], but efficacy decreases with time. Ulipristal acetate, a progesterone receptor modulator, is effective if taken within 120 hours (5 days) of unprotected intercourse.

Levonorgestrel is less effective than insertion of an intra-uterine device. Ulipristal acetate is as effective as levonorgestrel, but its efficacy compared to an intra-uterine device is not yet known.

Intra-uterine device

Insertion of an intra-uterine device is more effective than oral levonorgestrel for emergency contraception. A copper intra-uterine contraceptive device can be inserted up to 120 hours (5 days) after unprotected intercourse; sexually transmitted infections should be tested for and insertion of the device should usually be covered by antibacterial prophylaxis (e.g. azithromycin p. 308). If intercourse has occurred more than 5 days previously, the device can still be inserted up to 5 days after the earliest likely calculated ovulation (i.e. within the minimum period before

implantation), regardless of the number of episodes of unprotected intercourse earlier in the cycle.

Contraceptives, interactions

Combined hormonal contraceptives interactions

The effectiveness of *combined* oral contraceptives, *progestogen-only* oral contraceptives, contraceptive patches, and vaginal rings can be considerably reduced by interaction with drugs that induce hepatic enzyme activity (e.g. carbamazepine p. 184, nevirapine p. 389, oxcarbazepine p. 192, phenytoin p. 193, phenobarbital p. 203, primidone p. 204, ritonavir p. 397, **St John's Wort**, topiramate p. 199 and, above all, rifabutin p. 341 and rifampicin p. 342). A condom together with a long-acting method, such as an injectable contraceptive, may be more suitable for patients with HIV infection or at risk of HIV infection; advice on the possibility of interaction with antiretroviral drugs should be sought from HIV specialists.

Women taking combined hormonal contraceptives who require enzyme-inducing drugs should be advised to change to a contraceptive method that is unaffected by enzyme-inducers (e.g. some parenteral progestogen-only contraceptives, intra-uterine devices) for the duration of treatment and for 4 weeks after stopping. If a change in contraceptive method is undesirable or inappropriate the following options should be discussed:

- For a short course (2 months or less) of an enzyme-inducing drug, continue with a combined oral contraceptive providing ethinylestradiol 30 micrograms or more daily and use a 'tricycling' regimen (i.e. taking 3 packets of monophasic tablets without a break followed by a shortened tablet-free interval of 4 days [unlicensed use]). Additional contraceptive precautions should also be used whilst taking the enzyme-inducing drug and for 4 weeks after stopping. Another option (except for rifampicin or rifabutin) is to follow the advice for long-term courses, below.

For women using combined hormonal contraceptive patches or vaginal rings, additional contraceptive precautions are also required whilst taking the enzyme-inducing drug and for 4 weeks after stopping. If concomitant administration runs beyond the 3 weeks of patch or vaginal ring use, a new treatment cycle should be started immediately, without a patch-free or ring-free break.

- For a long-term course (over 2 months) of an enzyme-inducing drug (except rifampicin or rifabutin), adjust the dose of combined oral contraceptive to provide ethinylestradiol 50 micrograms or more daily [unlicensed use] and use a 'tricycling' regimen; continue for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

If breakthrough bleeding occurs (and all other causes are ruled out) it is recommended that the dose of ethinylestradiol is increased by increments of 10 micrograms up to a maximum of 70 micrograms daily [unlicensed use], or to use additional precautions, or to change to a method unaffected by enzyme-inducing drugs.

Contraceptive patches and vaginal rings are not recommended for women taking enzyme-inducing drugs over a long period.

- For a long-term course (over 2 months) of rifampicin or rifabutin, an alternative method of contraception (such as an IUD) is **always** recommended because they are such potent enzyme-inducing drugs; the alternative method of contraception should be continued for 4 weeks after stopping the enzyme-inducing drug.

Antibacterials that do not induce liver enzymes

Latest recommendations are that no additional contraceptive precautions are required when *combined* oral

contraceptives are used with antibacterials that do not induce liver enzymes (e.g. ampicillin p. 321, doxycycline p. 332), unless diarrhoea or vomiting occur. These recommendations should be discussed with the woman, who should also be advised that guidance in patient information leaflets may differ.

It is also currently recommended that no additional contraceptive precautions are required when contraceptive patches or vaginal rings are used with antibacterials that do not induce liver enzymes. There have been concerns that some antibacterials that do not induce liver enzymes reduce the efficacy of *combined* oral contraceptives by impairing the bacterial flora responsible for recycling ethinylestradiol from the large bowel; however, there is a lack of evidence to support this interaction.

Oral progestogen-only contraceptives interactions

Effectiveness of oral progestogen-only preparations is not affected by antibacterials that do not induce liver enzymes. The efficacy of oral progestogen-only preparations is, however, reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with an enzyme-inducing drug and for at least 4 weeks afterwards. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the progestogen-only oral method may be continued in combination with additional contraceptive precautions (e.g. barrier methods) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping.

Parenteral progestogen-only contraceptives interactions

Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of norethisterone intramuscular injection p. 447 and medroxyprogesterone acetate intramuscular and subcutaneous injections p. 478 is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs. However, effectiveness of the etonogestrel-releasing implant p. 477 may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.

Hormonal emergency contraception interactions

The effectiveness of levonorgestrel p. 475, and possibly ulipristal acetate p. 473, is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

Contraceptives, non-hormonal

Spermicidal contraceptives

Spermicidal contraceptives are useful additional safeguards but do **not** give adequate protection if used alone unless fertility is already significantly diminished. They have two

components: a spermicide and a vehicle which itself may have some inhibiting effect on sperm activity. They are suitable for use with barrier methods, such as diaphragms or caps; however, spermicidal contraceptives are not generally recommended for use with condoms, as there is no evidence of any additional protection compared with non-spermicidal lubricants.

Spermicidal contraceptives are not suitable for use in those with or at high risk of sexually transmitted infections (including HIV); high frequency use of the spermicide nonoxinol '9' p. 479 has been associated with genital lesions, which may increase the risk of acquiring these infections.

Products such as petroleum jelly (*Vaseline*®), baby oil and oil-based vaginal and rectal preparations are likely to damage condoms and contraceptive diaphragms made from latex rubber, and may render them less effective as a barrier method of contraception and as a protection from sexually transmitted infections (including HIV).

Contraceptive devices

Intra-uterine devices

The intra-uterine device (IUD) is a suitable contraceptive for women of all ages irrespective of parity; however, it is less appropriate for those with an increased risk of pelvic inflammatory disease e.g. women under 25 years.

The most effective intra-uterine devices have at least 380 mm² of copper and have banded copper on the arms. Smaller devices have been introduced to minimise side-effects; these consist of a plastic carrier wound with copper wire or fitted with copper bands; some also have a central core of silver to prevent fragmentation of the copper.

Fertility declines with age and therefore a copper intra-uterine device which is fitted in a woman over the age of 40, may remain in the uterus until menopause.

A frameless, copper-bearing intra-uterine device (*Gyne Fix*®) is also available. It consists of a knotted, polypropylene thread with 6 copper sleeves; the device is anchored in the uterus by inserting the knot into the uterine fundus.

(increased risk of pancreatitis) · risk factors for arterial disease · risk factors for venous thromboembolism · sickle-cell disease · undiagnosed breast mass

CAUTIONS, FURTHER INFORMATION

- ▶ Risk of venous thromboembolism There is an increased risk of venous thromboembolic disease in users of combined hormonal contraceptives particularly during the first year and possibly after restarting combined hormonal contraceptives following a break of four weeks or more. This risk is considerably smaller than that associated with pregnancy (about 60 cases of venous thromboembolic disease per 100 000 pregnancies). In all cases the risk of venous thromboembolism increases with age and in the presence of other risk factors, such as obesity. The risk also varies depending on the type of progestogen.

Provided that women are informed of the relative risks of venous thromboembolism and accept them, the choice of oral contraceptive is for the woman together with the prescriber jointly to make in light of her individual medical history and any contra-indications.

Combined hormonal contraceptives also slightly increase the risk of arterial thromboembolism; however, there is no evidence to suggest that this risk varies between different preparations.

- ▶ Risk factors for venous thromboembolism Use with **caution** if any of following factors present but **avoid** if two or more factors present:
 - *family history of venous thromboembolism* in first-degree relative aged under 45 years (avoid contraceptive containing desogestrel or gestodene, or avoid if known prothrombotic coagulation abnormality e.g. factor V Leiden or antiphospholipid antibodies (including lupus anticoagulant));
 - *obesity*; body mass index ≥ 30 kg/m² (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
 - *long-term immobilisation* e.g. in a wheelchair (avoid if confined to bed or leg in plaster cast);
 - *history of superficial thrombophlebitis*;
 - *age* over 35 years (avoid if over 50 years);
 - *smoking*.

3.1 Contraception, combined

OESTROGENS COMBINED WITH PROGESTOGENS

Combined hormonal contraceptives

- **CONTRA-INDICATIONS** Acute porphyrias p. 562 · gallstones · heart disease associated with pulmonary hypertension or risk of embolus · history during pregnancy of cholestatic jaundice · history during pregnancy of chorea · history during pregnancy of pemphigoid gestationis · history during pregnancy of pruritus · history of breast cancer (but can be used after 5 years if no evidence of disease and non-hormonal methods unacceptable) · history of haemolytic uraemic syndrome · migraine with aura · personal history of venous or arterial thrombosis · sclerosing treatment for varicose veins · severe or multiple risk factors for arterial disease · severe or multiple risk factors for venous thromboembolism · systemic lupus erythematosus · transient cerebral ischaemic attacks without headaches · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · Crohn's disease · gene mutations associated with breast cancer (e.g. BRCA 1) · history of severe depression especially if induced by hormonal contraceptive · hyperprolactinaemia (seek specialist advice) · inflammatory bowel disease · migraine · personal or family history of hypertriglyceridaemia

Combined Hormonal Contraception and Risk of Venous Thromboembolism

- ▶ Risk factors for arterial disease Use with **caution** if any one of following factors present but **avoid** if two or more factors present:

- **family history of arterial disease** in first degree relative aged under 45 years (avoid if atherogenic lipid profile);
- **diabetes mellitus** (avoid if diabetes complications present);
- **hypertension**; blood pressure above systolic 140 mmHg or diastolic 90 mmHg (avoid if blood pressure above systolic 160 mmHg or diastolic 95 mmHg); (in adolescents, avoid if blood pressure very high);
- **smoking** (avoid if smoking 40 or more cigarettes daily);
- **age** over 35 years (avoid if over 50 years);
- **obesity** (avoid if body mass index ≥ 35 kg/m² unless no suitable alternative); (in adolescents, caution if obese according to BMI (adjusted for age and gender); in those who are markedly obese, avoid unless no suitable alternative);
- **migraine without aura** (avoid if *migraine with aura* (focal symptoms), or severe migraine frequently lasting over 72 hours despite treatment, or migraine treated with ergot derivatives).
- **Migraine** Women should report any increase in headache frequency or onset of focal symptoms (discontinue immediately and refer urgently to neurology expert if focal neurological symptoms not typical of aura persist for more than 1 hour).

Combined hormonal contraceptives should be stopped (pending investigation and treatment), if serious neurological effects occur, including unusual severe, prolonged headache especially if first time or getting progressively worse or sudden partial or complete loss of vision or sudden disturbance of hearing or other perceptual disorders or dysphasia or bad fainting attack or collapse or first unexplained epileptic seizure or weakness, motor disturbances, very marked numbness suddenly affecting one side or one part of body.

- **INTERACTIONS** → Appendix 1 (oestrogens, progestogens).

● **SIDE-EFFECTS**

- **Rare** Gallstones · systemic lupus erythematosus
- **Frequency not known** Abdominal cramps · absence of withdrawal bleeding · amenorrhoea after discontinuation · breast enlargement · breast secretion · breast tenderness · cervical erosion · changes in libido · changes in lipid metabolism · changes in vaginal discharge · chloasma · chorea · contact lenses may irritate · depression · fluid retention · headache · hepatic tumours · hypertension · irritability · leg cramps · liver impairment · nausea · nervousness · photosensitivity · reduced menstrual loss · skin reactions · thrombosis (more common when factor V Leiden present or in blood groups A, B, and AB) · visual disturbances · vomiting · 'spotting' in early cycles

SIDE-EFFECTS, FURTHER INFORMATION

- **Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women taking the combined oral contraceptive pill; this relative risk may be due to an earlier diagnosis. In users of combined oral contraceptive pills the cancers are more likely to be localised to the breast. The most important factor for diagnosing breast cancer appears to be the age at which the contraceptive is stopped rather than the duration of use; any increase in the rate of diagnosis diminishes gradually during the 10 years after stopping and disappears by 10 years.
- **Cervical cancer** Use of combined oral contraceptives for 5 years or longer is associated with a small increased risk of cervical cancer; the risk diminishes after stopping and disappears by about 10 years.

The possible small increase in the risk of breast cancer and cervical cancer should be weighed against the protective effect against cancers of the ovary and endometrium.

- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Avoid until weaning or for 6 months after birth (adverse effects on lactation).

- **HEPATIC IMPAIRMENT** Avoid in active liver disease including disorders of hepatic excretion (e.g. Dubin-Johnson or Rotor syndromes), infective hepatitis (until liver function returns to normal), liver tumours.

● **DIRECTIONS FOR ADMINISTRATION**

- **With oral use** Each tablet should be taken at approximately same time each day; if delayed, contraceptive protection may be lost. **21-day combined preparations**, 1 tablet daily for 21 days; subsequent courses repeated after a 7-day interval (during which withdrawal bleeding occurs); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days. **Every day (ED) combined preparations**, 1 active tablet daily for 21 days, followed by 1 inactive tablet daily for 7 days; subsequent courses repeated without interval (withdrawal bleeding occurs when inactive tablets being taken); if reasonably certain woman is not pregnant, first course can be started on any day of cycle—if starting on day 6 of cycle or later, additional precautions (barrier methods) necessary during first 7 days.

Changing to combined preparation containing different progestogen If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start the first active tablet of new brand immediately. See individual monographs for requirements of specific preparations. Changing from progestogen-only tablet If previous contraceptive used correctly, or pregnancy can reasonably be excluded, start new brand immediately, additional precautions (barrier methods) necessary for first 7 days. Secondary amenorrhoea (exclude pregnancy) Start any day, additional precautions (barrier methods) necessary during first 7 days (9 days for *Qlaira*®). After childbirth (not breast-feeding) Start 3 weeks after birth (increased risk of thrombosis if started earlier); later than 3 weeks postpartum additional precautions (barrier methods) necessary for first 7 days (9 days for *Qlaira*®). After abortion or miscarriage Start same day.

● **PATIENT AND CARER ADVICE**

Missed doses

Missed pill The critical time for loss of contraceptive protection is when a pill is omitted at the *beginning or end* of a cycle (which lengthens the pill-free interval).

If a woman forgets to take a pill, it should be taken as soon as she remembers, and the next one taken at the normal time (even if this means taking 2 pills together). A missed pill is one that is 24 or more hours late. If a woman misses only one pill, she should take an active pill as soon as she remembers and then resume normal pill-taking. No additional precautions are necessary.

If a woman misses 2 or more pills (especially from the first 7 in a packet), she may not be protected. She should take an active pill as soon as she remembers and then resume normal pill-taking. In addition, she must either abstain from sex or use an additional method of contraception such as a condom for the next 7 days. If these 7 days run beyond the end of the packet, the next packet should be started at once, omitting the pill-free interval (or, in the case of *everyday* (ED) pills, omitting the 7 inactive tablets).

Emergency contraception is recommended if 2 or more combined oral contraceptive tablets are missed from the first 7 tablets in a packet and unprotected intercourse has occurred since finishing the last packet.

Travel Women taking oral contraceptives are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of combined oral contraceptives. If vomiting occurs within 2 hours of taking a combined oral contraceptive another pill should be taken as soon as possible. In cases of persistent vomiting or severe diarrhoea lasting more than 24 hours, additional precautions should be used during and for 7 days after recovery. If the vomiting and diarrhoea occurs during the last 7 tablets, the next pill-free interval should be omitted (in the case of ED tablets the inactive ones should be omitted).

Dienogest with estradiol valerate

● INDICATIONS AND DOSE

Contraception with 28-day combined preparations | Menstrual symptoms with 28-day combined preparations

► BY MOUTH

- Females of childbearing potential: 1 active tablet once daily for 26 days, followed by 1 inactive tablet daily for 2 days, withdrawal bleeding may occur during the 2-day interval of *inactive* tablets, tablets should be taken at approximately the same time each day

- **UNLICENSED USE** Consult product literature for the licensing status.

● DIRECTIONS FOR ADMINISTRATION

- Changing to *Qlaira*®: start the first active *Qlaira*® tablet on the day after taking the last active tablet of the previous brand

● PATIENT AND CARER ADVICE

Missed doses

A missed pill for a patient taking *Qlaira*® is one that is 12 hours or more late; for information on how to manage missed pills in women taking *Qlaira*®, refer to product literature.

Diarrhoea and vomiting In cases of persistent vomiting or severe diarrhoea lasting more than 12 hours in women taking *Qlaira*®, refer to product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

F 465

Ethinylestradiol with etonogestrel

• INDICATIONS AND DOSE

Contraception | Menstrual symptoms

- ▶ BY VAGINA
- ▶ Females of childbearing potential: 1 unit, insert the ring into the vagina on day 1 of cycle and leave in for 3 weeks; remove ring on day 22; subsequent courses repeated after 7-day ring free interval (during which withdrawal bleeding occurs)

• DIRECTIONS FOR ADMINISTRATION

Changing method of contraception to vaginal ring
Changing from combined hormonal contraception Insert ring at the latest on the day after the usual tablet-free, patch-free, or inactive-tablet interval. If previous contraceptive used correctly, or pregnancy can reasonably be excluded, can switch to ring on any day of cycle.

Changing from progestogen-only method From an implant or intra-uterine progestogen-only device, insert ring on the day implant or intra-uterine progestogen-only device removed; from an injection, insert ring when next injection due; from oral preparation, first ring may be inserted on any day after stopping pill. For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

• PATIENT AND CARER ADVICE

Patients or carers should be given advice on how to administer vaginal ring.

Counselling The presence of the ring should be checked regularly.

Missed doses

Expulsion, delayed insertion or removal, or broken vaginal ring

If the vaginal ring is expelled for *less than 3 hours*, rinse the ring with cool water and reinsert immediately; no additional contraception is needed.

If the ring remains outside the vagina for *more than 3 hours* or if the user does not know when the ring was expelled, contraceptive protection may be reduced:

- If ring expelled during week 1 or 2 of cycle, rinse ring with cool water and reinsert; use additional precautions (barrier methods) for next 7 days;
- If ring expelled during week 3 of cycle, either insert a new ring to start a new cycle or allow a withdrawal bleed and insert a new ring no later than 7 days after ring was expelled; latter option only available if ring was used continuously for at least 7 days before expulsion.

If insertion of a new ring at the start of a new cycle is delayed, contraceptive protection is lost. A new ring should be inserted as soon as possible; additional precautions (barrier methods) should be used for the first 7 days of the new cycle. If intercourse occurred during the extended ring-free interval, pregnancy should be considered.

No additional contraception is required if removal of the ring is delayed by up to 1 week (4 weeks of continuous use). The 7-day ring-free interval should be observed and subsequently a new ring should be inserted. Contraceptive protection may be reduced with continuous use of the ring for more than 4 weeks—pregnancy should be ruled out before inserting a new ring.

If the ring breaks during use, remove it and insert a new ring immediately; additional precautions (barrier methods) should be used for the first 7 days of the new cycle.

Ethinylestradiol with norelgestromin

● **INDICATIONS AND DOSE****Contraception | Menstrual symptoms**► **BY TRANSDERMAL APPLICATION**

- **Females of childbearing potential:** Apply 1 patch once weekly for 3 weeks, apply first patch on day 1 of cycle, change patch on days 8 and 15; remove third patch on day 22 and apply new patch after 7-day patch-free interval to start subsequent contraceptive cycle, subsequent courses repeated after a 7-day patch free interval (during which withdrawal bleeding occurs)

- **UNLICENSED USE** Consult product literature for the licensing status of individual preparations.
- **DIRECTIONS FOR ADMINISTRATION** Adhesives or bandages should not be used to hold patch in place. If no longer sticky do not reapply but use a new patch. Changing to a transdermal combined hormonal contraceptive
- Changing from combined oral contraception** Apply patch on the first day of withdrawal bleeding; if no withdrawal bleeding within 5 days of taking last active tablet, rule out pregnancy before applying first patch. Unless patch is applied on first day of withdrawal bleeding, additional precautions (barrier methods) should be used concurrently for first 7 days.

Changing from progestogen-only method

- from an implant, apply first patch on the day implant removed
 - from an injection, apply first patch when next injection due
 - from oral progestogen, first patch may be applied on any day after stopping pill
- For all methods additional precautions (barrier methods) should be used concurrently for first 7 days.

After childbirth (not breast-feeding) Start 4 weeks after birth; if started later than 4 weeks after birth additional precautions (barrier methods) should be used for first 7 days.

After abortion or miscarriage Before 20 weeks'

gestation start immediately; no additional contraception required if started immediately. After 20 weeks' gestation start on day 21 after abortion or on the first day of first spontaneous menstruation; additional precautions (barrier methods) should be used for first 7 days after applying the patch.

● **PATIENT AND CARER ADVICE**

Patients and carers should be given advice on how to administer patches.

Missed doses

Delayed application or detached patch If a patch is partly detached for less than 24 hours, reapply to the same site or replace with a new patch immediately; no additional contraception is needed and the next patch should be applied on the usual 'change day'. If a patch remains detached for more than 24 hours or if the user is not aware when the patch became detached, then stop the current contraceptive cycle and start a new cycle by applying a new patch, giving a new 'Day 1'; an additional non-hormonal contraceptive must be used concurrently for the first 7 days of the new cycle.

- If application of a new patch at the start of a new cycle is delayed, contraceptive protection is lost. A new patch should be applied as soon as remembered giving a new 'Day 1'; additional non-hormonal methods of contraception should be used for the first 7 days of the new cycle. If application of a patch in the middle of the cycle is delayed (i.e. the patch is not changed on day 8 or day 15):
- for up to 48 hours, apply a new patch immediately; next patch 'change day' remains the same and no additional contraception is required;
 - for more than 48 hours, contraceptive protection may have been lost. Stop the current cycle and start a new 4-week cycle immediately by applying a new patch giving a new 'Day 1'; additional non-hormonal contraception should be used for the first 7 days of the new cycle.

If the patch is not removed at the end of the cycle (day 22), remove it as soon as possible and start the next cycle on the usual 'change day', the day after day 28; no additional contraception is required.

Travel Women using patches are at an increased risk of deep vein thrombosis during travel involving long periods of immobility (over 3 hours). The risk may be reduced by appropriate exercise during the journey and possibly by wearing graduated compression hosiery.

● **NATIONAL FUNDING/ACCESS DECISIONS****Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (September 2003) that *Evra*® patches should be restricted for use in women who are likely to comply poorly with combined oral contraceptives.

3.2 Contraception, devices

Drugs used for contraception, devices not listed below
 Levonorgestrel p. 475

CONTRACEPTIVE DEVICES

Intra-uterine contraceptive devices (copper)

● INDICATIONS AND DOSE

Contraception

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: (consult product literature)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who

are breastfeeding. Before inserting an intra-uterine contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

- **CONTRA-INDICATIONS** Active trophoblastic disease (until return to normal of urine and plasma-gonadotrophin concentration) · distorted uterine cavity · established or marked immunosuppression · genital malignancy · medical diathesis · pelvic inflammatory disease · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · small uterine cavity · unexplained uterine bleeding · Wilson's disease

- **CAUTIONS** Anaemia · anticoagulant therapy (avoid if possible) · diabetes · disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age

CAUTIONS, FURTHER INFORMATION

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- **Risk of infection** The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old *or*
- they are over 25 years old *and*
 - have a new partner *or*
 - have had more than one partner in the past year *or*
 - their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend as an emergency if she experiences sustained pain during the next 20 days.

- **SIDE-EFFECTS** Allergy · bleeding (on insertion) · cervical perforation · displacement · dysmenorrhoea · expulsion · menorrhagia · occasionally epileptic seizure (on insertion) · pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection may be exacerbated · uterine perforation · vasovagal attack (on insertion)

SIDE-EFFECTS, FURTHER INFORMATION

- **Presence of significant symptoms (especially pain)** Advise the patient to seek medical attention promptly in case of significant symptoms.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if patient has a copper allergy.
- **PREGNANCY** If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Remove device; if pregnancy occurs, increased likelihood that it may be ectopic.
- **BREAST FEEDING** Not known to be harmful.
- **MONITORING REQUIREMENTS** Gynaecological examination before insertion, 6–8 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION** The timing and technique of fitting an intra-uterine device are critical for its subsequent performance. *The healthcare professional inserting (or removing) the device should be fully trained in the technique and should provide full counselling backed, where available, by the patient information leaflet.* Devices should not be fitted during the heavy days of the period; they are best fitted after the end of menstruation and before the calculated time of implantation.
- **PRESCRIBING AND DISPENSING INFORMATION**

UT380 STANDARD® For uterine length 6.5–9 cm; replacement every 5 years.

NOVAPLUS T 380® AG 'Mini' size for minimum uterine length 5 cm; 'Normal' size for uterine length 6.5–9 cm; replacement every 5 years.

3.3 Contraception, emergency

Drugs used for Contraception, emergency not listed below Intra-uterine contraceptive devices (copper), p. 471 • Levonorgestrel p. 475

PROGESTERONE RECEPTOR MODULATORS

Ulipristal acetate

- **DRUG ACTION** Ulipristal acetate is a progesterone receptor modulator with a partial progesterone antagonist effect.

• INDICATIONS AND DOSE

Emergency contraception

- **BY MOUTH**
- Females of childbearing potential: 30 mg for 1 dose, to be taken as soon as possible after coitus, but no later than after 120 hours

- **CONTRA-INDICATIONS** Repeated use as an emergency contraceptive within a menstrual cycle

- **CAUTIONS** Uncontrolled severe asthma

- **INTERACTIONS** → Appendix 1 (ulipristal).

The effectiveness of ulipristal as an emergency contraceptive is possibly reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

• SIDE-EFFECTS

- **Common or very common** Abdominal pain • back pain • diarrhoea • dizziness • fatigue • gastro-intestinal disturbances • headache • menstrual irregularities • muscle spasms • nausea • vomiting
- **Uncommon** Blurred vision • breast tenderness • dry mouth • hot flushes • pruritus • rash • tremor • uterine spasm

- **CONCEPTION AND CONTRACEPTION** When ulipristal is given as an emergency contraceptive the effectiveness of combined hormonal and progestogen-only contraceptives may be reduced—additional precautions (barrier methods) required for 14 days for combined and parenteral progestogen-only hormonal contraceptives (16 days for *Qlaira*®) and 9 days for oral progestogen-only contraceptives.

- **PREGNANCY** Limited information available when used as an emergency contraceptive.

- **BREAST FEEDING** In emergency contraception manufacturer advises avoid for 1 week after administration—present in milk.

- **HEPATIC IMPAIRMENT** Manufacturer advises avoid in severe impairment—no information available.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **EllaOne** (HRA Pharma UK Ltd)
Ulipristal acetate 30 mg EllaOne 30mg tablets | 1 tablet [P] £14.05
- **Esmya** (Gedeon Richter (UK) Ltd)
Ulipristal acetate 5 mg Esmya 5mg tablets | 28 tablet [POM] £114.13

3.4 Contraception, oral progestogen-only

Drugs used for Contraception, oral progestogen-only not listed below Norethisterone p. 447

PROGESTOGENS

Desogestrel

• INDICATIONS AND DOSE

Contraception

► BY MOUTH

- Females of childbearing potential: 75 micrograms daily, dose to be taken at same time each day, starting on day 1 of cycle then continuously, if administration delayed for 12 hours or more it should be regarded as a 'missed pill'

- **UNLICENSED USE** Consult product literature for the licensing status of individual preparations.
- **CONTRA-INDICATIONS** Acute porphyrias p. 562 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration) – seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- CAUTIONS, FURTHER INFORMATION**
 - Other conditions The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.
- **INTERACTIONS** → Appendix 1 (progestogens).
- **SIDE-EFFECTS** Breast discomfort · changes in libido · depression · disturbance of appetite · dizziness · headache · menstrual irregularities · nausea · skin disorders · vomiting
- SIDE-EFFECTS, FURTHER INFORMATION**
 - Breast cancer There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.
- **PREGNANCY** Not known to be harmful.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.
- **PATIENT AND CARER ADVICE**

Missed doses

Missed pill The following advice is recommended: 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 12 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare

recommends emergency contraception if one or more tablets are missed or taken more than 12 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Surgery All progestogen-only contraceptives are suitable for use as an alternative to combined hormonal contraceptives before major elective surgery, before all surgery to the legs, or before surgery which involves prolonged immobilisation of a lower limb.

Starting routine One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 12 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if desogestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days.

Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

Diarrhoea and vomiting Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking desogestrel, another pill should be taken as soon as possible. If a replacement pill is not taken within 12 hours of the normal time for taking desogestrel, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

• NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (September 2003) that *Cerazette*[®] should be restricted for use in women who cannot tolerate oestrogen-containing contraceptives or in whom such preparations are contra-indicated.

• MEDICINAL FORMS

Levonorgestrel

18.2.016

● INDICATIONS AND DOSE

Emergency contraception

► BY MOUTH

- Females of childbearing potential: 1.5 mg for 1 dose, taken as soon as possible after coitus, preferably within 12 hours but no later than after 72 hours

Contraception

► BY MOUTH

- Females of childbearing potential: 1 tablet daily starting on day 1 of the cycle then continuously, dose is to be taken at the same time each day, if administration delayed for 3 hours or more it should be regarded as a 'missed pill'

JAYDESS® 13.5MG INTRA-UTERINE DEVICE

Contraception

► BY VAGINA

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester termination; postpartum insertions should be delayed until at least 6 weeks after delivery (12 weeks if uterus involution is substantially delayed); effective for 3 years

LEVOSERT® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or immediately after first-trimester abortion; postpartum insertions should be delayed until at least 6 weeks after delivery; effective for 3 years

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

Contraception | Menorrhagia

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert into uterine cavity within 7 days of onset of menstruation, or any time if replacement, or any time if reasonably certain woman is not pregnant and there is no risk of conception (additional precautions (e.g. barrier methods) necessary for next 7 days), or immediately after first-trimester termination by curettage; postpartum insertions should be delayed until at least 4 weeks after delivery; effective for 5 years

Prevention of endometrial hyperplasia during oestrogen replacement therapy

► BY INTRA-UTERINE ADMINISTRATION

- Females of childbearing potential: Insert during last days of menstruation or withdrawal bleeding or at any time if amenorrhoeic; effective for 4 years

● UNLICENSED USE

- With oral use Consult product literature for licensing status of individual preparations.
- With vaginal use Not licensed for use in women under 18 years.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (JUNE 2015) INTRA-UTERINE CONTRACEPTION: UTERINE PERFORATION—UPDATED INFORMATION ON RISK FACTORS

Uterine perforation most often occurs during insertion, but might not be detected until sometime later. The risk of uterine perforation is increased when the device is inserted up to 36 weeks postpartum or in patients who are breastfeeding. Before inserting an intra-uterine

contraceptive device, inform patients that perforation occurs in approximately 1 in every 1000 insertions and signs and symptoms include:

- severe pelvic pain after insertion (worse than period cramps);
- pain or increased bleeding after insertion which continues for more than a few weeks;
- sudden changes in periods;
- pain during intercourse;
- unable to feel the threads.

Patients should be informed on how to check their threads and to arrange a check-up if threads cannot be felt, especially if they also have significant pain. Partial perforation may occur even if the threads can be seen; consider this if there is severe pain following insertion and perform an ultrasound.

● CONTRA-INDICATIONS

- With intra-uterine use Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration · acute cervicitis · acute vaginitis · distorted uterine cavity · established immunosuppression · genital malignancy · history of breast cancer but can be considered for a woman in long-term remission who has menorrhagia and requires effective contraception · infected abortion during the previous three months · marked immunosuppression · not suitable for emergency contraception · pelvic inflammatory disease · postpartum endometritis · recent sexually transmitted infection (if not fully investigated and treated) · severe anaemia · small uterine cavity · unexplained uterine bleeding
- With oral use Acute porphyrias p. 562
- When used for contraception With oral use for contraception history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding

● CAUTIONS

- With intra-uterine use Disease-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · anaemia · anticoagulant therapy (avoid if possible) · diabetes · drug-induced immunosuppression (risk of infection—avoid if marked immunosuppression) · endometriosis · epilepsy (risk of seizure at time of insertion) · fertility problems · history of pelvic inflammatory disease · increased risk of expulsion if inserted before uterine involution · menorrhagia (progestogen intra-uterine system might be preferable) · nulliparity · severe cervical stenosis · severe primary dysmenorrhoea · severely scarred uterus (including after endometrial resection) · young age
- When used for contraception With oral use for contraception active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · functional ovarian cysts · history of jaundice in pregnancy · malabsorption syndromes · past ectopic pregnancy · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- When used for emergency contraception With oral use for emergency contraception active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · past ectopic pregnancy · severe malabsorption syndromes

CAUTIONS, FURTHER INFORMATION

An intra-uterine device should not be removed in mid-cycle unless an additional contraceptive was used for the previous 7 days. If removal is essential post-coital contraception should be considered.

- Risk of infection with intra-uterine devices The main excess risk of infection occurs in the first 20 days after insertion and is believed to be related to existing carriage of a sexually

transmitted infection. Women are considered to be at a higher risk of sexually transmitted infections if:

- they are under 25 years old *or*
- they are over 25 years old *and*
- have a new partner *or*
- have had more than one partner in the past year *or*
- their regular partner has other partners.

In these women, pre-insertion screening (for chlamydia and, depending on sexual history and local prevalence of disease, *Neisseria gonorrhoeae*) should be performed. If results are unavailable at the time of fitting an intra-uterine device for emergency contraception, appropriate prophylactic antibacterial cover should be given. The woman should be advised to attend *as an emergency* if she experiences sustained pain during the next 20 days.

- ▶ Use as a contraceptive in co-morbidities
- ▶ With oral use The product literature advises caution in patients with history of thromboembolism, hypertension, diabetes mellitus and migraine; evidence for caution in these conditions is unsatisfactory.

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE Advanced uterine atrophy

- **INTERACTIONS** → Appendix 1 (progestogens). When used orally as an emergency contraceptive, the effectiveness of levonorgestrel is reduced in women taking enzyme-inducing drugs (and possibly for 4 weeks after stopping); a copper intra-uterine device can be offered instead. If the copper intra-uterine device is undesirable or inappropriate, the dose of levonorgestrel should be increased to a total of 3 mg taken as a single dose [unlicensed dose—advise women accordingly]. There is no need to increase the dose for emergency contraception if the patient is taking antibacterials that are not enzyme inducers.

With the progestogen-only intra-uterine device, levonorgestrel is released close to the site of the main contraceptive action (on cervical mucus and endometrium) and therefore progestogenic side-effects and interactions are less likely; in particular, enzyme-inducing drugs are unlikely to significantly reduce the contraceptive effect of the progestogen-only intra-uterine system and additional contraceptive precautions are not required.

• **SIDE-EFFECTS**

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Depression (sometimes severe) · headache · nausea
- ▶ **Frequency not known** Vomiting

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intra-uterine use Changes in the pattern and duration of menstrual bleeding (spotting or prolonged bleeding) · abdominal pain · acne · alopecia · back pain · breast pain · expulsion · hirsutism · migraine · nervousness · pelvic pain · peripheral oedema · salpingitis
- ▶ **Uncommon**
- ▶ With intra-uterine use Abdominal distension · cervicitis · eczema · pelvic inflammatory disease · pruritus · skin hyperpigmentation
- ▶ **Rare**
- ▶ With intra-uterine use Rash · uterine perforation
- ▶ **Frequency not known**
- ▶ With intra-uterine use Functional ovarian cysts (usually asymptomatic and usually resolve spontaneously—ultrasound monitoring recommended) · allergy · bleeding (on insertion) · cervical perforation · displacement · dysmenorrhoea · epileptic seizures (on insertion) · menorrhagia · pain (on insertion, alleviated by NSAID such as ibuprofen 30 minutes before insertion) · pelvic infection may be exacerbated · vasovagal attack (on insertion)

- ▶ With oral use Breast discomfort · breast tenderness · changes in libido · disturbances of appetite · dizziness · fatigue · menstrual irregularities · skin disorders

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.

Although the progestogen-only intra-uterine system produces little systemic progestogenic activity, it is usually avoided for 5 years after any evidence of breast cancer. However, the system can be considered for a woman in long-term remission from breast cancer who has menorrhagia and requires effective contraception.

- ▶ With intra-uterine use Endometrial disorders should be ruled out before insertion and the patient should be fully counselled (and provided with a patient information leaflet). Improvement in progestogenic side-effects, such as mastalgia and in the bleeding pattern may often become very light or absent. Removal of the intra-uterine system should be considered if the patient experiences migraine or severe headache, jaundice, marked increase of blood pressure, or severe arterial disease.

• **PREGNANCY**

- ▶ With oral use Not known to be harmful.
- ▶ With vaginal use If an intra-uterine device fails and the woman wishes to continue to full-term the device should be removed in the first trimester if possible. Avoid; if pregnancy occurs remove intra-uterine system.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.

- **HEPATIC IMPAIRMENT** Caution in severe liver disease and recurrent cholestatic jaundice. Avoid in liver tumour.

• **MONITORING REQUIREMENTS**

- ▶ With intra-uterine use Gynaecological examination before insertion, 4–6 weeks after insertion, then annually.
- **DIRECTIONS FOR ADMINISTRATION**
- ▶ With intra-uterine use *The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.*

• **PRESCRIBING AND DISPENSING INFORMATION**

- ▶ With intra-uterine use Levonorgestrel-releasing intra-uterine devices vary in licensed indication, duration of use and insertion technique—the MHRA recommends to prescribe and dispense by brand name to avoid inadvertent switching.

MIRENA® 20MICROGRAMS/24HOURS INTRA-UTERINE DEVICE

When system is removed (and not immediately replaced) and pregnancy is not desired, remove during the first few days of menstruation, otherwise additional precautions (e.g. barrier methods) should be used for at least 7 days before removal.

JAYDESS® 13.5MG INTRA-UTERINE DEVICE When system is removed (and not immediately replaced) and pregnancy is not desired, remove within 7 days of the onset of menstruation; additional precautions (e.g. barrier methods) should be used if the system is removed at some other time during the cycle and there is intercourse within 7 days.

LEVONELLE® ONE STEP Can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

● PATIENT AND CARER ADVICE

Missed doses

When used as an oral contraceptive, the following advice is recommended 'If you forget a pill, take it as soon as you remember and carry on with the next pill at the right time. If the pill was more than 3 hours overdue you are not protected. Continue normal pill-taking but you must also use another method, such as the condom, for the next 2 days'.

The Faculty of Sexual and Reproductive Healthcare recommends emergency contraception if one or more progestogen-only contraceptive tablets are missed or taken more than 3 hours late and unprotected intercourse has occurred before 2 further tablets have been correctly taken.

Diarrhoea and vomiting with use as an oral contraceptive Vomiting and persistent, severe diarrhoea can interfere with the absorption of oral progestogen-only contraceptives. If vomiting occurs within 2 hours of taking an oral progestogen-only contraceptive, another pill should be taken as soon as possible. If a replacement pill is not taken within 3 hours of the normal time for taking the progestogen-only pill, or in cases of persistent vomiting or very severe diarrhoea, additional precautions should be used during illness and for 2 days after recovery.

Starting routine

- With oral use for Contraception One tablet daily, on a continuous basis, starting on day 1 of cycle and taken at the same time each day (if delayed by longer than 3 hours contraceptive protection may be lost). Additional contraceptive precautions are not required if levonorgestrel is started up to and including day 5 of the menstrual cycle; if started after this time, additional contraceptive precautions are required for 2 days. Changing from a combined oral contraceptive Start on the day following completion of the combined oral contraceptive course without a break (or in the case of ED tablets omitting the inactive ones).

After childbirth Oral progestogen-only contraceptives can be started up to and including day 21 postpartum without the need for additional contraceptive precautions. If started more than 21 days postpartum, additional contraceptive precautions are required for 2 days.

- With intra-uterine use Counsel women to seek medical attention promptly in case of significant symptoms, especially pain. Patient counselling advised. Patient information leaflet to be provided.
- With oral use for Emergency contraception If vomiting occurs within 2 hours of taking levonorgestrel, a replacement dose should be given.
- With oral use for Emergency contraception
 - When prescribing or supplying hormonal emergency contraception, women should be advised:
 - that their next period may be early or late;
 - that a barrier method of contraception needs to be used until the next period;
 - to seek medical attention promptly if any lower abdominal pain occurs because this could signify an ectopic pregnancy;
 - to return in 3 to 4 weeks if the subsequent menstrual bleed is abnormally light, heavy or brief, or is absent, or if she is otherwise concerned (if there is any doubt as to whether menstruation has occurred, a pregnancy test should be performed at least 3 weeks after unprotected intercourse).

- EXCEPTIONS TO LEGAL CATEGORY *Levonelle*® One Step can be sold to women over 16 years; when supplying emergency contraception to the public, pharmacists should refer to guidance issued by the Royal Pharmaceutical Society.

● INDICATIONS AND DOSE

Contraception (no hormonal contraceptive use in previous month)

▶ BY SUBDERMAL IMPLANTATION

- Females of childbearing potential: 1 implant inserted during first 5 days of cycle, implant should be removed within 3 years of insertion

Contraception (postpartum)

▶ BY SUBDERMAL IMPLANTATION

- Females of childbearing potential: 1 implant to be inserted 21–28 days after delivery, 1 implant to be inserted after 28 days postpartum in breast-feeding mothers, implant should be removed within 3 years of insertion

Contraception following abortion or miscarriage in the second trimester

▶ BY SUBDERMAL IMPLANTATION

- Females of childbearing potential: 1 implant to be inserted 21–28 days after abortion or miscarriage, implant should be removed within 3 years of insertion

continued →

Contraception following abortion or miscarriage in the first trimester

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: 1 implant to be inserted within 5 days, implant should be removed within 3 years of insertion

Contraception (changing from other hormonal contraceptive)

- ▶ BY SUBDERMAL IMPLANTATION
- ▶ Females of childbearing potential: Implant should be removed within 3 years of insertion (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyria · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** Active trophoblastic disease (until return to normal of urine- and plasma-gonadotrophin concentration)—seek specialist advice · arterial disease · disturbances of lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · history of jaundice in pregnancy · malabsorption syndromes · possible risk of breast cancer · sex-steroid dependent cancer · systemic lupus erythematosus with positive (or unknown) antiphospholipid antibodies
- **INTERACTIONS** → Appendix 1 (progestogens). Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. Effectiveness of the etonogestrel-releasing implant may be reduced by enzyme-inducing drugs and an alternative contraceptive method, unaffected by the interacting drug, is recommended during treatment with the enzyme-inducing drug and for at least 4 weeks after stopping. For a short course of an enzyme-inducing drug, if a change in contraceptive method is undesirable or inappropriate, the implant may be continued in combination with additional contraceptive precautions (e.g. condom) for the duration of treatment with the enzyme-inducing drug and for 4 weeks after stopping it.
- **SIDE-EFFECTS** Breast discomfort · changes in libido · depression · disturbance of appetite · dizziness · headache · injection-site reactions · menstrual irregularities · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Cervical cancer** Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.
- ▶ **Breast cancer** There is a small increase in the risk of having breast cancer diagnosed in women using, or who have recently used, a progestogen-only contraceptive pill; this relative risk may be due to an earlier diagnosis. The most important risk factor appears to be the age at which the contraceptive is stopped rather than the duration of use; the risk disappears gradually during the 10 years after stopping and there is no excess risk by 10 years. A possible small increase in the risk of breast cancer should be weighed against the benefits.
- **PREGNANCY** Not known to be harmful, remove implant if pregnancy occurs.
- **BREAST FEEDING** Progestogen-only contraceptives do not affect lactation.
- **DIRECTIONS FOR ADMINISTRATION** The doctor or nurse administering (or removing) the system should be fully trained in the technique and should provide full counselling reinforced by the patient information leaflet.

- **PATIENT AND CARER ADVICE** Full counselling backed by patient information leaflet required before administration.

MEDICINAL FORMS

Medroxyprogesterone acetate**INDICATIONS AND DOSE****Contraception**

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 150 mg, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Females of childbearing potential: 104 mg, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Long-term contraception

- ▶ BY DEEP INTRAMUSCULAR INJECTION
- ▶ Females of childbearing potential: 150 mg every 12 weeks, to be administered within the first 5 days of cycle or within first 5 days after parturition (delay until 6 weeks after parturition if breast-feeding)
- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Females of childbearing potential: 104 mg every 13 weeks, to be administered within first 5 days of cycle or within 5 days postpartum (delay until 6 weeks postpartum if breast-feeding), injected into anterior thigh or abdomen, dose only suitable if no hormonal contraceptive use in previous month

Contraception (when patient changing from other hormonal contraception)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Females of childbearing potential: (consult product literature)

- **CONTRA-INDICATIONS** Acute porphyrias p. 562 · history of breast cancer but can be used after 5 years if no evidence of disease and non-hormonal contraceptive methods unacceptable · severe arterial disease · undiagnosed vaginal bleeding
- **CAUTIONS** History during pregnancy of disturbances in lipid metabolism · history during pregnancy of deterioration of otosclerosis · history during pregnancy of pruritus · possible risk of breast cancer
- **INTERACTIONS** → Appendix 1 (progestogens). Effectiveness of parenteral progestogen-only contraceptives is not affected by antibacterials that do not induce liver enzymes. The effectiveness of medroxyprogesterone acetate intramuscular and subcutaneous injections is not affected by enzyme-inducing drugs and they may be continued as normal during courses of these drugs.
- **SIDE-EFFECTS**
- ▶ **Rare** Osteoporosis · osteoporotic fractures
- ▶ **Frequency not known** Breast discomfort · changes in libido · depression · dizziness · disturbance of appetite · headache · indigestion · injection site reactions · loss of vision during

treatment (discontinue treatment if papilloedema or retinal vascular lesions) • menstrual irregularities • nausea • reduced bone mineral density • skin disorders • vomiting • weight gain

SIDE-EFFECTS, FURTHER INFORMATION

Use of injectable progestogen-only contraceptives may be associated with a small increased risk of cervical cancer, similar to that seen with combined oral contraceptives. The risk of cervical cancer with other progestogen-only contraceptives is not yet known.

Reduction in bone mineral density occurs in the first 2–3 years of use then stabilises.

• CONCEPTION AND CONTRACEPTION

▶ With intramuscular use If interval between dose is greater than 12 weeks and 5 days (in long-term contraception), rule out pregnancy before next injection and advise patient to use additional contraceptive measures (e.g. barrier) for 14 days after the injection.

▶ With subcutaneous use If interval between dose is greater than 13 weeks and 7 days (in long-term contraception), rule out pregnancy before next injection.

• **PREGNANCY** Not known to be harmful.

• **BREAST FEEDING** Present in milk—no adverse effects reported. Progestogen-only contraceptives do not affect lactation.

The manufacturers advise that in women who are breast-feeding, the first dose should be delayed until 6 weeks after birth; however, evidence suggests no harmful effect to infant if given earlier. The benefits of using medroxyprogesterone acetate in breast-feeding women outweigh any risks.

• **HEPATIC IMPAIRMENT** Avoid in liver tumour. Caution in severe liver disease and recurrent cholestatic jaundice.

• PATIENT AND CARER ADVICE

Full counselling backed by *patient information leaflet* required before administration—likelihood of menstrual disturbance and the potential for a delay in return to full fertility. Delayed return of fertility and irregular cycles may occur after discontinuation of treatment but there is no evidence of permanent infertility.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

4 Erectile and ejaculatory conditions

4.1 Erectile dysfunction

Erectile dysfunction

Adolescents presenting with erectile dysfunction should be referred to a specialist.

5 Vaginal and vulval conditions

Vaginal and vulval conditions

Management

Pre-pubertal girls may be particularly susceptible to vulvovaginitis. Barrier preparations applied after cleansing can be useful when the symptoms are due to non-specific irritation, but systemic drugs are required in the treatment of bacterial infection or threadworm infestation. Intravaginal preparations, particularly those that require the use of an applicator, are not generally suitable for young girls; topical preparations may be useful in some adolescent girls.

In older girls symptoms are often restricted to the vulva, but infections almost invariably involve the vagina, which should also be treated; treatment should be as for adults.

Preparations for vaginal and vulval changes

Topical oestrogen creams containing **estriol** 0.01% (*Gynest*®) are used in the treatment of labial adhesions;

treatment is usually restricted to symptomatic cases. Estriol cream should be applied to the adhesions once or twice daily for 2–6 weeks; adhesions may recur following treatment.

Vaginal and vulval infections

Effective specific treatments are available for the common vaginal infections.

Fungal infections

Vaginal fungal infections are not normally a problem in younger girls but can occur in adolescents. *Candidal vulvitis* can be treated locally with cream, but is almost invariably associated with vaginal infection which should also be treated. *Vaginal candidiasis*, rare in girls before puberty, can be treated with antifungal pessaries or cream inserted high into the vagina (including during menstruation), however, these are not recommended for pre-pubertal girls and treatment with an external cream may be more appropriate. Single-dose intravaginal preparations offer an advantage when compliance is a problem. Local irritation can occur on application of vaginal antifungal products.

Imidazole drugs (clotrimazole p. 481, econazole nitrate p. 481, fenticonazole nitrate p. 482, and miconazole p. 482) are effective against candida in short courses of 1 to 3 days according to the preparation used; treatment can be repeated if initial course fails to control symptoms or if symptoms recur. Vaginal applications may be supplemented with antifungal cream for vulvitis and to treat other superficial sites of infection.

Oral treatment of vaginal infection with fluconazole p. 352 may be considered for girls post-puberty.

Vulvovaginal candidiasis in pregnancy

Vulvovaginal candidiasis is common during pregnancy and can be treated with vaginal application of an imidazole (such as clotrimazole), and a topical imidazole cream for vulvitis. Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. There is limited absorption of imidazoles from the skin and vagina. Oral antifungal treatment should be avoided during pregnancy.

Recurrent vulvovaginal candidiasis

Recurrent vulvovaginal candidiasis is very rare in children, but can occur if there are predisposing factors such as antibacterial therapy, pregnancy, diabetes mellitus, or possibly oral contraceptive use. Reservoirs of infection can also lead to recontamination and should be treated; these include other skin sites such as the digits, nail beds, and umbilicus, as well as the gastro-intestinal tract and the bladder. The sexual partner may also be the source of re-infection and, if symptomatic, should be treated with a topical imidazole cream at the same time.

Treatment against candida may need to be extended for 6 months in recurrent vulvovaginal candidiasis.

Other infections

Trichomonal infections commonly involve the lower urinary tract as well as the genital system and need systemic treatment with metronidazole p. 313 or tinidazole p. 315.

Bacterial infections with Gram-negative organisms are particularly common in association with gynaecological operations and trauma. Metronidazole is effective against certain Gram-negative organisms, especially *Bacteroides* spp. and can be used prophylactically in gynaecological surgery.

Clindamycin below cream and metronidazole gel are indicated for bacterial vaginosis.

The antiviral drugs aciclovir p. 381 and valaciclovir p. 383 can be used in the treatment of genital infection due to *herpes simplex virus*, the HSV type 2 being a major cause of genital ulceration. They have a beneficial effect on virus shedding and healing, generally giving relief from pain and other symptoms.

CARBOXYLIC ACIDS

Lactic acid

● INDICATIONS AND DOSE

BALANCE ACTIV RX® GEL

Prevention of bacterial vaginosis

▶ BY VAGINA

- ▶ Child: 5 mL 1–2 times a week, insert the content of 1 tube (5 mL)

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Vaginal gel

EXCIPIENTS: May contain Propylene glycol

▶ Balance Activ (BBI Healthcare Ltd)

Balance Activ BV vaginal pH correction gel | 7 device £5.25
Balance Activ pessaries | 7 pessary £5.25

5.1b Vaginal and vulval fungal infections

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

Clotrimazole

● INDICATIONS AND DOSE

Superficial sites of infection in vaginal and vulval candidiasis (dose for 1% or 2% cream)

▶ BY VAGINA USING CREAM

- ▶ Child: Apply 2–3 times a day, to be applied to anogenital area

Vaginal candidiasis (dose for 10% intravaginal cream)

▶ BY VAGINA USING VAGINAL CREAM

- ▶ Child: 5 g for 1 dose, one applicatorful to be inserted into the vagina at night, dose can be repeated once if necessary

Vaginal candidiasis

▶ BY VAGINA USING PESSARIES

- ▶ Child: 200 mg for 3 nights, course can be repeated once if necessary, alternatively 500 mg for 1 night, dose can be repeated once if necessary

Recurrent vulvovaginal candidiasis

▶ BY VAGINA USING PESSARIES

- ▶ Child: 500 mg every 1 week for 6 months, dose to be administered following topical imidazole for 10–14 days

- **UNLICENSED USE** Consult product literature for individual preparations.

- **CAUTIONS** Avoid intravaginal preparations (particularly those that require use of an applicator) in young girls who are not sexually active, unless there is no alternative

- **SIDE-EFFECTS** Local irritation

- **CONCEPTION AND CONTRACEPTION** Cream and pessaries may damage latex condoms and diaphragms.

- **PREGNANCY** Pregnant women need a longer duration of treatment, usually about 7 days, to clear the infection. Oral antifungal treatment should be avoided during pregnancy.

- **EXCEPTIONS TO LEGAL CATEGORY** Brands for sale to the public include *Canesten*® Internal Cream.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Pessary

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

▶ Clotrimazole (Non-proprietary)

Immune system

1 Immune system disorders and transplantation

Immune response

Inflammatory bowel disease

Azathioprine p. 485, mercaptopurine p. 505, or once weekly methotrexate p. 506 are used to induce remission in unresponsive or chronically active Crohn's disease. Azathioprine or mercaptopurine may also be helpful for retaining remission in frequently relapsing inflammatory bowel disease; once weekly methotrexate is used in Crohn's disease when azathioprine or mercaptopurine are ineffective or not tolerated. Response to azathioprine or mercaptopurine may not become apparent for several months. Folic acid p. 533 should be given to reduce the possibility of methotrexate toxicity. Folic acid is usually given weekly on a different day to the methotrexate; alternative regimens may be used in some settings.

Ciclosporin (cyclosporin) p. 486 is a potent immunosuppressant and is markedly nephrotoxic. In children with severe ulcerative colitis unresponsive to other treatment, ciclosporin may reduce the need for urgent colorectal surgery.

Immunosuppressant therapy

Immunosuppressants are used to suppress rejection in organ transplant recipients and to treat a variety of chronic inflammatory and autoimmune diseases. Solid organ transplant patients are maintained on drug regimens, which may include antiproliferative drugs (azathioprine or mycophenolate mofetil p. 492), calcineurin inhibitors (ciclosporin or tacrolimus p. 488), corticosteroids, or sirolimus p. 487. Choice is dependent on the type of organ, time after transplant, and clinical condition of the patient. Specialist management is required and other immunomodulators may be used to initiate treatment or to treat rejection.

Impaired immune responsiveness

Infections in the immunocompromised child can be severe and show atypical features. Specific local protocols should be followed for the management of infection. Corticosteroids may suppress clinical signs of infection and allow diseases such as septicaemia or tuberculosis to reach an advanced stage before being recognised. Children should be up-to-

date with their childhood vaccinations before initiation of immunosuppressant therapy (e.g. before transplantation); vaccination with varicella-zoster vaccine is also necessary during this period—**important**: normal immunoglobulin administration should be considered as soon as possible after measles exposure, and varicella-zoster immunoglobulin (VZIG) is recommended for individuals who have significant chickenpox (varicella) exposure. Specialist advice should be sought on the use of live vaccines for those being treated with immunosuppressive drugs.

Antiproliferative immunosuppressants

Azathioprine is widely used for transplant recipients and it is also used to treat a number of auto-immune conditions, usually when corticosteroid therapy alone provides inadequate control. It is metabolised to mercaptopurine, and doses should be reduced (to one quarter of the original dose in children) when allopurinol p. 516 is given concurrently.

Mycophenolate mofetil is metabolised to mycophenolic acid which has a more selective mode of action than azathioprine.

There is evidence that compared with similar regimens incorporating azathioprine, mycophenolate mofetil may reduce the risk of acute rejection episodes; the risk of opportunistic infections (particularly due to tissue-invasive cytomegalovirus) and the occurrence of blood disorders such as leucopenia may be higher. Children may suffer a high incidence of side-effects, particularly gastrointestinal effects, calling for temporary reduction in dose or interruption of treatment.

Cyclophosphamide p. 498 is less commonly prescribed as an immunosuppressant.

Corticosteroids and other immunosuppressants

The corticosteroids prednisolone p. 413 and dexamethasone p. 410 are widely used in paediatric oncology; they have a marked antitumour effect. Dexamethasone is preferred for acute lymphoblastic leukaemia whilst prednisolone may be used for Hodgkin's disease, non-Hodgkin's lymphoma, and B-cell lymphoma and leukaemia.

Dexamethasone is the corticosteroid of choice in paediatric supportive and palliative care. For children who are not receiving a corticosteroid as a component of their chemotherapy, dexamethasone may be used to reduce raised intracranial pressure, or to help control emesis when combined with an appropriate anti-emetic.

The corticosteroids are also powerful immunosuppressants. They are used to prevent organ transplant rejection, and in high dose to treat rejection episodes.

Ciclosporin (cyclosporin), a calcineurin inhibitor, is a potent immunosuppressant which is virtually non-

myelotoxic but markedly nephrotoxic. It may be used in organ and tissue transplantation, for prevention of graft rejection following bone marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation, and for prophylaxis and treatment of graft-versus-host disease. Ciclosporin also has a role in steroid-sensitive and steroid-resistant nephrotic syndrome; in corticosteroid-sensitive nephrotic syndrome it may be given with prednisolone.

Tacrolimus is also a calcineurin inhibitor. Although not chemically related to ciclosporin it has a similar mode of action and side-effects.

NICE technology appraisals (TAs)

Immunosuppressive therapy for renal transplantation in adults (September 2004) **Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006)** NICE TA85

For induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects.

Mycophenolate mofetil [mycophenolic acid also available but not licensed for use in children] is recommended as part of an immunosuppressive regimen only if:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Sirolimus is recommended as a component of immunosuppressive regimen **only if** intolerance necessitates the withdrawal of a calcineurin inhibitor. These recommendations may not be consistent with the marketing authorisation of some of the products.

www.nice.org.uk/TA85

Immunosuppressive therapy for renal transplantation in children and adolescents (April 2006) NICE TA99

NICE has recommended that for induction therapy in the prophylaxis of organ rejection, either basiliximab or daclizumab [discontinued] are options for combining with a calcineurin inhibitor. For each individual, ciclosporin or tacrolimus is chosen as the calcineurin inhibitor on the basis of side-effects. Mycophenolate mofetil is recommended as part of an immunosuppressive regimen **only if**:

- the calcineurin inhibitor is not tolerated, particularly if nephrotoxicity endangers the transplanted kidney; or
- there is very high risk of nephrotoxicity from the calcineurin inhibitor, requiring a reduction in the dose of the calcineurin inhibitor or its avoidance.

Mycophenolic acid is not recommended as part of an immunosuppressive regimen for renal transplantation in children or adolescents.

Sirolimus [not licensed for use in children] is recommended as a component of immunosuppressive regimen **only if** intolerance necessitates the withdrawal of a calcineurin inhibitor.

These recommendations may not be consistent with the marketing authorisation of some of the products.

www.nice.org.uk/TA99

Drugs used for Immune system disorders and transplantation not listed below Hydroxychloroquine sulfate, p. 596

IMMUNE SERA AND IMMUNOGLOBULINS > IMMUNOGLOBULINS

Antithymocyte immunoglobulin (rabbit)

• INDICATIONS AND DOSE

Prophylaxis of organ rejection in heart allograft recipients

► BY INTRAVENOUS INFUSION

- Child: 1–2.5 mg/kg daily for 3–5 days, start treatment on day of transplantation, to be given over at least 6 hours

Prophylaxis of organ rejection in renal allograft recipients

► BY INTRAVENOUS INFUSION

- Child 1–17 years: 1–1.5 mg/kg daily for 3–9 days, start treatment on day of transplantation, to be given over at least 6 hours

Treatment of corticosteroid-resistant allograft rejection in renal transplantation

► BY INTRAVENOUS INFUSION

- Child 1–17 years: 1.5 mg/kg daily for 7–14 days, to be given over at least 6 hours

DOSES AT EXTREMES OF BODY-WEIGHT

To avoid excessive dosage in obese patients, calculate dose on the basis of ideal body weight.

• CONTRA-INDICATIONS Infection

- **SIDE-EFFECTS** Anaphylaxis · cytokine release syndrome · diarrhoea · dysphagia · fever · hypotension · increased susceptibility to infection · increased susceptibility to malignancy · infusion-related reactions · lymphopenia · myalgia · nausea · neutropenia · pruritus · rash · serum sickness · shivering · thrombocytopenia · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Tolerability is increased by pretreatment with an intravenous corticosteroid and antihistamine; an antipyretic drug such as paracetamol may also be beneficial.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor blood count.

• DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *continuous intravenous infusion* reconstitute each vial with 5 mL water for injections to produce a solution of 5 mg/mL; gently rotate to dissolve. Dilute requisite dose with Glucose 5% or Sodium Chloride 0.9% to an approx. concentration of 0.5 mg/mL; begin infusion immediately after dilution; give through an in-line filter (pore size 0.22 micron); incompatible with unfractionated heparin and hydrocortisone in glucose infusion—precipitation reported.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- **Antithymocyte immunoglobulin (rabbit) (Non-proprietary)**

Antithymocyte immunoglobulin (rabbit) 20 mg per 1 mL Grifalon 100mg/5mL concentrate for solution for infusion vials | 1 vial [PoM] no price available

Powder and solvent for solution for infusion

- **Thymoglobulin (Sanofi)**

Antithymocyte immunoglobulin (rabbit) 25 mg Thymoglobuline 25mg powder and solvent for solution for infusion vials | 1 vial [PoM] £158.77 (Hospital only)

IMMUNOSUPPRESSANTS > ANTIMETABOLITES**Azathioprine**

- **DRUG ACTION** Azathioprine is metabolised to mercaptopurine.

- **INDICATIONS AND DOSE**

- **Severe ulcerative colitis | Severe Crohn's disease**

- **BY MOUTH**

- Child 2–17 years: Initially 2 mg/kg once daily, then increased if necessary up to 2.5 mg/kg once daily

- **Systemic lupus erythematosus | Vasculitis | Autoimmune conditions usually when corticosteroid therapy alone has proved inadequate**

- **BY MOUTH**

- Child: Initially 1 mg/kg daily, then adjusted according to response to 3 mg/kg daily, consider withdrawal if no improvement within 3 months; maximum 3 mg/kg per day

- **Suppression of transplant rejection**

- **BY MOUTH, OR BY INTRAVENOUS INFUSION**

- Child: Maintenance 1–3 mg/kg daily, adjusted according to response, consult local treatment protocol for details, oral route preferred, but if oral route is not possible then can be given by intravenous infusion, the total daily dose may alternatively be given in 2 divided doses

- **CAUTIONS** Reduced thiopurine methyltransferase activity

- **INTERACTIONS** → Appendix 1 (azathioprine).

- **SIDE-EFFECTS**

- **Rare** Hepatic veno-occlusive disease · lymphoma · pancreatitis · pneumonitis · red cell aplasia
- **Frequency not known** Arthralgia · cholestatic jaundice · colitis in patients also receiving corticosteroids · diarrhoea · dizziness · dose-related bone marrow suppression · fever · hair loss · herpes zoster infection · hypersensitivity reactions · hypotension · increased susceptibility to infections in patients also receiving corticosteroids · interstitial nephritis · liver impairment · malaise · myalgia · nausea · neutropenia · rash · rigors · thrombocytopenia · vomiting

- **SIDE-EFFECTS, FURTHER INFORMATION**

- **Red cell aplasia** Cases of pure red cell aplasia have been reported with azathioprine; dose reduction or discontinuation should be considered under specialist supervision.
- **Neutropenia and thrombocytopenia** Usually resolved by reducing the dose.
- **Hypersensitivity reactions** Hypersensitivity reactions (including malaise, dizziness, vomiting, diarrhoea, fever, rigors, myalgia, arthralgia, rash, hypotension and interstitial nephritis) call for immediate withdrawal.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in hypersensitivity to mercaptopurine.

- **PREGNANCY** Transplant patients immunosuppressed with azathioprine should not discontinue it on becoming pregnant. However, there have been reports of premature birth and low birth-weight following exposure to azathioprine, particularly in combination with corticosteroids. Spontaneous abortion has been reported following maternal or paternal exposure. Azathioprine is teratogenic in animal studies. The use of azathioprine during pregnancy needs to be supervised in specialist units. Treatment should not generally be initiated during pregnancy.

- **BREAST FEEDING** Present in milk in low concentration. No evidence of harm in small studies—use if potential benefit outweighs risk.

- **HEPATIC IMPAIRMENT** Reduce dose. Monitor liver function.

- **RENAL IMPAIRMENT** Reduce dose.

- **PRE-TREATMENT SCREENING**

Thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Consider measuring TPMT activity before starting azathioprine, mercaptopurine, or tioguanine therapy. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

- **MONITORING REQUIREMENTS**

- Monitor for toxicity throughout treatment.
- Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
- Blood tests and monitoring for signs of myelosuppression are essential in long-term treatment.

- **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use Consult local treatment protocol for details. For *intravenous injection*, reconstitute 50 mg with 5–15 mL Water for Injections; give over at least 1 minute. For *intravenous infusion*, reconstitute 50 mg with 5–15 mL Water for Injections; dilute requisite dose to a concentration of 0.25–2.5 mg/mL in Glucose 5% or Sodium Chloride 0.9%. Intravenous injection is alkaline and very irritant. Intravenous route should therefore be used **only** if oral route not feasible and discontinued as soon as oral route can be tolerated. To reduce irritation flush line with infusion fluid.

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Azathioprine for inflammatory bowel disease www.medicinesforchildren.org.uk/azathioprine-inflammatory-bowel-disease-0

Medicines for Children leaflet: Azathioprine for renal (kidney) transplant www.medicinesforchildren.org.uk/azathioprine-renal-kidney-transplant-0

Bone marrow suppression Patients and their carers should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. inexplicable bruising or bleeding, infection.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

IMMUNOSUPPRESSANTS > CALCINEURIN INHIBITORS AND RELATED DRUGS

Ciclosporin

(Cyclosporin)

- **DRUG ACTION** Ciclosporin is a calcineurin inhibitor.

● INDICATIONS AND DOSE

Refractory ulcerative colitis

► BY MOUTH

- Child 2–17 years: Initially 2 mg/kg twice daily (max. per dose 5 mg/kg twice daily), dose adjusted according to blood-ciclosporin concentration and response

► BY INTRAVENOUS INFUSION

- Child 3–17 years: Initially 0.5–1 mg/kg twice daily, dose adjusted according to blood-ciclosporin concentration and response

Short-term treatment of severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

► BY MOUTH

- Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily) usual maximum duration of 8 weeks but may be used for longer under specialist supervision, if good initial response not achieved within 2 weeks, increase dose rapidly up to maximum

Short-term treatment of very severe atopic dermatitis where conventional therapy ineffective or inappropriate (administered on expert advice)

► BY MOUTH

- Child: 2.5 mg/kg twice daily usual maximum duration of 8 weeks but may be used for longer under specialist supervision

Severe psoriasis where conventional therapy ineffective or inappropriate (administered on expert advice)

► BY MOUTH

- Child: Initially 1.25 mg/kg twice daily (max. per dose 2.5 mg/kg twice daily), increased gradually to maximum if no improvement within 1 month, initial dose of 2.5 mg/kg twice daily justified if condition requires rapid improvement; discontinue if inadequate response after 3 months at the optimum dose; max. duration of treatment usually 1 year unless other treatments cannot be used

Prevention of graft rejection following bone-marrow, kidney, liver, pancreas, heart, lung, and heart-lung transplantation | Prevention and treatment of graft-versus-host disease

► BY MOUTH, OR BY INTRAVENOUS INFUSION

- Child: (consult local protocol)

Nephrotic syndrome

► BY MOUTH

- Child: 3 mg/kg twice daily, dose can be increased if necessary in corticosteroid-resistant disease; for maintenance reduce to lowest effective dose according to whole blood-ciclosporin concentrations, proteinuria, and renal function

- **UNLICENSED USE** Not licensed for use in children under 3 months. Not licensed for use in children under 16 years for atopic eczema (dermatitis) or psoriasis. Not licensed for use in ulcerative colitis.

IMPORTANT SAFETY INFORMATION

Patients should be stabilised on a particular brand of oral ciclosporin because switching between formulations without close monitoring may lead to clinically important changes in blood-ciclosporin concentration.

- **CONTRA-INDICATIONS** Abnormal renal function (in non-transplant indications) · malignancy (in non-transplant indications) · uncontrolled hypertension (in non-transplant indications) · uncontrolled infections (in non-transplant indications) · use with tacrolimus specifically contra-indicated
- **CAUTIONS** Hyperuricaemia · in atopic dermatitis allow herpes simplex infections to clear before starting (if they occur during treatment withdraw if severe) · in atopic dermatitis and psoriasis discontinue if lymphoproliferative disorder develops · in atopic dermatitis *Staphylococcus aureus* skin infections—not absolute contra-indication providing controlled (but avoid erythromycin unless no other alternative) · in psoriasis treat patients with malignant or pre-malignant conditions of skin only after appropriate treatment (and if no other option)
- **INTERACTIONS** → Appendix 1 (ciclosporin). For patients other than transplant recipients, preferably avoid other immunosuppressants (increased risk of infection and malignancies, including lymphoma and skin cancer).

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Abdominal pain · anorexia · diarrhoea · fatigue · gingival hyperplasia · headache · hepatic dysfunction · hypercholesterolaemia · hyperkalaemia · hyperlipidaemia · hypertension · hypertrichosis · hyperuricaemia · hypomagnesaemia · muscle cramps · myalgia · nausea · paraesthesia · renal dysfunction (renal structural changes on long-term administration) · tremor · vomiting
- **Uncommon** Anaemia · oedema · signs of encephalopathy · thrombocytopenia · weight gain
- **Rare** Gynaecomastia · haemolytic uraemic syndrome · hyperglycaemia · menstrual disturbances · micro-angiopathic haemolytic anaemia · motor polyneuropathy · muscle weakness · myopathy · pancreatitis · visual disturbances secondary to benign intracranial hypertension

SPECIFIC SIDE-EFFECTS

- With intravenous use Anaphylaxis

SIDE-EFFECTS, FURTHER INFORMATION

- **Visual disturbances** Discontinue if visual disturbances secondary to benign intracranial hypertension occur.
- **PREGNANCY** Crosses placenta. There is less experience of ciclosporin in pregnancy but it does not appear to be any more harmful than azathioprine. The use of ciclosporin during pregnancy needs to be supervised in specialist units.
- **BREAST FEEDING** Present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Dosage adjustment based on bilirubin and liver enzymes may be needed.
- **RENAL IMPAIRMENT** In patients with nephrotic syndrome and renal impairment initially 2.5 mg/kg daily. Reduce dose by 25–50% if serum creatinine more than 30% above baseline on more than one measurement.
In psoriasis and atopic dermatitis, reduce dose by 25–50% if serum creatinine increases more than 30% above baseline (even if within normal range) and discontinue if reduction not successful within 1 month.
- **PRE-TREATMENT SCREENING** In psoriasis, exclude malignancies (including those of skin and cervix) before starting (biopsy any lesions not typical of psoriasis).

● MONITORING REQUIREMENTS

- Monitor whole blood ciclosporin concentration (trough level dependent on indication—consult local treatment protocol for details).
- Dermatological and physical examination, including blood pressure and renal function measurements required at

least twice before starting treatment for psoriasis or atopic dermatitis.

- ▶ Monitor liver function.
- ▶ Monitor serum potassium especially in renal dysfunction (risk of hyperkalaemia).
- ▶ Monitor serum magnesium.
- ▶ Measure blood lipids before treatment and after the first month of treatment.
- ▶ In psoriasis and atopic dermatitis monitor serum creatinine every 2 weeks for first 3 months then every month.
- ▶ Investigate lymphadenopathy that persists despite improvement in atopic dermatitis.
- ▶ Monitor kidney function—dose dependent increase in serum creatinine and urea during first few weeks may necessitate discontinuation (exclude rejection of kidney transplant).
- ▶ Monitor blood pressure—discontinue if hypertension develops that cannot be controlled by antihypertensives.
- ▶ In long-term management of nephrotic syndrome, perform renal biopsies every 1–2 years.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With oral use Mix solution with orange juice (or squash) or apple juice (to improve taste) or with water immediately before taking (and rinse with more to ensure total dose). Do not mix with grapefruit juice. With capsules and oral solution, total daily dose should be taken in 2 divided doses.
- ▶ With intravenous use For intermittent *intravenous infusion*, dilute to a concentration of 0.5–2.5 mg/mL with Glucose 5% or Sodium Chloride 0.9%; give over 2–6 hours; not to be used with PVC equipment. Observe patient for signs of anaphylaxis for at least 30 minutes after starting infusion and at frequent intervals thereafter.

● PRESCRIBING AND DISPENSING INFORMATION

Brand name prescribing Prescribing and dispensing of ciclosporin should be by brand name to avoid inadvertent switching. If it is necessary to switch a patient to a different brand of ciclosporin, the patient should be monitored closely for changes in blood-ciclosporin concentration, serum creatinine, blood pressure, and transplant function.

- ▶ With oral use *Sandimmun*[®] capsules and oral solution are available direct from Novartis for patients who cannot be transferred to a different oral preparation.

- **HANDLING AND STORAGE** Keep medicine measure away from other liquids (including water).

● PATIENT AND CARER ADVICE

Avoid excessive exposure to UV light, including sunlight. In psoriasis and atopic dermatitis, avoid use of UVB or PUVA.

Medicines for Children leaflet: Ciclosporin for nephrotic syndrome www.medicinesforchildren.org.uk/ciclosporin-nephrotic-syndrome-0

- ▶ With oral use Patients and carers should be counselled on the administration of ciclosporin capsules and oral solution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

Oral solution

EXCIPIENTS: May contain Alcohol, propylene glycol

- ▶ **Neoral** (Novartis Pharmaceuticals UK Ltd)

Ciclosporin 100 mg per 1 ml Neoral 100mg/ml oral solution sugar-free | 50 ml [PoM] £102.30

Solution for infusion

EXCIPIENTS: May contain Alcohol, polyoxyl castor oils

- ▶ **Sandimmun** (Novartis Pharmaceuticals UK Ltd)

Ciclosporin 50 mg per 1 ml Sandimmun 250mg/5ml concentrate for solution for infusion ampoules | 10 ampoule [PoM] £110.05

Sandimmun 50mg/1ml concentrate for solution for infusion ampoules | 10 ampoule [PoM] £23.23

Sirolimus

- **DRUG ACTION** Sirolimus is a non-calcineurin inhibiting immunosuppressant.

● INDICATIONS AND DOSE

As a component of immunosuppressive therapy for renal transplantation in children and adolescents only if intolerance necessitates the withdrawal of a calcineurin inhibitor

- ▶ BY MOUTH
- ▶ Child: (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

The 500 microgram tablet is not bioequivalent to the 1 mg and 2 mg tablets. Multiples of 500 microgram tablets should **not** be used as a substitute for other tablet strengths.

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** Hyperlipidaemia · increased susceptibility to infection (especially urinary-tract infection) · increased susceptibility to lymphoma and other malignancies, particularly of the skin (limit exposure to UV light)
- **INTERACTIONS** → Appendix 1 (sirolimus).

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · acne · anaemia · arthralgia · ascites · constipation · diarrhoea · epistaxis · haemolytic uraemic syndrome · headache · hypercholesterolaemia · hyperglycaemia · hypertension · hypertriglyceridaemia · hypokalaemia · hypophosphataemia · impaired healing · leucopenia · lymphocoele · nausea · neutropenia · oedema · osteonecrosis · pleural effusion · pneumonitis · proteinuria · pyrexia · rash · stomatitis · tachycardia · thrombocytopenia · thrombotic thrombocytopenic purpura · venous thromboembolism
- ▶ **Uncommon** Nephrotic syndrome · pancreatitis · pancytopenia · pericardial effusion · pulmonary embolism · pulmonary haemorrhage
- ▶ **Rare** Alveolar proteinosis · anaphylactic reactions · angioedema · exfoliative dermatitis · hepatic necrosis · hypersensitivity reactions · hypersensitivity vasculitis · interstitial lung disease · lymphoedema
- ▶ **Frequency not known** Focal segmental glomerulosclerosis · reversible impairment of male fertility

● CONCEPTION AND CONTRACEPTION

Effective contraception must be used during treatment and for 12 weeks after stopping.

● PREGNANCY

Avoid unless essential—toxicity in *animal* studies.

● BREAST FEEDING

Discontinue breast-feeding.

● HEPATIC IMPAIRMENT

Dose reduction may be necessary, consult local treatment protocols for details. Monitor whole blood-sirolimus level closely and consult local treatment protocol in hepatic impairment.

● MONITORING REQUIREMENTS

- ▶ Monitor whole blood-sirolimus trough concentration (Afro-Caribbean patients may require higher doses).
- ▶ Monitor kidney function when given with ciclosporin; monitor lipids; monitor urine proteins.

● DIRECTIONS FOR ADMINISTRATION

Food may affect absorption (take at the same time with respect to food). Sirolimus oral solution should be mixed with at least 60 mL water or orange juice in a glass or plastic container immediately before taking; refill container with at least 120 mL of water or orange juice and drink immediately (to ensure total dose). Do not mix with any other liquids.

● PATIENT AND CARER ADVICE

Patient or carers should be given advice on how to administer sirolimus.
Patients should be advised to avoid excessive exposure to UV light.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Rapamune (Pfizer Ltd)

Sirolimus 500 microgram Rapamune 0.5mg tablets | 30 tablet **[PoM]** £69.00 DT price = £69.00

Sirolimus 1 mg Rapamune 1mg tablets | 30 tablet **[PoM]** £86.49 DT price = £86.49

Sirolimus 2 mg Rapamune 2mg tablets | 30 tablet **[PoM]** £172.98 DT price = £172.98

Oral solution

EXCIPIENTS: May contain Ethanol

▶ Rapamune (Pfizer Ltd)

Sirolimus 1 mg per 1 ml Rapamune 1mg/ml oral solution sugar-free | 60 ml **[PoM]** £162.41

Tacrolimus

● DRUG ACTION

Tacrolimus is a calcineurin inhibitor.

● INDICATIONS AND DOSE

ADOPT®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily.

▶ Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily.

▶ Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

▶ BY MOUTH

▶ Neonate: Initially 50–150 micrograms/kg twice daily.

▶ Child: Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

▶ Child: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion)

Allograft rejection resistant to conventional immunosuppressive therapy

▶ BY MOUTH

▶ Child: Seek specialist advice

CAPEXION®

Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily.

▶ Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

▶ BY MOUTH

▶ Neonate: Initially 150 micrograms/kg twice daily.

▶ Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

Prophylaxis of graft rejection following heart transplantation following antibody induction, starting within 5 days of transplantation

▶ BY MOUTH

▶ Neonate: Initially 50–150 micrograms/kg twice daily.

▶ Child: Initially 50–150 micrograms/kg twice daily

Prophylaxis of graft rejection following heart transplantation without antibody induction, starting within 12 hours of transplantation

► BY MOUTH

► Neonate: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion).

► Child: Initially 150 micrograms/kg twice daily, dose to be given as soon as clinically possible (8–12 hours after discontinuation of intravenous infusion)

Allograft rejection resistant to conventional immunosuppressive therapy

► BY MOUTH

► Child: Seek specialist advice

MODIGRAF®**Prophylaxis of graft rejection following liver transplantation, starting 12 hours after transplantation**

► BY MOUTH

► Neonate: Initially 150 micrograms/kg twice daily.

► Child: Initially 150 micrograms/kg twice daily

Prophylaxis of graft rejection following kidney transplantation, starting within 24 hours of transplantation

► BY MOUTH

► Neonate: Initially 150 micrograms/kg twice daily.

► Child: Initially 150 micrograms/kg twice daily, a lower initial dose of 100 micrograms/kg twice daily has been used in adolescents to prevent very high 'trough' concentrations

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: ORAL TACROLIMUS PRODUCTS: PRESCRIBE AND DISPENSE BY BRAND NAME ONLY, TO MINIMISE THE RISK OF INADVERTENT SWITCHING BETWEEN PRODUCTS, WHICH HAS BEEN ASSOCIATED WITH REPORTS OF TOXICITY AND GRAFT REJECTION (JUNE 2012)

Inadvertent switching between oral tacrolimus products has been associated with reports of toxicity and graft rejection. To ensure maintenance of therapeutic response when a patient is stabilised on a particular brand, oral tacrolimus products should be prescribed and dispensed by brand name only.

- **Adoport®**, **Prograf®**, **Capexion®**, **Tacni®**, and **Vivadex®** are immediate-release capsules that are taken twice daily, once in the morning and once in the evening;
- **Modigraf®** granules are used to prepare an immediate-release oral suspension which is taken twice daily, once in the morning and once in the evening;
- **Advagraf®** is a prolonged-release capsule that is taken once daily in the morning.

Switching between tacrolimus brands requires careful supervision and therapeutic monitoring by an appropriate specialist.

Important: **Envarsus®** is not interchangeable with other oral tacrolimus containing products; the MHRA has advised (June 2012) that oral tacrolimus products should be prescribed and dispensed by brand only.

- **CAUTIONS** Increased risk of infections · lymphoproliferative disorders · malignancies · neurotoxicity · QT-interval prolongation · UV light (avoid excessive exposure to sunlight and sunlamps)
- **INTERACTIONS** Appendix 1 (tacrolimus). Contraindication—avoid concurrent administration with ciclosporin (care if patient has previously received ciclosporin).
- **SIDE-EFFECTS**
 - **Common or very common** Acne · alopecia · anaemia · anorexia · anxiety · arthralgia · ascites · bile-duct abnormalities · bloating · blood disorders · cholestasis · confusion · constipation · depression · diarrhoea · dizziness · dyspepsia · dyspnoea · electrolyte disturbances · flatulence · gastro-intestinal inflammation · gastro-intestinal perforation · gastro-intestinal ulceration · haemorrhage · headache · hepatic dysfunction · hyperglycaemia · hyperkalaemia · hypertension · hyperuricaemia · hypokalaemia · impaired hearing · ischaemic events · jaundice · leucopenia · mood changes · muscle cramp · nausea · oedema · pancytopenia · paraesthesia · parenchymal lung disorders · peripheral neuropathy · photophobia · pleural effusion · psychosis · renal failure · renal impairment · renal tubular necrosis · seizures · sleep disturbances · sweating · tachycardia · thrombocytopenia · thromboembolic events · tinnitus · tremor · urinary abnormalities · visual disturbances · vomiting · weight changes
 - **Uncommon** Amnesia · arrhythmia · cardiac arrest · cardiomyopathy · cataract · cerebrovascular accident · coagulation disorders · coma · dermatitis · dysmenorrhoea · encephalopathy · gastro-intestinal reflux disease · heart failure · hypertension · hypoglycaemia · influenza-like symptoms · palpitation · pancreatitis · paralysis · paralytic ileus · peritonitis · photosensitivity · respiratory failure · speech disorder
 - **Rare** Blindness · dehydration · hirsutism · pericardial effusion · posterior reversible encephalopathy syndrome ·

respiratory distress syndrome • thrombotic thrombocytopenic purpura • toxic epidermal necrolysis

- ▶ **Very rare** Haemorrhagic cystitis • myasthenia • Stevens-Johnson syndrome

- ▶ **Frequency not known** Agranulocytosis • haemolytic anaemia • pure red cell aplasia

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Cardiomyopathy**

Cardiomyopathy has been reported in children. Patients should be monitored by echocardiography for hypertrophic changes—consider dose reduction or discontinuation if these occur.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to macrolides.
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment.
- **PREGNANCY** Avoid unless potential benefit outweighs risk—crosses the placenta and risk of premature delivery, intra-uterine growth restriction, and hyperkalaemia.
- **BREAST FEEDING** Avoid—present in breast milk (following systemic administration).
- **HEPATIC IMPAIRMENT** Dose reduction may be necessary in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ After initial dosing, and for maintenance treatment, tacrolimus doses should be adjusted according to whole-blood concentration. Monitor whole blood-tacrolimus trough concentration (especially during episodes of diarrhoea)—consult local treatment protocol for details.
 - ▶ Monitor blood pressure, ECG (for hypertrophic changes—risk of cardiomyopathy), fasting blood-glucose concentration, haematological and neurological (including visual) and coagulation parameters, electrolytes, hepatic and renal function.

DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *continuous intravenous infusion* over 24 hours, dilute to a concentration of 4–100 micrograms/mL with Glucose 5% or Sodium Chloride 0.9%, to a total volume between 20–500mL. Tacrolimus is incompatible with PVC.

PRESCRIBING AND DISPENSING INFORMATION

PROGRAF® INFUSION ▶ With intravenous use Intravenous route should only be used if oral route is inappropriate.

PATIENT AND CARER ADVICE

Avoid excessive exposure to UV light including sunlight.
Driving and skilled tasks
 May affect performance of skilled tasks (e.g. driving).
 Medicines for Children leaflet: Tacrolimus for prevention of transplant rejection www.medicinesforchildren.org.uk/tacrolimus-for-prevention-of-transplant-rejection

NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (November 2010) that tacrolimus granules for oral suspension (*Modigraf*®) are accepted for restricted use within NHS Scotland in patients for whom tacrolimus is an appropriate choice of immunosuppressive therapy and where small changes (less than 500 micrograms) in dosing increments are required (such as, in paediatric patients) or in seriously ill patients who are unable to swallow tacrolimus capsules.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Canakinumab

- **DRUG ACTION** Canakinumab is a recombinant human monoclonal antibody that selectively inhibits interleukin-1 beta receptor binding.

INDICATIONS AND DOSE

Treatment of cryopyrin-associated periodic syndromes, including severe forms of familial cold auto-inflammatory syndrome (or familial cold urticaria), Muckle-Wells syndrome, and neonatal-onset multisystem inflammatory disease (also known as chronic infantile neurological cutaneous and articular syndrome)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: (consult product literature)

Active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone) in children who have had an inadequate response to NSAIDs and systemic corticosteroids

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2–17 years (body-weight 7.5 kg and above): 4 mg/kg every 4 weeks (max. per dose 300 mg)

- **CONTRA-INDICATIONS** Active infection • leucopenia • neutropenia
 - **CAUTIONS** History of recurrent infection • latent and active tuberculosis • predisposition to infection
- CAUTIONS, FURTHER INFORMATION**
- ▶ **Vaccinations** Patients should receive all recommended vaccinations (including pneumococcal and inactivated influenza vaccine) before starting treatment; avoid live vaccines unless potential benefit outweighs risk—consult product literature for further information.

- **INTERACTIONS** → Appendix 1 (canakinumab).
Contra-indicated with concomitant use with tumour necrosis factor inhibitors (possible increased risk of infections).
- **SIDE-EFFECTS**
GENERAL SIDE-EFFECTS
 - ▶ **Common or very common** Back pain · increased susceptibility to infection (including serious infection) · injection-site reactions · malaise · neutropenia · vertigo
 - ▶ **Uncommon** Gastro-oesophageal reflux
 - ▶ **Frequency not known** Malignancy · vomiting
- **SPECIFIC SIDE-EFFECTS**
 - ▶ When used for active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone) in children who have had an inadequate response to nsaids and systemic corticosteroids Abdominal pain · arthralgia · musculoskeletal pain · rhinitis
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for up to 3 months after last dose.
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk.
- **BREAST FEEDING** Consider if benefit outweighs risk—not known if present in human milk.
- **HEPATIC IMPAIRMENT** No information available.
- **RENAL IMPAIRMENT** Limited information available but manufacturer advises no dose adjustment required.
- **PRE-TREATMENT SCREENING** Patients should be evaluated for latent and active tuberculosis before starting treatment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor full blood count including neutrophil count before starting treatment, 1–2 months after starting treatment, and periodically thereafter.
 - ▶ Monitor for signs and symptoms of tuberculosis during and after treatment.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Powder for solution for injection

Basiliximab

- **DRUG ACTION** Basiliximab is a monoclonal antibody that acts as an interleukin-2 receptor antagonist and prevents T-lymphocyte proliferation.
- **INDICATIONS AND DOSE**
Prophylaxis of acute rejection in allogeneic renal transplantation used in combination with ciclosporin and corticosteroid-containing immunosuppression regimens (specialist use only)
 - ▶ **BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
 - ▶ Child 1–17 years (body-weight up to 35 kg): Initially 10 mg, dose to be administered within 2 hours before transplant surgery, followed by 10 mg after 4 days, dose administered after transplant surgery, withhold second dose if severe hypersensitivity or graft loss occurs
 - ▶ Child 1–17 years (body-weight 35 kg and above): Initially 20 mg, administered within 2 hours before transplant surgery, followed by 20 mg after 4 days, dose to be administered after surgery, withhold second dose if severe hypersensitivity or graft loss occurs

- **CAUTIONS** Off-label use in cardiac transplantation—increased risk of serious cardiac side-effects
- **INTERACTIONS** → Appendix 1 (basiliximab).
- **SIDE-EFFECTS** Atrial flutter · cardiac arrest · cytokine release syndrome · palpitations · severe hypersensitivity reactions
- **CONCEPTION AND CONTRACEPTION** Adequate contraception must be used during treatment and for 16 weeks after last dose.
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ With intravenous use For *intravenous infusion*, dilute reconstituted solution to a concentration not exceeding 400 micrograms/mL, with Glucose 5% or Sodium Chloride 0.9%; give over 20–30 minutes.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
Powder and solvent for solution for injection
 - ▶ **Simulect** (Novartis Pharmaceuticals UK Ltd)
Basiliximab 10 mg Simulect 10mg powder and solvent for solution for injection vials | 1 vial [PoM] £758.69 (Hospital only)
 - Basiliximab 20 mg** Simulect 20mg powder and solvent for solution for injection vials | 1 vial [PoM] £842.38 (Hospital only)

IMMUNOSUPPRESSANTS > PURINE SYNTHESIS INHIBITORS

Mycophenolate mofetil

- **INDICATIONS AND DOSE**
Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and ciclosporin) (under expert supervision)
 - ▶ **BY MOUTH**
 - ▶ Child: 600 mg/m² twice daily, consult local protocol for details; maximum 2 g per day
- Prophylaxis of acute rejection in renal transplantation (in combination with a corticosteroid and tacrolimus) (under expert supervision)**
 - ▶ **BY MOUTH**
 - ▶ Child: 300 mg/m² twice daily, consult local protocol for details; maximum 2 g per day
- Prophylaxis of acute rejection in hepatic transplantation (in combination with a corticosteroid and ciclosporin or tacrolimus) (under expert supervision)**
 - ▶ **BY MOUTH**
 - ▶ Child: 10 mg/kg twice daily, increased to 20 mg/kg twice daily, consult local protocol for details; maximum 2 g per day
- DOSE EQUIVALENCE AND CONVERSION**
MYFORTIC®
Mycophenolic acid 720 mg is approximately equivalent to mycophenolate mofetil 1 g but avoid unnecessary switching because of pharmacokinetic differences.

- **UNLICENSED USE** Not licensed for use in children under 2 years for the prophylaxis of acute rejection in renal transplantation. Not licensed for use in children for the prophylaxis of acute rejection in hepatic transplantation.
- **CAUTIONS** Active serious gastro-intestinal disease (risk of haemorrhage, ulceration and perforation) · children (higher incidence of side-effects may call for temporary reduction of dose or interruption) · delayed graft function · increased susceptibility to skin cancer (avoid exposure to strong sunlight) · risk of hypogammaglobulinaemia or

bronchiectasis when used in combination with other immunosuppressants

CAUTIONS, FURTHER INFORMATION

- ▶ **Hypogammaglobulinaemia or bronchiectasis** Measure serum immunoglobulin levels if recurrent infections develop, and consider bronchiectasis or pulmonary fibrosis if persistent respiratory symptoms such as cough and dyspnoea develop.

- **INTERACTIONS** → Appendix 1 (mycophenolate).

Possible decreased effectiveness of vaccination—avoid live vaccines.

- **SIDE-EFFECTS**

- ▶ **Common or very common** Abdominal pain · acne · agitation · alopecia · anaemia · anorexia · anxiety · arthralgia · blood disorders · confusion · constipation · convulsions · cough · depression · diarrhoea · disturbances of blood lipids · disturbances of electrolytes and blood lipids · dizziness · dyspnoea · flatulence · gastro-intestinal bleeding · gastro-intestinal inflammation · gastro-intestinal ulceration · gingival hyperplasia · headache · hepatitis · hyperglycaemia · hypertension · hypotension · ileus · infections · influenza-like syndrome · insomnia · jaundice · leucopenia · malignancy (particularly of the skin) · myasthenic syndrome · nausea · oedema · pancreatitis · pancytopenia · paraesthesia · pleural effusion · rash · red cell aplasia · renal impairment · skin hypertrophy · stomatitis · tachycardia · taste disturbance · thrombocytopenia · tremor · vasodilatation · vomiting · weight loss

- ▶ **Frequency not known** Interstitial lung disease · intestinal villous atrophy · progressive multifocal leucoencephalopathy · pulmonary fibrosis

SIDE-EFFECTS, FURTHER INFORMATION

Cases of pure red cell aplasia have been reported with mycophenolate mofetil; dose reduction or discontinuation should be considered under specialist supervision.

- **CONCEPTION AND CONTRACEPTION**

Pregnancy prevention In females of child-bearing potential, exclude pregnancy immediately before and during treatment.

Women should use 2 methods of effective contraception during treatment, and for 6 weeks after discontinuation. Men should use condoms during treatment and for at least 90 days after discontinuation of treatment; female partners of male patients should also use effective contraception during treatment and for 90 days after discontinuation.

- **PREGNANCY** Avoid unless no suitable alternative—congenital malformations and spontaneous abortions reported.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **RENAL IMPAIRMENT** Manufacturer advises consider dose reduction if estimated glomerular filtration rate less than 25 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS** Monitor full blood count every week for 4 weeks then twice a month for 2 months then every month in the first year (consider interrupting treatment if neutropenia develops).
- **PRESCRIBING AND DISPENSING INFORMATION** Tablets and capsules not appropriate for dose titration in children with body surface are less than 1.25 m².

- **PATIENT AND CARER ADVICE**

Bone marrow suppression Patients should be warned to report immediately any signs or symptoms of bone marrow suppression e.g. infection or inexplicable bruising or bleeding.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Tablet

- ▶ **Mycophenolate mofetil (Non-proprietary)**

Mycophenolate mofetil 500 mg Mycophenolate mofetil 500mg tablets | 50 tablet [PoM] £82.26 DT price = £8.05

- ▶ **CellCept** (Roche Products Ltd)

Mycophenolate mofetil 500 mg CellCept 500mg tablets | 50 tablet [PoM] £82.26 DT price = £8.05

- ▶ **Myfenax** (Teva UK Ltd)

Mycophenolate mofetil 500 mg Myfenax 500mg tablets | 50 tablet [PoM] £78.15 DT price = £8.05

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 25

- ▶ **Myfortic** (Novartis Pharmaceuticals UK Ltd)

Mycophenolic acid (as Mycophenolate sodium) 180 mg Myfortic 180mg gastro-resistant tablets | 120 tablet [PoM] £96.72

Mycophenolic acid (as Mycophenolate sodium) 360 mg Myfortic 360mg gastro-resistant tablets | 120 tablet [PoM] £193.43

Capsule

- ▶ **Mycophenolate mofetil (Non-proprietary)**

Mycophenolate mofetil 250 mg Mycophenolate mofetil 250mg capsules | 100 capsule [PoM] £82.26 DT price = £82.26

- ▶ **CellCept** (Roche Products Ltd)

Mycophenolate mofetil 250 mg CellCept 250mg capsules | 100 capsule [PoM] £82.26 DT price = £82.26

- ▶ **Myfenax** (Teva UK Ltd)

Mycophenolate mofetil 250 mg Myfenax 250mg capsules | 100 capsule [PoM] £78.15 DT price = £82.26

Oral suspension

EXCIPIENTS: May contain Aspartame

- ▶ **CellCept** (Roche Products Ltd)

Mycophenolate mofetil 200 mg per 1 ml CellCept 1g/5ml oral suspension sugar-free | 175 ml [PoM] £115.16

Malignant disease

1 Antibody responsive malignancy

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES > MONOCLONAL ANTIBODIES, ANTI-LYMPHOCYTE

Anti-lymphocyte monoclonal antibodies

- **DRUG ACTION** The anti-lymphocyte monoclonal antibodies cause lysis of B lymphocytes.

IMPORTANT SAFETY INFORMATION

All anti-lymphocyte monoclonal antibodies should be given under the supervision of an experienced specialist, in an environment where full resuscitation facilities are immediately available.

- **SIDE-EFFECTS**

- ▶ **Common or very common** Allergic reactions · angioedema · bronchospasm · chills · cytokine release syndrome · dyspnoea · fever · flushing · nausea · pruritus · rash · tumour pain · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Infusion-related side effects** Infusion-related side-effects occur predominantly during the first infusion. Patients should be given paracetamol and an antihistamine before each dose of anti-lymphocyte monoclonal antibodies to reduce infusion-related side-effects. Premedication with a

corticosteroid should also be considered.

The infusion may have to be stopped temporarily and the infusion-related effects treated—consult product literature for appropriate management.

Evidence of pulmonary infiltration and features of tumour lysis syndrome should be sought if infusion-related effects occur.

- ▶ **Cytokine release syndrome** Fatalities following severe cytokine release syndrome (characterised by severe dyspnoea) and associated with features of tumour lysis syndrome have occurred after infusions of anti-lymphocyte monoclonal antibodies. Patients with a high tumour burden as well as those with pulmonary insufficiency or infiltration are at increased risk and should be monitored **very closely** (and a slower rate of infusion considered).
- **PRE-TREATMENT SCREENING** All patients should be screened for hepatitis B before treatment.

F 493

Rituximab

● INDICATIONS AND DOSE

Post-transplantation lymphoproliferative disease (under expert supervision) | Non-Hodgkin's lymphoma (under expert supervision) | Hodgkin's lymphoma (under expert supervision) | Severe cases of resistant immune modulated disease including idiopathic thrombocytopenia purpura, haemolytic anaemia, and systemic lupus erythematosus (under expert supervision)

▶ BY INTRAVENOUS INFUSION

- ▶ **Child:** Patients should receive premedication before each dose (consult product literature for details) (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CAUTIONS** History of cardiovascular disease; in adults exacerbation of angina, arrhythmia, and heart failure have been reported. Transient hypotension occurs frequently during infusion (anti-hypertensives may need to be withheld for 12 hours before infusion)

CAUTIONS, FURTHER INFORMATION

- ▶ **Hepatitis B infection and reactivation** Hepatitis B infection and reactivation (including fatal cases) have been reported in patients taking **rituximab**. Patients with positive hepatitis B serology should be referred to a liver specialist for monitoring and initiation of antiviral therapy before treatment initiation; treatment should not be initiated in patients with evidence of current hepatitis B infection until the infection has been adequately treated. Patients should be closely monitored for clinical and laboratory signs of active hepatitis B infection during treatment and for up to a year following the last infusion (consult product literature).

For full details on cautions, consult product literature or local treatment protocol.

- **INTERACTIONS** → Appendix 1 (rituximab).
- **SIDE-EFFECTS** Abdominal pain · anaemia · antibody formation · aplastic anaemia · arthralgia · asthenia · blood disorders · depression · dyspepsia · headache · hypertension · hypotension · injection-site reactions · leucopenia · lupus erythematosus-like syndrome · migraine · muscle spasm · pancytopenia · paraesthesia · progressive multifocal leucoencephalopathy · pruritus · rhinitis · severe fatal skin reactions · severe skin reactions (permanently discontinue treatment if occurs) · sore throat · Stevens-Johnson syndrome (permanently discontinue treatment if occurs) · thrombocytopenia · toxic epidermal necrolysis (permanently discontinue treatment if occurs) · urticaria · worsening heart failure

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicæmia, and hepatitis B reactivation.

- ▶ **Progressive multifocal leucoencephalopathy** Progressive multifocal leucoencephalopathy (which is usually fatal or causes severe disability) has been reported in association with rituximab; patients should be monitored for cognitive, neurological, or psychiatric signs and symptoms. If progressive multifocal leucoencephalopathy is suspected, suspend treatment until it has been excluded. For full details, including management of side-effects, consult product literature.
- **CONCEPTION AND CONTRACEPTION** Effective contraception (in both sexes) required during and for 12 months after treatment.
- **PREGNANCY** Avoid unless potential benefit to mother outweighs risk of B-lymphocyte depletion in fetus.
- **BREAST FEEDING** Avoid breast-feeding during and for 12 months after treatment.
- **MONITORING REQUIREMENTS** For full details on monitoring requirements consult product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **MabThera** (Roche Products Ltd)

Rituximab 10 mg per 1 ml MabThera 100mg/10ml concentrate for solution for infusion vials | 2 vial [PoM] £349.25

MabThera 500mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] £873.15

2 Cytotoxic responsive malignancy

Cytotoxic drugs

Overview

The management of childhood cancer is complex and is generally confined to specialist regional centres and some associated shared-care units.

Cytotoxic drugs have both anti-cancer activity and the potential for damage to normal tissue. In children, chemotherapy is almost always started with curative intent, but may be continued as palliation if the disease is refractory.

Chemotherapy with a combination of two or more cytotoxic drugs aims to reduce the development of resistance and to improve cytotoxic effect. Treatment protocols generally incorporate a series of treatment courses at defined intervals with clear criteria for starting each course, such as adequate bone-marrow recovery and renal or cardiac function. The principal component of treatment for leukaemias in children is cytotoxic therapy, whereas solid tumours may be managed with surgery or radiotherapy in addition to chemotherapy.

Only medical or nursing staff who have received appropriate training should administer parenteral cytotoxics. In most instances central venous access will be required for the intravenous administration of cytotoxics to children; care is required to avoid the risk of extravasation (see Side-effects of Cytotoxic Drugs and their Management).

Guidelines for handling cytotoxic drugs

- Trained personnel should reconstitute cytotoxics
- Reconstitution should be carried out in designated pharmacy areas

- Protective clothing (including gloves, gowns, and masks) should be worn
- The eyes should be protected and means of first aid should be specified
- Pregnant staff should avoid exposure to cytotoxic drugs (all females of child-bearing age should be informed of the reproductive hazard)
- Use local procedures for dealing with spillages and safe disposal of waste material, including syringes, containers, and absorbent material
- Staff exposure to cytotoxic drugs should be monitored

Intrathecal chemotherapy

A Health Service Circular (HSC 2008/001) provides guidance on the introduction of safe practice in NHS Trusts where intrathecal chemotherapy is administered; written local guidance covering all aspects of national guidance should be available. Support for training programmes is also available.

Copies, and further information may be obtained from:

Department of Health
PO Box 777
London
SE1 6XH

Fax: 01623 724524

It is also available from the Department of Health website (www.dh.gov.uk).

Safe systems for cytotoxic medicines:

Safe system requirements for cytotoxic medicines:

- Cytotoxic drugs for the treatment of cancer should be given as part of a wider pathway of care that is co-ordinated by a multi-disciplinary team
- Cytotoxic drugs should be prescribed, dispensed and administered only in the context of a written protocol or treatment plan
- Injectable cytotoxic drugs should only be dispensed if they are prepared for administration
- Oral cytotoxic medicines should be dispensed with clear directions for use

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

The National Patient Safety Agency has advised (January 2008) that the prescribing and use of oral cytotoxic medicines should be carried out to the same standard as parenteral cytotoxic therapy. Standards to be followed to achieve this include:

- non-specialists who prescribe or administer on-going oral cytotoxic medication should have access to written protocols and treatment plans, including guidance on the monitoring and treatment of toxicity;
- staff dispensing oral cytotoxic medicines should confirm that the prescribed dose is appropriate for the patient. Patients should have written information that includes details of the intended oral anti-cancer regimen, the treatment plan, and arrangements for monitoring, taken from the original protocol from the initiating hospital. Staff dispensing oral cytotoxic medicines should also have access to this information, and to advice from an experienced cancer pharmacist in the initiating hospital.

Doses

Doses of cytotoxic drugs are determined using a variety of different methods including age, body-surface area, or body-weight. Alternatively, doses may be fixed. Doses may be further adjusted following consideration of a patient's neutrophil count, renal and hepatic function, and history of previous adverse effects to the cytotoxic drug. Doses may also differ depending on whether a drug is used alone or in combination.

Because of the complexity of dosage regimens in the treatment of malignant disease, dose statements have been omitted from many of the drug entries in this chapter.

Pregnancy and reproductive function

Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Exclude pregnancy before treatment with cytotoxic drugs. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.

Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended).

Alkylating drugs can have an adverse effect on gametogenesis, which may be reversible particularly in females. Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy. Amenorrhoea may occur, which also may be reversible.

Side-effects of cytotoxic drugs and their management

Gastro-intestinal effects

Management of gastrointestinal effects of cytotoxic drugs includes the use of antacids, H_2 -receptor antagonists, and proton pump inhibitors to protect the gastric mucosa, laxatives to treat constipation, and enteral and parenteral nutritional support.

Oral mucositis

Good oral hygiene keeps the mouth clean and moist and helps to prevent mucositis; prevention is more effective than treatment of the complication. Good oral hygiene measures for children over 6 months include brushing teeth with a soft small brush with fluoride toothpaste 2–3 times daily, and rinsing the mouth frequently. Daily fluoride supplements can be used on the advice of the child's dental team. For children under 6 months or when it is not possible to brush teeth, carers should be instructed how to clean the mouth using an oral sponge moistened with water or with an antimicrobial solution such as diluted chlorhexidine. Mucositis related to chemotherapy can be extremely painful and may, in some circumstances, require opioid analgesia. Secondary infection with candida is frequent; treatment with a systemically absorbed antifungal, such as fluconazole p. 352, is effective.

Nausea and vomiting

Nausea and vomiting cause considerable distress to many children who receive chemotherapy, and to a lesser extent abdominal radiotherapy, and may lead to refusal of further treatment; prophylaxis of nausea and vomiting is therefore extremely important. Symptoms may be acute (occurring within 24 hours of treatment), delayed (first occurring more than 24 hours after treatment), or anticipatory (occurring prior to subsequent doses). Delayed and anticipatory symptoms are more difficult to control than acute symptoms and require different management.

Susceptibility to nausea and vomiting may increase with repeated exposure to the cytotoxic drug.

Drugs may be divided according to their emetogenic potential and some examples are given below, but the symptoms vary according to the dose, to other drugs

administered, and to the individual's susceptibility to emetogenic stimuli.

Mildly emetogenic treatment—fluorouracil, etoposide p. 510, low doses of methotrexate p. 506, the vinca alkaloids, and abdominal radiotherapy.

Moderately emetogenic treatment—carboplatin p. 509, doxorubicin hydrochloride p. 502, intermediate and low doses of cyclophosphamide p. 498, mitoxantrone p. 503, and high doses of methotrexate.

Highly emetogenic treatment—cisplatin p. 510, dacarbazine p. 499, and high doses of alkylating drugs.

Anti-emetic drugs, when given regularly, help prevent or ameliorate emesis associated with chemotherapy in children.

Prevention of acute symptoms: For patients at low risk of emesis, pretreatment with a 5HT₃-receptor antagonist may be of benefit.

For patients at high risk of *emesis* or when other treatment is inadequate, a 5HT₃-receptor antagonist is often highly effective. The addition of dexamethasone p. 410 and other anti-emetics may also be required.

Prevention of delayed symptoms: dexamethasone, given by mouth, is the drug of choice for preventing delayed symptoms; it is used alone or with metoclopramide hydrochloride p. 246. Due to the risks of neurological side-effects, metoclopramide hydrochloride should only be used in children as a second-line option. The 5HT₃-receptor antagonists may have a role in preventing uncontrolled symptoms.

Prevention of anticipatory symptoms: Good symptom control is the best way to prevent anticipatory symptoms. Lorazepam p. 209 can be helpful for its amnesiac, sedative, and anxiolytic effects.

Bone-marrow suppression

All cytotoxic drugs except vincristine sulfate p. 511 and bleomycin p. 509 cause bone-marrow suppression. This commonly occurs 7 to 10 days after administration, but is delayed for certain drugs, such as melphalan p. 500. Peripheral blood counts must be checked before each treatment. The duration and severity of neutropenia can be reduced by the use of granulocyte-colony stimulating factors; their use should be reserved for children who have previously experienced severe neutropenia.

Cytotoxic drugs may be contra-indicated in children with acute infection; any infection should be treated before, or when starting, cytotoxic drugs.

Infection in a child with neutropenia requires immediate broad-spectrum antibacterial treatment that covers all likely pathogens. Appropriate bacteriological investigations should be conducted as soon as possible. Children taking cytotoxic drugs who have signs or symptoms of infection (or their carers) should be advised to seek prompt medical attention. All children should be investigated and treated under the supervision of an appropriate oncology or haematology specialist. Antifungal treatment may be required in a child with prolonged neutropenia or fever lasting longer than 4–5 days. Chickenpox and measles can be particularly hazardous in immunocompromised children. Varicella-zoster immunoglobulin p. 730 is indicated if the child does not have immunity against varicella and has had close contact with infectious chickenpox or herpes zoster. Antiviral prophylaxis can be considered in addition to varicella-zoster immunoglobulin or as an alternative if varicella-zoster immunoglobulin is inappropriate. If an immunocompromised child has come into close contact with an infectious individual with measles, normal immunoglobulin p. 727 should be given.

For advice on the use of live vaccines in individuals with impaired immune response, see Vaccines.

Alpecia

Reversible hair loss is a common complication, although it varies in degree between drugs and individual patients.

Long-term and delayed toxicity

Cytotoxic drugs may produce specific organ-related toxicity in children (e.g. cardiotoxicity with doxorubicin hydrochloride or nephrotoxicity with cisplatin and ifosfamide p. 499). Manifestations of such toxicity may not appear for several months or even years after cancer treatment. Careful follow-up of survivors of childhood cancer is therefore vital; national and local guidelines have been developed to facilitate this.

Thromboembolism

Venous thromboembolism can be a complication of cancer itself, but chemotherapy increases the risk.

Tumour lysis syndrome

Tumour lysis syndrome occurs secondary to spontaneous or treatment related rapid destruction of malignant cells.

Patients at risk of tumour lysis syndrome include those with non-Hodgkin's lymphoma (especially if high grade and bulky disease), Burkitt's lymphoma, acute lymphoblastic leukaemia and acute myeloid leukaemia (particularly if high white blood cell counts or bulky disease), and occasionally those with solid tumours. Pre-existing hyperuricaemia, dehydration and renal impairment are also predisposing factors. Features, include hyperkalaemia, hyperuricaemia, and hyperphosphataemia with hypocalcaemia; renal damage and arrhythmias can follow. Early recognition of patients at risk, and initiation of prophylaxis or therapy for tumour lysis syndrome, is essential.

Treatment for cytotoxic-induced side effects

Hyperuricaemia

Hyperuricaemia, which may be present in high-grade lymphoma and leukaemia, can be markedly worsened by chemotherapy and is associated with acute renal failure.

Allopurinol p. 516 is used routinely in children at low to moderate risk of hyperuricaemia. It should be started 24 hours before treatment; patients should be adequately hydrated (consideration should be given to omitting phosphate and potassium from hydration fluids). The dose of mercaptopurine p. 505 or azathioprine p. 485 should be reduced if allopurinol is given concomitantly.

Rasburicase p. 516 is a recombinant urate oxidase used in children who are at high-risk of developing hyperuricaemia. It rapidly reduces plasma-uric acid concentration and may be of particular value in preventing complications following treatment of leukaemias or bulky lymphomas.

Methotrexate-induced mucositis and myelosuppression

Folinic acid p. 515 (given as calcium folinate) is used to counteract the folate-antagonist action of methotrexate and thus speed recovery from methotrexate-induced mucositis or myelosuppression ('folinic acid rescue').

The calcium salt of levofolinic acid p. 516, a single isomer of folinic acid, is also used following methotrexate administration. The dose of calcium levofolate is generally half that of calcium folinate.

The disodium salts of folinic acid and levofolinic acid are also used for rescue therapy following methotrexate administration.

The efficacy of high dose methotrexate is enhanced by delaying initiation of folinic acid for at least 24 hours, local protocols define the correct time. Folinic acid is normally continued until the plasma-methotrexate concentration falls to 45–90 nanograms/mL (100–200 nanomol/litre).

In the treatment of methotrexate p. 506 overdose, folinate should be administered immediately; other measures to enhance the elimination of methotrexate are also necessary.

Urothelial toxicity

Haemorrhagic cystitis is a common manifestation of urothelial toxicity which occurs with the oxazaphosphorines, cyclophosphamide p. 498 and ifosfamide p. 499; it is caused by the metabolite acrolein. Adequate hydration is essential to reduce the risk of urothelial toxicity. Mesna p. 515 reacts

specifically with acrolein in the urinary tract, preventing toxicity. Mesna is given for the same duration as cyclophosphamide or ifosfamide. It is generally given intravenously; the dose of mesna is equal to or greater than that of the oxazaphosphorine. See the role of nebulised mesna as a mucolytic in cystic fibrosis.

Cytotoxic antibiotics

Cytotoxic antibiotics are widely used. Many act as radiomimetics and simultaneous use of radiotherapy should be **avoided** because it may markedly increase toxicity.

Doxorubicin p. 501, doxorubicin hydrochloride p. 502, and epirubicin hydrochloride p. 502 are anthracycline antibiotics. Mitoxantrone p. 503 (mitozantrone) is an anthracycline derivative.

Epirubicin hydrochloride and mitoxantrone are considered less toxic than the other anthracycline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.

Vinca alkaloids

The vinca alkaloids, vinblastine sulfate p. 511 and vincristine sulfate p. 511 are used to treat a variety of cancers including leukaemias, lymphomas, and some solid tumours.

Antimetabolites

Antimetabolites are incorporated into new nuclear material or they combine irreversibly with cellular enzymes and prevent normal cellular division. Cytarabine p. 504, fludarabine phosphate p. 505, mercaptopurine p. 505, methotrexate, and tioguanine p. 508 are commonly used in paediatric chemotherapy.

Other antineoplastic drugs

Asparaginase

Asparaginase is used almost exclusively in the treatment of acute lymphoblastic leukaemia. Hypersensitivity reactions may occur and facilities for the management of anaphylaxis should be available. A number of different preparations of asparaginase exist and only the product specified in the treatment protocol should be used.

ANTINEOPLASTIC DRUGS > ALKYLATING AGENTS

Busulfan

(Busulphan)

● INDICATIONS AND DOSE

Conditioning treatment before haematopoietic progenitor cell transplantation

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

DOSES AT EXTREMES OF BODY-WEIGHT

Dose may need to be calculated based on body surface area or adjusted ideal body weight in obese patients—consult product literature.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 494.

- **CAUTIONS** Avoid in Acute porphyrias p. 562 · high dose (antiepileptic prophylaxis required) · history of seizures (antiepileptic prophylaxis required) · ineffective once in blast crisis phase · previous progenitor cell transplant (increased risk of hepatic veno-occlusive disease) · previous radiation therapy (increased risk of hepatic veno-occlusive disease) · risk of second malignancy · three or more cycles of chemotherapy (increased risk of hepatic veno-occlusive disease)

- **INTERACTIONS** → Appendix 1 (busulfan).

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Cardiac tamponade in thalassaemia · hepatic fibrosis · hepatic veno-occlusive disease · hepatotoxicity · hyperbilirubinaemia · jaundice · pneumonia · skin hyperpigmentation
- **Rare** Aplastic anaemia · erythema · hypersensitivity reactions · progressive pulmonary fibrosis · seizures · urticaria · visual disturbances
- **Very rare** Gynaecomastia · myasthenia gravis
- **Frequency not known** Alopecia · amenorrhoea (may be reversible) · bone-marrow suppression · dilutional hyponatraemia · fluid retention · gastro-intestinal effects · hyperuricaemia · irreversible bone-marrow aplasia · lung toxicity · male sterility · nausea · oedema · oral mucositis · organ-related toxicity (long-term and delayed) · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

- With intravenous use Extravasation

SIDE-EFFECTS, FURTHER INFORMATION

- Lung toxicity Discontinue if lung toxicity develops.
- Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.
- **CONCEPTION AND CONTRACEPTION** Manufacturers advise effective contraception during and for 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Avoid (teratogenic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution. In patients with hepatic impairment, manufacturer advises regular liver function tests—consult product literature.

● MONITORING REQUIREMENTS

- Monitor cardiac and liver function.
- Monitor full blood count regularly throughout treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

- **Busulfan (Non-proprietary)**

Busulfan 2 mg Busulfan 2mg tablets | 25 tablet [PoM] £69.02

Solution for infusion

- **Busilvex** (Pierre Fabre Ltd)

Busulfan 6 mg per 1 ml Busilvex 60mg/10ml concentrate for solution for infusion ampoules | 8 ampoule [PoM] £1,610.00 (Hospital only)

Chlorambucil

● INDICATIONS AND DOSE

Hodgkin's disease | Non-Hodgkin's lymphoma

- BY MOUTH
- Child: (consult local protocol)

Relapsing steroid-sensitive nephrotic syndrome (initiated in specialist centres)

- BY MOUTH
- Child 3 months–17 years: 200 micrograms/kg daily for 8 weeks

- **UNLICENSED USE** Not licensed for use in nephrotic syndrome.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 494.

- **CAUTIONS** Avoid in Acute porphyrias p. 562 · children with nephrotic syndrome (increased seizure risk) · history of epilepsy (increased seizure risk)

● SIDE-EFFECTS

- **Uncommon** Skin rash
- **Rare** Hepatotoxicity · jaundice · seizures
- **Very rare** Irreversible bone-marrow suppression · male sterility (in prepubertal and pubertal males) · peripheral neuropathy · pulmonary fibrosis · sterile cystitis · tremor
- **Frequency not known** Alopecia · amenorrhoea · bone-marrow suppression · dilutional hyponatraemia · fluid retention · gastro-intestinal effects · hyperuricaemia · nausea · oedema · oral mucositis · organ-related toxicity (long-term and delayed) · premature menopause · secondary malignancy · Stevens-Johnson syndrome · thromboembolism · toxic epidermal necrolysis · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Manufacturer advises consider dose reduction in severe impairment—limited information available.

- **MONITORING REQUIREMENTS** Monitor full blood count regularly throughout treatment.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Chlorambucil for nephrotic syndrome www.medicinesforchildren.org.uk/chlorambucil-nephrotic-syndrome-0

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Chlorambucil (Non-proprietary)**

Chlorambucil 2 mg Chlorambucil 2mg tablets | 25 tablet [POM]
£42.87 DT price = £42.87

Cyclophosphamide

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia, non-Hodgkin's lymphoma, retinoblastoma, neuroblastoma, rhabdomyosarcoma, soft-tissue sarcomas, Ewing tumour, neuroectodermal tumours (including medulloblastoma), infant brain tumours, ependymoma, high-dose conditioning for bone marrow transplantation, lupus nephritis

- BY MOUTH, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

Steroid-sensitive nephrotic syndrome

- BY MOUTH
- Child 3 months–17 years: 2–3 mg/kg daily for 8 weeks
- BY INTRAVENOUS INFUSION
- Child 3 months–17 years: 500 mg/m² once a month for 6 months

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 494.

- **CONTRA-INDICATIONS** Haemorrhagic cystitis

- **CAUTIONS** Avoid in Acute porphyrias p. 562 · diabetes mellitus · previous or concurrent mediastinal irradiation—risk of cardiotoxicity

- **INTERACTIONS** → Appendix 1 (cyclophosphamide).

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- **Common or very common** Anorexia · cardiotoxicity at high doses · disturbances of carbohydrate metabolism · inappropriate secretion of anti-diuretic hormone · interstitial pulmonary fibrosis · pancreatitis · pigmentation of nails · pigmentation of palms · pigmentation of soles · urothelial toxicity
- **Rare** Hepatotoxicity · renal dysfunction
- **Frequency not known** Alopecia · amenorrhoea · bone-marrow suppression · dilutional hyponatraemia · fluid retention · gastro-intestinal effects · haemorrhagic cystitis · hyperuricaemia · male sterility · nausea · oedema · oral mucositis · organ-related toxicity (long-term and delayed) · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

- With intravenous use Extravasation

SIDE-EFFECTS, FURTHER INFORMATION

- Haemorrhagic cystitis and urothelial toxicity Haemorrhagic cystitis is a common manifestation of urothelial toxicity; adequate hydration is essential to reduce the risk of urothelial toxicity with intravenous use of cyclophosphamide; mesna provides further protection against urotoxic effects.
- Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **BREAST FEEDING** Discontinue breast-feeding during and for 36 hours after stopping treatment.
- **HEPATIC IMPAIRMENT** Reduce dose—consult local treatment protocol for details.
- **RENAL IMPAIRMENT** Reduce dose—consult local treatment protocol for details.
- **DIRECTIONS FOR ADMINISTRATION** Consult local treatment protocol for details.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Cyclophosphamide for nephrotic syndrome www.medicinesforchildren.org.uk/cyclophosphamide-nephrotic-syndrome-0

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral suspension, oral solution, solution for injection, solution for infusion

Tablet

CAUTIONARY AND ADVISORY LABELS 25, 27

▶ Cyclophosphamide (Non-proprietary)

Cyclophosphamide (as Cyclophosphamide monohydrate)

50 mg Cyclophosphamide 50mg tablets | 100 tablet [PoM] £139.00
DT price = £139.00

▶ Cytoxan (Imported (United States))

Cyclophosphamide 25 mg Cytoxan 25mg tablets | 100 tablet [PoM]
no price available

Powder for solution for injection

▶ Cyclophosphamide (Non-proprietary)

Cyclophosphamide (as Cyclophosphamide monohydrate)

500 mg Cyclophosphamide 500mg powder for solution for injection vials | 1 vial [PoM] £9.66–£9.95

Cyclophosphamide (as Cyclophosphamide monohydrate)

1 gram Cyclophosphamide 1g powder for solution for injection vials | 1 vial [PoM] £17.06–£18.47

Cyclophosphamide (as Cyclophosphamide monohydrate)

2 gram Cyclophosphamide 2g powder for solution for injection vials | 1 vial [PoM] £34.12

- **RENAL IMPAIRMENT** Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** Dacarbazine is a component of a commonly used combination for Hodgkin's disease (ABVD—doxorubicin [previously *Adiamycin*®], bleomycin, vinblastine, and dacarbazine).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ Dacarbazine (Non-proprietary)

Dacarbazine (as Dacarbazine citrate) 100 mg Dacarbazine 100mg powder for solution for injection vials | 10 vial [PoM] £90.00

Dacarbazine (as Dacarbazine citrate) 200 mg Dacarbazine 200mg powder for solution for injection vials | 10 vial [PoM] £160.00

Powder for solution for infusion

▶ Dacarbazine (Non-proprietary)

Dacarbazine (as Dacarbazine citrate) 500 mg Dacarbazine 500mg powder for solution for infusion vials | 1 vial [PoM] £37.50

Dacarbazine (as Dacarbazine citrate) 1 gram Dacarbazine 1g powder for solution for infusion vials | 1 vial [PoM] £70.00

Ifosfamide

● INDICATIONS AND DOSE

Rhabdomyosarcoma | Soft-tissue sarcomas | Ewing tumour
| Germ cell tumour | Osteogenic sarcoma

▶ BY INTRAVENOUS INFUSION

- ▶ Child: (consult local protocol)

- **CONTRA-INDICATIONS** Acute infection · urinary-tract infection · urinary-tract obstruction · urothelial damage
- **CAUTIONS** Avoid in Acute porphyrias p. 562
- **INTERACTIONS** → Appendix 1 (ifosfamide).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Confusion · disorientation · drowsiness · psychosis · renal toxicity (may lead to tubular dysfunction, Fanconi's syndrome, or diabetes insipidus) · restlessness · urothelial toxicity causing haemorrhagic cystitis and dysuria
 - ▶ **Uncommon** Severe encephalopathy
 - ▶ **Rare** Anorexia · constipation · convulsions · diarrhoea
 - ▶ **Very rare** Jaundice · syndrome of inappropriate antidiuretic hormone secretion · thrombophlebitis
 - ▶ **Frequency not known** Alopecia · amenorrhoea · bone-marrow suppression · dilutional hyponatraemia · extravasation · fluid retention · gastro-intestinal effects · hyperuricaemia · male sterility · nausea · oedema · oral mucositis · organ-related toxicity (long-term and delayed) · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Urothelial toxicity Adequate hydration may reduce the risk of urothelial toxicity with intravenous use of ifosfamide; mesna provides further protection against urotoxic effects.
- ▶ Secondary malignancy Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- ▶ Fluid retention Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

Dacarbazine

● INDICATIONS AND DOSE

Hodgkin's disease | Paediatric solid tumours

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1 (dacarbazine).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anorexia
 - ▶ **Uncommon** Blurred vision · confusion · facial flushing · facial paraesthesia · headache · influenza-like symptoms · rash · renal impairment · seizures
 - ▶ **Rare** Diarrhoea · hepatic vein thrombosis · hepatotoxicity · injection-site reactions · irritant to skin · irritant to tissues · liver necrosis · photosensitivity
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during and for at least 6 months after treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Avoid (carcinogenic and teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Dose reduction may be required in combined renal and hepatic impairment. Avoid in severe impairment.

- **PREGNANCY** Avoid (teratogenic and carcinogenic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid.
- **RENAL IMPAIRMENT** Avoid.
- **MONITORING REQUIREMENTS** Ensure satisfactory electrolyte balance and renal function before each course (risk of tubular dysfunction, Fanconi's syndrome or diabetes insipidus if renal toxicity not treated promptly).

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

► Ifosfamide (Non-proprietary)

Ifosfamide 1 gram Ifosfamide 1g powder for concentrate for solution for injection vials | 1 vial [\[PoM\]](#) £91.32

Ifosfamide 2 gram Ifosfamide 2g powder for concentrate for solution for injection vials | 1 vial [\[PoM\]](#) £179.88

Melphalan

INDICATIONS AND DOSE

High intravenous dose with haematopoietic stem cell transplantation in the treatment of childhood neuroblastoma and some other advanced embryonal tumours

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in embryonal tumours.
- **CAUTIONS** Avoid in Acute porphyrias p. 562 • consider use of prophylactic anti-infective agents • for high-dose intravenous administration establish adequate hydration • haematopoietic stem cell transplantation essential for high dose treatment (consult local treatment protocol for details)

- **INTERACTIONS** → Appendix 1 (melphalan).

SIDE-EFFECTS

- **Rare** Interstitial pneumonitis • life threatening pulmonary fibrosis
- **Frequency not known** Alopecia • amenorrhoea • bone-marrow suppression (delayed) • dilutional hyponatraemia • extravasation • fluid retention • gastro-intestinal effects • hyperuricaemia • male sterility • nausea • oedema • oral mucositis • organ-related toxicity (long-term and delayed) • premature menopause • secondary malignancy • thromboembolism • tumour lysis syndrome • vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Secondary malignancy** Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- **Fluid retention** Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment in men or women. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Reduce dose initially (consult product literature).

- **MONITORING REQUIREMENTS** Monitor full blood count before and throughout treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

► Melphalan (Non-proprietary)

Melphalan (as Melphalan hydrochloride) 50 mg Melphalan 50mg powder and solvent for solution for injection vials | 1 vial [\[PoM\]](#) £137.37

Temozolomide

- **DRUG ACTION** Temozolomide is structurally related to dacarbazine.

INDICATIONS AND DOSE

Treatment of recurrent or progressive malignant glioma

- BY MOUTH
- Child 3-17 years: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 494.

- **CAUTIONS** *Pneumocystis jirovecii* pneumonia—consult product literature for monitoring and prophylaxis requirements
- **INTERACTIONS** → Appendix 1 (temozolomide).
- **SIDE-EFFECTS** Alopecia • bone-marrow suppression • gastro-intestinal effects • hyperuricaemia • nausea • oral mucositis • organ-related toxicity (long-term and delayed) • thromboembolism • tumour lysis syndrome • vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
For further information on side-effects consult product literature.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises adequate contraception during treatment. Men should avoid fathering a child during and for at least 6 months after treatment. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution in severe impairment—no information available.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS**
 - Monitor liver function before treatment initiation, after each treatment cycle and midway through 42-day treatment cycles—consider the balance of benefits and risks of treatment if results are abnormal at any point (fatal liver injury reported).
 - Monitor for myelodysplastic syndrome.
 - Monitor for secondary malignancies.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension

Capsule

CAUTIONARY AND ADVISORY LABELS 23, 25

► Temozolomide (Non-proprietary)

Temozolomide 5 mg Temozolomide 5mg capsules | 5 capsule [\[PoM\]](#) £16.44 | 5 capsule [\[PoM\]](#) £17.30 (Hospital only)

Temozolomide 20 mg Temozolomide 20mg capsules | 5 capsule [\[PoM\]](#) £67.88 | 5 capsule [\[PoM\]](#) £69.20 (Hospital only)

Temozolomide 250 mg Temozolomide 250mg capsules | 5 capsule [PoM] £814.00 | 5 capsule [PoM] £865.00 (Hospital only)

► **Temodal** (Merck Sharp & Dohme Ltd)

Temozolomide 5 mg Temodal 5mg capsules | 5 capsule [PoM] £10.59 (Hospital only)
Temozolomide 20 mg Temodal 20mg capsules | 5 capsule [PoM] £42.35 (Hospital only)
Temozolomide 100 mg Temodal 100mg capsules | 5 capsule [PoM] £211.77 (Hospital only)
Temozolomide 140 mg Temodal 140mg capsules | 5 capsule [PoM] £296.48 (Hospital only)
Temozolomide 180 mg Temodal 180mg capsules | 5 capsule [PoM] £381.19 (Hospital only)
Temozolomide 250 mg Temodal 250mg capsules | 5 capsule [PoM] £529.43 (Hospital only)

► **Temomedac** (medac UK)

Temozolomide 5 mg Temomedac 5mg capsules | 5 capsule [PoM] £16.12
Temozolomide 20 mg Temomedac 20mg capsules | 5 capsule [PoM] £64.49
Temozolomide 100 mg Temomedac 100mg capsules | 5 capsule [PoM] £322.43
Temozolomide 140 mg Temomedac 140mg capsules | 5 capsule [PoM] £451.40
Temozolomide 180 mg Temomedac 180mg capsules | 5 capsule [PoM] £580.37
Temozolomide 250 mg Temomedac 250mg capsules | 5 capsule [PoM] £806.08

Thiotepa

● INDICATIONS AND DOSE

Conditioning treatment before haematopoietic stem cell transplantation in the treatment of haematological disease or solid tumours, in combination with other chemotherapy

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

● **CAUTIONS** Avoid in Acute porphyrias p. 562

● **INTERACTIONS** → Appendix 1 (thiotepa).

● **SIDE-EFFECTS** Alopecia · amenorrhoea · bone-marrow suppression · dilutional hyponatraemia · extravasation · fluid retention · gastro-intestinal effects · hyperuricaemia · male sterility · nausea · oedema · oral mucositis · organ-related toxicity (long-term and delayed) · premature menopause · secondary malignancy · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- Secondary malignancy. Alkylating drugs are associated with a marked increase in the incidence of secondary tumours and leukaemia, particularly when they are combined with extensive irradiation.
- Fluid retention. Alkylating drugs can cause fluid retention with oedema and dilutional hyponatraemia in younger children; the risk of this complication is higher in the first 2 days and also when given with concomitant vinca alkaloids.

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

● **PREGNANCY** Avoid (teratogenic and embryotoxic in animals). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

● **BREAST FEEDING** Discontinue breast-feeding.

● **NATIONAL FUNDING/ACCESS DECISIONS**

Scottish Medicines Consortium (SMC) Decisions

The Scottish Medicines Consortium has advised (June 2012) that thiotepa (Tepadina®) is **not** recommended for use

within NHS Scotland in combination with other chemotherapy as conditioning treatment in adults or children with haematological diseases, or solid tumours prior to haematopoietic stem cell transplantation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

► Tepadina (Adienne Pharma & Biotech)

Thiotepa 15 mg Tepadina 15mg powder for concentrate for solution for infusion vials | 1 vial [PoM] no price available

Thiotepa 100 mg Tepadina 100mg powder for concentrate for solution for infusion vials | 1 vial [PoM] no price available

ANTINEOPLASTIC DRUGS ► ANTHRACYCLINES AND RELATED DRUGS

Daunorubicin

● INDICATIONS AND DOSE

Acute myelogenous leukaemia | Acute lymphocytic leukaemia

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

● **UNLICENSED USE** *DaunoXome*® is not licensed for use in children.

● **CONTRA-INDICATIONS** Myocardial insufficiency · previous treatment with maximum cumulative doses of daunorubicin or other anthracycline · recent myocardial infarction · severe arrhythmia

CONTRA-INDICATIONS, FURTHER INFORMATION

Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

● **CAUTIONS** Caution in handling—irritant to tissues

● **INTERACTIONS** → Appendix 1 (daunorubicin). Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Cardiac function should be monitored closely on the concomitant use of anthracyclines with trastuzumab.

● SIDE-EFFECTS

- Common or very common Leucopenia
- Uncommon Mucositis
- Frequency not known Alopecia · bone-marrow suppression · cardiac toxicity (usually 1–6 months after initiation of therapy) · extravasation · fever · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · red urine discolouration · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

► Cardiotoxicity. All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible

● **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

● **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

● **BREAST FEEDING** Discontinue breast-feeding.

● **HEPATIC IMPAIRMENT** Reduce dose according to serum bilirubin concentration—consult local protocol for details. Avoid in severe impairment.

● **RENAL IMPAIRMENT** Reduce dose—consult local treatment protocol for details. Avoid in severe impairment.

● MONITORING REQUIREMENTS

- ▶ Cardiac monitoring essential.
- ▶ Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Doxorubicin (Non-proprietary)**

Doxorubicin (as Doxorubicin hydrochloride)

20 mg Doxorubicin 20mg powder for solution for infusion vials | 10 vial [PoM] £650.00 (Hospital only)

Emulsion for infusion

▶ **DaunoXome (Galen Ltd)**

Doxorubicin (as Doxorubicin hydrochloride citrate)

50 mg DaunoXome 50mg emulsion for infusion vials | 1 vial [PoM] £250.00

Doxorubicin hydrochloride

10.6.2016

● INDICATIONS AND DOSE

Some paediatric malignancies | Ewing's sarcoma | Osteogenic sarcoma | Wilms' tumour | Neuroblastoma | Retinoblastoma | Some liver tumours | Acute lymphoblastic leukaemia | Hodgkin's lymphoma | Non-Hodgkin's lymphoma

▶ BY INTRAVENOUS INFUSION

▶ Child: (consult local protocol)

- **CONTRA-INDICATIONS** Acute inflammatory heart disease · consult product literature · increased haemorrhagic tendency · marked persisting myelosuppression induced by previous treatment · marked persisting stomatitis induced by previous treatment · previous myocardial infarction · previous treatment with maximum cumulative doses of doxorubicin · previous treatment with maximum cumulative doses of other anthracycline · severe arrhythmia · severe myocardial insufficiency

CONTRA-INDICATIONS, FURTHER INFORMATION

Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

- **CAUTIONS** Caution in handling—irritant to tissues · consult product literature
- **INTERACTIONS** → Appendix 1 (doxorubicin). Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Cardiac function should be monitored closely on the concomitant use of anthracyclines with trastuzumab.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Red colouration of the urine
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · consult product literature · extravasation · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Extravasation** Extravasation can cause severe tissue necrosis.
- ▶ **Cardiotoxic** All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and toxic in *animal studies*). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Reduce dose according to bilirubin concentration—consult product literature or local treatment protocol for details. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Consult product literature in severe impairment.

- **MONITORING REQUIREMENTS** Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

Epirubicin hydrochloride

● INDICATIONS AND DOSE

Recurrent acute lymphoblastic leukaemia | Rhabdomyosarcoma | Other soft-tissue tumours of childhood

▶ BY INTRAVENOUS INFUSION

▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

- **CONTRA-INDICATIONS** Bladder inflammation or contraction (when used as a bladder instillation) · catheterisation difficulties (when used as a bladder instillation) · haematuria (when used as a bladder instillation) · invasive tumours penetrating the bladder (when used as a bladder instillation) · myocardiopathy ·

previous treatment with maximum cumulative doses of epirubicin or other anthracycline · recent myocardial infarction · severe arrhythmia · severe myocardial insufficiency · unstable angina · urinary tract infections (when used as a bladder instillation)

CONTRA-INDICATIONS, FURTHER INFORMATION

Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1 (epirubicin). Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Cardiac function should be monitored closely on the concomitant use of anthracyclines with trastuzumab.
- **SIDE-EFFECTS** Alopecia · anaphylaxis · bone-marrow suppression · cardiotoxicity · extravasation · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · red colouration of the urine · thromboembolism · tumour lysis syndrome · vomiting
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - ▶ **Cardiotoxicity** All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.
 - ▶ **Cumulative doses of other anthracycline** Epirubicin is considered less toxic than other anthracycline antibiotics, and may be suitable for children who have received high cumulative doses of other anthracyclines.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Avoid (carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose according to bilirubin concentration—consult local treatment protocol for details. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Dose reduction may be necessary in severe impairment.
- **MONITORING REQUIREMENTS**
 - ▶ **Cardiac toxicity** Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Solution for injection

- ▶ **Epirubicin hydrochloride (Non-proprietary)**
Epirubicin hydrochloride 2 mg per 1 ml Epirubicin 50mg/25ml solution for injection vials | 1 vial [PoM] £100.88
Epirubicin 10mg/5ml solution for injection vials | 1 vial [PoM] £21.24
- ▶ **Pharmorubicin (Pfizer Ltd)**
Epirubicin hydrochloride 2 mg per 1 ml Pharmorubicin 50mg/25ml solution for injection Cytosafe vials | 1 vial [PoM] £106.19
Pharmorubicin 10mg/5ml solution for injection Cytosafe vials | 1 vial [PoM] £21.24

Solution for infusion

- ▶ **Epirubicin hydrochloride (Non-proprietary)**
Epirubicin hydrochloride 2 mg per 1 ml Epirubicin 100mg/50ml solution for infusion vials | 1 vial [PoM] £169.92
Epirubicin 200mg/100ml solution for infusion vials | 1 vial [PoM] £386.16
- ▶ **Pharmorubicin (Pfizer Ltd)**
Epirubicin hydrochloride 2 mg per 1 ml Pharmorubicin 200mg/100ml solution for infusion Cytosafe vials | 1 vial [PoM] £386.16

Mitoxantrone

(Mitoxantrone)

• INDICATIONS AND DOSE

Acute myeloid leukaemia | Recurrent acute lymphoblastic leukaemia

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

• CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Anthracycline antibiotics should not normally be used in children with left ventricular dysfunction.

- **INTERACTIONS** → Appendix 1 (mitoxantrone). Caution is necessary with concomitant use of cardiotoxic drugs, or drugs that reduce cardiac contractility. Cardiac function should be monitored closely on the concomitant use of anthracyclines with trastuzumab.
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Transient blue-green discoloration of urine
 - ▶ **Uncommon** Allergic reactions · amenorrhoea · anorexia · dyspnoea · fatigue · fever · gastro-intestinal bleeding · transient blue discoloration of nails · transient blue discoloration of skin
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · dose-related cardiotoxicity · extravasation · gastro-intestinal effects · hyperuricaemia · myelosuppression · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Cardiotoxicity** All anthracycline antibiotics have been associated with varying degrees of cardiac toxicity—this may be idiosyncratic and reversible, but is commonly related to total cumulative dose and is irreversible.
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Use with caution—consult local treatment protocol.
- **MONITORING REQUIREMENTS**
 - ▶ **Cardiac toxicity** Cardiac function should be monitored before and at regular intervals throughout treatment and afterwards.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Mitoxantrone (Non-proprietary)**
Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Mitoxantrone 20mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] £121.85
- ▶ **Onkotrone (Baxter Healthcare Ltd)**
Mitoxantrone (as Mitoxantrone hydrochloride) 2 mg per 1 ml Onkotrone 20mg/10ml solution for infusion vials | 1 vial [PoM] no price available
Onkotrone 25mg/12.5ml solution for infusion vials | 1 vial [PoM] no price available

ANTINEOPLASTIC DRUGS > ANTIMETABOLITES

Clofarabine

● INDICATIONS AND DOSE

Relapsed or refractory acute lymphoblastic leukaemia in patients who have received at least two previous regimens

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 1–17 years: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children under 1 year.
- **CAUTIONS** Cardiac disease
- **SIDE-EFFECTS** Abdominal pain · agitation · alopecia · anxiety · arthralgia · bone-marrow suppression · cough · diarrhoea · dizziness · drowsiness · dyspnoea · extravasation · flushing · gastro-intestinal effects · haematoma · haematuria · hand-foot (desquamative) syndrome · headache · hyperuricaemia · hypotension · increased sweating · jaundice · myalgia · nausea · oedema · oral mucositis · organ-related toxicity (long-term and delayed) · pancreatitis · paraesthesia · pericardial effusion · peripheral neuropathy · pruritus · rash · restlessness · tachycardia · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- ▶ **Evolttra** (Sanofi) ▼

Clofarabine 1 mg per 1 ml Evolttra 20mg/20ml concentrate for solution for infusion vials | 4 vial **[PoM]** £5,304.72 (Hospital only)

Cytarabine

- **DRUG ACTION** Cytarabine acts by interfering with pyrimidine synthesis.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia | Acute myeloid leukaemia | Non-Hodgkin's lymphoma

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: (consult local protocol)

Meningeal leukaemia | Meningeal neoplasms

- ▶ BY INTRATHECAL INJECTION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** *DepoCyte*® intrathecal injection not licensed for use in children.

IMPORTANT SAFETY INFORMATION

Not all cytarabine preparations can be given by intrathecal injection—consult product literature.

- **INTERACTIONS** → Appendix 1 (cytarabine).

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

- ▶ **Common or very common** Bone pain · maculopapular rash · myalgia
- ▶ **Uncommon** Conjunctivitis (consider prophylactic corticosteroid eye drops) · hepatic dysfunction · jaundice · neurotoxicity · renal dysfunction
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · chest pain · extravasation · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ **Common or very common**
- ▶ With intravenous use 'cytarabine syndrome' (6–12 hours after intravenous administration—characterised by fever and malaise)
- ▶ **Rare**
- ▶ With intrathecal use Severe spinal cord toxicity following intrathecal administration
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Reduce dose—consult product literature.
- **RENAL IMPAIRMENT** Consult local treatment protocols.
- **MONITORING REQUIREMENTS**
- ▶ Haematological monitoring Cytarabine is a potent myelosuppressant and requires careful haematological monitoring.
- **PRESCRIBING AND DISPENSING INFORMATION** Dose is based on weight or body-surface area, children may tolerate higher doses of cytarabine than adults.
- **NATIONAL FUNDING/ACCESS DECISIONS**

DEPOCYTE®**Scottish Medicines Consortium (SMC) Decisions**

The *Scottish Medicines Consortium* has advised (July 2007) that liposomal cytarabine suspension (*DepoCyte*®) is not recommended for use within NHS Scotland for the intrathecal treatment of lymphomatous meningitis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection

Solution for injection

- ▶ **Cytarabine (Non-proprietary)**

Cytarabine 20 mg per 1 ml Cytarabine 500mg/25ml solution for injection vials | 1 vial **[PoM]** £19.50

Cytarabine 100mg/5ml solution for injection vials | 5 vial **[PoM]** £20.98–£30.00

Cytarabine 100 mg per 1 ml Cytarabine 500mg/5ml solution for injection vials | 5 vial **[PoM]** £100.00

Cytarabine 100mg/1ml solution for injection vials | 5 vial **[PoM]** £30.00

Cytarabine 2g/20ml solution for injection vials | 1 vial **[PoM]** £79.00

Cytarabine 1g/10ml solution for injection vials | 1 vial **[PoM]** £40.00

Suspension for injection

- ▶ **DepoCyte** (Napp Pharmaceuticals Ltd)

Cytarabine 10 mg per 1 ml DepoCyte 50mg/5ml suspension for injection vials | 1 vial **[PoM]** £1,223.75 (Hospital only)

Fludarabine phosphate

● INDICATIONS AND DOSE

Poor prognosis or relapsed acute myeloid leukaemia | Relapsed acute lymphoblastic leukaemia | Conditioning before bone marrow transplantation

► BY MOUTH, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Child: (consult local protocol)

● **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 494.

● **CONTRA-INDICATIONS** Haemolytic anaemia

● **CAUTIONS** Increased susceptibility to skin cancer · worsening of existing skin cancer

CAUTIONS, FURTHER INFORMATION

► **Immunosuppression** Fludarabine has a potent and prolonged immunosuppressive effect. Patients treated with fludarabine are more prone to serious bacterial, opportunistic fungal, and viral infections, and prophylactic therapy is recommended in those at risk. To prevent potentially fatal transfusion-related graft-versus-host reaction, only irradiated blood products should be administered. Prescribers should consult specialist literature when using highly immunosuppressive drugs.

● **INTERACTIONS** → Appendix 1 (fludarabine).

● SIDE-EFFECTS

► **Common or very common** Acute myeloid leukaemia · anorexia · chills · cough · diarrhoea · fever · immunosuppression · malaise · myelodysplastic syndrome · myelosuppression (may be cumulative) · oedema · peripheral neuropathy · pneumonia · rash · visual disturbances · weakness

► **Uncommon** Autoimmune disorder · confusion · fibrosis · haemorrhage · pneumonitis · pulmonary toxicity

► **Rare** Agitation · arrhythmia · blindness · coma · heart failure · optic neuropathy · seizures · skin cancer · Stevens-Johnson syndrome · toxic epidermal necrolysis

► **Frequency not known** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · haemorrhagic cystitis · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

● **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.

● **PREGNANCY** Avoid (embryotoxic and teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

● **BREAST FEEDING** Discontinue breast-feeding.

● **RENAL IMPAIRMENT** Reduce dose by up to 50% if creatinine clearance 30–70 mL/minute/1.73 m². Avoid if creatinine clearance less than 30 mL/minute/1.73 m².

● MONITORING REQUIREMENTS

► Monitor for signs of haemolysis.
► Monitor for neurological toxicity.

● **DIRECTIONS FOR ADMINISTRATION** Concentrate for intravenous injection or infusion must be diluted before administration (consult product literature).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

► **Fludara** (Sanofi)

Fludarabine phosphate 10 mg Fludara 10mg tablets | 15 tablet [PoM] £302.48 (Hospital only) | 20 tablet [PoM] £403.31 (Hospital only)

Solution for injection

► **Fludarabine phosphate (Non-proprietary)**

Fludarabine phosphate 25 mg per 1 ml Fludarabine phosphate 50mg/2ml solution for injection vials | 1 vial [PoM] £117.75
Fludarabine phosphate 50mg/2ml concentrate for solution for injection vials | 1 vial [PoM] £156.00 (Hospital only) | 1 vial [PoM] £155.00

Powder for solution for injection

► **Fludarabine phosphate (Non-proprietary)**

Fludarabine phosphate 50 mg Fludarabine phosphate 50mg powder for solution for injection vials | 1 vial [PoM] £155.00 (Hospital only) | 1 vial [PoM] £155.00 | 5 vial [PoM] £735.35 (Hospital only)

► **Fludara** (Sanofi)

Fludarabine phosphate 50 mg Fludara 50mg powder for solution for injection vials | 5 vial [PoM] £735.34 (Hospital only)

Mercaptopurine

(6-Mercaptopurine)

● INDICATIONS AND DOSE

Severe ulcerative colitis | Severe Crohn's disease

► BY MOUTH

► Child 2–17 years: Initially 1–1.5 mg/kg once daily (max. per dose 50 mg), then increased if necessary up to 75 mg once daily

Acute lymphoblastic leukaemia | Lymphoblastic lymphomas

► BY MOUTH

► Child: (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

Mercaptopurine tablets and *Xaluprine*® oral suspension are **not** bioequivalent, haematological monitoring is advised when switching formulations.

● **UNLICENSED USE** Not licensed for use in severe ulcerative colitis and Crohn's disease.

Not licensed for use in children for acute lymphoblastic lymphoma or T-cell non-Hodgkins lymphoma.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 494.

● **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity

● **CAUTIONS** Reduced thiopurine methyltransferase activity

CAUTIONS, FURTHER INFORMATION

► **Thiopurine methyltransferase** The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.

● **INTERACTIONS** → Appendix 1 (mercaptopurine).

● SIDE-EFFECTS

► **Rare** Crystalluria with haematuria · fever · hyperpigmentation · intestinal ulceration · pancreatitis · rash

► **Very rare** Lymphoma

- ▶ **Frequency not known** Alopecia · bone-marrow suppression · gastro-intestinal effects · hepatotoxicity (more frequent at higher doses) · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Gastro-intestinal side-effects** Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Avoid (teratogenic). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** May need dose reduction.
- **RENAL IMPAIRMENT** Manufacturer advises consider reducing dose.
- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting mercaptopurine therapy.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor liver function—discontinue if jaundice develops.
 - ▶ When used for Severe ulcerative colitis or Severe Crohn's disease Monitor for toxicity throughout treatment. Monitor full blood count weekly (more frequently with higher doses or if severe hepatic or renal impairment) for first 4 weeks (manufacturer advises weekly monitoring for 8 weeks but evidence of practical value unsatisfactory), thereafter reduce frequency of monitoring to at least every 3 months.
- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include raspberry.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, capsule, oral suspension

Tablet

▶ Mercaptopurine (Non-proprietary)

Mercaptopurine 50 mg Mercaptopurine 50mg tablets | 25 tablet [PoM] £49.15 DT price = £49.15

Oral suspension

EXCIPIENTS: May contain Aspartame

▶ Xaluprine (Nova Laboratories Ltd)

Mercaptopurine 20 mg per 1 ml Xaluprine 20mg/ml oral suspension | 100 ml [PoM] £170.00

Methotrexate

- **DRUG ACTION** Methotrexate inhibits the enzyme dihydrofolate reductase, essential for the synthesis of purines and pyrimidines.

INDICATIONS AND DOSE

Severe Crohn's disease

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 7–17 years: 15 mg/m² once weekly (max. per dose 25 mg)

Maintenance of remission of severe Crohn's disease

- ▶ BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child 7–17 years: 15 mg/m² once weekly (max. per dose 25 mg), dose reduced according to response to lowest effective dose

Juvenile idiopathic arthritis | Juvenile dermatomyositis | Vasculitis | Uveitis | Systemic lupus erythematosus | Localised scleroderma | Sarcoidosis

- ▶ BY MOUTH, OR BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION
- ▶ Child: Initially 10–15 mg/m² once weekly, then increased if necessary up to 25 mg/m² once weekly

Maintenance and remission of acute lymphoblastic leukaemia, lymphoblastic lymphoma

- ▶ BY MOUTH
- ▶ Child: (consult local protocol)

Treatment of early stage Burkitt's lymphoma, non-Hodgkin's lymphoma, osteogenic sarcoma, some CNS tumours including infant brain tumours, acute lymphoblastic leukaemia

- ▶ BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

Meningeal leukaemia, treatment and prevention of CNS involvement of leukaemia

- ▶ BY INTRATHECAL INJECTION
- ▶ Child: (consult local protocol)

Severe psoriasis unresponsive to conventional therapy (specialist use only)

- ▶ BY MOUTH
- ▶ Child 2–17 years: Initially 200 micrograms/kg once weekly (max. per dose 10 mg), then increased if necessary to 400 micrograms/kg once weekly (max. per dose 25 mg), adjusted according to response, stop treatment if inadequate response after 3 months at the optimum dose
- **UNLICENSED USE** *Metoject*® is licensed for use in children over 3 years for polyarticular forms of juvenile idiopathic arthritis; other preparations not licensed for use in children for non-malignant conditions.

IMPORTANT SAFETY INFORMATION

Note that the dose is a **weekly** dose. To avoid error with low-dose methotrexate, it is recommended that:

- the child or their carer is carefully advised of the **dose** and **frequency** and the reason for taking methotrexate and any other prescribed medication (e.g. folic acid);
- only one strength of methotrexate tablet (usually 2.5 mg) is prescribed and dispensed;
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the child or their carer is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

- **CONTRA-INDICATIONS** Active infection (in non-malignant conditions) · ascites · immunodeficiency syndromes (in non-malignant conditions) · significant pleural effusion
- **CAUTIONS** Acute porphyrias p. 562 · photosensitivity—psoriasis lesions aggravated by UV radiation (skin ulceration reported) · diarrhoea · extreme caution in blood disorders (avoid if severe) · peptic ulceration · risk of accumulation in pleural effusion or ascites—drain before treatment · ulcerative colitis · ulcerative stomatitis
- **CAUTIONS, FURTHER INFORMATION**
 - ▶ **Blood count** Bone marrow suppression can occur abruptly; factors likely to increase toxicity include advanced age, renal impairment, and concomitant use with another antifolate drug (e.g. trimethoprim). A clinically significant drop in white cell count or platelet count calls for immediate withdrawal of methotrexate and introduction of supportive therapy.

- **Gastro-intestinal toxicity** Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.
- **Liver toxicity** Persistent 2-fold rise in liver transaminases may necessitate dose reduction or rarely discontinuation; abrupt withdrawal should be avoided as this can lead to disease flare.
- **Pulmonary toxicity** Acute pulmonary toxicity is rare in children treated for juvenile idiopathic arthritis, but children and carers should seek medical attention if dyspnoea, cough or fever develops; discontinue if pneumonitis suspected.
- **INTERACTIONS** → Appendix 1 (methotrexate).
If aspirin or other NSAIDs are given concurrently the dose of methotrexate should be carefully monitored.
- **SIDE-EFFECTS**
 - ▶ **Rare** Pneumonitis
 - ▶ **Frequency not known** Abdominal discomfort · abnormal cranial sensations · acne · alopecia · anaphylactic reactions · anorexia · arthralgia · blepharitis · blood dyscrasias (including fatalities) · cerebral oedema · changes in nail pigmentation · changes in skin pigmentation · chills · chronic pulmonary fibrosis · confusion · conjunctivitis · cystitis · diarrhoea · dizziness · drowsiness · dyspepsia · dysuria · ecchymosis · fever · furunculosis · gastro-intestinal bleeding · gastro-intestinal ulceration · haematuria · headache · hepatotoxicity · hypotension · impotence · injection-site reactions · insomnia · interstitial pneumonitis · liver cirrhosis · malaise · menstrual disturbances · mood changes · mucositis · myalgia · myelosuppression · nausea · neurotoxicity · osteoporosis · paraesthesia · pericardial tamponade · pericarditis · photosensitivity · pleuritic pain · precipitation of diabetes · pruritus · psychosis · pulmonary fibrosis · pulmonary oedema · rash · reduced libido · renal failure · Stevens-Johnson syndrome · telangiectasia · thrombosis · toxic epidermal necrolysis · toxic megacolon · urticaria · vaginitis · vasculitis · visual disturbance · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

In patients taking methotrexate for non-malignant conditions who experience side-effects, folic acid given on a different day from the methotrexate, may help to reduce the frequency of such side-effects.

Withdraw treatment if stomatitis develops—may be first sign of gastro-intestinal toxicity.

Treatment with folic acid (as calcium folinate) may be required in acute toxicity.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for at least 3 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic; fertility may be reduced during therapy but this may be reversible).
- **BREAST FEEDING** Discontinue breast-feeding—present in milk.
- **HEPATIC IMPAIRMENT** When used for malignancy, avoid in severe hepatic impairment—consult local treatment protocol for details. Avoid with hepatic impairment in non-malignant conditions—dose-related toxicity.
- **RENAL IMPAIRMENT** Reduce dose. Risk of nephrotoxicity at high doses. Avoid in severe impairment.
- **PRE-TREATMENT SCREENING** Exclude pregnancy before treatment.
Patients should have full blood count and renal and liver function tests before starting treatment.
Check immunity to varicella-zoster and consider vaccination before initiating therapy.
- **MONITORING REQUIREMENTS** Full blood count and liver function tests repeated fortnightly for at least the first 4 weeks of treatment and at this frequency after any change in dose until therapy stabilised, thereafter

monthly; renal function tests should be performed regularly during treatment.

- **PRESCRIBING AND DISPENSING INFORMATION** Folic acid following methotrexate administration helps to prevent methotrexate-induced mucositis and myelosuppression.
- **PATIENT AND CARER ADVICE**
Patients and their carers should be warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort and dark urine), and respiratory effects (e.g. shortness of breath).
Children and carers should be advised to avoid self-medication with over-the-counter ibuprofen.
Children and their carers should be counselled on the dose and use of NSAIDs.

Medicines for Children leaflet: Methotrexate for skin conditions www.medicinesforchildren.org.uk/methotrexate-for-skin-conditions

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, solution for injection

Tablet

▶ Methotrexate (Non-proprietary)

Methotrexate 2.5 mg Methotrexate 2.5mg tablets | 24 tablet [PoM] £3.75 | 28 tablet [PoM] £3.82 DT price = £1.97 | 100 tablet [PoM] £14.19

Methotrexate 10 mg Methotrexate 10mg tablets | 100 tablet [PoM] £57.21 DT price = £37.75

 Zlatal 10mg/0.4ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £13.77
 Zlatal 25mg/1ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.64
 Zlatal 20mg/0.8ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.06
 Zlatal 12.5mg/0.5ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.85
 Zlatal 7.5mg/0.3ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £13.37
 Zlatal 22.5mg/0.9ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £16.61
 Zlatal 15mg/0.6ml solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £14.92

Solution for infusion

► **Methotrexate (Non-proprietary)**

Methotrexate (as Methotrexate sodium) 25 mg per 1 ml Methotrexate 5g/200ml solution for infusion vials | 1 vial [PoM] £200.57
Methotrexate (as Methotrexate sodium) 100 mg per 1 ml Methotrexate 5g/50ml solution for infusion vials | 1 vial [PoM] £400.00

Nelarabine

● **INDICATIONS AND DOSE**

T-cell acute lymphoblastic leukaemia and T-cell lymphoblastic lymphoma in children who have relapsed or who are refractory after receiving at least two previous regimens

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **CAUTIONS** Previous or concurrent craniospinal irradiation (increased risk of neurotoxicity) · previous or concurrent intrathecal chemotherapy (increased risk of neurotoxicity)

● **SIDE-EFFECTS**

- **Common or very common** Neurotoxicity (discontinue)
- **Frequency not known** Alopecia · arthralgia · asthenia · ataxia · benign and malignant tumours · bone-marrow suppression · confusion · constipation · demyelination · diarrhoea · drowsiness · electrolyte disturbances · extravasation · fatigue · gastro-intestinal effects · headache · hyperuricaemia · hypoaesthesia · hypoglycaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · paraesthesia · peripheral neurological disorders · pyrexia · seizures · thromboembolism · tremor · tumour lysis syndrome · vomiting

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 3 months after treatment in men and women.

- **PREGNANCY** Avoid (toxicity in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **BREAST FEEDING** Discontinue breast-feeding.

● **MONITORING REQUIREMENTS**

- **Neurotoxicity** Close monitoring for neurological events is strongly recommended—discontinue if neurotoxicity occurs.

● **PATIENT AND CARER ADVICE**

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. cycling or driving).

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

ELECTROLYTES: May contain Sodium

- **Atriance** (Novartis Pharmaceuticals UK Ltd) ▼

Nelarabine 5 mg per 1 ml Atriance 250mg/50ml solution for infusion vials | 6 vial [PoM] £1,332.00

Tioguanine

(Thioguanine)

● **INDICATIONS AND DOSE**

Infant acute lymphoblastic leukaemia

- BY MOUTH
- Child: Can be given at various stages of treatment in short-term cycles (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES

See Cytotoxic drugs p. 494.

- **CONTRA-INDICATIONS** Absent thiopurine methyltransferase activity

- **CAUTIONS** Thiopurine methyltransferase status

CAUTIONS, FURTHER INFORMATION

- **Thiopurine methyltransferase** The enzyme thiopurine methyltransferase (TPMT) metabolises thiopurine drugs (azathioprine, mercaptopurine, tioguanine); the risk of myelosuppression is increased in patients with reduced activity of the enzyme, particularly for the few individuals in whom TPMT activity is undetectable. Patients with absent TPMT activity should not receive thiopurine drugs; those with reduced TPMT activity may be treated under specialist supervision.
- **Long-term therapy** Long-term therapy is no longer recommended because of the high risk of liver toxicity.

- **INTERACTIONS** → Appendix 1 (tioguanine).

● **SIDE-EFFECTS**

- **Rare** Intestinal necrosis · intestinal perforation
- **Frequency not known** Alopecia · bone-marrow suppression · gastro-intestinal effects · hepatotoxicity (discontinue) · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · stomatitis · thromboembolism · tumour lysis syndrome · vomiting · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- **Gastro-intestinal side-effects** Tioguanine has a lower incidence of gastrointestinal side-effects than mercaptopurine.

- **CONCEPTION AND CONTRACEPTION** Ensure effective contraception during treatment in men or women.

- **PREGNANCY** Avoid (teratogenicity reported when men receiving tioguanine have fathered children). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Reduce dose.

- **RENAL IMPAIRMENT** Reduce dose.

- **PRE-TREATMENT SCREENING** Consider measuring thiopurine methyltransferase (TPMT) activity before starting tioguanine therapy.

- **MONITORING REQUIREMENTS** Monitor liver function weekly—discontinue if liver toxicity develops.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule

Tablet

▶ Tioguanine (Non-proprietary)

Tioguanine 40 mg Tioguanine 40mg tablets | 25 tablet [PoM]
£109.57

ANTINEOPLASTIC DRUGS > CYTOTOXIC ANTIBIOTICS AND RELATED SUBSTANCES

Bleomycin

● INDICATIONS AND DOSE

Some germ cell tumours | Hodgkin's lymphoma

▶ BY INTRAVENOUS INFUSION

▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Acute pulmonary infection · significantly reduced lung function
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1 (bleomycin).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Dermatological toxicity · mucositis
 - ▶ **Rare** Cardiorespiratory collapse · hyperpyrexia
 - ▶ **Frequency not known** Alopecia · anorexia · chills (after drug administration) · extravasation · fatigue · fever (after drug administration) · gastro-intestinal effects · hypersensitivity reactions · hyperuricaemia · increased pigmentation particularly affecting the flexures and subcutaneous sclerotic plaques · less bone marrow suppression · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · progressive pulmonary fibrosis (dose-related) · pulmonary toxicity · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Avoid (teratogenic and carcinogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494
- **BREAST FEEDING** Discontinue breast feeding.
- **RENAL IMPAIRMENT** Reduce dose—consult local treatment protocol for details.
- **MONITORING REQUIREMENTS** Ensure monitoring of pulmonary function—investigate any shortness of breath before initiation.
- **PRESCRIBING AND DISPENSING INFORMATION** To conform to the European Pharmacopoeia vials previously labelled as containing '15 units' of bleomycin are now labelled as containing 15 000 units. The amount of bleomycin in the vial has not changed.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ Bleo-Kyowa (ProStrakan Ltd)

Bleomycin (as Bleomycin sulfate) 15000 unit Bleo-Kyowa 15,000unit powder for solution for injection vials | 10 vial [PoM]
£190.60

Dactinomycin

(Actinomycin D)

● INDICATIONS AND DOSE

Wilms' tumour | Childhood rhabdomyosarcoma and other soft-tissue sarcomas | Ewing's sarcoma

▶ BY INTRAVENOUS INJECTION

▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children under 12 years.
- **CAUTIONS** Caution in handling—irritant to tissues
- **INTERACTIONS** → Appendix 1 (dactinomycin).
- **SIDE-EFFECTS**
 - ▶ **Uncommon** Acne · anaemia · cheilitis · dysphagia · fever · hypoglycaemia · lethargy · malaise · myalgia
 - ▶ **Rare** Hepatotoxicity (possibly dose-related)
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Exclude pregnancy before treatment with cytotoxic drugs. Contraceptive advice should be given to men and women before cytotoxic therapy begins (and should cover the duration of contraception required after therapy has ended). Regimens that do not contain an alkylating drug or procarbazine may have less effect on fertility, but those with an alkylating drug or procarbazine carry the risk of causing permanent male sterility (there is no effect on potency). Pretreatment counselling and consideration of sperm storage may be appropriate. Women are less severely affected, though the span of reproductive life may be shortened by the onset of a premature menopause. No increase in fetal abnormalities or abortion rate has been recorded in patients who remain fertile after cytotoxic chemotherapy.
- **PREGNANCY** Avoid (teratogenic in animal studies). Most cytotoxic drugs are teratogenic and should not be administered during pregnancy, especially during the first trimester. Considerable caution is necessary if a pregnant woman presents with cancer requiring chemotherapy, and specialist advice should always be sought.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Consider dose reduction if raised serum bilirubin or biliary obstruction; consult local treatment protocols.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

▶ Cosmegen (Orphan Europe (UK) Ltd)

Dactinomycin 500 microgram Cosmegen Lyovac 500microgram powder for solution for injection vials | 1 vial [PoM] £52.58

ANTINEOPLASTIC DRUGS > PLATINUM COMPOUNDS

Carboplatin

10.6.2016

● INDICATIONS AND DOSE

Stage 4 neuroblastoma | Germ cell tumours | Low-grade gliomas (including astrocytomas) | Neuroectodermal tumours (including medulloblastoma) | Rhabdomyosarcoma (metastatic and non-metastatic disease) | Soft-tissue sarcomas | Retinoblastoma | High risk Wilms' tumour | Some liver tumours

▶ BY INTRAVENOUS INFUSION

▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **INTERACTIONS** → Appendix 1 (platinum compounds).
- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · myelosuppression · nausea · nausea · nephrotoxicity · neurotoxicity · oral mucositis · organ-related toxicity (long-term and delayed) · ototoxicity · thromboembolism · tumour lysis syndrome · vomiting · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Carboplatin is better tolerated than cisplatin; nausea and vomiting are reduced in severity and nephrotoxicity, neurotoxicity, and ototoxicity are much less of a problem than with cisplatin. It is, however, more myelosuppressive than cisplatin.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Avoid (teratogenic and embryotoxic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Reduce dose. Avoid if creatinine clearance less than 20 mL/minute/1.73 m². Monitor haematological parameters in renal impairment. Monitor renal function in renal impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Consider therapeutic drug monitoring.
- **PRESCRIBING AND DISPENSING INFORMATION** Carboplatin can be given in an outpatient setting.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Carboplatin (Non-proprietary)

Carboplatin 10 mg per 1 ml Carboplatin 50mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £22.04 (Hospital only) | 1 vial [PoM] £20.00
Carboplatin 150mg/15ml concentrate for solution for infusion vials | 1 vial [PoM] £56.92 (Hospital only) | 1 vial [PoM] £50.00
Carboplatin 600mg/60ml concentrate for solution for infusion vials | 1 vial [PoM] £260.00
Carboplatin 600mg/60ml solution for infusion vials | 1 vial [PoM] £260.00
Carboplatin 450mg/45ml concentrate for solution for infusion vials | 1 vial [PoM] £168.85 (Hospital only) | 1 vial [PoM] £160.00
Carboplatin 450mg/45ml solution for infusion vials | 1 vial [PoM] £197.48
Carboplatin 150mg/15ml solution for infusion vials | 1 vial [PoM] £65.83
Carboplatin 50mg/5ml solution for infusion vials | 1 vial [PoM] £22.86

- **SIDE-EFFECTS** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · hyperuricaemia · hypocalcaemia · hypokalaemia · hypomagnesaemia · hypophosphataemia · nephrotoxicity (dose-related and potentially cumulative) · neurotoxicity (dose-related and potentially cumulative) · oral mucositis · organ-related toxicity (long-term and delayed) · ototoxicity (dose-related and potentially cumulative) · peripheral neuropathy · severe nausea · severe vomiting (may be delayed and difficult to control) · thromboembolism · tumour lysis syndrome
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for at least 6 months after treatment in men or women.
- **PREGNANCY** Avoid (teratogenic and toxic in animal studies. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **RENAL IMPAIRMENT** Avoid if possible—nephrotoxic. Baseline testing of renal function is required; for children with pre-existing renal impairment, consideration should be given to withholding treatment or using another drug.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor full blood count.
 - ▶ Monitor audiology.
 - ▶ Monitor plasma electrolytes.
 - ▶ Baseline testing of hearing is required; for children with pre-existing hearing impairment, consideration should be given to withholding treatment or using another drug.
 - ▶ For children with pre-existing marked bone-marrow suppression, consideration should be given to withholding treatment or using another drug.
 - ▶ Monitor renal function.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

▶ Cisplatin (Non-proprietary)

Cisplatin 1 mg per 1 ml Cisplatin 50mg/50ml concentrate for solution for infusion vials | 1 vial [PoM] no price available
Cisplatin 100mg/100ml solution for infusion vials | 1 vial [PoM] £50.22 (Hospital only) | 1 vial [PoM] £50.22–£55.64
Cisplatin 10mg/10ml solution for infusion vials | 1 vial [PoM] £5.90 (Hospital only) | 1 vial [PoM] £5.90
Cisplatin 50mg/50ml solution for infusion vials | 1 vial [PoM] £25.37 (Hospital only) | 1 vial [PoM] £25.37–£28.11
Cisplatin 10mg/10ml concentrate for solution for infusion vials | 1 vial [PoM] no price available
Cisplatin 100mg/100ml concentrate for solution for infusion vials | 1 vial [PoM] £50.22 (Hospital only) | 1 vial [PoM] no price available

Cisplatin

● INDICATIONS AND DOSE

Osteogenic sarcoma | Stage 4 neuroblastoma | Some liver tumours | Infant brain tumours | Intra-cranial germ-cell tumours

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

- ▶ **Hydration** Cisplatin requires intensive intravenous hydration; routine use of intravenous fluids containing potassium or magnesium may also be required to help control hypokalaemia and hypomagnesaemia. Treatment may be complicated by severe nausea and vomiting; delayed vomiting may occur and is difficult to control.
- **INTERACTIONS** → Appendix 1 (platinum compounds).

ANTINEOPLASTIC DRUGS > PODOPHYLLOTOXIN DERIVATIVES

Etoposide

● INDICATIONS AND DOSE

Stage 4 neuroblastoma | Germ-cell tumours | Intracranial germ-cell tumours | Rhabdomyosarcoma | Soft-tissue sarcomas | Neuroectodermal tumours (including medulloblastoma) | Relapsed Hodgkin's disease | Non-Hodgkin's lymphoma | Ewing tumour | Acute lymphoblastic leukaemia | Acute myeloid leukaemia

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
 See Cytotoxic drugs p. 494.

- **INTERACTIONS** → Appendix 1 (etoposide).

● SIDE-EFFECTS

GENERAL SIDE-EFFECTS

Alopecia · bone-marrow suppression · dose limiting myelosuppression · gastro-intestinal effects · hyperuricaemia · irritant to tissues · nausea · oral mucositis (more common if given with doxorubicin) · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

SPECIFIC SIDE-EFFECTS

- ▶ With intravenous use Anaphylaxis (associated with concentrated infusions) · hypotension associated with rapid infusion · irritant to tissues (if extravasated)
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Avoid in severe impairment.
- **RENAL IMPAIRMENT** Consider dose reduction—consult local treatment protocol for details.
- **DIRECTIONS FOR ADMINISTRATION** Etoposide is usually given by slow intravenous infusion. It may also be given by mouth, but it is unpredictably absorbed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

- ▶ **Vepesid** (Bristol-Myers Squibb Pharmaceuticals Ltd)
Etoposide 50 mg Vepesid 50mg capsules | 20 capsule [PoM] £99.82 (Hospital only)
Etoposide 100 mg Vepesid 100mg capsules | 10 capsule [PoM] £87.23 (Hospital only)

Powder for solution for injection

- ▶ **Etopophos** (Bristol-Myers Squibb Pharmaceuticals Ltd)
Etoposide (as Etoposide phosphate) 100 mg Etopophos 100mg powder for solution for injection vials | 10 vial [PoM] £261.68 (Hospital only)

Solution for infusion

- ▶ **Etoposide (Non-proprietary)**
Etoposide 20 mg per 1 ml Etoposide 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] no price available (Hospital only) | 1 vial [PoM] £11.50 | 10 vial [PoM] £115.00
Etoposide 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £60.75 (Hospital only)
- ▶ **Eposin** (medac UK)
Etoposide 20 mg per 1 ml Eposin 500mg/25ml concentrate for solution for infusion vials | 1 vial [PoM] £67.50 (Hospital only)
Eposin 100mg/5ml concentrate for solution for infusion vials | 1 vial [PoM] £13.50 (Hospital only)

ANTINEOPLASTIC DRUGS > VINCA ALKALOIDS

Vinblastine sulfate

● INDICATIONS AND DOSE

Hodgkin's disease and other lymphomas

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

Vinblastine is for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in

an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

- **CONTRA-INDICATIONS** Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues

- **INTERACTIONS** → Appendix 1 (vinblastine).

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · constipation · leucopenia · muscle pain
- ▶ **Uncommon** Peripheral neuropathy
- ▶ **Rare** Paralytic ileus
- ▶ **Frequency not known** Alopecia (reversible) · autonomic neuropathy · gastro-intestinal effects · hyperuricaemia · loss of deep tendon reflexes · motor weakness · myelosuppression (dose-limiting) · nausea · neurotoxicity · oral mucositis · organ-related toxicity (long-term and delayed) · ototoxicity · peripheral neuropathy · peripheral paraesthesia · severe local irritation (care must be taken to avoid extravasation) · thromboembolism · tumour lysis syndrome · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Neurotoxicity** Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids; it occurs less often with vinblastine than with vincristine. Patients with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

- ▶ **Constipation** Prophylactic use of laxatives may be considered.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **PREGNANCY** Avoid (limited experience suggests fetal harm; teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Dose reduction may be necessary—consult local treatment protocol for details.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Vinblastine sulfate (Non-proprietary)**
Vinblastine sulfate 1 mg per 1 ml Vinblastine 10mg/10ml solution for injection vials | 5 vial [PoM] £85.00

Vincristine sulfate

● INDICATIONS AND DOSE

Acute leukaemias | Lymphomas | Paediatric solid tumours

- ▶ BY INTRAVENOUS INJECTION
- ▶ Child: (consult local protocol)

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

IMPORTANT SAFETY INFORMATION

Vincristine injections are for **intravenous administration only**. Inadvertent intrathecal administration can cause severe neurotoxicity, which is usually fatal.

The National Patient Safety Agency has advised (August 2008) that adult and teenage patients treated in an adult or adolescent unit should receive their vinca alkaloid dose in a 50 mL minibag. Teenagers and children treated in a child unit may receive their vinca alkaloid dose in a syringe.

● CONTRA-INDICATIONS

CONTRA-INDICATIONS, FURTHER INFORMATION

Intrathecal injection **contra-indicated**.

- **CAUTIONS** Caution in handling—irritant to tissues · ileus · neuromuscular disease

- **INTERACTIONS** → Appendix 1 (vincristine).

● SIDE-EFFECTS

- ▶ **Common or very common** Constipation
- ▶ **Rare** Convulsions followed by coma · inappropriate secretion of antidiuretic hormone
- ▶ **Frequency not known** Abdominal pain · alopecia (reversible) · autonomic neuropathy · diarrhoea · extravasation · gastro-intestinal effects · hyperuricaemia · intestinal necrosis · loss of deep tendon reflexes · motor weakness · myelosuppression (negligible) · nausea · neuromuscular effects (dose-limiting) · neurotoxicity · oral mucositis · organ-related toxicity (long-term and delayed) · ototoxicity · paralytic ileus (in young children) · peripheral neuropathy · peripheral paraesthesia · severe local irritation (care must be taken to avoid extravasation) · thromboembolism · tumour lysis syndrome · urinary retention · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Neurotoxicity** Neurotoxicity, usually as peripheral or autonomic neuropathy, occurs with all vinca alkaloids and is a limiting side-effect of vincristine. Children with neurotoxicity commonly have peripheral paraesthesia, loss of deep tendon reflexes, abdominal pain, and constipation; ototoxicity has been reported. If symptoms of neurotoxicity are severe, doses should be reduced, but children generally tolerate vincristine better than adults.

Motor weakness can also occur and dose reduction or discontinuation of therapy may be appropriate if motor weakness increases. Recovery from neurotoxic effects is usually slow but complete.

- ▶ **Constipation** Prophylactic use of laxatives may be considered.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **PREGNANCY** Avoid (teratogenicity and fetal loss in *animal* studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **BREAST FEEDING** Discontinue breast-feeding.

- **HEPATIC IMPAIRMENT** Dose reduction may be necessary—consult local treatment protocol for details.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Vincristine sulfate (Non-proprietary)**

Vincristine sulfate 1 mg per 1 mL Vincristine 1mg/1mL solution for injection vials | 1 vial [PoM] £13.47 (Hospital only) | 5 vial [PoM] £67.35

Vincristine 2mg/2mL solution for injection vials | 1 vial [PoM] £26.66 (Hospital only) | 5 vial [PoM] £133.30

Vincristine 5mg/5mL solution for injection vials | 5 vial [PoM] £329.50

ANTINEOPLASTIC DRUGS > OTHER

└ Crisantaspase

- **DRUG ACTION** Crisantaspase is the enzyme asparaginase produced by *Erwinia chrysanthemi*.

● INDICATIONS AND DOSE

Acute lymphoblastic leukaemia | Acute myeloid leukaemia | Non-Hodgkin's lymphoma

- ▶ **BY INTRAVENOUS INJECTION, OR BY INTRAMUSCULAR INJECTION, OR BY SUBCUTANEOUS INJECTION**
- ▶ **Child:** (consult local protocol)

- **UNLICENSED USE** Preparations of asparaginase derived from *Escherichia coli* are available but they are not licensed, they include: *Medac*® asparaginase, *Elspar*® asparaginase, and *Oncaspar*® pegaspargase.

- **CONTRA-INDICATIONS** History of pancreatitis related to asparaginase therapy

● SIDE-EFFECTS

- ▶ **Common or very common** Coagulation disorders · confusion · convulsions · diarrhoea · dizziness · drowsiness · headache · lethargy · liver dysfunction · neurotoxicity · pancreatitis
- ▶ **Uncommon** Anaphylaxis · changes in blood lipids · hyperglycaemia
- ▶ **Rare** CNS depression
- ▶ **Very rare** Abdominal pain · hypertension · myalgia
- ▶ **Frequency not known** Alopecia · bone-marrow suppression · extravasation · gastro-intestinal effects · hyperuricaemia · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting

- **ALLERGY AND CROSS-SENSITIVITY** Children who are hypersensitive to asparaginase derived from one organism may tolerate asparaginase derived from another organism but cross-sensitivity occurs in about 20–30% of individuals.

- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **PREGNANCY** Avoid. See also, *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **BREAST FEEDING** Discontinue breast-feeding.

- **DIRECTIONS FOR ADMINISTRATION** Facilities for the management of anaphylaxis should be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Erwinase** (EUSA Pharma Ltd)

Crisantaspase 10000 unit Erwinase 10,000unit powder for solution for injection vials | 5 vial [PoM] £3,065.00

└ Hydroxycarbamide (Hydroxyurea)

● INDICATIONS AND DOSE

Sickle-cell disease in children who have recurrent episodes of acute pain (more than 3 admissions in the previous 12 months, or who are very symptomatic in the community) or who have had 2 or more episodes of acute sickle chest syndrome in the last 2 years (or 1 episode requiring ventilatory support)—consult with a specialist centre

- ▶ **BY MOUTH**

- ▶ **Child 2–17 years:** Initially 10–15 mg/kg once daily, increased in steps of 2.5–5 mg/kg daily, dose to be

increased every 12 weeks according to response; usual dose 15–30 mg/kg daily; maximum 35 mg/kg per day

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 494.

- **CAUTIONS** Leg ulcers (review treatment if cutaneous vasculitic ulcerations develop)
- **INTERACTIONS** → Appendix 1 (hydroxycarbamide).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Headache · myelosuppression · skin reactions
 - ▶ **Rare** Amenorrhoea (in sickle-cell disease) · fever (in sickle-cell disease)
 - ▶ **Frequency not known** Alopecia · bleeding (in sickle-cell disease) · bone-marrow suppression · dizziness · hyperuricaemia · hypomagnesaemia (in sickle-cell disease) · nausea · oral mucositis · rash · reduced sperm count and activity · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception before and during treatment.
- **PREGNANCY** Avoid (teratogenic in animal studies). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment, unless used for malignant conditions.
- **RENAL IMPAIRMENT** In sickle-cell disease, reduce initial dose by 50% if estimated glomerular filtration rate less than 60 mL/minute/1.73 m². In sickle-cell disease, avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **MONITORING REQUIREMENTS**
 - ▶ Monitor renal and hepatic function before and during treatment.
 - ▶ Monitor full blood count before treatment, and repeatedly throughout use; in sickle-cell disease monitor every 2 weeks for the first 2 months and then every 2 months thereafter (or every 2 weeks if on maximum dose).
 - ▶ Patients receiving long-term therapy for malignant disease should be monitored for secondary malignancies.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Hydroxycarbamide for sickle cell disease www.medicinesforchildren.org.uk/hydroxycarbamide-for-sickle-cell-disease
Patients receiving long-term therapy with hydroxycarbamide should be advised to protect skin from sun exposure.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

- ▶ **Siklos** (Nordic Pharma Ltd)
Hydroxycarbamide 100 mg Siklos 100mg tablets | 60 tablet [PoM](#)
£100.00 DT price = £100.00
Hydroxycarbamide 1 gram Siklos 1000mg tablets | 30 tablet [PoM](#)
£500.00

Capsule

- ▶ **Hydroxycarbamide (Non-proprietary)**
Hydroxycarbamide 500 mg Hydroxycarbamide 500mg capsules | 100 capsule [PoM](#) £86.00 DT price = £11.70
- ▶ **Droxia** (Imported United States))
Hydroxycarbamide 300 mg Droxia 300mg capsules | 60 capsule [PoM](#) no price available

- ▶ **Hydrea** (Bristol-Myers Squibb Pharmaceuticals Ltd)
Hydroxycarbamide 500 mg Hydrea 500mg capsules | 100 capsule [PoM](#) £10.47 DT price = £11.70

Mitotane

- **DRUG ACTION** Mitotane selectively inhibits the activity of the adrenal cortex, necessitating corticosteroid replacement therapy.

INDICATIONS AND DOSE

Symptomatic treatment of advanced or inoperable adrenocortical carcinoma

- ▶ **BY MOUTH**
- ▶ **Child:** (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 494.

- **CAUTIONS** Avoid in Acute porphyrias p. 562 · risk of accumulation in overweight patients
- **INTERACTIONS** → Appendix 1 (mitotane).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Anaemia · anorexia · asthenia · ataxia · cognitive impairment · confusion · diarrhoea · dizziness · drowsiness · epigastric discomfort · gastro-intestinal disturbances · gynaecomastia · headache · hypercholesterolaemia · hypertriglyceridaemia · leucopenia · liver disorders · movement disorder · myasthenia · nausea · neuropathy · paraesthesia · prolonged bleeding time · rash · thrombocytopenia · vomiting
 - ▶ **Rare** Flushing · haematuria · haemorrhagic cystitis · hypersalivation · hypertension · hypouricaemia · ocular disorders · postural hypotension · proteinuria · pyrexia · visual disturbances
 - ▶ **Frequency not known** Alopecia · bone-marrow suppression · gastro-intestinal effects · hyperuricaemia · nausea · neuropsychological impairment (possibly secondary to hypothyroidism, and growth retardation) · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Manufacturer advises avoid. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. In mild to moderate hepatic impairment, monitoring of plasma-mitotane concentration is recommended.
- **RENAL IMPAIRMENT** Manufacturer advises caution in mild to moderate impairment. Avoid in severe impairment. In mild to moderate renal impairment, monitoring of plasma-mitotane concentration is recommended.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor plasma-mitotane concentration—consult product literature.
- **PRESCRIBING AND DISPENSING INFORMATION**
Corticosteroid replacement therapy Corticosteroid replacement therapy is necessary with treatment with mitotane. The dose of glucocorticoid should be increased in case of shock, trauma, or infection.

● PATIENT AND CARER ADVICE

Patients should be warned to contact doctor immediately if injury, infection, or illness occurs (because of risk of acute adrenal insufficiency).

Driving and skilled tasks

Central nervous system toxicity may affect performance of skilled tasks (e.g. driving).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

CAUTIONARY AND ADVISORY LABELS 2, 10, 21

► **Lysodren** (HRA Pharma UK Ltd)

Mitotane 500 mg Lysodren 500mg tablets | 100 tablet **[PoM]**
£590.97

Procarbazine

- **DRUG ACTION** Procarbazine is a mild monoamine-oxidase inhibitor.

● INDICATIONS AND DOSE

Hodgkin's lymphoma

► BY MOUTH

► Child: (consult local protocol)

IMPORTANT SAFETY INFORMATION

RISKS OF INCORRECT DOSING OF ORAL ANTI-CANCER MEDICINES
See Cytotoxic drugs p. 494.

- **CONTRA-INDICATIONS** Pre-existing severe leucopenia · pre-existing severe thrombocytopenia
- **CAUTIONS** Cardiovascular disease · cerebrovascular disease · epilepsy · phaeochromocytoma · procarbazine is a mild monoamineoxidase inhibitor (dietary restriction is rarely considered necessary)
- **INTERACTIONS** → Appendix 1 (procarbazine). Alcohol ingestion may cause a disulfiram-like reaction.
- **SIDE-EFFECTS**
 - **Common or very common** Loss of appetite
 - **Frequency not known** Alopecia · bone-marrow suppression · gastro-intestinal effects · hypersensitivity rash (discontinue treatment) · hyperuricaemia · jaundice · nausea · oral mucositis · organ-related toxicity (long-term and delayed) · thromboembolism · tumour lysis syndrome · vomiting
- **CONCEPTION AND CONTRACEPTION** Contraceptive advice required, see *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **PREGNANCY** Avoid (teratogenic in animal studies and isolated reports in humans). See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Discontinue breast-feeding.
- **HEPATIC IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.
- **RENAL IMPAIRMENT** Caution in mild to moderate impairment. Avoid in severe impairment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 4

► **Procarbazine (Non-proprietary)**

Procarbazine (as Procarbazine hydrochloride)

50 mg Procarbazine 50mg capsules | 50 capsule **[PoM]** £339.95

RETINOID AND RELATED DRUGS

Tretinoin

● INDICATIONS AND DOSE

Induction of remission in acute promyelocytic leukaemia (used in previously untreated patients as well as in those who have relapsed after standard chemotherapy or who are refractory to it)

► BY MOUTH

► Child: (consult local protocol)

- **CAUTIONS** Increased risk of thromboembolism during first month of treatment

- **INTERACTIONS** → Appendix 1 (retinoids).

- **SIDE-EFFECTS** Alopecia · anxiety · arrhythmias · benign intracranial hypertension (children particularly susceptible—consider dose reduction if intractable headache in children) · bone pain · cheilitis · chest pain · confusion · depression · dizziness · dry mucous membranes · dry skin · erythema · flushing · gastro-intestinal disturbances · genital ulceration · headache · hearing disturbances · hypercalcaemia · insomnia · oedema · pancreatitis · paraesthesia · pruritus · raised lipids · raised liver enzymes · raised serum creatinine · rash · retinoic acid syndrome · shivering · sweating · thromboembolism · visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- **Retinoic acid syndrome** Fever, dyspnoea, acute respiratory distress, pulmonary infiltrates, pleural effusion, hyperleucocytosis, hypotension, oedema, weight gain, hepatic, renal and multi-organ failure requires immediate treatment—consult product literature.
- **Nervous system effects** Children particularly susceptible to nervous system effects.
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used for at least 1 month before oral treatment, during treatment and for at least 1 month after stopping (oral progestogen-only contraceptives not considered effective).
- **PREGNANCY** Teratogenic. See *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.
- **BREAST FEEDING** Avoid (discontinue breast-feeding).
- **HEPATIC IMPAIRMENT** Reduce dose—consult local treatment protocol for details.
- **RENAL IMPAIRMENT** Reduce dose—consult local treatment protocol for details.
- **MONITORING REQUIREMENTS** Monitor haematological and coagulation profile, liver function, serum calcium and plasma lipids before and during treatment.
- **PRESCRIBING AND DISPENSING INFORMATION** Tretinoin is the acid form of vitamin A.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

► **Tretinoin (Non-proprietary)**

Tretinoin 10 mg Tretinoin 10mg capsules | 100 capsule **[PoM]**
£240.00 DT price = £240.00

2.1 Cytotoxic drug-induced side effects

DETOXIFYING DRUGS > UROPROTECTIVE DRUGS

Mesna

● INDICATIONS AND DOSE

Urothelial toxicity following oxazaphosphorine therapy

- ▶ BY INTRAVENOUS INJECTION, OR BY CONTINUOUS INTRAVENOUS INFUSION
- ▶ Child: (consult local protocol)

Mucolytic in cystic fibrosis

- ▶ BY INHALATION OF NEBULISED SOLUTION
- ▶ Child: 3–6 mL twice daily, use a 20% solution

- **UNLICENSED USE** Not licensed for use in children.

● SIDE-EFFECTS

- ▶ **Common or very common** Colic · depression · diarrhoea · fatigue · headache · hypotension · irritability · joint pains · limb pains · nausea · rash · tachycardia · vomiting
- ▶ **Rare** Hypersensitivity reactions (more common in patients with auto-immune disorders)

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to thiol-containing compounds.

- **PREGNANCY** Not known to be harmful. See also *Pregnancy and reproductive function* in Cytotoxic drugs p. 494.

- **DIRECTIONS FOR ADMINISTRATION** For oral administration of the injection, contents of ampoule are taken in a flavoured drink such as orange juice or cola which may be stored in a refrigerator for up to 24 hours in a sealed container.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

Tablet

▶ Mesna (Non-proprietary)

Mesna 400 mg Mesna 400mg tablets | 10 tablet [PoM] £134.30–£134.40

Mesna 600 mg Mesna 600mg tablets | 10 tablet [PoM] £190.60

Solution for injection

▶ Mesna (Non-proprietary)

Mesna 100 mg per 1 mL Mesna 1g/10mL solution for injection ampoules | 15 ampoule [PoM] £441.15

Mesna 400mg/4mL solution for injection ampoules | 15 ampoule [PoM] £201.15

VITAMINS AND TRACE ELEMENTS > FOLATES

Folinic acid

● INDICATIONS AND DOSE

Reduction of methotrexate-induced toxicity

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child: (consult local protocol)

Methotrexate overdose

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child: (consult local protocol)

Megaloblastic anaemia due to folate deficiency

- ▶ BY MOUTH
- ▶ Child 1 month–11 years: 250 micrograms/kg once daily
- ▶ Child 12–17 years: 15 mg once daily

Metabolic disorders leading to folate deficiency

- ▶ BY MOUTH, OR BY INTRAVENOUS INFUSION
- ▶ Child: 15 mg once daily, larger doses may be required in older children

Prevention of megaloblastic anaemia associated with pyrimethamine and sulfadiazine treatment of congenital toxoplasmosis

▶ BY MOUTH

- ▶ Neonate: 5 mg 3 times a week; increased if necessary up to 20 mg 3 times a week, if the patient is neutropenic.

- ▶ Child 1–11 months: 10 mg 3 times a week

SODIOFOLIN®

As an antidote to methotrexate

- ▶ BY INTRAVENOUS INFUSION, OR BY INTRAVENOUS INJECTION
- ▶ Child: (consult product literature)

- **UNLICENSED USE** Consult product literature for licensing status of individual preparations.

- **CONTRA-INDICATIONS** Intrathecal injection

- **CAUTIONS** Avoid simultaneous administration of methotrexate · **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency

- **INTERACTIONS** → Appendix 1 (folates).

● SIDE-EFFECTS

- ▶ **Rare** Agitation (after high doses) · depression (after high doses) · gastro-intestinal disturbances (after high doses) · insomnia (after high doses) · pyrexia (after parenteral use)

- **PREGNANCY** Not known to be harmful; benefit outweighs risk.

- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

▶ Folinic acid (Non-proprietary)

Folinic acid (as Calcium folinate) 15 mg Calcium folinate 15mg tablets | 10 tablet [PoM] £49.10 DT price = £49.11

▶ Refolinon (Pfizer Ltd)

Folinic acid (as Calcium folinate) 15 mg Refolinon 15mg tablets | 30 tablet [PoM] £85.74

Solution for injection

▶ Folinic acid (Non-proprietary)

Folinic acid (as Calcium folinate) 3 mg per 1 mL Calcium folinate 3mg/1mL solution for injection ampoules | 5 ampoule [PoM] £30.00

Folinic acid (as Calcium folinate) 7.5 mg per 1 mL Calcium folinate 15mg/2mL solution for injection ampoules | 5 ampoule [PoM] £38.99–£39.00

Folinic acid (as Calcium folinate) 10 mg per 1 mL Calcium folinate 50mg/5mL solution for injection vials | 1 vial [PoM] £18.44 (Hospital only) | 1 vial [PoM] £20.00

Calcium folinate 300mg/30mL solution for injection vials | 1 vial [PoM] £89.95 (Hospital only) | 1 vial [PoM] £100.00

Calcium folinate 100mg/10mL solution for injection vials | 1 vial [PoM] £34.94 (Hospital only) | 1 vial [PoM] £37.50

Folinic acid (as Disodium folinate) 50 mg per 1 mL Disodium folinate 50mg/1mL solution for injection vials | 1 vial [PoM] £24.70
Disodium folinate 200mg/4mL solution for injection vials | 1 vial [PoM] £80.40

▶ Refolinon (Pfizer Ltd)

Folinic acid (as Calcium folinate) 3 mg per 1 mL Refolinon 30mg/10mL solution for injection ampoules | 5 ampoule [PoM] £23.12

▶ Sodiofolin (medac UK)

Folinic acid (as Disodium folinate) 50 mg per 1 mL Sodiofolin 400mg/8mL solution for injection vials | 1 vial [PoM] £126.25 (Hospital only)

Sodiofolin 100mg/2mL solution for injection vials | 1 vial [PoM] £35.09 (Hospital only)

Levofolinic acid

- **DRUG ACTION** Levofolinic acid is an isomer of folinic acid.

● INDICATIONS AND DOSE

Reduction of methotrexate-induced toxicity

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

Methotrexate overdose

- BY INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **CONTRA-INDICATIONS** Intrathecal injection
- **CAUTIONS** Avoid simultaneous administration of methotrexate • **not** indicated for pernicious anaemia or other megaloblastic anaemias caused by vitamin B₁₂ deficiency
- **INTERACTIONS** → Appendix 1 (folates).
- **SIDE-EFFECTS**
 - **Rare** Agitation (after high doses) • depression (after high doses) • gastro-intestinal disturbances (after high doses) • insomnia (after high doses) • pyrexia (after parenteral use)
- **PREGNANCY** Not known to be harmful; benefit outweighs risk.
- **BREAST FEEDING** Presence in milk unknown but benefit outweighs risk.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- **Isovorin** (Pfizer Ltd)
Levofolinic acid (as Calcium levofolinate) 10 mg per 1 ml Isovorin 175mg/17.5ml solution for injection vials | 1 vial [PoM] £81.33 (Hospital only)
Isovorin 25mg/2.5ml solution for injection vials | 1 vial [PoM] £11.62 (Hospital only)

2.1a Hyperuricaemia associated with cytotoxic drugs

DETOXIFYING DRUGS > URATE OXIDASES

Rasburicase

● INDICATIONS AND DOSE

Prophylaxis and treatment of acute hyperuricaemia with initial chemotherapy for haematological malignancy

- BY INTRAVENOUS INFUSION
- Child: (consult local protocol)

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** G6PD deficiency
- **CAUTIONS** Atopic allergies
- **SIDE-EFFECTS**
 - **Common or very common** Fever • nausea • vomiting
 - **Uncommon** Anaphylaxis • bronchospasm • diarrhoea • haemolytic anaemia • headache • hypersensitivity reactions • methaemoglobinaemia • rash
- **PREGNANCY** Manufacturer advises avoid—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **MONITORING REQUIREMENTS** Monitor closely for hypersensitivity.
- **EFFECT ON LABORATORY TESTS** May interfere with test for uric acid—consult product literature.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for infusion

- **Fasturtec** (Sanofi)
Rasburicase 1.5 mg Fasturtec 1.5mg powder and solvent for solution for infusion vials | 3 vial [PoM] £208.39 (Hospital only)
Rasburicase 7.5 mg Fasturtec 7.5mg powder and solvent for solution for infusion vials | 1 vial [PoM] £347.32 (Hospital only)

XANTHINE OXIDASE INHIBITORS

Allopurinol

● INDICATIONS AND DOSE

Prophylaxis of hyperuricaemia associated with cancer chemotherapy | Prophylaxis of hyperuricaemic nephropathy, enzyme disorders causing increased serum urate e.g Lesch-Nyhan syndrome

- BY MOUTH
- Child 1 month–14 years: 10–20 mg/kg daily, dose to be taken preferably after food; maximum 400 mg per day
- Child 15–17 years: Initially 100 mg daily, taken preferably after food; dose to be increased according to response, up to 900 mg daily in divided doses (max. per dose 300 mg)

- **CAUTIONS** Ensure adequate fluid intake • for hyperuricaemia associated with cancer therapy, allopurinol treatment should be started before cancer therapy
- **INTERACTIONS** → Appendix 1 (allopurinol).
- **SIDE-EFFECTS**
 - **Common or very common** Gastro-intestinal disorders • rashes (**withdraw** therapy; if rash mild re-introduce cautiously but **discontinue** immediately if recurrence)
 - **Rare** Alopecia • aplastic anaemia • arthralgia • blood disorders • drowsiness • eosinophilia resembling Stevens-Johnson syndrome • eosinophilia resembling toxic epidermal necrolysis • exfoliation • fever • haemolytic anaemia • headache • hepatitis • hepatotoxicity • hypersensitivity reactions • hypertension • leucopenia • lymphadenopathy • malaise • neuropathy • paraesthesia • renal impairment • taste disturbances • thrombocytopenia • vasculitis • vertigo • visual disturbances
 - **Very rare** Seizures
- **PREGNANCY** Toxicity not reported. Manufacturer advises use only if no safer alternative and disease carries risk for mother or child.
- **BREAST FEEDING** Present in milk—not known to be harmful.
- **HEPATIC IMPAIRMENT** Reduce dose. Monitor hepatic function.
- **RENAL IMPAIRMENT** Manufacturer advises reduce dose or increase dose interval in severe impairment; adjust dose to maintain plasma-oxipurinol concentration below 100 micromol/litre.
- **PATIENT AND CARER ADVICE**
Medicines for Children leaflet: Allopurinol for hyperuricaemia www.medicinesforchildren.org.uk/allopurinol-for-hyperuricaemia

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 8, 21, 27

► Allopurinol (Non-proprietary)

3 Immunotherapy responsive malignancy

IMMUNOSTIMULANTS > INTERFERONS

Interferon alfa

- **DRUG ACTION** Interferon alfa has shown some antitumour effect in certain lymphomas and solid tumours.

● INDICATIONS AND DOSE

Induction of early regression of life-threatening corticosteroid resistant haemangiomas of infancy

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: (consult local protocol)

INTRONA® PEN

Chronic active hepatitis B

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2–17 years: 5 000 000–10 000 000 units/m² 3 times a week

Chronic active hepatitis C (in combination with oral ribavirin)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 3–17 years: 3 000 000 units/m² 3 times a week

INTRONA® VIALS

Chronic active hepatitis B

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2–17 years: 5 000 000–10 000 000 units/m² 3 times a week

Chronic active hepatitis C (in combination with ribavirin)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 3–17 years: 3 000 000 units/m² 3 times a week

ROFERON-A®

Chronic active hepatitis B

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 2–17 years: 2 500 000–5 000 000 units/m² 3 times a week, up to 10 000 000 units/m² has been used 3 times a week

- **UNLICENSED USE** Not licensed for use in children for chronic active hepatitis B.

ROFERON-A® Roferon-A® not licensed for use in children.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · history of severe psychiatric illness

CONTRA-INDICATIONS, FURTHER INFORMATION

For contra-indications consult product literature and local treatment protocol.

- **CAUTIONS**

CAUTIONS, FURTHER INFORMATION

For cautions consult product literature and local treatment protocol.

Interferon alfa should always be used under the close supervision of a specialist; the decision to treat should be made only after careful assessment of the expected benefits versus the potential risks, in particular the risk of growth inhibition caused by combination therapy.

- **INTERACTIONS** → Appendix 1 (interferons).

● SIDE-EFFECTS

- ▶ **Common or very common** Anorexia · influenza-like symptoms · lethargy · nausea
- ▶ **Rare** Pneumonia · pneumonitis · pulmonary infiltrates
- ▶ **Frequency not known** Alopecia · arrhythmias · cardiovascular problems · coma · confusion · depression · hepatotoxicity · hyperglycaemia · hypersensitivity reactions · hypertension · hypertriglyceridaemia (sometimes severe) · hypotension · myelosuppression (particularly affecting granulocyte counts) · nephrotoxicity · ocular side-effects · psoriasisiform rash · reversible motor problems in young children · seizures · suicidal behaviour · thyroid abnormalities

SIDE-EFFECTS, FURTHER INFORMATION

Consult product literature and local treatment protocols for information on side-effects.

Respiratory symptoms should be investigated and if pulmonary infiltrates are suspected or lung function is impaired the discontinuation of interferon alfa should be considered.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.
- **PREGNANCY** Avoid unless potential benefit outweighs risk (toxicity in animal studies).
- **BREAST FEEDING** Unlikely to be harmful.
- **HEPATIC IMPAIRMENT** Avoid in severe hepatic impairment. Close monitoring required in mild to moderate hepatic impairment.
- **RENAL IMPAIRMENT** Avoid in severe renal impairment. Close monitoring required in mild to moderate renal impairment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitoring of lipid concentration is recommended.
 - ▶ Monitoring of hepatic function is recommended.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol

- ▶ **Introna** (Merck Sharp & Dohme Ltd)

Interferon alfa-2b 10 mega u per 1 ml Introna 10million units/1ml solution for injection vials | 1 vial [PoM] no price available

Interferon gamma-1b

(Immune interferon)

• INDICATIONS AND DOSE

To reduce the frequency of serious infection in chronic granulomatous disease

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 6 months–17 years (body surface area up to 0.6 m²): 1.5 micrograms/kg 3 times a week
- ▶ Child 6 months–17 years (body surface area 0.6 m² and above): 50 micrograms/m² 3 times a week

To reduce the frequency of serious infection in severe malignant osteoporosis

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child (body surface area up to 0.6 m²): 1.5 micrograms/kg 3 times a week
- ▶ Child (body surface area 0.6 m² and above): 50 micrograms/m² 3 times a week

- **CAUTIONS** Arrhythmias · cardiac disease · congestive heart failure · ischaemia · seizure disorders (including seizures associated with fever)

- **INTERACTIONS** → Appendix 1 (interferons). Avoid simultaneous administration of foreign proteins including immunological products (risk of exaggerated immune response).

• SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · arthralgia · chills · depression · diarrhoea · fatigue · fever · headache · injection-site reactions · myalgia · nausea · rash · vomiting
- ▶ **Rare** Confusion · systemic lupus erythematosus
- ▶ **Frequency not known** Neutropenia · proteinuria · raised liver enzymes · thrombocytopenia

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment—consult product literature.

- **PREGNANCY** Manufacturers recommend avoid unless potential benefit outweighs risk (toxicity in *animal* studies).

- **BREAST FEEDING** Manufacturers advise avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.

- **RENAL IMPAIRMENT** Manufacturer advises caution in severe impairment—risk of accumulation.

- **MONITORING REQUIREMENTS** Monitor before and during treatment: haematological tests (including full blood count, differential white cell count, and platelet count), blood chemistry tests (including renal and liver function tests) and urinalysis.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Immukin** (Boehringer Ingelheim Ltd)
Interferon gamma-1b (recombinant human) 200 microgram per 1 ml
Immukin 100micrograms/0.5ml solution for injection vials | 6 vial [PoM] £450.00

IMMUNOSTIMULANTS > IMMUNOSTIMULANTS, OTHER

Mifamurtide

• INDICATIONS AND DOSE

Treatment of high-grade, resectable, non-metastatic osteosarcoma after complete surgical resection (in combination with chemotherapy)

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 2–17 years: Infusion to be given over 1 hour (consult product literature or local protocols)

- **UNLICENSED USE** Not licensed for use in patients under 2 years of age at initial diagnosis.

- **CAUTIONS** Asthma—consider prophylactic bronchodilator therapy · chronic obstructive pulmonary disease—consider prophylactic bronchodilator therapy · history of autoimmune disease · history of collagen disease · history of inflammatory disease

- **INTERACTIONS** → Appendix 1 (mifamurtide).

- **SIDE-EFFECTS** Abdominal pain · alopecia · anaemia · anorexia · anxiety · blurred vision · confusion · constipation · cough · depression · diarrhoea · dizziness · drowsiness · dry skin · dyspepsia · dyspnoea · dysuria · epistaxis · flushing · gastro-intestinal disturbances · granulocytopenia · haematuria · haemoptysis · headache · hearing loss · hypertension · hypoaesthesia · hypokalaemia · hypotension · insomnia · leucopenia · musculoskeletal pain · nausea · oedema · palpitations · paraesthesia · phlebitis · pleural effusion · pollakiuria · rash · respiratory disorders · sweating · tachycardia · tachypnoea · thrombocytopenia · tinnitus · tremor · vertigo · vomiting

- **CONCEPTION AND CONTRACEPTION** Effective contraception required.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid—no information available.

- **HEPATIC IMPAIRMENT** Use with caution—no information available.

- **RENAL IMPAIRMENT** Use with caution—no information available.

• MONITORING REQUIREMENTS

- ▶ Monitor renal function, hepatic function and clotting parameters.
- ▶ Monitor patients with history of venous thrombosis, vasculitis, or unstable cardiovascular disorders for persistent or worsening symptoms during administration—consult product literature.

• NATIONAL FUNDING/ACCESS DECISIONS

Blood and blood-forming organs

1 Anaemias

Anaemias

Initiation of treatment

Before initiating treatment for anaemia it is essential to determine which type is present. Iron salts may be harmful and result in iron overload if given alone to patients with anaemias other than those due to iron deficiency.

Sickle-cell anaemia

Sickle-cell disease is caused by a structural abnormality of haemoglobin resulting in deformed, less flexible red blood cells. Acute complications in the more severe forms include sickle-cell crisis, where infarction of the microvasculature and blood supply to organs results in severe pain. Sickle-cell crisis requires hospitalisation, intravenous fluids, analgesia and treatment of any concurrent infection. Chronic complications include skin ulceration, renal failure, and increased susceptibility to infection. Pneumococcal vaccine, haemophilus influenzae type b vaccine, an annual influenza vaccine and prophylactic penicillin reduce the risk of

infection. Hepatitis B vaccine should be considered if the patient is not immune.

In most forms of sickle-cell disease, varying degrees of haemolytic anaemia are present accompanied by increased erythropoiesis; this may increase folate requirements and folate supplementation may be necessary.

Hydroxycarbamide p. 512 can reduce the frequency of crises and the need for blood transfusions in sickle-cell disease. The beneficial effects of hydroxycarbamide may not become evident for several months.

G6PD deficiency

Glucose 6-phosphate dehydrogenase (G6PD) deficiency is highly prevalent in individuals originating from most parts of Africa, from most parts of Asia, from Oceania, and from Southern Europe; it can also occur, rarely, in any other individuals. G6PD deficiency is more common in males than it is in females.

Individuals with G6PD deficiency are susceptible to developing acute haemolytic anaemia when they take a number of common drugs. They are also susceptible to developing acute haemolytic anaemia when they eat fava beans (broad beans, *Vicia faba*); this is termed *favism* and can be more severe in children or when the fresh fava beans are eaten raw.

When prescribing drugs for patients with G6PD deficiency, the following three points should be kept in mind:

- G6PD deficiency is genetically heterogeneous; susceptibility to the haemolytic risk from drugs varies;

thus, a drug found to be safe in some G6PD-deficient individuals may not be equally safe in others;

- manufacturers do not routinely test drugs for their effects in G6PD-deficient individuals;
- the risk and severity of haemolysis is almost always dose-related.

The lists below should be read with these points in mind. Ideally, information about G6PD deficiency should be available before prescribing a drug listed below. However, in the absence of this information, the possibility of haemolysis should be considered, especially if the patient belongs to a group in which G6PD deficiency is common.

A very few G6PD-deficient individuals with chronic non-spherocytic haemolytic anaemia have haemolysis even in the absence of an exogenous trigger. These patients must be regarded as being at high risk of severe exacerbation of haemolysis following administration of any of the drugs listed below.

Drugs with definite risk of haemolysis in most G6PD-deficient individuals

- Dapsone and other sulfones (higher doses for dermatitis herpetiformis more likely to cause problems)
- Methylthioninium chloride
- Niridazole [not on UK market]
- Nitrofurantoin
- Pamaquin [not on UK market]
- Primaquine (30 mg weekly for 8 weeks has been found to be without undue harmful effects in African and Asian people)
- Quinolones (including ciprofloxacin, moxifloxacin, nalidixic acid, norfloxacin, and ofloxacin)
- Rasburicase
- Sulfonamides (including co-trimoxazole; some sulfonamides, e.g. sulfadiazine, have been tested and found not to be haemolytic in many G6PD-deficient individuals)

Drugs with possible risk of haemolysis in some G6PD-deficient individuals

- Aspirin (acceptable up to a dose of at least 1 g daily in most G6PD-deficient individuals)
- Chloroquine (acceptable in acute malaria and malaria chemoprophylaxis)
- Menadione, water-soluble derivatives (e.g. menadiol sodium phosphate)
- Quinidine (acceptable in acute malaria) [not on UK market]
- Quinine (acceptable in acute malaria)
- Sulfonyleureas

Naphthalene in mothballs also causes haemolysis in individuals with G6PD deficiency.

Drugs used in hypoplastic, haemolytic, and renal anaemias

Anabolic steroids, pyridoxine hydrochloride p. 585, antilymphocyte immunoglobulin, and various corticosteroids are used in hypoplastic and haemolytic anaemias.

Antilymphocyte immunoglobulin given intravenously through a central line over 12–18 hours each day for 5 days produces a response in about 50% of cases of acquired *aplastic anaemia*; the response rate may be increased when ciclosporin p. 486 is given as well. Severe reactions are common in the first 2 days and profound immunosuppression can occur; antilymphocyte immunoglobulin should be given under specialist supervision with appropriate resuscitation facilities. Alternatively, oxymetholone tablets (available from 'special order' manufacturers or specialist importing companies) can be used in aplastic anaemia for 3 to 6 months.

It is unlikely that dietary deprivation of pyridoxine hydrochloride produces clinically relevant haematological effects. However, certain forms of *sideroblastic anaemia*

respond to pharmacological doses, possibly reflecting its role as a co-enzyme during haemoglobin synthesis. Pyridoxine hydrochloride is indicated in both *idiopathic acquired* and *hereditary sideroblastic anaemias*. Although complete cures have not been reported, some increase in haemoglobin can occur with high doses. *Reversible sideroblastic anaemia*s respond to treatment of the underlying cause but pyridoxine hydrochloride is indicated in pregnancy, haemolytic anaemias, or during isoniazid p. 345 treatment.

Corticosteroids have an important place in the management of haematological disorders including *autoimmune haemolytic anaemia*, *idiopathic thrombocytopenias* and *neutropenias*, and *major transfusion reactions*. They are also used in chemotherapy schedules for many types of *lymphoma*, *lymphoid leukaemias*, and *paraproteinaemias*, including *multiple myeloma*.

Erythropoietins

Epoetins (recombinant human erythropoietins) are used to treat the anaemia associated with erythropoietin deficiency in chronic renal failure.

Epoetin beta p. 525 is also used for the prevention of anaemia in preterm neonates of low birth-weight; a therapeutic response may take several weeks.

There is insufficient information to support the use of erythropoietins in children with leukaemia or in those receiving cancer chemotherapy.

Darbepoetin is a glycosylated derivative of epoetin; it persists longer in the body and can be administered less frequently than epoetin.

EPOETINS

Epoetins

IMPORTANT SAFETY INFORMATION

ERYTHROPOIETINS—HAEMOGLOBIN CONCENTRATION

In chronic kidney disease, the use of erythropoietins can be considered in a child with anaemia. The aim of treatment is to relieve symptoms of anaemia and to avoid the need for blood transfusion. The optimum haemoglobin concentration is dependent on the child's age and factors such as symptoms, comorbidities, and patient preferences. The haemoglobin concentration should not be increased beyond that which provides adequate control of symptoms of anaemia. In *adults*, overcorrection of haemoglobin concentration with erythropoietins in those with chronic kidney disease may

increase the risk of serious cardiovascular events and death; haemoglobin concentrations higher than 12 g/100 mL should be avoided in children.

- **CONTRA-INDICATIONS** Avoid injections containing benzyl alcohol in neonates · pure red cell aplasia following erythropoietin therapy · uncontrolled hypertension
- **CAUTIONS** Aluminium toxicity (can impair the response to erythropoietin) · concurrent infection (can impair the response to erythropoietin) · correct factors that contribute to the anaemia of chronic renal failure, such as iron or folate deficiency, before treatment · during dialysis (increase in unfractionated or low molecular weight heparin dose may be needed) · epilepsy · inadequately treated or poorly controlled blood pressure—interrupt treatment if blood pressure uncontrolled · ischaemic vascular disease · malignant disease · other inflammatory disease (can impair the response to erythropoietin) · sickle-cell disease (lower target haemoglobin concentration may be appropriate) · sudden stabbing migraine-like pain (warning of a hypertensive crisis) · thrombocytosis (monitor platelet count for first 8 weeks)

● SIDE-EFFECTS

- ▶ **Common or very common** Aggravation of hypertension (dose-dependent) · cardiovascular events · diarrhoea · dose-dependent increase in platelet count regressing during treatment (but thrombocytosis rare) · headache · hypertensive crisis (in isolated patients with normal or low blood pressure) · increase in blood pressure (dose-dependent) · influenza-like symptoms (may be reduced if intravenous injection given over 5 minutes) · nausea · shunt thrombosis especially if tendency to hypotension or arteriovenous shunt complications · vomiting
- ▶ **Very rare** Sudden loss of efficacy because of pure red cell aplasia, particularly following subcutaneous administration in patients with chronic renal failure
- ▶ **Frequency not known** Anaphylaxis · angioedema · hyperkalaemia · hypersensitivity reactions · injection-site reactions · peripheral oedema · skin reactions

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Hypertensive crisis** In isolated patients with normal or low blood pressure, hypertensive crisis with cephalopathy-like symptoms and generalised tonic-clonic seizures requiring immediate medical attention has occurred with epoetin.
- ▶ **Pure red cell aplasia** There have been very rare reports of pure red cell aplasia in patients treated with erythropoietins. In patients who develop a lack of efficacy with erythropoietin therapy and with a diagnosis of pure red cell aplasia, treatment with erythropoietins must be discontinued and testing for erythropoietin antibodies considered. Patients who develop pure red cell aplasia should **not** be switched to another form of erythropoietin.

● MONITORING REQUIREMENTS

- ▶ Monitor closely blood pressure, reticulocyte counts, haemoglobin, and electrolytes—interrupt treatment if blood pressure uncontrolled.
- ▶ Other factors, such as iron or folate deficiency, that contribute to the anaemia of chronic renal failure should be corrected before treatment and monitored during therapy. Supplemental iron may improve the response in resistant patients and in preterm neonates.

Darbepoetin alfa

● INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic renal failure in patients on dialysis

- ▶ **BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INJECTION**
- ▶ Child 11–17 years: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose to be given once weekly or once every 2 weeks, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

- ▶ **BY SUBCUTANEOUS INJECTION**
- ▶ Child 11–17 years: Initially 450 nanograms/kg once weekly, alternatively initially 750 nanograms/kg every 2 weeks, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose can be given once weekly, every 2 weeks, or once a month, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

Symptomatic anaemia associated with chronic renal failure in patients not on dialysis

- ▶ **BY INTRAVENOUS INJECTION**
- ▶ Child 11–17 years: Initially 450 nanograms/kg once weekly, dose to be adjusted according to response by approximately 25% at intervals of at least 4 weeks, maintenance dose given once weekly, subcutaneous route preferred in patients not on haemodialysis, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose, when changing route give same dose then adjust according to weekly or fortnightly haemoglobin measurements, adjust doses not more frequently than every 2 weeks during maintenance treatment

- **SIDE-EFFECTS** Injection-site pain · oedema

- **PREGNANCY** No evidence of harm in *animal* studies—manufacturer advises caution.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution.

● INDICATIONS AND DOSE

BINOCRIT® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

► BY INTRAVENOUS INJECTION

► Child (body-weight up to 10 kg): Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–150 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin

concentration decreases and then restart at a dose approximately 25% lower than the previous dose

- Child (body-weight 10–30 kg): Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 60–150 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose
- Child (body-weight 31 kg and above): Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 30–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

EPREX® PRE-FILLED SYRINGES

Symptomatic anaemia associated with chronic renal failure in patients on haemodialysis

► BY INTRAVENOUS INJECTION

- Child (body-weight up to 10 kg): Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–150 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose
- Child (body-weight 10–30 kg): Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 60–150 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose
- Child (body-weight 31–60 kg): Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 30–100 units/kg 3 times a week, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

- ▶ **Child** (body-weight 61 kg and above): Initially 50 units/kg 3 times a week, adjusted in steps of 25 units/kg 3 times a week, dose adjusted according to response at intervals of at least 4 weeks; maintenance 75–300 units/kg once weekly, maintenance dose can be given as a single dose or in divided doses, intravenous injection to be given over 1–5 minutes, reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose

- **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.
- **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.
- **HEPATIC IMPAIRMENT** Manufacturers advise caution in chronic hepatic failure.
- **PRESCRIBING AND DISPENSING INFORMATION** Products containing epoetin alfa are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name, see *Biosimilar medicines*, under Guidance on prescribing p. 1.

Eprex 40,000units/1mL solution for injection pre-filled syringes | 1 pre-filled disposable injection [PoM] £265.48

Epoetin beta

● INDICATIONS AND DOSE

Symptomatic anaemia associated with chronic renal failure

- ▶ **BY SUBCUTANEOUS INJECTION**

- ▶ **Neonate:** Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

- ▶ **Child:** Initially 20 units/kg 3 times a week for 4 weeks, increased in steps of 20 units/kg 3 times a week, according to response at intervals of 4 weeks, total weekly dose may be divided into daily doses; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks, total weekly maintenance dose may be given as a single dose or in 3 or 7 divided doses. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

- ▶ **BY INTRAVENOUS INJECTION**

- ▶ **Neonate:** Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week.

- ▶ **Child:** Initially 40 units/kg 3 times a week for 4 weeks, then increased to 80 units/kg 3 times a week, then increased in steps of 20 units/kg 3 times a week if required, at intervals of 4 weeks; maintenance dose, initially reduce dose by half then adjust according to response at intervals of 1–2 weeks. Intravenous injection to be administered over 2 minutes. Subcutaneous route preferred in patients not on haemodialysis. Reduce dose by approximately 25% if rise in haemoglobin concentration exceeds 2 g/100 mL over 4 weeks or if haemoglobin

continued →

concentration approaches or exceeds 12 g/100 mL; if haemoglobin concentration continues to rise, despite dose reduction, suspend treatment until haemoglobin concentration decreases and then restart at a dose approximately 25% lower than the previous dose; maximum 720 units/kg per week

Prevention of anaemias of prematurity in neonates

► BY SUBCUTANEOUS INJECTION

- Neonate up to 33 weeks corrected gestational age (body-weight 0.75–1.5 kg): 250 units/kg 3 times a week preferably started within 3 days of birth and continued for 6 weeks, using single-dose unpreserved injection.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MAY 2015) EPOETIN BETA (NEORECORMON): INCREASED RISK OF RETINOPATHY IN PRETERM INFANTS CANNOT BE EXCLUDED

There is a possible increased risk of retinopathy in premature infants, when epoetin beta is used for preventing anaemia of prematurity. When using epoetin beta in preterm infants:

- consider the benefits and risks of treatment, including the possible risk of retinopathy,
- monitor the infant for features of retinopathy, and
- advise parents or carers that their baby's eyes will be carefully monitored for any ill effects.

- **PREGNANCY** No evidence of harm. Benefits probably outweigh risk of anaemia and of blood transfusion in pregnancy.

- **BREAST FEEDING** Unlikely to be present in milk. Minimal effect on infant.

- **HEPATIC IMPAIRMENT** Manufacturers advise caution in chronic hepatic failure.

• MEDICINAL FORMS

1.1a Atypical haemolytic uraemic syndrome and paroxysmal nocturnal haemoglobinuria

IMMUNOSUPPRESSANTS > MONOCLONAL ANTIBODIES

Eculizumab

- **DRUG ACTION** Eculizumab, a recombinant monoclonal antibody, inhibits terminal complement activation at the C5 protein and thereby reduces haemolysis and thrombotic microangiopathy.

● INDICATIONS AND DOSE

Reduce haemolysis in paroxysmal nocturnal haemoglobinuria (PNH), in those with a history of blood transfusions (under expert supervision)

► BY INTRAVENOUS INFUSION

- Child: Refer for specialist advice, experience very limited

Reduce thrombotic microangiopathy in atypical haemolytic uraemic syndrome (aHUS) (specialist use only)

► BY INTRAVENOUS INFUSION

- Child 2 months–17 years (body-weight 5–9 kg): Initially 300 mg once weekly for 2 weeks, followed by 300 mg every 3 weeks
- Child 2 months–17 years (body-weight 10–19 kg): Initially 600 mg once weekly for 1 week, then reduced to 300 mg once weekly for 1 week, followed by 300 mg every 2 weeks
- Child 2 months–17 years (body-weight 20–29 kg): Initially 600 mg once weekly for 3 weeks, followed by 600 mg every 2 weeks
- Child 2 months–17 years (body-weight 30–39 kg): Initially 600 mg once weekly for 2 weeks, then increased to 900 mg once weekly for 1 week, followed by 900 mg every 2 weeks
- Child 2 months–17 years (body-weight 40 kg and above): Initially 900 mg once weekly for 4 weeks, then increased to 1.2 g once weekly for 1 week, followed by 1.2 g every 2 weeks

- **UNLICENSED USE** Not licensed for use in children for paroxysmal nocturnal haemoglobinuria.
- **CONTRA-INDICATIONS** Patients unvaccinated against *Neisseria meningitidis* · unresolved *Neisseria meningitidis* infection
- **CAUTIONS** Active systemic infection
- **CAUTIONS, FURTHER INFORMATION**
 - Meningococcal infection Vaccinate against *Neisseria meningitidis* at least 2 weeks before treatment (tetravalent vaccine against serotypes A, C, W135 and Y recommended); revaccinate according to current medical guidelines. Patients receiving eculizumab less than 2 weeks after receiving meningococcal vaccine must be given prophylactic antibiotics until 2 weeks after vaccination. Advise patient to report promptly any signs of meningococcal infection. Other immunisations should also be up to date.
- **SIDE-EFFECTS**
 - **Common or very common** Alopecia · arthralgia · blood disorders · cough · dizziness · dysgeusia · dysuria · fatigue · gastro-intestinal disturbances · headache · infection (including meningococcal infection) · influenza-like symptoms · infusion-related reactions · leucopenia ·

myalgia · nasopharyngitis · oedema · paraesthesia · pruritus · rash · spontaneous erection · thrombocytopenia · vertigo

- **Uncommon** Anorexia · anxiety · chest pain · depression · epistaxis · gingival pain · Graves' disease · haematoma · hot flushing · hyperhidrosis · hypotension · jaundice · malignant melanoma · menstrual disorders · mood changes · muscle spasms · myelodysplastic syndrome · palpitation · petechiae · renal impairment · skin depigmentation · sleep disturbances · syncope · tinnitus · tremor · visual disturbances

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception during and for 5 months after treatment.
- **PREGNANCY** No information available—use only if potential benefit outweighs risk. Human IgG antibodies known to cross placenta.
- **BREAST FEEDING** No information available—manufacturer advises avoid breast-feeding during and for 5 months after treatment.
- **MONITORING REQUIREMENTS**
 - Monitor for 1 hour after infusion.
 - For *paroxysmal nocturnal haemoglobinuria*, monitor for intravascular haemolysis (including serum-lactate dehydrogenase concentration) during treatment and for at least 8 weeks after discontinuation.
 - For *atypical haemolytic uraemic syndrome*, monitor for thrombotic microangiopathy (measure platelet count, serum-lactate dehydrogenase concentration, and serum creatinine) during treatment and for at least 12 weeks after discontinuation.
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use Dilute requisite dose to a concentration of 5 mg/mL with Glucose 5% or Sodium Chloride 0.9% and mix gently; give over 25–45 minutes. If infusion-related reactions occur, infusion time may be increased to 4 hours in child under 12 years or 2 hours in child over 12 years.
- **PRESCRIBING AND DISPENSING INFORMATION** Consult product literature for details of supplemental doses with concomitant plasmapheresis, plasma exchange, or plasma infusion.
- **PATIENT AND CARER ADVICE** A patient information card should be provided.
 - Patient or carers should be advised to report promptly any signs of meningococcal infection.

- **MEDICINAL FORMS** There can be variation in the licensing of different medicines containing the same drug.
- **Solution for infusion**

ELECTROLYTES: May contain Sodium

 - **Soliris** (Alexion Pharma UK Ltd)
Eculizumab 10 mg per 1 mL Soliris 300mg/30ml concentrate for solution for infusion vials | 1 vial [PoM] £3,150.00 (Hospital only)

1.2 Iron deficiency anaemia

Anaemia, iron deficiency

Treatment and prophylaxis

Treatment with an iron preparation is justified only in the presence of a demonstrable iron-deficiency state. Before starting treatment, it is important to exclude any serious underlying cause of the anaemia (e.g. gastro-intestinal bleeding). The possibility of thalassaemia should be considered in children of Mediterranean or Indian subcontinent descent.

Prophylaxis with an iron preparation may be appropriate in those with a poor diet, malabsorption, menorrhagia,

pregnancy, in haemodialysis patients, and in the management of low birth-weight infants such as preterm neonates.

Oral iron

Iron salts should be given by mouth unless there are good reasons for using another route.

Ferrous salts show only marginal differences between one another in efficiency of absorption of iron. Haemoglobin regeneration rate is little affected by the type of salt used provided sufficient iron is given, and in most patients the speed of response is not critical. Choice of preparation is thus usually decided by formulation, palatability, incidence of side-effects, and cost.

Treatment of iron-deficiency anaemia

The oral dose of elemental iron to treat deficiency is 3–6 mg/kg (max. 200 mg) daily given in 2–3 divided doses. Iron supplementation may also be required to produce an optimum response to erythropoietins in iron-deficient children with chronic renal failure or in preterm neonates.

When prescribing, express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription. The iron content of artificial formula feeds should also be considered.

Iron content of different iron salts	
Iron salt/amount	Content of ferrous iron
ferrous fumarate 200 mg	65 mg
ferrous gluconate 300 mg	35 mg
ferrous sulfate 300 mg	60 mg
ferrous sulfate dried 200 mg	65 mg
sodium feredetate 190 mg	27.5 mg

Prophylaxis of iron deficiency

In neonates, haemoglobin and haematocrit concentrations change rapidly. These changes are not due to iron deficiency and cannot be corrected by iron supplementation. Similarly, neonatal anaemia resulting from repeated blood sampling does not respond to iron therapy.

All babies, including preterm neonates, are born with substantial iron stores but these stores can become depleted unless dietary intake is adequate. All babies require an iron intake of 400–700 nanograms daily to maintain body stores. Iron in breast milk is well absorbed but that in artificial feeds or in cow's milk is less so. Most artificial formula feeds are sufficiently fortified with iron to prevent deficiency and their iron content should be taken into account when considering further iron supplementation.

Prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.

Infants with a poor diet may become anaemic in the second year of life, particularly if cow's milk, rather than fortified formula feed, is a major part of the diet.

Compound preparations

Some oral preparations contain ascorbic acid p. 587 to aid absorption of the iron, but the therapeutic advantage of such preparations is minimal and cost may be increased.

There is no justification for the inclusion of other ingredients, such as the **B group of vitamins**, except folic acid for pregnant women.

Parenteral iron

Iron can be administered parenterally as iron dextran p. 529, iron sucrose p. 529 or ferric carboxymaltose p. 529.

Parenteral iron is generally reserved for use when oral therapy is unsuccessful because the child cannot tolerate

oral iron, or does not take it reliably, or if there is continuing blood loss, or in malabsorption.

Many children with chronic renal failure who are receiving haemodialysis (and some who are receiving peritoneal dialysis) also require iron by the intravenous route on a regular basis.

With the exception of children with severe renal failure receiving haemodialysis, parenteral iron does not produce a faster haemoglobin response than oral iron provided that the oral iron preparation is taken reliably and is absorbed adequately. If parenteral iron is necessary, the dose should be calculated according to the child's body-weight and total iron deficit. Depending on the preparation used, parenteral iron is given as a total dose or in divided doses. Further treatment should be guided by monitoring haemoglobin and serum iron concentrations.

MINERALS AND TRACE ELEMENTS > IRON, INJECTABLE

Iron (injectable)

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: SERIOUS HYPERSENSITIVITY REACTIONS WITH INTRAVENOUS IRON (AUGUST 2013)

Serious hypersensitivity reactions, including life-threatening and fatal anaphylactic reactions, have been reported in patients receiving intravenous iron. These reactions can occur even when a previous administration has been tolerated (including a negative test dose). Test doses are no longer recommended and caution is needed with every dose of intravenous iron.

Intravenous iron products should only be administered when appropriately trained staff and resuscitation facilities are immediately available; patients should be closely monitored for signs of hypersensitivity during and for at least 30 minutes after every administration. In the event of a hypersensitivity reaction, treatment should be stopped immediately and appropriate management initiated.

The risk of hypersensitivity is increased in patients with known allergies, immune or inflammatory conditions, or those with a history of severe asthma, eczema, or other atopic allergy; in these patients, intravenous iron should only be used if the benefits outweigh the risks.

Intravenous iron should be avoided in the first trimester of pregnancy and used in the second or third trimesters only if the benefit outweighs the potential risks for both mother and fetus.

● SIDE-EFFECTS Hypersensitivity reactions

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Anaphylactic reactions** Anaphylactic reactions can occur with parenteral administration of iron complexes and facilities for cardiopulmonary resuscitation must be available. If children complain of acute symptoms particularly nausea, back pain, breathlessness, or develop hypotension, the infusion should be stopped.

Overdose

For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 786.

Ferric carboxymaltose

● INDICATIONS AND DOSE

Iron-deficiency anaemia

- **BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION**
- **Child:** Dose calculated according to body-weight and iron deficit (consult product literature)

- **UNLICENSED USE** Not licensed for use in children under 14 years.
- **CAUTIONS** Allergic disorders · asthma · eczema · hypersensitivity can occur with parenteral iron and facilities for cardiopulmonary resuscitation must be available · infection (discontinue if ongoing bacteraemia) · oral iron should not be given until 5 days after last injection
- **SIDE-EFFECTS**
 - **Common or very common** Dizziness · gastro-intestinal disturbances · headache · injection-site reactions · rash
 - **Uncommon** Anaphylaxis · arthralgia · back pain · chest pain · fatigue · flushing · hypertension · hypotension · malaise · myalgia · paraesthesia · peripheral oedema · pruritus · pyrexia · rigors · urticaria
 - **Rare** Dyspnoea
- **PREGNANCY** Avoid in first trimester; crosses the placenta in animal studies. May influence skeletal development.
- **HEPATIC IMPAIRMENT** Use with caution. Avoid in conditions where iron overload increases risk of impairment.
- **PRESCRIBING AND DISPENSING INFORMATION** A ferric carboxymaltose complex containing 5% (50 mg/mL) of iron.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

ELECTROLYTES: May contain Sodium

MINERALS AND TRACE ELEMENTS > IRON, ORAL

Iron (oral)

- **SIDE-EFFECTS** Constipation · diarrhoea · epigastric pain (dose related) · faecal impaction · gastro-intestinal irritation · nausea (dose related)

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Managing side-effects If side-effects occur, the dose may be reduced; alternatively, another iron salt may be used, but an improvement in tolerance may simply be a result of a lower content of elemental iron. The incidence of side-effects due to ferrous sulfate is no greater than with other iron salts when compared on the basis of equivalent amounts of elemental iron.

- ▶ Altered bowel habit Iron preparations taken orally can be constipating and occasionally lead to faecal impaction.

Oral iron, particularly modified-release preparations, can exacerbate diarrhoea in patients with inflammatory bowel disease; care is also needed in patients with intestinal strictures and diverticular disease.

The relationship between dose and altered bowel habit (constipation or diarrhoea) is less clear than for nausea and epigastric pain.

Overdose

For details on the management of poisoning, see Iron salts, under Emergency treatment of poisoning p. 786.

Iron preparations are an important cause of accidental overdose in children and as little as 20 mg/kg of elemental iron can lead to symptoms of toxicity.

MONITORING REQUIREMENTS

- ▶ Therapeutic response The haemoglobin concentration should rise by about 100–200 mg/100 mL (1–2 g/litre) per day or 2 g/100 mL (20 g/litre) over 3–4 weeks. When the haemoglobin is in the normal range, treatment should be continued for a further 3 months to replenish the iron stores. Epithelial tissue changes such as atrophic glossitis and koilonychia are usually improved, but the response is often slow.

- **PRESCRIBING AND DISPENSING INFORMATION** Express the dose in terms of elemental iron and iron salt and select the most appropriate preparation; specify both the iron salt and formulation on the prescription.

The iron content of artificial formula feeds should also be considered.

The most common reason for lack of response in children is poor compliance; poor absorption is rare in children.

- **PATIENT AND CARER ADVICE** Although iron preparations are best absorbed on an empty stomach they can be taken after food to reduce gastro-intestinal side-effects. May discolour stools.

Ferrous fumarate

INDICATIONS AND DOSE

Iron-deficiency anaemia (prophylactic)

- ▶ BY MOUTH USING TABLETS
- ▶ Child 12–17 years: 210 mg 1–2 times a day

- ▶ BY MOUTH USING SYRUP

- ▶ Child 12–17 years: 140 mg twice daily

Iron-deficiency anaemia (therapeutic)

- ▶ BY MOUTH USING TABLETS

- ▶ Child 12–17 years: 210 mg 2–3 times a day

- ▶ BY MOUTH USING SYRUP

- ▶ Child 12–17 years: 280 mg twice daily

FERSADAY®

Iron-deficiency anaemia (prophylactic)

- ▶ BY MOUTH

- ▶ Child 12–17 years: 322 mg daily

Iron-deficiency anaemia (therapeutic)

- ▶ BY MOUTH

- ▶ Child 12–17 years: 322 mg twice daily

GALFER® CAPSULES

Iron-deficiency anaemia (prophylactic)

- ▶ BY MOUTH

- ▶ Child 12–17 years: 305 mg daily

Iron-deficiency anaemia (therapeutic)

- ▶ BY MOUTH

- ▶ Child 12–17 years: 305 mg twice daily

GALFER® SYRUP

Iron-deficiency anaemia (prophylaxis)

- ▶ BY MOUTH

- ▶ Neonate up to 36 weeks corrected gestational age (body-weight up to 3 kg): 0.5 mL daily, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established.

- ▶ Neonate: 0.25 mL/kg twice daily, the total daily dose may alternatively be given in 3 divided doses, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established; maximum 20 mL per day

- ▶ Child 1 month–11 years: 0.25 mL/kg twice daily, the total daily dose may alternatively be given in 3 divided doses, prophylactic iron supplementation may be required in babies of low birth-weight who are solely breast-fed; supplementation is started 4–6 weeks after birth and continued until mixed feeding is established; maximum 20 mL per day

- ▶ Child 12–17 years: 10 mL once daily

Iron-deficiency anaemia (therapeutic)

- ▶ BY MOUTH

- ▶ Neonate: 0.25 mL/kg twice daily, the total daily dose may alternatively be given in 3 divided doses.

- ▶ Child 1 month–11 years: 0.25 mL/kg twice daily, the total daily dose may alternatively be given in 3 divided doses; maximum 20 mL per day

- ▶ Child 12–17 years: 10 mL 1–2 times a day

- **INTERACTIONS** → Appendix 1 (iron salts).

- **PRESCRIBING AND DISPENSING INFORMATION** Non-proprietary ferrous fumarate tablets may contain 210 mg (68 mg iron), syrup may contain approx. 140 mg (45 mg iron)/5 mL; *Galfer*® capsules contain ferrous fumarate 305 mg (100 mg iron); *Fersaday*® tablets contain ferrous fumarate 322 mg (100 mg iron).

1.3 Megaloblastic anaemia

Anaemia, megaloblastic

Overview

Megaloblastic anaemias are rare in children; they may result from a lack of either vitamin B₁₂ or folate and it is essential to establish in every case which deficiency is present and the underlying cause. In emergencies, when delay might be dangerous, it is sometimes necessary to administer both substances after the bone marrow test while plasma assay results are awaited. Normally, however, appropriate treatment should not be instituted until the results of tests are available.

Vitamin B₁₂ is used in the treatment of megaloblastosis caused by *prolonged nitrous oxide anaesthesia*, which inactivates the vitamin, and in the rare disorders of *congenital transcobalamin II deficiency* and *homocystinuria*.

Vitamin B₁₂ should be given prophylactically after *total ileal resection*.

Apart from dietary deficiency, all other causes of vitamin B₁₂ deficiency are attributable to malabsorption. There is little place for the use of low-dose vitamin B₁₂ orally and none for vitamin B₁₂ intrinsic factor complexes given by mouth. Vitamin B₁₂ in large oral doses [unlicensed] may be effective.

Hydroxocobalamin p. 534 has completely replaced cyanocobalamin p. 534 as the form of vitamin B₁₂ of choice for therapy; it is retained in the body longer than cyanocobalamin and thus for maintenance therapy can be given at intervals of up to 3 months. Treatment is generally initiated with frequent administration of intramuscular injections to replenish the depleted body stores. Thereafter, maintenance treatment, which is usually for life, can be instituted. There is no evidence that doses larger than those recommended provide any additional benefit in vitamin B₁₂ neuropathy.

Folic acid below has few indications for long-term therapy since most causes of folate deficiency are self-limiting or will yield to a short course of treatment. It should not be used in undiagnosed megaloblastic anaemia unless vitamin B₁₂ is administered concurrently otherwise neuropathy may be precipitated.

In *folate-deficient megaloblastic anaemia* (e.g. because of poor nutrition, pregnancy, or antiepileptic drugs), daily folic acid supplementation for 4 months brings about haematological remission and replenishes body stores; higher doses may be necessary in malabsorption states. In pregnancy, folic acid daily is continued to term.

For prophylaxis in *chronic haemolytic states, malabsorption, or in renal dialysis*, folic acid is given daily or sometimes weekly, depending on the diet and the rate of haemolysis.

Folic acid is also used for the prevention of methotrexate-induced side-effects in juvenile idiopathic arthritis, severe Crohn's disease and severe psoriasis.

Folic acid is actively excreted in breast milk and is well absorbed by the infant. It is also present in cow's milk and artificial formula feeds but is heat labile. Serum and red cell folate concentrations fall after delivery and urinary losses are high, particularly in low birth-weight neonates. Although symptomatic deficiency is rare in the absence of malabsorption or prolonged diarrhoea, it is common for neonatal units to give supplements of folic acid to all preterm neonates from 2 weeks of age until full-term corrected age is reached, particularly if heated breast milk is used without an artificial formula fortifier.

Folinic acid p. 515 is also effective in the treatment of folate deficient megaloblastic anaemia but it is normally only used in association with cytotoxic drugs; it is given as calcium folinate.

There is **no** justification for prescribing multiple ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

For the use of folic acid before and during pregnancy, see Neural tube defects (prevention in pregnancy) p. 594.

VITAMINS AND TRACE ELEMENTS > FOLATES

Folic acid

9.6.2016

● INDICATIONS AND DOSE

Folate-deficient megaloblastic anaemia

► BY MOUTH

- Neonate: Initially 500 micrograms/kg once daily for up to 4 months.
- Child 1-11 months: Initially 500 micrograms/kg once daily (max. per dose 5 mg) for up to 4 months, doses up to 10 mg daily may be required in malabsorption states
- Child 1-17 years: 5 mg daily for 4 months (until term in pregnant women), doses up to 15 mg daily may be required in malabsorption states

Folate supplementation in neonates

► BY MOUTH

- Neonate: 50 micrograms once daily.

Prevention of neural tube defects (in those at a low risk of conceiving a child with a neural tube defect see p. 594)

► BY MOUTH

- Females of childbearing potential: 400 micrograms daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those in the high-risk group who wish to become pregnant or who are at risk of becoming pregnant see p. 594)

► BY MOUTH

- Females of childbearing potential: 5 mg daily, to be taken before conception and until week 12 of pregnancy

Prevention of neural tube defects (in those with sickle-cell disease)

► BY MOUTH

- Females of childbearing potential: 5 mg daily, patient should continue taking their normal dose of folic acid 5 mg daily (or increase the dose to 5 mg daily) before conception and continue this throughout pregnancy

Prevention of methotrexate side-effects in severe Crohn's disease | Prevention of methotrexate side-effects in severe psoriasis

► BY MOUTH

- Child: 5 mg once weekly, dose to be taken on a different day to methotrexate dose

Prophylaxis of folate deficiency in dialysis

► BY MOUTH

- Child 1 month-11 years: 250 micrograms/kg once daily (max. per dose 10 mg)
- Child 12-17 years: 5-10 mg once daily

Haemolytic anaemia | Metabolic disorders

► BY MOUTH

- Child 1 month-11 years: 2.5-5 mg once daily
- Child 12-17 years: 5-10 mg once daily

Prevention of methotrexate side-effects in juvenile idiopathic arthritis

► BY MOUTH

- Child: 1 mg daily, alternatively 5 mg once weekly, dose to be adjusted according to local guidelines, weekly dose to be taken on a different day to methotrexate dose

- **UNLICENSED USE** Unlicensed for limiting methotrexate toxicity.

- **CAUTIONS** Should never be given alone for pernicious anaemia (may precipitate subacute combined degeneration of the spinal cord)

- **INTERACTIONS** → Appendix 1 (folates).

- **SIDE-EFFECTS**

- **Rare** Gastro-intestinal disturbances

- **PATIENT AND CARER ADVICE**

Hydroxocobalamin● **INDICATIONS AND DOSE****Macrocytic anaemia without neurological involvement**► **BY INTRAMUSCULAR INJECTION**

► Child: Initially 0.25–1 mg 3 times a week for 2 weeks, then 0.25 mg once weekly until blood count normal, then 1 mg every 3 months

Macrocytic anaemia with neurological involvement► **BY INTRAMUSCULAR INJECTION**

► Child: Initially 1 mg once daily on alternate days until no further improvement, then 1 mg every 2 months

Prophylaxis of macrocytic anaemias associated with vitamin B₁₂ deficiency► **BY INTRAMUSCULAR INJECTION**

► Child: 1 mg every 2–3 months

Leber's optic atrophy► **BY INTRAMUSCULAR INJECTION**

► Child: Initially 1 mg daily for 2 weeks, then 1 mg twice weekly until no further improvement, then 1 mg every 1–3 months

Congenital transcobalamin II deficiency► **BY INTRAMUSCULAR INJECTION**

► Neonate: 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate.

► Child: 1 mg 3 times a week for 1 year, then reduced to 1 mg once weekly, adjusted as appropriate

Methylmalonic acidemia and homocystinuria► **BY INTRAMUSCULAR INJECTION**

► Child: Initially 1 mg daily for 5–7 days, then adjusted according to response to up to 1 mg 1–2 times a week, this is the maintenance dose

Methylmalonic acidemia, maintenance once intramuscular response established► **BY MOUTH**

► Child: 5–10 mg 1–2 times a week, some children do not respond to oral route

CYANOKIT®**Poisoning with cyanides**► **BY INTRAVENOUS INFUSION**

► Child (body-weight 5 kg and above): Initially 70 mg/kg (max. per dose 5 g), to be given over 15 minutes, then 70 mg/kg (max. per dose 5 g) if required, this second dose can be given over 15 minutes–2 hours depending on severity of poisoning and patient stability

● **UNLICENSED USE**

► With intramuscular use or oral use Licensed for use in children (age not specified by manufacturers). Not licensed for use in inborn errors of metabolism.

● **CAUTIONS**

► With intramuscular or oral use Should not be given before diagnosis fully established

● **INTERACTIONS** → Appendix 1 (hydroxocobalamin).

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

Dizziness · headache · pruritus

SPECIFIC SIDE-EFFECTS

- With intramuscular use Chromaturia · fever · hypersensitivity reactions · hypokalaemia (during initial treatment) · injection-site reactions · nausea · rash · thrombocytosis (during initial treatment)
- With intravenous use Dyspnoea · eye disorders · gastro-intestinal disturbances · hot flush · lymphocytopenia · memory impairment · peripheral oedema · pustular rashes · red coloration of urine · restlessness · reversible red coloration of skin and mucous membranes · throat disorders · transient hypertension
- With oral use Chromaturia · fever · hypersensitivity reactions · nausea

- **BREAST FEEDING** Present in milk but not known to be harmful.

● **EFFECT ON LABORATORY TESTS**

► With intravenous use Deep red colour of hydroxocobalamin may interfere with laboratory tests.

● **DIRECTIONS FOR ADMINISTRATION**

- With intravenous use For intravenous infusion (*Cyanokit*)®, given intermittently in Sodium chloride 0.9%, reconstitute 5 g vial with 200 mL Sodium Chloride 0.9%; gently invert vial for at least 1 minute to mix (do not shake).
- With oral use For administration by mouth, injection solution may be given orally; it will not have prolonged effect via this route.

● **PRESCRIBING AND DISPENSING INFORMATION**

► With intramuscular use The BP directs that when vitamin B₁₂ injection is prescribed or demanded, hydroxocobalamin injection shall be dispensed or supplied.

Poisoning by cyanides

- With intravenous use *Cyanokit*® is the only preparation of hydroxocobalamin that is suitable for use in victims of

smoke inhalation who show signs of significant cyanide poisoning.

• NATIONAL FUNDING/ACCESS DECISIONS

Cobalin-H[®] is not prescribable under National Health Service (NHS). *Neo-Cytamen*[®] is not prescribable under National Health Service (NHS).

Hydroxocobalamin 5 gram Cyanokit 5g powder for solution for infusion vials | 1 vial [PoM] no price available

2 Iron overload

Iron overload

Overview

Severe tissue iron overload can occur in aplastic and other refractory anaemias, mainly as the result of repeated blood transfusions. It is a particular problem in refractory anaemias with hyperplastic bone marrow, especially *thalassaemia major*, where excessive iron absorption from the gut and inappropriate iron therapy can add to the tissue siderosis.

Iron overload associated with haemochromatosis can be treated with repeated venesection. Venesection may also be used for patients who have received multiple transfusions and whose bone marrow has recovered. Where venesection is contra-indicated, and in *thalassaemia*, the long-term administration of the iron chelating compound desferrioxamine mesilate p. 536 is useful. Desferrioxamine mesilate (up to 2 g per unit of blood) may also be given at the time of blood transfusion, provided that the desferrioxamine mesilate is **not** added to the blood and is **not** given through the same line as the blood (but the two may be given through the same cannula).

Iron excretion induced by desferrioxamine mesilate is enhanced by ascorbic acid p. 587 (vitamin C) daily by mouth; it should be given separately from food since it also enhances iron absorption. Ascorbic acid should not be given to children with cardiac dysfunction; in children with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine mesilate.

Desferrioxamine mesilate infusion can be used to treat *aluminium overload* in dialysis patients; theoretically 100 mg of desferrioxamine binds with 4.1 mg of aluminium.

ANTIDOTES AND CHELATORS > IRON CHELATORS

Deferasirox

• DRUG ACTION Deferasirox is an oral iron chelator.

• INDICATIONS AND DOSE

Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in children aged 2–5 years with thalassaemia major who receive frequent blood transfusions | **Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients over 2 years with thalassaemia major who receive infrequent blood transfusions (less than 7 mL/kg/month of packed red blood cells)** | **Transfusion-related chronic iron overload when desferrioxamine is contra-indicated or inadequate in patients over 2 years with other anaemias** | **Treatment of chronic iron overload in patients over 6 years with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells)**

▶ BY MOUTH

▶ Child 2–17 years: Initially 10–30 mg/kg once daily, dose adjusted according to serum-ferritin concentration and amount of transfused blood—consult product literature; adjusted in steps of 5–10 mg/kg every 3–6 months, maintenance dose adjusted according to serum-ferritin concentration; maximum 40 mg/kg per day; Usual maximum 30 micrograms/kg

Treatment of chronic iron overload when desferrioxamine is contra-indicated or inadequate (with non-transfusion-dependent thalassaemia syndromes)

▶ BY MOUTH

▶ Child 10–17 years: Initially 10 mg/kg once daily, maintenance dose adjusted according to serum-ferritin concentration and liver-iron concentration (consult product literature); maximum 10 mg/kg per day

• **UNLICENSED USE** Not licensed for treatment of chronic iron overload in children under 6 years with thalassaemia major who receive frequent blood transfusions (more than 7 mL/kg/month of packed red blood cells).

• **CAUTIONS** History of liver cirrhosis · not recommended in conditions which may reduce life expectancy (e.g. high-risk myelodysplastic syndromes) · platelet count less than $50 \times 10^9/\text{litre}$ · risk of gastro-intestinal ulceration and haemorrhage · unexplained cytopenia—consider treatment interruption

• **INTERACTIONS** → Appendix 1 (deferiasirox).

• SIDE-EFFECTS

▶ **Common or very common** Fatal gastro-intestinal haemorrhage · gastro-intestinal disturbances · gastro-intestinal ulceration · headache · proteinuria · pruritus · rash

▶ **Uncommon** Anxiety · cholelithiasis · disturbances of hearing and vision · dizziness · fatigue · glucosuria · hepatitis · lens opacity · maculopathy · oedema · pharyngitis · pyrexia · renal tubulopathy · skin pigmentation · sleep disorder

▶ **Frequency not known** Acute renal failure · agranulocytosis · alopecia · anaemia · anaphylaxis · angioedema · blood disorders · hepatic failure · hypersensitivity reactions · neutropenia · pancytopenia · thrombocytopenia · tubulointerstitial nephritis

• **PREGNANCY** Manufacturer advises avoid unless essential— toxicity in *animal studies*.

• **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal studies*.

• **HEPATIC IMPAIRMENT** Use with caution in moderate impairment, reduce dose considerably then gradually

increase to max. 50% of normal dose. Avoid in severe impairment.

- **RENAL IMPAIRMENT** Reduce dose by 10 mg/kg if serum-creatinine increased above age-appropriate limits or estimated glomerular filtration rate less than 90 mL/minute/1.73 m² on 2 consecutive occasions—interrupt treatment if deterioration in renal function persists after dose reduction. Avoid if estimated glomerular filtration rate less than 60 mL/minute/1.73 m².

- **MONITORING REQUIREMENTS**

- ▶ Eye and ear examinations required before treatment and annually during treatment.
- ▶ Monitor body-weight, height, and sexual development in children annually.
- ▶ Monitor serum-ferritin concentration monthly.
- ▶ Test liver function before treatment, then every 2 weeks during the first month, and then monthly.
- ▶ Measure baseline serum creatinine and monitor renal function weekly during the first month of treatment and monthly thereafter.
- ▶ Test for proteinuria monthly.
- ▶ Monitor liver-iron concentration every three months in children with non-transfusion-dependent thalassaemia syndromes when serum ferritin is <800 micrograms/litre.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be dispersed in water, orange juice, or apple juice; if necessary resuspend residue.

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Deferasirox for removing excess iron www.medicinesforchildren.org.uk/deferasirox-for-removing-excess-iron

Patient or carers should be given advice on how to administer deferasirox dispersible tablets.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Dispersible tablet

Deferiprone

- **DRUG ACTION** Deferiprone is an oral iron chelator.

- **INDICATIONS AND DOSE**

Treatment of iron overload in patients with thalassaemia major in whom desferrioxamine is contra-indicated or is inadequate

- ▶ **BY MOUTH**
- ▶ Child 6–17 years: 25 mg/kg 3 times a day; maximum 100 mg/kg per day

- **UNLICENSED USE** Not licensed for use in children under 6 years.

- **CONTRA-INDICATIONS** History of agranulocytosis or recurrent neutropenia

- **INTERACTIONS** → Appendix 1 (deferiprone).

- **SIDE-EFFECTS** Agranulocytosis · arthropathy · blood dyscrasias · gastro-intestinal disturbances (reducing dose and increasing gradually may improve tolerance) · headache · increased appetite · neutropenia · red-brown urine discoloration · zinc deficiency

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises avoid before intended conception—teratogenic and

embryotoxic in *animal* studies. Contraception advised in females of child-bearing potential.

- **PREGNANCY** Manufacturer advises avoid during pregnancy—teratogenic and embryotoxic in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises monitor liver function—interrupt treatment if persistent elevation in serum alanine aminotransferase.
- **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.
- **MONITORING REQUIREMENTS** Monitor neutrophil count weekly and discontinue treatment if neutropenia develops.
- **PATIENT AND CARER ADVICE** Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever or sore throat develop.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: capsule, oral suspension, oral solution

Tablet

Desferrioxamine mesilate

(Deferoxamine Mesilate)

- **INDICATIONS AND DOSE**

Iron poisoning

- ▶ **BY CONTINUOUS INTRAVENOUS INFUSION**

- ▶ Neonate: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service.

- ▶ Child: Initially up to 15 mg/kg/hour, max. 80 mg/kg in 24 hours, dose to be reduced after 4–6 hours, in severe cases, higher doses may be given on advice from the National Poisons Information Service

Aluminium overload in dialysis patients

- ▶ **BY INTRAVENOUS INFUSION**

- ▶ Child: 5 mg/kg once weekly

Chronic iron overload (low iron overload)

- ▶ **BY SUBCUTANEOUS INFUSION**

- ▶ Child: Initially up to 30 mg/kg 3–7 times a week, to be given over 8–12 hours, the dose should reflect the degree of iron overload

Chronic iron overload (established overload)

- ▶ **BY SUBCUTANEOUS INFUSION**

- ▶ Child: 20–50 mg/kg daily

- **UNLICENSED USE**

- ▶ When used for Iron poisoning Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Aluminium-related encephalopathy (may exacerbate neurological dysfunction)

- **INTERACTIONS** → Appendix 1 (desferrioxamine).

● SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · arthralgia · bone disorders · growth retardation · headache · hearing disturbances · injection-site reactions · myalgia · nausea · pyrexia · vomiting
- ▶ **Rare** Anaphylaxis · blood dyscrasias · bone pain · diarrhoea · hepatic impairment · hypotension (especially when given too rapidly by intravenous injection) · leg cramps · lens opacity · leucopenia · rash · retinopathy · thrombocytopenia · visual disturbances · Yersinia and mucormycosis infections
- ▶ **Very rare** Acute respiratory distress · convulsions · dizziness · neurological disturbances · neuropathy · paraesthesia · renal impairment
- ▶ **Frequency not known** Muscle spasms

● **PREGNANCY** Teratogenic in *animal* studies. Manufacturer advises use only if potential benefit outweighs risk.

● **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.

● **RENAL IMPAIRMENT** Use with caution.

● MONITORING REQUIREMENTS

- ▶ Eye and ear examinations before treatment and at 3-month intervals during treatment.
- ▶ Monitor body-weight and height in children at 3-month intervals—risk of growth retardation with excessive doses.

● **DIRECTIONS FOR ADMINISTRATION** For full details and warnings relating to administration, consult product literature.

- ▶ When used for Chronic iron overload or Aluminium overload in dialysis patients For *intravenous* or *subcutaneous infusion*, reconstitute powder with Water for Injection to a concentration of 100 mg/mL; dilute with Glucose 5% or Sodium Chloride 0.9%. In *haemodialysis* or *haemo-filtration* administer over the last hour of dialysis (may be given via the dialysis fistula). *Intraperitoneal*: may be added to dialysis fluid. In CAPD give prior to the last exchange of the day.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Deferasirox for removing excess iron www.medicinesforchildren.org.uk/deferasirox-removing-excess-iron-0

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for injection

- ▶ **Desferrioxamine mesilate (Non-proprietary)**

Desferrioxamine mesilate 500 mg Desferrioxamine 500mg powder for solution for injection vials | 10 vial [PoM] £39.90–£50.00

Desferrioxamine mesilate 2 gram Desferrioxamine 2g powder for solution for injection vials | 1 vial [PoM] £17.95–£20.00

- ▶ **Desferal** (Novartis Pharmaceuticals UK Ltd)

Desferrioxamine mesilate 500 mg Desferal 500mg powder for solution for injection vials | 10 vial [PoM] £46.63

Desferrioxamine mesilate 2 gram Desferal 2g powder for solution for injection vials | 1 vial [PoM] £18.66

and thereby reduce the incidence of associated sepsis; there is as yet no evidence that it improves overall survival.

Filgrastim p. 538 (unglycosylated rhG-CSF) and lenograstim p. 539 (glycosylated rhG-CSF) have similar effects; both have been used in a variety of clinical settings, including cytotoxic-induced neutropenia, and neutropenia following bone marrow transplantation, but they do not have any clear-cut routine indications. In congenital neutropenia filgrastim usually increases the neutrophil count with an appropriate clinical response. Prolonged use may be associated with an increased risk of myeloid malignancy.

Treatment with granulocyte-colony stimulating factors should only be prescribed by those experienced in their use.

Neonatal neutropenia

Filgrastim has been used to treat sepsis-induced neutropenia in preterm neonates. There is no clear evidence that granulocyte-colony stimulating factors improve survival or long-term outcomes.

IMMUNOSTIMULANTS > GRANULOCYTE-COLONY STIMULATING FACTORS

Granulocyte-colony stimulating factors

● **DRUG ACTION** Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils.

● **CAUTIONS** Malignant myeloid conditions · pre-malignant myeloid conditions · risk of splenomegaly and rupture—spleen size should be monitored · sickle-cell disease

CAUTIONS, FURTHER INFORMATION

- ▶ **Acute respiratory distress syndrome** There have been reports of pulmonary infiltrates leading to acute respiratory distress syndrome—patients with a recent history of pulmonary infiltrates or pneumonia may be at higher risk.

● SIDE-EFFECTS

- ▶ **Common or very common** Alopecia · anorexia · asthenia · bone pain · chest pain · fever · gastro-intestinal disturbances · headache · injection-site reactions · leucocytosis · musculoskeletal pain · rash · thrombocytopenia
- ▶ **Rare** Acute febrile neutrophilic dermatosis · cutaneous vasculitis · pulmonary side-effects (particularly interstitial pneumonia)

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Pulmonary infiltration** Treatment should be withdrawn in patients who develop signs of pulmonary infiltration.
- **PREGNANCY** There have been reports of toxicity in *animal* studies and manufacturers advise not to use granulocyte-colony stimulating factors during pregnancy unless the potential benefit outweighs the risk.
- **BREAST FEEDING** There is no evidence for the use of granulocyte-colony stimulating factors during breast-feeding and manufacturers advise avoiding their use.

● MONITORING REQUIREMENTS

- ▶ Full blood counts including differential white cell and platelet counts should be monitored.
- ▶ Spleen size should be monitored during treatment—risk of splenomegaly and rupture.

3 Neutropenia and stem cell mobilisation

3.1 Neutropenia

Neutropenia

Management

Recombinant human granulocyte-colony stimulating factor (rhG-CSF) stimulates the production of neutrophils and may reduce the duration of chemotherapy-induced neutropenia

Filgrastim

(Recombinant human granulocyte-colony stimulating factor; G-CSF)

● INDICATIONS AND DOSE

Reduction in duration of neutropenia and incidence of febrile neutropenia in cytotoxic chemotherapy for malignancy (except chronic myeloid leukaemia and myelodysplastic syndromes) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 5 micrograms/kg daily until neutrophil count in normal range, usually for up to 14 days (up to 38 days in acute myeloid leukaemia), to be started at least 24 hours after cytotoxic chemotherapy. Preferably given by subcutaneous injection; if given by intravenous infusion, administer over 30 minutes

Reduction in duration of neutropenia (and associated sequelae) in myeloablative therapy followed by bone-marrow transplantation (specialist use only)

- ▶ BY SUBCUTANEOUS INFUSION, OR BY INTRAVENOUS INFUSION
- ▶ Child: 10 micrograms/kg daily, to be started at least 24 hours following cytotoxic chemotherapy and within 24 hours of bone-marrow infusion, then adjusted according to neutrophil count—consult product literature, doses administered over 30 minutes or 24 hours via intravenous route and over 24 hours via subcutaneous route

Mobilisation of peripheral blood progenitor cells for autologous infusion, used alone (specialist use only)

- ▶ BY SUBCUTANEOUS INFUSION, OR BY SUBCUTANEOUS INJECTION
- ▶ Child: 10 micrograms/kg daily for 5–7 days, to be administered over 24 hours if given by subcutaneous infusion

Mobilisation of peripheral blood progenitor cells for autologous infusion, used following adjunctive myelosuppressive chemotherapy—to improve yield (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: 5 micrograms/kg daily until neutrophil count in normal range, to be started the day after completing chemotherapy, for timing of leucopheresis, consult product literature

Mobilisation of peripheral blood progenitor cells in normal donors for allogeneic infusion (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child 16–17 years: 10 micrograms/kg daily for 4–5 days, for timing of leucopheresis, consult product literature

Severe congenital neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Initially 12 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Severe cyclic neutropenia, or idiopathic neutropenia and history of severe or recurrent infections (distinguish carefully from other haematological disorders) (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Initially 5 micrograms/kg daily, adjusted according to response, can be given in single or divided doses, consult product literature and local protocol

Persistent neutropenia in HIV infection (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Initially 1 microgram/kg daily, subsequent doses increased as necessary until neutrophil count in normal range, then adjusted to maintain neutrophil count in normal range—consult product literature; maximum 4 micrograms/kg per day

Neonatal neutropenia (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION

- ▶ Neonate: 10 micrograms/kg daily, to be discontinued if white cell count exceeds $50 \times 10^9/\text{litre}$.

Glycogen storage disease type 1b (specialist use only)

- ▶ BY SUBCUTANEOUS INJECTION
- ▶ Child: Initially 5 micrograms/kg daily, dose to be adjusted as necessary

- **UNLICENSED USE** Not licensed for treatment of glycogen storage disease or neonatal neutropenia.

- **CONTRA-INDICATIONS** Severe congenital neutropenia (Kostmann's syndrome) with abnormal cytogenetics

- **CAUTIONS** Osteoporotic bone disease (monitor bone density if given for more than 6 months) · secondary acute myeloid leukaemia

- **INTERACTIONS** → Appendix 1 (filgrastim).

● SIDE-EFFECTS

- ▶ **Common or very common** Anaemia · dysuria · epistaxis · exacerbation of rheumatoid arthritis · haematuria · hepatomegaly · mucositis · osteoporosis · proteinuria · pseudogout · raised uric acid · splenic enlargement · transient decrease in blood glucose · transient hypotension · urinary abnormalities
- ▶ **Uncommon** Capillary leak syndrome (including fatal cases)
- ▶ **Rare** Splenic rupture

- **MONITORING REQUIREMENTS** Regular morphological and cytogenetic bone-marrow examinations recommended in severe congenital neutropenia (possible risk of myelodysplastic syndromes or leukaemia).

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use or subcutaneous use For *subcutaneous* or *intravenous infusion*, dilute with Glucose 5% to a concentration of not less than 15 micrograms/mL; to dilute to a concentration of 2–15 micrograms/mL, add albumin solution (human albumin solution) to produce a final albumin solution of 2 mg/mL; not compatible with Sodium Chloride solutions.

- **PRESCRIBING AND DISPENSING INFORMATION** Products containing filgrastim are not identical and although theoretically there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name, see *Biosimilar medicines*, under Guidance on prescribing p. 1. 1 million units of filgrastim solution for injection contains 10 micrograms filgrastim.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

- ▶ **Accofil** (Accord Healthcare Ltd) ▼

537

Lenograstim

(Recombinant human granulocyte-colony stimulating factor; rHuG-CSF)

• **INDICATIONS AND DOSE**

Reduction in the duration of neutropenia and associated complications following bone-marrow transplantation for non-myeloid malignancy (specialist use only)

Reduction in the duration of neutropenia and associated complications following peripheral stem cells transplantation for non-myeloid malignancy (specialist use only)

► BY INTRAVENOUS INFUSION, OR BY SUBCUTANEOUS INJECTION

• Child 2–17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started the day after transplantation. Intravenous infusion to be given over 30 minutes

Reduction in the duration of neutropenia and associated complications following treatment with cytotoxic chemotherapy associated with a significant incidence of febrile neutropenia (specialist use only)

► BY SUBCUTANEOUS INJECTION

• Child 2–17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range (max. 28 days), to be started on the day after completion of chemotherapy

Mobilisation of peripheral blood progenitor cells for harvesting and subsequent infusion, used alone (specialist use only)

► BY SUBCUTANEOUS INJECTION

• Child 2–17 years: 10 micrograms/kg daily for 4–6 days (5–6 days in healthy donors)

Mobilisation of peripheral blood progenitor cells, used following adjunctive myelosuppressive chemotherapy (to improve yield) (specialist use only)

► BY SUBCUTANEOUS INJECTION

• Child 2–17 years: 150 micrograms/m² daily until neutrophil count stable in acceptable range, to be started 1–5 days after completion of chemotherapy, for timing of leucopheresis, consult product literature

• **UNLICENSED USE** Not licensed for use in children for cytotoxic-induced neutropenia, mobilisation of peripheral blood progenitor cells (monotherapy or adjunctive therapy), or following peripheral stem cells transplantation.

• **SIDE-EFFECTS** Mucositis • splenic rupture • toxic epidermal necrolysis

• **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, dilute reconstituted solution to a concentration of not less than 2 micrograms/mL (*Granocyte-13*) or 2.5 micrograms/mL (*Granocyte-34*) with Sodium Chloride 0.9%.

• **PRESCRIBING AND DISPENSING INFORMATION** *Granocyte*[®] solution for injection contains 105 micrograms of lenograstim per 13.4 mega unit vial and 263 micrograms lenograstim per 33.6 mega unit vial.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder and solvent for solution for injection

4 Platelet disorders

Platelet disorders

Idiopathic thrombocytopenic purpura

Acute idiopathic thrombocytopenic purpura is usually self-limiting in children. A corticosteroid, such as prednisolone p. 413, is sometimes used if idiopathic thrombocytopenic purpura does not resolve spontaneously or if it is associated with severe cutaneous symptoms or mucous membrane bleeding; corticosteroid treatment should not be continued longer than 14 days regardless of the response.

Immunoglobulin preparations may be used in idiopathic thrombocytopenic purpura or where a temporary rapid rise in platelets is needed, as in pregnancy or pre-operatively; they are often used in preference to a corticosteroid. Anti-D (Rh₀) immunoglobulin p. 725 is licensed for the management of idiopathic thrombocytopenic purpura.

Other therapy that has been tried under specialist supervision in refractory idiopathic thrombocytopenic purpura includes azathioprine, cyclophosphamide, vincristine sulfate, and ciclosporin. Rituximab p. 494 is also used in specialist centres but experience of its use in children is limited. For patients with chronic severe thrombocytopenia refractory to other therapy, tranexamic acid p. 76 may be given to reduce the severity of haemorrhage.

Splenectomy is considered in chronic thrombocytopenic purpura if a satisfactory platelet count is not achieved with regular immunoglobulin infusions, if there is a relapse on withdrawing or reducing the dose of corticosteroid, and if other therapies are considered inappropriate.

Essential thrombocythaemia

Anagrelide p. 540 reduces platelets in essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs.

4.1 Essential thrombocythaemia

ANTITHROMBOTIC DRUGS > CYCLIC AMP PHOSPHODIESTERASE III INHIBITORS

Anagrelide

• INDICATIONS AND DOSE

Essential thrombocythaemia in patients at risk of thrombo-haemorrhagic events who have not responded adequately to other drugs or who cannot tolerate other drugs (initiated under specialist supervision)

► BY MOUTH

- Child 7–17 years: Initially 500 micrograms daily, dose to be adjusted at weekly intervals according to response, increased in steps of 500 micrograms daily; usual dose 1–3 mg daily in divided doses (max. per dose 2.5 mg); maximum 10 mg per day

- **UNLICENSED USE** Not licensed for use in children.

- **CAUTIONS** Cardiovascular disease—assess cardiac function before and regularly during treatment • concomitant use of drugs that prolong QT-interval—assess cardiac function before and regularly during treatment • risk factors for QT-interval prolongation—assess cardiac function before and regularly during treatment

- **INTERACTIONS** → Appendix 1 (anagrelide).

Caution with concomitant aspirin in patients at risk of haemorrhage.

• SIDE-EFFECTS

- **Common or very common** Anaemia • dizziness • fatigue • fluid retention • gastro-intestinal disturbances • headache • palpitation • rash • tachycardia
- **Uncommon** Alopecia • amnesia • anorexia • arrhythmias • arthralgia • back pain • blood disorders • chest pain • confusion • congestive heart failure • depression • dry mouth • dyspnoea • ecchymosis • epistaxis • fever • gastro-intestinal haemorrhage • haemorrhage • hypertension • hypoaesthesia • impotence • malaise • myalgia • nervousness • oedema • pancreatitis • paraesthesia • pneumonia pleural effusion • pruritus • skin discoloration • sleep disturbances • syncope • weight changes
- **Rare** Angina • asthenia • cardiomegaly • cardiomyopathy • colitis • dry skin • dysarthria • gastritis • gingival bleeding • impaired coordination • migraine • myocardial infarction • nocturia • pericardial effusion • postural hypotension • pulmonary hypertension • pulmonary infiltrates • renal failure • somnolence • tinnitus • vasodilatation • visual disturbances
- **Frequency not known** Hepatitis • interstitial lung disease • Torsade de pointes • tubulointerstitial nephritis
- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment.
- **PREGNANCY** Manufacturer advises avoid (toxicity in animal studies).
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution in mild impairment. Avoid in moderate to severe impairment.
- **RENAL IMPAIRMENT** Manufacturer advises avoid if estimated glomerular filtration rate less than 50 mL/minute/1.73 m²
- **MONITORING REQUIREMENTS**
 - Monitor full blood count (monitor platelet count every 2 days for 1 week, then weekly until maintenance dose established).
 - Monitor liver function.
 - Monitor serum creatinine.

- Monitor urea.
- Monitor electrolytes (including potassium, magnesium and calcium) before and during treatment.
- Monitor closely for further signs of disease progression such as malignant transformation.
- **PRESCRIBING AND DISPENSING INFORMATION** Initiate only when signs of disease progression or patient suffers from thrombosis. Consider stopping treatment after 3 months if inadequate response.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks** Dizziness may affect performance of skilled tasks (e.g. cycling, driving).

2 Fluid and electrolyte imbalances

Fluids and electrolytes

Electrolyte replacement therapy

The electrolyte concentrations (intravenous fluid) table and the electrolyte content (gastro-intestinal secretions) table may be helpful in planning replacement electrolyte therapy; faeces, vomit, or aspiration should be saved and analysed where possible if abnormal losses are suspected.

Oral preparations for fluid and electrolyte imbalance

Sodium and potassium salts, may be given by mouth to prevent deficiencies or to treat established deficiencies of mild or moderate degree.

Oral potassium

Compensation for potassium loss is especially necessary:

- in children in whom secondary hyperaldosteronism occurs, e.g. renal artery stenosis, renal tubule disorder, the nephrotic syndrome, and severe heart failure;
- in children with excessive losses of potassium in the faeces, e.g. chronic diarrhoea associated with intestinal malabsorption or laxative abuse;
- in those taking digoxin or anti-arrhythmic drugs, where potassium depletion may induce arrhythmias.

Measures to compensate for potassium loss may be required during long-term administration of drugs known to induce potassium loss (e.g. corticosteroids). Potassium supplements are **seldom required** with the small doses of diuretics given to treat hypertension; **potassium-sparing diuretics** (rather than potassium supplements) are recommended for prevention of hypokalaemia due to diuretics such as furosemide p. 132 or the thiazides when these are given to eliminate oedema.

If potassium salts are used for the *prevention of hypokalaemia*, then doses of potassium chloride p. 561 daily by mouth are suitable in patients taking a normal diet. Smaller doses must be used if there is renal insufficiency to reduce the risk of **hyperkalaemia**.

Potassium salts cause nausea and vomiting and poor compliance is a major limitation to their effectiveness (small divided doses may minimise gastric irritation); when appropriate, potassium-sparing diuretics are preferable. When there is *established potassium depletion* larger doses may be necessary, the quantity depending on the severity of any continuing potassium loss (monitoring of plasma-potassium concentration and specialist advice would be required). Potassium depletion is frequently associated with chloride depletion and with metabolic alkalosis, and these disorders require correction.

Management of hyperkalaemia

Acute severe hyperkalaemia calls for urgent treatment with intravenous infusion of **soluble insulin** (0.3–0.6 units/kg/hour in neonates and 0.05–0.2 units/kg/hour in children over 1 month) with glucose 0.5–1 g/kg/hour (5–10 mL/kg of glucose 10%; 2.5–5 mL/kg of glucose 20% via a central venous catheter may also be considered). If insulin cannot be used, salbutamol p. 146 can be given by intravenous injection, but it has a slower onset of action and may be less effective for reducing plasma-potassium concentration.

Calcium gluconate p. 553 is given by slow intravenous injection to manage cardiac excitability caused by hyperkalaemia.

The correction of causal or compounding acidosis with sodium bicarbonate infusion p. 544 should be considered (**important**: preparations of sodium bicarbonate and calcium salts should not be administered in the same line—risk of precipitation). Intravenous furosemide can also be given but is less effective in children with renal impairment. Drugs exacerbating hyperkalaemia should be reviewed and stopped as appropriate; dialysis may occasionally be required.

Ion-exchange resins may be used to remove excess potassium in *mild hyperkalaemia* or in *moderate hyperkalaemia* when there are no ECG changes. Calcium polystyrene sulfonate is preferred unless plasma-calcium concentrations are high.

Oral sodium and water

Sodium chloride p. 547 is indicated in states of sodium depletion. In preterm neonates in the first few weeks of life and in chronic conditions associated with mild or moderate degrees of sodium depletion, e.g. in salt-losing bowel or renal disease, oral supplements of sodium chloride may be sufficient. Sodium chloride solutions suitable for use by mouth in neonates are available from 'special-order' manufacturers or specialist importing companies, they should be used with care because they are hypertonic. Supplementation with sodium chloride may be required to replace losses in children with cystic fibrosis particularly in warm weather.

Oral rehydration therapy (ORT)

Diarrhoea in children is usually self-limiting, however, in children under 6 months of age, and more particularly in those under 3 months, symptoms of dehydration may be less obvious and there is a risk of rapid and severe deterioration. Intestinal absorption of sodium and water is enhanced by glucose (and other carbohydrates). Replacement of fluid and electrolytes lost through diarrhoea can therefore be achieved by giving solutions containing sodium, potassium, and glucose or another carbohydrate such as rice starch.

Oral rehydration solutions should:

- enhance the absorption of water and electrolytes;
- replace the electrolyte deficit adequately and safely;
- contain an alkalising agent to counter acidosis;
- be slightly hypo-osmolar (about 250 mmol/litre) to prevent the possible induction of osmotic diarrhoea;
- be simple to use in hospital and at home;
- be palatable and acceptable, especially to children;
- be readily available.

It is the policy of the World Health Organization (WHO) to promote a single oral rehydration solution but to use it flexibly (e.g. by giving extra water between drinks of oral rehydration solution to moderately dehydrated infants).

The WHO oral rehydration salts formulation contains sodium chloride 2.6 g, potassium chloride 1.5 g, sodium citrate 2.9 g, anhydrous glucose 13.5 g. It is dissolved in sufficient water to produce 1 litre (providing Na⁺ 75 mmol, K⁺ 20 mmol, Cl⁻ 65 mmol, citrate 10 mmol, glucose 75 mmol/litre). This formulation is recommended by the WHO and the United Nations Children's fund, but it is not commonly used in the UK.

Oral rehydration solutions used in the UK are lower in sodium (50–60 mmol/litre) than the WHO formulation since, in general, patients suffer less severe sodium loss.

Rehydration should be rapid over 3 to 4 hours (except in hypernatraemic dehydration in which case rehydration should occur more slowly over 12 hours). The patient should be reassessed after initial rehydration and if still dehydrated rapid fluid replacement should continue.

Once rehydration is complete further dehydration is prevented by encouraging the patient to drink normal volumes of an appropriate fluid and by replacing continuing losses with an oral rehydration solution; in infants, breast-

feeding or formula feeds should be offered between oral rehydration drinks.

Oral bicarbonate

Sodium bicarbonate is given by mouth for *chronic acidotic states* such as uraemic acidosis or renal tubular acidosis. The dose for correction of metabolic acidosis is not predictable and the response must be assessed. For severe *metabolic acidosis*, sodium bicarbonate can be given intravenously.

Sodium supplements may increase blood pressure or cause fluid retention and pulmonary oedema in those at risk; hypokalaemia may be exacerbated.

Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

Where *hyperchloraemic acidosis* is associated with potassium deficiency, as in some renal tubular and gastrointestinal disorders it may be appropriate to give oral **potassium bicarbonate**, although acute or severe deficiency should be managed by intravenous therapy.

Parenteral preparations for fluid and electrolyte imbalance

Electrolytes and water

Solutions of electrolytes are given intravenously, to meet normal fluid and electrolyte requirements or to replenish substantial deficits or continuing losses when it is not possible or desirable to use the oral route. When intravenous administration is not possible, fluid (as sodium chloride 0.9% p. 547 or glucose 5% p. 549) can also be given subcutaneously by hypodermoclysis.

In an individual patient the nature and severity of the electrolyte imbalance must be assessed from the history and clinical and biochemical examination. Sodium, potassium, chloride, magnesium, phosphate, and water depletion can occur singly and in combination with or without disturbances of acid-base balance.

Isotonic solutions may be infused safely into a peripheral vein. Solutions more concentrated than plasma, for example 15% glucose, are best given through an indwelling catheter positioned in a large vein.

Maintenance fluid requirements in children are usually derived from the relationship that exists between body-weight and metabolic rate; the figures in the table below may be used as a guide outside the neonatal period. The glucose requirement is that needed to minimise gluconeogenesis from amino acids obtained as substrate from muscle breakdown. Maintenance fluids are intended only to provide hydration for a short period until enteral or parenteral nutrition can be established.

It is usual to meet these requirements by using a standard solution of sodium chloride with glucose. Solutions containing 20 mmol/litre of potassium chloride meet usual potassium requirements when given in the suggested volumes; adjustments may be needed if there is an inability to excrete fluids or electrolytes, excessive renal loss or continuing extra-renal losses. The exact requirements depend upon the nature of the clinical situation and types of losses incurred.

Fluid requirements for children over 1 month:

Body-weight	24-hour fluid requirement
Under 10 kg	100 mL/kg
10–20 kg	100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight over 10 kg
Over 20 kg	100 mL/kg for the first 10 kg + 50 mL/kg for each 1 kg body-weight between 10–20 kg + 20 mL/kg for each 1 kg body-weight over 20 kg (max. 2 litres in females, 2.5 litres in males)

Important The baseline fluid requirements shown in the table should be adjusted to take account of factors that reduce water loss (e.g. increased antidiuretic hormone, renal failure, hypothermia, and high ambient humidity) or increase water loss (e.g. pyrexia or burns).

Replacement therapy: initial intravenous replacement fluid is generally required if the child is over 10% dehydrated, or if 5–10% dehydrated and oral or enteral rehydration is not tolerated or possible. Oral rehydration is adequate, if tolerated, in the majority of those less than 10% dehydrated. Subsequent fluid and electrolyte requirements are determined by clinical assessment of fluid balance.

Intravenous sodium

Intravenous sodium chloride in isotonic (0.9%) solution provides the most important extracellular ions in near physiological concentrations and is indicated in *sodium depletion*. It may be given for initial treatment of acute fluid loss and to replace ongoing gastro-intestinal losses from the upper gastro-intestinal tract. Intravenous sodium chloride is commonly given as a component of maintenance and replacement therapy, usually in combination with other electrolytes and glucose.

Chronic hyponatraemia should ideally be corrected by fluid restriction. However, if sodium chloride is required, the deficit should be corrected slowly to avoid the risk of osmotic demyelination syndrome; the rise in plasma sodium concentration should be no more than 10 mmol/litre in 24 hours.

Sodium chloride with glucose solutions are indicated when there is combined *water and sodium depletion*. A 1:1 mixture of isotonic sodium chloride and 5% glucose allows some of the water (free of sodium) to enter body cells which suffer most from dehydration while the sodium salt with a volume of water determined by the normal plasma Na^+ remains extracellular.

Combined sodium, potassium, chloride, and water depletion may occur, for example, with severe diarrhoea or persistent vomiting; replacement is carried out with sodium chloride intravenous infusion 0.9% and glucose intravenous infusion 5% with potassium as appropriate.

Compound sodium lactate (Hartmann's solution) can be used instead of isotonic sodium chloride solution during or after surgery, or in the initial management of the injured or wounded.

Intravenous glucose

Glucose solutions are used mainly to replace water deficit. Water depletion (dehydration) tends to occur when losses are not matched by a comparable intake, as may occur in coma or dysphagia.

Water loss rarely exceeds electrolyte losses but this can occur in fevers, hyperthyroidism, and in uncommon water-losing renal states such as diabetes insipidus or hypercalcaemia. The volume of glucose solution needed to replace deficits varies with the severity of the disorder; the rate of infusion should be adjusted to return the plasma-sodium concentration to normal over 48 hours.

Glucose solutions are also used to correct and prevent hypoglycaemia and to provide a source of energy in those

Electrolyte concentrations—intravenous fluids

Intravenous infusion	Millimoles per litre				
	Na ⁺	K ⁺	HCO ₃ ⁻	Cl ⁻	Ca ²⁺

Small bowel	–	120–140	5–15	20–40	90–130

too ill to be fed adequately by mouth; glucose solutions are a key component of parenteral nutrition.

Glucose solutions are given with insulin for the emergency management of *hyperkalaemia*. They are also given, after correction of hyperglycaemia, during treatment of diabetic ketoacidosis, when they must be accompanied by continuous insulin infusion.

Intravenous potassium

Potassium chloride with sodium chloride intravenous infusion is the initial treatment for the correction of *severe hypokalaemia* and when sufficient potassium cannot be taken by mouth.

Repeated measurements of plasma-potassium concentration are necessary to determine whether further infusions are required and to avoid the development of hyperkalaemia, which is especially likely in renal impairment.

Initial potassium replacement therapy should **not** involve glucose infusions, because glucose may cause a further decrease in the plasma-potassium concentration.

Bicarbonate and trometamol

Sodium bicarbonate is used to control severe *metabolic acidosis* (pH < 7.1) particularly that caused by loss of bicarbonate (as in renal tubular acidosis or from excessive gastro-intestinal losses). Mild metabolic acidosis associated with volume depletion should first be managed by appropriate fluid replacement because acidosis usually resolves as tissue and renal perfusion are restored. In more severe metabolic acidosis or when the acidosis remains unresponsive to correction of anaemia or hypovolaemia, sodium bicarbonate (1.26%) p. 544 can be infused over 3–4 hours with plasma-pH and electrolyte monitoring. In

severe shock, for example in cardiac arrest, metabolic acidosis can develop without sodium depletion; in these circumstances sodium bicarbonate is best given intravenously as a small volume of hypertonic solution, such as 8.4%; plasma pH and electrolytes should be monitored. For *chronic acidotic states*, sodium bicarbonate can be given by mouth.

Trometamol (tris(hydroxymethyl)aminomethane, THAM) p. 540, an organic buffer, corrects metabolic acidosis by causing an increase in urinary pH and an osmotic diuresis. It is indicated when sodium bicarbonate is unsuitable as in carbon dioxide retention, hypernatraemia, or renal impairment. It is also used during cardiac bypass surgery and, very rarely, in cardiac arrest.

Plasma and plasma substitutes

Albumin solution p. 554, prepared from whole blood, contain soluble proteins and electrolytes but no clotting factors, blood group antibodies, or plasma cholinesterases; they may be given without regard to the recipient's blood group.

Albumin is usually used after the acute phase of illness to correct a plasma-volume deficit; hypoalbuminaemia itself is not an appropriate indication. The use of albumin solution in acute plasma or blood loss may be wasteful; plasma substitutes are more appropriate. Concentrated albumin solution may also be used to obtain a diuresis in hypoalbuminaemic patients (e.g. in nephrotic syndrome).

Recent evidence does not support the previous view that the use of albumin increases mortality.

Plasma substitutes

Gelatin p. 555 is a macromolecular substance that is metabolised slowly. Gelatin may be used at the outset to expand and maintain blood volume in shock arising from

conditions such as burns or septicaemia; it may also be used as an immediate short-term measure to treat haemorrhage until blood is available. Gelatin is rarely needed when shock is due to sodium and water depletion because, in these circumstances, the shock responds to water and electrolyte repletion; see also the management of shock.

Plasma substitutes should **not** be used to maintain plasma volume in conditions such as burns or peritonitis where there is loss of plasma protein, water, and electrolytes over periods of several days or weeks. In these situations, plasma or plasma protein fractions containing large amounts of albumin should be given.

Large volumes of *some* plasma substitutes can increase the risk of bleeding through depletion of coagulation factors.

Parenteral preparations for fluid and electrolyte imbalance in neonates

Electrolytes and water

Neonates lose water through the skin and nose, particularly if preterm or if the skin is damaged. The basic fluid requirement for a term baby in average ambient humidity is 40–60 mL/kg/day plus urinary losses. Preterm babies have very high transepidermal losses particularly in the first few days of life; they may need more fluid replacement than full term babies and up to 180 mL/kg/day may be required. Local guidelines for fluid management in the neonatal period should be consulted.

Intravenous sodium

The sodium requirement for most healthy neonates is 3 mmol/kg daily. Preterm neonates, particularly below 30 weeks gestation, may require up to 6 mmol/kg daily. *Hyponatraemia* may be caused by excessive renal loss of sodium; it may also be dilutional and restriction of fluid intake may be appropriate. Sodium supplementation is likely to be required if the serum sodium concentration is significantly reduced.

Hypernatraemia may also occur, most often due to dehydration (e.g. breast milk insufficiency). Severe hypernatraemia and hyponatraemia can cause fits and rarely brain damage. Sodium in drug preparations, delivered via continuous infusions, or in infusions to maintain the patency of intravascular or umbilical lines, can result in significant amounts of sodium being delivered, (e.g. 1 mL/hour of 0.9% sodium chloride infused over 24 hours is equivalent to 3.6 mmol/day of sodium).

BICARBONATE

Sodium bicarbonate

● INDICATIONS AND DOSE

Chronic acidotic states such as uraemic acidosis or renal tubular acidosis

► BY MOUTH

► Neonate: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response.

► Child: Initially 1–2 mmol/kg daily in divided doses, adjusted according to response

Severe metabolic acidosis

► BY SLOW INTRAVENOUS INJECTION, OR BY INTRAVENOUS INFUSION

► Child: Administer an amount appropriate to the body base deficit, to be given by slow intravenous injection of a strong solution (up to 8.4%), or by continuous intravenous infusion of a weaker solution (usually 1.26%)

Renal hyperkalaemia

► BY SLOW INTRAVENOUS INJECTION

► Neonate: 1 mmol/kg daily.

► Child: 1 mmol/kg daily

Persistent cyanotic spell in a child with congenital heart disease despite optimal use of 100% oxygen and propranolol

► BY INTRAVENOUS INFUSION

► Child: 1 mmol/kg, dose given to correct acidosis (or dose calculated according to arterial blood gas results), sodium bicarbonate 4.2% intravenous infusion is appropriate for a child under 1 year and sodium bicarbonate 8.4% intravenous infusion in children over 1 year

● CONTRA-INDICATIONS

► With oral use Salt restricted diet

● CAUTIONS

► With systemic use Respiratory acidosis

► **INTERACTIONS** → Appendix 1 (antacids).

● SIDE-EFFECTS

► When used for chronic acidotic states such as uraemic acidosis or renal tubular acidosis With oral use for chronic acidotic states such as uraemic acidosis or renal tubular acidosis fluid retention (in those at risk) · hypokalaemia may be exacerbated · increase blood pressure · pulmonary oedema (in those at risk)

● MONITORING REQUIREMENTS

► With intravenous use Plasma-pH and electrolytes should be monitored.

● DIRECTIONS FOR ADMINISTRATION

► With intravenous use For *peripheral infusion* dilute 8.4% solution at least 1 in 10. For *central line infusion* dilute 1 in 5 with Glucose 5% or 10% or Sodium Chloride 0.9%. Extravasation can cause severe tissue damage.

► With oral use Sodium bicarbonate may affect the stability or absorption of other drugs if administered at the same time. If possible, allow 1–2 hours before administering other drugs orally.

● PRESCRIBING AND DISPENSING INFORMATION

► With oral use *Sodium bicarbonate* 500mg capsules contain approximately 6 mmol each of Na⁺ and HCO₃⁻; *Sodium bicarbonate* 600mg capsules contain approximately 7 mmol each of Na⁺ and HCO₃⁻. Oral solutions of sodium bicarbonate are required occasionally; these are available from 'special-order' manufacturers or specialist importing companies; the strength of sodium bicarbonate should be stated on the prescription.

► With intravenous use Usual strength Sodium bicarbonate 1.26% (12.6 g, 150 mmol each of Na⁺ and HCO₃⁻/litre), various other strengths available.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Sodium bicarbonate for acidosis www.medicinesforchildren.org.uk/sodium-bicarbonate-for-acidosis

► With oral use Patients or carers should be given advice on the administration of sodium bicarbonate oral medicines.

● MEDICINAL FORMS

Potassium chloride with glucose and sodium chloride

The properties listed below are those particular to the combination only. For the properties of the components please consider, potassium chloride p. 561, glucose p. 549, sodium chloride p. 547.

• INDICATIONS AND DOSE

Electrolyte imbalance

- BY INTRAVENOUS INFUSION
- Child: Dosed according to the deficit or daily maintenance requirements

• PRESCRIBING AND DISPENSING INFORMATION

Concentration of potassium chloride to be specified by the prescriber (usually K⁺ 10–40 mmol/litre).

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: infusion, solution for infusion

Infusion

- Potassium chloride with glucose and sodium chloride (Non-proprietary)

ELECTROLYTES AND MINERALS > SODIUM CHLORIDE

Sodium chloride

● INDICATIONS AND DOSE

Chronic renal salt wasting

▶ BY MOUTH

- ▶ Child: 1–2 mmol/kg daily in divided doses, adjusted according to requirements

Sodium supplementation in neonates

▶ INITIALLY BY MOUTH

- ▶ Neonate up to 36 weeks corrected gestational age: 2 mmol, dose to be administered in 100 ml of formula feed (consult dietician), alternatively (by mouth using modified-release tablets) 3–4 mmol, dose to be administered in 100 ml of breast milk (consult dietician).

Sodium replacement

▶ BY MOUTH USING MODIFIED-RELEASE TABLETS

- ▶ Child: 1–2 mmol/kg daily in divided doses, adjusted according to requirements, higher doses may be needed in severe depletion

Management of diabetic ketoacidosis (to restore circulating volume if systolic blood pressure is below 90 mmHg and adjusted for age, sex, and medication as appropriate)

▶ BY INTRAVENOUS INFUSION

- ▶ Child: (consult local protocol)

Diluent for instillation of drugs to the bladder

▶ BY INTRAVESICAL INSTILLATION

- ▶ Child: (consult product literature)

● CAUTIONS

- ▶ With intravenous use Avoid excessive administration · cardiac failure · cardio-respiratory diseases · children receiving glucocorticoids · dilutional hyponatraemia · hepatic cirrhosis · hypertension · peripheral oedema · pulmonary oedema · reduced fluid loss · renal insufficiency · restrict intake in impaired renal function · toxæmia of pregnancy

CAUTIONS, FURTHER INFORMATION

- ▶ Reduced fluid loss
- ▶ With intravenous use The volume of fluid infused should take into account the possibility of reduced fluid loss owing to increased antidiuretic hormone and factors such as renal failure, hypothermia, and high humidity.
- ▶ Dilutional hyponatraemia
- ▶ With intravenous use Dilutional hyponatraemia is a rare but potentially fatal risk of parenteral hydration. It may be caused by inappropriate use of hypotonic fluids such as sodium chloride 0.18% and glucose 4% intravenous infusion, especially in the postoperative period when antidiuretic hormone secretion is increased. Dilutional hyponatraemia is characterized by a rapid fall in plasma-sodium concentration leading to cerebral oedema and seizures; any child with severe hyponatraemia or rapidly changing plasma-sodium concentration should be referred urgently to a paediatric high dependency facility.

● SIDE-EFFECTS

- ▶ With intravenous use Administration of large doses may give rise to sodium accumulation · oedema

● MONITORING REQUIREMENTS

- ▶ With intravenous use During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

● PRESCRIBING AND DISPENSING INFORMATION

- ▶ With intravenous use Sodium chloride 0.9% intravenous infusion contains Na^+ and Cl^- each 150 mmol/litre. The term 'normal saline' should not be used to describe sodium chloride intravenous infusion 0.9%; the term 'physiological saline' is acceptable but it is preferable to give the composition (i.e. sodium chloride intravenous infusion 0.9%).
- ▶ With oral use Each *Slow Sodium*® tablet contains approximately 10 mmol each of Na^+ and Cl^- ; tablets can be crushed before administration.

chloride and sodium chloride and sodium lactate, p. 545 - *Potassium chloride with calcium chloride dihydrate and sodium chloride*, p. 545 - *Potassium chloride with glucose and sodium chloride*, p. 546 - *Potassium chloride with sodium chloride*, p. 546

Sodium chloride with glucose

The properties listed below are those particular to the combination only. For the properties of the components please consider, sodium chloride p. 547, glucose below.

● INDICATIONS AND DOSE

Combined water and sodium depletion

- BY INTRAVENOUS INFUSION
- Child: (consult product literature)

● CAUTIONS

CAUTIONS, FURTHER INFORMATION

Sodium chloride 0.18% and glucose 4% intravenous infusion fluid should not be used for fluid replacement in children aged 16 years or less because of the risk of hyponatraemia; availability of this infusion should be restricted to high dependency and intensive care units, and specialist wards, such as renal, liver, and cardiac units. Local guidelines on intravenous fluids should be consulted.

● MONITORING REQUIREMENTS

- Maintenance fluid should accurately reflect daily requirements and close monitoring is required to avoid fluid and electrolyte imbalance.
- During parenteral hydration, fluids and electrolytes should be monitored closely and any disturbance corrected by slow infusion of an appropriate solution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

NUTRIENTS > SUGARS

Glucose

(Dextrose Monohydrate)

● INDICATIONS AND DOSE

Establish presence of gestational diabetes

- BY MOUTH
- Child: Test dose 75 g, anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals, to be given with 200–300 mL fluid

Oral glucose tolerance test

- BY MOUTH
- Child: Test dose 1.75 g/kg (max. per dose 75 g), anhydrous glucose to be given to the fasting patient and blood-glucose concentrations measured at intervals. To be given with 200–300 mL fluid

Neonatal hypoglycaemia

- BY INTRAVENOUS INFUSION
- Neonate: 500 mg/kg/hour, to be administered as Glucose 10% intravenous infusion, an initial dose of 250 mg/kg over 5 minutes may be required if hypoglycaemia is severe enough to cause loss of consciousness or seizures.

Hypoglycaemia

- BY INTRAVENOUS INFUSION
- Child: 500 mg/kg, to be administered as Glucose 10% intravenous infusion into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs

Energy source

- BY INTRAVENOUS INFUSION
- Child: (consult product literature)

Water replacement

- BY INTRAVENOUS INFUSION
- Child: The volume of glucose solution needed to replace deficits may vary (consult product literature)

Persistent cyanosis (in combination with propranolol) when blood glucose less than 3 mmol/litre (followed by morphine)

- BY INTRAVENOUS INFUSION
- Child: 200 mg/kg, to be administered as Glucose 10% intravenous infusion over 10 minutes

Management of diabetic ketoacidosis

- BY INTRAVENOUS INFUSION
- Child: Glucose 5% or 10% should be added to replacement fluid once blood-glucose concentration falls below 14 mmol/litre

DOSE EQUIVALENCE AND CONVERSION

75 g anhydrous glucose is equivalent to Glucose BP 82.5 g.

- **CAUTIONS** Do not give alone except when there is no significant loss of electrolytes - prolonged administration of glucose solutions without electrolytes can lead to hyponatraemia and other electrolyte disturbances
- **SIDE-EFFECTS** Glucose injections especially if hypertonic may have a low pH and may cause venous irritation and thrombophlebitis
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use Injections containing more than 10% glucose can be irritant and should be given into a central venous line; however, solutions containing up to 12.5% can be administered for a short period into a peripheral line.
- **PRESCRIBING AND DISPENSING INFORMATION** Glucose BP is the monohydrate but Glucose Intravenous Infusion BP is a sterile solution of anhydrous glucose or glucose

monohydrate, potency being expressed in terms of anhydrous glucose.

• EXCEPTIONS TO LEGAL CATEGORY

- ▶ With intravenous use Prescription only medicine restriction does not apply to 50% solution where administration is for saving life in emergency.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, solution for infusion

Oral solution

- ▶ **Rapilose OGTT** (Aspire Pharma Ltd)

Glucose 250 mg per 1 ml Rapilose OGTT solution | 300 ml £3.48

Oral gel

- ▶ **DextroGel** (Neocuticals Ltd)

Glucose 400 mg per 1 gram DextroGel 40% gel | 75 gram £7.16 DT price = £7.16 | 80 gram £6.84

- ▶ **GlucoBoost** (Ennogen Healthcare Ltd)

Glucose 400 mg per 1 gram GlucoBoost 40% gel | 75 gram £7.16 DT price = £7.16 | 80 gram £6.84

- ▶ **GlucoseGel** (BBI Healthcare Ltd)

Glucose 400 mg per 1 gram GlucoseGel 40% gel original | 75 gram £5.16 DT price = £7.16 | 80 gram £6.84

- ▶ **Rapilose** (Galen Ltd)

Glucose 400 mg per 1 gram Rapilose 40% gel | 75 gram £5.49 DT price = £7.16

ORAL REHYDRATION SALTS

Disodium hydrogen citrate with glucose, potassium chloride and sodium chloride

(Formulated as oral rehydration salts)

• INDICATIONS AND DOSE

Fluid and electrolyte loss in diarrhoea

- ▶ BY MOUTH

- ▶ Child 11–11 months: 1–1½ times usual feed volume to be given
- ▶ Child 1–11 years: 200 mL, to be given after every loose motion
- ▶ Child 12–17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200mL of water (freshly boiled and cooled for infants); 5 sachets reconstituted with 1 litre of water provide Na⁺ 60 mmol, K⁺ 20 mmol, Cl⁻ 60 mmol, citrate 10 mmol, and glucose 90 mmol.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral powder formulations may include black currant, citrus, or natural.

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Oral rehydration salts

www.medicinesforchildren.org.uk/oral-rehydration-salts

After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder

► **Dioralyte** (Sanofi)

Potassium chloride 300 mg, Sodium chloride 470 mg, Disodium hydrogen citrate 530 mg, Glucose 3.56 gram Dioralyte oral powder sachets citrus | 20 sachet [P] £6.72

Dioralyte oral powder sachets plain | 20 sachet [P] £6.72

Dioralyte oral powder sachets blackcurrant | 20 sachet [P] £6.72

Glucose with potassium chloride, sodium bicarbonate and sodium chloride

(Formulated as oral rehydration salts)

● INDICATIONS AND DOSE

Fluid and electrolyte loss in diarrhoea

► BY MOUTH

- Child 1–11 months: 1–1½ times usual feed volume to be given
- Child 1–11 years: 200 mL, to be given after every loose motion
- Child 12–17 years: 200–400 mL, to be given after every loose motion, dose according to fluid loss

- **DIRECTIONS FOR ADMINISTRATION** Reconstitute 1 sachet with 200 mL of water (freshly boiled and cooled for infants); 5 sachets when reconstituted with 1 litre of water provide Na⁺ 50 mmol, K⁺ 20 mmol, Cl⁻ 40 mmol, HCO₃⁻ 30 mmol, and glucose 111 mmol.

- **PREScribing AND DISPENSING INFORMATION** Flavours of oral powder formulations may include banana, orange, black current, lemon and lime, plain, or multiflavour.

- **PATIENT AND CARER ADVICE** Patients and carers should be advised how to reconstitute *Electrolade*® oral powder. After reconstitution any unused solution should be discarded no later than 1 hour after preparation unless stored in a refrigerator when it may be kept for up to 24 hours.

Dioralyte Relief oral powder sachets blackcurrant sugar-free | 20 sachet [P] £7.13

2.1 Calcium imbalance

Calcium

Calcium supplements

Calcium supplements are usually only required where dietary calcium intake is deficient. This dietary requirement varies with age and is relatively greater in childhood, pregnancy, and lactation, due to an increased demand. Hypocalcaemia may be caused by vitamin D deficiency (see Vitamin D under Vitamins p. 581), impaired metabolism, a failure of secretion (hypoparathyroidism), or resistance to parathyroid hormone (pseudohypoparathyroidism).

Mild asymptomatic hypocalcaemia may be managed with oral calcium supplements. *Severe symptomatic hypocalcaemia* requires an intravenous infusion of calcium gluconate 10% p. 553 over 5 to 10 minutes, repeating the dose if symptoms persist; in exceptional cases it may be necessary to maintain a continuous calcium infusion over a day or more. Calcium chloride injection p. 553 is also available, but is more irritant; care should be taken to prevent extravasation.

See the role of calcium gluconate in temporarily reducing the toxic effects of *hyperkalaemia*.

Persistent hypocalcaemia requires oral calcium supplements and either a vitamin D analogue (alfacalcidol p. 588 or calcitriol p. 588) for hypoparathyroidism and pseudohypoparathyroidism or natural vitamin D (calciferol) if due to vitamin D deficiency. It is important to monitor plasma and urinary calcium during long-term maintenance therapy.

Severe hypercalcaemia

Severe hypercalcaemia calls for urgent treatment before detailed investigation of the cause. Dehydration should be corrected first with intravenous infusion of sodium chloride 0.9% p. 547. Drugs (such as thiazides and vitamin D compounds) which promote hypercalcaemia, should be discontinued and dietary calcium should be restricted.

If *severe hypercalcaemia persists* drugs which inhibit mobilisation of calcium from the skeleton may be required. The **bisphosphonates** are useful and pamidronate disodium p. 437 is probably the most effective.

Corticosteroids are widely given, but may only be useful where hypercalcaemia is due to sarcoidosis or vitamin D intoxication; they often take several days to achieve the desired effect.

Calcitonin (salmon) p. 439 can be used by specialists for the treatment of hypercalcaemia associated with malignancy; it is rarely effective where bisphosphonates have failed to reduce serum calcium adequately.

After treatment of severe hypercalcaemia the underlying cause must be established. *Further treatment* is governed by the same principles as for initial therapy. Salt and water depletion and drugs promoting hypercalcaemia should be avoided; oral administration of a bisphosphonate may be helpful. Parathyroidectomy may be indicated for hyperparathyroidism.

Hypercalciuria

Hypercalciuria should be investigated for an underlying cause, which should be treated. Reducing dietary calcium intake may be beneficial but severe restriction of calcium intake has not proved beneficial and may even be harmful.

Neonates

Calcium supplements

Hypocalcaemia is common in the first few days of life, particularly following birth asphyxia or respiratory distress. Late onset at 4–10 days after birth may be secondary to vitamin D deficiency, hypoparathyroidism or hypomagnesaemia and may be associated with seizures.

2.1a Hypocalcaemia

ELECTROLYTES AND MINERALS > CALCIUM

Calcium salts

- **CONTRA-INDICATIONS** Conditions associated with hypercalcaemia (e.g. some forms of malignant disease) · conditions associated with hypercalciuria (e.g. some forms of malignant disease)
- **CAUTIONS** History of nephrolithiasis · sarcoidosis
- **INTERACTIONS** → Appendix 1 (antacids, calcium salts).
- **SIDE-EFFECTS**
 - GENERAL SIDE-EFFECTS
 - ▶ **Rare** Gastro-intestinal disturbances
 - ▶ **Frequency not known** Hypercalcaemia
 - SPECIFIC SIDE-EFFECTS
 - ▶ With intravenous use Arrhythmias · bradycardia · fall in blood pressure · injection-site reactions · peripheral vasodilatation · severe tissue damage with extravasation · sweating
- **RENAL IMPAIRMENT** Use with caution. Risk of hypercalcaemia and renal calculi.

Calcium carbonate

● INDICATIONS AND DOSE

Phosphate binding in renal failure and hyperphosphataemia

- ▶ BY MOUTH
- ▶ Child 1–11 months: 120 mg 3–4 times a day, dose to be adjusted as necessary, to be taken with feeds
- ▶ Child 1–5 years: 300 mg 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals
- ▶ Child 6–11 years: 600 mg 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals

- ▶ Child 12–17 years: 1.25 g 3–4 times a day, dose to be adjusted as necessary, to be taken prior to or with meals

Calcium deficiency

- ▶ BY MOUTH
- ▶ Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.
- ▶ Child 1 month–4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
- ▶ Child 5–11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
- ▶ Child 12–17 years: 10 mmol 4 times a day, adjusted according to response

- **PRESCRIBING AND DISPENSING INFORMATION** *Adcal*® contains calcium carbonate 1.5 g (calcium 600 mg or Ca^{2+} 15 mmol); *CalciChew*® contains calcium carbonate 1.25 g (calcium 500 mg or Ca^{2+} 12.5 mmol); *CalciChew Forte*® contains calcium carbonate 2.5 g (calcium 1 g or Ca^{2+} 25 mmol); *Cacit*® contains calcium carbonate 1.25 g, providing calcium citrate when dispersed in water (calcium 500 mg or Ca^{2+} 12.5 mmol); consult product literature for details of other available products.

Flavours of chewable tablet formulations may include orange or fruit flavour.

Calcium chloride 14.7% solution for injection 10ml ampoules | 10 ampoule [PoM] £64.69–£66.38

Calcium gluconate

● INDICATIONS AND DOSE

Calcium deficiency | Mild asymptomatic hypocalcaemia

- ▶ BY MOUTH

- ▶ Neonate: 0.25 mmol/kg 4 times a day, adjusted according to response.
- ▶ Child 1 month–4 years: 0.25 mmol/kg 4 times a day, adjusted according to response
- ▶ Child 5–11 years: 0.2 mmol/kg 4 times a day, adjusted according to response
- ▶ Child 12–17 years: 10 mmol 4 times a day, adjusted according to response

Acute hypocalcaemia, urgent correction | Hyperkalaemia (prevention of arrhythmias)

- ▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Neonate: 0.11 mmol/kg for 1 dose, to be given over 5–10 minutes, some units use a dose of 0.46 mmol/kg (2 mL/kg calcium gluconate 10%) for hypocalcaemia in line with US practice.

- ▶ Child: 0.11 mmol/kg, to be given over 5–10 minutes, maximum 4.5 mmol (20 mL calcium gluconate 10%)

Acute hypocalcaemia, maintenance

- ▶ BY CONTINUOUS INTRAVENOUS INFUSION

- ▶ Neonate: 0.5 mmol/kg daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation.
- ▶ Child 1 month–1 year: 1 mmol/kg daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation; Usual maximum 8.8 mmol
- ▶ Child 2–17 years: 8.8 mmol daily, adjusted according to response, dose to be given over 24 hours, use oral route as soon as possible due to risk of extravasation

DOSE EQUIVALENCE AND CONVERSION

0.11 mmol/kg is equivalent to 0.5 mL/kg of calcium gluconate 10%.

IMPORTANT SAFETY INFORMATION

The MHRA has advised that repeated or prolonged administration of calcium gluconate injection packaged in 10 mL glass containers is contra-indicated in children under 18 years and in patients with renal impairment owing to the risk of aluminium accumulation; in these patients the use of calcium gluconate injection packaged in plastic containers is recommended.

● MONITORING REQUIREMENTS

- ▶ With intravenous use Plasma-calcium and ECG monitoring required for administration by slow intravenous injection (risk of arrhythmias if given too rapidly).

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For intravenous infusion dilute to at least 45 micromol/mL with Glucose 5% or Sodium Chloride 0.9%. Maximum administration rate 45 micromol/kg/hour (or in neonates max. 22 micromol/kg/hour). May be given more concentrated via a central venous catheter. May be used undiluted (10% calcium gluconate) in emergencies. Avoid extravasation; should not be given by intramuscular injection. Incompatible with sodium bicarbonate and phosphate solutions.

- **PRESCRIBING AND DISPENSING INFORMATION** Calcium gluconate 1 g contains calcium 89 mg or Ca^{2+} 2.23 mmol.

PLASMA SUBSTITUTES

Gelatin

● INDICATIONS AND DOSE

Low blood volume in hypovolaemic shock, burns and cardiopulmonary bypass

► BY INTRAVENOUS INFUSION

► Child: Initially 10–20 mL/kilogram, use 3.5–4% solution

● CAUTIONS Cardiac disease · severe liver disease

CAUTIONS, FURTHER INFORMATION

The use of plasma substitutes in children requires specialist supervision due to the risk of fluid overload; use is best restricted to an intensive care setting.

● SIDE-EFFECTS

► **Rare** Severe anaphylactic reactions
 ► **Frequency not known** Hypersensitivity reactions · transient increase in bleeding time

● **PREGNANCY** Manufacturer of *Geloplasma*® advises avoid at the end of pregnancy.

● **HEPATIC IMPAIRMENT** Use with caution in severe impairment.

● **RENAL IMPAIRMENT** Use with caution in renal impairment.

● MONITORING REQUIREMENTS

► Urine output should be monitored. Care should be taken to avoid haematocrit concentration from falling below 25–30% and the patient should be monitored for hypersensitivity reactions.
 ► Plasma and plasma substitutes are often used in very ill patients whose condition is unstable. Therefore, close monitoring is required and fluid and electrolyte therapy should be adjusted according to the patient's condition at all times.

● **PRESCRIBING AND DISPENSING INFORMATION** The gelatin is partially degraded.

Gelaspan® contains succinylated gelatin (modified fluid gelatin, average molecular weight 26 500) 40 g, Na⁺ 151 mmol, K⁺ 4 mmol, Mg²⁺ 1 mmol, Cl⁻ 103 mmol, Ca²⁺ 1 mmol, acetate 24 mmol/litre; *Gelofusine*® contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 124 mmol/litre; *Geloplasma*® contains partially hydrolysed and succinylated gelatin (modified liquid gelatin) (as anhydrous gelatin) 30 g (3%), Na⁺ 150 mmol, K⁺ 5 mmol, Mg²⁺ 1.5 mmol, Cl⁻ 100 mmol, lactate 30 mmol/litre; *Isoplex*® contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 145 mmol, K⁺ 4 mmol, Mg²⁺ 0.9 mmol, Cl⁻ 105 mmol, lactate 25 mmol/litre; *Volplex*® contains succinylated gelatin (modified fluid gelatin, average molecular weight 30 000) 40 g (4%), Na⁺ 154 mmol, Cl⁻ 125 mmol/litre.

Volplex 4% infusion 1litre bags | 6 bag [PoM] £54.54 (Hospital only)

2.3 Magnesium imbalance

Magnesium

Magnesium is an essential constituent of many enzyme systems, particularly those involved in energy generation; the largest stores are in the skeleton.

Magnesium salts are not well absorbed from the gastrointestinal tract, which explains the use of magnesium sulfate as an osmotic laxative.

Magnesium is excreted mainly by the kidneys and is therefore retained in renal failure, but significant *hypermagnesaemia* (causing muscle weakness and arrhythmias) is rare.

Hypomagnesaemia

Since magnesium is secreted in large amounts in the gastrointestinal fluid, excessive losses in diarrhoea, stoma or fistula are the most common causes of *hypomagnesaemia*; deficiency may also occur as a result of treatment with certain drugs. Hypomagnesaemia often causes secondary hypocalcaemia (with which it may be confused), particularly in neonates, and also hypokalaemia and hyponatraemia.

Symptomatic *hypomagnesaemia* is associated with a deficit of 0.5–1 mmol/kg. Magnesium is given initially by intravenous infusion or by intramuscular injection of magnesium sulfate; the intramuscular injection is painful. Plasma magnesium concentration should be measured to determine the rate and duration of infusion and the dose should be reduced in renal impairment. To prevent recurrence of the deficit, magnesium may be given by mouth in divided doses, but there is limited evidence of benefit. Magnesium aspartate powder for oral solution p. 556 is available as a licensed preparation.

Arrhythmias

Magnesium sulfate injection has also been recommended for the emergency treatment of *serious arrhythmias*, especially in the presence of hypokalaemia (when hypomagnesaemia may also be present) and when salvos of rapid ventricular tachycardia show the characteristic twisting wave front known as *torsade de pointes*.

2.3a Hypomagnesaemia

ELECTROLYTES AND MINERALS > MAGNESIUM

Magnesium aspartate

● INDICATIONS AND DOSE

Treatment and prevention of magnesium deficiency

► BY MOUTH

- Child 2–3 years: 4.5 mmol daily, given as one level 5 mL spoonful of *Magnaspartate*® powder.
- Child 4–9 years: 4.5 mmol daily, given as a 5 mL level spoonful of *Magnaspartate*® powder, alternatively 10 mmol daily, given as 1 sachet of *Magnaspartate*® powder.
- Child 10–17 years: 10 mmol daily, given as 1 sachet of *Magnaspartate*® powder.

- **CONTRA-INDICATIONS** Disorders of cardiac conduction

- **INTERACTIONS** → Appendix 1 (magnesium salts, oral).

● SIDE-EFFECTS

- Uncommon Diarrhoea
- Rare Hypermagnesaemia
- Frequency not known Dental caries (on long term use) • gastrointestinal irritation

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects generally occur at higher doses; if side-effects (such as diarrhoea) occur, consider interrupting treatment and restarting at a reduced dose.

Overdose

Symptoms of hypermagnesaemia may include nausea, vomiting, flushing of the skin, thirst, hypotension due to peripheral vasodilatation, drowsiness, confusion, loss of tendon reflexes and respiratory depression due to neuromuscular blockade, slurred speech, double vision, muscle weakness, bradycardia, cardiac arrhythmias, coma, and cardiac arrest.

- **RENAL IMPAIRMENT** Avoid in severe impairment (estimated glomerular filtration rate less than 30 mL/minute/1.73²).
- **DIRECTIONS FOR ADMINISTRATION** Dissolve sachet contents in 50–200 mL water, tea or orange juice and take immediately.
- **PRESCRIBING AND DISPENSING INFORMATION** *Magnaspartate*® contains magnesium aspartate 6.5 g (10 mmol Mg²⁺)/sachet.
- **PATIENT AND CARER ADVICE** Patients and carers should be given advice on how to administer magnesium aspartate powder.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder

EXCIPIENTS: May contain Sucrose

► Magnesium aspartate (Non-proprietary)

Magnesium (as Magnesium aspartate) 243 mg *Magnaspartate* 243mg (magnesium 10mmol) oral powder sachets | 10 sachet (PoM) £8.95

Magnesium glycerophosphate

● INDICATIONS AND DOSE

Hypomagnesaemia

► BY MOUTH

- Child 1 month–11 years: Initially 50 mg/kg 3 times a day, dose to be adjusted as necessary
- Child 12–17 years: Initially 1–2 g 3 times a day, dose to be adjusted as necessary

DOSE EQUIVALENCE AND CONVERSION

Magnesium glycerophosphate 1 g is equivalent to approximately magnesium 97 mg or Mg²⁺ 4 mmol.

- **UNLICENSED USE** Not licensed.
- **INTERACTIONS** → Appendix 1 (magnesium salts, oral).
- **SIDE-EFFECTS** Arrhythmias • colic • coma • confusion • diarrhoea • drowsiness • flushing of skin • hypermagnesaemia associated side-effects • hypotension • loss of tendon reflexes • muscle weakness • nausea • respiratory depression • thirst • vomiting
- **RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity.
- **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdose (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).
- **DIRECTIONS FOR ADMINISTRATION** Tablets may be dispersed in water.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, chewable tablet, capsule, oral suspension, oral solution, powder

Tablet

► Magnesium glycerophosphate (Non-proprietary)

Magnesium (as Magnesium glycerophosphate) 24.25 mg per 1 mL LiquetaMag GP (magnesium 121.25mg/5mL (5mmol/5mL)) oral solution sugar-free | 250 mL £55.00

Magnesium sulfate

● INDICATIONS AND DOSE

Severe acute asthma | Continuing respiratory deterioration in anaphylaxis

► BY INTRAVENOUS INFUSION

- Child 2–17 years: 40 mg/kg (max. per dose 2 g), to be given over 20 minutes

Persistent pulmonary hypertension of the newborn

► INITIALLY BY INTRAVENOUS INFUSION

- Neonate: Initially 200 mg/kg, to be given over 20–30 minutes, then (by continuous intravenous infusion) 20–75 mg/kg/hour for up to 5 days if response occurs after initial dose (to maintain plasma magnesium concentration between 3.5–5.5 mmol/litre).

Hypomagnesaemia

► BY INTRAVENOUS INJECTION

- Neonate: 100 mg/kg every 6–12 hours as required, to be given over at least 10 minutes.
- Child 1 month–11 years: 50 mg/kg every 12 hours as required, to be given over at least 10 minutes
- Child 12–17 years: 1 g every 12 hours as required, to be given over at least 10 minutes

Hypomagnesaemia maintenance (e.g. in intravenous nutrition)

- BY INTRAVENOUS INFUSION, OR BY INTRAMUSCULAR INJECTION
- Child: 50–100 mg/kg daily; maximum 5 g per day

Neonatal hypocalcaemia

- BY DEEP INTRAMUSCULAR INJECTION, OR BY INTRAVENOUS INFUSION

- Neonate: 100 mg/kg every 12 hours for 2–3 doses.

Torsade de pointes

► BY INTRAVENOUS INJECTION

- Child: 25–50 mg/kg (max. per dose 2 g), to be given over 10–15 minutes, dose may be repeated once if necessary (consult local protocol)

DOSE EQUIVALENCE AND CONVERSION

Magnesium sulfate heptahydrate 1 g equivalent to Mg^{2+} approx. 4 mmol.

- **UNLICENSED USE** Unlicensed indication in severe acute asthma. Continuing respiratory deterioration in anaphylaxis.
- **INTERACTIONS** → Appendix 1 (magnesium, parenteral).
- **SIDE-EFFECTS** Arrhythmias • colic • coma • confusion • diarrhoea • drowsiness • flushing of skin • hypermagnesaemia associated side-effects • hypotension • loss of tendon reflexes • muscle weakness • nausea • respiratory depression • thirst • vomiting
- **PREGNANCY**
 - When used for Neonatal hypocalcaemia or Hypomagnesaemia or Torsade de pointes or Severe acute asthma or Continuing respiratory deterioration in anaphylaxis Sufficient amount may cross the placenta in mothers treated with high doses causing hypotonia and respiratory depression in newborns.
- **HEPATIC IMPAIRMENT** Avoid in hepatic coma if risk of renal failure.
- **RENAL IMPAIRMENT** Avoid or reduce dose. Increased risk of toxicity.
- **MONITORING REQUIREMENTS** Monitor blood pressure, respiratory rate, urinary output and for signs of overdosage (loss of patellar reflexes, weakness, nausea, sensation of warmth, flushing, drowsiness, double vision, and slurred speech).
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use In severe hypomagnesaemia administer initially via controlled infusion device (preferably syringe pump).
 - With intravenous use For intravenous infusion, in persistent pulmonary hypertension of the newborn, dilute to a max. concentration of 100 mg/mL (10%) (0.4 mmol/mL Mg^{2+}) magnesium sulfate heptahydrate (200 mg/mL (0.8 mmol/mL Mg^{2+}) if fluid restricted) with Glucose 5% or Sodium Chloride 0.9%.

- With intravenous use For neonatal hypocalcaemia, hypomagnesaemia, and torsade de pointes, dilute to 10% (100 mg magnesium sulfate heptahydrate (0.4 mmol Mg^{2+}) in 1 mL) with Glucose 5% or 10%, Sodium Chloride 0.45% or 0.9% or Glucose and Sodium Chloride combinations. Up to 20% solution may be given in fluid restriction. Rate of administration should not exceed 10 mg/kg/minute (0.04 mmol/kg/minute Mg^{2+}) of magnesium sulfate heptahydrate.

● **PRESCRIBING AND DISPENSING INFORMATION**

- With intramuscular use or intravenous use The BP directs that the label states the strength as the % w/v of magnesium sulfate heptahydrate and as the approximate concentration of magnesium ions (Mg^{2+}) in mmol/mL. Magnesium Sulfate Injection BP is a sterile solution of Magnesium Sulfate Heptahydrate.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for injection, infusion, solution for infusion

Solution for infusion► **Magnesium sulfate (Non-proprietary)**

Magnesium sulfate heptahydrate 100 mg per 1 ml Magnesium sulfate 10% (magnesium 0.4mmol/ml) solution for injection 10ml ampoules | 10 ampoule [PoM] £57.12–£58.80
Magnesium sulfate heptahydrate 500 mg per 1 ml Magnesium sulfate 50% (magnesium 2mmol/ml) solution for infusion 50ml vials | 10 vial [PoM] £63.70

2.4 Phosphate imbalance

Phosphorus

Phosphate supplements

Oral phosphate supplements p. 559 may be required in addition to vitamin D in children with hypophosphataemic vitamin D-resistant rickets, see also Vitamin D, under Vitamins p. 581.

Phosphate infusion is occasionally needed in phosphate deficiency arising from use of parenteral nutrition deficient in phosphate supplements; phosphate depletion also occurs in severe diabetic ketoacidosis. It is difficult to provide detailed guidelines for the treatment of severe hypophosphatemia because the extent of total body deficits and response to therapy are difficult to predict. High doses of phosphate may result in a transient serum elevation followed by redistribution into intracellular compartments or bone tissue. It is recommended that severe hypophosphataemia be treated intravenously as large doses of oral phosphate may cause diarrhoea; intestinal absorption may be unreliable and dose adjustment may be necessary.

Phosphate is not the first choice for the treatment of hypercalcaemia because of the risk of precipitation of calcium phosphate in the kidney and other tissues. If used, the child should be well hydrated and electrolytes monitored.

Neonates

Phosphate deficiency may occur in very low-birthweight infants and may compromise bone growth if not corrected. Parenterally fed infants may be at risk of phosphate

deficiency due to the limited solubility of phosphate. Some units routinely supplement expressed breast milk with phosphate, although the effect on the osmolality of the milk should be considered.

Phosphate-binding agents

Calcium-containing preparations are used as phosphate-binding agents in the management of hyperphosphataemia complicating renal failure. Aluminium-containing preparations are rarely used as phosphate-binding agents and can cause aluminium accumulation.

Sevelamer hydrochloride is licensed for the treatment of hyperphosphataemia in adults on haemodialysis or peritoneal dialysis. Although experience is limited in children sevelamer hydrochloride may be useful when hypercalcaemia prevents the use of calcium carbonate p. 552.

2.4a Hyperphosphataemia

ELECTROLYTES AND MINERALS > ALUMINIUM

Aluminium hydroxide

● INDICATIONS AND DOSE

Hyperphosphataemia in renal failure

► BY MOUTH USING CAPSULES

- Child 5–11 years: 1–2 capsules 3–4 times a day, dose adjusted as necessary
- Child 12–17 years: 1–5 capsules 3–4 times a day, dose adjusted as necessary

- **CONTRA-INDICATIONS** Hypophosphataemia · infants · neonates

CONTRA-INDICATIONS, FURTHER INFORMATION

- Neonates and infants Aluminium-containing antacids should not be used because accumulation may lead to increased plasma-aluminium concentrations.
- **INTERACTIONS** → Appendix 1 (antacids). Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may damage enteric coatings designed to prevent dissolution in the stomach.
- **SIDE-EFFECTS** Constipation · hyperaluminiaemia
- **HEPATIC IMPAIRMENT** Avoid; can cause constipation which can precipitate coma.
- **RENAL IMPAIRMENT** There is a risk of accumulation and aluminium toxicity with antacids containing aluminium salts. Absorption of aluminium from aluminium salts is increased by citrates, which are contained in many effervescent preparations (such as effervescent analgesics).

● MEDICINAL FORMS

► BY MOUTH USING EFFERVESCENT TABLETS

► Neonate: 1 mmol/kg daily in 1–2 divided doses, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 mL if calcium also added, contact pharmacy department for details.

► Child 1 month–4 years: 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary, dose can be taken as a supplement in breast milk—caution advised as solubility in breast milk is limited to 1.2 mmol in 100 mL if calcium also added, contact pharmacy department for details; maximum 48 mmol per day

► Child 5–17 years: 2–3 mmol/kg daily in 2–4 divided doses, dose to be adjusted as necessary; maximum 97 mmol per day

► BY INTRAVENOUS INFUSION

► Neonate: 1 mmol/kg daily, dose to be adjusted as necessary.

► Child 1 month–1 year: 0.7 mmol/kg daily, dose to be adjusted as necessary

► Child 2–17 years: 0.4 mmol/kg daily, dose to be adjusted as necessary

IMPORTANT SAFETY INFORMATION

► With intravenous use

Some phosphate injection preparations also contain potassium. For peripheral intravenous administration the *concentration* of potassium should not usually exceed 40 mmol/litre. The infusion solution should be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium concentrate should be followed. The potassium content of some phosphate preparations may also limit the *rate* at which they may be administered.

CAUTIONS

GENERAL CAUTIONS

Cardiac disease • dehydration • diabetes mellitus • sodium and potassium concentrations of preparations

SPECIFIC CAUTIONS

► With intravenous use Avoid extravasation • severe tissue necrosis

SIDE-EFFECTS

► Common or very common Diarrhoea

► Frequency not known Acute renal failure • hypocalcaemia • hypotension • metastatic calcification • nausea • oedema • phlebitis • tissue necrosis on extravasation

SIDE-EFFECTS, FURTHER INFORMATION

Diarrhoea is a common side-effect and should prompt a reduction in dosage.

► **RENAL IMPAIRMENT** Reduce dose. Monitor closely in renal impairment.

► **MONITORING REQUIREMENTS** It is essential to monitor closely plasma concentrations of calcium, phosphate, potassium, and other electrolytes—excessive doses of phosphates may cause hypocalcaemia and metastatic calcification.

DIRECTIONS FOR ADMINISTRATION

► With intravenous use Dilute injection with Sodium Chloride 0.9% or 0.45% or Glucose 5% or 10%. Administration rate of phosphate should not exceed 0.05 mmol/kg/hour. In emergencies in intensive care faster rates may be used—seek specialist advice.

► **PRESCRIBING AND DISPENSING INFORMATION** *Phosphate Sandoz*® contains sodium dihydrogen phosphate anhydrous (anhydrous sodium acid phosphate) 1.936 g, sodium bicarbonate 350 mg, potassium bicarbonate 315 mg, equivalent to phosphorus 500 mg (phosphate 16.1 mmol), sodium 468.8 mg (Na⁺ 20.4 mmol), potassium 123 mg (K⁺ 3.1 mmol); *Polyfusor NA*® contains Na⁺ 162 mmol/litre, K⁺ 19 mmol/litre, PO₄³⁻ 100 mmol/litre; non-proprietary *potassium dihydrogen phosphate injection* (potassium acid phosphate) 13.6% may contain 1 mmol/mL phosphate, 1 mmol/mL potassium.

2.5 Potassium imbalance

2.5a Hyperkalaemia

Drugs used for Hyperkalaemia not listed below Calcium gluconate p. 553

ANTIDOTES AND CHELATORS > CATION EXCHANGE RESINS

Calcium polystyrene sulfonate

INDICATIONS AND DOSE

Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients

► BY MOUTH

► Child: 0.5–1 g/kg daily in divided doses; maximum 60 g per day continued →

► BY RECTUM

- Neonate: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours.

- Child: 0.5–1 g/kg daily, irrigate colon to remove resin after 8–12 hours; maximum 30 g per day

SORBISTERIT[®] POWDER**Hyperkalaemia associated with anuria or severe oliguria, and in dialysis patients**

► BY MOUTH

- Child: 0.5–1 g/kg daily, to be given in at least 3 divided doses; maximum 60 g per day

► BY RECTUM

- Neonate: 0.5–1 g/kg daily, retained for 6 hours followed by irrigation to remove resin from colon.

- Child: 0.5–1 g/kg daily, retained for 6 hours followed by irrigation to remove resin from colon; maximum 40 g per day

- **CONTRA-INDICATIONS** Hyperparathyroidism · metastatic carcinoma · multiple myeloma · obstructive bowel disease · reduced gut motility (in neonates) · sarcoidosis

- **CAUTIONS** Impaction of resin with excessive dosage or inadequate dilution

- **INTERACTIONS** → Appendix 1 (polystyrene sulfonate resins).

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

Anorexia · constipation (discontinue treatment—avoid magnesium-containing laxatives) · diarrhoea · gastric irritation · gastro-intestinal obstruction · hypercalcaemia (including in dialysed patients and occasionally in those with renal impairment) · hypomagnesaemia · intestinal necrosis (reported with concomitant sorbitol) · ischaemic colitis · nausea · necrosis · ulceration · vomiting

SPECIFIC SIDE-EFFECTS

- With oral use Gastro-intestinal concretions
- With rectal use Faecal impaction
- **PREGNANCY** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **BREAST FEEDING** Manufacturers advise use only if potential benefit outweighs risk—no information available.
- **MONITORING REQUIREMENTS** Monitor for electrolyte disturbances (stop if plasma-potassium concentration below 5 mmol/litre).
- **DIRECTIONS FOR ADMINISTRATION**
 - With rectal use Mix each 1 g of resin with 5 mL of water or 10% glucose.

SORBISTERIT[®] POWDER *By mouth*, administer in a small amount of water or soft drink—do not give with fruit juice or squash, which have a high potassium content.

By rectum, mix each 1 g of resin with 4 mL of 5% glucose.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: enema

Powder

Sodium polystyrene sulfonate 999.34 mg per 1 gram Resonium A powder sugar-free | 454 gram P £81.11

2.5b Hypokalaemia

ELECTROLYTES AND MINERALS > POTASSIUM

Potassium bicarbonate with potassium acid tartrate

● INDICATIONS AND DOSE

Hyperchloraemic acidosis associated with potassium deficiency (as in some renal tubular and gastro-intestinal disorders)

- ▶ BY MOUTH
- ▶ Child: (consult product literature)

● **CONTRA-INDICATIONS** Hypochloraemia · plasma-potassium concentration above 5 mmol/litre

● **CAUTIONS** Cardiac disease

● **INTERACTIONS** → Appendix 1 (potassium salts).

● **SIDE-EFFECTS** Abdominal pain · diarrhoea · flatulence · nausea · vomiting

● **RENAL IMPAIRMENT** Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

● **DIRECTIONS FOR ADMINISTRATION** To be dissolved in water before administration.

● **PRESCRIBING AND DISPENSING INFORMATION** These tablets do not contain chloride.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Effervescent tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

▶ Potassium bicarbonate with potassium acid tartrate (Non-proprietary)

Potassium acid tartrate 300 mg, Potassium bicarbonate 500 mg Potassium (potassium 6.5mmol) effervescent tablets BPC 1968 | 56 tablet [CST] £77.77–£99.15 DT price = £92.02

Potassium chloride

● INDICATIONS AND DOSE

Prevention of hypokalaemia (patients with normal diet)

- ▶ BY MOUTH
- ▶ Child: 1–2 mmol/kg daily; Usual maximum 50 mmol

Electrolyte imbalance

- ▶ BY INTRAVENOUS INFUSION

▶ Neonate: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements.

▶ Child: 1–2 mmol/kg daily, dose dependent on deficit or the daily maintenance requirements

Potassium depletion

- ▶ BY MOUTH

▶ Neonate: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration.

▶ Child: 0.5–1 mmol/kg twice daily, total daily dose may alternatively be given in 3 divided doses, dose to be adjusted according to plasma-potassium concentration

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Potassium overdose can be fatal. Ready-mixed infusion solutions containing potassium should be used. Exceptionally, if potassium chloride concentrate is used for preparing an infusion, the infusion solution should

be **thoroughly mixed**. Local policies on avoiding inadvertent use of potassium chloride concentrate should be followed.

● **CONTRA-INDICATIONS** Plasma-potassium concentration above 5 mmol/litre

● CAUTIONS

- ▶ With intravenous use Seek specialist advice in very severe potassium depletion or difficult cases
- ▶ With oral use Cardiac disease · hiatus hernia (*with modified-release preparations*) · history of peptic ulcer (*with modified-release preparations*) · intestinal stricture (*with modified-release preparations*)

● **INTERACTIONS** → Appendix 1 (potassium salts).

● SIDE-EFFECTS

▶ Common or very common

▶ With oral use Abdominal pain · diarrhoea · flatulence · nausea · vomiting

▶ Frequency not known

▶ With intravenous use Heart toxicity (with rapid infusion)

▶ With oral use Bleeding (*with modified-release preparations*) · gastro-intestinal obstruction (*with modified-release preparations*) · ulceration (*with modified-release preparations*)

● **RENAL IMPAIRMENT** Smaller doses must be used in the prevention of hypokalaemia, to reduce the risk of hyperkalaemia. Avoid in severe impairment. Close monitoring required in renal impairment—high risk of hyperkalaemia.

● MONITORING REQUIREMENTS

▶ Regular monitoring of plasma-potassium concentration is essential in those taking potassium supplements.

▶ With intravenous use ECG monitoring should be performed in difficult cases.

● DIRECTIONS FOR ADMINISTRATION

▶ With oral use in neonates Potassium chloride solutions suitable for use by mouth in neonates are available from 'special order' manufacturers or specialist importing companies; they should be used with care because they are hypertonic and can damage the gastric mucosa.

▶ With oral use Potassium salts are preferably given as a liquid (or effervescent) preparation, rather than modified-release tablets; they should be given as the chloride (the use of effervescent potassium tablets BPC 1968 should be restricted to *hyperchloraemic* states).

▶ With intravenous use Potassium chloride concentrate must be diluted with **not less** than 50 times its volume of sodium chloride intravenous infusion 0.9% or other suitable diluent and **mixed well**.

▶ With intravenous use Ready-mixed infusion solutions should be used when possible. For *peripheral intravenous infusion*, the concentration of potassium should not usually exceed 40 mmol/L. Potassium infusions should be given slowly over at least 2–3 hours and at a rate not exceeding 0.2 mmol/kg/hour with specialist advice and ECG monitoring in difficult cases. Higher concentrations of potassium chloride or faster infusion rates may be given in very severe depletion, but require specialist advice.

● **PRESCRIBING AND DISPENSING INFORMATION** Kay-Cee-L[®] contains 1 mmol/mL each of K⁺ and Cl⁻. Potassium Tablets

▶ With oral use Do not confuse Effervescent Potassium Tablets BPC 1968 with effervescent potassium chloride tablets. Effervescent Potassium Tablets BPC 1968 do not contain chloride ions and their use should be restricted to hyperchloraemic states.

● PATIENT AND CARER ADVICE

Patient or carers should be given advice on how to administer potassium chloride modified-release tablets. Salt substitutes A number of salt substitutes which contain significant amounts of potassium chloride are readily available as health food products (e.g. *LoSalt*[®] and

Ruthmol®). These should not be used by patients with renal failure as potassium intoxication may result.

- **LESS SUITABLE FOR PRESCRIBING** Modified-release tablets are less suitable for prescribing. Modified-release preparations should be avoided unless effervescent tablets or liquid preparations inappropriate.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: modified-release tablet, modified-release capsule, oral solution, solution for injection, infusion, solution for infusion

Modified-release tablet

3 Metabolic disorders

Metabolic disorders

Use of medicines in metabolic disorders

Metabolic disorders should be managed under the guidance of a specialist. As many preparations are unlicensed and may be difficult to obtain, arrangements for continued prescribing and supply should be made in primary care.

General advice on the use of medicines in metabolic disorders can be obtained from:

Alder Hey Children's Hospital, Medicines Information Centre

(0151) 252 5381

and

Great Ormond Street Hospital for Children, pharmacy
(020) 7405 9200

Urea cycle disorders

Sodium benzoate p. 572 and sodium phenylbutyrate p. 573 are used in the management of urea cycle disorders. Both, either singly or in combination, are indicated as adjunctive therapy in all patients with neonatal-onset disease and in those with late-onset disease who have a history of hyperammonaemic encephalopathy. Sodium benzoate is also used in non-ketotic hyperglycaemia.

The long-term management of urea cycle disorders includes oral maintenance treatment with sodium benzoate and sodium phenylbutyrate combined with a low protein diet and other drugs such as arginine p. 571 or citrulline p. 572, depending on the specific disorder.

Emergency management

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at: www.bimdg.org.uk.

3.1 Acute porphyrias

Acute porphyrias

Overview

The acute porphyrias (acute intermittent porphyria, variegate porphyria, hereditary coproporphyria, and 5-aminolaevulinic acid dehydratase deficiency porphyria) are hereditary disorders of haem biosynthesis; they have a prevalence of about 1 in 10 000 of the population.

Great care must be taken when prescribing for patients with acute porphyria, since certain drugs can induce acute porphyric crises. Since acute porphyrias are hereditary, relatives of affected individuals should be screened and advised about the potential danger of certain drugs. Acute attacks of porphyria are exceptionally rare before puberty. When acute porphyria is suspected in a child, support from an expert porphyria service should be sought.

Treatment of serious or life-threatening conditions should not be withheld from patients with acute porphyria. When there is no safe alternative, treatment should be started and urinary porphobilinogen excretion should be measured regularly; if it increases or symptoms occur, the drug can be withdrawn and the acute attack treated. If an acute attack of porphyria occurs during pregnancy, contact an expert porphyria service for further advice.

Haem arginate p. 564 is administered by short intravenous infusion as haem replacement in moderate, severe, or unremitting acute porphyria crises.

In the United Kingdom the National Acute Porphyria Service (NAPS) provides clinical support and treatment with haem arginate from three centres (University Hospital of Wales, Addenbrooke's Hospital, and King's College Hospital). To access the service telephone (029) 2074 7747 and ask for the Acute Porphyria Service.

Drugs unsafe for use in acute porphyrias

The following list contains drugs on the UK market that have been classified as 'unsafe' in porphyria because they have been shown to be porphyrinogenic in animals or in vitro, or have been associated with acute attacks in patients. Absence of a drug from the following lists does not necessarily imply that the drug is safe. For many drugs no information about porphyria is available.

An up-to-date list of drugs considered **safe** in acute porphyrias is available at www.wmic.wales.nhs.uk/porphyria_info.php.

Further information may be obtained from: www.porphyria-europe.org and also from:

Welsh Medicines Information Centre

University Hospital of Wales

CF14 4XW

Cardiff

(029) 2074 2979/3877

Quite modest changes in chemical structure can lead to changes in porphyrinogenicity but where possible general statements have been made about groups of drugs; these should be checked first.

Unsafe Drug Groups (check first)

- Alkylating drugs (contact Welsh Medicines Information Centre for further advice)
- Anabolic steroids
- Antidepressants (includes tricyclic (and related) antidepressants and MAOIs; fluoxetine, duloxetine, venlafaxine, and trazodone thought to be safe)
- Antihistamines (alimemazine, chlorphenamine, desloratadine, fexofenadine, ketotifen, loratadine, and promethazine thought to be safe)

- Barbiturates (includes primidone and thiopental)
- Calcium channel blockers (amlodipine, felodipine, and nifedipine thought to be safe)
- Contraceptives, hormonal (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in young women who have had a previous attack. Long-acting progestogen preparations should **never** be used in those at risk of acute porphyria).
- Ergot derivatives (includes ergometrine (oxytocin probably safe) and pergolide)
- Imidazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Non-nucleoside reverse transcriptase inhibitors (contact Welsh Medicines Information Centre for further advice)
- Progestogens (progestogens are more porphyrinogenic than oestrogens; oestrogens may be safe at least in replacement doses. Progestogens should be avoided whenever possible by all women susceptible to acute porphyria; however, when non-hormonal contraception is inappropriate, progestogens may be used with extreme caution if the potential benefit outweighs risk. The risk of an acute attack is greatest in young women who have had a previous attack. Long-acting progestogen preparations should **never** be used in those at risk of acute porphyria.)
- Protease inhibitors (contact Welsh Medicines Information Centre for further advice)
- Sulfonamides (includes co-trimoxazole and sulfasalazine)
- Sulfonylureas (glipizide is thought to be safe)
- Taxanes (contact Welsh Medicines Information Centre for further advice)
- Thiazolidinediones (contact Welsh Medicines Information Centre for further advice)
- Triazole antifungals (applies to oral and intravenous use; topical antifungals are thought to be safe due to low systemic exposure)
- Fenfluramine
- Flupentixol
- Flutamide
- Fosaprepitant (contact Welsh Medicines Information Centre for further advice)
- Fosphenytoin
- Griseofulvin
- Hydralazine
- Indapamide
- Isometheptene mucate
- Isoniazid (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Ketamine
- Mefenamic acid (may be used with caution if safer alternative not available)
- Meprobamate
- Methyldopa
- Metolazone
- Metyrapone
- Mifepristone
- Minoxidil (may be used with caution if safer alternative not available)
- Mitotane
- Nalidixic acid
- Nitrazepam
- Nitrofurantoin
- Orphenadrine
- Oxcarbazepine
- Oxybutynin
- Pentazocine (buprenorphine, codeine, diamorphine, dihydrocodeine, fentanyl, methadone, morphine, oxycodone, pethidine, and tramadol are thought to be safe)
- Pentoxifylline
- Phenoxybenzamine
- Phenytoin
- Pivmecillinam
- Porfimer
- Potassium canrenoate (evidence of hazard uncertain—contact Welsh Medicines Information Centre for further advice)
- Raloxifene
- Rifabutin (safety uncertain, contact Welsh Medicines Information Centre for further advice)
- Rifampicin
- Riluzole
- Risperidone
- Selegiline
- Spironolactone
- Sulfapyrazone
- Tamoxifen
- Telithromycin
- Temoporfin
- Tiagabine
- Tibolone
- Tinidazole
- Topiramate
- Toremifene
- Trimethoprim
- Valproate
- Xipamide
- Zidovudine (contact Welsh Medicines Information Centre for further advice)
- Zuclopenthixol

Unsafe drugs (check groups above first)

- Aceclofenac
- Alcohol
- Amiodarone
- Aprepitant (contact Welsh Medicines Information Centre for further advice)
- Artemether with lumefantrine
- Bexarotene
- Bosentan
- Bromocriptine
- Buspirone
- Cabergoline
- Carbamazepine
- Chloral hydrate (although evidence of hazard is uncertain, manufacturer advises avoid)
- Chloramphenicol
- Chloroform (small amounts in medicines probably safe)
- Clindamycin
- Cocaine
- Colistimethate sodium
- Danazol
- Dapsone
- Dexfenfluramine
- Disopyramide
- Disulfiram
- Erythromycin
- Etamsylate
- Ethosuximide
- Etomidate

BLOOD AND RELATED PRODUCTS > HAEM DERIVATIVES

Haem arginate

(Human hemin)

● INDICATIONS AND DOSE

Acute porphyrias | **Acute intermittent porphyria** | **Porphyria variegata** | **Hereditary coproporphyria**

► BY INTRAVENOUS INFUSION

- Child: Initially 3 mg/kg once daily for 4 days, if response inadequate, repeat 4-day course with close biochemical monitoring; maximum 250 mg per day

● SIDE-EFFECTS

- **Common or very common** Pain at injection site · thrombophlebitis at injection site
- **Rare** Fever · hypersensitivity reactions
- **Frequency not known** Headache
- **PREGNANCY** Manufacturer advises avoid unless essential.
- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use Administer over at least 30 minutes through a filter via large antebraclial or central vein; dilute requisite dose in 100 mL Sodium Chloride 0.9% in glass bottle; administer within 1 hour after dilution; max. concentration 2.5 mg/mL.

● MEDICAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

► **Normosang** (Orphan Europe (UK) Ltd)

Haem arginate 25 mg per 1 mL Normosang 250mg/10mL solution for infusion ampoules | 4 ampoule [PoM] £1,737.00

3.2 Carnitine deficiency

AMINO ACIDS AND DERIVATIVES

Levocarnitine

(Carnitine)

● INDICATIONS AND DOSE

Primary carnitine deficiency due to inborn errors of metabolism

► BY MOUTH

- Neonate: Up to 200 mg/kg daily in 2–4 divided doses.

- Child: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day

► INITIALLY BY INTRAVENOUS INFUSION

- Neonate: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.

- Child: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour

► BY SLOW INTRAVENOUS INJECTION

- Neonate: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.

- Child: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

Secondary carnitine deficiency in haemodialysis patients

► INITIALLY BY SLOW INTRAVENOUS INJECTION

- Child: 20 mg/kg, to be administered over 2–3 minutes, after each dialysis session, dosage adjusted according to plasma-carnitine concentration, then (by mouth) maintenance 1 g daily, administered if benefit is gained from first intravenous course

Organic acidemias

► BY MOUTH

- Neonate: Up to 200 mg/kg daily in 2–4 divided doses.

- Child: Up to 200 mg/kg daily in 2–4 divided doses; maximum 3 g per day

► INITIALLY BY INTRAVENOUS INFUSION

- Neonate: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour.

- Child: Initially 100 mg/kg, to be administered over 30 minutes, followed by (by continuous intravenous infusion) 4 mg/kg/hour

► BY SLOW INTRAVENOUS INJECTION

- Neonate: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes.

- Child: Up to 100 mg/kg daily in 2–4 divided doses, to be administered over 2–3 minutes

● UNLICENSED USE

Not licensed for use in organic acidemias.

- With intravenous use Not licensed for use by intravenous infusion.
- With oral use Tablets, chewable tablets, and oral liquid (10%) not licensed in children under 12 years. Paediatric oral solution (30%) not licensed in children over 12 years.

● CAUTIONS Diabetes mellitus

- **SIDE-EFFECTS** Abdominal pain · body odour · diarrhoea · nausea · vomiting

SIDE-EFFECTS, FURTHER INFORMATION

Side-effects may be dose-related—monitor tolerance during first week and after any dose increase.

- **PREGNANCY** Appropriate to use; no evidence of teratogenicity in *animal* studies.
- **RENAL IMPAIRMENT** Accumulation of metabolites may occur with chronic oral administration in severe impairment.
- **MONITORING REQUIREMENTS**
 - Monitoring of free and acyl carnitine in blood and urine recommended.
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use For *intravenous infusion*, dilute injection with Sodium Chloride 0.9% or Glucose 5% or 10%.
- **PRESCRIBING AND DISPENSING INFORMATION**
 - When used for Organic acidemias Levocarnitine is used in the treatment of some organic acidemias; however, use in fatty acid oxidation is controversial.
- **PATIENT AND CARER ADVICE** Medicines for Children leaflet: Carnitine for metabolic disorders www.medicinesforchildren.org.uk/carnitine-metabolic-disorders-0

● MEDICAL FORMS

L-Carnitine 300 mg per 1 ml Levocarnitine 1.5g/5ml (30%) oral
solution paediatric | 20 ml [PoM] £71.40 DT price = £71.40
- ▶ **Carnitor** (Sigma-Tau Pharma Ltd)
L-Carnitine 100 mg per 1 ml Carnitor oral single dose 1g solution
sugar-free | 10 unit dose [PoM] £35.00

Solution for injection

- ▶ **Carnitor** (Sigma-Tau Pharma Ltd)
L-Carnitine 200 mg per 1 ml Carnitor 1g/5ml solution for injection
ampoules | 5 ampoule [PoM] £59.50

3.3 Fabry's disease

ENZYMES

Agalsidase alfa

- **DRUG ACTION** Agalsidase alfa, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

● INDICATIONS AND DOSE**Fabry's disease (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 7-17 years: 200 micrograms/kg every 2 weeks

- **INTERACTIONS** → Appendix 1 (agalsidase alfa and beta).

● SIDE-EFFECTS

- ▶ **Common or very common** Acne · angioedema · arthralgia · asthenia · bradycardia · chest pain · cough · dizziness · dyspnoea · eye irritation · fatigue · flushing · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypertension · hypotension · influenza-like symptoms · muscle spasms · myalgia · nasopharyngitis · neuropathic pain · oedema · palpitation · paraesthesia · pruritus · rash · rhinorrhoea · sleep disturbances · syncope · tachycardia · taste disturbances · tinnitus · tremor · urticaria
- ▶ **Uncommon** Cold extremities · ear pain · ear swelling · injection-site reactions · parosmia · skin discoloration
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution—no information available.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use Administration for *intravenous infusion*, dilute requisite dose with 100 mL Sodium Chloride 0.9% and give over 40 minutes using an in-line filter; use within 3 hours of dilution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Replagal** (Shire Pharmaceuticals Ltd)
Agalsidase alfa 1 mg per 1 ml Replagal 3.5mg/3.5ml solution for infusion vials | 1 vial [PoM] £1,068.64

Agalsidase beta

- **DRUG ACTION** Agalsidase beta, an enzyme produced by recombinant DNA technology are licensed for long-term enzyme replacement therapy in Fabry's disease (a lysosomal storage disorder caused by deficiency of alpha-galactosidase A).

● INDICATIONS AND DOSE**Fabry's disease (specialist use only)**

- ▶ BY INTRAVENOUS INFUSION
- ▶ Child 8-17 years: 1 mg/kg every 2 weeks

- **INTERACTIONS** → Appendix 1 (agalsidase alfa and beta).

● SIDE-EFFECTS

- ▶ **Common or very common** Acne · angioedema · arthralgia · asthenia · bradycardia · chest pain · cough · dizziness · dyspnoea · eye irritation · fatigue · flushing · gastro-intestinal disturbances · headache · hypersensitivity reactions · hypertension · hypotension · influenza-like symptoms · muscle spasms · myalgia · nasopharyngitis · neuropathic pain · oedema · palpitation · paraesthesia · pruritus · rash · rhinorrhoea · sleep disturbances · syncope · tachycardia · taste disturbances · tinnitus · tremor · urticaria
- ▶ **Uncommon** Cold extremities · ear pain · ear swelling · injection-site reactions · parosmia · skin discoloration
- SIDE-EFFECTS, FURTHER INFORMATION**
- ▶ Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.

- **PREGNANCY** Use with caution.

- **BREAST FEEDING** Use with caution—no information available.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*, given intermittently in Sodium chloride 0.9%, reconstitute initially with Water for Injections (5 mg in 1.1 mL, 35 mg in 7.2 mL) to produce a solution containing 5 mg/mL. Dilute with Sodium Chloride 0.9% (for doses less than 35 mg dilute with at least 50 mL; doses 35–70 mg dilute with at least 100 mL; doses 70–100 mg dilute with at least 250 mL; doses greater than 100 mg dilute with 500 mL) and give through an in-line low protein-binding 0.2 micron filter at an initial rate of no more than 15 mg/hour; for subsequent infusions, infusion rate may be increased gradually once tolerance has been established.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

- ▶ **Fabrazyme** (Genzyme Therapeutics Ltd)
Agalsidase beta 5 mg Fabrazyme 5mg powder for solution for infusion vials | 1 vial [PoM] £315.08
- Agalsidase beta 35 mg** Fabrazyme 35mg powder for solution for infusion vials | 1 vial [PoM] £2,196.59

3.4 Gaucher's disease

ENZYMES

Imiglucerase

- **DRUG ACTION** Imiglucerase is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for non-neurological manifestations of type I or type III Gaucher's disease, a familial disorder affecting principally the liver, spleen, bone marrow, and lymph nodes.

● INDICATIONS AND DOSE

Gaucher's disease type I (specialist use only)

► BY INTRAVENOUS INFUSION

- Neonate: Initially 60 units/kg every 2 weeks, adjusted according to response, doses as low as 30 units/kg once every 2 weeks may be appropriate.
- Child: Initially 60 units/kg every 2 weeks, adjusted according to response, doses as low as 30 units/kg once every 2 weeks may be appropriate

Gaucher's disease type III (specialist use only)

► BY INTRAVENOUS INFUSION

- Neonate: Initially 60–120 units/kg every 2 weeks, adjusted according to response.
- Child: Initially 60–120 units/kg every 2 weeks, adjusted according to response

● SIDE-EFFECTS

- **Common or very common** Angioedema · backache · cyanosis · flushing · hypersensitivity reactions · hypotension · paraesthesia · tachycardia · urticaria
- **Uncommon** Abdominal cramps · arthralgia · diarrhoea · dizziness · fatigue · fever · headache · injection-site reactions · nausea · vomiting

- **PREGNANCY** Manufacturer advises use with caution—limited information available.

- **BREAST FEEDING** No information available.

● MONITORING REQUIREMENTS

- Monitor for immunoglobulin G (IgG) antibodies to imiglucerase.
- When stabilised, monitor all parameters and response to treatment at intervals of 6–12 months.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use For *intravenous infusion* (Cerezyme®), give intermittently in Sodium chloride 0.9%; initially reconstitute with water for injections (200 units in 5.1 mL, 400 units in 10.2 mL) to give 40 units/mL solution; dilute requisite dose with infusion fluid to a final volume of 100–200 mL and give initial dose at a rate not exceeding 0.5 units/kg/minute, subsequent doses to be given at a rate not exceeding 1 unit/kg/minute; administer within 3 hours after reconstitution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- **Cerezyme** (Genzyme Therapeutics Ltd)

Imiglucerase 400 unit Cerezyme 400unit powder for solution for infusion vials | 1 vial [PoM] £1,071.29

Velaglucerase alfa

- **DRUG ACTION** Velaglucerase alfa is an enzyme produced by recombinant DNA technology that is administered as enzyme replacement therapy for the treatment of type I Gaucher's disease.

● INDICATIONS AND DOSE

Type I Gaucher's disease (specialist use only)

► BY INTRAVENOUS INFUSION

- Child 4–17 years: Initially 60 units/kg every 2 weeks; adjusted according to response to 15–60 units/kg every 2 weeks

- **SIDE-EFFECTS** Abdominal pain · arthralgia · back pain · bone pain · dizziness · flushing · headache · hypersensitivity reactions · hypertension · hypotension · malaise · nausea · pyrexia · rash · tachycardia · urticaria

SIDE-EFFECTS, FURTHER INFORMATION

- Infusion-related reactions Infusion-related reactions very common; manage by slowing the infusion rate, or interrupting the infusion, or minimise by pre-treatment with an antihistamine, antipyretic, or corticosteroid—consult product literature.
- **PREGNANCY** Manufacturer advises use with caution—limited information available.
- **BREAST FEEDING** Manufacturer advises use with caution—no information available.
- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration in severe infusion-related reactions or if there is a lack or loss of effect with velaglucerase alfa.
- **DIRECTIONS FOR ADMINISTRATION**
 - With intravenous use For *intravenous infusion*, reconstitute each 400-unit vial with 4.3 mL water for injections; dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over 60 minutes through a 0.22 micron filter; start infusion within 24 hours of reconstitution.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

ELECTROLYTES: May contain Sodium

- **VPRIV** (Shire Pharmaceuticals Ltd)

Velaglucerase alfa 400 unit VPRIV 400units powder for solution for infusion vials | 1 vial [PoM] £1,410.20

3.5 Homocystinuria

METHYL DONORS

Betaine

● INDICATIONS AND DOSE

Adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism (specialist use only)

► BY MOUTH

- Neonate: Initially 50 mg/kg twice daily (max. per dose 75 mg/kg), adjusted according to response; maximum 150 mg/kg per day.
- Child 1 month–9 years: Initially 50 mg/kg twice daily (max. per dose 75 mg/kg), adjusted according to response; maximum 150 mg/kg per day
- Child 10–17 years: 3 g twice daily (max. per dose 10 g), adjusted according to response; maximum 20 g per day

● SIDE-EFFECTS

► **Uncommon** Agitation · alopecia · anorexia · depression · gastro-intestinal disorders · personality disorder · reversible cerebral oedema · sleep disturbances · urinary incontinence · urticaria

● **PREGNANCY** Manufacturer advises avoid unless essential—limited information available.

● **BREAST FEEDING** Manufacturer advises caution—no information available.

● **MONITORING REQUIREMENTS** Monitor plasma-methionine concentration before and during treatment—interrupt treatment if symptoms of cerebral oedema occur.

● **DIRECTIONS FOR ADMINISTRATION** Powder should be mixed with water, juice, milk, formula, or food until completely dissolved and taken immediately; measuring spoons are provided to measure 1 g, 150 mg, and 100 mg of *Cystadane*® powder.

● **PRESCRIBING AND DISPENSING INFORMATION** Betaine should be used in conjunction with dietary restrictions and may be given with supplements of Vitamin B₁₂, pyridoxine, and folate under specialist advice.

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (July 2010) that betaine anhydrous (*Cystadane*®) is accepted for restricted use within NHS Scotland for the adjunctive treatment of homocystinuria involving deficiencies or defects in cystathionine beta-synthase, 5,10-methylene-tetrahydrofolate reductase, or cobalamin cofactor metabolism in patients who are not responsive to pyridoxine treatment.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: tablet, oral solution

Powder

► *Cystadane* (Orphan Europe (UK) Ltd)
Betaine 1 gram per 1 gram *Cystadane* oral powder | 180 gram **[PoM]** £347.00

3.6 Mitochondrial disorders

CO-ENZYMES

Ubidecarenone

(Ubiquinone; Co-enzyme Q10)

● INDICATIONS AND DOSE

Mitochondrial disorders

► BY MOUTH

► **Neonate:** Initially 5 mg 1–2 times a day, adjusted according to response, dose too be taken with food, increased if necessary up to 200 mg daily.

► **Child:** Initially 5 mg 1–2 times a day, adjusted according to response, dose to be taken with food, increased if necessary up to 300 mg daily

● **UNLICENSED USE** Not licensed.

● **CAUTIONS** May reduce insulin requirement in diabetes mellitus

● **INTERACTIONS** → Appendix 1 (ubidecarenone).

● SIDE-EFFECTS

► **Common or very common** Diarrhoea · heartburn · nausea

► **Rare** Agitation · dizziness · headache · irritability

● **HEPATIC IMPAIRMENT** Reduce dose in moderate and severe impairment.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Ubidecarenone for mitochondrial disease www.medicinesforchildren.org.uk/ubidecarenone-for-mitochondrial-disease

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution, oral drops

3.7 Mucopolysaccharidosis

ENZYMES

Galsulfase

● **DRUG ACTION** Galsulfase is a recombinant form of human N-acetylgalactosamine-4-sulfatase.

● INDICATIONS AND DOSE

Mucopolysaccharidosis VI (specialist use only)

► BY INTRAVENOUS INFUSION

► **Child 5-17 years:** 1 mg/kg once weekly

● **CAUTIONS** Acute febrile illness (consider delaying treatment) · acute respiratory illness (consider delaying treatment) · infusion-related reactions can occur · respiratory disease

- **SIDE-EFFECTS** Abdominal pain · apnoea · areflexia · chest pain · conjunctivitis · corneal opacity · dyspnoea · ear pain · facial oedema · gastroenteritis · hypertension · infusion-related reactions · malaise · nasal congestion · pharyngitis · rigors · umbilical hernia

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion*, dilute requisite dose with Sodium Chloride 0.9% to a final volume of 250 mL and mix gently; infuse through a 0.2 micron in-line filter; give approx. 2.5% of the total volume over 1 hour, then infuse remaining volume over next 3 hours; if body-weight under 20 kg and at risk of fluid overload, dilute requisite dose in 100 mL Sodium Chloride 0.9% and give over at least 4 hours.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Naglazyme** (BioMarin Europe Ltd) ▼

Galsulfase 1 mg per 1 mL Naglazyme 5mg/5mL solution for infusion vials | 1 vial [PoM] £982.00

Idursulfase

- **DRUG ACTION** Idursulfase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in mucopolysaccharidosis II (Hunter syndrome), a lysosomal storage disorder caused by deficiency of iduronate-2-sulfatase.

INDICATIONS AND DOSE

Mucopolysaccharidosis II (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Child 5–17 years: 500 micrograms/kg once weekly

- **CAUTIONS** Acute febrile respiratory illness (consider delaying treatment) · infusion-related reactions can occur · severe respiratory disease

SIDE-EFFECTS

- ▶ **Common or very common** Arrhythmia · arthralgia · bronchospasm · chest pain · cough · cyanosis · dizziness · dyspnoea · erythema · facial oedema · flushing · gastrointestinal disturbances · headache · hypertension · hypotension · hypoxia · infusion-site swelling · peripheral oedema · pruritus · pyrexia · rash · swollen tongue · tachycardia · tachypnoea · tremor · urticaria · wheezing
- ▶ **Frequency not known** Anaphylaxis · infusion-related reactions · pulmonary embolism

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **CONCEPTION AND CONTRACEPTION** Contra-indicated in women of child-bearing potential.

- **PREGNANCY** Manufacturer advises avoid.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion*, dilute requisite dose in 100 mL Sodium Chloride 0.9% and mix gently (do not shake); give over 3 hours (gradually reduced to 1 hour if no infusion-related reactions).

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ▶ **Elaprase** (Shire Pharmaceuticals Ltd) ▼

Idursulfase 2 mg per 1 mL Elaprase 6mg/3mL concentrate for solution for infusion vials | 1 vial [PoM] £1,985.00

Laronidase

- **DRUG ACTION** Laronidase is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in the treatment of non-neurological manifestations of mucopolysaccharidosis I, a lysosomal storage disorder caused by deficiency of alpha-L-iduronidase.

INDICATIONS AND DOSE

Non-neurological manifestations of mucopolysaccharidosis I (specialist use only)

- ▶ BY INTRAVENOUS INFUSION

- ▶ Child: 100 units/kg once weekly

- **CAUTIONS** Infusion-related reactions can occur

- **INTERACTIONS** → Appendix 1 (Laronidase).

SIDE-EFFECTS

- ▶ **Common or very common** Abdominal pain · alopecia · anaphylaxis · angioedema · blood pressure changes · cold extremities · cough · diarrhoea · dizziness · dyspnoea · fatigue · flushing · headache · influenza-like symptoms · infusion-site reactions · musculoskeletal pain · nausea · pain in extremities · pallor · paraesthesia · pruritus · rash · restlessness · tachycardia · urticaria · vomiting
- ▶ **Frequency not known** Bronchospasm · infusion-related reactions · respiratory arrest

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Infusion-related reactions Infusion-related reactions often occur, they can be managed by slowing the infusion rate or interrupting the infusion, and can be minimised by pre-treatment with an antihistamine and an antipyretic. Recurrent infusion-related reactions may require pre-treatment with a corticosteroid—consult product literature for details.

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **MONITORING REQUIREMENTS** Monitor immunoglobulin G (IgG) antibody concentration.

DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use For *intravenous infusion*, dilute with Sodium Chloride 0.9%; body-weight under 20 kg, dilute to 100 mL, body-weight over 20 kg dilute to 250 mL; give through in-line filter (0.22 micron) initially at a rate of 2 units/kg/hour then increase gradually every 15 minutes to max. 43 units/kg/hour.

MEDICINAL FORMS

- There can be variation in the licensing of different medicines containing the same drug.

Solution for infusion

- ELECTROLYTES: May contain Sodium

- ▶ **Aldurazyme** (Genzyme Therapeutics Ltd)

Laronidase 100 unit per 1 mL Aldurazyme 500units/5mL solution for infusion vials | 1 vial [PoM] £444.70

3.8 Nephropathic cystinosis

AMINO ACIDS AND DERIVATIVES

Mercaptamine

(Cysteamine)

● INDICATIONS AND DOSE

Nephropathic cystinosis (specialist use only)

► BY MOUTH

- Neonate: Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses.
- Child 1 month–11 years (body-weight up to 50 kg): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses
- Child 12–17 years (body-weight up to 50 kg): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 1.3 g/m² daily in 4 divided doses
- Child 12–17 years (body-weight 50 kg and above): Initially one-sixth to one-quarter of the expected maintenance dose, increased gradually over 4–6 weeks to avoid intolerance, maintenance 2 g daily in 4 divided doses

DOSE EQUIVALENCE AND CONVERSION

1.3 g/m² is approximately equivalent to 50 mg/kg.

● UNLICENSED USE

- When used by eye Mercaptamine eye drops for the management of ocular symptoms arising from the deposition of cystine crystals in the eye are not licensed.

IMPORTANT SAFETY INFORMATION

SAFE PRACTICE

Mercaptamine has been confused with mercaptopurine; care must be taken to ensure the correct drug is prescribed and dispensed.

- **CAUTIONS** Dose of phosphate supplement may need to be adjusted if transferring from phosphocysteamine to mercaptamine
- **SIDE-EFFECTS**
 - **Common or very common** Abdominal pain · anorexia · breath and body odour · diarrhoea · dyspepsia · encephalopathy · fever · gastroenteritis · headache · malaise · nausea · rash · vomiting
 - **Uncommon** Drowsiness · gastro-intestinal ulcer · hallucinations · leucopenia · nephrotic syndrome · nervousness · seizures
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of hypersensitivity to penicillamine.
- **PREGNANCY** Avoid—teratogenic and toxic in *animal* studies.
- **BREAST FEEDING** Avoid.
- **MONITORING REQUIREMENTS** Leucocyte-cystine concentration and haematological monitoring required—consult product literature.
- All patients receiving mercaptamine should be registered (contact local specialist centre for details).
- **DIRECTIONS FOR ADMINISTRATION**
 - With oral use For children under 6 years at risk of aspiration, capsules can be opened and contents sprinkled on food (at a temperature suitable for eating); avoid adding to acidic drinks (e.g. orange juice).

● PRESCRIBING AND DISPENSING INFORMATION

Mercaptamine has a very unpleasant taste and smell, which can affect compliance.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Mercaptamine eye drops for ocular symptoms of cystinosis www.medicinesforchildren.org.uk/mercaptamine-eye-drops-for-cystinosis

3.9 Niemann-pick type C disease

ENZYME INHIBITORS > GLUCOSYLCERAMIDE SYNTHASE INHIBITORS

Miglustat

- **DRUG ACTION** Miglustat is an inhibitor of glucosylceramide synthase.

● INDICATIONS AND DOSE

Treatment of progressive neurological manifestations of Niemann-Pick type C disease (under expert supervision)

► BY MOUTH

- Child 4–11 years (body surface area up to 0.48 m²): 100 mg once daily
- Child 4–11 years (body surface area 0.48–0.73 m²): 100 mg twice daily
- Child 4–11 years (body surface area 0.74–0.88 m²): 100 mg 3 times a day
- Child 4–11 years (body surface area 0.89–1.25 m²): 200 mg twice daily
- Child 4–11 years (body surface area 1.26 m² and above): 200 mg 3 times a day
- Child 12–17 years: 200 mg 3 times a day

- **SIDE-EFFECTS** Abdominal pain · amnesia · anorexia · ataxia · chills · constipation · decreased libido · depression · diarrhoea · dizziness · dyspepsia · flatulence · headache · hypoaesthesia · insomnia · malaise · muscle spasm · muscle weakness · nausea · paraesthesia · peripheral neuropathy · thrombocytopenia · tremor · vomiting · weight changes
- **CONCEPTION AND CONTRACEPTION** Effective contraception must be used during treatment. Men should avoid fathering a child during and for 3 months after treatment.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** No information available—manufacturer advises caution.

- **RENAL IMPAIRMENT** Child 12–17 years, initially 200 mg twice daily if estimated glomerular filtration rate 50–70 mL/minute/1.73 m². Child 12–17 years, initially 100 mg twice daily if estimated glomerular filtration rate 30–50 mL/minute/1.73 m². Avoid if estimated glomerular filtration less than 30 mL/minute/1.73 m².
Child under 12 years—consult product literature.

• **MONITORING REQUIREMENTS**

- ▶ Monitor cognitive and neurological function.
- ▶ Monitor growth and platelet count in Niemann-Pick type C disease.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Capsule

- ▶ **Zavesca** (Actelion Pharmaceuticals UK Ltd)
Miglustat 100 mg Zavesca 100mg capsules | 84 capsule [PoM]
£3,934.17 (Hospital only)

3.10 Pompe disease

ENZYMES

Alglucosidase alfa

- **DRUG ACTION** Alglucosidase alfa is an enzyme produced by recombinant DNA technology licensed for long-term replacement therapy in Pompe disease, a lysosomal storage disorder caused by deficiency of acid alpha-glucosidase.

• **INDICATIONS AND DOSE**

Pompe disease (specialist use only)

▶ **BY INTRAVENOUS INFUSION**

- ▶ Neonate: 20 mg/kg every 2 weeks.
- ▶ Child: 20 mg/kg every 2 weeks

- **CAUTIONS** Cardiac dysfunction · infusion-related reactions—consult product literature · respiratory dysfunction

• **SIDE-EFFECTS**

- ▶ **Common or very common** Agitation · anaphylaxis · antibody formation · blood pressure changes · bronchospasm · chest discomfort · cold extremities · cough · cyanosis · diarrhoea · dizziness · facial oedema · fatigue · flushing · headache · hypersensitivity reactions · injection-site reactions · irritability · muscle spasm · myalgia · nausea · paraesthesia · pruritus · pyrexia · rash · restlessness · sweating · tachycardia · tachypnoea · tremor · urticaria · vomiting
- ▶ **Frequency not known** Infusion-related reactions · necrotising skin lesions · severe skin reactions · ulcerative skin lesions

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Infusion-related reactions Infusion-related reactions very common, calling for use of antihistamine, antipyretic, or corticosteroid; consult product literature for details.
- **PREGNANCY** Toxicity in *animal* studies, but treatment should not be withheld.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

• **MONITORING REQUIREMENTS**

- ▶ Monitor closely if cardiac dysfunction.
- ▶ Monitor closely if respiratory dysfunction.
- ▶ Monitor immunoglobulin G (IgG) antibody concentration.

• **DIRECTIONS FOR ADMINISTRATION**

- ▶ With intravenous use For *intravenous infusion*, reconstitute 50 mg with 10.3 mL water for injections to produce 5 mg/mL solution; gently rotate vial without shaking; dilute requisite dose with Sodium Chloride 0.9% to give a

final concentration of 0.5–4 mg/mL; give through a low protein-binding in-line filter (0.2 micron) at an initial rate of 1 mg/kg/hour increased by 2 mg/kg/hour every 30 minutes to max. 7 mg/kg/hour.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Powder for solution for infusion

▶ **Myozyme** (Genzyme Therapeutics Ltd)

Alglucosidase alfa 50 mg Myozyme 50mg powder for concentrate for solution for infusion vials | 1 vial [PoM] £356.06 (Hospital only)

3.11 Tyrosinaemia type I

ENZYMES INHIBITORS > 4-

HYDROXYPHENYLPYRUVATE DIOXYGENASE INHIBITORS

Nitisinone

(NTBC)

• **INDICATIONS AND DOSE**

Hereditary tyrosinaemia type I (in combination with dietary restriction of tyrosine and phenylalanine) (specialist use only)

▶ **BY MOUTH**

- ▶ Neonate: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day.
- ▶ Child: Initially 500 micrograms/kg twice daily, adjusted according to response; maximum 2 mg/kg per day

• **SIDE-EFFECTS**

- ▶ **Common or very common** Conjunctivitis · corneal opacity · eye pain · granulocytopenia · keratitis · leucopenia · photophobia · thrombocytopenia
- ▶ **Uncommon** Blepharitis · erythematous rash · exfoliative dermatitis · leucocytosis · pruritus
- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—adverse effects in *animal* studies.
- **PRE-TREATMENT SCREENING** Slit-lamp examination of eyes recommended before treatment.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor liver function regularly.
 - ▶ Monitor platelet and white blood cell count every 6 months.
- **DIRECTIONS FOR ADMINISTRATION** Capsules can be opened and the contents suspended in a small amount of water or formula diet and taken immediately.

• **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Capsule

3.12 Urea cycle disorders

AMINO ACIDS AND DERIVATIVES

Arginine

● INDICATIONS AND DOSE

Acute hyperammonaemia in carbamylphosphate synthetase deficiency (specialist use only) | Acute hyperammonaemia in ornithine transcarbamylase deficiency (specialist use only)

► BY INTRAVENOUS INFUSION

- Neonate: 6 mg/kg/hour.
- Child (body-weight up to 40 kg): 6 mg/kg/hour
- Child (body-weight 40 kg and above): 4 mg/kg/hour

Maintenance treatment of hyperammonaemia in carbamylphosphate synthetase deficiency (specialist use only) | Maintenance treatment of hyperammonaemia in ornithine transcarbamylase deficiency (specialist use only)

► BY MOUTH

- Neonate: 100–200 mg/kg daily in 3–4 divided doses, dose to be taken with feeds.
- Child (body-weight up to 20 kg): 100–200 mg/kg daily in 3–4 divided doses, dose to be given with feeds or meals
- Child (body-weight 20 kg and above): 2.5–6 g/m² daily in 3–4 divided doses, dose to be taken with meals; maximum 6 g per day

Acute hyperammonaemia in citrullinaemia (specialist use only) | Acute hyperammonaemia in arginosuccinic aciduria (specialist use only)

► BY INTRAVENOUS INFUSION

- Neonate: Initially 300 mg/kg, to be administered over 90 minutes, followed by 12.5 mg/kg/hour, to be administered over 24 hours (maximum 25 mg/kg/hour thereafter).
- Child (body-weight up to 40 kg): Initially 300 mg/kg, to be administered over 90 minutes, followed by 12.5 mg/kg/hour, to be administered over 24 hours (maximum 25 mg/kg/hour thereafter)
- Child (body-weight 40 kg and above): 21 mg/kg/hour

Maintenance treatment of hyperammonaemia in citrullinaemia (specialist use only) | Maintenance treatment of hyperammonaemia in arginosuccinic aciduria (specialist use only)

► BY MOUTH

- Neonate: 100–300 mg/kg daily in 3–4 divided doses, dose to be taken with feeds.
- Child (body-weight up to 20 kg): 100–300 mg/kg daily in 3–4 divided doses, dose to be taken with feed or meals
- Child (body-weight 20 kg and above): 2.5–6 g/m² daily in 3–4 divided doses, doses to be taken with meals; maximum 6 g per day

● UNLICENSED USE

- With intravenous use Injection not licensed in children.
- With oral use Tablets not licensed in children. Powder licensed for urea cycle disorders in children.

● **CONTRA-INDICATIONS** Not to be used in the treatment of arginase deficiency

● SIDE-EFFECTS

- With intravenous use Flushing · headache · hyperchloraemic metabolic acidosis · hypotension · irritation at injection-site · nausea · numbness · vomiting

● **PREGNANCY** No information available.

● **BREAST FEEDING** No information available.

● **MONITORING REQUIREMENTS** Monitor plasma pH and chloride.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use For intravenous infusion, dilute to a max. concentration of 50 mg/mL with glucose 10%.

● PRESCRIBING AND DISPENSING INFORMATION

- With oral use Powder to be prescribed as a borderline substance (ACBS). For use as a supplement in urea cycle disorders other than arginase deficiency, such as hyperammonaemia types I and II, citrullinaemia, arginosuccinic aciduria, and deficiency of N-acetyl glutamate synthetase.

● INDICATIONS AND DOSE

Hyperammonaemia due to N-acetylglutamate synthase deficiency (under expert supervision)

► BY MOUTH

- Neonate: Initially 50–125 mg/kg twice daily, to be taken immediately before feeds, dose adjusted according to plasma-ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses.

- Child: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma-ammonia concentration; maintenance 5–50 mg/kg twice daily, the total daily dose may alternatively be given in 3–4 divided doses

Hyperammonaemia due to organic acidaemia (under expert supervision)

► BY MOUTH

- Neonate: Initially 50–125 mg/kg twice daily, to be taken immediately before feeds, dose adjusted according to plasma-ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses.

- Child: Initially 50–125 mg/kg twice daily, to be taken immediately before food, dose adjusted according to plasma-ammonia concentration, the total daily dose may alternatively be given in 3–4 divided doses

IMPORTANT SAFETY INFORMATION

EMERGENCY MANAGEMENT OF UREA CYCLE DISORDERS

For further information on the emergency management of urea cycle disorders consult the British Inherited Metabolic Disease Group (BIMDG) website at www.bimdg.org.uk.

- **SIDE-EFFECTS**
 - ▶ **Common or very common** Sweating
 - ▶ **Uncommon** Bradycardia · diarrhoea · pyrexia · vomiting
- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.
- **BREAST FEEDING** Manufacturer advises avoid—present in milk in *animal* studies.
- **DIRECTIONS FOR ADMINISTRATION** Dispersible tablets must be dispersed in at least 5–10 mL of water and taken orally immediately, or administered via a nasogastric tube.

3.13 Wilson's disease

ANTIDOTES AND CHELATORS > COPPER

ABSORPTION INHIBITORS

Zinc acetate

- **DRUG ACTION** Zinc prevents the absorption of copper in Wilson's disease.

● **INDICATIONS AND DOSE****Wilson's disease (initiated under specialist supervision)**

▶ BY MOUTH

- ▶ Child 1–5 years: 25 mg twice daily
- ▶ Child 6–15 years (body-weight up to 57 kg): 25 mg 3 times a day
- ▶ Child 6–15 years (body-weight 57 kg and above): 50 mg 3 times a day
- ▶ Child 16–17 years: 50 mg 3 times a day

DOSE EQUIVALENCE AND CONVERSION

Doses expressed as elemental zinc.

PHARMACOKINETICS

Symptomatic Wilson's disease patients should be treated initially with a chelating agent because zinc has a slow onset of action. When transferring from chelating treatment to zinc maintenance therapy, chelating treatment should be co-administered for 2–3 weeks until zinc produces its maximal effect.

- **CAUTIONS** Portal hypertension (risk of hepatic decompensation when switching from chelating agent)

- **INTERACTIONS** → Appendix 1 (zinc).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Gastric irritation (usually transient)
- ▶ **Uncommon** Leucopenia · sideroblastic anaemia

SIDE-EFFECTS, FURTHER INFORMATION

Transient gastric irritation may be reduced if first dose is taken mid-morning or with a little protein.

- **PREGNANCY** Usual dose 25 mg 3 times daily adjusted according to plasma-copper concentration and urinary copper excretion.

- **BREAST FEEDING** Manufacturer advises avoid; present in milk—may cause zinc-induced copper deficiency in infant.

- **MONITORING REQUIREMENTS** Monitor full blood count and serum cholesterol.
- **DIRECTIONS FOR ADMINISTRATION** Capsules may be opened and the contents mixed with water.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

CAUTIONARY AND ADVISORY LABELS 23

Zinc (as Zinc acetate) 25 mg Wilzin 25mg capsules | 250 capsule [PoM] £132.00

Zinc (as Zinc acetate) 50 mg Wilzin 50mg capsules | 250 capsule [PoM] £242.00

ANTIDOTES AND CHELATORS > COPPER CHELATORS

Penicillamine

- **DRUG ACTION** Penicillamine aids the elimination of copper ions in Wilson's disease (hepatolenticular degeneration).

INDICATIONS AND DOSE

Wilson's disease

► BY MOUTH

- Child 1 month–11 years: 20 mg/kg daily in 2–3 divided doses, to be taken 1 hour before food; maximum 2 g per day
- Child 12–17 years: Initially 20 mg/kg daily in 2–3 divided doses, maintenance 0.75–1 g daily, to be taken 1 hour before food; maximum 2 g per day

Cystinuria

► BY MOUTH

- Child: 20–30 mg/kg daily in 2–3 divided doses, lower doses may be used initially and increased gradually, doses to be adjusted to maintain 24-hour urinary cystine below 1 mmol/litre, maintain adequate fluid intake, to be taken 1 hour before food; maximum 3 g per day

- **CONTRA-INDICATIONS** Lupus erythematosus
- **CAUTIONS** Neurological involvement in Wilson's disease
- **INTERACTIONS** → Appendix 1 (penicillamine). Caution with concomitant nephrotoxic drugs (increased risk of toxicity).
- **SIDE-EFFECTS**
 - **Common or very common** Anorexia · fever · nausea · proteinuria · rash · thrombocytopenia
 - **Rare** Alopecia · breast enlargement (male and female) · elastosis perforans · haematuria (withdraw immediately if cause unknown) · mouth ulceration · pseudoxanthoma elasticum · skin laxity · stomatitis
 - **Frequency not known** Agranulocytosis · aplastic anaemia · blood disorders · bronchiolitis · cholestatic jaundice · dermatomyositis · glomerulonephritis · Goodpasture's syndrome · haemolytic anaemia · haemolytic leucopenia · late rashes (consider dose reduction) · lupus erythematosus · myasthenia gravis · nephrotic syndrome · neuropathy (especially if neurological involvement in Wilson's disease—prophylactic pyridoxine recommended) · neutropenia · pancreatitis · pemphigus · pneumonitis · polymyositis · pulmonary haemorrhage · rheumatoid arthritis · Stevens-Johnson syndrome · taste loss (mineral supplements not recommended) · urticaria · vomiting
- **ALLERGY AND CROSS-SENSITIVITY** Patients who are hypersensitive to penicillin may react rarely to penicillamine.
- **PREGNANCY** Fetal abnormalities reported rarely; avoid if possible.

- **BREAST FEEDING** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **RENAL IMPAIRMENT** Reduce dose and monitor renal function or avoid (consult product literature).
- **MONITORING REQUIREMENTS**
 - Consider withdrawal if platelet count falls below 120 000/mm³ or white blood cells below 2500/mm³ or if 3 successive falls within reference range (can restart at reduced dose when counts return to within reference range but permanent withdrawal necessary if recurrence of leucopenia or thrombocytopenia).
 - Monitor urine for proteinuria.
 - Monitor blood and platelet count regularly.
- **PATIENT AND CARER ADVICE** Counselling on the symptoms of blood disorders is advised. Warn patient and carers to tell doctor immediately if sore throat, fever, infection, non-specific illness, unexplained bleeding and bruising, purpura, mouth ulcers, or rashes develop.

4 Mineral and trace elements deficiencies

4.1 Zinc deficiency

Zinc deficiency

Zinc supplements should not be given unless there is good evidence of deficiency (hypoproteinaemia spuriously lowers plasma-zinc concentration) or in zinc-losing conditions. Zinc deficiency can occur as a result of inadequate diet or malabsorption; excessive loss of zinc can occur in trauma, burns, and protein-losing conditions. A zinc supplement is given until clinical improvement occurs, but it may need to be continued in severe malabsorption, metabolic disease, or in zinc-losing states.

Zinc is used in the treatment of Wilson's disease and acrodermatitis enteropathica, a rare inherited abnormality of zinc absorption.

Parenteral nutrition regimens usually include trace amounts of zinc, see also Intravenous nutrition below. If necessary, further zinc can be added to intravenous feeding regimens.

ELECTROLYTES AND MINERALS > ZINC

Zinc sulfate

● INDICATIONS AND DOSE

Zinc deficiency or supplementation in zinc-losing conditions

► BY MOUTH USING EFFERVESCENT TABLETS

- Neonate: 1 mg/kg daily, dose expressed as elemental zinc, to be dissolved in water and taken after food.
- Child (body-weight up to 10 kg): 22.5 mg daily, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- Child (body-weight 10–30 kg): 22.5 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc
- Child (body-weight 30 kg and above): 45 mg 1–3 times a day, dose to be adjusted as necessary, to be dissolved in water and taken after food, dose expressed as elemental zinc

Acrodermatitis enteropathica

► BY MOUTH USING EFFERVESCENT TABLETS

- Neonate: 0.5–1 mg/kg twice daily, dose to be adjusted as necessary, total daily dose may alternatively be given in 3 divided doses, dose expressed as elemental zinc.
- Child: 0.5–1 mg/kg twice daily, dose to be adjusted as necessary, total daily dose may alternatively be given in 3 divided doses, dose expressed as elemental zinc

- **UNLICENSED USE** *Solvazinc*® is not licensed for use in acrodermatitis enteropathica.
- **INTERACTIONS** → Appendix 1 (zinc).
- **SIDE-EFFECTS** Abdominal pain · diarrhoea · dyspepsia · gastric irritation · gastritis · headache · irritability · lethargy · nausea · vomiting
- **PREGNANCY** Crosses placenta; risk theoretically minimal, but no information available.
- **BREAST FEEDING** Present in milk; risk theoretically minimal, but no information available.
- **RENAL IMPAIRMENT** Accumulation may occur in acute renal failure.

- **PRESCRIBING AND DISPENSING INFORMATION** Each *Solvazinc*® tablet contains zinc sulfate monohydrate 125 mg (45 mg zinc).

5 Nutrition (intravenous)

Intravenous nutrition

Overview

When adequate feeding through the alimentary tract is not possible, nutrients may be given by intravenous infusion.

This may be in addition to oral or enteral tube feeding—**supplemental parenteral nutrition**, or may be the sole source of nutrition—**total parenteral nutrition (TPN)**. Complete enteral starvation is undesirable and total parenteral nutrition is a last resort.

Indications for parenteral nutrition include prematurity; severe or prolonged disorders of the gastro-intestinal tract; preparation of undernourished patients for surgery, chemotherapy, or radiation therapy; major surgery, trauma, or burns; prolonged coma or inability to eat; and some patients with renal or hepatic failure. The composition of proprietary preparations used in children is given under Proprietary Infusion Fluids for Parenteral Feeding p. 576.

Parenteral nutrition requires the use of a solution containing amino acids, glucose, lipids, electrolytes, trace elements, and vitamins. This is now commonly provided by the pharmacy in the form of an amino-acid, glucose, electrolyte bag, and a separate lipid infusion or, in older children a single 'all-in-one' bag. If the patient is able to take small amounts by mouth, vitamins may be given orally.

The nutrition solution is infused through a central venous catheter inserted under full surgical precautions.

Alternatively, infusion through a peripheral vein may be used for supplementary as well as total parenteral nutrition, depending on the availability of peripheral veins; factors prolonging cannula life and preventing thrombophlebitis include the use of soft polyurethane paediatric cannulas and use of nutritional solutions of low osmolality and neutral pH. Nutritional fluids should be given by a dedicated intravenous line; if not possible, compatibility with any drugs or fluids should be checked as precipitation of components may occur. Extravasation of parenteral nutrition solution can cause severe tissue damage and injury; the infusion site should be regularly monitored.

Before starting intravenous nutrition the patient should be clinically stable and renal function and acid-base status should be assessed. Appropriate biochemical tests should have been carried out beforehand and serious deficits corrected. Nutritional and electrolyte status must be monitored throughout treatment. The nutritional components of parenteral nutrition regimens are usually increased gradually over a number of days to prevent metabolic complications and to allow metabolic adaptation to the infused nutrients. The solutions are usually infused over 24 hours but this may be gradually reduced if long-term nutrition is required. Home parenteral nutrition is usually infused over 12 hours overnight.

Proprietary Infusion Fluids for Parenteral Feeding								
Preparation	Nitrogen g/litre	^{1,2} Energy kJ/litre	Electrolytes					Other components/litre
			K ⁺	Mg ²⁺	Na ⁺	Acet ⁻	Cl ⁻

2 Excludes protein- or amino acid-derived energy

Complications of long-term parenteral nutrition include gall bladder sludging, gall stones, cholestasis and abnormal liver function tests. For details of the prevention and management of parenteral nutrition complications, specialist literature should be consulted.

Protein (nitrogen) is given as mixtures of essential and non-essential synthetic L-amino acids. Ideally, all essential amino acids should be included with a wide variety of non-essential ones to provide sufficient nitrogen together with electrolytes. Solutions vary in their composition of amino acids; they often contain an energy source (usually glucose) and electrolytes. Solutions for use in neonates and children under 1 year of age are based on the amino acid profile of umbilical cord blood (*Primene*®) or breast milk (*Vaminolact*®) and contain amino acids that are essential in this age group; these amino acids may not be present in sufficient quantities in preparations designed for older children and adults.

Energy requirements must be met if amino acids are to be utilised for tissue maintenance. An appropriate energy to protein ratio is essential and requirements will vary depending on the child's age and condition. A mixture of

carbohydrate and fat energy sources (usually 30–50% as fat) gives better utilisation of amino acids than glucose alone.

Glucose p. 549 is the preferred source of carbohydrate, but frequent monitoring of blood glucose is required particularly during initiation and build-up of the regimen; insulin may be necessary. Glucose above a concentration of 12.5% must be infused through a central venous catheter to avoid thrombosis; the maximum concentration of glucose that should normally be infused in fluid restricted children is 20–25%.

In parenteral nutrition regimens, it is necessary to provide adequate **phosphate** in order to allow phosphorylation of glucose and to prevent hypophosphataemia. Neonates, particularly preterm neonates, and young children also require phosphorus and calcium to ensure adequate bone mineralisation. The compatibility and solubility of calcium and phosphorus salts is complex and unpredictable; precipitation is a risk and specialist pharmacy advice should be sought.

Fat (lipid) emulsions have the advantages of a high energy to fluid volume ratio, neutral pH, and iso-osmolality with

plasma, and provide essential fatty acids. Several days of adaptation may be required to attain maximal utilisation. Reactions include occasional febrile episodes (usually only with 20% emulsions) and rare anaphylactic responses. Interference with biochemical measurements such as those for blood gases and calcium may occur if samples are taken before fat has been cleared. Regular monitoring of plasma cholesterol and triglyceride is necessary to ensure clearance from the plasma, particularly in conditions where fat metabolism may be disturbed e.g. infection. Emulsions containing 20% or 30% fat should be used in neonates as they are cleared more efficiently. **Additives should not be mixed with fat emulsions unless compatibility is known.**

Electrolytes are usually provided as the chloride salts of potassium and sodium. Acetate salts can be used to reduce the amount of chloride infused; hyperchloraemic acidosis or hypochloraemic alkalosis can occur in preterm neonates or children with renal impairment.

Administration

Because of the complex requirements relating to parenteral nutrition full details relating to administration have been omitted. In all cases *specialist pharmacy advice, product literature and other specialist literature should be consulted.*

NUTRIENTS > PARENTERAL NUTRITION

Parenteral nutrition supplements

● INDICATIONS AND DOSE

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES

Amino acid supplement for hypercatabolic or hypermetabolic states

► BY INTRAVENOUS INFUSION

- Child: 300–400 mg/kg daily, dose not to exceed 20% of total amino acid intake

● CAUTIONS

PEDITRACE SOLUTION FOR INFUSION 10ML VIALS Reduced biliary excretion · reduced biliary excretion in cholestatic liver disease · reduced biliary excretion in markedly reduced urinary excretion (careful biochemical monitoring required) · total parenteral nutrition exceeding one month

CAUTIONS, FURTHER INFORMATION

- Total parenteral nutrition exceeding one month Measure serum manganese concentration and check liver function before commencing treatment and regularly during treatment—discontinue if manganese concentration raised or if cholestasis develops.

- **DIRECTIONS FOR ADMINISTRATION** Because of the complex requirements relating to parenteral nutrition, full details relating to administration have been omitted. In all cases *specialist pharmacy advice, product literature, and other specialist literature should be consulted.* Compatibility with the infusion solution must be ascertained before adding supplementary preparations. **Additives should not be mixed with fat emulsions unless compatibility is known.**

CERNEVIT SOLUTION FOR INJECTION VIALS AND DILUENT

Dissolve in 5 mL water for injections.

PEDITRACE SOLUTION FOR INFUSION 10ML VIALS For addition to *Vaminolact*[®], *Vamin*[®] 14 Electrolyte-Free solutions, and glucose intravenous infusions.

DECAN CONCENTRATE FOR SOLUTION FOR INFUSION 40ML BOTTLES For addition to infusion solutions.

ADDIPHOS[®] VIALS For addition to *Vamin*[®] solutions and glucose intravenous infusions.

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES For addition to infusion solutions containing amino acids.

ADDITRACE SOLUTION FOR INFUSION 10ML AMPOULES For addition to *Vamin*[®] solutions and glucose intravenous infusions.

GLYCOPHOS[®] VIALS For addition to *Vamin*[®] and *Vaminolact*[®] solutions, and glucose intravenous infusions.

SOLIVITO N POWDER FOR SOLUTION FOR INFUSION

VIALS Dissolve in water for injections or glucose intravenous infusion for adding to glucose intravenous infusion or *Intralipid*[®]; dissolve in *Vitlipid N*[®] or *Intralipid*[®] for adding to *Intralipid*[®] only.

VITLIPID N INFANT EMULSION FOR INJECTION 10ML AMPOULES For addition to *Intralipid*[®].

VITLIPID N ADULT EMULSION FOR INJECTION 10ML AMPOULES For addition to *Intralipid*[®].

● PRESCRIBING AND DISPENSING INFORMATION

CERNEVIT SOLUTION FOR INJECTION VIALS AND DILUENT

Cernevit[®] solution contains *dl*-alpha tocopherol 11.2 units, ascorbic acid 125 mg, biotin 69 micrograms, colexicaliferol 220 units, cyanocobalamin 6 micrograms, folic acid 414 micrograms, glycine 250 mg, nicotinamide 46 mg, pantothenic acid (as dexpantenol) 17.25 mg, pyridoxine hydrochloride 5.5 mg, retinol (as palmitate) 3500 units, riboflavin (as dihydrated sodium phosphate) 4.14 mg, thiamine (as cocarboxylase tetrahydrate) 3.51 mg.

PEDITRACE SOLUTION FOR INFUSION 10ML VIALS For use in neonates (when kidney function established, usually second day of life), infants, and children.

Peditrace[®] solution contains traces of Zn²⁺, Cu²⁺, Mn²⁺, Se⁴⁺, F⁻, I⁻.

DECAN CONCENTRATE FOR SOLUTION FOR INFUSION 40ML BOTTLES For patients over 40 kg.

Decan[®] solution contains trace elements Fe²⁺, Zn²⁺, Cu²⁺, Mn²⁺, F⁻, Co²⁺, I⁻, Se⁴⁺, Mo⁶⁺, Cr³⁺.

ADDIPHOS[®] VIALS *Addiphos*[®] sterile solution contains phosphate 40 mmol, K⁺ 30 mmol, Na⁺ 30 mmol/20 mL.

DIPEPTIVEN 20G/100ML CONCENTRATE FOR SOLUTION FOR INFUSION BOTTLES *Dipeptiven*[®] solution contains N(2)-L-alanyl-L-glutamine 200 mg/mL (providing L-alanine 82 mg, L-glutamine 134.6 mg).

ADDITRACE SOLUTION FOR INFUSION 10ML AMPOULES For patients over 40 kg. *Additrace*[®] solution contains traces of Fe³⁺, Zn²⁺, Mn²⁺, Cu²⁺, Cr³⁺, Se⁴⁺, Mo⁶⁺, F⁻, I⁻.

GLYCOPHOS[®] VIALS *Glycophos*[®] Sterile Concentrate solution contains phosphate 20 mmol, Na⁺ 40 mmol/20 mL.

SOLIVITO N POWDER FOR SOLUTION FOR INFUSION

VIALS *Solivito N*[®] powder for reconstitution contains biotin 60 micrograms, cyanocobalamin 5 micrograms, folic acid 400 micrograms, glycine 300 mg, nicotinamide 40 mg, pyridoxine hydrochloride 4.9 mg, riboflavin sodium phosphate 4.9 mg, sodium ascorbate 113 mg, sodium pantothenate 16.5 mg, thiamine mononitrate 3.1 mg.

VITLIPID N INFANT EMULSION FOR INJECTION 10ML

AMPOULES *Vitlipid N*[®] infant emulsion contains vitamin A 230 units, ergocalciferol 40 units, *dl*-alpha tocopherol 0.7 unit, phytomenadione 20 micrograms/mL.

VITLIPID N ADULT EMULSION FOR INJECTION 10ML

AMPOULES *Vitlipid N*[®] adult emulsion contains vitamin A 330 units, ergocalciferol 20 units, *dl*-alpha tocopherol 1 unit, phytomenadione 15 micrograms/mL. For children over 11 years.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: solution for infusion

Solution for injection

- **Cernevit** (Baxter Healthcare Ltd)
Alpha tocopherol 11.2 unit, Cyanocobalamin 6 microgram, Biotin 69 microgram, Folic acid 414 microgram, Thiamine 3.51 mg, Riboflavin (as Riboflavin sodium phosphate) 4.14 mg, Pyridoxine (as Pyridoxine hydrochloride) 4.53 mg, Ascorbic acid 125 mg, Colecalciferol 220 unit, Pantothenic acid (as Dexpantenol) 17.25 mg, Nicotinamide 46 mg, Retinol 3500 unit Cernevit solution for injection vials and diluent | 10 vial [PoM] no price available

Emulsion for injection

- **Vitlipid N Adult** (Fresenius Kabi Ltd)
Alpha tocopherol 910 microgram per 1 ml, Ergocalciferol 500 nanogram per 1 ml, Phytomenadione 15 microgram per 1 ml, Retinol palmitate 99 microgram per 1 ml Vitlipid N Adult emulsion for injection 10ml ampoules | 1 ampoule [PoM] £1.97 | 10 ampoule [PoM] no price available
- **Vitlipid N Infant** (Fresenius Kabi Ltd)
Ergocalciferol 1 microgram per 1 ml, Phytomenadione 20 microgram per 1 ml, Retinol palmitate 69 microgram per 1 ml, Alpha tocopherol 640 microgram per 1 ml Vitlipid N Infant emulsion for injection 10ml ampoules | 1 ampoule [PoM] £1.97 | 10 ampoule [PoM] no price available

Solution for infusion

- **Parenteral nutrition supplements (Non-proprietary)**
Sodium glycerophosphate 216 mg per 1 ml Sodium glycerophosphate 4.32g/20ml concentrate for solution for infusion vials | 1 vial [PoM] £4.83 | 10 vial [PoM] no price available
- **Additrac** (Fresenius Kabi Ltd)
Sodium molybdate 4.85 microgram per 1 ml, Chromic chloride 5.33 microgram per 1 ml, Sodium selenite 10.5 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Manganese chloride 99 microgram per 1 ml, Sodium fluoride 210 microgram per 1 ml, Copper chloride 340 microgram per 1 ml, Ferric chloride 544 microgram per 1 ml, Zinc chloride 1.36 mg per 1 ml Additrac solution for infusion 10ml ampoules | 1 ampoule [PoM] £1.96 | 20 ampoule [PoM] no price available
- **N2(Dipectiven)** (Fresenius Kabi Ltd)
N(2)-L-alanyl-L-glutamine 200 mg per 1 ml Dipectiven 20g/100ml concentrate for solution for infusion bottles | 1 bottle [PoM] £25.93 | 10 bottle [PoM] no price available
Dipectiven 10g/50ml concentrate for solution for infusion bottles | 1 bottle [PoM] £13.94 | 10 bottle [PoM] no price available
- **Peditrace** (Fresenius Kabi Ltd)
Manganese (as Manganese chloride) 1 microgram per 1 ml, Iodine (as Potassium iodide) 1 microgram per 1 ml, Selenium (as Sodium selenite) 2 microgram per 1 ml, Copper (as Copper chloride) 20 microgram per 1 ml, Fluoride (as Sodium fluoride) 57 microgram per 1 ml, Zinc (as Zinc chloride) 250 microgram per 1 ml Peditrace solution for infusion 10ml vials | 1 vial [PoM] £3.55 | 10 vial [PoM] no price available
- **Tracutit** (B.Braun Medical Ltd)
Sodium molybdate dihydrate 2.42 microgram per 1 ml, Chromic chloride 5.3 microgram per 1 ml, Sodium selenite pentahydrate 7.89 microgram per 1 ml, Potassium iodide 16.6 microgram per 1 ml, Sodium fluoride 126 microgram per 1 ml, Manganese chloride 197.9 microgram per 1 ml, Copper chloride 204.6 microgram per 1 ml, Zinc chloride 681.5 microgram per 1 ml, Ferrous chloride 695.8 microgram per 1 ml Tracutit concentrate for solution for infusion 10ml ampoules | 5 ampoule [PoM] £7.96

Powder for solution for infusion

- **Solivitro N** (Fresenius Kabi Ltd)
Cyanocobalamin 5 microgram, Biotin 60 microgram, Folic acid 400 microgram, Thiamine nitrate 3.1 mg, Pyridoxine hydrochloride 4.9 mg, Riboflavin sodium phosphate 4.9 mg, Sodium pantothenate 16.5 mg, Nicotinamide 40 mg, Sodium ascorbate 113 mg Solivitro N powder for solution for infusion vials | 1 vial [PoM] £1.97 | 10 vial [PoM] no price available

6 Nutrition (oral)

Enteral nutrition

Overview

Children have higher nutrient requirements per kg bodyweight, different metabolic rates, and physiological responses compared to adults. They have low nutritional stores and are particularly vulnerable to growth and nutritional problems during critical periods of development. Major illness, operations, or trauma impose increased metabolic demands and can rapidly exhaust nutritional reserves.

Every effort should be made to optimise oral food intake before beginning enteral tube feeding; this may include change of posture, special seating, feeding equipment, oral desensitisation, food texture changes, thickening of liquids, increasing energy density of food, treatment of reflux or oesophagitis, as well as using age-specific nutritional supplements.

Enteral tube feeding has a role in both short-term rehabilitation and long-term nutritional management in paediatrics. It can be used as supportive therapy, in which the enteral feed supplies a proportion of the required nutrients, or as primary therapy, in which the enteral feed delivers all the necessary nutrients. Most children receiving tube feeds should also be encouraged to take oral food and drink. Tube feeding should be considered in the following situations:

- unsafe swallowing and risk of aspiration
- inability to consume at least 60% of energy needs by mouth
- total feeding time of more than 4 hours per day
- weight loss or no weight gain for a period of 3 months (less for younger children and infants)
- weight for height (or length) less than 2nd percentile for age and sex

Most feeds for enteral use contain protein derived from cows' milk or soya. Elemental feeds containing protein hydrolysates or free amino acids can be used for children who have diminished ability to break down protein, for example in inflammatory bowel disease or pancreatic insufficiency.

Even when nutritionally complete feeds are given, water and electrolyte balance should be monitored. Haematological and biochemical parameters should also be monitored, particularly in the clinically unstable child. Extra minerals (e.g. magnesium and zinc) may be needed in patients where gastro-intestinal secretions are being lost. Additional vitamins may also be needed..

Choosing the best formula for children depends on several factors including: nutritional requirements, gastro-intestinal function, underlying disease, nutrient restrictions, age, and feed characteristics (nutritional composition, viscosity, osmolality, availability and cost). Children have specific dietary requirements and in many situations liquid feeds prepared for adults are totally unsuitable and should not be given. Expert advice from a dietician should be sought before prescribing enteral feeds for a child.

Infant formula feeds

Child 0–12 months. Term infants with normal gastro-intestinal function are given either breast milk or normal infant formula during the first year of life. The average intake is between 150 mL and 200 mL/kg/day. Infant milk formulas are based on whey- or casein-dominant protein, lactose with or without maltodextrin, amylose, vegetable oil and milk fat. The composition of all normal and soya infant formulas have to meet The Infant Formula and Follow-on Formula Regulations (England and Wales) 2007, which enact

the European Community Regulations 2006/141/EC; the composition of other enteral and specialist feeds has to meet the Commission Directive (1999/21/EC) on Dietary Foods for Special Medical Purposes.

A high-energy feed, which contains 9–11% of energy derived from protein can be used for infants who fail to grow adequately. Alternatively, energy supplements may be added to normal infant formula to achieve a higher energy content (but this will reduce the protein to energy ratio) or the normal infant formula concentration may be increased slightly. Care should be taken not to present an osmotic load of more than 500 milliosmols/kg water to the normal functioning gut, otherwise osmotic diarrhoea will result. Concentrating or supplementing feeds should not be attempted without the advice of a paediatric dietician.

Enteral feeds

Child 1–6 years (body-weight 8–20 kg). Ready-to-use feeds based on caseinates, maltodextrin and vegetable oils (with or without added medium chain triglyceride (MCT) oil or fibre) are well tolerated and effective in improving nutritional status in this age group. Although originally designed for children 1–6 years (body-weight 8–20 kg), some products have ACBS approval for use in children weighing up to 30 kg (approx. 10 years of age). Enteral feeds formulated for children 1–6 years are low in sodium and potassium; electrolyte intake and biochemical status should be monitored. Older children in this age range taking small feed volumes may need to be given additional micronutrients. Fibre-enriched feeds may be helpful for children with chronic constipation or diarrhoea.

Child 7–12 years (body-weight 21–45 kg). Depending on age, weight, clinical condition and nutritional requirements, ready-to-use feeds formulated for 7–12 year olds may be given at appropriate rates.

Child over 12 years (body-weight over 45 kg). As there are no standard enteral feeds formulated for this age group, adult formulations are used. The intake of protein, electrolytes, vitamins, and trace minerals should be carefully assessed and monitored. Note: Adult feeds containing more than 6 g/100 mL protein or 2 g/100 mL fibre should be used with caution and expert advice.

Specialised formula

It is essential that any infant who is intolerant of breast milk or normal infant formula, or whose condition requires nutrient-specific adaptation, is prescribed an adequate volume of a nutritionally complete replacement formula. In the first 4 months of life, a volume of 150–200 mL/kg/day is recommended. After 6 months, should the formula still be required, a volume of 600 mL/day should be maintained, in addition to solid food.

Products for cow's milk protein intolerance or lactose intolerance. There are a number of infant formulas formulated for cow's milk protein intolerance or lactose intolerance; these feeds may contain a residual amount of lactose (less than 1 g/100 mL formula)—sometimes described as clinically lactose-free or 'lactose-free' by manufacturers. If the total daily intake of these formulas is low, it may be necessary to supplement with calcium, and a vitamin and mineral supplement.

Soya-based infant formulas have a high phytoestrogen content and this may be a long-term reproductive health risk. The Chief Medical Officer has advised that soya-based infant formulas should not be used as the first choice for the management of infants with proven cow's milk sensitivity, lactose intolerance, galactokinase deficiency and galactosaemia. Most UK paediatricians with expertise in inherited metabolic disease still advocate soya-based formulations for infants with galactosaemia as there are concerns about the residual lactose content of low lactose formulas and protein hydrolysates based on cow's milk protein.

Low lactose infant formulations, based on whole cow's milk protein, are unsuitable for children with cow's milk protein intolerance. Liquid soya milks purchased from supermarkets and health food stores are not nutritionally complete and should never be used for infants under 1 year of age.

Protein hydrolysate formulas. Non-milk, peptide-based feeds containing hydrolysates of casein, whey, meat and soya protein, are suitable for infants with disaccharide or whole protein intolerance. The total daily intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet the child's nutritional requirements; these feeds have a high osmolality when given at recommended dilution and need gradual and careful introduction.

Elemental (amino acid based formula). Specially formulated elemental feeds containing essential and nonessential amino acids are available for use in infants and children under 6 years with proven whole protein intolerance. Adult elemental formula may be used for children over 6 years; the intake of electrolytes, vitamins and minerals should be carefully assessed and modified to meet nutritional requirements. These feeds have a high osmolality when given at the recommended concentration and therefore need gradual and careful introduction.

Modular feeds. Modular feeds (see Specialised Formulas for Specific Clinical Conditions) are based on individual protein, fat, carbohydrate, vitamin and mineral components or modules which can be combined to meet the specific needs of a child. Modular feeds are used when nutritionally complete specialised formula are not tolerated, or if the fluid and nutrient requirements change e.g. in gastro-intestinal, renal or liver disease. The main advantage of modular feeds is their flexibility; disadvantages include their complexity and preparation difficulties. Modular feeds should not be used without the supervision of a paediatric dietician.

Specialised formula. Highly specialised formulas are designed to meet the specific requirements in various clinical conditions such as renal and liver diseases. When using these formulas, both the biochemical status of the child and their growth parameters need to be monitored.

Feed thickeners

Carob based thickeners may be used to thicken feeds for infants under 1 year with significant gastro-oesophageal reflux. Breast-fed infants can be given the thickener mixed to a paste with water or breast-milk prior to feeds.

Pre-thickened formula Milk-protein- or casein-dominant infant formula, which contains small quantities of pre-gelatinized starch, is recommended primarily for infants with mild gastro-oesophageal reflux. Pre-thickened formula is prepared in the same way as normal infant formula and flows through a standard teat. The feeds do not thicken on standing but thicken in the stomach when exposed to acid pH.

Starched based thickeners can be used to thicken liquids and feeds for children over 1 year of age with dysphagia.

Dietary supplements for oral use

Three types of prescribable fortified dietary supplements are available: fortified milk and non-milk tasting (juice-style) drinks, and fortified milk-based semi-solid preparations. The recommended daily quantity is age-dependent. The following is a useful guide: 1–2 years, 200 kcal (840 kJ); 3–5 years, 400 kcal (1680 kJ); 6–11 years, 600 kcal (2520 kJ); and over 12 years, 800 kcal (3360 kJ). Supplements containing 1.5 kcal/mL are high in protein and should not be used for children under 3 years of age. Many supplements are high in sugar or maltodextrin; care should be taken to prevent prolonged contact with teeth. Ideally supplements should be administered after meals or at bedtime so as not to affect appetite.

Products for metabolic diseases

There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

Enteral feeding tubes

Care is required in choosing an appropriate formulation of a drug for administration through a nasogastric narrow-bore feeding tube or through a percutaneous endoscopic gastrostomy (PEG) or jejunostomy tube. Liquid preparations (or soluble tablets) are preferred; injection solutions may also be suitable for administration through an enteral tube.

If a solid formulation of a medicine needs to be given, it should be given as a suspension of particles fine enough to pass through the tube. It is possible to crush many immediate-release tablets but enteric-coated or modified-release preparations should **not** be crushed.

Enteral feeds may affect the absorption of drugs and it is therefore important to consider the timing of drug administration in relation to feeds. If more than one drug needs to be given, they should be given separately and the tube should be flushed with water after each drug has been given.

Clearing blockages

Carbonated (sugar-free) drinks may be marginally more effective than water in unblocking feeding tubes, but mildly acidic liquids (such as pineapple juice or cola-based drinks) can coagulate protein in feeds, causing further blockage. If these measures fail to clear the enteral feeding tube, an alkaline solution containing pancreatic enzymes may be introduced into the tube (followed after at least 5 minutes by water). Specific products designed to break up blockages caused by formula feeds are also available.

6.1 Special diets

Nutrition in special diets

Overview

These are preparations that have been modified to eliminate a particular constituent from a food or that are nutrient mixtures formulated as food substitutes for children who either cannot tolerate or cannot metabolise certain common constituents of food.

Coeliac disease

Intolerance to **gluten** in *coeliac disease* is managed by completely eliminating **gluten** from the diet. A range of gluten-free products is available for prescription.

Phenylketonuria

Phenylketonuria (hyperphenylalaninaemia, PKU), which results from the inability to metabolise **phenylalanine**, is managed by restricting dietary intake of **phenylalanine** to a small amount sufficient for tissue building and repair.

Aspartame (used as a sweetener in some foods and medicines) contributes to the **phenylalanine** intake and may affect control of *phenylketonuria*. If alternatives are unavailable, children with phenylketonuria should not be denied access to appropriate medication; the amount of **aspartame** consumed can be taken in to account in the management of the condition. Where the presence of **aspartame** in a preparation is specified in the product literature, **aspartame** is listed as an excipient in the relevant

product entry in *BNF for Children*; the child or carer should be informed of this.

Some rare forms of *phenylketonuria* are caused by a deficiency of **tetrahydrobiopterin**. Treatment involves oral supplementation of tetrahydrobiopterin p. 581; in some severe cases, the addition of the neurotransmitter precursors, levodopa and 5-hydroxytryptophan, is also necessary.

Sapropterin dihydrochloride below, a synthetic form of tetrahydrobiopterin p. 581, is licensed as an adjunct to dietary restriction of **phenylalanine** in the management of patients with *phenylketonuria* and *tetrahydrobiopterin deficiency*.

Products for metabolic diseases

There is a large range of disease-specific infant formulas and amino acid-based supplements available for use in children with metabolic diseases (see under specific metabolic diseases). Some of these formulas are nutritionally incomplete and supplementation with vitamins and other nutrients may be necessary. Many of the product names are similar; to prevent metabolic complications in children who cannot tolerate specific amino acids it is important to ensure the correct supplement is supplied.

6.1a Phenylketonuria

DRUGS FOR METABOLIC DISORDERS > TETRAHYDROBIOPTERIN AND DERIVATIVES

Sapropterin dihydrochloride

● INDICATIONS AND DOSE

Phenylketonuria (adjunct to dietary restriction of phenylalanine) (specialist use only)

► BY MOUTH

- Child 4–17 years: Initially 10 mg/kg once daily, adjusted according to response; usual dose 5–20 mg/kg once daily, dose to be taken preferably in the morning

Tetrahydrobiopterin deficiency (adjunct to dietary restriction of phenylalanine) (specialist use only)

► BY MOUTH

- Neonate: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day.
- Child: Initially 2–5 mg/kg once daily, adjusted according to response, dose to be taken preferably in the morning, the total daily dose may alternatively be given in 2–3 divided doses; maximum 20 mg/kg per day

● **CAUTIONS** History of convulsions

● **SIDE-EFFECTS**

- **Common or very common** Abdominal pain · cough · diarrhoea · headache · nasal congestion · pharyngolaryngeal pain · vomiting
- **Frequency not known** Hypersensitivity reactions

● **PREGNANCY** Manufacturer advises caution—consider only if strict dietary management inadequate.

● **BREAST FEEDING** Manufacturer advises avoid—no information available.

● **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises caution—no information available.

● **MONITORING REQUIREMENTS**

- Monitor blood-phenylalanine concentration before and after first week of treatment—if unsatisfactory response

increase dose at weekly intervals to max. dose and monitor blood-phenylalanine concentration weekly; discontinue treatment if unsatisfactory response after 1 month.

- ▶ Monitor blood-phenylalanine and tyrosine concentrations 1–2 weeks after dose adjustment and during treatment.

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be dissolved in water and taken within 20 minutes.
- **PRESCRIBING AND DISPENSING INFORMATION** Sapropterin is a synthetic form of tetrahydrobiopterin.
- **PATIENT AND CARER ADVICE** Patient or carers should be given advice on how to administer sapropterin dihydrochloride dispersible tablets.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- ▶ **Sapropterin dihydrochloride (Non-proprietary)**
Sapropterin dihydrochloride 10 mg Tetrahydrobiopterin 10mg tablets | 100 tablet (PoM) no price available

Soluble tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

- ▶ **Kuvan** (BioMarin Europe Ltd)
Sapropterin dihydrochloride 100 mg Kuvan 100mg soluble tablets sugar-free | 30 tablet (PoM) £597.22

Tetrahydrobiopterin

● INDICATIONS AND DOSE

Monotherapy in tetrahydrobiopterin-sensitive phenylketonuria (specialist use only)

- ▶ BY MOUTH
- ▶ Child: 10 mg/kg twice daily, adjusted according to response, total daily dose may alternatively be given in 3 divided doses

In combination with neurotransmitter precursors for tetrahydrobiopterin-sensitive phenylketonuria (specialist use only)

- ▶ BY MOUTH
- ▶ Child 1 month–1 year: Initially 250–750 micrograms/kg 4 times a day, adjusted according to response, total daily dose may alternatively be given in 3 divided doses; maximum 7 mg/kg per day
- ▶ Child 2–17 years: Initially 250–750 micrograms/kg 4 times a day, adjusted according to response, total daily dose may alternatively be given in 3 divided doses; maximum 10 mg/kg per day

- **UNLICENSED USE** Not licensed.
- **SIDE-EFFECTS** Diarrhoea · disturbed sleep · urinary frequency
- **PREGNANCY** Crosses the placenta; use only if benefit outweighs risk.
- **BREAST FEEDING** Present in milk, effects unknown.
- **RENAL IMPAIRMENT** Use with caution—accumulation of metabolites.
- **MEDICINAL FORMS**
There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

7 Vitamin deficiency

Vitamins

Overview

Vitamins are used for the prevention and treatment of specific deficiency states or where the diet is known to be inadequate; they may be prescribed in the NHS to prevent or treat deficiency but not as dietary supplements. Except for iron-deficiency anaemia, a primary vitamin or mineral deficiency due to simple dietary inadequacy is rare in the developed world. Some children may be at risk of developing deficiencies because of an inadequate intake, impaired vitamin synthesis or malabsorption in disease states such as cystic fibrosis and Crohn's disease.

The use of vitamins as general 'pick-me-ups' is of unproven value and, the 'fad' for mega-vitamin therapy with water-soluble vitamins, such as ascorbic acid and pyridoxine hydrochloride, is unscientific and can be harmful. Many vitamin supplements are described as 'multivitamin' but few contain the whole range of essential vitamins and many contain relatively high amounts of vitamins A and D. Care should be taken to ensure the correct dose is not exceeded.

Dietary reference values for vitamins are available in the Department of Health publication:

Dietary Reference Values for Food Energy and Nutrients for the United Kingdom: Report of the Panel on Dietary Reference Values of the Committee on Medical Aspects of Food Policy. *Report on Health and Social Subjects* 41. London: HMSO, 1991.

Dental patients

It is unjustifiable to treat stomatitis or glossitis with mixtures of vitamin preparations; this delays diagnosis and correct treatment.

Most patients who develop a nutritional deficiency despite an adequate intake of vitamins have malabsorption and if this is suspected the patient should be referred to a medical practitioner.

Vitamin A

Deficiency of vitamin A (retinol) p. 584 is associated with ocular defects (particularly xerophthalmia) and an increased susceptibility to infections, but deficiency is rare in the UK (even in disorders of fat absorption).

Vitamin A supplementation may be required in children with liver disease, particularly cholestatic liver disease, due to the malabsorption of fat soluble vitamins. In those with complete biliary obstruction an intramuscular dose once a month may be appropriate.

Preterm neonates have low plasma concentrations of vitamin A and are usually given vitamin A supplements, often as part of an oral multivitamin preparation once enteral feeding has been established.

Vitamin B group

Deficiency of the B vitamins, other than vitamin B₁₂, is rare in the UK and is usually treated by preparations containing thiamine (B₁) p. 586, and riboflavin (B₂). Other members (or substances traditionally classified as members) of the vitamin B complex such as aminobenzoic acid, biotin, choline, inositol nicotinate, and pantothenic acid or panthenol may be included in vitamin B preparations, but there is no evidence of their value as supplements; however, they can be used in the management of certain metabolic disorders. Anaphylaxis has been reported with parenteral B vitamins.

As with other vitamins of the B group, pyridoxine hydrochloride (B₆) deficiency is rare, but it may occur during isoniazid p. 345 therapy or penicillamine p. 574 treatment in

Wilson's disease and is characterised by peripheral neuritis. High doses of pyridoxine hydrochloride are given in some metabolic disorders, such as hyperoxaluria, cystathioninuria and homocystinuria; folic acid p. 533 supplementation may also be beneficial in these disorders. Pyridoxine hydrochloride is also used in sideroblastic anaemia. Rarely, seizures in the neonatal period or during infancy respond to pyridoxine hydrochloride treatment; pyridoxine hydrochloride should be tried in all cases of early-onset intractable seizures and status epilepticus. Pyridoxine hydrochloride has been tried for a wide variety of other disorders, but there is little sound evidence to support the claims of efficacy.

A number of mitochondrial disorders may respond to treatment with certain B vitamins but these disorders require specialist management. Thiamine is used in the treatment of maple syrup urine disease, mitochondrial respiratory chain defects and, together with riboflavin, in the treatment of congenital lactic acidosis; riboflavin is also used in glutaric acidcaemias and cytochrome oxidase deficiencies; biotin is used in carboxylase defects.

Folic acid and vitamin B₁₂ are used in the treatment of megaloblastic anaemia. Folinic acid p. 515 (available as calcium folinate) is used in association with cytotoxic therapy.

Vitamin C

Vitamin C (ascorbic acid) therapy is essential in scurvy, but less florid manifestations of vitamin C deficiency have been reported. Vitamin C is used to enhance the excretion of iron one month after starting desferrioxamine mesilate p. 536 therapy; it is given separately from food as it also enhances iron absorption. Vitamin C is also used in the treatment of some inherited metabolic disorders, particularly mitochondrial disorders; specialist management of these conditions is required.

Severe scurvy causes gingival swelling and bleeding margins as well as petechiae on the skin. This is, however, exceedingly rare and a child with these signs is more likely to have leukaemia. Investigation should not be delayed by a trial period of vitamin treatment.

Claims that vitamin C ameliorates colds or promotes wound healing have not been proved.

Vitamin D

The term Vitamin D is used for a range of compounds including ergocalciferol (calciferol, vitamin D₂) p. 591, colecalciferol (vitamin D₃) p. 589, dihydrotachysterol, alfalcidol (1 α -hydroxycholecalciferol) p. 588, and calcitriol (1,25-dihydroxycholecalciferol) p. 588.

Asymptomatic vitamin D deficiency is common in the United Kingdom; symptomatic deficiency may occur in certain ethnic groups, particularly as rickets or hypocalcaemia, and rarely in association with malabsorption. The amount of vitamin D required in infancy is related to the stores built up *in-utero* and subsequent exposure to sunlight. The amount of vitamin D in breast milk varies and some breast-fed babies, particularly if preterm or born to vitamin D deficient mothers, may become deficient. Most formula milk and supplement feeds contain adequate vitamin D to prevent deficiency.

Simple, nutritional vitamin D deficiency can be prevented by oral supplementation of ergocalciferol (calciferol, vitamin D₂) or colecalciferol (vitamin D₃) daily, using multi-vitamin drops, preparations of vitamins A and D, manufactured 'special' solutions, or as calcium and ergocalciferol tablets (although the calcium and other vitamins in supplements are unnecessary); excessive supplementation may cause hypercalcaemia.

Inadequate bone mineralisation can be caused by a deficiency, or a lack of action of vitamin D or its active metabolite. In childhood this causes bowing and distortion

of bones (rickets). In nutritional vitamin D deficiency rickets, initial high doses of ergocalciferol or colecalciferol should be reduced to supplemental doses after 8–12 weeks, as there is a significant risk of hypercalcaemia. However, calcium supplements are recommended if there is hypocalcaemia or evidence of a poor dietary calcium intake. A single large dose of ergocalciferol p. 591 or colecalciferol p. 589 can also be effective for the treatment of nutritional vitamin D deficiency rickets.

Poor bone mineralisation in neonates and young children may also be due to inadequate intake of phosphate or calcium particularly during long-term parenteral nutrition—supplementation with phosphate or calcium may be required.

Hypophosphataemic rickets occurs due to abnormal phosphate excretion; treatment with high doses of oral phosphate, and hydroxylated (activated) forms of vitamin D allow bone mineralisation and optimise growth.

Nutritional deficiency of vitamin D is best treated with colecalciferol or ergocalciferol. Preparations containing calcium and colecalciferol are also occasionally used in children where there is evidence of combined calcium and vitamin D deficiency. Vitamin D deficiency caused by *intestinal malabsorption* or *chronic liver disease* usually requires vitamin D in pharmacological doses; the hypocalcaemia of *hypoparathyroidism* often requires higher doses in order to achieve normocalcaemia and alfalcidol p. 588 is generally preferred.

Vitamin D supplementation is often given in combination with calcium supplements for persistent hypocalcaemia in neonates, and in chronic renal disease.

Vitamin D requires hydroxylation, by the kidney and liver, to its active form therefore the hydroxylated derivatives alfalcidol or calcitriol p. 588 should be prescribed if patients with *severe liver or renal impairment* require vitamin D therapy. Alfalcidol is generally preferred in children as there is more experience of its use and appropriate formulations are available. Calcitriol is unlicensed for use in children and is generally reserved for those with severe liver disease.

Vitamin E

The daily requirement of vitamin E (tocopherol) has not been well defined. Vitamin E supplements are given to children with fat malabsorption such as in cystic fibrosis and cholestatic liver disease. In children with abetalipoproteinaemia abnormally low vitamin E concentrations may occur in association with neuromuscular problems; this usually responds to high doses of vitamin E. Some neonatal units still administer a single intramuscular dose of vitamin E at birth to preterm neonates to reduce the risk of complications; no trials of long-term outcome have been carried out. The intramuscular route should also be considered in children with severe liver disease when response to oral therapy is inadequate.

Vitamin E has been tried for various other conditions but there is little scientific evidence of its value.

Vitamin K

Vitamin K is necessary for the production of blood clotting factors and proteins necessary for the normal calcification of bone.

Because vitamin K is fat soluble, children with fat malabsorption, especially in biliary obstruction or hepatic disease, may become deficient. For oral administration to prevent vitamin K deficiency in malabsorption syndromes, a water-soluble synthetic vitamin K derivative, menadiol sodium phosphate p. 593 can be used if supplementation with phytonadione p. 593 by mouth has been insufficient.

Oral coumarin anticoagulants act by interfering with vitamin K metabolism in the hepatic cells and their effects

can be antagonised by giving vitamin K; see advice on the use of vitamin K in haemorrhage.

Multivitamins

Multivitamin supplements are used in children with vitamin deficiencies and also in malabsorption conditions such as cystic fibrosis or liver disease. Supplementation is not required if nutrient enriched feeds are used; consult a dietician for further advice.

Vitamin K

► In neonates Vitamin K deficiency bleeding

Neonates are relatively deficient in vitamin K and those who do not receive supplements of vitamin K are at risk of serious bleeding including intracranial bleeding. The Chief Medical Officer and the Chief Nursing Officer have recommended that all newborn babies should receive vitamin K to prevent vitamin K deficiency bleeding (previously termed haemorrhagic disease of the newborn). An appropriate regimen should be selected after discussion with parents in the antenatal period.

Vitamin K (as phytomenadione) may be given by a single intramuscular injection at birth; this prevents vitamin K deficiency bleeding in virtually all babies.

Alternatively, in healthy babies who are not at particular risk of bleeding disorders, vitamin K may be given by mouth, and arrangements must be in place to ensure the appropriate regimen is followed. Two doses of a colloidal (mixed micelle) preparation of phytomenadione should be given by mouth in the first week, the first dose being given at birth and the second dose at 4–7 days. For exclusively breast-fed babies, a third dose of colloidal phytomenadione is given by mouth at 1 month of age; the third dose is omitted in formula-fed babies because formula feeds contain adequate vitamin K. An alternative regimen is to give one dose of phytomenadione by mouth at birth (using the contents of a phytomenadione capsule) to protect from the risk of vitamin K deficiency bleeding in the first week; for exclusively breast-fed babies, further doses of phytomenadione are given by mouth (using the contents of a phytomenadione capsule) at weekly intervals for 12 weeks.

VITAMINS AND TRACE ELEMENTS ►

MULTIVITAMINS

Vitamins A and D

● INDICATIONS AND DOSE

Prevention of vitamin A and D deficiency

► BY MOUTH

- Child: 1 capsule daily, 1 capsule contains 4000 units vitamin A and 400 units (10 micrograms) vitamin D

- **UNLICENSED USE** Not licensed in children under 6 months of age.

- **INTERACTIONS** → Appendix 1 (vitamins).

● SIDE-EFFECTS

Overdose

Excessive ingestion Prolonged excessive ingestion of vitamins A and D can lead to hypervitaminosis.

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Capsule

► Vitamins A and D (Non-proprietary)

Vitamin D 400 unit, Vitamin A 4000 unit Vitamins A and D capsules BPC 1973 | 28 capsule £2.81 | 28 capsule [GSL](#) £2.81 | 84 capsule £8.42 DT price = £8.42

Vitamins A, B group, C and D

● INDICATIONS AND DOSE

Prevention of deficiency

► BY MOUTH USING CAPSULES

- Child 1–11 years: 1 capsule daily
- Child 12–17 years: 2 capsules daily

Cystic Fibrosis: prevention of deficiency

► BY MOUTH USING CAPSULES

- Child 1–17 years: 2–3 capsules daily

ABIDEC MULTIVITAMIN DROPS®

Prevention of deficiency

► BY MOUTH USING ORAL DROPS

- Preterm neonate: 0.6 mL daily.

- Neonate: 0.3 mL daily.

- Child 1–11 months: 0.3 mL daily
- Child 1–17 years: 0.6 mL daily

Cystic Fibrosis: prevention of deficiency

► BY MOUTH USING ORAL DROPS

- Child 1–11 months: 0.6 mL daily
- Child 1–17 years: 1.2 mL daily

DALIVIT ORAL DROPS®

Prevention of deficiency

► BY MOUTH USING ORAL DROPS

- Preterm neonate: 0.3 mL daily.

- Neonate: 0.3 mL daily.

- Child 1–11 months: 0.3 mL daily
- Child 1–17 years: 0.6 mL daily

Cystic Fibrosis: prevention of deficiency

► BY MOUTH USING ORAL DROPS

- Child 1–11 months: 0.6 mL daily
- Child 1–17 years: 1 mL daily

- **UNLICENSED USE** *Dalavit*® not licensed for use in children under 6 weeks.

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.

Vitamin A concentration of preparations varies.

ABIDEC MULTIVITAMIN DROPS® *Abidec*® contains 1333 units of vitamin A (as palmitate) per 0.6 mL dose.

DALIVIT ORAL DROPS® *Dalavit*® contains 5000 units of vitamin A (as palmitate) per 0.6 mL dose.

Vitamins A, C and D

The properties listed below are those particular to the combination only. For the properties of the components please consider, vitamin A below, ascorbic acid p. 587.

● INDICATIONS AND DOSE

Prevention of vitamin deficiency

▶ BY MOUTH

- ▶ Child 1 month–4 years: 5 drops daily, 5 drops contain vitamin A approx. 700 units, vitamin D approx. 300 units (7.5 micrograms), ascorbic acid approx. 20 mg

- **PRESCRIBING AND DISPENSING INFORMATION** This drug contains vitamin D; consult individual vitamin D monographs.

Available free of charge to children under 4 years in families on the Healthy Start Scheme, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

Healthy Start Vitamins for women (containing ascorbic acid, vitamin D, and folic acid) are also available free of charge to women on the Healthy Start Scheme during pregnancy and until their baby is one year old, or alternatively may be available direct to the public—further information for healthcare professionals can be accessed at www.healthystart.nhs.uk. Beneficiaries can contact their midwife or health visitor for further information on where to obtain supplies.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral drops

- ▶ **Healthy Start Children's Vitamin** (Secretary of State for Health)
Vitamin A and D3 concentrate 55 mg per 1 ml, Sodium ascorbate 18.58 mg per 1 ml, Ascorbic acid 150 mg per 1 ml, Vitamin D 2000 iu per 1 ml, Vitamin A 5000 iu per 1 ml | Healthy Start Children's Vitamin drops | 10 ml no price available

VITAMINS AND TRACE ELEMENTS > VITAMIN A

Vitamin A

(Retinol)

● INDICATIONS AND DOSE

Vitamin A deficiency

▶ BY MOUTH

- ▶ Neonate: 5000 units daily, higher doses may be used initially for treatment of severe deficiency.
- ▶ Child 1–11 months: 5000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency
- ▶ Child 1–17 years: 10 000 units daily, to be taken with or after food, higher doses may be used initially for treatment of severe deficiency

Prevention of deficiency in complete biliary obstruction

▶ BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 50 000 units once a month.
- ▶ Child 1–11 months: 50 000 units once a month

- **UNLICENSED USE** Preparations containing only vitamin A are not licensed.

- **INTERACTIONS** → Appendix 1 (vitamins).

● SIDE-EFFECTS

Overdose

Massive overdose can cause rough skin, dry hair, an enlarged liver, and a raised erythrocyte sedimentation rate and raised serum calcium and serum alkaline phosphatase concentrations.

- **PREGNANCY** Excessive doses may be teratogenic. In view of evidence suggesting that high levels of vitamin A may cause birth defects, women who are (or may become) pregnant are advised not to take vitamin A supplements (including tablets and fish liver oil drops), except on the advice of a doctor or an antenatal clinic; nor should they eat liver or products such as liver pâté or liver sausage.

- **BREAST FEEDING** Theoretical risk of toxicity in infants of mothers taking large doses.

- **MONITORING REQUIREMENTS** Treatment is sometimes initiated with very high doses of vitamin A and the child should be monitored closely; very high doses are associated with acute toxicity.

Pyridoxine hydrochloride

(Vitamin B₆)

● INDICATIONS AND DOSE

Isoniazid-induced neuropathy (prophylaxis)

► BY MOUTH

► Neonate: 5 mg daily.

► Child 1 month–11 years: 5–10 mg daily
 ► Child 12–17 years: 10 mg daily

Isoniazid-induced neuropathy (treatment)

► BY MOUTH

► Neonate: 5–10 mg daily.

► Child 1 month–11 years: 10–20 mg 2–3 times a day
 ► Child 12–17 years: 30–50 mg 2–3 times a day

Prevention of penicillamine-induced neuropathy in Wilson's disease

► BY MOUTH

► Child 1–11 years: 5–10 mg daily
 ► Child 12–17 years: 10 mg daily

Metabolic diseases | Cystathioninuria | Homocystinuria

► BY MOUTH

► Neonate: 50–100 mg 1–2 times a day.

► Child: 50–250 mg 1–2 times a day

Pyridoxine-dependent seizures

► INITIALLY BY INTRAVENOUS INJECTION

► Neonate: Test dose 50–100 mg, repeated if necessary, if responsive, followed by an oral maintenance dose; (by mouth) maintenance 50–100 mg once daily, dose to be adjusted as necessary.

► Child 1 month–11 years: Test dose 50–100 mg daily, if responsive, followed by an oral maintenance dose, (by mouth) maintenance 20–50 mg 1–2 times a day, dose to be adjusted as necessary, (by mouth) increased if necessary up to 30 mg/kg daily, alternatively (by mouth) increased if necessary up to 1 g daily

● **UNLICENSED USE** Not licensed for prophylaxis of penicillamine-induced neuropathy in Wilson's disease. Not licensed for use in children.

● CAUTIONS

► With intravenous use Risk of cardiovascular collapse (with intravenous injection—resuscitation facilities must be available and monitor closely)

● **INTERACTIONS** → Appendix 1 (vitamins).

● **SIDE-EFFECTS** Sensory neuropathy (with high doses when given for extended periods)

Overdose

Overdosage induces toxic effects.

Thiamine

(Vitamin B₁)

● INDICATIONS AND DOSE

Maple syrup urine disease

► BY MOUTH

► Neonate: 5 mg/kg daily, dose to be adjusted as necessary.

► Child: 5 mg/kg daily, dose to be adjusted as necessary

Metabolic disorders | Congenital lactic acidosis

► BY MOUTH, OR BY INTRAVENOUS INFUSION

► Neonate: 50–200 mg once daily, dose to be adjusted as necessary, the total dose may alternatively be given in 2–3 divided doses, administer intravenous infusion over 30 minutes.

► Child: 100–300 mg once daily, dose to be adjusted as necessary, the total dose may alternatively be given in 2–3 divided doses, administer intravenous infusion over 30 minutes, increased if necessary up to 2 g daily

● **UNLICENSED USE** Not licensed in children.

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (SEPTEMBER 2007)

Although potentially serious allergic adverse reactions may rarely occur during, or shortly after, parenteral administration, the CHM has recommended that:

- This should not preclude the use of parenteral thiamine in patients where this route of administration is required, particularly in patients at risk of Wernicke-Korsakoff syndrome where treatment with thiamine is essential;
- Intravenous administration should be by infusion over 30 minutes;
- Facilities for treating anaphylaxis (including resuscitation facilities) should be available when parenteral thiamine is administered.

● **CAUTIONS** Anaphylaxis may occasionally follow injection

● SIDE-EFFECTS

► With intravenous use Hypersensitivity reactions

● **BREAST FEEDING** Severely thiamine-deficient mothers should avoid breast-feeding as toxic methyl-glyoxal present in milk.

● PRESCRIBING AND DISPENSING INFORMATION

► With intramuscular use or intravenous use Some preparations may contain phenol as a preservative.

● MEDICINAL FORMS

Vitamin B complex

● INDICATIONS AND DOSE

Treatment of deficiency

► BY MOUTH USING SYRUP

► Child 1–11 months: 5 mL 3 times a day, this dose is for *Vigranon B*[®] syrup.

► Child 1–11 years: 10 mL 3 times a day, this dose is for *Vigranon B*[®] syrup.

► Child 12–17 years: 10–15 mL 3 times a day, this dose is for *Vigranon B*[®] syrup.

Prophylaxis of deficiency

► BY MOUTH USING SYRUP

► Child 1–11 months: 5 mL once daily, this dose is for *Vigranon B*[®] syrup.

► Child 1–11 years: 5 mL twice daily, this dose is for *Vigranon B*[®] syrup.

► Child 12–17 years: 5 mL 3 times a day, this dose is for *Vigranon B*[®] syrup.

● NATIONAL FUNDING/ACCESS DECISIONS

Vigranon[®] syrup is not prescribable under the National Health Service (NHS).

● **LESS SUITABLE FOR PRESCRIBING** *Vigranon B*[®] syrup are less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Oral solution

► Vigranon-B (Wallace Manufacturing Chemists Ltd)

Pyridoxine hydrochloride 400 microgram per 1 mL, Riboflavin sodium phosphate 548 microgram per 1 mL, Dexpantenol 600 microgram per 1 mL, Thiamine hydrochloride 1 mg per 1 mL, Nicotinamide 4 mg per 1 mL Vigranon-B syrup sugar-free | 150 mL [P] £26.00

Vitamins with minerals and trace elements

● INDICATIONS AND DOSE

FORCEVAL[®] CAPSULES

Vitamin and mineral deficiency and as adjunct in synthetic diets

► BY MOUTH

► Child 12–17 years: 1 capsule daily, one hour after a meal

KETOVITE[®] LIQUID

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets

► BY MOUTH

► Child: 5 mL daily, dose adjusted according to condition, diet, or age, use with *Ketovite*[®] Tablets for complete vitamin supplementation.

KETOVITE® TABLETS

Prevention of vitamin deficiency in disorders of carbohydrate or amino-acid metabolism | Adjunct in restricted, specialised, or synthetic diets

► BY MOUTH

- Child: 1 tablet 3 times a day, dose adjusted according to condition, diet, or age, use with *Ketovite® Liquid* for complete vitamin supplementation.

- **PRESCRIBING AND DISPENSING INFORMATION** To avoid potential toxicity, the content of all vitamin preparations, particularly vitamin A, should be considered when used together with other supplements.

- **PATIENT AND CARER ADVICE**

Medicines for Children leaflet: Multivitamin preparations for vitamin deficiency www.medicinesforchildren.org.uk/multivitamin-preparations-vitamin-deficiency

KETOVITE® LIQUID *Ketovite®* liquid may be mixed with milk, cereal, or fruit juice.

KETOVITE® TABLETS Tablets may be crushed immediately before use.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Tablet

- **Ketovite** (Essential Pharmaceuticals Ltd)
Biotin 170 microgram, Folic acid 250 microgram, Pyridoxine hydrochloride 330 microgram, Acetomenaphthone 500 microgram, Riboflavin 1 mg, Thiamine hydrochloride 1 mg, Calcium pantothenate 1.16 mg, Nicotinamide 3.3 mg, Alpha tocopheryl acetate 5 mg, Ascorbic acid 16.6 mg, Inositol 50 mg Ketovite tablets | 100 tablet [PoM] £9.21

Capsule

- **Forceval** (Alliance Pharmaceuticals Ltd)
Cyanocobalamin 3 microgram, Selenium 50 microgram, Biotin 100 microgram, Iodine 140 microgram, Chromium 200 microgram, Molybdenum 250 microgram, Folic acid 400 microgram, Thiamine 1.2 mg, Riboflavin 1.6 mg, Copper 2 mg, Pyridoxine 2 mg, Manganese 3 mg, Pantothenic acid 4 mg, Potassium 4 mg, Tocopheryl acetate 10 mg, Iron 12 mg, Zinc 15 mg, Nicotinamide 18 mg, Magnesium 30 mg, Ascorbic acid 60 mg, Phosphorus 77 mg, Calcium 100 mg, Ergocalciferol 400 unit, Vitamin A 2500 unit Forceval capsules | 15 capsule [P] £4.42 | 30 capsule [P] £7.71 | 90 capsule [P] £18.62

Oral emulsion

- **Ketovite** (Essential Pharmaceuticals Ltd)
Cyanocobalamin 2.5 microgram per 1 ml, Choline chloride 30 mg per 1 ml, Ergocalciferol 80 unit per 1 ml, Vitamin A 500 unit per 1 ml Ketovite liquid sugar-free | 150 ml [P] £19.10

VITAMINS AND TRACE ELEMENTS > VITAMIN C

Ascorbic acid

(Vitamin C)

- **INDICATIONS AND DOSE**

Treatment of scurvy

► BY MOUTH

- Child 1 month–3 years: 125–250 mg daily in 1–2 divided doses
- Child 4–11 years: 250–500 mg daily in 1–2 divided doses
- Child 12–17 years: 0.5–1 g daily in 1–2 divided doses

Adjunct to desferrioxamine (to enhance the excretion of iron 1 month after treatment)

► BY MOUTH

- Child: 100–200 mg daily, to be taken 1 hour before food

Metabolic disorders | Tyrosinaemia type III | Transient tyrosinaemia of the newborn | Glutathione synthase deficiency | Hawkinsinuria

► BY MOUTH

- Neonate: 50–200 mg daily, dose to be adjusted as necessary.
- Child: 200–400 mg daily in 1–2 divided doses, dose to be adjusted as necessary, increased if necessary up to 1 g daily

- **UNLICENSED USE** Not licensed for metabolic disorders.

- **CONTRA-INDICATIONS** Hyperoxaluria

- **CAUTIONS**

- **CAUTIONS, FURTHER INFORMATION**

- Iron overload Ascorbic acid should not be given to patients with cardiac dysfunction.

In patients with normal cardiac function ascorbic acid should be introduced 1 month after starting desferrioxamine.

- **INTERACTIONS** → Appendix 1 (vitamins).

- **SIDE-EFFECTS** Diarrhoea · fatigue · headache · hyperoxaluria · nausea

- **PRESCRIBING AND DISPENSING INFORMATION** It is rarely necessary to prescribe more than 100 mg daily except early in the treatment of scurvy.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

EXCIPIENTS: May contain Aspartame

VITAMINS AND TRACE ELEMENTS > VITAMIN D AND ANALOGUES

Vitamin D and analogues (systemic)

● **CONTRA-INDICATIONS** Hypercalcaemia · metastatic calcification

● **INTERACTIONS** → Appendix 1 (vitamins).

● **SIDE-EFFECTS**

Overdose

Symptoms of overdosage include anorexia, lassitude, nausea and vomiting, diarrhoea, constipation, weight loss, polyuria, sweating, headache, thirst, vertigo, and raised concentrations of calcium and phosphate in plasma and urine.

● **PREGNANCY** High doses teratogenic in *animals* but therapeutic doses unlikely to be harmful.

● **BREAST FEEDING** Caution with high doses; may cause hypercalcaemia in infant—monitor serum-calcium concentration.

● **MONITORING REQUIREMENTS** **Important:** All patients receiving pharmacological doses of vitamin D should have their plasma-calcium concentration checked at intervals (initially once or twice weekly) and whenever nausea or vomiting occur.

Alfacalcidol

(1 α -Hydroxycholecalciferol)

● INDICATIONS AND DOSE

Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism or pseudohypoparathyroidism

► BY MOUTH, OR BY INTRAVENOUS INJECTION

► Child 1 month–11 years: 25–50 nanograms/kg once daily, dose to be adjusted as necessary; maximum 1 microgram per day

► Child 12–17 years: 1 microgram once daily, dose to be adjusted as necessary

Persistent neonatal hypocalcaemia

► BY MOUTH, OR BY INTRAVENOUS INJECTION

► Neonate: 50–100 nanograms/kg once daily, dose to be adjusted as necessary, in resistant cases higher doses may be needed; increased if necessary up to 2 micrograms/kg daily.

Prevention of vitamin D deficiency in renal or cholestatic liver disease

► BY MOUTH, OR BY INTRAVENOUS INJECTION

► Neonate: 20 nanograms/kg once daily, dose to be adjusted as necessary.

► Child 1 month–11 years (body-weight up to 20 kg): 15–30 nanograms/kg once daily (max. per dose 500 nanograms)

► Child 1 month–11 years (body-weight 20 kg and above): 250–500 nanograms once daily, dose to be adjusted as necessary

► Child 12–17 years: 250–500 nanograms once daily, dose to be adjusted as necessary

DOSE EQUIVALENCE AND CONVERSION

One drop of alfacalcidol 2 microgram/mL oral drops contains approximately 100 nanograms alfacalcidol.

● **CAUTIONS** Nephrolithiasis · take care to ensure correct dose in infants

● **SIDE-EFFECTS**

► **Rare** Nephrocalcinosis · pruritus · rash · urticaria

● **RENAL IMPAIRMENT**

Monitoring

Monitor plasma-calcium concentration in renal impairment.

● **MONITORING REQUIREMENTS** Monitor plasma-calcium concentration in patients receiving high doses.

● **DIRECTIONS FOR ADMINISTRATION**

► With intravenous use For injection, shake ampoule for at least 5 seconds before use, and give over 30 seconds.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Capsule

EXCIPIENTS: May contain Sesame oil

► **Alfacalcidol (Non-proprietary)**

Solution for injection

EXCIPIENTS: May contain Alcohol, propylene glycol

► **One-Alpha (LEO Pharma)**

Alfacalcidol 2 microgram per 1 ml One-Alpha 2micrograms/1ml solution for injection ampoules | 10 ampoule [PoM] £41.13

One-Alpha 1micrograms/0.5ml solution for injection ampoules | 10 ampoule [PoM] £21.57

Calcitriol

(1,25-Dihydroxycholecalciferol)

● **INDICATIONS AND DOSE**

Vitamin D dependent rickets | Hypophosphataemic rickets | Persistent hypocalcaemia due to hypoparathyroidism | Pseudo-hypoparathyroidism (limited experience)

► BY MOUTH

► Child 1 month–11 years: Initially 15 nanograms/kg once daily (max. per dose 250 nanograms), increased in steps of 5 nanograms/kg daily (max. per dose 250 nanograms) if required, dose to be increased every 2–4 weeks

► Child 12–17 years: Initially 250 nanograms once daily, increased in steps of 5 nanograms/kg daily (max. per dose 250 nanograms) if required, dose to be increased every 2–4 weeks; usual dose 0.5–1 microgram daily

● **UNLICENSED USE** Not licensed for use in children.

● **CAUTIONS** Take care to ensure correct dose in infants

● **HEPATIC IMPAIRMENT** Manufacturer advises avoid—no information available.

● **RENAL IMPAIRMENT** Manufacturer advises avoid—no information available. Monitor plasma-calcium concentration in renal impairment.

- **MONITORING REQUIREMENTS** Monitor plasma calcium, phosphate, and creatinine during dosage titration. Monitor plasma-calcium concentration in patients receiving high doses.

- **DIRECTIONS FOR ADMINISTRATION** Contents of capsule may be administered by oral syringe.

Alpha tocopheryl acetate

(Tocopherol)

● INDICATIONS AND DOSE

Vitamin E deficiency

- ▶ BY MOUTH

- ▶ Neonate: 10 mg/kg once daily.
- ▶ Child: 2–10 mg/kg daily, increased if necessary up to 20 mg/kg daily

Malabsorption in cystic fibrosis

- ▶ BY MOUTH

- ▶ Child 1–11 months: 50 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- ▶ Child 1–11 years: 100 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes
- ▶ Child 12–17 years: 100–200 mg once daily, dose to be adjusted as necessary, to be taken with food and pancreatic enzymes

Vitamin E deficiency in cholestasis and severe liver disease

- ▶ BY MOUTH

- ▶ Neonate: 10 mg/kg daily.
- ▶ Child 1 month–11 years: Initially 100 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily
- ▶ Child 12–17 years: Initially 200 mg daily, adjusted according to response, increased if necessary up to 200 mg/kg daily

- ▶ BY INTRAMUSCULAR INJECTION

- ▶ Neonate: 10 mg/kg once a month.
- ▶ Child: 10 mg/kg once a month (max. per dose 100 mg)

Malabsorption in abetalipoproteinaemia

- ▶ BY MOUTH

- ▶ Neonate: 100 mg/kg once daily.
- ▶ Child: 50–100 mg/kg once daily

- **CAUTIONS** Increased risk of necrotising enterocolitis in neonate weighing less than 1.5 kg or in a preterm neonate · predisposition to thrombosis
- **INTERACTIONS** → Appendix 1 (Vitamins).
- **SIDE-EFFECTS** Abdominal pain (particularly with high doses) · diarrhoea (particularly with high doses)
- **PREGNANCY** No evidence of safety of high doses.
- **BREAST FEEDING** Excreted in milk; minimal risk, although caution with large doses.
- **MONITORING REQUIREMENTS** Increased bleeding tendency in vitamin-K deficient patients or those taking anticoagulants (prothrombin time and INR should be monitored).
- **DIRECTIONS FOR ADMINISTRATION**
 - ▶ In neonates Consider dilution of oral suspension for use in neonates due to high osmolality.

- Couples are at a high risk of conceiving a child with a neural tube defect if either partner has a neural tube defect (or either partner has a family history of neural tube defects), if they have had a previous pregnancy affected by a neural tube defect, or if the woman has *coeliac disease* (or other malabsorption state), diabetes mellitus, sickle-cell anaemia, or is taking **antiepileptic medicines**.
- Women in the high-risk group who wish to become pregnant (or who are at risk of becoming pregnant) should be advised to take folic acid daily (at high-risk group dose) and continue until week 12 of pregnancy (women with sickle-cell disease should continue taking their normal dose of folic acid (or to increase the dose to high-risk group daily dose) and continue this throughout pregnancy).

There is no justification for prescribing multiple-ingredient vitamin preparations containing vitamin B₁₂ or folic acid.

7.1 Neural tube defects (prevention in pregnancy)

Neural tube defects (prevention in pregnancy)

Prevention in pregnancy

Folic acid supplements p. 533 taken before and during pregnancy can reduce the occurrence of neural tube defects. The risk of a neural tube defect occurring in a child should be assessed and folic acid given as follows:

- Women at a low risk of conceiving a child with a neural tube defect should be advised to take folic acid as a medicinal or food supplement daily (at low-risk group dose) before conception and until week 12 of pregnancy. Women who have not been taking folic acid and who suspect they are pregnant should start at once and continue until week 12 of pregnancy.

1 Arthritis

Juvenile idiopathic arthritis

Management

Rheumatic diseases require symptomatic treatment to relieve pain, swelling, and stiffness, together with treatment to control and suppress disease activity. Treatment of juvenile idiopathic arthritis may involve Non-steroidal anti-inflammatory drugs (NSAIDs) p. 604, a disease modifying anti-rheumatic drug (DMARD) such as methotrexate p. 506 or a cytokine modulator, and intra-articular, intravenous, or oral corticosteroids.

Rheumatic disease, suppressing drugs

Overview

Certain drugs, such as methotrexate p. 506, cytokine modulators, and sulfasalazine p. 29, are used to suppress the disease process in *juvenile idiopathic arthritis* (juvenile chronic arthritis); these drugs are known as disease-modifying antirheumatic drugs (DMARDs). In children, disease modifying antirheumatic drugs should be used under specialist supervision.

Some children with juvenile idiopathic arthritis do not require disease-modifying antirheumatic drugs. Methotrexate is effective in juvenile idiopathic arthritis; sulfasalazine is an alternative but should be avoided in *systemic-onset juvenile idiopathic arthritis*. Gold and penicillamine p. 574 are no longer used. Cytokine modulators have a role in *polyarticular juvenile idiopathic arthritis*.

Unlike NSAIDs, disease-modifying antirheumatic drugs can affect the progression of disease but they may require 3–6 months of treatment for a full therapeutic response. Response to a disease-modifying antirheumatic drug may allow the dose of the NSAID to be reduced.

Disease-modifying antirheumatic drugs can improve not only the symptoms of inflammatory joint disease but also extra-articular manifestations. They reduce the erythrocyte sedimentation rate and C-reactive protein.

Antimalarials

The antimalarial hydroxychloroquine sulfate p. 596 is rarely used to treat juvenile idiopathic arthritis. Hydroxychloroquine sulfate can also be useful for systemic or discoid lupus erythematosus, particularly involving the skin and joints, and in sarcoidosis.

Retinopathy rarely occurs provided that the recommended doses are not exceeded.

Mepacrine hydrochloride is used on rare occasions to treat discoid lupus erythematosus [unlicensed].

Drugs affecting the immune response

Methotrexate, given as a once weekly dose, is the disease-modifying antirheumatic drug of choice in the treatment of juvenile idiopathic arthritis and also has a role in juvenile dermatomyositis, vasculitis, uveitis, systemic lupus erythematosus, localised scleroderma, and sarcoidosis; for these indications it is given by the subcutaneous, oral, or rarely, the intramuscular route. Absorption from intramuscular or subcutaneous routes may be more predictable than from the oral route; if the oral route is ineffective subcutaneous administration is generally preferred. Folic acid may reduce mucosal or gastro-intestinal side-effects of methotrexate. The dosage regimen for folic acid p. 533 has not been established—in children over 2 years a weekly dose [unlicensed indication], may be given on a different day from the methotrexate.

Azathioprine p. 485 may be used in children for vasculitis which has failed to respond to other treatments, for the management of severe cases of *systemic lupus erythematosus* and other connective tissue disorders, in conjunction with corticosteroids for patients with severe or progressive renal disease, and in cases of *polymyositis* which are resistant to corticosteroids. Azathioprine has a corticosteroid-sparing effect in patients whose corticosteroid requirements are excessive.

Ciclosporin p. 486 is rarely used in juvenile idiopathic arthritis, connective tissue diseases, vasculitis, and uveitis; it may be considered if the condition has failed to respond to other treatments.

Cytokine modulators

Cytokine modulators should be used under specialist supervision.

Adalimumab p. 598, etanercept p. 600, and infliximab p. 30 inhibit the activity of tumour necrosis factor alpha (TNF- α). Adalimumab can be used for the management of active polyarticular juvenile idiopathic arthritis and enthesitis-related arthritis. Etanercept is licensed for the treatment of the following subtypes of juvenile idiopathic arthritis: polyarticular juvenile idiopathic arthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, oligoarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it, psoriatic arthritis in children over 12 years who have had an inadequate response to methotrexate or cannot tolerate it, and enthesitis-related arthritis in children over 12 years who have had an inadequate response to conventional therapy or cannot tolerate it. Infliximab has been used in

refractory polyarticular juvenile idiopathic arthritis [unlicensed indication] when other treatments, such as etanercept, have failed.

Abatacept p. 598 prevents the full activation of T-lymphocytes; it can be used for the management of active polyarticular juvenile idiopathic arthritis. Abatacept is not recommended for use in combination with TNF inhibitors.

Canakinumab p. 491 inhibits the activity of interleukin-1 beta (IL-1 β) and is licensed for the treatment of active systemic juvenile idiopathic arthritis in children over 2 years, when there has been an inadequate response to NSAIDs and systemic corticosteroids.

Tocilizumab p. 597 antagonises the actions of interleukin-6; it can be used for the management of active systemic juvenile idiopathic arthritis when there has been an inadequate response to NSAIDs and systemic corticosteroids and polyarticular juvenile idiopathic arthritis when there has been an inadequate response to methotrexate. Tocilizumab can be used in combination with methotrexate, or as monotherapy if methotrexate is not tolerated or is contra-indicated. Tocilizumab is not recommended for use with other cytokine modulators.

Sulfasalazine

Sulfasalazine has a beneficial effect in suppressing the inflammatory activity associated with some forms of juvenile idiopathic arthritis; it is generally not used in systemic-onset disease.

Drugs used for Arthritis not listed below Diclofenac potassium, p. 605 · Diclofenac sodium, p. 605 · Etoricoxib, p. 607 · Flurbiprofen, p. 608 · Ibuprofen, p. 608 · Indometacin, p. 611 · Ketoprofen, p. 612 · Meloxicam, p. 613 · Naproxen, p. 614 · Piroxicam, p. 615

DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS

Hydroxychloroquine sulfate

● INDICATIONS AND DOSE

Active rheumatoid arthritis (including juvenile idiopathic arthritis) (administered on expert advice) | Systemic and discoid lupus erythematosus (administered on expert advice) | Dermatological conditions caused or aggravated by sunlight (administered on expert advice)

► BY MOUTH

► Child: 5–6.5 mg/kg once daily (max. per dose 400 mg), dose given based on ideal body-weight

● **UNLICENSED USE** *Plaquenil*® not licensed for use in children for dermatological conditions caused or aggravated by sunlight.

● **CAUTIONS** Acute porphyrias p. 562 · G6PD deficiency · may aggravate myasthenia gravis · may exacerbate psoriasis · neurological disorders (especially in those with a history of epilepsy) · severe gastro-intestinal disorders

CAUTIONS, FURTHER INFORMATION

► **Screening for ocular toxicity** Hydroxychloroquine is rarely associated with ocular toxicity. The British Society for Paediatric and Adolescent Rheumatology recommends that children should have their vision tested before long-term treatment with hydroxychloroquine and have an annual review of visual acuity. Children should be referred to an ophthalmologist if there is visual impairment, changes in visual acuity, or blurred vision. The Royal College of Ophthalmologists has recommended that a locally agreed protocol between the prescribing doctor and ophthalmologist be established to monitor the vision of these children. A review group convened by the Royal College of Ophthalmologists has updated guidelines for screening to prevent ocular toxicity on long-term

treatment with hydroxychloroquine (*Hydroxychloroquine and Ocular Toxicity: Recommendations on Screening* 2009); this includes the recommendation that a child treated for juvenile idiopathic arthritis should receive slit-lamp examination routinely to check for uveitis.

● **INTERACTIONS** → Appendix 1 (hydroxychloroquine).

Concurrent use of hepatotoxic drugs should be avoided.

● SIDE-EFFECTS

- **Common or very common** Gastro-intestinal disturbances · headache · pruritus · rashes · skin reactions
- **Uncommon** Convulsions · discoloration of skin, nails, and mucous membranes · ECG changes · hair depigmentation · hair loss · keratopathy · ototoxicity · retinal damage · visual changes
- **Rare** Acute generalised exanthematous pustulosis · agranulocytosis · aplastic anaemia · blood disorders · cardiomyopathy · emotional disturbances · exfoliative dermatitis · hepatic damage · mental changes · myopathy · neuromyopathy · photosensitivity · psychosis · Stevens-Johnson syndrome · thrombocytopenia
- **Frequency not known** Angioedema · bronchospasm

Overdose

Hydroxychloroquine is very toxic in overdose; overdose is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

● **PREGNANCY** It is not necessary to withdraw an antimalarial drug during pregnancy if the rheumatic disease is well controlled; however, the manufacturer of hydroxychloroquine advises avoiding use.

● **BREAST FEEDING** Avoid—risk of toxicity in infant.

● **HEPATIC IMPAIRMENT** Caution in moderate to severe hepatic impairment.

● **RENAL IMPAIRMENT** Manufacturer advises caution.

Monitor plasma-hydroxychloroquine concentration in severe renal impairment.

● **PRESCRIBING AND DISPENSING INFORMATION** To avoid excessive dosage in obese patients, the dose of hydroxychloroquine should be calculated on the basis of ideal body-weight.

● **PATIENT AND CARER ADVICE** Do not take antacids for at least 4 hours before or after hydroxychloroquine to reduce possible interference with hydroxychloroquine absorption.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 21

► **Hydroxychloroquine sulfate (Non-proprietary)**

IMMUNOSUPPRESSANTS > INTERLEUKIN INHIBITORS

Tocilizumab

31.5.2016

● INDICATIONS AND DOSE

Active systemic juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have had an inadequate response to NSAIDs and systemic corticosteroids

► BY INTRAVENOUS INFUSION

- Child 2–17 years (body-weight up to 30 kg): 12 mg/kg every 2 weeks, review treatment if no improvement within 6 weeks
- Child 2–17 years (body-weight 30 kg and above): 8 mg/kg every 2 weeks, review treatment if no improvement within 6 weeks

Polyarticular juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have had an inadequate response to methotrexate

► BY INTRAVENOUS INFUSION

- Child 2–17 years (body-weight up to 30 kg): 10 mg/kg every 4 weeks, review treatment if no improvement within 12 weeks
- Child 2–17 years (body-weight 30 kg and above): 8 mg/kg every 4 weeks, review treatment if no improvement within 12 weeks

- **CONTRA-INDICATIONS** Do not initiate if absolute neutrophil count less than $2 \times 10^9/\text{litre}$ · severe active infection

- **CAUTIONS** History of diverticulitis · history of intestinal ulceration · history of recurrent or chronic infection (interrupt treatment if serious infection occurs) · low absolute neutrophil count · low platelet count · predisposition to infection (interrupt treatment if serious infection occurs)

CAUTIONS, FURTHER INFORMATION

- Tuberculosis Patients with latent tuberculosis should be treated with standard therapy before starting tocilizumab.

- **INTERACTIONS** → Appendix 1 (tocilizumab).

● SIDE-EFFECTS

- Common or very common Headache · hypercholesterolaemia · infection · neutropenia · raised hepatic transaminases · upper respiratory-tract infection
- Frequency not known Antibody formation · diarrhoea · infusion related reactions · nausea · thrombocytopenia

SIDE-EFFECTS, FURTHER INFORMATION

- Neutrophil and platelet counts Discontinue if absolute neutrophil count less than $0.5 \times 10^9/\text{litre}$ or platelet count less than $50 \times 10^3/\text{microlitre}$.

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during and for 3 months after treatment.

- **PREGNANCY** Manufacturer advises avoid unless essential—toxicity in *animal* studies.

- **BREAST FEEDING** Manufacturer advises use only if potential benefit outweighs risk—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—consult product literature.

- **RENAL IMPAIRMENT** Manufacturer advises monitor renal function closely in moderate or severe impairment.

● PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

● MONITORING REQUIREMENTS

- Monitor lipid profile 4–8 weeks after starting treatment and then as indicated.
- Monitor for demyelinating disorders.
- Monitor hepatic transaminases.
- Monitor neutrophil and platelet counts.

- **DIRECTIONS FOR ADMINISTRATION** For *intravenous infusion*; body-weight less than 30 kg, dilute requisite dose to a volume of 50 mL with Sodium chloride 0.9% and give over 1 hour; body-weight over 30 kg, dilute requisite dose to a volume of 100 mL with Sodium chloride 0.9% and give over 1 hour.

- **PATIENT AND CARER ADVICE** An alert card should be provided.

Patients and their carers should be advised to seek immediate medical attention if symptoms of infection occur, or if symptoms of diverticular perforation such as abdominal pain, haemorrhage, or fever accompanying change in bowel habits occur.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Tocilizumab for the treatment of systemic juvenile idiopathic arthritis (December 2011) NICE TA238

Tocilizumab is recommended for the treatment of systemic juvenile idiopathic arthritis in children aged over 2 years who have not responded adequately to NSAIDs, systemic corticosteroids and methotrexate, if the manufacturer makes tocilizumab available with the discount agreed as part of the patient access scheme.

Tocilizumab is not recommended for the treatment of systemic juvenile idiopathic arthritis in children whose disease continues to respond to methotrexate or who have not been treated with methotrexate.

Children currently receiving tocilizumab for systemic juvenile idiopathic arthritis who do not meet these criteria should have the option to continue treatment until it is considered appropriate to stop.

www.nice.org.uk/TA238

- Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373

Tocilizumab is recommended as an option for treatment of polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in children 2 years and older whose disease has responded inadequately to previous therapy with methotrexate and if the manufacturer provides tocilizumab with the discounts agreed in the patient access schemes.

RoActemra 80mg/4mL concentrate for solution for infusion vials | 1 vial [PoM] £102.40 (Hospital only)

IMMUNOSUPPRESSANTS > T-CELL ACTIVATION INHIBITORS

Abatacept

31.5.2016

● INDICATIONS AND DOSE

Moderate to severe active polyarticular juvenile idiopathic arthritis (in combination with methotrexate) in children who have not responded adequately to other disease-modifying antirheumatic drugs (including at least one tumour necrosis factor (TNF) inhibitor)

► BY INTRAVENOUS INFUSION

- Child 6–17 years (body-weight up to 75 kg): 10 mg/kg every 2 weeks for 3 doses, then 10 mg/kg every 4 weeks, review treatment if no response within 6 months
- Child 6–17 years (body-weight 75–100 kg): 750 mg every 2 weeks for 3 doses, then 750 mg every 4 weeks, review treatment if no response within 6 months
- Child 6–17 years (body-weight 101 kg and above): 1 g every 2 weeks for 3 doses, then 1 g every 4 weeks, review treatment if no response within 6 months

● CONTRA-INDICATIONS Severe infection

- **CAUTIONS** Children should be brought up to date with current immunisation schedule before initiating therapy. do not initiate until active infections are controlled. predisposition to infection (screen for latent tuberculosis and viral hepatitis). progressive multifocal leucoencephalopathy (discontinue treatment if neurological symptoms present)

● INTERACTIONS → Appendix 1 (abatacept).

● SIDE-EFFECTS

- **Common or very common** Abdominal pain · conjunctivitis · cough · diarrhoea · dizziness · dyspepsia · fatigue · flushing · headache · hypertension · infection · leucopenia · nausea · pain in extremities · paraesthesia · stomatitis · vomiting
- **Uncommon** Psoriasis · alopecia · anxiety · arthralgia · basal and squamous cell carcinoma · bradycardia · bronchospasm · bruising · depression · dry eye · dry skin · dyspnoea · gastritis · hyperhidrosis · hypotension · menstrual disturbances · palpitation · skin papilloma · sleep disorder · tachycardia · thrombocytopenia · visual disturbance · weight gain

► Frequency not known Lung cancer · lymphoma

- **CONCEPTION AND CONTRACEPTION** Effective contraception required during treatment and for 14 weeks after last dose.

- **PREGNANCY** Manufacturer advises avoid unless essential.

- **BREAST FEEDING** Present in milk in *animal* studies—manufacturer advises avoid breast-feeding during treatment and for 14 weeks after last dose.

- **DIRECTIONS FOR ADMINISTRATION** For intravenous infusion, given intermittently in Sodium chloride 0.9%; reconstitute each vial with 10 mL water for injections using the silicone-free syringe provided; dilute requisite dose in Sodium Chloride 0.9% to 100 mL (using the same silicone-free syringe); give over 30 minutes through a low protein-binding filter (pore size 0.2–1.2 micron).

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015) NICE TA373

Abatacept is recommended as options for treating polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in patients 6 years and older whose disease has responded inadequately to other disease-modifying anti-rheumatic drugs (DMARDs) including at least 1 tumour necrosis factor (TNF) inhibitor,

only if the manufacturer provides abatacept with the discounts agreed in the patient access schemes.

Abatacept 250 mg Orencia 250mg powder for concentrate for solution for infusion vials | 1 vial (POM) £302.40 (Hospital only)

IMMUNOSUPPRESSANTS > TUMOR NECROSIS FACTOR ALPHA (TNF- α) INHIBITORS

Adalimumab

31.5.2016

● INDICATIONS AND DOSE

Severe chronic plaque psoriasis in children who have had an inadequate response to, or are inappropriate for topical therapy and phototherapies

► BY SUBCUTANEOUS INJECTION

- Child 4–17 years: Initially 0.8 mg/kg every 1 week (max. per dose 40 mg) for 2 doses, then 0.8 mg/kg every 2 weeks (max. per dose 40 mg), review treatment if no response within 16 weeks; for further information on dose banding, consult product literature

Active polyarticular juvenile idiopathic arthritis (in combination with methotrexate or alone if methotrexate inappropriate) in children who have not responded adequately to one or more disease-modifying antirheumatic drug

► BY SUBCUTANEOUS INJECTION

- Child 2–3 years: 24 mg/m² every 2 weeks (max. per dose 20 mg), review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
- Child 4–12 years: 24 mg/m² every 2 weeks (max. per dose 40 mg), review treatment if no response within 12 weeks; for further information on dose banding, consult product literature
- Child 13–17 years: 40 mg every 2 weeks, review treatment if no response within 12 weeks; for further information on dose banding, consult product literature

Active enthesitis-related arthritis in children who have had an inadequate response to, or who are intolerant of, conventional therapy

► BY SUBCUTANEOUS INJECTION

- Child 6–17 years: 24 mg/m² every 2 weeks (max. per dose 40 mg), for further information on dose banding, consult product literature

Severe active Crohn's disease

► BY SUBCUTANEOUS INJECTION

- Child 6–17 years (body-weight up to 40 kg): Initially 40 mg, then 20 mg after 2 weeks; maintenance 20 mg every 2 weeks, increased if necessary to 20 mg once weekly, review treatment if no response within 12 weeks of initial dose
- Child 6–17 years (body-weight 40 kg and above): Initially 80 mg, then 40 mg after 2 weeks; maintenance 40 mg every 2 weeks, increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

Severe active Crohn's disease (accelerated regimen)

► BY SUBCUTANEOUS INJECTION

- Child 6–17 years (body-weight up to 40 kg): Initially 80 mg, then 40 mg after 2 weeks; maintenance 20 mg every 2 weeks, increased if necessary to 20 mg once

weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

- ▶ Child 6–17 years (body-weight 40 kg and above): Initially 160 mg, dose can alternatively be given as divided injections over 2 days, then 80 mg after 2 weeks; maintenance 40 mg every 2 weeks, then increased if necessary to 40 mg once weekly, maximum 40 mg administered at a single site, review treatment if no response within 12 weeks of initial dose

- **CONTRA-INDICATIONS** Moderate or severe heart failure · severe infection
- **CAUTIONS** Children should be brought up to date with current immunisation schedule before initiating therapy · demyelinating disorders (risk of exacerbation) · development of malignancy · do not initiate until active infections are controlled (discontinue if new serious infection develops) · hepatitis B virus—monitor for active infection · history of malignancy · mild heart failure (discontinue if symptoms develop or worsen) · predisposition to infection

CAUTIONS, FURTHER INFORMATION

- ▶ **Tuberculosis** Active tuberculosis should be treated with standard treatment for at least 2 months before starting adalimumab. Patients who have previously received adequate treatment for tuberculosis can start adalimumab but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting adalimumab. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with adalimumab.

- **INTERACTIONS** → Appendix 1 (adalimumab).

● SIDE-EFFECTS

- ▶ **Common or very common** Anxiety · benign tumours · chest pain · cough · dehydration · dermatitis · dizziness · dyspepsia · dyspnoea · electrolyte disturbances · eye disorders · flushing · gastrointestinal haemorrhage · haematuria · hyperlipidaemia · hypertension · hyperuricaemia · impaired healing · mood changes · musculoskeletal pain · oedema · onycholysis · paraesthesia · rash · renal impairment · skin cancer · sleep disturbances · tachycardia · vomiting
- ▶ **Uncommon** Aortic aneurysm · arrhythmias · cholecystitis · cholelithiasis · dysphagia · erectile dysfunction · hearing loss · hepatic steatosis · interstitial lung disease · leukaemia · lymphoma · malignancy · neuropathy · nocturia · pancreatitis · pneumonitis · rhabdomyolysis · solid tumours · tinnitus · tremor · vascular occlusion
- ▶ **Rare** Autoimmune hepatitis · demyelinating disorders · myocardial infarction
- ▶ **Frequency not known** Abdominal pain · anaemia · antibody formation · aplastic anaemia · blood disorders · cutaneous vasculitis · depression · fever · headache · hypersensitivity reactions · injection-site reactions · leucopenia · lupus erythematosus-like syndrome · nausea · new onset psoriasis · pancytopenia · pleural effusion · pruritus · pulmonary embolism · sarcoidosis · Stevens-Johnson syndrome · thrombocytopenia · worsening heart failure · worsening of symptoms of dermatomyositis · worsening psoriasis

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for at least 5 months after last dose.

- **PREGNANCY** Avoid.

- **BREAST FEEDING** Avoid; manufacturer advises avoid for at least 5 months after last dose.

● PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

● MONITORING REQUIREMENTS

- ▶ Monitor for infection before, during, and for 4 months after treatment.
- ▶ Monitor for non-melanoma skin cancer before and during treatment, especially in patients with a history of PUVA treatment for psoriasis or extensive immunosuppressant therapy.

- **PATIENT AND CARER ADVICE** An alert card should be provided.

Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

● NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- ▶ **Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015)**

NICE TA373

Adalimumab is recommended as an option for treating polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA in patients 2 years and older whose disease has responded inadequately to 1 or more disease-modifying antirheumatic drugs (DMARDs) and for treating enthesitis-related JIA in patients 6 years and older whose disease has responded inadequately to, or who are intolerant of, conventional therapy.

www.nice.org.uk/TA373

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (April 2015) that adalimumab (*Humira*®) is accepted for restricted use within NHS Scotland for the treatment of active enthesitis-related arthritis in children over 6 years of age who have had an inadequate response to, or who are intolerant of, conventional therapy, and is used within specialist rheumatology services (including those working within the network for paediatric rheumatology).

The *Scottish Medicines Consortium* has advised (June 2015) that adalimumab (*Humira*®) is accepted for restricted use within NHS Scotland for the treatment of severe chronic plaque psoriasis in children over 4 years who have had an inadequate response to, or are inappropriate for, topical therapy and phototherapies, and have severe disease as defined by a total Psoriasis Area Severity Index (PASI) score of ≥ 10 and a Dermatology Life Quality Index (DLQI) of > 10 .

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Solution for injection

CAUTIONARY AND ADVISORY LABELS 10

- ▶ **Humira** (AbbVie Ltd)

Adalimumab 50 mg per 1 ml Humira 40mg/0.8ml solution for injection pre-filled syringes | 2 pre-filled disposable injection [PoM] £704.28

Humira 40mg/0.8ml solution for injection pre-filled pen | 2 pre-filled disposable injection [PoM] £704.28

Etanercept

4.5.2016

• INDICATIONS AND DOSE

Polyarticular juvenile idiopathic arthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it | Oligoarthritis in children who have had an inadequate response to methotrexate or who cannot tolerate it | Psoriatic arthritis in children who have had an inadequate response to methotrexate or cannot tolerate it | Enthesitis-related arthritis in children who have had an inadequate response to conventional therapy or cannot tolerate it

► BY SUBCUTANEOUS INJECTION

- Child 2–16 years: 400 micrograms/kg twice weekly (max. per dose 25 mg), to be given at an interval of 3–4 days between doses, alternatively 800 micrograms/kg once weekly (max. per dose 50 mg), consider discontinuation if no response after 4 months

Severe plaque psoriasis either refractory to at least 2 standard systemic treatments and photochemotherapy, or when standard treatments cannot be used because of intolerance or contra-indications

► BY SUBCUTANEOUS INJECTION

- Child 6–17 years: 800 micrograms/kg once weekly (max. per dose 50 mg) for up to 24 weeks, discontinue if no response after 12 weeks

• CONTRA-INDICATIONS Active infection

- **CAUTIONS** Children should be brought up to date with current immunisation schedule before initiating therapy · development of malignancy · diabetes mellitus · heart failure (risk of exacerbation) · hepatitis B virus—monitor for active infection · hepatitis C infection (monitor for worsening infection) · history of blood disorders · history of malignancy · history or increased risk of demyelinating disorders · predisposition to infection (avoid if predisposition to septicaemia) · significant exposure to herpes zoster virus—interrupt treatment and consider varicella–zoster immunoglobulin

CAUTIONS, FURTHER INFORMATION

- Tuberculosis Active tuberculosis should be treated with standard treatment for at least 2 months before starting etanercept. Patients who have previously received adequate treatment for tuberculosis can start etanercept but should be monitored every 3 months for possible recurrence. In patients without active tuberculosis but who were previously not treated adequately, chemoprophylaxis should ideally be completed before starting etanercept. In patients at high risk of tuberculosis who cannot be assessed by tuberculin skin test, chemoprophylaxis can be given concurrently with etanercept.

• INTERACTIONS → Appendix 1 (etanercept).

• SIDE-EFFECTS

- **Uncommon** Interstitial lung disease · new onset or worsening psoriasis · rash · skin cancer · uveitis
- **Rare** Demyelinating disorders · lymphoma · seizures · Stevens–Johnson syndrome · vasculitis
- **Very rare** Toxic epidermal necrolysis
- **Frequency not known** Abdominal pain · anaemia · antibody formation · aplastic anaemia · appendicitis · blood disorders · cutaneous ulcer · depression · diabetes mellitus · fever · gastritis · headache · hypersensitivity reactions · inflammatory bowel disease · injection-site reactions · leucopenia · leukaemia · lupus erythematosus-like syndrome · macrophage activation syndrome · malignancy · nausea · oesophagitis · pancytopenia · pruritus · solid tumours · thrombocytopenia · vomiting · worsening heart failure

SIDE-EFFECTS, FURTHER INFORMATION

Associated with infections, sometimes severe, including tuberculosis, septicaemia, and hepatitis B reactivation.

- **CONCEPTION AND CONTRACEPTION** Manufacturer advises effective contraception required during treatment and for 3 weeks after last dose.

- **PREGNANCY** Avoid—limited information available.

- **BREAST FEEDING** Manufacturer advises avoid—present in milk in animal studies.

- **HEPATIC IMPAIRMENT** Use with caution in moderate to severe alcoholic hepatitis.

• PRE-TREATMENT SCREENING

Tuberculosis Patients should be evaluated for tuberculosis before treatment.

- **MONITORING REQUIREMENTS** Monitor for skin cancer before and during treatment, particularly in those at risk (including patients with psoriasis or a history of PUVA treatment).

- **PRESCRIBING AND DISPENSING INFORMATION** Products containing etanercept are not identical and although there should be no important differences in terms of safety and efficacy, when prescribing biological products it is good practice to use the brand name, see *Biosimilar medicines*, under Guidance on prescribing p. 1.

- **PATIENT AND CARER ADVICE** An alert card should be provided.

Blood disorders Patients and their carers should be advised to seek medical attention if symptoms suggestive of blood disorders (such as fever, sore throat, bruising, or bleeding) develop.

Tuberculosis Patients and their carers should be advised to seek medical attention if symptoms suggestive of tuberculosis (e.g. persistent cough, weight loss, and fever) develop.

• NATIONAL FUNDING/ACCESS DECISIONS

NICE technology appraisals (TAs)

- Abatacept, adalimumab, etanercept and tocilizumab for treating juvenile idiopathic arthritis (December 2015)

NICE TA373

Etanercept is recommended as an option for treating:

- polyarticular juvenile idiopathic arthritis (JIA), including polyarticular-onset, polyarticular-course and extended oligoarticular JIA, in patients 2 years and over whose disease has responded inadequately to, or who are intolerant of, methotrexate;
- enthesitis-related JIA in patients 12 years and over whose disease has responded inadequately to, or who are intolerant of, conventional therapy;
- psoriatic JIA in patients 12 years and over whose disease has responded inadequately to, or who are intolerant of, methotrexate.

www.nice.org.uk/TA373

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* issued similar advice to NICE TA103 on the use of etanercept for severe plaque psoriasis in adults (August 2009) and children over 6 years old (April 2012).

The *Scottish Medicines Consortium* has advised (January 2013) that etanercept (*Enbrel*®) is accepted for restricted use within NHS Scotland for the treatment of polyarthritis (rheumatoid factor positive or negative) and extended oligoarthritis in children and adolescents from the age of 2 years who have had an inadequate response to or are intolerant of methotrexate, psoriatic arthritis in adolescents from the age of 12 years who have had an inadequate response to or are intolerant of methotrexate, and enthesitis-related arthritis in adolescents from the age of 12 years who have had an inadequate response to or are intolerant of conventional therapy. It is further restricted to use within specialist rheumatology services (including

those working within the network for paediatric rheumatology).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

2 Neuromuscular disorders

Neuromuscular disorders

Drugs that enhance neuromuscular transmission

Anticholinesterases are used as first-line treatment in *ocular myasthenia gravis* and as an adjunct to immunosuppressant therapy for *generalised myasthenia gravis*.

Corticosteroids are used when anticholinesterases do not control symptoms completely. A second-line immunosuppressant such as azathioprine p. 485 is frequently used to reduce the dose of corticosteroid.

Plasmapheresis or infusion of intravenous immunoglobulin [unlicensed indication] may induce temporary remission in severe relapses, particularly where bulbar or respiratory function is compromised or before thymectomy.

Anticholinesterases

Anticholinesterase drugs enhance neuromuscular transmission in voluntary and involuntary muscle in *myasthenia gravis*. Excessive dosage of these drugs can impair neuromuscular transmission and precipitate cholinergic crises by causing a depolarising block. This may be difficult to distinguish from a worsening myasthenic state.

Muscarinic side-effects of anticholinesterases include increased sweating, increased salivary and gastric secretions, increased gastro-intestinal and uterine motility, and bradycardia. These parasympathomimetic effects are antagonised by atropine sulfate p. 624.

Neostigmine p. 602 produces a therapeutic effect for up to 4 hours. Its pronounced muscarinic action is a disadvantage, and simultaneous administration of an antimuscarinic drug such as atropine sulfate or propantheline bromide p. 58 may be required to prevent colic, excessive salivation, or diarrhoea. In severe disease neostigmine can be given every 2 hours. In infants, neostigmine by either subcutaneous or intramuscular injection is preferred for the short-term management of myasthenia.

Pyridostigmine bromide p. 602 is less powerful and slower in action than neostigmine but it has a longer duration of

action. It is preferable to neostigmine because of its smoother action and the need for less frequent dosage. It is particularly preferred in patients whose muscles are weak on waking. It has a comparatively mild gastrointestinal effect but an antimuscarinic drug may still be required. It is inadvisable to use excessive doses because acetylcholine receptor down regulation may occur. Immunosuppressant therapy may be considered if high doses of pyridostigmine bromide are needed.

Neostigmine and pyridostigmine bromide should be given to neonates 30 minutes before feeds to improve suckling.

Neostigmine is also used to reverse the actions of the non-depolarising neuromuscular blocking drugs.

Immunosuppressant therapy

A course of **corticosteroids** is an established treatment in severe cases of *myasthenia gravis* and may be particularly useful when antibodies to the acetylcholine receptor are present in high titre. Short courses of high-dose ('pulsed') methylprednisolone p. 412 followed by maintenance therapy with oral corticosteroids may also be useful.

Corticosteroid treatment is usually initiated under specialist supervision. Transient but very serious worsening of symptoms can occur in the first 2–3 weeks, especially if the corticosteroid is started at a high dose. Once remission has occurred (usually after 2–6 months), the dose of prednisolone p. 413 should be reduced slowly to the minimum effective dose.

Skeletal muscle relaxants

The drugs described are used for the relief of chronic muscle spasm or spasticity associated with neurological damage; they are not indicated for spasm associated with minor injuries. They act principally on the central nervous system with the exception of dantrolene, which has a peripheral site of action. They differ in action from the muscle relaxants used in anaesthesia, which block transmission at the neuromuscular junction.

The underlying cause of spasticity should be treated and any aggravating factors (e.g. pressure sores, infection) remedied. Skeletal muscle relaxants are effective in most forms of spasticity except the rare alpha variety. The major disadvantage of treatment with these drugs is that reduction in muscle tone can cause a loss of splinting action of the spastic leg and trunk muscles and sometimes lead to an increase in disability.

Dantrolene sodium p. 775 acts directly on skeletal muscle and produces fewer central adverse effects. It is generally used in resistant cases. The dose should be increased slowly.

Baclofen p. 603 inhibits transmission at spinal level and also depresses the central nervous system. The dose should be increased slowly to avoid the major side-effects of sedation and muscular hypotonia (other adverse events are uncommon).

Diazepam p. 207 has undoubted efficacy in some children. Sedation and occasionally extensor hypotonus are disadvantages. Other benzodiazepines also have muscle-relaxant properties.

2.1 Myasthenia gravis

ANTICHOLINESTERASES > OTHER

Anticholinesterases

● **DRUG ACTION** They prolong the action of acetylcholine by inhibiting the action of the enzyme acetylcholinesterase.

● **CONTRA-INDICATIONS** Intestinal obstruction · urinary obstruction

- **CAUTIONS** Arrhythmias · asthma (extreme caution) · atropine or other antidote to muscarinic effects may be necessary (particularly when neostigmine is given by injection) but not given routinely because it may mask signs of overdosage · bradycardia · epilepsy · hyperthyroidism · hypotension · parkinsonism · peptic ulceration · recent myocardial infarction · vagotonia
- **INTERACTIONS** → Appendix 1 (parasympathomimetics).
- **SIDE-EFFECTS** Abdominal cramps (more marked with higher doses) · diarrhoea · increased salivation · nausea · vomiting

Overdose

Signs of overdosage include bronchoconstriction, increased bronchial secretions, lacrimation, excessive sweating, involuntary defaecation, involuntary micturition, miosis, nystagmus, bradycardia, heart block, arrhythmias, hypotension, agitation, excessive dreaming, and weakness eventually leading to fasciculation and paralysis.

- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Amount probably too small to be harmful.

F 601

Neostigmine

(Neostigmine methylsulfate)

● **INDICATIONS AND DOSE****Treatment of myasthenia gravis**

► BY MOUTH

- Neonate: Initially 1–2 mg, then 1–5 mg every 4 hours, given 30 minutes before feeds.
- Child 1 month–5 years: Initially 7.5 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg
- Child 6–11 years: Initially 15 mg, dose repeated at suitable intervals throughout the day, total daily dose 15–90 mg
- Child 12–17 years: Initially 15–30 mg, dose repeated at suitable intervals throughout the day, total daily dose 75–300 mg, the maximum that most patients can tolerate is 180 mg daily

► BY SUBCUTANEOUS INJECTION, OR BY INTRAMUSCULAR INJECTION

- Neonate: 150 micrograms/kg every 6–8 hours, to be given 30 minutes before feeds, then increased if necessary up to 300 micrograms/kg every 4 hours.
- Child 1 month–11 years: 200–500 micrograms, dose repeated at suitable intervals throughout the day
- Child 12–17 years: 1–2.5 mg, dose repeated at suitable intervals throughout the day

Reversal of non-depolarising (competitive) neuromuscular blockade

► BY INTRAVENOUS INJECTION

- Neonate: 50 micrograms/kg, to be given over 1 minute after or with glycopyrronium or atropine, followed by 25 micrograms/kg if required.
- Child 1 month–11 years: 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg if required
- Child 12–17 years: 50 micrograms/kg (max. per dose 2.5 mg), to be given over 1 minute after or with glycopyrronium or atropine, then 25 micrograms/kg (max. per dose 2.5 mg) if required

● **UNLICENSED USE**

- In neonates Dose for treatment of myasthenia gravis by subcutaneous or intramuscular injection is unlicensed.
- **CAUTIONS**
- With intravenous use Glycopyrronium or atropine should also be given when reversing neuromuscular blockade
- **INTERACTIONS** → Appendix 1 (parasympathomimetics).
- **RENAL IMPAIRMENT** May need dose reduction.
- **DIRECTIONS FOR ADMINISTRATION** For *intravenous injection*, give undiluted or dilute with Glucose 5% or Sodium Chloride 0.9%.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral solution

F 601

Pyridostigmine bromide

- **DRUG ACTION** Pyridostigmine bromide has weaker muscarinic action than neostigmine.

● **INDICATIONS AND DOSE****Myasthenia gravis**

► INITIALLY BY MOUTH

- Neonate: Initially 1–1.5 mg/kg, dose repeated throughout the day, then (by mouth using immediate-release medicines) increased if necessary up to 10 mg, to be increased gradually and given 30–60 minutes before feeds.
- Child 1 month–11 years: Initially 1–1.5 mg/kg daily, then (by mouth using immediate-release medicines) increased to 7 mg/kg daily in 6 divided doses, to be increased gradually; (by mouth using immediate-release medicines) usual dose 30–360 mg daily in divided doses
- Child 12–17 years: 30–120 mg, dose repeated throughout the day; (by mouth using immediate-release medicines) usual dose 300–600 mg daily in divided doses, consider immunosuppressant therapy if total daily dose exceeds 360 mg, down-regulation of acetylcholine receptors possible if total daily dose exceeds 450 mg

- **RENAL IMPAIRMENT** Reduce dose; excreted by kidney.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet► **Pyridostigmine bromide (Non-proprietary)**

Pyridostigmine bromide 60 mg Pyridostigmine bromide 60mg tablets | 200 tablet [PoM] £45.58 DT price = £45.58

► **Mestinon** (Meda Pharmaceuticals Ltd)

Pyridostigmine bromide 60 mg Mestinon 60mg tablets | 200 tablet [PoM] £45.57 DT price = £45.58

2.2 Spasticity

MUSCLE RELAXANTS > CENTRALLY ACTING

Baclofen

● INDICATIONS AND DOSE

Chronic severe spasticity of voluntary muscle

► BY MOUTH

- Child 1 month–7 years: Initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; maintenance 0.75–2 mg/kg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 40 mg per day
- Child 8–17 years: Initially 300 micrograms/kg daily in 4 divided doses, increased gradually at weekly intervals until satisfactory response; maintenance 0.75–2 mg/kg daily in divided doses, review treatment if no benefit within 6 weeks of achieving maximum dose; maximum 60 mg per day

Severe chronic spasticity of cerebral or spinal origin unresponsive to oral antispastic drugs (or oral therapy not tolerated) (specialist use only)

► BY INTRATHECAL INJECTION

- Child 4–17 years: Test dose 25–50 micrograms, to be given over at least 1 minute via catheter or lumbar puncture, then increased in steps of 25 micrograms (max. per dose 100 micrograms), not more often than every 24 hours to determine initial maintenance dose; maintenance 25–200 micrograms daily, adjusted according to response, dose–titration phase, most often using infusion pump (implanted into chest wall or abdominal wall tissues) to establish maintenance dose retaining some spasticity to avoid sensation of paralysis

IMPORTANT SAFETY INFORMATION

Consult product literature for details on test dose and titration—important to monitor patients closely in appropriately equipped and staffed environment during screening and immediately after pump implantation. Resuscitation equipment must be available for immediate use. Treatment with continuous pump-administered intrathecal baclofen should be initiated within 3 months of a satisfactory response to intrathecal baclofen testing.

● CONTRA-INDICATIONS

- With intrathecal use Local infection · systemic infection
- With oral use Avoid oral route in active peptic ulceration

● CAUTIONS

GENERAL CAUTIONS

Diabetes · epilepsy · history of peptic ulcer · hypertonic bladder sphincter · psychiatric illness · respiratory impairment

SPECIFIC CAUTIONS

- With intrathecal use Coagulation disorders · malnutrition (increased risk of post-surgical complications) · previous spinal fusion procedure

- INTERACTIONS → Appendix 1 (muscle relaxants).

● SIDE-EFFECTS

- Common or very common Agitation · anxiety · ataxia · cardiovascular depression · confusion · depression · dizziness · drowsiness · dry mouth · euphoria · gastro-intestinal disturbances · hallucinations · headache · hyperhidrosis · hypotension · insomnia · myalgia · nightmares · rash · respiratory depression · sedation · seizure · tremor · urinary disturbances · visual disorders

- Rare Abdominal pain · changes in hepatic function · dysarthria · erectile dysfunction · paraesthesia · taste disturbances

- Very rare Hypothermia

- PREGNANCY Manufacturer advises use only if potential benefit outweighs risk (toxicity in *animal* studies).

- BREAST FEEDING Present in milk—amount probably too small to be harmful.

● HEPATIC IMPAIRMENT

- With oral use Manufacturer advises use with caution.

● RENAL IMPAIRMENT

- With oral use Risk of toxicity—use smaller oral doses and if necessary increase dosage interval; if estimated glomerular filtration rate less than 15 mL/minute/1.73 m² use by mouth only if potential benefit outweighs risk. Excreted by the kidney.

- TREATMENT CESSATION Avoid abrupt withdrawal (risk of hyperactive state, may exacerbate spasticity, and precipitate autonomic dysfunction including hyperthermia, psychiatric reactions and convulsions; to minimise risk, discontinue by gradual dose reduction over at least 1–2 weeks (longer if symptoms occur)).

- PRESCRIBING AND DISPENSING INFORMATION Flavours of oral liquid formulations may include raspberry.

● PATIENT AND CARER ADVICE

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

3 Pain and inflammation in musculoskeletal disorders

Non-steroidal anti-inflammatory drugs

Therapeutic effects

In *single doses* non-steroidal anti-inflammatory drugs (NSAIDs) have analgesic activity comparable to that of paracetamol p. 254 but paracetamol is preferred.

In regular *full dosage* NSAIDs have both a lasting analgesic and an anti-inflammatory effect which makes them particularly useful for the treatment of continuous or regular pain associated with inflammation.

Choice

Differences in anti-inflammatory activity between NSAIDs are small, but there is considerable variation in individual response and tolerance of these drugs. A large proportion of children will respond to any NSAID; of the others, those who do not respond to one may well respond to another. Pain relief starts soon after taking the first dose and a full analgesic effect should normally be obtained within a week, whereas an anti-inflammatory effect may not be achieved (or may not be clinically assessable) for up to 3 weeks. However, in juvenile idiopathic arthritis NSAIDs may take 4–12 weeks to be effective. If appropriate responses are not obtained within these times, another NSAID should be tried. The availability of appropriate formulations needs to be considered when prescribing NSAIDs for children.

NSAIDs reduce the production of prostaglandins by inhibiting the enzyme cyclo-oxygenase. They vary in their selectivity for inhibiting different types of cyclo-oxygenase; selective inhibition of cyclo-oxygenase-2 is associated with less gastro-intestinal intolerance. However, in children gastro-intestinal symptoms are rare in those taking NSAIDs for short periods. The role of selective inhibitors of cyclo-oxygenase-2 is undetermined in children.

Ibuprofen p. 608 and naproxen p. 614 are propionic acid derivatives used in children.

Ibuprofen combines anti-inflammatory, analgesic, and antipyretic properties. It has fewer side-effects than other NSAIDs but its anti-inflammatory properties are weaker.

Naproxen combines good efficacy with a low incidence of side-effects.

Diclofenac sodium p. 605, diclofenac potassium p. 605, indometacin p. 611, mefenamic acid p. 612, and piroxicam p. 615 have properties similar to those of propionic acid derivatives:

Diclofenac sodium and diclofenac potassium are similar in efficacy to naproxen.

Indometacin has an action equal to or superior to that of naproxen, but with a high incidence of side-effects including headache, dizziness, and gastro-intestinal disturbances. It is rarely used in children and should be reserved for when other NSAIDs have been unsuccessful.

Mefenamic acid has minor anti-inflammatory properties. It has occasionally been associated with diarrhoea and haemolytic anaemia which require discontinuation of treatment.

Piroxicam is as effective as naproxen and has a long duration of action which permits once-daily administration. However, it has more gastro-intestinal side-effects than

most other NSAIDs, and is associated with more frequent serious skin reactions.

Meloxicam p. 613 is a selective inhibitor of cyclo-oxygenase-2. Its use may be considered in adolescents intolerant to other NSAIDs.

Ketorolac trometamol p. 636 can be used for the short-term management of postoperative pain.

Etoricoxib p. 607, a selective inhibitor of cyclo-oxygenase-2, is licensed for the relief of pain in osteoarthritis, rheumatoid arthritis, ankylosing spondylitis, and acute gout in children aged 16 years and over.

Dental and orofacial pain

Most mild to moderate dental pain and inflammation is effectively relieved by ibuprofen, diclofenac potassium or diclofenac sodium.

NSAIDs and cardiovascular events

The risk of cardiovascular events secondary to NSAID use is undetermined in children. In adults, all NSAID use (including cyclo-oxygenase-2 selective inhibitors) can, to varying degrees, be associated with a small increased risk of thrombotic events (e.g. myocardial infarction and stroke) independent of baseline cardiovascular risk factors or duration of NSAID use; however, the greatest risk may be in those patients receiving high doses long term. A small increased thrombotic risk cannot be excluded in children.

In adults, cyclo-oxygenase-2 selective inhibitors, diclofenac (150 mg daily) and ibuprofen (2.4 g daily) are associated with an increased risk of thrombotic events. The increased risk for diclofenac is similar to that of etoricoxib. Naproxen (in adults, 1 g daily) is associated with a lower thrombotic risk, and lower doses of ibuprofen (in adults, 1.2 g daily or less) have not been associated with an increased risk of myocardial infarction.

The lowest effective dose of NSAID should be prescribed for the shortest period of time to control symptoms, and the need for long-term treatment should be reviewed periodically.

NSAIDs and gastro-intestinal events

All NSAIDs are associated with gastro-intestinal toxicity. In adults, evidence on the relative safety of NSAIDs indicates differences in the risks of serious upper gastro-intestinal side-effects—piroxicam and ketorolac trometamol are associated with the highest risk; indometacin, diclofenac, and naproxen are associated with intermediate risk, and ibuprofen with the lowest risk (although high doses of ibuprofen have been associated with intermediate risk). Selective inhibitors of cyclo-oxygenase-2 are associated with a *lower risk* of serious upper gastro-intestinal side-effects than non-selective NSAIDs.

Children appear to tolerate NSAIDs better than adults and gastro-intestinal side-effects are less common although they do still occur and can be significant; use of gastro-protective drugs may be necessary.

Asthma

All NSAIDs have the potential to worsen asthma, either acutely or as a gradual worsening of symptoms; consider both prescribed NSAIDs and those that are purchased over the counter.

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Diclofenac potassium

● INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders

► BY MOUTH

- Child 14–17 years: 75–100 mg daily in 2–3 divided doses

Postoperative pain

► BY MOUTH

- Child 9–13 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day
- Child 14–17 years: 75–100 mg daily in 2–3 divided doses

Fever in ear, nose, or throat infection

► BY MOUTH

- Child 9–17 years (body-weight 35 kg and above): Up to 2 mg/kg daily in 3 divided doses; maximum 100 mg per day

- **UNLICENSED USE** Voltarol® *Rapid* not licensed for use in children under 14 years or in fever.
- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
 - **Rare** Aleveitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
 - **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of

fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Amount in milk too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** The lowest effective dose should be used for the shortest possible duration. Avoid if possible or use with caution. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **PATIENT AND CARER ADVICE**

VOLTAROL® SOLUTION FOR INJECTION**Postoperative pain**

► BY INTRAVENOUS INFUSION, OR BY DEEP INTRAMUSCULAR INJECTION

- Child 2–17 years: 0.3–1 mg/kg 1–2 times a day for maximum 2 days, for intramuscular injection, to be injected into the gluteal muscle; maximum 150 mg per day

- **UNLICENSED USE** Not licensed for use in children under 1 year. *Suppositories* not licensed for use in children under 6 years except for use in children over 1 year for juvenile idiopathic arthritis. Solid dose forms containing more than 25 mg not licensed for use in children. *Injection* not licensed for use in children.

● **CONTRA-INDICATIONS****GENERAL CONTRA-INDICATIONS**

Active gastro-intestinal bleeding · active gastro-intestinal ulceration · avoid injections containing benzyl alcohol in neonates; avoid suppositories in proctitis · cerebrovascular disease · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease

SPECIFIC CONTRA-INDICATIONS

- With intravenous use Dehydration · history of asthma · history of confirmed or suspected cerebrovascular bleeding · history of haemorrhagic diathesis · hypovolaemia · operations with high risk of haemorrhage

● **CAUTIONS**

- With systemic use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- With intravenous use Contra-indicated in concomitant NSAID use. Contra-indicated in concomitant anticoagulant use (including low-dose heparins).

● **SIDE-EFFECTS****GENERAL SIDE-EFFECTS**

- **Rare** Allergic · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal

ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SPECIFIC SIDE-EFFECTS

- **Frequency not known**
- With intramuscular use or intravenous use Injection site reactions
- With rectal use Suppositories may cause rectal irritation

SIDE-EFFECTS, FURTHER INFORMATION

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount in milk too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. If used, the lowest effective dose should be given for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- With intravenous use Contra-indicated in moderate or severe renal impairment.
- **DIRECTIONS FOR ADMINISTRATION**
- With intravenous use For *intravenous infusion*, dilute 75 mg with 100–500 mL Glucose 5% or Sodium Chloride 0.9% (previously buffered with 0.5 mL Sodium Bicarbonate 8.4% solution or with 1 mL Sodium Bicarbonate 4.2% solution); give over 30–120 minutes.

- Medicines for Children leaflet: Diclofenac for pain and inflammation www.medicinesforchildren.org.uk/diclofenac-for-pain-and-inflammation

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: dispersible tablet, oral suspension, oral solution

Dispersible tablet

CAUTIONARY AND ADVISORY LABELS 13, 21

- **Voltarol** (Novartis Pharmaceuticals UK Ltd)

Diclofenac sodium 50 mg Voltarol 50mg dispersible tablets sugar-free | 21 tablet [PoM] £7.43 DT price = £7.43

Modified-release tablet

CAUTIONARY AND ADVISORY LABELS 21, 25

- **Voltarol Retard** (Novartis Pharmaceuticals UK Ltd)

Diclofenac sodium 100 mg Voltarol Retard 100mg tablets | 28 tablet [PoM] £11.36 DT price = £11.36

- **Voltarol SR** (Novartis Pharmaceuticals UK Ltd)

Diclofenac sodium 75 mg Voltarol 75mg SR tablets | 28 tablet [PoM] £7.75 | 56 tablet [PoM] £15.50 DT price = £15.50

Gastro-resistant tablet

CAUTIONARY AND ADVISORY LABELS 5, 25

► **Diclofenac sodium (Non-proprietary)**

Diclofenac sodium 25 mg Diclofenac sodium 25mg gastro-resistant tablets | 28 tablet [PoM] £2.25–£8.99 DT price = £2.45 | 84 tablet [PoM] £8.16

Diclofenac sodium 50 mg Diclofenac sodium 50mg gastro-resistant tablets | 28 tablet [PoM] £4.97 DT price = £3.29 | 84 tablet [PoM] £15.00 | 100 tablet [PoM] no price available

► **Dicloflex** (Dexcel-Pharma Ltd, Almus Pharmaceuticals Ltd)

Diclofenac sodium 25 mg Dicloflex 25mg gastro-resistant tablets | 84 tablet [PoM] £4.42

Diclofenac sodium 50 mg Dicloflex 50mg gastro-resistant tablets | 28 tablet [PoM] £2.75 DT price = £3.29 (Hospital only) | 84 tablet [PoM] £8.05–£8.85

► **Fenactol** (Discovery Pharmaceuticals)

Diclofenac sodium 50 mg Fenactol 50mg gastro-resistant tablets | 100 tablet [PoM] £3.70

► **Voltarol** (Novartis Pharmaceuticals UK Ltd)

Diclofenac sodium 25 mg Voltarol 25mg gastro-resistant tablets | 84 tablet [PoM] £2.94

Diclofenac sodium 50 mg Voltarol 50mg gastro-resistant tablets | 10 tablet [PoM] £0.91 (Hospital only) | 14 tablet [PoM] no price available (Hospital only) | 84 tablet [PoM] £4.57 | 90 tablet [PoM] £5.88

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 21 (does not apply to Motifene® 75 mg), 25

EXCIPIENTS: May contain Propylene glycol

► **Diclomax Retard** (Galen Ltd)

Diclofenac sodium 100 mg Diclomax Retard 100mg capsules | 28 capsule [PoM] £6.97 DT price = £6.97

► **Diclomax SR** (Galen Ltd)

Diclofenac sodium 75 mg Diclomax SR 75mg capsules | 56 capsule [PoM] £9.69 DT price = £9.69

► **Motifene** (Daiichi Sankyo UK Ltd)

Diclofenac sodium 75 mg Motifene 75mg modified-release capsules | 56 capsule [PoM] £8.00 DT price = £8.00

Solution for injection

EXCIPIENTS: May contain Benzyl alcohol, propylene glycol

► **Voltarol** (Novartis Pharmaceuticals UK Ltd)

Diclofenac sodium 25 mg per 1 ml Voltarol 75mg/3ml solution for injection ampoules | 10 ampoule [PoM] £9.91 DT price = £9.91

Suppository► **Diclofenac sodium (Non-proprietary)**

Diclofenac sodium 100 mg Diclofenac 100mg suppositories | 10 suppository [PoM] £7.75 DT price = £3.64

► **Econac** (AMCo)

Diclofenac sodium 100 mg Econac 100mg suppositories | 10 suppository [PoM] £3.04 DT price = £3.64

► **Voltarol** (Novartis Pharmaceuticals UK Ltd)

Diclofenac sodium 12.5 mg Voltarol 12.5mg suppositories | 10 suppository [PoM] £0.70 DT price = £0.70

Diclofenac sodium 25 mg Voltarol 25mg suppositories | 10 suppository [PoM] £1.24 DT price = £1.24

Diclofenac sodium 50 mg Voltarol 50mg suppositories | 10 suppository [PoM] £2.04 DT price = £2.04

Diclofenac sodium 100 mg Voltarol 100mg suppositories | 10 suppository [PoM] £3.64 DT price = £3.64

Etoricoxib● **INDICATIONS AND DOSE****Pain and inflammation in osteoarthritis**► **BY MOUTH**

- Child 16–17 years: 30 mg once daily, then increased if necessary to 60 mg once daily

Pain and inflammation in rheumatoid arthritis |**Ankylosing spondylitis**► **BY MOUTH**

- Child 16–17 years: 90 mg once daily

Acute gout► **BY MOUTH**

- Child 16–17 years: 120 mg once daily for maximum 8 days

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · cerebrovascular disease · inflammatory bowel disease · ischaemic heart disease · mild to severe heart failure · peripheral arterial disease · uncontrolled hypertension (persistently above 140/90 mmHg)
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · dehydration · history of cardiac failure · hypertension · left ventricular dysfunction · oedema · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated)
- **INTERACTIONS** → Appendix 1 (NSAIDs).

● **SIDE-EFFECTS**

- **Common or very common** Ecchymosis · fatigue · influenza-like symptoms · palpitation
- **Uncommon** Anxiety · appetite change · arthralgia · atrial fibrillation · chest pain · cough · dry mouth · dyspnoea · electrolyte disturbance · epistaxis · flushing · mental acuity impaired · mouth ulcer · myalgia · paraesthesia · taste disturbance · transient ischaemic attack · weight change
- **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
- **Very rare** Confusion · hallucinations
- **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.
- **PREGNANCY** Manufacturer advises avoid (teratogenic in animal studies). Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Manufacturer advises avoid—present in milk in animal studies.
- **HEPATIC IMPAIRMENT** Max. 60 mg daily in mild impairment. Max. 60 mg on alternate days or 30 mg once daily in moderate impairment. Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m². If used, the lowest effective dose should be given for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **MONITORING REQUIREMENTS** Monitor blood pressure before treatment, 2 weeks after initiation and periodically during treatment.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Tablet

▶ Arcoxia (Grunenthal Ltd)

Etoricoxib 30 mg Arcoxia 30mg tablets | 28 tablet [PoM](#) | £13.99 DT price = £13.99

Etoricoxib 60 mg Arcoxia 60mg tablets | 28 tablet [PoM](#) | £20.11 DT price = £20.11

Etoricoxib 120 mg Arcoxia 120mg tablets | 7 tablet [PoM](#) | £6.03 | 28 tablet [PoM](#) | £24.11 DT price = £24.11

Flurbiprofen

INDICATIONS AND DOSE

Pain and inflammation in rheumatic disease and other musculoskeletal disorders | Migraine | Postoperative analgesia | Mild to moderate pain

▶ BY MOUTH

- ▶ Child 12–17 years: 150–200 mg daily in 2–4 divided doses, then increased to 300 mg daily, dose to be increased only in acute conditions

Dysmenorrhoea

▶ BY MOUTH

- ▶ Child 12–17 years: Initially 100 mg, then 50–100 mg every 4–6 hours; maximum 300 mg per day

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
 - ▶ **Common or very common** Stomatitis
 - ▶ **Uncommon** Confusion · fatigue · hallucinations · paraesthesia
 - ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
 - ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid

retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Small amount present in milk—manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. If used, the lowest effective dose should be given for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

MEDICINAL FORMS

Tablet

CAUTIONARY AND ADVISORY LABELS 21

▶ Flurbiprofen (Non-proprietary)

Flurbiprofen 50 mg Flurbiprofen 50mg tablets | 100 tablet [PoM](#) | £21.30–£35.97 DT price = £30.29

Flurbiprofen 100 mg Flurbiprofen 100mg tablets | 100 tablet [PoM](#) | £64.34 DT price = £54.18

Ibuprofen

INDICATIONS AND DOSE

Closure of ductus arteriosus

▶ BY SLOW INTRAVENOUS INJECTION

- ▶ Neonate: Initially 10 mg/kg for 1 dose, followed by 5 mg/kg every 24 hours for 2 doses, the course may be repeated after 48 hours if necessary.

Mild to moderate pain | Pain and inflammation of soft-tissue injuries | Pyrexia with discomfort

▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- ▶ Child 1–2 months: 5 mg/kg 3–4 times a day
- ▶ Child 3–5 months: 50 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- ▶ Child 6–11 months: 50 mg 3–4 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- ▶ Child 1–3 years: 100 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day

- ▶ Child 4–6 years: 150 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day
- ▶ Child 7–9 years: 200 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- ▶ Child 10–11 years: 300 mg 3 times a day, maximum daily dose to be given in 3–4 divided doses; maximum 30 mg/kg per day; maximum 2.4 g per day
- ▶ Child 12–17 years: Initially 300–400 mg 3–4 times a day; increased if necessary up to 600 mg 4 times a day; maintenance 200–400 mg 3 times a day, may be adequate

Pain and inflammation

- ▶ BY MOUTH USING MODIFIED-RELEASE MEDICINES
- ▶ Child 12–17 years: 1.6 g once daily, dose preferably taken in the early evening, increased to 2.4 g daily in 2 divided doses, dose to be increased only in severe cases

Pain and inflammation in rheumatic disease including juvenile idiopathic arthritis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 3 months–17 years: 30–40 mg/kg daily in 3–4 divided doses; maximum 2.4 g per day

Pain and inflammation in systemic juvenile idiopathic arthritis

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 3 months–17 years: Up to 60 mg/kg daily in 4–6 divided doses; maximum 2.4 g per day

Post-immunisation pyrexia in infants (on doctor's advice only)

- ▶ BY MOUTH USING IMMEDIATE-RELEASE MEDICINES
- ▶ Child 2–3 months: 50 mg for 1 dose, followed by 50 mg after 6 hours if required

● UNLICENSED USE

- ▶ With intravenous use in neonates Orphan licence for the injection for closure of ductus arteriosus in premature neonates less than 34 weeks corrected gestational age.
- ▶ With oral use Not licensed for use in children under 3 months or body-weight under 5 kg. Maximum dose for systemic juvenile idiopathic arthritis is unlicensed.

● CONTRA-INDICATIONS

- ▶ With intravenous use in neonates Active bleeding (especially intracranial or gastro-intestinal) · coagulation defects · known or suspected necrotising enterocolitis · life-threatening infection · marked unconjugated hyperbilirubinaemia · pulmonary hypertension · thrombocytopenia
- ▶ With oral use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

● CAUTIONS

- ▶ With intravenous use in neonates May mask symptoms of infection
- ▶ With oral use Cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

CAUTIONS, FURTHER INFORMATION

- ▶ High-dose ibuprofen A small increase in cardiovascular risk, similar to the risk associated with cyclo-oxygenase-2

inhibitors and diclofenac, has been reported with high-dose ibuprofen (≥ 2.4 g daily); use should be avoided in patients with established ischaemic heart disease, peripheral arterial disease, cerebrovascular disease, congestive heart failure (New York Heart Association classification II–III), and uncontrolled hypertension.

- **INTERACTIONS** → Appendix 1 (NSAIDs).

● SIDE-EFFECTS

▶ Common or very common

- ▶ With intravenous use in neonates Bronchopulmonary dysplasia · fluid retention · haematuria · hyponatraemia · intestinal perforation · intra-ventricular haemorrhage · ischaemic brain injury · neutropenia · oliguria · pulmonary haemorrhage · thrombocytopenia

▶ Uncommon

- ▶ With intravenous use in neonates Gastrointestinal haemorrhage

▶ Rare

- ▶ With oral use Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances

▶ Frequency not known

- ▶ With intravenous use in neonates Hypoxaemia
- ▶ With oral use Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.

Overdose

Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Charcoal, activated p. 793 followed by symptomatic measures are indicated if more than 100 mg/kg has been ingested within the preceding hour.

For details on the management of poisoning, see Emergency treatment of poisoning p. 786.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but some manufacturers advise avoid.

● HEPATIC IMPAIRMENT

- ▶ With intravenous use in neonates Increased risk of gastro-

intestinal bleeding and fluid retention. Avoid in severe liver disease.

- ▶ With oral use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.

● RENAL IMPAIRMENT

- ▶ With intravenous use in neonates Use lowest effective dose and monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure. Avoid if possible in severe impairment.
- ▶ With oral use Avoid if possible or use with caution. Avoid in severe impairment. If used, the lowest effective dose should be given for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● MONITORING REQUIREMENTS

- ▶ With intravenous use in neonates Monitor for bleeding. Monitor gastro-intestinal function.

● DIRECTIONS FOR ADMINISTRATION

- ▶ With intravenous use in neonates For *slow intravenous injection*, give over 15 minutes, preferably undiluted. May be diluted with Glucose 5% or Sodium Chloride 0.9%.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of syrup may include orange.

● PATIENT AND CARER ADVICE

Indometacin

(Indomethacin)

● INDICATIONS AND DOSE

Symptomatic ductus arteriosus

► BY INTRAVENOUS INFUSION

- Neonate: Initially 100–200 micrograms/kg for 1 dose, followed by 100 micrograms/kg after 24 hours for 2 doses, at 24-hour intervals, doses to be given over 20–30 minutes, if residual patency present, 100 micrograms/kg to be given for a further 3 doses at 24-hour intervals.

Relief of pain and inflammation in rheumatic diseases including juvenile idiopathic arthritis

► BY MOUTH USING IMMEDIATE-RELEASE MEDICINES

- Child: 0.5–1 mg/kg twice daily, higher doses may be used under specialist supervision

● UNLICENSED USE

- With oral use Not licensed for use in children.

● CONTRA-INDICATIONS

- With intravenous use in neonates Bleeding (especially with active intracranial haemorrhage or gastro-intestinal bleeding) · coagulation defects · necrotising enterocolitis · thrombocytopenia · untreated infection
- With oral use Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding related to previous NSAID therapy · history of gastro-intestinal perforation related to previous NSAID therapy · history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) · history of recurrent gastro-intestinal ulceration (two or more distinct episodes) · severe heart failure

● CAUTIONS

GENERAL CAUTIONS

Heart failure

SPECIFIC CAUTIONS

- With intravenous use in neonates Inhibition of platelet aggregation (monitor for bleeding) · may induce hyponatraemia · may mask symptoms of infection · may reduce urine output by 50% or more and precipitate renal impairment especially if extracellular volume depleted · sepsis
- With oral use Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · epilepsy · ischaemic heart disease · peripheral arterial disease · psychiatric disturbances · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

● INTERACTIONS → Appendix 1 (NSAIDs).

- With intravenous use in neonates Caution with concomitant use of nephrotoxic drugs.

● SIDE-EFFECTS

► Rare

- With oral use Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · blood disorders · confusion · convulsions · hepatic damage · hyperglycaemia · interstitial fibrosis associated with NSAIDs can lead to renal failure · intestinal strictures · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · peripheral neuropathy · psychiatric disturbances · pulmonary eosinophilia · Stevens-Johnson syndrome · syncope · thrombocytopenia · toxic epidermal necrolysis · visual disturbances

► Frequency not known

- With intravenous use in neonates Coagulation disorders · exacerbation of infection · fluid retention · gastro-intestinal disorders · haemorrhagic disorders · intracranial bleeding · metabolic disorders · pulmonary hypertension · renal disorders
- With oral use Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hyperkalaemia · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Amount probably too small to be harmful—manufacturers advise avoid. Use with caution during breast-feeding.
- **HEPATIC IMPAIRMENT**
 - With intravenous use in neonates Increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe impairment.
 - With oral use Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT**
 - With intravenous use in neonates Use lowest effective dose. Avoid if possible in severe impairment.
 - With oral use The lowest effective dose should be used for the shortest possible duration.

Anuria or oliguria

- With intravenous use in neonates If anuria or marked oliguria (urinary output less than 0.6 mL/kg/hour), delay further doses until renal function returns to normal.
- With oral use Avoid if possible or use with caution. Avoid in severe impairment. In renal impairment monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

● MONITORING REQUIREMENTS

- With oral use During prolonged therapy ophthalmic and blood examinations particularly advisable.

● DIRECTIONS FOR ADMINISTRATION

- With intravenous use in neonates For intravenous infusion, dilute each vial with 1–2 mL Sodium Chloride 0.9% or Water for Injections.

● PATIENT AND CARER ADVICE

Driving and skilled tasks Dizziness may affect performance of skilled tasks (e.g. driving).

Ketoprofen**INDICATIONS AND DOSE****For use as a component of below**► **BY MOUTH**

► Child 15–17 years: (consult product literature)

• **CONTRA-INDICATIONS** Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding • history of gastro-intestinal perforation • history of gastro-intestinal ulceration • severe heart failure

• **CAUTIONS** Allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn's disease (may be exacerbated) • heart failure • ischaemic heart disease • peripheral arterial disease • risk factors for cardiovascular events • ulcerative colitis (may be exacerbated) • uncontrolled hypertension

• **INTERACTIONS** → Appendix 1 (NSAIDs).

SIDE-EFFECTS

► **Rare** Alveolitis • aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) • hepatic damage • interstitial fibrosis associated with NSAIDs can lead to renal failure • pancreatitis • papillary necrosis associated with NSAIDs can lead to renal failure • pulmonary eosinophilia • Stevens-Johnson syndrome • toxic epidermal necrolysis • visual disturbances

► **Frequency not known** Angioedema • blood disorders • bronchospasm • colitis (induction of or exacerbation of) • Crohn's disease (induction of or exacerbation of) • depression • diarrhoea • dizziness • drowsiness • fluid retention (rarely precipitating congestive heart failure) • gastro-intestinal bleeding • gastro-intestinal discomfort • gastro-intestinal disturbances • gastro-intestinal ulceration • haematuria • headache • hearing disturbances • hypersensitivity reactions • insomnia • nausea • nervousness • photosensitivity • raised blood pressure • rashes • renal failure (especially in patients with pre-existing renal impairment) • tinnitus • vertigo

SIDE-EFFECTS, FURTHER INFORMATION

► **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.

• **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.

• **CONCEPTION AND CONTRACEPTION** Caution—long-term use of some NSAIDs is associated with reduced female fertility, which is reversible on stopping treatment.

• **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.

• **BREAST FEEDING** Use with caution during breast-feeding. Amount probably too small to be harmful but manufacturers advise avoid.

• **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Should be avoided in severe liver disease.

• **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. If used, the lowest effective dose should be given for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

• **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral liquid formulations may include strawberry.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ketoprofen with omeprazole

The properties listed below are those particular to the combination only. For the properties of the components please consider, ketoprofen above, omeprazole p. 54.

INDICATIONS AND DOSE

Patients requiring ketoprofen for osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis, who are at risk of NSAID associated duodenal or gastric ulcer or gastroduodenal erosions

► **BY MOUTH USING MODIFIED-RELEASE MEDICINES**

► **Child 15–17 years:** Initially 100/20 mg daily, increased if necessary to 200/20 mg daily, depending on severity of symptoms, dose expressed as x/ymg ketoprofen/omeprazole

• **PRESCRIBING AND DISPENSING INFORMATION** Capsules enclose microgranules containing modified-release ketoprofen and gastro-resistant omeprazole.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 21, 25

EXCIPIENTS: May contain Propylene glycol

Mefenamic acid**INDICATIONS AND DOSE**

Acute pain including dysmenorrhoea | Menorrhagia

► **BY MOUTH**

► **Child 12–17 years:** 500 mg 3 times a day

• **CONTRA-INDICATIONS** Active gastro-intestinal bleeding • active gastro-intestinal ulceration • history of gastro-intestinal bleeding related to previous NSAID therapy • history of gastro-intestinal perforation related to previous NSAID therapy • history of recurrent gastro-intestinal haemorrhage (two or more distinct episodes) • history of recurrent gastro-intestinal ulceration (two or more distinct episodes) • inflammatory bowel disease • severe heart failure

• **CAUTIONS** Acute porphyrias p. 562 • allergic disorders • cardiac impairment (NSAIDs may impair renal function) • cerebrovascular disease • coagulation defects • connective-tissue disorders • Crohn's disease (may be exacerbated) •

epilepsy · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension

● **INTERACTIONS** → Appendix 1 (NSAIDs).

● **SIDE-EFFECTS**

- ▶ **Common or very common** Diarrhoea (withdraw treatment) · rashes (withdraw treatment) · stomatitis
- ▶ **Uncommon** Fatigue · paraesthesia
- ▶ **Rare** Alveolitis · aplastic anaemia · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · glucose intolerance · haemolytic anaemia (positive Coombs' test) · hepatic damage · hypotension · interstitial fibrosis associated with NSAIDs can lead to renal failure · palpitation · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis · visual disturbances
- ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Serious side-effects** For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.

Overdose

Mefenamic acid has important consequences in overdosage because it can cause convulsions, which if prolonged or recurrent, require treatment.

For details on the management of poisoning, see Emergency treatment of poisoning p. 786, in particular, Convulsions.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful but manufacturer advises avoid.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. If used, the lowest effective dose should be given for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.

- **UNLICENSED USE** Not licensed for use in children.

IMPORTANT SAFETY INFORMATION

CHMP ADVICE—PIROXICAM (JUNE 2007)

The CHMP has recommended restrictions on the use of piroxicam because of the increased risk of gastro-intestinal side effects and serious skin reactions. The CHMP has advised that:

- piroxicam should be initiated only by physicians experienced in treating inflammatory or degenerative rheumatic diseases
- piroxicam should not be used as first-line treatment
- in adults, use of piroxicam should be limited to the symptomatic relief of osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis
- piroxicam dose should not exceed 20 mg daily
- piroxicam should no longer be used for the treatment of acute painful and inflammatory conditions
- treatment should be reviewed 2 weeks after initiating piroxicam, and periodically thereafter

- concomitant administration of a gastro-protective agent should be considered.
- Topical preparations containing piroxicam are not affected by these restrictions.

- **CONTRA-INDICATIONS** Active gastro-intestinal bleeding · active gastro-intestinal ulceration · history of gastro-intestinal bleeding · history of gastro-intestinal perforation · history of gastro-intestinal ulceration · inflammatory bowel disease · severe heart failure
- **CAUTIONS** Allergic disorders · cardiac impairment (NSAIDs may impair renal function) · cerebrovascular disease · coagulation defects · connective-tissue disorders · Crohn's disease (may be exacerbated) · heart failure · ischaemic heart disease · peripheral arterial disease · risk factors for cardiovascular events · ulcerative colitis (may be exacerbated) · uncontrolled hypertension
- **INTERACTIONS** → Appendix 1 (NSAIDs).
- **SIDE-EFFECTS**
 - ▶ **Rare** Alveolitis · aseptic meningitis (patients with connective-tissue disorders such as systemic lupus erythematosus may be especially susceptible) · hepatic damage · interstitial fibrosis associated with NSAIDs can lead to renal failure · pancreatitis · papillary necrosis associated with NSAIDs can lead to renal failure · pulmonary eosinophilia · Stevens-Johnson syndrome · toxic epidermal necrolysis · visual disturbances
 - ▶ **Frequency not known** Angioedema · blood disorders · bronchospasm · colitis (induction of or exacerbation of) · Crohn's disease (induction of or exacerbation of) · depression · diarrhoea · dizziness · drowsiness · fluid retention (rarely precipitating congestive heart failure) · gastro-intestinal bleeding · gastro-intestinal discomfort · gastro-intestinal disturbances · gastro-intestinal ulceration · haematuria · headache · hearing disturbances · hypersensitivity reactions · insomnia · nausea · nervousness · photosensitivity · raised blood pressure · rashes · renal failure (especially in patients with pre-existing renal impairment) · tinnitus · vertigo
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - ▶ Serious side-effects For information about cardiovascular and gastro-intestinal side-effects, and a possible exacerbation of symptoms in asthma, see Non-steroidal anti-inflammatory drugs p. 604.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with a history of hypersensitivity to aspirin or any other NSAID—which includes those in whom attacks of asthma, angioedema, urticaria or rhinitis have been precipitated by aspirin or any other NSAID.
- **PREGNANCY** Avoid unless the potential benefit outweighs the risk. Avoid during the third trimester (risk of closure of fetal ductus arteriosus *in utero* and possibly persistent pulmonary hypertension of the newborn); onset of labour may be delayed and duration may be increased.
- **BREAST FEEDING** Use with caution during breast-feeding. Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Use with caution; there is an increased risk of gastro-intestinal bleeding and fluid retention. Avoid in severe liver disease.
- **RENAL IMPAIRMENT** Avoid if possible or use with caution. Avoid in severe impairment. If used, the lowest effective dose should be given for the shortest possible duration. Monitor renal function; sodium and water retention may occur and renal function may deteriorate, possibly leading to renal failure.
- **DIRECTIONS FOR ADMINISTRATION** Piroxicam orodispersible tablets can be taken by placing on the tongue and allowing to dissolve or by swallowing. Piroxicam orodispersible tablets may be halved to give 10 mg dose.

- **LESS SUITABLE FOR PRESCRIBING** Piroxicam is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

4 Soft tissue and joint disorders

4.1 Local inflammation of joints and soft tissue

CORTICOSTEROIDS

Corticosteroids, inflammatory disorders

Systemic corticosteroids

In children with rheumatic diseases corticosteroids should be reserved for specific indications (e.g. when other therapies are unsuccessful or while waiting for DMARDs to take effect) and should be used only under the supervision of a specialist.

Systemic corticosteroids may be considered for the management of juvenile idiopathic arthritis in systemic disease or when several joints are affected. Systemic corticosteroids may also be considered in severe, possibly life-threatening conditions such as systemic lupus erythematosus, systemic vasculitis, juvenile dermatomyositis, Behçet's disease, and polyarticular joint disease.

In severe conditions, short courses ('pulses') of high dose intravenous methylprednisolone p. 617 or a pulsed oral corticosteroid may be particularly effective for providing rapid relief, and has fewer long-term adverse effects than continuous treatment.

Corticosteroid doses should be reduced with care because of the possibility of relapse if the reduction is too rapid. If complete discontinuation of corticosteroids is not possible, consideration should be given to alternate-day (or alternate high-dose, low-dose) administration; on days when no corticosteroid is given, or a lower dose is given, an additional dose of a NSAID may be helpful. In some conditions, alternative treatment using an antimalarial or concomitant use of an immunosuppressant drug, such as azathioprine p. 485, methotrexate p. 506 or cyclophosphamide p. 498 may prove useful; in less severe conditions treatment with a NSAID alone may be adequate.

Administration of corticosteroids may result in suppression of growth and may affect the development of puberty. The risk of corticosteroid-induced osteoporosis should be considered for those on long-term corticosteroid

treatment; corticosteroids may also increase the risk of osteopenia in those unable to exercise. See the disadvantages of corticosteroid treatment.

Local corticosteroid injections

Corticosteroids are injected locally for an anti-inflammatory effect. In inflammatory conditions of the joints, including juvenile idiopathic arthritis, they are given by *intra-articular injection* as monotherapy, or as an adjunct to long-term therapy to reduce swelling and deformity in one or a few joints. Aseptic precautions (e.g. a no-touch technique) are essential, as is a clinician skilled in the technique; infected areas should be avoided and general anaesthesia, or local anaesthesia, or conscious sedation should be used. Occasionally an acute inflammatory reaction develops after an intra-articular or soft-tissue injection of a corticosteroid. This may be a reaction to the microcrystalline suspension of the corticosteroid used, but must be distinguished from sepsis introduced into the injection site.

Triamcinolone hexacetonide p. 617 [unlicensed] is preferred for intra-articular injection because it is almost insoluble and has a long-acting (depot) effect. Triamcinolone acetate p. 617 and methylprednisolone may also be considered for intra-articular injection into larger joints, whilst hydrocortisone below acetate should be reserved for smaller joints or for soft-tissue injections. Intra-articular corticosteroid injections can cause flushing and, in adults, may affect the hyaline cartilage. Each joint should usually be treated no more than 3–4 times in one year.

A smaller amount of corticosteroid may also be injected directly into soft tissues for the relief of inflammation in conditions such as *tennis or golfer's elbow* or *compression neuropathies*, which occur rarely in children. In *tendinitis*, injections should be made into the tendon sheath and not directly into the tendon (due to the absence of a true tendon sheath and a high risk of rupture, the Achilles tendon should not be injected).

Corticosteroid injections are also injected into soft tissues for the treatment of skin lesions.

407

Hydrocortisone

• INDICATIONS AND DOSE

HYDROCORTISTAB®

Local inflammation of joints and soft-tissues

► BY INTRA-ARTICULAR INJECTION

- Child 1 month–11 years: 5–30 mg, select dose according to size of child and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature
- Child 12–17 years: 5–50 mg, select dose according to size of patient and joint; where appropriate dose may be repeated at intervals of 21 days. Not more than 3 joints should be treated on any one day, for details consult product literature

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Suspension for injection

► Hydrocortistab (AMCo)

4.2 Soft tissue disorders

Soft-tissue disorders

Soft-tissue and musculoskeletal disorders

The management of children with soft-tissue injuries and strains, and musculoskeletal disorders, may include temporary rest together with the local application of heat or cold, local massage and physiotherapy. For pain relief, paracetamol p. 254 is often adequate and should be used first. Alternatively, the lowest effective dose of a **NSAID** (e.g. ibuprofen p. 608) can be used. If pain relief with either drug is inadequate, both paracetamol (in a full dose appropriate for the child) and a low dose of a NSAID may be required.

Extravasation

Local guidelines for the management of extravasation should be followed where they exist or specialist advice sought.

Extravasation injury follows leakage of drugs or intravenous fluids from the veins or inadvertent administration into the subcutaneous or subdermal tissue. It must be dealt with **promptly** to prevent tissue necrosis.

Acidic or alkaline preparations and those with an osmolality greater than that of plasma can cause extravasation injury; excipients including alcohol and polyethylene glycol have also been implicated. Cytotoxic drugs commonly cause extravasation injury. Very young children are at increased risk. Those receiving anticoagulants are more likely to lose blood into surrounding tissues if extravasation occurs, while those receiving sedatives or

analgesics may not notice the early signs or symptoms of extravasation.

Prevention of extravasation

Precautions should be taken to avoid extravasation; ideally, drugs likely to cause extravasation injury should be given through a central line and children receiving repeated doses of hazardous drugs peripherally should have the cannula resited at regular intervals. Attention should be paid to the manufacturers' recommendations for administration.

Placing a glyceryl trinitrate patch p. 127 or using glyceryl trinitrate ointment distal to the cannula may improve the patency of the vessel in children with small veins or in those whose veins are prone to collapse. Children or their carers should be asked to report any pain or burning at the site of injection immediately.

Management of extravasation

If extravasation is suspected the infusion should be stopped immediately but the cannula should not be removed until after an attempt has been made to aspirate the area (through the cannula) in order to remove as much of the drug as possible. Aspiration is sometimes possible if the extravasation presents with a raised bleb or blister at the injection site and is surrounded by hardened tissue, but it is often unsuccessful if the tissue is soft or soggy.

Corticosteroids are usually given to treat inflammation, although there is little evidence to support their use in extravasation. Hydrocortisone p. 616 or dexamethasone p. 410 can be given either locally by subcutaneous injection or intravenously at a site distant from the injury. Antihistamines and analgesics may be required for symptom relief.

The management of extravasation beyond these measures is not well standardised and calls for specialist advice. Treatment depends on the nature of the offending substance; one approach is to localise and neutralise the substance whereas another is to spread and dilute it. The first method may be appropriate following extravasation of vesicant drugs and involves administration of an antidote (if available) and the application of cold compresses 3–4 times a day (consult specialist literature for details of specific antidotes). Spreading and diluting the offending substance involves infiltrating the area with physiological saline, applying warm compresses, elevating the affected limb, and administering hyaluronidase below. A saline flush-out technique (involving flushing the subcutaneous tissue with physiological saline) may be effective but requires specialist advice. Hyaluronidase should **not** be administered following extravasation of vesicant drugs (unless it is either specifically indicated or used in the saline flush-out technique).

Enzymes

Hyaluronidase is used for the management of extravasation.

ENZYMES

Hyaluronidase

● INDICATIONS AND DOSE

Extravasation

- ▶ BY LOCAL INFILTRATION
- ▶ Child: (consult product literature)

- **UNLICENSED USE** Licensed for use in children, but age range not specified by the manufacturer.
- **CONTRA-INDICATIONS** Avoid sites where infection is present · avoid sites where malignancy is present · do not apply direct to cornea · not for anaesthesia in unexplained premature labour · not for intravenous administration · not to be used to enhance the absorption and dispersion of dopamine and/or alpha-adrenoceptor agonists · not to be

used to reduce swelling of bites · not to be used to reduce swelling of stings

- **CAUTIONS** Infants (control speed and total volume and avoid overhydration especially in renal impairment)

● SIDE-EFFECTS

- ▶ **Common or very common** Oedema
- ▶ **Rare** Bleeding · bruising · infection · local irritation
- ▶ **Frequency not known** Anaphylaxis · severe allergy

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye

Administration of drugs to the eye

Drugs are most commonly administered to the eye by topical application as eye drops or eye ointments. When a higher drug concentration is required within the eye, a local injection may be necessary.

Eye-drop dispenser devices are available to aid the instillation of eye drops from plastic bottles and some are prescribable on the NHS (consult Drug Tariff—see Appliances and Reagents). Product-specific devices may be supplied by manufacturers—contact individual manufacturers for further information. They are particularly useful for children in whom normal application is difficult, for the visually impaired, or otherwise physically limited patients.

Eye drops and eye ointments

Eye drops are generally instilled into the pocket formed by gently pulling down the lower eyelid and keeping the eye closed for as long as possible after application; in neonates and infants it may be more appropriate to administer the drop in the inner angle of the open eye. One drop is all that is needed; instillation of more than one drop at a time should be discouraged because it may increase systemic side-effects. A small amount of eye ointment is applied similarly; the ointment melts rapidly and blinking helps to spread it.

When two different eye-drop preparations are used at the same time of day, dilution and overflow can occur when one immediately follows the other. The carer or child should therefore leave an interval of at least 5 minutes between the two; the interval should be extended when eye drops with a prolonged contact time, such as gels and suspensions, are used. Eye ointment should be applied after drops. Both drops and ointment can cause transient blurred vision; children should be warned, where appropriate, not to perform skilled tasks (e.g. cycling or driving) until vision is clear.

Systemic effects may arise from absorption of drugs into the general circulation from conjunctival vessels or from the nasal mucosa after the excess preparation has drained down through the tear ducts. The extent of systemic absorption following ocular administration is highly variable; nasal drainage of drugs is associated with eye drops much more often than with eye ointments. Pressure on the lacrimal punctum for at least a minute after applying eye drops reduces nasolacrimal drainage and therefore decreases systemic absorption from the nasal mucosa.

Also see warnings relating to eye drops and contact lenses.

Eye lotions

These are solutions for the irrigation of the conjunctival sac. They act mechanically to flush out irritants or foreign bodies as a first-aid treatment. Sterile sodium chloride 0.9% p. 628 solution is usually used. Clean water will suffice in an emergency.

Other preparations administered to the eye

Subconjunctival injection may be used to administer anti-infective drugs, mydriatics, or corticosteroids for conditions not responding to topical therapy; intracameral and intravitreal routes can also be used to administer certain drugs, for example antibacterials. These injections should only be used under specialist supervision.

Drugs such as antimicrobials and corticosteroids may be administered systemically to treat susceptible eye conditions.

Ophthalmic Specials

The Royal College of Ophthalmologists and the UK Ophthalmic Pharmacy Group have produced the Ophthalmic Specials Guidance to help prescribers and pharmacists manage and restrict the use of unlicensed eye preparations. 'Specials' should only be prescribed in situations where a licensed product will not be suitable for a child's needs. The Ophthalmic Specials Guidance can be accessed on the Royal College of Ophthalmologists website (www.rcophth.ac.uk). The guidance will be reviewed every six months to ensure the most accurate and up-to-date information is available.

Preservatives and sensitisers

Information on preservatives and substances identified as skin sensitisers is provided under Excipients statements in preparation entries. Very rarely, cases of corneal calcification have been reported with the use of phosphate-containing eye drops in patients with significantly damaged corneas—consult product literature for further information.

Control of microbial contamination

Preparations for the eye should be sterile when issued. Care should be taken to avoid contamination of the contents during use.

Eye drops in multiple-application containers for *domiciliary* use should not be used for more than 4 weeks after first opening (unless otherwise stated by the manufacturer).

Multiple application eye drops for use in *hospital wards* are normally discarded 1 week after first opening—local practice may vary. Individual containers should be provided for each patient. A separate container should be supplied for each eye only if there are special concerns about contamination. Containers used before an eye operation should be discarded

at the time of the operation and fresh containers supplied postoperatively. A fresh supply should also be provided upon discharge from hospital; in specialist ophthalmology units, it may be acceptable to issue containers that have been dispensed to the patient on the day of discharge.

In *out-patient departments* single-application containers should be used; if multiple-application containers are used, they should be discarded after single patient use within one clinical session.

In *eye surgery* single-application containers should be used if possible; if a multiple-application container is used, it should be discarded after single use. Preparations used during intra-ocular procedures and others that may penetrate into the anterior chamber must be isotonic and without preservatives and buffered if necessary to a neutral pH. Specially formulated fluids should be used for intra-ocular surgery; intravenous infusion preparations are not usually suitable for this purpose (Hartmann's solution may be used in some ocular surgery). For all surgical procedures, a previously unopened container is used for each patient.

Contact lenses

For cosmetic reasons many people prefer to wear contact lenses rather than spectacles; contact lenses are also sometimes required for medical indications. Visual defects are corrected by either rigid ('hard' or gas permeable) lenses or soft (hydrogel or silicone hydrogel—in adults only) lenses; soft lenses are the most popular type, because they are initially the most comfortable, but they may not give the best vision. Lenses should usually be worn for a specified number of hours each day and removed for sleeping. The risk of infectious and non-infectious keratitis is increased by extended continuous contact lens wear, which is not recommended, except when medically indicated.

Contact lenses require meticulous care. Poor compliance with directions for use, and with daily cleaning and disinfection, can result in complications including ulcerative keratitis or conjunctivitis. One-day disposable lenses, which are worn only once and therefore require no disinfection or cleaning, are becoming increasingly popular.

Acanthamoeba keratitis, a painful and sight-threatening condition, is associated with ineffective lens cleaning and disinfection, the use of contaminated lens cases, or tap water coming into contact with the lenses. The condition is especially associated with the use of soft lenses (including frequently replaced lenses) and should be treated by specialists.

Contact lenses and drug treatment

Special care is required in prescribing eye preparations for contact lens users. Some drugs and preservatives in eye preparations can accumulate in hydrogel lenses and may induce toxic and adverse reactions. Therefore, unless medically indicated, the lenses should be removed before instillation of the eye preparation and not worn during the period of treatment. Alternatively, unpreserved drops can be used. Eye drops may, however, be instilled while patients are wearing rigid corneal contact lenses. Ointment preparations should never be used in conjunction with contact lens wear; oily eye drops should also be avoided.

Many drugs given systemically can also have adverse effects on contact lens wear. These include oral contraceptives (particularly those with a higher oestrogen content), drugs which reduce blink rate (e.g. anxiolytics, hypnotics, antihistamines, and muscle relaxants), drugs which reduce lacrimation (e.g. antihistamines, antimuscarinics, phenothiazines and related drugs, some beta-blockers, diuretics, and tricyclic antidepressants), and drugs which increase lacrimation (including ephedrine hydrochloride p. 114 and hyalalazine hydrochloride p. 108). Other drugs that may affect contact lens wear are isotretinoin p. 712 (can cause conjunctival inflammation), aspirin p. 83 (salicylic acid appears in tears and can be

absorbed by contact lenses—leading to irritation), and rifampicin p. 342 and sulfasalazine p. 29 (can discolour lenses).

1 Allergic and inflammatory eye conditions

Eye, allergy and inflammation

Corticosteroids

Corticosteroids administered locally to the eye or given by mouth are effective for treating anterior segment inflammation, including that which results from surgery.

Topical corticosteroids should normally only be used under expert supervision; three main dangers are associated with their use:

- a 'red eye', when the diagnosis is unconfirmed, may be due to herpes simplex virus, and a corticosteroid may aggravate the condition, leading to corneal ulceration, with possible damage to vision and even loss of the eye. Bacterial, fungal, and amoebic infections pose a similar hazard;
- 'steroid glaucoma' can follow the use of corticosteroid eye preparations in susceptible individuals;
- a 'steroid cataract' can follow prolonged use.

Products combining a corticosteroid with an antimicrobial are used after ocular surgery to reduce inflammation and prevent infection: use of combination products is otherwise rarely justified.

Systemic corticosteroids may be useful for ocular conditions. The risk of producing a 'steroid cataract' increases with the dose and duration of corticosteroid use.

Other anti-inflammatory preparations

Eye drops containing **antihistamines**, such as **antazoline** (with xylometazoline hydrochloride p. 650 as *Otrivine-Antistin*®), azelastine hydrochloride p. 621, epinastine hydrochloride p. 621, ketotifen p. 621, and olopatadine p. 621, can be used for allergic conjunctivitis.

Sodium cromoglicate p. 622 and nedocromil sodium p. 622 eye drops may be useful for vernal keratoconjunctivitis and other allergic forms of conjunctivitis.

Lodoxamide eye drops p. 622 are used for allergic conjunctival conditions including seasonal allergic conjunctivitis.

Emedastine eye drops p. 621 are licensed for seasonal allergic conjunctivitis.

1.1 Allergic conjunctivitis

ANTIHISTAMINES

Antazoline with xylometazoline

• INDICATIONS AND DOSE

Allergic conjunctivitis

► TO THE EYE

- Child 12–17 years: Apply 2–3 times a day for maximum 7 days

- **CAUTIONS** Angle-closure glaucoma • cardiovascular disease • diabetes mellitus • hypertension • hyperthyroidism • phaeochromocytoma • urinary retention
- **INTERACTIONS** → Appendix 1 (antihistamines and sympathomimetics).

Absorption of antazoline and xylometazoline may result in the possibility of interaction with other drugs.

● SIDE-EFFECTS

- ▶ **Common or very common** Transient stinging
- ▶ **Frequency not known** Blurred vision · eye irritation · mydriasis

SIDE-EFFECTS, FURTHER INFORMATION

Absorption of antazoline and xylometazoline may result in systemic side-effects.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Otrivine Antistin** (Thea Pharmaceuticals Ltd)

(Sodium cromoglycate)

● INDICATIONS AND DOSE

Allergic conjunctivitis | Seasonal keratoconjunctivitis

- ▶ TO THE EYE
- ▶ Child: Apply 4 times a day

- SIDE-EFFECTS Transient burning · transient stinging

- EXCEPTIONS TO LEGAL CATEGORY Sodium cromoglicate 2% eye drops can be sold to the public (in max. pack size of 10 mL) for treatment of acute seasonal and perennial allergic conjunctivitis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

- ▶ **Sodium cromoglicate (Non-proprietary)**

Sodium cromoglicate 20 mg per 1 ml Sodium cromoglicate 2% eye drops | 13.5 ml [PoM] £3.85 DT price = £2.06

- ▶ **Catacrom** (Moorfields Pharmaceuticals)

Sodium cromoglicate 20 mg per 1 ml Catacrom 2% eye drops 0.3ml unit dose | 30 unit dose [P] £8.99 DT price = £8.99

- ▶ **Cromolux** (Tubilux Pharma Ltd)

Sodium cromoglicate 20 mg per 1 ml Cromolux 2% eye drops | 13.5 ml [PoM] £3.20 DT price = £2.06

- ▶ **Opticrom** (Sanofi)

Sodium cromoglicate 20 mg per 1 ml Opticrom Allergy 2% eye drops | 5 ml [P] £2.74 | 10 ml [P] £3.35

Opticrom Aqueous 2% eye drops | 13.5 ml [PoM] £8.03 DT price = £2.06

- ▶ **Optrex Allergy** (Reckitt Benckiser Healthcare (UK) Ltd)

Sodium cromoglicate 20 mg per 1 ml Optrex Allergy 2% eye drops | 10 ml [P] £3.88

- ▶ **Pollenase (sodium cromoglicate)** (E M Pharma)

Sodium cromoglicate 20 mg per 1 ml Pollenase Allergy 2% eye drops | 10 ml [P] £2.08

- ▶ **Vividrin** (Bausch & Lomb UK Ltd)

Sodium cromoglicate 20 mg per 1 ml Vividrin 2% eye drops | 13.5 ml [PoM] £10.95 DT price = £2.06

1.2 Inflammatory eye conditions

CORTICOSTEROIDS

Betamethasone

● INDICATIONS AND DOSE

Local treatment of inflammation (short term)

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply every 1–2 hours until controlled then reduce frequency
- ▶ TO THE EYE USING EYE OINTMENT
- ▶ Child: Apply 2–4 times a day, alternatively apply at night when used in combination with eye drops

- SIDE-EFFECTS Adrenal suppression following prolonged use in neonates · corneal thinning · scleral thinning

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betamethasone (Non-proprietary)**

Betamethasone sodium phosphate 1 mg per 1 ml Betamethasone 0.1% ear/eye/nose drops | 5 ml [PoM] no price available

- ▶ **Betnesol** (Focus Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 ml Betnesol 0.1% eye/ear/nose drops | 10 ml [PoM] £2.32 DT price = £2.32

- ▶ **Vistamethasone** (Martindale Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 ml Vistamethasone 0.1% ear/eye/nose drops | 5 ml [PoM] £0.87 | 10 ml [PoM] £0.99 DT price = £2.32

Eye ointment

- ▶ **Betnesol** (Focus Pharmaceuticals Ltd)

Betamethasone sodium phosphate 1 mg per 1 gram Betnesol 0.1% eye ointment | 3 gram [PoM] £1.41 DT price = £1.41

Combinations available: *Betamethasone with neomycin*, p. 623

Dexamethasone

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

► TO THE EYE USING EYE DROP

► Child: Apply 4–6 times a day

Short term local treatment of inflammation (severe conditions)

► TO THE EYE USING EYE DROP

► Child: Apply every 30–60 minutes until controlled, reduce frequency when control achieved

- **UNLICENSED USE** *Maxidex*® not licensed for use in children under 2 years. *Dropodex*® not licensed for use in children.
- **SIDE-EFFECTS** Adrenal suppression following prolonged use in neonates · corneal thinning · scleral thinning
- **PREGNANCY** Dexamethasone readily crosses the placenta.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose Dexamethasone eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

► Dexamethasone (Non-proprietary)

Dexamethasone sodium phosphate 1 mg per 1 ml Dexamethasone 0.1% eye drops 0.4ml unit dose preservative free | 20 unit dose [PoM] £9.75 DT price = £9.75

Minims dexamethasone 0.1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.46 DT price = £11.46

► Dexafree (Thea Pharmaceuticals Ltd)

Dexamethasone sodium phosphate 1 mg per 1 ml Dexafree 1mg/1ml eye drops 0.4ml unit dose | 30 unit dose [PoM] £9.70

► Dropodex (Moorfields Pharmaceuticals)

Dexamethasone sodium phosphate 1 mg per 1 ml Dropodex 0.1% eye drops 0.4ml unit dose | 20 unit dose [PoM] £9.75 DT price = £9.75

► Maxidex (Alcon Laboratories (UK) Ltd)

Dexamethasone 1 mg per 1 ml Maxidex 0.1% eye drops | 5 ml [PoM] £1.42 DT price = £1.42 | 10 ml [PoM] £2.80 DT price = £2.80

Combinations available: *Dexamethasone with framycetin sulfate and gramicidin*, p. 624 · *Dexamethasone with hypromellose, neomycin and polymyxin B sulfate*, p. 624

Fluorometholone

● INDICATIONS AND DOSE

Local treatment of inflammation (short term)

► TO THE EYE

► Child 2–17 years: Apply every 1 hour for 24–48 hours, then reduced to 2–4 times a day

- **UNLICENSED USE** Not licensed for use in children under 2 years.
- **SIDE-EFFECTS** Adrenal suppression following prolonged use in neonates · corneal thinning · scleral thinning

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate, polysorbates

CORTICOSTEROIDS > WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 622.

● INDICATIONS AND DOSE

Local treatment of eye inflammation and bacterial infection (short-term)

► TO THE EYE USING EYE DROP

► Child: (consult product literature)

- **LESS SUITABLE FOR PRESCRIBING** Betamethasone with neomycin eye-drops are less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Betnesol-N (Focus Pharmaceuticals Ltd)

Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT price = £2.39

Dexamethasone with framycetin sulfate and gramicidin

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 623.

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- ▶ TO THE EYE
- ▶ Child: Apply 4–6 times a day, may be administered every 30–60 minutes in severe conditions until controlled, then reduce frequency

- **LESS SUITABLE FOR PRESCRIBING** *Sofradex*® is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain Polysorbates

▶ *Sofradex* (Sanofi)

Gramicidin 50 microgram per 1 ml, Dexamethasone (as Dexamethasone sodium metasulfobenzoate) 500 microgram per 1 ml, Framycetin sulfate 5 mg per 1 ml *Sofradex* ear/eye drops | 10 ml [PoM] £7.50

Dexamethasone with hypromellose, neomycin and polymyxin B sulfate

The properties listed below are those particular to the combination only. For the properties of the components please consider, dexamethasone p. 623.

● INDICATIONS AND DOSE

Local treatment of inflammation (short-term)

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply every 30–60 minutes until controlled, then reduced to 4–6 times a day

Local treatment of inflammation (short-term)

- ▶ TO THE EYE USING EYE OINTMENT
- ▶ Child: Apply 3–4 times a day, alternatively, apply at night when used with eye drops

- **LESS SUITABLE FOR PRESCRIBING** Dexamethasone with neomycin and polymyxin B sulfate is less suitable for prescribing.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, polysorbates

▶ *Maxitrol* (Alcon Laboratories (UK) Ltd)

Dexamethasone 1 mg per 1 ml, Neomycin (as Neomycin sulfate) 3.5 mg per 1 ml, Hypromellose 5 mg per 1 ml, Polymyxin B sulfate 6000 unit per 1 ml *Maxitrol* eye drops | 5 ml [PoM] £1.68

Eye ointment

EXCIPIENTS: May contain Hydroxybenzoates (parabens), wool fat and related substances including lanolin

▶ *Maxitrol* (Alcon Laboratories (UK) Ltd)

Dexamethasone 1 mg per 1 gram, Neomycin (as Neomycin sulfate) 3500 unit per 1 gram, Polymyxin B sulfate 6000 unit per 1 gram *Maxitrol* eye ointment | 3.5 gram [PoM] £1.44

1.2a Anterior uveitis

ANTIMUSCARINICS

Antimuscarinics (eye)

- **CAUTIONS** Children under 3 months owing to the possible association between cycloplegia and the development of amblyopia · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage · mydriasis can precipitate acute angle-closure glaucoma (usually in those who are predisposed to the condition because of a shallow anterior chamber) · neonates at increased risk of systemic toxicity
- **SIDE-EFFECTS** Conjunctivitis (on prolonged administration) · contact dermatitis · eye oedema (on prolonged administration) · hyperaemia (on prolonged administration) · local irritation (on prolonged administration) · raised intraocular pressure · transient stinging
- **PATIENT AND CARER ADVICE** Patients may not be able to undertake skilled tasks until vision clears after mydriasis.

 above

Atropine sulfate

● INDICATIONS AND DOSE

Cycloplegia

- ▶ TO THE EYE USING EYE DROP
- ▶ Child 3 months–17 years: Apply twice daily for 3 days, before procedure

Anterior uveitis

- ▶ TO THE EYE USING EYE DROP
- ▶ Child 2–17 years: Apply 1 drop up to 4 times a day

- **UNLICENSED USE** Not licensed for use in children for uveitis.

● SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION

Toxic systemic reactions can occur. Systemic side-effects can occur.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose atropine sulfate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

▶ *Atropine sulfate* (Non-proprietary)

Atropine sulfate 10 mg per 1 ml *Atropine* 1% eye drops | 10 ml [PoM] £41.99 DT price = £35.15

▶ *Atropine sulfate* (Bausch & Lomb UK Ltd)

Atropine sulfate 10 mg per 1 ml Minims atropine sulfate 1% eye drops 0.5ml unit dose | 20 unit dose [PoM] £15.10 DT price = £15.10

F 624

Cyclopentolate hydrochloride

● INDICATIONS AND DOSE

Cycloplegia

► TO THE EYE

- Child 3 months–11 years: Apply 1 drop, 30–60 minutes before examination, using 1% eye drops
- Child 12–17 years: Apply 1 drop, 30–60 minutes before examination, using 0.5% eye drops

Uveitis

► TO THE EYE

- Child 3 months–17 years: Apply 1 drop 2–4 times a day, using 0.5% eye drops (1% for deeply pigmented eyes)

● SIDE-EFFECTS

SIDE-EFFECTS, FURTHER INFORMATION

Toxic systemic reactions can occur. Systemic side-effects can occur.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose cyclopentolate eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

- **Cyclopentolate hydrochloride** (Bausch & Lomb UK Ltd)

F 624

Homatropine hydrobromide

● INDICATIONS AND DOSE

Anterior uveitis

► TO THE EYE

- Child 3 months–1 year: Apply 1 drop daily, alternatively apply 1 drop once daily on alternate days, adjusted according to response, only 0.5% eye drops to be used
- Child 2–17 years: Apply 1 drop twice daily, adjusted according to response

- **UNLICENSED USE** Not licensed for use in children under 3 months.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

2 Dry eye conditions

Dry eye

Tear deficiency, ocular lubricants, and astringents

Chronic soreness of the eyes associated with reduced or abnormal tear secretion often responds to tear replacement therapy. The severity of the condition and child's preference will often guide the choice of preparation.

Hypromellose p. 626 is the traditional choice of treatment for tear deficiency. It may need to be instilled frequently (e.g. hourly) for adequate relief. Ocular surface mucin is often abnormal in tear deficiency and the combination of hypromellose with a mucolytic such as acetylcysteine below can be helpful.

The ability of **carbomers** to cling to the eye surface may help reduce frequency of application to 4 times daily.

Polyvinyl alcohol p. 627 increases the persistence of the tear film and is useful when the ocular surface mucin is reduced.

Sodium hyaluronate eye drops p. 628 are also used in the management of tear deficiency.

Sodium chloride 0.9% drops p. 628 are sometimes useful in tear deficiency, and can be used as 'comfort drops' by contact lens wearers, and to facilitate lens removal. Special presentations of sodium chloride 0.9% and other irrigation solutions are used routinely for intra-ocular surgery and in first aid for removal of harmful substances.

Eye ointments containing a paraffin can be used to lubricate the eye surface, especially in cases of recurrent corneal epithelial erosion. They may cause temporary visual disturbance and are best suited for application before sleep. Ointments should not be used during contact lens wear.

OCULAR LUBRICANTS

Acetylcysteine

● INDICATIONS AND DOSE

Tear deficiency | Impaired or abnormal mucus production

► TO THE EYE

- Child: Apply 3–4 times a day

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- **Ilube** (Moorfields Pharmaceuticals)

Acetylcysteine 50 mg per 1 ml Ilube 5% eye drops | 10 ml [PoM] £14.93 DT price = £14.93

Carbomers

(Polyacrylic acid)

● INDICATIONS AND DOSE

Dry eyes including keratoconjunctivitis sicca, unstable tear film

► TO THE EYE

- Child: Apply 3–4 times a day or when required

- **UNLICENSED USE** Some preparations not licensed for use in children.

- **PRESCRIBING AND DISPENSING INFORMATION** Synthetic high molecular weight polymers of acrylic acid cross-linked with either allyl ethers of sucrose or allyl ethers of pentaerythritol.

● MEDICINAL FORMS

Hypromellose 3 mg per 1 ml Tear-Lac Hypromellose 0.3% eye drops preservative free | 10 ml £5.75

► Xailin Hydrate (Nicox Pharma)

Hypromellose 3 mg per 1 ml Xailin Hydrate 0.3% eye drops preservative free | 10 ml £4.60

Hypromellose with dextran 70

The properties listed below are those particular to the combination only. For the properties of the components please consider, hypromellose p. 626.

● INDICATIONS AND DOSE

Tear deficiency

- TO THE EYE
- Child: Apply as required

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Tears Naturale (Alcon Laboratories (UK) Ltd)

Dextran 70 1 mg per 1 ml, Hypromellose 3 mg per 1 ml Tears Naturale eye drops | 15 ml [P] £1.89

Tears Naturale eye drops 0.4ml unit dose | 28 unit dose [P] £13.26

Liquid paraffin with white soft paraffin and wool alcohols

● INDICATIONS AND DOSE

Dry eye conditions

- TO THE EYE
- Child: Apply as required, best suited for application before sleep

- **PATIENT AND CARER ADVICE** May cause temporary visual disturbance. Should not be used during contact lens wear.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

► Lacri-Lube (Allergan Ltd)

Wool alcohols 2 mg per 1 gram, Liquid paraffin 425 mg per 1 gram, White soft paraffin 573 mg per 1 gram Lacri-lube eye ointment | 3.5 gram [P] £2.94 | 5 gram [P] £3.88

Paraffin, yellow, soft

● INDICATIONS AND DOSE

Eye surface lubrication

- TO THE EYE
- Child: Apply every 2 hours as required

- **PATIENT AND CARER ADVICE** Ophthalmic preparations may cause temporary visual disturbance. Should not be used during contact lens wear.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye ointment

► Paraffin, yellow, soft (Non-proprietary)

Liquid paraffin 100 mg per 1 gram, Wool fat 100 mg per 1 gram, Yellow soft paraffin 800 mg per 1 gram Simple eye ointment | 4 gram [P] £6.98 DT price = £5.82

Polyvinyl alcohol

● INDICATIONS AND DOSE

Tear deficiency

- TO THE EYE
- Child: Apply as required

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose polyvinyl alcohol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Polyvinyl alcohol (Non-proprietary)

Polyvinyl alcohol 14 mg per 1 ml Polyvinyl alcohol 1.4% eye drops 0.4ml unit dose preservative free | 30 unit dose [P] no price available
Polyvinyl alcohol 1.4% eye drops | 10 ml [P] no price available | 15 ml [P] no price available

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

► Emustil (Moorfields Pharmaceuticals)

Emustil eye drops 0.3ml unit dose preservative free | 20 unit dose £6.22

3 Eye infections

Eye infections

Most acute superficial eye infections can be treated topically. Blepharitis and conjunctivitis are often caused by staphylococci; keratitis and endophthalmitis may be bacterial, viral, or fungal.

Bacterial *blepharitis* is treated by lid hygiene and application of antibacterial eye drops to the conjunctival sac or to the lid margins. Systemic treatment may be required and may be necessary for 3 months or longer.

Most cases of acute bacterial conjunctivitis are self-limiting; where treatment is appropriate, antibacterial eye drops or an eye ointment are used. A poor response might indicate viral or allergic conjunctivitis or antibiotic resistance.

Corneal *ulcer* and *keratitis* require specialist treatment, usually under inpatient care, and may call for intensive topical, subconjunctival, or systemic administration of antimicrobials.

Endophthalmitis is a medical emergency which also calls for specialist management and requires intravitreal administration of antimicrobials; concomitant systemic treatment is required in some cases. Surgical intervention, such as vitrectomy, is sometimes indicated.

See reference to the treatment of *crab lice of the eyelashes*.

Antibacterials

Bacterial eye infections are generally treated topically with eye drops and eye ointments. Systemic administration is sometimes appropriate in blepharitis.

Chloramphenicol p. 631 has a broad spectrum of activity and is the drug of choice for *superficial eye infections*. Chloramphenicol eye drops are well tolerated and the recommendation that chloramphenicol eye drops should be avoided because of an increased risk of aplastic anaemia is not well founded.

Other antibacterials with a broad spectrum of activity include the quinolones, ciprofloxacin p. 630, levofloxacin p. 631, moxifloxacin p. 631, and ofloxacin p. 631; the aminoglycosides, gentamicin p. 630 and tobramycin p. 630 are also active against a wide variety of bacteria. Gentamicin, tobramycin, quinolones (except moxifloxacin), and **polymyxin B** are effective for infections caused by *Pseudomonas aeruginosa*.

Ciprofloxacin eye drops are licensed for corneal ulcers; intensive application (especially in the first 2 days) is required throughout the day and night.

Azithromycin eye drops p. 630 are licensed for trachomatous conjunctivitis caused by *Chlamydia trachomatis* and for purulent bacterial conjunctivitis. *Trachoma* which results from chronic infection with *Chlamydia trachomatis* can be treated with azithromycin by mouth [unlicensed indication].

Fusidic acid is useful for staphylococcal infections.

Propamidine isetionate p. 632 is of little value in bacterial infections but is used by specialists to treat the rare, but potentially sight-threatening, condition of *acanthamoeba keratitis* [unlicensed indication].

Other antibacterial eye drops may be prepared aseptically in a specialist manufacturing unit from material supplied for injection.

With corticosteroids

Many antibacterial preparations also incorporate a corticosteroid but such mixtures should **not** be used unless a patient is under close specialist supervision. In particular they should not be prescribed for undiagnosed 'red eye' which is sometimes caused by the herpes simplex virus and may be difficult to diagnose.

Administration

Frequency of application depends on the severity of the infection and the potential for irreversible ocular damage; antibacterial eye preparations are usually administered as follows:

- *Eye drops*, apply 1 drop at least every 2 hours in severe infection then reduce frequency as infection is controlled and continue for 48 hours after healing. For less severe infection 3–4 times daily is generally sufficient.
- *Eye ointment*, apply *either* at night (if eye drops used during the day) or 3–4 times daily (if eye ointment used alone).

Antifungals

Fungal infections of the cornea are rare. Orbital mycosis is rarer, and when it occurs it is usually because of direct spread of infection from the paranasal sinuses. Debility or immunosuppression can encourage fungal proliferation. The spread of infection through blood occasionally produces metastatic endophthalmitis.

Many different fungi are capable of producing ocular infection; they can be identified by appropriate laboratory procedures.

Antifungal preparations for the eye are not generally available. Treatment will normally be carried out at specialist centres, but requests for information about supplies of preparations not available commercially should be addressed to the Strategic Health Authority (or equivalent in Scotland or Northern Ireland), or to the nearest hospital ophthalmology unit, or to Moorfields Eye Hospital, 162 City Road, London EC1V 2PD (Tel. (020) 7253 3411) or www.moorfields.nhs.uk.

Antivirals

Herpes simplex infections producing, for example, dendritic corneal ulcers can be treated with aciclovir p. 632. Aciclovir eye ointment is used in combination with systemic treatment for ophthalmic zoster.

Also see systemic treatment of CMV retinitis.

Antibacterials in neonates

Antibacterial eye drops are used to treat acute bacterial conjunctivitis in neonates (ophthalmia neonatorum); where possible the causative microorganism should be identified. Chloramphenicol eye drops are used to treat mild conjunctivitis; more serious infections also require a systemic antibacterial. Failure to respond to initial treatment requires further investigation; chlamydial infection is one of the most frequent causes of neonatal conjunctivitis and should be considered. Azithromycin eye drops are licensed to treat trachomatous conjunctivitis caused by *Chlamydia trachomatis* and purulent bacterial conjunctivitis in neonates. However, as there is a risk of simultaneous infection at other sites in neonates and children under 3 months presenting with conjunctivitis caused by *Chlamydia trachomatis*, systemic treatment with oral erythromycin p. 310 is required. *Gonococcal eye infections* are treated with a single-dose of parenteral cefotaxime p. 301 or

ceftriaxone p. 302. Gentamicin eye drops together with appropriate systemic antibacterials are used in the treatment of *pseudomonal eye infections*; high-strength gentamicin eye drops (1.5%) [unlicensed] are available for severe infections.

3.1 Bacterial eye infection

ANTIBACTERIALS > AMINOGLYCOSIDES

Gentamicin

● INDICATIONS AND DOSE

Bacterial eye infections

- ▶ TO THE EYE
- ▶ Child: Apply 1 drop at least every 2 hours in severe infection, reduce frequency as infection is controlled and continue for 48 hours after healing, frequency of eye drops depends on the severity of the infection and the potential for irreversible ocular damage; for less severe infection 3–4 times daily is generally sufficient

- **PRESCRIBING AND DISPENSING INFORMATION** Eye drops may be sourced as a manufactured special or from specialist importing companies.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride

▶ Gentamicin (Non-proprietary)

Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 0.3% ear/eye drops | 10 ml [PoM] £2.55 DT price = £2.13
Gentamicin 0.3% eye/ear drops | 10 ml [PoM] £2.13 DT price = £2.13

Tobramycin

● INDICATIONS AND DOSE

Local treatment of infections

- ▶ TO THE EYE
- ▶ Child 1–17 years: Apply twice daily for 6–8 days

Local treatment of infections (severe infection)

- ▶ TO THE EYE
- ▶ Child 1–17 years: Apply 4 times a day for first day, then apply twice daily for 5–7 days

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzododecinium bromide

▶ Tobravisc (Alcon Laboratories (UK) Ltd)

Tobramycin 3 mg per 1 ml Tobravisc 3mg/ml eye drops | 5 ml [PoM] £4.74

ANTIBACTERIALS > MACROLIDES

Azithromycin

● INDICATIONS AND DOSE

Trachomatous conjunctivitis caused by *Chlamydia trachomatis* | Purulent bacterial conjunctivitis

- ▶ TO THE EYE
- ▶ Child: Apply twice daily for 3 days, review if no improvement after 3 days of treatment

- **INTERACTIONS** → Appendix 1 (macrolides). Caution with concomitant use of drugs that prolong the QT interval.

● SIDE-EFFECTS

- ▶ **Common or very common** Blurred vision · ocular burning · ocular discomfort · ocular pruritus
- ▶ **Uncommon** Conjunctival hyperaemia · eyelid eczema · eyelid erythema · eyelid oedema · keratitis

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

▶ Azyter (Thea Pharmaceuticals Ltd)

Azithromycin dihydrate 15 mg per 1 gram Azyter 15mg/g eye drops 0.25g unit dose | 6 unit dose [PoM] £6.99 DT price = £6.99

ANTIBACTERIALS > QUINOLONES

Ciprofloxacin

● INDICATIONS AND DOSE

Superficial bacterial eye infection

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply 4 times a day for maximum duration of treatment 21 days
- ▶ TO THE EYE USING EYE OINTMENT
- ▶ Child 1–17 years: Apply 1.25 centimetres 3 times a day for 2 days, then apply 1.25 centimetres twice daily for 5 days

Superficial bacterial eye infection (severe infection)

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply every 2 hours during waking hours for 2 days, then apply 4 times a day for maximum duration of treatment 21 days

Corneal ulcer

- ▶ TO THE EYE USING EYE DROP
- ▶ Child: Apply every 15 minutes for 6 hours, then apply every 30 minutes for the remainder of day 1, then apply every 1 hour on day 2, then apply every 4 hours on days 3–14, maximum duration of treatment 21 days, to be administered throughout the day and night
- ▶ TO THE EYE USING EYE OINTMENT
- ▶ Child 1–17 years: Apply 1.25 centimetres every 1–2 hours for 2 days, then apply 1.25 centimetres every 4 hours for the next 12 days, to be administered throughout the day and night

- **UNLICENSED USE** Eye ointment not licensed for use in children under 1 year.

● SIDE-EFFECTS

- ▶ **Common or very common** Corneal deposits (reversible after completion of treatment) · ocular discomfort · ocular hyperaemia · taste disturbance
- ▶ **Uncommon** Increased lacrimation · blurred vision · conjunctival hyperaemia · corneal infiltrates · corneal staining · eye dryness · eye irritation · eye pain · eye pruritus · eye swelling · eyelid disorders · eyelid erythema · eyelid exfoliation · eyelid oedema · headache · keratopathy · nausea · photophobia
- ▶ **Rare** Abdominal pain · asthenopia · corneal disorders · corneal epithelium defect · dermatitis · diarrhoea · diplopia · dizziness · ear pain · eye hypoaesthesia · keratitis · paranasal sinus hypersecretion · rhinitis
- **PREGNANCY** Manufacturer advises use only if potential benefit outweighs risk.
- **BREAST FEEDING** Manufacturer advises caution.

 Oftraquix 5mg/ml eye drops | 5 ml [PoM] £6.95

Moxifloxacin**INDICATIONS AND DOSE****Local treatment of infections**

► TO THE EYE

► Child: Apply 3 times a day continue treatment for 2–3 days after infection improves; review if no improvement within 5 days

► **CAUTIONS** Not recommended for neonates

SIDE-EFFECTS

► **Common or very common** Hyperaemia · ocular discomfort · ocular dryness · ocular irritation · ocular pain · taste disturbances
 ► **Uncommon** Conjunctival haemorrhage · corneal disorders · corneal erosion · corneal keratitis · corneal staining · eyelid erythema · headache · nasal discomfort · paraesthesia · pharyngolaryngeal pain · visual disturbances · vomiting
 ► **Frequency not known** Dizziness · dyspnoea · nausea · palpitation · photophobia · pruritus · raised intra-ocular pressure · rash

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

► **Moxivig** (Alcon Laboratories (UK) Ltd)

Moxifloxacin (as Moxifloxacin hydrochloride) 5 mg per 1 ml Moxivig 0.5% eye drops | 5 ml [PoM] £9.80

Ofloxacin**INDICATIONS AND DOSE****Local treatment of infections**

► TO THE EYE

► Child 1-17 years: Apply every 2–4 hours for the first 2 days, then reduced to 4 times a day for maximum 10 days treatment

► **CAUTIONS** Corneal ulcer (risk of corneal perforation) · epithelial defect (risk of corneal perforation)

SIDE-EFFECTS

► **Common or very common** Ocular discomfort
 ► **Frequency not known** Dry eyes · facial oedema · increased lacrimation · keratitis · ocular hyperaemia · ocular oedema · photophobia · visual disturbances

► **PREGNANCY** Manufacturer advises use only if benefit outweighs risk (systemic quinolones have caused arthropathy in animal studies).

► **BREAST FEEDING** Manufacturer advises avoid.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► **Exocin** (Allergan Ltd)

Ofloxacin 3 mg per 1 ml Exocin 0.3% eye drops | 5 ml [PoM] £2.17
 DT price = £2.17

ANTIBACTERIALS > OTHER**Chloramphenicol**

► **DRUG ACTION** Chloramphenicol is a potent broad-spectrum antibiotic.

INDICATIONS AND DOSE**Superficial eye infections**

► TO THE EYE USING EYE DROP

► Child: Apply 1 drop every 2 hours then reduce frequency as infection is controlled and continue for 48 hours after healing, frequency dependent on the severity of the infection. For less severe infection 3–4 times daily is generally sufficient

► TO THE EYE USING EYE OINTMENT

► Child: Apply daily, to be applied at night (if eye drops used during the day), alternatively apply 3–4 times a day, if ointment used alone

► **SIDE-EFFECTS** Transient stinging

► **PREGNANCY** Avoid unless essential—no information on topical use but risk of 'neonatal grey-baby syndrome' with oral use in third trimester.

► **BREAST FEEDING** Avoid unless essential—*theoretical* risk of bone-marrow toxicity.

► **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose chloramphenicol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Chloramphenicol for eye infections
www.medicinesforchildren.org.uk/chloramphenicol-eye-infections-0

- **EXCEPTIONS TO LEGAL CATEGORY** Chloramphenicol 0.5% eye drops (in max. pack size 10 mL) and 1% eye ointment (in max. pack size 4 g) can be sold to the public for treatment of acute bacterial conjunctivitis in adults and children over 2 years; max. duration of treatment 5 days.

Chloramphenicol 10 mg per 1 gram Optrex Infected Eyes 1% eye ointment | 4 gram [P] £3.88 DT price = £1.63

Fusidic acid

- **DRUG ACTION** Fusidic acid and its salts are narrow-spectrum antibiotics used for staphylococcal infections.

● INDICATIONS AND DOSE

Staphylococcal eye infections

- TO THE EYE
- Child: Apply twice daily

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Modified-release drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

► Fusidic acid (Non-proprietary)

Fusidic acid 10 mg per 1 gram Fusidic acid 1% modified-release eye drops | 5 gram [PoM] £29.06 DT price = £29.06

ANTIPROTOZOALS

Propamidine isetonate

● INDICATIONS AND DOSE

Acanthamoeba keratitis infections (specialist use only) |

Local treatment of eye infections

- TO THE EYE USING EYE OINTMENT
- Child: Apply 1–2 times a day
- TO THE EYE USING EYE DROP
- Child: Apply up to 4 times a day

- **UNLICENSED USE** Not licensed for *acanthamoeba keratitis* infections.

- **SIDE-EFFECTS** Eye irritation · eye pain

- **PREGNANCY** Manufacturer advises avoid unless essential—no information available.

- **BREAST FEEDING** Manufacturer advises avoid unless essential—no information available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► Brolene (Propamidine) (Sanofi)

Propamidine isetonate 1 mg per 1 ml Brolene 0.1% eye drops | 10 ml [P] £2.80

► Golden eye (Cambridge Healthcare Supplies Ltd)

Propamidine isetonate 1 mg per 1 ml Golden Eye 0.1% drops | 10 ml [P] £3.26

Eye ointment

► Brolene (Dibrompropamidine) (Sanofi)

Dibrompropamidine isetonate 1.5 mg per 1 gram Brolene 0.15% eye ointment | 5 gram [P] £2.92 DT price = £3.49

► Golden eye (Cambridge Healthcare Supplies Ltd)

Dibrompropamidine isetonate 1.5 mg per 1 gram Golden Eye 0.15% ointment | 5 gram [P] £3.49 DT price = £3.49

3.2 Viral eye infection

3.2a Ophthalmic herpes simplex

ANTIVIRALS > NUCLEOSIDE ANALOGUES

Aciclovir

(Acyclovir)

● INDICATIONS AND DOSE

Herpes simplex infection (local treatment)

- TO THE EYE USING EYE OINTMENT
- Child: Apply 1 centimetre 5 times a day continue for at least 3 days after complete healing

● SIDE-EFFECTS

- **Common or very common** Local inflammation · local irritation · superficial punctate keratopathy
- **Rare** Blepharitis
- **Very rare** Angioedema · hypersensitivity reactions

● PATIENT AND CARER ADVICE

Medicines for Children leaflet: Aciclovir eye ointment for herpes simplex infections www.medicinesforchildren.org.uk/aciclovir-eye-ointment-for-herpes-simplex-infection

Aciclovir 30 mg per 1 gram Zovirax 3% ophthalmic ointment | 4.5 gram [PoM] £9.34 DT price = £9.34

4 Eye procedures

Mydriatics and cycloplegics

Overview

Antimuscarinics dilate the pupil and paralyse the ciliary muscle; they vary in potency and duration of action.

Short-acting, relatively weak mydriatics, such as tropicamide 0.5% below (action lasts for 4–6 hours), facilitate the examination of the fundus of the eye. Cyclopentolate hydrochloride 1% p. 625 (action up to 24 hours) or atropine sulfate p. 624 (action up to 7 days) are preferable for producing cycloplegia for refraction in young children; tropicamide may be preferred in neonates.

Phenylephrine hydrochloride p. 634 is used for mydriasis in diagnostic or therapeutic procedures; mydriasis occurs within 60–90 minutes and lasts up to 5–7 hours.

Mydriatics and cycloplegics are used in the treatment of anterior uveitis, usually as an adjunct to corticosteroids. Atropine sulfate is used in anterior uveitis mainly to prevent posterior synechiae and to relieve ciliary spasm; cyclopentolate hydrochloride or homatropine hydrobromide p. 625 (action up to 3 days) can also be used and may be preferred because they have a shorter duration of action.

ANTIMUSCARINICS

624

Tropicamide

● INDICATIONS AND DOSE

Funduscopy

► TO THE EYE

- Neonate: 0.5% eye drops to be applied 20 minutes before examination.
- Child: 0.5% eye drops to be applied 20 minutes before examination

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tropicamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, edetic acid (edta)

► Mydracyl (Alcon Laboratories (UK) Ltd)

Tropicamide 5 mg per 1 ml Mydracyl 0.5% eye drops | 5 ml [PoM] £1.29

Tropicamide 10 mg per 1 ml Mydracyl 1% eye drops | 5 ml [PoM] £1.60

There can be variation in the licensing of different medicines containing the same drug.

Irrigation

- ▶ **Miochol-E** (Bausch & Lomb UK Ltd)
Acetylcholine chloride 20 mg Miochol-E 20mg powder and solvent for solution for intraocular irrigation vials | 1 vial [PoM] £7.28
- ▶ **Miphtel** (Alan Pharmaceuticals)
Acetylcholine chloride 20 mg Miphtel 20mg powder and solvent for solution for intraocular irrigation ampoules | 6 ampoule [PoM] £43.68 (Hospital only)

SYMPATHOMIMETICS > VASOCONSTRICTOR

Phenylephrine hydrochloride

● INDICATIONS AND DOSE

Mydriasis

- ▶ TO THE EYE
- ▶ Child: Apply 1 drop, to be administered before procedure, a drop of proxymetacaine topical anaesthetic may be applied to the eye a few minutes before using phenylephrine to prevent stinging

- **CONTRA-INDICATIONS** 10% strength eye drops · aneurysms · cardiovascular disease · hypertension · thyrotoxicosis
- **CAUTIONS** Asthma · corneal epithelial damage · darkly pigmented iris is more resistant to pupillary dilatation and caution should be exercised to avoid overdosage. · diabetes (avoid eye drops in long standing diabetes) · mydriasis can precipitate acute angle-closure glaucoma in the very few children who are predisposed to the condition because of a shallow anterior chamber · neonates are at an increased risk of systemic toxicity · ocular hyperaemia · susceptibility to angle-closure glaucoma
- **INTERACTIONS** → Appendix 1 (sympathomimetics). Phenylephrine may interact with systemically administered monoamine-oxidase inhibitors.
- **SIDE-EFFECTS** Arrhythmias · blurred vision · conjunctivitis on prolonged administration · coronary artery spasm · extrasystoles · hyperaemia on prolonged administration · local irritation on prolonged administration · hypertension · myocardial infarction (usually after use of 10% strength in patients with pre-existing cardiovascular disease) · oedema on prolonged administration · palpitation · photophobia · raised intraocular pressure · tachycardia · transient stinging
- **PREGNANCY** Use only if potential benefit outweighs risk.
- **BREAST FEEDING** Use only if potential benefit outweighs risk—no information available.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose phenylephrine eye drops commonly contain

preservatives, preservative-free unit dose vials may be available.

● PATIENT AND CARER ADVICE

Driving and skilled tasks

Patients should be warned not to undertake skilled tasks (e.g. driving) until vision clears after mydriasis.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Disodium edetate, sodium metabisulfite

- ▶ **Phenylephrine hydrochloride** (Bausch & Lomb UK Ltd)

Phenylephrine hydrochloride 25 mg per 1 ml Minims phenylephrine hydrochloride 2.5% eye drops 0.5ml unit dose | 20 unit dose [P] £11.41

4.1 Post-operative pain and inflammation

Eye, surgical and peri-operative drug use

Ocular peri-operative drugs

Drugs used to prepare the eye for surgery and drugs that are injected into the anterior chamber at the time of surgery are included here.

Sodium hyaluronate p. 628 is used during surgical procedures on the eye.

Apraclonidine p. 641, an α_2 -adrenoceptor agonist, reduces intra-ocular pressure possibly by reducing the production of aqueous humour. It is used for short-term treatment only.

Balanced Salt Solution is used routinely in intra-ocular surgery.

Povidone-iodine p. 633 is used for peri-ocular and conjunctival antisepsis before ocular surgery to support postoperative infection control.

Local anaesthetics

Oxybuprocaine hydrochloride p. 635 and tetracaine p. 635 are widely used topical local anaesthetics. Proxymetacaine hydrochloride p. 635 causes less initial stinging and is useful for children. Oxybuprocaine hydrochloride or a combined preparation of lidocaine hydrochloride p. 780 and fluorescein sodium p. 633 is used for tonometry. Tetracaine produces a more profound anaesthesia and is suitable for use before minor surgical procedures, such as the removal of corneal sutures. It has a temporary disruptive effect on the corneal epithelium. Lidocaine hydrochloride, with or without adrenaline/epinephrine p. 128, is injected into the eyelids for minor surgery. Local anaesthetics should never be used for the management of ocular symptoms.

Local anaesthetic eye drops should be avoided in preterm neonates because of the immaturity of the metabolising enzyme system.

ANAESTHETICS, LOCAL

Fluorescein with lidocaine

● INDICATIONS AND DOSE

Local anaesthesia

- ▶ TO THE EYE
- ▶ Child: Apply as required

- **CONTRA-INDICATIONS** Avoid in pre-term neonate (immature metabolising enzyme system)

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose lidocaine and fluorescein eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- ▶ **Lidocaine and Fluorescein** (Bausch & Lomb UK Ltd)
Fluorescein sodium 2.5 mg per 1 ml, Lidocaine hydrochloride 40 mg per 1 ml Minims lidocaine and fluorescein eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.24

Oxybuprocaine hydrochloride

(Benoxinate hydrochloride)

- **INDICATIONS AND DOSE**

Local anaesthetic

- ▶ TO THE EYE
- ▶ Child: Apply as required

- **CONTRA-INDICATIONS** Avoid in preterm neonates

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose oxybuprocaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

oxybuprocaine hydrochloride 4 mg per 1 ml Minims oxybuprocaine hydrochloride 0.4% eye drops 0.5ml unit dose | 20 unit dose [PoM] £10.15

Proxymetacaine hydrochloride

- **INDICATIONS AND DOSE**

Local anaesthetic

- ▶ TO THE EYE
- ▶ Child: Apply as required

- **CONTRA-INDICATIONS** Avoid in preterm neonates

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose proxymetacaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

- ▶ **Proxymetacaine** (Bausch & Lomb UK Ltd)
Proxymetacaine hydrochloride 5 mg per 1 ml Minims proxymetacaine 0.5% eye drops 0.5ml unit dose | 20 unit dose [PoM] £11.54

Tetracaine

(Amethocaine)

- **INDICATIONS AND DOSE**

Local anaesthetic

- ▶ TO THE EYE
- ▶ Child: Apply as required

- **UNLICENSED USE** Not licensed for use in neonates.

- **CONTRA-INDICATIONS** Avoid in preterm neonates

- **SIDE-EFFECTS** Local skin reactions

SIDE-EFFECTS, FURTHER INFORMATION

The systemic toxicity of local anaesthetics mainly involves the central nervous and cardiovascular systems; systemic side effects unlikely as minimal absorption following topical application.

- **ALLERGY AND CROSS-SENSITIVITY**

- ▶ Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine; reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose tetracaine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

- **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

supportive, and can be used temporarily, pre- or post-operatively, or both, to reduce intra-ocular pressure. In secondary glaucomas, drug therapy is often used first-line, and long-term treatment may be required. Drugs that reduce intra-ocular pressure by different mechanisms are available for managing glaucoma. A topical beta-blocker or a prostaglandin analogue can be used. It may be necessary to combine these drugs or add others, such as carbonic anhydrase inhibitors, or miotics to control intra-ocular pressure.

Children with an acute form of glaucoma (usually presenting with pain in older children, a cloudy cornea, and may be associated with a previous history of controlled glaucoma or recent intra-ocular surgery) need immediate referral for specialist ophthalmology assessment and treatment.

Beta-blockers

Topical application of a beta-blocker to the eye reduces intra-ocular pressure effectively in primary and secondary glaucomas, probably by reducing the rate of production of aqueous humour.

Prostaglandin analogues

The prostaglandin analogues latanoprost p. 641, and travoprost, and the synthetic prostamide, bimatoprost, increase uveoscleral outflow and subsequently reduce intra-ocular pressure. They are used to reduce intra-ocular pressure. Only latanoprost (*Xalatan*®) and certain non-proprietary preparations of latanoprost is licensed for use in children. Children receiving prostaglandin analogues should be managed by a specialist.

Sympathomimetics

Apraclonidine p. 641 is an α_2 -adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. Eye drops containing apraclonidine 0.5% are used for a short period to delay laser treatment or surgery for glaucoma in patients not adequately controlled by another drug; eye drops containing 1% are used for control of intra-ocular pressure after anterior segment laser surgery.

Brimonidine tartrate, an α_2 -adrenoceptor agonist, is thought to lower intra-ocular pressure by reducing aqueous humour formation and increasing uveoscleral outflow.

Carbonic anhydrase inhibitors and systemic drugs

The **carbonic anhydrase inhibitors**, acetazolamide p. 638, brinzolamide p. 639, and dorzolamide p. 639, reduce intra-ocular pressure by reducing aqueous humour production. Systemic use of acetazolamide also produces weak diuresis.

Acetazolamide is given by mouth or, rarely in children, by intravenous injection (intramuscular injections are painful because of the alkaline pH of the solution). It is used as an adjunct to other treatment for reducing intra-ocular pressure. Acetazolamide is not generally recommended for long-term use.

Dorzolamide and brinzolamide are topical carbonic anhydrase inhibitors. They are unlicensed in children but are used in those resistant to beta-blockers or those in whom beta-blockers are contra-indicated. They are used alone or as an adjunct to a topical beta-blocker. Brinzolamide can also be used as an adjunct to a prostaglandin analogue. Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

Metabolic acidosis can occur in children using topical carbonic anhydrase inhibitors; symptoms may include poor feeding and lack of weight gain.

Miotics

Miotics act by opening up the inefficient drainage channels in the trabecular meshwork. Pilocarpine p. 640 is a miotic used pre- and post-operatively in goniotomy and trabeculotomy; it is used occasionally for aphakic glaucoma.

5 Glaucoma and ocular hypertension

Glaucoma

Overview

Glaucoma describes a group of disorders characterised by a loss of visual field associated with cupping of the optic disc and optic nerve damage and is generally associated with raised intra-ocular pressure.

Glaucoma is rare in children and should always be managed by a specialist. *Primary congenital glaucoma* is the most common form of glaucoma in children, followed by *secondary glaucomas*, such as following hereditary anterior segment malformations; *juvenile open-angle glaucoma* is less common and usually occurs in older children.

Treatment of glaucoma is determined by the pathophysiology and usually involves controlling raised intra-ocular pressure with surgery. Drug therapy is generally

BETA-ADRENOCEPTOR BLOCKERS**Betaxolol****● INDICATIONS AND DOSE****Primary and secondary glaucomas**

- TO THE EYE
- Child: Apply twice daily

EXCIPIENTS: May contain Benzalkonium chloride

► Timolol maleate (Non-proprietary)

Timolol (as Timolol maleate) 2.5 mg per 1 ml Timolol 0.25% eye drops | 5 ml [PoM] £1.80 DT price = £1.02

Timolol (as Timolol maleate) 5 mg per 1 ml Timolol 0.5% eye drops | 5 ml [PoM] £1.95 DT price = £1.04

► Timoptol (Santen UK Ltd)

Timolol (as Timolol maleate) 2.5 mg per 1 ml Timoptol 0.25% eye drops | 5 ml [PoM] £3.12 DT price = £1.02

Timoptol Unit Dose 0.25% ophthalmic solution 0.2ml unit dose | 30 unit dose [PoM] £8.45

Timolol (as Timolol maleate) 5 mg per 1 ml Timoptol 0.5% eye drops | 5 ml [PoM] £3.12 DT price = £1.04

Timoptol Unit Dose 0.5% ophthalmic solution 0.2ml unit dose | 30 unit dose [PoM] £9.65 DT price = £9.65

► Tiopex (Thea Pharmaceuticals Ltd)

Timolol (as Timolol maleate) 1 mg per 1 gram Tiopex 1mg/g eye gel 0.4g unit dose | 30 unit dose [PoM] £7.49 DT price = £7.49

Eye gel

EXCIPIENTS: May contain Benzododecinium bromide

► Timoptol-LA (Santen UK Ltd)

Timolol (as Timolol maleate) 2.5 mg per 1 ml Timoptol-LA 0.25% ophthalmic gel-forming solution | 2.5 ml [PoM] £3.12 DT price = £3.12

Timolol (as Timolol maleate) 5 mg per 1 ml Timoptol-LA 0.5% ophthalmic gel-forming solution | 2.5 ml [PoM] £3.12 DT price = £3.12

Combinations available: **Dorzolamide with timolol**, p. 640

CARBONIC ANHYDRASE INHIBITORS

Acetazolamide

● INDICATIONS AND DOSE

Glaucoma

- BY MOUTH USING MODIFIED-RELEASE MEDICINES
- Child 12-17 years: 250–500 mg daily

Epilepsy

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION

- Neonate: Initially 2.5 mg/kg 2–3 times a day, followed by maintenance 5–7 mg/kg 2–3 times a day.

- Child 1 month–11 years: Initially 2.5 mg/kg 2–3 times a day, followed by maintenance 5–7 mg/kg 2–3 times a day; maximum 750 mg per day

- Child 12–17 years: 250 mg 2–4 times a day

Reduction of intra-ocular pressure in primary and secondary glaucoma (specialist use only)

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY INTRAVENOUS INJECTION

- Child 1 month–11 years: 5 mg/kg 2–4 times a day, adjusted according to response; maximum 750 mg per day

- Child 12–17 years: 250 mg 2–4 times a day

Raised intracranial pressure

- BY MOUTH USING IMMEDIATE-RELEASE MEDICINES, OR BY SLOW INTRAVENOUS INJECTION

- Child 1 month–11 years: Initially 8 mg/kg 3 times a day, then increased if necessary up to 100 mg/kg daily

- **UNLICENSED USE** Not licensed for the treatment of glaucoma.
- **CONTRA-INDICATIONS** Adrenocortical insufficiency · hyperchloraemic acidosis · hypokalaemia · hyponatraemia · long-term administration in chronic angle-closure glaucoma
- **CAUTIONS** Avoid extravasation at injection site (risk of necrosis) · diabetes mellitus · impaired alveolar ventilation (risk of acidosis) · not generally recommended for long-term use · pulmonary obstruction (risk of acidosis) · renal calculi

- **INTERACTIONS** → Appendix 1 (diuretics).

● SIDE-EFFECTS

- **Common or very common** Ataxia · depression · diarrhoea · dizziness · excitement · fatigue · flushing · headache · irritability · loss of appetite · nausea · paraesthesia · polyuria · taste disturbance · thirst · vomiting
- **Uncommon** Blood disorders · bone marrow suppression · confusion · crystalluria · drowsiness · electrolyte disturbances on long-term therapy · fever · glycosuria · haematuria · hearing disturbances · melaena · metabolic acidosis · rash · renal calculi · renal colic · renal failure · renal lesions · Stevens-Johnson syndrome · toxic epidermal necrosis · ureteric colic
- **Rare** Cholestatic jaundice · convulsions · flaccid paralysis · fulminant hepatic necrosis · hepatitis · photosensitivity
- **Frequency not known** Transient myopia

SIDE-EFFECTS, FURTHER INFORMATION

Acetazolamide is a sulfonamide derivative; blood disorders, rashes, and other sulfonamide-related side-

effects occur occasionally—patients should be told to report any unusual skin rash.

If electrolyte disturbances and metabolic acidosis occur, these can be corrected by administering potassium bicarbonate (as effervescent potassium tablets).

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid, especially in first trimester (toxicity in *animal* studies).
- **BREAST FEEDING** Amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid—risk of metabolic acidosis.
- **MONITORING REQUIREMENTS** Monitor blood count and plasma electrolyte concentrations with prolonged use.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: oral suspension, oral solution

Tablet

CAUTIONARY AND ADVISORY LABELS 3

▶ Acetazolamide (Non-proprietary)

Acetazolamide 250 mg Acetazolamide 250mg tablets | 100 tablet [PoM] no price available | 112 tablet [PoM] £75.36 DT price = £64.00

Modified-release capsule

CAUTIONARY AND ADVISORY LABELS 3, 25

▶ Diamox SR (AMCo)

Acetazolamide 250 mg Diamox SR 250mg capsules | 30 capsule [PoM] £16.66 DT price = £16.66

▶ Eytazox (Auden McKenzie (Pharma Division) Ltd)

Acetazolamide 250 mg Eytazox 250mg modified-release capsules | 30 capsule [PoM] £16.60 DT price = £16.66

Powder for solution for injection

▶ Diamox (AMCo)

Acetazolamide 500 mg Diamox Sodium Parenteral 500mg powder for solution for injection vials | 1 vial [PoM] £14.76

Brinzolamide

● INDICATIONS AND DOSE

Reduction of intra-ocular pressure in primary and secondary glaucoma either as adjunct to beta-blockers or prostaglandin analogues or used alone if unresponsive to beta-blockers or if beta-blockers contra-indicated

▶ TO THE EYE

- ▶ Child: Apply twice daily, then increased if necessary up to 3 times a day

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Hyperchloraemic acidosis
- **CAUTIONS** Renal tubular immaturity or abnormality—risk of metabolic acidosis . systemic absorption follows topical application
- **INTERACTIONS** → Appendix 1 (brinzolamide).
- ▶ When used by eye Since systemic absorption may follow topical application of brinzolamide to the eye, the possibility of interactions should be borne in mind.

● SIDE-EFFECTS

- ▶ **Common or very common** Corneal erosion . corneal oedema . dry mouth . headache . ocular disturbances . photophobia . reduced visual acuity . taste disturbances
- ▶ **Uncommon** Alopecia . amnesia . bradycardia . chest pain . cough . decreased libido . depression . diarrhoea . dizziness . drowsiness . dyspepsia . dyspnoea . epistaxis . erectile dysfunction . flatulence . malaise . nasal dryness . nausea . nervousness . oesophagitis . oral hypoaesthesia and paraesthesia . palpitation . paraesthesia . pharyngitis . renal pain . sinusitis . sleep disturbances . throat irritation . tinnitus . upper respiratory tract congestion . vomiting

- ▶ **Frequency not known** Arrhythmia . asthma . dermatitis . erythema . hypertension . peripheral oedema . pollakiuria . rhinitis . tachycardia . tremor . vertigo

SIDE-EFFECTS, FURTHER INFORMATION

Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Use only if benefit outweighs risk.
- **HEPATIC IMPAIRMENT** Manufacturer advises avoid.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

▶ Brinzolamide (Non-proprietary)

Brinzolamide 10 mg per 1 mL Brinzolamide 10mg/ml eye drops | 5 mL [PoM] £6.92 DT price = £3.36

▶ Azopt (Alcon Laboratories (UK) Ltd)

Brinzolamide 10 mg per 1 mL Azopt 10mg/ml eye drops | 5 mL [PoM] £6.92 DT price = £3.36

Dorzolamide

● INDICATIONS AND DOSE

Raised intra-ocular pressure in primary and secondary glaucoma used alone in patients unresponsive to beta-blockers or if beta-blockers contra-indicated

▶ TO THE EYE

- ▶ Child: Apply 3 times a day

Raised intra-ocular pressure in primary and secondary glaucoma as adjunct to a beta-blocker

▶ TO THE EYE

- ▶ Child: Apply twice daily

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Hyperchloraemic acidosis
- **CAUTIONS** Chronic corneal defects . history of intra-ocular surgery . history of renal calculi . immature renal tubules (neonates and infants)—risk of metabolic acidosis . low endothelial cell count . systemic absorption follows topical application
- **INTERACTIONS** → Appendix 1 (dorzolamide).
- ▶ When used by eye Since systemic absorption may follow topical application of dorzolamide to the eye, the possibility of interactions should be borne in mind.
- **SIDE-EFFECTS**
- ▶ **Common or very common** Asthenia . bitter taste . blurred vision . conjunctivitis . eyelid inflammation . headache . lacrimation . nausea . ocular irritation . superficial punctate keratitis
- ▶ **Uncommon** Iridocyclitis
- ▶ **Rare** Contact dermatitis . corneal oedema . dizziness . dry mouth . epistaxis . eyelid crusting . paraesthesia . Stevens-Johnson syndrome . throat irritation . toxic epidermal necrolysis . transient myopia . urolithiasis
- ▶ **Frequency not known** Metabolic acidosis
- SIDE-EFFECTS, FURTHER INFORMATION**
- Systemic absorption can rarely cause sulfonamide-like side-effects and may require discontinuation if severe.
- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated if history of sulfonamide hypersensitivity.
- **PREGNANCY** Manufacturer advises avoid—toxicity in *animal* studies.
- **BREAST FEEDING** Manufacturer advises avoid—no information available.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution—no information available.
- **RENAL IMPAIRMENT** Avoid if estimated glomerular filtration rate less than 30 mL/minute/1.73 m².
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose dorzolamide eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► Dorzolamide (Non-proprietary)

Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 mL Dorzolamide 2% eye drops | 5 mL [PoM] £6.33 DT price = £1.92

► Trusopt (Santen UK Ltd)

Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 mL Trusopt 2% eye drops | 5 mL [PoM] £6.33 DT price = £1.92
Trusopt 2% eye drops 0.2 mL unit dose preservative free | 60 unit dose [PoM] £24.18 DT price = £24.18

Dorzolamide with timolol

The properties listed below are those particular to the combination only. For the properties of the components please consider, dorzolamide p. 639, timolol maleate p. 638.

INDICATIONS AND DOSE

Raised intra-ocular pressure in open-angle glaucoma when beta-blockers alone not adequate | Raised intra-ocular pressure in pseudo-exfoliative glaucoma when beta-blockers alone not adequate

► TO THE EYE

► Child: Apply twice daily

- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose dorzolamide with timolol eye drops commonly contain preservatives, preservative-free unit dose vials may be available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► Dorzolamide with timolol (Non-proprietary)

Timolol (as Timolol maleate) 5 mg per 1 mL, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 mL Dorzolamide 2% / Timolol 0.5% eye drops | 5 mL [PoM] £27.16 DT price = £2.20
Dorzolamide 2% / Timolol 0.5% eye drops 0.2 mL unit dose preservative free | 60 unit dose [PoM] £27.16 DT price = £28.59

► Cosopt (Santen UK Ltd)

Timolol (as Timolol maleate) 5 mg per 1 mL, Dorzolamide (as Dorzolamide hydrochloride) 20 mg per 1 mL Cosopt eye drops 0.2 mL unit dose preservative free | 60 unit dose [PoM] £28.59 DT price = £28.59

Cosopt eye drops | 5 mL [PoM] £10.05 DT price = £2.20

MIOTICS > PARASYMPATHOMIMETICS

Pilocarpine

- **DRUG ACTION** Pilocarpine acts by opening the inefficient drainage channels in the trabecular meshwork.

INDICATIONS AND DOSE

Raised intra-ocular pressure

► TO THE EYE

- Child 1 month–1 year: Apply 1 drop 3 times a day, doses are for 0.5% or 1% solution
- Child 2–17 years: Apply 1 drop 4 times a day

Pre- and postoperatively in goniotomy and trabeculectomy

► TO THE EYE

- Child: Apply once daily, 1% or 2% solution to be applied

- **UNLICENSED USE** Not licensed for use in children.
- **CONTRA-INDICATIONS** Acute inflammatory disease of the anterior segment · acute iritis · anterior uveitis · conditions where pupillary constriction is undesirable · some forms of secondary glaucoma (where pupillary constriction is undesirable)
- **CAUTIONS** A darkly pigmented iris may require a higher concentration of the miotic or more frequent administration and care should be taken to avoid overdosage · asthma · cardiac disease · care in conjunctival damage · care in corneal damage · epilepsy · gastro-intestinal spasm · hypertension · hyperthyroidism · hypotension · peptic ulceration · retinal detachment has occurred in susceptible individuals and those with retinal disease · urinary-tract obstruction
- **INTERACTIONS** → Appendix 1 (parasympathomimetics). Systemic effects rare following application to the eye.
- **SIDE-EFFECTS**
 - Rare Parasympathomimetics systemic side effects
 - **Frequency not known** Blurred vision · ciliary spasm (leads to headache and browache which may be more severe in the initial 2–4 weeks of treatment—a particular disadvantage in patients under 40 years of age) · conjunctival vascular congestion · lens changes (with chronic use) · myopia · ocular burning · ocular itching · pupillary block · smarting · vitreous haemorrhage
- **PREGNANCY** Avoid unless the potential benefit outweighs risk—limited information available.
- **BREAST FEEDING** Avoid unless the potential benefit outweighs risk—no information available.
- **PRE-TREATMENT SCREENING** Fundus examination is advised before starting treatment with a miotic (retinal detachment has occurred).
- **MONITORING REQUIREMENTS** Intra-ocular pressure and visual fields should be monitored in those with chronic simple glaucoma and those receiving long-term treatment with a miotic.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose pilocarpine eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE**
 - Driving and skilled tasks**
Blurred vision may affect performance of skilled tasks (e.g. driving) particularly at night or in reduced lighting.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: eye drops

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► Pilocarpine (Non-proprietary)

PROSTAGLANDIN ANALOGUES AND PROSTAMIDES

Latanoprost

● INDICATIONS AND DOSE

Reduction of intra-ocular pressure in raised intra-ocular pressure and glaucoma

► TO THE EYE

- Child: Apply once daily, to be administered preferably in the evening

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE: LATANOPROST (XALATAN®): INCREASED REPORTING OF EYE IRRITATION SINCE REFORMULATION (JULY 2015) Following reformulation of *Xalatan*®, to allow for long-term storage at room temperature, there has been an increase in the number of reports of eye irritation from across the EU. Patients should be advised to tell their health professional promptly (within a week) if they experience eye irritation (e.g. excessive watering) severe enough to make them consider stopping treatment. Review treatment and prescribe a different formulation if necessary.

- **CONTRA-INDICATIONS** Active herpes simplex keratitis · history of recurrent herpetic keratitis associated with prostaglandin analogues
- **CAUTIONS** Aphakia · asthma · children less than 1 year—limited information available · history of herpetic keratitis · history of significant ocular viral infections · peri-operative period of cataract surgery · preterm neonates less than 36 weeks gestational age—no information available · pseudophakia with torn posterior lens capsule or anterior chamber lenses · risk factors for cystoid macular oedema · risk factors for iritis · risk factors for uveitis
- **SIDE-EFFECTS**
 - **Common or very common** Blepharitis · conjunctival hyperaemia · eye irritation · eye pain · eyelash and vellus hair changes · increased iris pigmentation · transient punctate epithelial erosion
 - **Uncommon** Blurred vision · conjunctivitis · dry eye · eyelid oedema · keratitis · skin rash
 - **Rare** Corneal erosion · corneal oedema · distichiasis · iritis · macular oedema · misdirected eyelashes · periorbital oedema · photophobia · uveitis
 - **Very rare** Chest pain · darkening of palpebral skin of the eyelids · localised skin reaction on the eyelids · periorbital changes resulting in deepening of the eyelid sulcus
 - **Frequency not known** Arthralgia · asthma · dizziness · dyspnoea · exacerbation of asthma · headache · herpetic keratitis · iris cyst · myalgia · nasopharyngitis · palpitation · pyrexia
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** May be present in milk—manufacturer advises avoid.
- **MONITORING REQUIREMENTS** Monitor for changes to eye coloration.
- **PRESCRIBING AND DISPENSING INFORMATION** Although multi-dose latanoprost eye drops commonly contain preservatives, preservative-free unit dose vials may be available.
- **PATIENT AND CARER ADVICE** Changes in eye colour Before initiating treatment, patients should be warned of a possible change in eye colour as an increase in the brown pigment in the iris can occur, which may be permanent; particular care is required in those with mixed coloured irides and those receiving treatment to one eye only. Changes in eyelashes and vellus hair can also occur, and patients should also be advised to avoid

repeated contact of the eye drop solution with skin as this can lead to hair growth or skin pigmentation.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Eye drops

EXCIPIENTS: May contain Benzalkonium chloride

► Latanoprost (Non-proprietary)

Latanoprost 50 microgram per 1 ml Latanoprost 50micrograms/ml eye drops | 2.5 ml [PoM] £12.48 DT price = £1.56

► Monopost (Thea Pharmaceuticals Ltd)

Latanoprost 50 microgram per 1 ml Monopost 50micrograms/ml eye drops 0.2ml unit dose | 30 unit dose [PoM] £8.49 DT price = £8.49 | 90 unit dose [PoM] £25.47 DT price = £25.47

► Xalatan (Pfizer Ltd)

Latanoprost 50 microgram per 1 ml Xalatan 50micrograms/ml eye drops | 2.5 ml [PoM] £12.48 DT price = £1.56

SYMPATHOMIMETICS > ALPHA₂-ADRENOCEPTOR AGONISTS

Apraclonidine

- **DRUG ACTION** Apraclonidine is an alpha₂-adrenoceptor agonist that lowers intra-ocular pressure by reducing aqueous humour formation. It is a derivative of clonidine.

● INDICATIONS AND DOSE

Control or prevention of postoperative elevation of intra-ocular pressure after anterior segment laser surgery

► TO THE EYE

- Child: Apply 1 drop, 1 hour before laser procedure, then 1 drop, immediately after completion of procedure, 1% eye drops to be administered

Short-term adjunctive treatment of chronic glaucoma in patients not adequately controlled by another drug

► TO THE EYE

- Child 12-17 years: Apply 1 drop 3 times a day usually for maximum 1 month, 0.5% eye drops to be administered, may not provide additional benefit if patient already using two drugs that suppress the production of aqueous humour

- **UNLICENSED USE** 0.5% drops are not licensed for use in children under 12 years. 1% drops are not licensed for use in children.
- **CONTRA-INDICATIONS** History of severe or unstable and uncontrolled cardiovascular disease
- **CAUTIONS** Cerebrovascular disease · depression · heart failure · history of angina · hypertension · loss of effect may occur over time · Raynaud's syndrome · recent myocardial infarction · reduction in vision in end-stage glaucoma (suspend treatment) · severe coronary insufficiency · thromboangiitis obliterans · vasovagal attack
- **INTERACTIONS** → Appendix 1 (apraclonidine).
- **SIDE-EFFECTS**
 - **Common or very common** Conjunctivitis · dry eye · ocular intolerance · rhinitis · taste disturbance
 - **Uncommon** Asthma · blepharitis · blepharospasm · chest pain · conjunctival vascular disorders · corneal erosion and infiltrates · dyspnoea · eyelid ptosis or retraction · impaired co-ordination · irritability · keratitis · keratopathy · myalgia · mydriasis · nervousness · parosmia · photophobia · rhinorrhoea · throat irritation · visual impairment
- **SIDE-EFFECTS, FURTHER INFORMATION**
 - Ocular intolerance Withdraw if eye pruritus, ocular hyperaemia, increased lacrimation, or oedema of the eyelids and conjunctiva occur.
 - Systemic effects Since absorption may follow topical application, see clonidine hydrochloride p. 93.
- **PREGNANCY** Manufacturer advises avoid—no information available.

- **BREAST FEEDING** Manufacturer advises avoid—no information available.
- **HEPATIC IMPAIRMENT** Manufacturer advises caution.
- **RENAL IMPAIRMENT** Use with caution in chronic renal failure.
- **MONITORING REQUIREMENTS**
 - ▶ Monitor intra-ocular pressure and visual fields.
 - ▶ Monitor for excessive reduction in intra-ocular pressure following peri-operative use.
- **PATIENT AND CARER ADVICE**

Driving and skilled tasks

Drowsiness may affect performance of skilled tasks (e.g. driving).

Ear

Ear

Otitis externa

Otitis externa is an inflammatory reaction of the lining of the ear canal usually associated with an underlying seborrhoeic dermatitis or eczema; it is important to exclude an underlying chronic otitis media before treatment is commenced. Many cases recover after thorough cleansing of the external ear canal by suction or dry mopping.

A frequent problem in resistant cases is the difficulty in applying lotions and ointments satisfactorily to the relatively inaccessible affected skin. The most effective method is to introduce a ribbon gauze dressing or sponge wick soaked with **corticosteroid** ear drops or with an astringent such as aluminium acetate solution p. 647. When this is not practical, the ear should be gently cleansed with a probe covered in cotton wool and the patient encouraged to lie with the affected ear uppermost for ten minutes after the canal has been filled with a liberal quantity of the appropriate solution.

Secondary infection in otitis externa may be of bacterial, fungal, or viral origin. If infection is present, a topical anti-infective which is not used systemically (such as neomycin sulfate p. 645 or **clioquinol**) may be used, but for only about a week because excessive use may result in fungal infections that are difficult to treat. Sensitivity to the anti-infective or solvent may occur and resistance to antibacterials is a possibility with prolonged use. Aluminium acetate ear drops are also effective against bacterial infection and inflammation of the ear. Chloramphenicol p. 645 may be used, but the ear drops contain propylene glycol and cause hypersensitivity reactions in about 10% of patients. Solutions containing an anti-infective and a corticosteroid are used for treating children when infection is present with inflammation and eczema. Clotrimazole 1% solution p. 645 is used topically to treat fungal infection in otitis externa.

In view of reports of ototoxicity, manufacturers contraindicate treatment with topical **aminoglycosides** or **polymyxins** in children with a perforated tympanic membrane (eardrum) or patent grommet. However, some specialists do use these drops cautiously in the presence of a perforation or patent grommet in children with chronic suppurative otitis media and when other measures have

failed for otitis externa; treatment should be considered only by **specialists** in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances.

A solution of **acetic acid** 2% acts as an antifungal and antibacterial in the external ear canal. It may be used to treat mild otitis externa but in severe cases an anti-inflammatory preparation with or without an anti-infective drug is required. A proprietary preparation containing acetic acid 2% (*EarCalm*® spray) is on sale to the public for children over 12 years.

For severe pain associated with otitis externa, a simple analgesic, such as paracetamol p. 254 or ibuprofen p. 608, can be used. A systemic antibacterial can be used if there is spreading cellulitis or if the patient is systemically unwell. When a resistant staphylococcal infection (a boil) is present in the external auditory meatus, flucloxacillin p. 325 is the drug of choice; oral ciprofloxacin p. 328 or a systemic aminoglycoside may be needed for pseudomonal infections, particularly in children with diabetes or compromised immunity.

The skin of the pinna adjacent to the ear canal is often affected by eczema. Topical corticosteroid creams and ointments are then required, but prolonged use should be avoided.

Otitis media

Acute otitis media

Acute otitis media is the commonest cause of severe aural pain in young children and may occur with even minor upper respiratory tract infections. Children diagnosed with acute otitis media should not be prescribed antibacterials routinely as many infections, especially those accompanying coryza, are caused by viruses. Most uncomplicated cases resolve without antibacterial treatment and a **simple analgesic**, such as paracetamol, may be sufficient. In children without systemic features, a **systemic antibacterial** may be started after 72 hours if there is no improvement, or earlier if there is deterioration, if the child is systemically unwell, if the

child is at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis), if mastoiditis is present, or in children under 2 years of age with bilateral otitis media. Perforation of the tympanic membrane in children with *acute otitis media* usually heals spontaneously without treatment; if there is no improvement, e.g. pain or discharge persists, a systemic antibacterial can be given. Topical antibacterial treatment of acute otitis media is ineffective and there is no place for ear drops containing a local anaesthetic.

Otitis media with effusion

Otitis media with effusion (glue ear) occurs in about 10% of children and in 90% of children with cleft palates. Antimicrobials, corticosteroids, decongestants, and antihistamines have little place in the routine management of otitis media with effusion. If glue ear persists for more than a month or two, the child should be referred for assessment and follow up because of the risk of long-term hearing impairment which can delay language development. Untreated or resistant glue ear may be responsible for some types of *chronic otitis media*.

Chronic otitis media

Opportunistic organisms are often present in the debris, keratin, and necrotic bone of the middle ear and mastoid in children with chronic otitis media. The mainstay of treatment is thorough cleansing with aural microsuction, which may completely resolve long-standing infection. Cleansing may be followed by topical treatment as for otitis externa; this is particularly beneficial for discharging ears or infections of the mastoid cavity. Acute exacerbations of chronic infection may require treatment with an oral antibacterial; a swab should be taken to identify infecting organisms and antibacterial sensitivity.

In view of reports of ototoxicity, manufacturers contraindicate topical treatment with ototoxic antibacterials in the presence of a tympanic perforation or patent grommet. Ciprofloxacin or ofloxacin eye drops used in the ear [unlicensed use] or ear drops [both unlicensed; available from 'special-order' manufacturers or specialist importing companies] are an effective alternative to such ototoxic ear drops for chronic otitis media in patients with perforation of the tympanic membrane.

However, some specialists do use ear drops containing **aminoglycosides** or **polymyxins** [unlicensed indications] cautiously in children with chronic suppurative otitis media and perforation of the tympanic membrane, if the otitis media has failed to settle with systemic antibacterials; treatment should be considered only by **specialists** in the following circumstances:

- drops should only be used in the presence of obvious infection;
- treatment should be for no longer than 2 weeks;
- the carer and child should be counselled on the risk of ototoxicity and given justification for the use of these topical antibiotics;
- baseline audiometry should be performed, if possible, before treatment is commenced.

Clinical expertise and judgement should be used to assess the risk of treatment versus the benefit to the patient in such circumstances. It is considered that the pus in the middle ear associated with otitis media also carries a risk of ototoxicity.

Removal of ear wax

Ear wax (cerumen) is a normal bodily secretion which provides a protective film on the meatal skin and need only be removed if it causes hearing loss or interferes with a proper view of the ear drum.

Ear wax causing discomfort or impaired hearing may be softened using simple remedies such as **olive oil** ear drops or **almond oil** ear drops; sodium bicarbonate ear drops p. 647 are also effective, but may cause dryness of the ear canal. If

the wax is hard and impacted, the drops can be used twice daily for several days and this may reduce the need for mechanical removal of the wax. The child should lie with the affected ear uppermost for 5 to 10 minutes after a generous amount of the softening remedy has been introduced into the ear. Proprietary preparations containing organic solvents can irritate the meatal skin, and in most cases the simple remedies indicated above are just as effective and less likely to cause irritation. Docusate sodium p. 647 or urea hydrogen peroxide p. 648 are ingredients in a number of proprietary preparations for softening ear wax.

If necessary, wax may be removed by irrigation with water (warmed to body temperature). Ear irrigation is generally best avoided in young children, in children unable to co-operate with the procedure, in children who have had otitis media in the last six weeks, in otitis externa, in children with cleft palate, a history of ear drum perforation, or previous ear surgery. A child who has hearing in one ear only should not have that ear irrigated because even a very slight risk of damage is unacceptable in this situation.

Administration

To administer ear drops, lay the child down with the head turned to one side; for an infant pull the earlobe back and down, for an older child pull the earlobe back and up.

1 Otitis externa

ANTIBACTERIALS > AMINOGLYCOSIDES

Framycetin sulfate

• INDICATIONS AND DOSE

Bacterial infection in otitis externa

- ▶ TO THE EAR
- ▶ Child: (consult product literature)

- **CONTRA-INDICATIONS** Perforated tympanic membrane
- **CAUTIONS** Avoid prolonged use
- **SIDE-EFFECTS** Local sensitivity

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed medicines listed.

Combinations available: **Dexamethasone with framycetin sulfate and gramicidin**, p. 646

Gentamicin

• INDICATIONS AND DOSE

Bacterial infection in otitis externa

- ▶ TO THE EAR
- ▶ Child: Apply 2–3 drops 4–5 times a day, (including a dose at bedtime)

- **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists (see Ear p. 643) • perforated tympanic membrane (although may be used by specialists (see Ear p. 643)

- **CAUTIONS** Avoid prolonged use
- **SIDE-EFFECTS** Local sensitivity

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye drops solution

EXCIPIENTS: May contain Benzalkonium chloride

► Gentamicin (Non-proprietary)

Gentamicin (as Gentamicin sulfate) 3 mg per 1 ml Gentamicin 0.3% ear/eye drops | 10 ml [PoM] £2.55 DT price = £2.13
Gentamicin 0.3% eye/ear drops | 10 ml [PoM] £2.13 DT price = £2.13

Gentamicin with hydrocortisone

INDICATIONS AND DOSE

Eczematous inflammation in otitis externa

► TO THE EAR

► Child: Apply 2–4 drops 4–5 times a day, (including a dose at bedtime)

● **CONTRA-INDICATIONS** Patent grommet (although may be used by specialists, see Ear p. 643) · perforated tympanic membrane (although may be used by specialists, see Ear p. 643)

● **CAUTIONS** Avoid prolonged use

● **SIDE-EFFECTS** Local sensitivity reactions

Nose

Nose

Rhinitis and bacterial sinusitis

Rhinitis is often self-limiting but bacterial sinusitis may require treatment with antibacterials. Many nasal preparations contain sympathomimetic drugs which can give rise to rebound congestion (*rhinitis medicamentosa*) and may damage the nasal cilia. Sodium chloride 0.9% solution p. 547 may be used as a douche or 'sniff' following endonasal surgery.

Administration

To administer nasal drops, lay the child face-upward with the neck extended, instil the drops, then sit the child up and tilt the head forward.

Drugs used in nasal allergy

Mild allergic rhinitis is controlled by **antihistamines** (see under Antihistamines, allergen immunotherapy and allergic emergencies p. 162) or topical **nasal corticosteroids**; systemic nasal decongestants are not recommended for use in children. Topical nasal decongestants can be used for a short period to relieve congestion and allow penetration of a topical nasal corticosteroid.

More persistent symptoms can be relieved by topical nasal **corticosteroids**; sodium cromoglicate p. 654 is an alternative, but may be less effective. The topical antihistamine, azelastine hydrochloride, is useful for controlling breakthrough symptoms in allergic rhinitis. Azelastine hydrochloride is less effective than nasal corticosteroids, but probably more effective than sodium cromoglicate. In seasonal allergic rhinitis (e.g. hay fever), treatment should begin 2 to 3 weeks before the season commences and may have to be continued for several months; continuous long-term treatment may be required in perennial rhinitis.

Montelukast p. 155 is less effective than topical nasal corticosteroids; it can be used in children with seasonal allergic rhinitis (unresponsive to other treatments) and concomitant asthma.

Children with disabling symptoms of seasonal rhinitis (e.g. students taking important examinations), may be treated with oral **corticosteroids** for short periods. Oral corticosteroids may also be used at the beginning of a course

of treatment with a corticosteroid spray to relieve severe mucosal oedema and allow the spray to penetrate the nasal mucosa.

Sometimes allergic rhinitis is accompanied by vasomotor rhinitis. In this situation, the addition of topical nasal ipratropium bromide p. 651 can reduce watery rhinorrhoea.

Corticosteroids

Corticosteroid nasal preparations should be avoided in the presence of untreated nasal infections, after nasal surgery (until healing has occurred), and in pulmonary tuberculosis. Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; for cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays. The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Nasal polyps

Short-term use of corticosteroid nasal drops helps to shrink nasal polyps; to be effective, the drops must be administered with the child in the 'head down' position. A short course of a systemic corticosteroid may be required initially to shrink large polyps. A corticosteroid nasal spray can be used to maintain the reduction in swelling and also for the initial treatment of small polyps.

Pregnancy

If a pregnant woman cannot tolerate the symptoms of allergic rhinitis, treatment with nasal beclometasone dipropionate p. 652, budesonide p. 652, fluticasone p. 652, or sodium cromoglicate may be considered.

Topical nasal decongestants

Sodium chloride 0.9% given as nasal drops or spray may relieve nasal congestion by helping to liquefy mucous secretions in children with rhinitis. In infants, 1–2 drops of sodium chloride 0.9% solution in each nostril before feeds will help relieve congestion and allow more effective suckling.

Inhalation of **warm moist air** is useful in the treatment of symptoms of acute nasal congestion in infants and children, but the use of boiling water for steam inhalation is dangerous for children and should **not** be recommended. Volatile substances such as menthol and eucalyptus may encourage inhalation of warm moist air (see also Aromatic inhalations, cough preparations and systemic nasal decongestants p. 176).

Topical nasal decongestants containing sympathomimetics can cause rebound congestion (*rhinitis medicamentosa*) following prolonged use (more than 7 days), and are therefore of limited value in the treatment of nasal congestion.

Ephedrine hydrochloride nasal drops p. 649 is the least likely of the sympathomimetic nasal decongestants to cause rebound congestion and can provide relief for several hours. The more potent sympathomimetic drugs **oxymetazoline** and **xylometazoline hydrochloride** p. 650 are more likely to cause a rebound effect.

Non-allergic watery rhinorrhoea often responds well to treatment with the antimuscarinic ipratropium bromide.

Recurrent, persistent bleeding may respond to the use of a sympathomimetic nasal spray; if infection is present, chlorhexidine and neomycin (*Naseptin*®) cream may be effective.

Sinusitis and oral pain

Sinusitis affecting the maxillary antrum can cause pain in the upper jaw. Where this is associated with blockage of the opening from the sinus into the nasal cavity, it may be helpful to relieve the congestion with inhalation of warm moist air or with ephedrine hydrochloride nasal drops.

Systemic antibacterials may sometimes be required for sinusitis (see under Nose infections, bacterial p. 289).

Nasal preparations for infection

There is **no** evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis; see elimination of nasal staphylococci. In children, acute complications such as periorbital cellulitis require hospital treatment.

Nasal staphylococci

Elimination of organisms such as staphylococci from the nasal vestibule can be achieved by the use of a cream containing **chlorhexidine** and **neomycin** (*Naseptin*®), but re-colonisation frequently occurs. Coagulase-positive staphylococci are present in the noses of 40% of the population.

A nasal ointment containing mupirocin p. 650 is also available; it should probably be held in reserve for resistant infections. In hospitals or in care establishments, mupirocin nasal ointment should be reserved for the eradication (in both patients and staff) of nasal carriage of methicillin-resistant *Staphylococcus aureus* (MRSA). A sample should be taken 2 days after treatment to confirm eradication. The course may be repeated if the sample is positive (and the throat is not colonised). To avoid the development of resistance, the treatment course should not exceed 7 days and the course should not be repeated on more than one occasion. If the MRSA strain is mupirocin-resistant or does not respond after 2 courses, consider alternative products such as chlorhexidine and neomycin cream.

For eradication of MRSA also consult local infection control policy. See also MRSA p. 339.

1 Nasal congestion

SYMPATHOMIMETICS > VASOCONSTRICTOR

Ephedrine hydrochloride

● INDICATIONS AND DOSE

Nasal congestion | Sinusitis affecting the maxillary antrum

► BY INTRANASAL ADMINISTRATION

- Child 12-17 years: Apply 1–2 drops up to 4 times a day as required for a maximum of 7 days, to be instilled into each nostril, administer ephedrine 0.5% nasal drops

IMPORTANT SAFETY INFORMATION

CHM/MHRA ADVICE

The CHM/MHRA has stated that non-prescription cough and cold medicines containing ephedrine can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Avoid excessive or prolonged use · cardiovascular disease · diabetes mellitus · hypertension · hyperthyroidism
- **INTERACTIONS** → Appendix 1 (sympathomimetics).
- **SIDE-EFFECTS**
 - **Common or very common** Headache · nausea
 - **Frequency not known** After excessive use tolerance with diminished effect · cardiovascular effect · local irritation · rebound congestion
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Present in milk; manufacturer advises avoid—irritability and disturbed sleep reported.

● PRESCRIBING AND DISPENSING INFORMATION

For nasal drops, the BP directs that if no strength is specified 0.5% drops should be supplied.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Ephedrine nasal drops may be prescribed.

- **EXCEPTIONS TO LEGAL CATEGORY** Ephedrine nasal drops can be sold to the public provided no more than 180 mg of ephedrine base (or salts) are supplied at one time, and pseudoephedrine salts are not supplied at the same time; for conditions that apply to supplies made at the request of a patient, see *Medicines, Ethics and Practice*, London, Pharmaceutical Press (always consult latest edition).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: nasal drops

Nasal drops

► Ephedrine hydrochloride (Non-proprietary)

Ephedrine hydrochloride 5 mg per 1 ml Ephedrine 0.5% nasal drops | 10 ml [P] £1.73–£1.75 DT price = £1.74

Ephedrine hydrochloride 10 mg per 1 ml Ephedrine 1% nasal drops | 10 ml [P] £1.79–£1.81 DT price = £1.80

Pseudoephedrine hydrochloride

● INDICATIONS AND DOSE

Congestion of mucous membranes of upper respiratory tract

► BY MOUTH

- Child 6–11 years: 30 mg 3–4 times a day
- Child 12–17 years: 60 mg 3–4 times a day

IMPORTANT SAFETY INFORMATION

MHRA/CHM ADVICE (MARCH 2008 AND FEBRUARY 2009): OVER-THE-COUNTER COUGH AND COLD MEDICINES FOR CHILDREN
Children under 6 years should not be given over-the-counter cough and cold medicines containing pseudoephedrine.

- **CAUTIONS** Diabetes · heart disease · hypertension · hyperthyroidism · raised intra-ocular pressure
- **INTERACTIONS** → Appendix 1 (sympathomimetics).
Contra-indicated in patients taking monoamine oxidase inhibitors within the previous 2 weeks.
- **SIDE-EFFECTS**
 - **Common or very common** Anxiety · headache · hypertension · insomnia · nausea · restlessness · tachycardia · vomiting
 - **Rare** Hallucinations · rash
 - **Very rare** Angle-closure glaucoma
 - **Frequency not known** Urinary retention
- **PREGNANCY** Defective closure of the abdominal wall (gastroschisis) reported very rarely in newborns after first trimester exposure.
- **BREAST FEEDING** May suppress lactation; avoid if lactation not well established or if milk production insufficient.
- **HEPATIC IMPAIRMENT** Manufacturer advises use with caution in severe impairment.
- **RENAL IMPAIRMENT** Use with caution in mild to moderate renal impairment. Manufacturer advises avoid in severe renal impairment.
- **LESS SUITABLE FOR PRESCRIBING** Pseudoephedrine hydrochloride is less suitable for prescribing.
- **EXCEPTIONS TO LEGAL CATEGORY** *Galpseud*® and *Sudafed*® can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see

Medicines, Ethics and Practice, London, Pharmaceutical Press (always consult latest edition).

Nasal congestion

- ▶ BY INTRANASAL ADMINISTRATION USING NASAL DROPS
- ▶ Child 6–11 years: 1–2 drops 1–2 times a day as required for maximum duration of 5 days, 0.05% solution to be administered into each nostril
- ▶ Child 12–17 years: 2–3 drops 2–3 times a day as required for maximum duration of 7 days, 0.1% solution to be administered into each nostril
- ▶ BY INTRANASAL ADMINISTRATION USING NASAL SPRAY
- ▶ Child 12–17 years: 1 spray 1–3 times a day as required for maximum duration of 7 days, to be administered into each nostril

IMPORTANT SAFETY INFORMATION

The CHM/MHRA has stated that non-prescription cough and cold medicines containing oxymetazoline or xylometazoline can be considered for up to 5 days' treatment in children aged 6–12 years after basic principles of best care have been tried; these medicines should not be used in children under 6 years of age.

- **CAUTIONS** Angle-closure glaucoma · avoid excessive or prolonged use · cardiovascular disease · diabetes mellitus · hypertension · hyperthyroidism · rebound congestion

CAUTIONS, FURTHER INFORMATION

- ▶ Rebound congestion Sympathomimetic drugs are of limited value in the treatment of nasal congestion because they can, following prolonged use (more than 7 days), give rise to a rebound congestion (rhinitis medicamentosa) on withdrawal, due to a secondary vasodilatation with a subsequent temporary increase in nasal congestion. This in turn tempts the further use of the decongestant, leading to a vicious cycle of events.
- **SIDE-EFFECTS** Cardiovascular effects · hallucinations in small children · headache · local irritation · nausea · rebound congestion · restlessness in small children · sleep disturbances in small children · tolerance with diminished effect (after excessive use) · transient visual disturbances

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Hallucinations (in small children) Discontinue treatment if the hallucinations occur.
- **PREGNANCY** Manufacturer advises avoid.
- **BREAST FEEDING** Manufacturer advises caution—no information available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

- ▶ **Otrivine** (Novartis Consumer Health UK Ltd)
Xylometazoline hydrochloride 1 mg per 1 ml Otrivine Congestion Relief 0.1% nasal spray | 10 ml [GSL] £3.05 DT price = £2.18
Otrivine Allergy Relief 0.1% nasal spray | 10 ml [GSL] £2.62 DT price = £2.18
- ▶ **Sudafed Congestion Relief** (McNeil Products Ltd)
Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Congestion Relief 0.1% nasal spray | 10 ml [GSL] £3.25 DT price = £2.18
- ▶ **Sudafed Mucus Relief** (McNeil Products Ltd)
Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Mucus Relief 0.1% nasal spray | 15 ml [GSL] £2.37
- ▶ **Sudafed Non-Drowsy Decongestant (xylometazoline)** (McNeil Products Ltd)
Xylometazoline hydrochloride 1 mg per 1 ml Sudafed Blocked Nose 0.1% spray | 15 ml [GSL] £2.38

Nasal drops

- ▶ **Otrivine** (Novartis Consumer Health UK Ltd)
Xylometazoline hydrochloride 500 microgram per 1 ml Otrivine Child nasal drops | 10 ml [P] £1.91 DT price = £1.91
Xylometazoline hydrochloride 1 mg per 1 ml Otrivine Adult 0.1% nasal drops | 10 ml [GSL] £2.18 DT price = £2.18

2 Nasal infection

ANTIBACTERIALS > AMINOGLYCOSIDES

Chlorhexidine with neomycin

INDICATIONS AND DOSE

Eradication of nasal carriage of staphylococci

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply 4 times a day for 10 days

Preventing nasal carriage of staphylococci

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply twice daily

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Arachis (peanut) oil, cetostearyl alcohol (including cetyl and stearyl alcohol)

- ▶ **Naseptin** (Alliance Pharmaceuticals Ltd)
Chlorhexidine hydrochloride 1 mg per 1 gram, Neomycin sulfate 5 mg per 1 gram Naseptin nasal cream | 15 gram [PoM] £2.24 DT price = £2.24

ANTIBACTERIALS > OTHER

Mupirocin

INDICATIONS AND DOSE

BACTROBAN NASAL®

For eradication of nasal carriage of staphylococci, including meticillin-resistant *Staphylococcus aureus* (MRSA)

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child: Apply 2–3 times a day for 5 days; a sample should be taken 2 days after treatment to confirm eradication. Course may be repeated once if sample

positive (and throat not colonised), dose to be applied to the inner surface of each nostril

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.
- **BREAST FEEDING** No information available.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Nasal ointment

- ▶ **Bactroban** (GlaxoSmithKline UK Ltd)
Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban
2% nasal ointment | 3 gram [PoM] £3.89 DT price = £3.89

CORTICOSTEROIDS > CORTICOSTEROID COMBINATIONS WITH ANTI-INFECTIVES

Betamethasone with neomycin

The properties listed below are those particular to the combination only. For the properties of the components please consider, betamethasone p. 645, neomycin sulfate p. 645.

INDICATIONS AND DOSE

Nasal infection

- ▶ BY INTRANASAL ADMINISTRATION USING NASAL DROPS
- ▶ Child: Apply 2–3 drops 2–3 times a day, to be applied into each nostril

- **LESS SUITABLE FOR PRESCRIBING** Betamethasone with neomycin nasal-drops are less suitable for prescribing; there is no evidence that topical anti-infective nasal preparations have any therapeutic value in rhinitis or sinusitis.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ear/eye/nose drops solution

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Betnesol-N** (Focus Pharmaceuticals Ltd)
Betamethasone (as Betamethasone sodium phosphate) 1 mg per 1 ml, Neomycin sulfate 5 mg per 1 ml Betnesol-N ear/eye/nose drops | 10 ml [PoM] £2.39 DT price = £2.39

3 Nasal inflammation, nasal polyps and rhinitis

Drugs used for Nasal inflammation, nasal polyps and rhinitis not listed below Desloratadine, p. 165 · Fexofenadine hydrochloride, p. 165 · Ketotifen, p. 170

ANTIMUSCARINICS > OTHER

Ipratropium bromide

24.2.2016

INDICATIONS AND DOSE

Rhinorrhoea associated with allergic and non-allergic rhinitis

- ▶ BY INTRANASAL ADMINISTRATION
- ▶ Child 12–17 years: 2 sprays 2–3 times a day, dose to be sprayed into each nostril

DOSE EQUIVALENCE AND CONVERSION

1 metered spray of nasal spray = 21 micrograms.

- **CAUTIONS** Avoid spraying near eyes · bladder outflow obstruction · cystic fibrosis · susceptibility to angle-closure glaucoma

SIDE-EFFECTS

- ▶ **Common or very common** Epistaxis · nasal dryness · nasal irritation
- ▶ **Uncommon** Headache · nausea
- ▶ **Very rare** Gastro-intestinal motility disturbances · palpitations · urinary retention
- **PREGNANCY** Manufacturer advises only use if potential benefit outweighs the risk.
- **BREAST FEEDING** No information available—manufacturer advises only use if potential benefit outweighs risk.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

EXCIPIENTS: May contain Benzalkonium chloride, disodium edetate

- ▶ **Rinatec** (Boehringer Ingelheim Ltd)
Ipratropium bromide 21 microgram per 1 dose Rinatec
21micrograms/dose nasal spray | 180 dose [PoM] £6.54 DT price = £6.54

CORTICOSTEROIDS

Corticosteroids (intranasal)

- **CAUTIONS** Avoid after nasal surgery (until healing has occurred) · avoid in pulmonary tuberculosis · avoid in the presence of untreated nasal infections · patients transferred from systemic corticosteroids may experience exacerbation of some symptoms

CAUTIONS, FURTHER INFORMATION

- ▶ **Systemic absorption** Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged; therefore also consider the cautions and side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.

SIDE-EFFECTS

- ▶ **Rare** Glaucoma · raised intra-ocular pressure
- ▶ **Very rare** Nasal septal perforation (usually following nasal surgery)
- ▶ **Frequency not known** Aggression (particularly in children) · anxiety (particularly in children) · bronchospasm · depression (particularly in children) · dryness · epistaxis · headache · hyperactivity (particularly in children) · hypersensitivity reactions · nasal irritation · nasal ulceration · sleep disturbances (particularly in children) · smell disturbances · taste disturbances · throat irritation

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ **Systemic absorption** Systemic absorption may follow nasal administration particularly if high doses are used or if treatment is prolonged. Therefore also consider the side-effects of systemic corticosteroids. The risk of systemic effects may be greater with nasal drops than with nasal sprays; drops are administered incorrectly more often than sprays.
- **MONITORING REQUIREMENTS** The height of children receiving prolonged treatment with nasal corticosteroids should be monitored; if growth is slowed, referral to a paediatrician should be considered.

Oropharynx

1 Dry mouth

Treatment of dry mouth

Overview

Dry mouth (xerostomia) may be caused by drugs with antimuscarinic (anticholinergic) side-effects (e.g. antispasmodics and sedating antihistamines), by irradiation of the head and neck region or by damage to or disease of the salivary glands. Children with a persistently dry mouth may develop a burning or scalded sensation and have poor oral hygiene; they may develop dental caries, periodontal disease, and oral infections (particularly candidiasis). Dry mouth may be relieved in many patients by simple measures such as frequent sips of cool drinks or sucking pieces of ice or sugar-free fruit pastilles. Sugar-free chewing gum stimulates salivation in patients with residual salivary function.

Artificial saliva can provide useful relief of dry mouth. A properly balanced artificial saliva should be of a neutral pH and contain electrolytes (including fluoride) to correspond approximately to the composition of saliva. The acidic pH of some artificial saliva products may be inappropriate.

Artificial saliva products

ARTIFICIAL SALIVA PRODUCTS

AS SALIVA ORTHANA® LOZENGES

Mucin 65 mg, xylitol 59 mg, in a sorbitol basis, pH neutral

INDICATIONS AND DOSE

Dry mouth as a result of having (or having undergone) radiotherapy | Sicca syndrome

► BY MOUTH

- Child: 1 lozenge as required, allow to dissolve slowly in the mouth

- **PRESCRIBING AND DISPENSING INFORMATION** *AS Saliva Orthana*® lozenges do not contain fluoride.

- *AS Saliva Orthana lozenges* (A S Pharma Ltd)
30 lozenge(ACBS) • NHS indicative price = £3.50

AS SALIVA ORTHANA® SPRAY

Gastric mucin (porcine) 3.5%, xylitol 2%, sodium fluoride 4.2 mg/litre, with preservatives and flavouring agents, pH neutral.

INDICATIONS AND DOSE

Symptomatic treatment of dry mouth

► BY MOUTH

- Child: Apply 2–3 sprays as required, spray onto oral and pharyngeal mucosa

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

AS Saliva Orthana® Oral Spray may be prescribed.

BIOXTRA® GEL

Lactoperoxidase, lactoferrin, lysozyme, whey colostrum, xylitol and other ingredients.

INDICATIONS AND DOSE

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

► BY MOUTH

- Child: Apply as required, apply to oral mucosa

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

BioXtra® Gel may be prescribed.

- *BioXtra moisturising gel for dry mouths* (R.I.S. Products Ltd)
40 ml • NHS indicative price = £3.94

BIOTENE ORALBALANCE®

Lactoperoxidase, lactoferrin, lysozyme, glucose oxidase, xylitol in a gel basis

INDICATIONS AND DOSE

Symptomatic treatment of dry mouth

► BY MOUTH

- Child: Apply as required, apply to gums and tongue

- **PATIENT AND CARER ADVICE** Avoid use with toothpastes containing detergents (including foaming agents).

- **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Biotene Oralbalance® Saliva Replacement Gel may be prescribed as Artificial Saliva Gel.

- *Biotene Oralbalance dry mouth saliva replacement gel* (GlaxoSmithKline Consumer Healthcare)

Glucose oxidase 12000 unit, Lactoferrin 12 mg, Lactoperoxidase 12000 unit, Muramidase 12 mg 50 gram • NHS indicative price = £4.46 • Drug Tariff (Part IXa)

GLANDOSANE®

Carmellose sodium 500 mg, sorbitol 1.5 g, potassium chloride 60 mg, sodium chloride 42.2 mg, magnesium chloride 2.6 mg, calcium chloride 7.3 mg, and dipotassium hydrogen phosphate 17.1 mg/50 g, pH 5.75.

● **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

► BY MOUTH

► Child: Apply as required, spray onto oral and pharyngeal mucosa

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Glandosane® Aerosol Spray may be prescribed.

► *Glandosane synthetic saliva spray lemon* (Fresenius Kabi Ltd)

50 ml(ACBS) • NHS indicative price = £5.58

► *Glandosane synthetic saliva spray natural* (Fresenius Kabi Ltd)

50 ml(ACBS) • NHS indicative price = £5.58

► *Glandosane synthetic saliva spray peppermint* (Fresenius Kabi Ltd)

50 ml(ACBS) • NHS indicative price = £5.58

ORALIEVE GEL● **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

► BY MOUTH

► Child: Apply as required, particularly at night, to oral mucosa

● **PRESCRIBING AND DISPENSING INFORMATION** Contains traces of milk protein and egg white protein.**SST®**

Sugar-free, citric acid, malic acid and other ingredients in a sorbitol base.

● **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth in patients with impaired salivary gland function and patent salivary ducts

► BY MOUTH

► Child: 1 tablet as required, allow tablet to dissolve slowly in the mouth

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

May be prescribed as Saliva Stimulating Tablets.

► *SST saliva stimulating tablets* (Sinclair IS Pharma Plc)

100 tablet • NHS indicative price = £4.86 • Drug Tariff (Part IXa)

SALIVEZE®

Carmellose sodium (sodium carboxymethylcellulose), calcium chloride, magnesium chloride, potassium chloride, sodium chloride, and dibasic sodium phosphate, pH neutral

● **INDICATIONS AND DOSE**

Dry mouth as a result of having (or having undergone) radiotherapy (ACBS) | Dry mouth as a result of sicca syndrome (ACBS)

► BY MOUTH

► Child: Apply 1 spray as required, spray onto oral mucosa

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Saliveze® Oral Spray may be prescribed.

► *Saliveze mouth spray* (Wyvern Medical Ltd)

50 ml(ACBS) • NHS indicative price = £3.50

SALIVIX®

Sugar-free, reddish-amber, acacia, malic acid and other ingredients.

● **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

► BY MOUTH USING PASTILLES

► Child: 1 unit as required, suck pastille

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Salivix® Pastilles may be prescribed as Artificial Saliva Pastilles.

► *Salivix pastilles* (Galen Ltd)

50 pastille • NHS indicative price = £3.55 • Drug Tariff (Part IXa)

XEROTIN®

Sugar-free, water, sorbitol, carmellose (carboxymethylcellulose), potassium chloride, sodium chloride, potassium phosphate, magnesium chloride, calcium chloride and other ingredients, pH neutral.

● **INDICATIONS AND DOSE**

Symptomatic treatment of dry mouth

► BY MOUTH

► Child: 1 spray as required

● **PROFESSION SPECIFIC INFORMATION**

Dental practitioners' formulary

Xerotin® Oral Spray may be prescribed as Artificial Saliva Oral Spray.

► *Xerotin spray* (SpePharm UK Ltd)

100 ml • NHS indicative price = £6.86 • Drug Tariff (Part IXa)

2 Oral hygiene

Mouthwashes and other preparations for oropharyngeal use

Lozenges and sprays

There is no convincing evidence that antiseptic lozenges and sprays have a beneficial action and they sometimes irritate and cause sore tongue and sore lips. Some of these preparations also contain local anaesthetics which relieve pain but may cause sensitisation.

Mouthwashes and gargles

Superficial infections of the mouth are often helped by warm mouthwashes which have a mechanical cleansing effect and cause some local hyperaemia. However, to be effective, they must be used frequently and vigorously. Mouthwashes may not be suitable for children under 7 years (risk of the solution being swallowed); the mouthwash or dental gel may be applied using a cotton bud.

A warm saline mouthwash is ideal and can be prepared either by dissolving half a teaspoonful of salt in a glassful of warm water or by diluting compound sodium chloride mouthwash p. 657 with an equal volume of warm water.

Mouthwashes containing an oxidising agent, such as hydrogen peroxide p. 657, may be useful in the treatment of acute ulcerative gingivitis (Vincent's infection) since the organisms involved are anaerobes. It also has a mechanical cleansing effect arising from frothing when in contact with oral debris. Concentrations greater than 1.5% in children may cause ulceration and tissue damage.

Chlorhexidine p. 656 is an effective antiseptic which has the advantage of inhibiting plaque formation on the teeth. It does not, however, completely control plaque deposition and is not a substitute for effective toothbrushing. Moreover,

chlorhexidine preparations do not penetrate significantly into stagnation areas and are therefore of little value in the control of dental caries or of periodontal disease once pocketing has developed. Chlorhexidine preparations are of little value in the control of acute necrotising ulcerative gingivitis. With prolonged use, chlorhexidine causes reversible brown staining of teeth and tongue. Chlorhexidine may be incompatible with some ingredients in toothpaste, causing an unpleasant taste in the mouth; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing products.

Chlorhexidine can be used as a mouthwash, spray or gel for secondary infection in mucosal ulceration and for controlling gingivitis, as an adjunct to other oral hygiene measures. These preparations may also be used instead of toothbrushing where there is a painful periodontal condition (e.g. primary herpetic stomatitis) or if the patient has a haemorrhagic disorder, or is disabled. Chlorhexidine mouthwash is used in the prevention of oral candidiasis in immunocompromised patients. Chlorhexidine mouthwash reduces the incidence of alveolar osteitis following tooth extraction. Chlorhexidine mouthwash should not be used for the prevention of endocarditis in children undergoing dental procedures.

ANTISEPTICS AND DISINFECTANTS > OTHER

Chlorhexidine

• INDICATIONS AND DOSE

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

► BY MOUTH USING MOUTHWASH

► Child: Rinse or gargle 10 mL twice daily (rinse or gargle for about 1 minute)

Oral hygiene and plaque inhibition and gingivitis

► BY MOUTH USING DENTAL GEL

► Child: Apply 1–2 times a day, to be brushed on the teeth

Oral candidiasis | Management of aphthous ulcers

► BY MOUTH USING DENTAL GEL

► Child: Apply 1–2 times a day, to affected areas

Oral hygiene and plaque inhibition | Oral candidiasis | Gingivitis | Management of aphthous ulcers

► BY MOUTH USING OROMUCOSAL SPRAY

► Child: Apply up to 12 sprays twice daily as required, to be applied tooth, gingival, or ulcer surfaces

Bladder irrigation and catheter patency solutions

► BY INTRAVESICAL INSTILLATION

► Child: (consult product literature)

• **UNLICENSED USE** *Corsodyl*® not licensed for use in children under 12 years (unless on the advice of a healthcare professional).

• **SIDE-EFFECTS** Anaphylaxis · hypersensitivity · mucosal irritation · parotid gland swelling · reversible brown staining of composite restorations · reversible brown staining of silicate compositions · reversible brown staining of teeth · taste disturbance · tongue discolouration

SIDE-EFFECTS, FURTHER INFORMATION

If desquamation occurs with mucosal irritation, discontinue treatment or dilute mouthwash with an equal volume of water.

• **PATIENT AND CARER ADVICE** Chlorhexidine gluconate may be incompatible with some ingredients in toothpaste; rinse the mouth thoroughly with water between using toothpaste and chlorhexidine-containing product.

• PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Corsodyl® dental gel may be prescribed as Chlorhexidine Gluconate Gel; *Corsodyl*® mouthwash may be prescribed as Chlorhexidine Mouthwash; *Corsodyl*® oral spray may be prescribed as Chlorhexidine Oral Spray.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Dental gel

► *Corsodyl* (GlaxoSmithKline Consumer Healthcare)

Chlorhexidine gluconate 10 mg per 1 gram *Corsodyl* 1% dental gel sugar-free | 50 gram [P] £1.26 DT price = £1.26

Mouthwash

► **Chlorhexidine (Non-proprietary)**

Chlorhexidine gluconate 2 mg per 1 ml Chlorhexidine gluconate 0.2% mouthwash natural | 300 ml [GSL] £3.65 DT price = £3.48

Chlorhexidine gluconate 0.2% mouthwash | 300 ml [GSL] £1.99–£2.09 DT price = £3.48

Chlorhexidine gluconate 0.2% mouthwash plain | 300 ml [GSL] £3.48 DT price = £3.48

Chlorhexidine gluconate 0.2% mouthwash peppermint | 300 ml [GSL] £3.65 DT price = £3.48

Chlorhexidine gluconate 0.2% mouthwash original | 300 ml [GSL] £3.65 DT price = £3.48

Chlorhexidine gluconate 0.2% mouthwash alcohol free | 300 ml [GSL] no price available DT price = £3.48 | 500 ml [GSL] no price available

► *Corsodyl* (GlaxoSmithKline Consumer Healthcare)

Chlorhexidine gluconate 2 mg per 1 ml *Corsodyl* 0.2% mouthwash anised | 300 ml [GSL] £2.44 DT price = £3.48

Corsodyl Mint 0.2% mouthwash | 300 ml [GSL] £2.44 DT price = £3.48 | 600 ml [GSL] £4.76

Corsodyl 0.2% mouthwash alcohol free | 300 ml [GSL] £3.06 DT price = £3.48

► *Curasept* (Curaprox (UK) Ltd)

Chlorhexidine gluconate 2 mg per 1 ml *Curasept* 0.2% oral rinse | 200 ml no price available

Irrigation

► **Chlorhexidine (Non-proprietary)**

Chlorhexidine acetate 200 microgram per 1 ml *Uro-Tainer* chlorhexidine 1:5000 catheter maintenance solution | 100 ml [P] £2.70

Chlorhexidine with chlorobutanol

The properties listed below are those particular to the combination only. For the properties of the components please consider, chlorhexidine above.

• INDICATIONS AND DOSE

Oral hygiene and plaque inhibition

► BY MOUTH USING MOUTHWASH

► Child 6–17 years: Rinse or gargle 10–15 mL 2–3 times a day, to be diluted with lukewarm water in measuring cup provided

• **PRESCRIBING AND DISPENSING INFORMATION** Flavours of mouthwash may include mint.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.
No licensed medicines listed.

Hexetidine

● INDICATIONS AND DOSE

Oral hygiene

► BY MOUTH USING MOUTHWASH

- Child 6–17 years: Rinse or gargle 15 mL 2–3 times a day, to be used undiluted

● SIDE-EFFECTS

- **Very rare** Taste disturbance • transient anaesthesia
- **Frequency not known** Local irritation

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Mouthwash

- **Oraldene** (McNeil Products Ltd)

Hexetidine 1 mg per 1 mL Oraldene Icemint 0.1% mouthwash sugar-free | 200 mL [GSL] £2.21 DT price = £2.21

Oraldene 0.1% mouthwash peppermint sugar-free | 100 mL [GSL]

£1.43 sugar-free | 200 mL [GSL] £2.21 DT price = £2.21

Hydrogen peroxide

- **DRUG ACTION** Hydrogen peroxide is an oxidising agent.

● INDICATIONS AND DOSE

Oral hygiene (with hydrogen peroxide 6%)

► BY MOUTH USING MOUTHWASH

- Child: Rinse or gargle 15 mL 2–3 times a day for 2–3 minutes, to be diluted in half a tumblerful of warm water

PEROXYL®

Oral hygiene

► BY MOUTH USING MOUTHWASH

- Child 6–17 years: Rinse or gargle 10 mL 3 times a day for about 1 minute, for maximum 7 days, to be used after meals and at bedtime

- **SIDE-EFFECTS** Hypertrophy of papillae of tongue on prolonged use

- **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Hydrogen Peroxide Mouthwash, BP consists of hydrogen peroxide 6% solution (= approx. 20 volume) BP.

- **HANDLING AND STORAGE** Hydrogen peroxide bleaches fabric.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Hydrogen Peroxide Mouthwash may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Mouthwash

- **Peroxyl** (Colgate-Palmolive (UK) Ltd)

Hydrogen peroxide 15 mg per 1 mL Peroxyl 1.5% mouthwash sugar-free | 300 mL [GSL] £2.94

Sodium bicarbonate with sodium chloride

● INDICATIONS AND DOSE

Oral hygiene

► BY MOUTH USING MOUTHWASH

- Child: (consult product literature)

- **DIRECTIONS FOR ADMINISTRATION** For mouthwash, extemporaneous preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint

emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water prior to administration.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of mouthwash may include peppermint.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Compound sodium chloride mouthwash may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: mouthwash

Sodium chloride

● INDICATIONS AND DOSE

Oral hygiene

► BY MOUTH USING MOUTHWASH

- Child: Rinse or gargle as required

- **DIRECTIONS FOR ADMINISTRATION** Extemporaneous mouthwash preparations should be prepared according to the following formula: sodium chloride 1.5 g, sodium bicarbonate 1 g, concentrated peppermint emulsion 2.5 mL, double-strength chloroform water 50 mL, water to 100 mL. To be diluted with an equal volume of warm water.

- **PRESCRIBING AND DISPENSING INFORMATION** No mouthwash preparations available—when prepared extemporaneously, the BP states Sodium Chloride Mouthwash, Compound, BP consists of sodium bicarbonate 1%, sodium chloride 1.5% in a suitable vehicle with peppermint flavour.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Compound Sodium Chloride Mouthwash may be prescribed.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. No licensed preparations listed.

2.1 Dental caries

Fluoride

Availability of adequate fluoride confers significant resistance to dental caries. It is now considered that the topical action of fluoride on enamel and plaque is more important than the systemic effect.

When the fluoride content of drinking water is less than 700 micrograms per litre (0.7 parts per million), daily administration of fluoride tablets or drops provides suitable supplementation. Systemic fluoride supplements should not be prescribed without reference to the fluoride content of the local water supply. Infants need not receive fluoride supplements until the age of 6 months.

Denitrifiers which incorporate sodium fluoride or monofluorophosphate are also a convenient source of fluoride.

Individuals who are either particularly caries prone or medically compromised may be given additional protection by use of fluoride rinses or by application of fluoride gels. Rinses may be used daily or weekly; daily use of a less concentrated rinse is more effective than weekly use of a more concentrated one. High-strength gels must be applied regularly under professional supervision; extreme caution is necessary to prevent children from swallowing any excess.

Less concentrated gels are available for home use. Varnishes are also available and are particularly valuable for young or disabled children since they adhere to the teeth and set in the presence of moisture.

VITAMINS AND TRACE ELEMENTS

Sodium fluoride

● INDICATIONS AND DOSE

Prophylaxis of dental caries for water content less than 300micrograms/litre (0.3 parts per million) of fluoride ion

► BY MOUTH USING TABLETS

- Child 6 months–2 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
- Child 3–5 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)
- Child 6–17 years: 1 mg daily, doses expressed as fluoride ion (F⁻)

Prophylaxis of dental caries for water content between 300 and 700micrograms/litre (0.3–0.7 parts per million) of fluoride ion

► BY MOUTH USING TABLETS

- Child 3–5 years: 250 micrograms daily, doses expressed as fluoride ion (F⁻)
- Child 6–17 years: 500 micrograms daily, doses expressed as fluoride ion (F⁻)

Prophylaxis of dental caries for water content above 700micrograms/litre (0.7 parts per million) of fluoride ion

- Child 6 months–17 years: Supplements not advised

Prophylaxis of dental caries for individuals who are caries prone or medically compromised

► BY MOUTH USING MOUTHWASH

- Child 6–17 years: Rinse or gargle 10 mL daily

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE

Prophylaxis of dental caries

► BY MOUTH USING PASTE

- Child 10–17 years: Apply 1 centimetre twice daily, to be applied using a toothbrush

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE

Prophylaxis of dental caries

► BY MOUTH USING PASTE

- Child 16–17 years: Apply 2 centimetres 3 times a day, to be applied after meals using a toothbrush

EN-DE-KAY® FLUORINSE

Prophylaxis of dental caries for individuals who are caries prone or medically compromised

► BY MOUTH USING MOUTHWASH

- Child 8–17 years: 5 drops daily, dilute 5 drops to 10 mL of water, alternatively 20 drops once weekly, dilute 20 drops to 10 mL

DOSE EQUIVALENCE AND CONVERSION

Sodium fluoride 2.2 mg provides approx. 1 mg fluoride ion.

These doses reflect the recommendations of the British Dental Association, the British Society of Paediatric Dentistry and the British Association for the Study of Community Dentistry (*Br Dent J* 1997; **182**: 6–7).

- **CONTRA-INDICATIONS** Not for areas where drinking water is fluoridated

● SIDE-EFFECTS

- **Uncommon** Occasional white flecks on teeth with recommended doses
- **Rare** Yellowish-brown discoloration if recommended doses are exceeded

- **DIRECTIONS FOR ADMINISTRATION** Tablets should be sucked or dissolved in the mouth and taken preferably in the evening. For mouthwash, rinse mouth for 1 minute and then spit out.

COLGATE DURAPHAT® 2800PPM FLUORIDE

TOOTHPASTE Brush teeth for 1 minute before spitting out.

COLGATE DURAPHAT® 5000PPM FLUORIDE

TOOTHPASTE Brush teeth for 3 minutes before spitting out.

- **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral tablet formulations may include orange.

● PATIENT AND CARER ADVICE

Mouthwash Avoid eating, drinking, or rinsing mouth for 15 minutes after use.

COLGATE DURAPHAT® 2800PPM FLUORIDE

TOOTHPASTE Patients or carers should be given advice on how to administer sodium fluoride toothpaste. Avoid drinking or rinsing mouth for 30 minutes after use.

COLGATE DURAPHAT® 5000PPM FLUORIDE

TOOTHPASTE Patients or carers should be given advice on how to administer Sodium fluoride toothpaste.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Tablets may be prescribed as Sodium Fluoride Tablets. Oral drops may be prescribed as Sodium Fluoride Oral Drops.

Mouthwashes may be prescribed as Sodium Fluoride Mouthwash 0.05% or Sodium Fluoride Mouthwash 2%.

COLGATE DURAPHAT® 2800PPM FLUORIDE TOOTHPASTE May be prescribed as Sodium Fluoride Toothpaste 0.619%.

COLGATE DURAPHAT® 5000PPM FLUORIDE TOOTHPASTE May be prescribed as Sodium Fluoride Toothpaste 1.1%.

Dental information

Fluoride mouthwash, oral drops, tablets and toothpaste are prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

There are also arrangements for health authorities to supply fluoride tablets in the course of pre-school dental schemes, and they may also be supplied in school dental schemes.

Fluoride gels are not prescribable on form FP10D (GP14 in Scotland, WP10D in Wales).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

3 Oral ulceration and inflammation

Oral ulceration and inflammation

Ulceration and inflammation

Ulceration of the oral mucosa may be caused by trauma (physical or chemical), recurrent aphthae, infections, carcinoma, dermatological disorders, nutritional deficiencies, gastro-intestinal disease, haematopoietic disorders, and drug therapy. It is important to establish the diagnosis in each case as the majority of these lesions require specific management in addition to local treatment. Local treatment aims to protect the ulcerated area, to relieve pain, to reduce inflammation, or to control secondary infection. Children with an unexplained mouth ulcer of more than 3 weeks' duration require urgent referral to hospital to exclude oral cancer in adults or secondary causes such as leukaemia.

Simple mouthwashes

A **saline** mouthwash may relieve the pain of traumatic ulceration. The mouthwash is made up with warm water and used at frequent intervals until the discomfort and swelling subsides.

Antiseptic mouthwashes

Secondary bacterial infection may be a feature of any mucosal ulceration; it can increase discomfort and delay healing. Use of chlorhexidine mouthwash p. 656 is often beneficial and may accelerate healing of recurrent aphthae.

Corticosteroids

Topical corticosteroid therapy may be used for some forms of oral ulceration. In the case of aphthous ulcers it is most effective if applied in the 'prodromal' phase. Thrush or other types of candidiasis are recognised complications of corticosteroid treatment.

Hydrocortisone **oromucosal tablets** p. 661 are allowed to dissolve next to an ulcer and are useful in recurrent aphthae and erosive lichenoid lesions.

Beclometasone dipropionate inhaler p. 150 sprayed on the oral mucosa is used to manage oral ulceration [unlicensed indication]. Alternatively, betamethasone soluble tablets p. 660 dissolved in water can be used as a mouthwash to treat oral ulceration [unlicensed indication].

Systemic corticosteroid therapy (see under Corticosteroids, inflammatory disorders p. 616) is reserved for severe conditions such as pemphigus vulgaris.

Local analgesics

Local analgesics have a limited role in the management of oral ulceration. When applied topically their action is of a relatively short duration so that analgesia cannot be maintained continuously throughout the day. When local

anaesthetics are used in the mouth, care must be taken not to produce anaesthesia of the pharynx before meals as this might lead to choking.

Benzylamine hydrochloride p. 660 and flurbiprofen p. 660 are non-steroidal anti-inflammatory drugs (NSAIDs). Benzylamine hydrochloride mouthwash or spray may be useful in reducing the discomfort associated with a variety of ulcerative conditions. It has also been found to be effective in reducing the discomfort of tonsillectomy and post-irradiation mucositis. Some patients find the full-strength mouthwash causes some stinging and, for them, it should be diluted with an equal volume of water. Flurbiprofen lozenges are licensed for the relief of sore throat in adolescents.

Choline salicylate p. 661 is a derivative of salicylic acid and has some analgesic action. The dental gel may provide relief for recurrent aphthae, but excessive application or confinement under a denture irritates the mucosa and can itself cause ulceration in adults and children over 16 years of age.

Other preparations

Doxycycline p. 662 rinsed in the mouth may be of value for recurrent aphthous ulceration.

Periodontitis

Low-dose doxycycline (*Periostat*®) is licensed as an adjunct to scaling and root planing for the treatment of periodontitis; a low dose of doxycycline reduces collagenase activity without inhibiting bacteria associated with periodontitis.

For anti-infectives used in the treatment of destructive (refractory) forms of periodontal disease, see under Oropharyngeal bacterial infections p. 661. See also Mouthwashes and other preparations for oropharyngeal use p. 655 for mouthwashes used for oral hygiene and plaque inhibition.

ANAESTHETICS, LOCAL

Lidocaine hydrochloride

(Lignocaine hydrochloride)

• INDICATIONS AND DOSE**Dental practice**

- BY BUCCAL ADMINISTRATION USING OINTMENT
- Child: Rub gently into dry gum

LARYNGOJET®**Anaesthesia of mucous membranes of oropharynx, trachea, or respiratory tract**

- TO MUCOUS MEMBRANES
- Child: Up to 3 mg/kg (max. per dose 200 mg), to be given as a single dose sprayed, instilled (if a cavity) or applied with a swab; reduce dose according to size, age, and condition of child

XYLOCAINE®**Bronchoscopy | Laryngoscopy | Oesophagoscopy | Endotracheal intubation**

- TO MUCOUS MEMBRANES
- Child: Up to 3 mg/kg

- **CAUTIONS** Can damage plastic cuffs of endotracheal tubes
- **INTERACTIONS** → Appendix 1 (lidocaine). Interactions less likely when lidocaine used topically.

● SIDE-EFFECTS**SIDE-EFFECTS, FURTHER INFORMATION**

A single application of a topical lidocaine preparation does not generally cause systemic side-effects.

● ALLERGY AND CROSS-SENSITIVITY

- Hypersensitivity and cross-sensitivity Hypersensitivity reactions occur mainly with the ester-type local anaesthetics, such as tetracaine and chloroprocaine;

reactions are less frequent with the amide types, such as articaine, bupivacaine, levobupivacaine, lidocaine, mepivacaine, prilocaine, and ropivacaine. Cross-sensitivity reactions may be avoided by using the alternative chemical type.

- **PREGNANCY** Crosses the placenta but not known to be harmful in *animal* studies—use if benefit outweighs risk. When used as a local anaesthetic, large doses can cause fetal bradycardia; if given during delivery can also cause neonatal respiratory depression, hypotonia, or bradycardia after paracervical or epidural block.
- **BREAST FEEDING** Present in milk but amount too small to be harmful.
- **HEPATIC IMPAIRMENT** Caution—increased risk of side-effects.
- **RENAL IMPAIRMENT** Possible accumulation of lidocaine and active metabolite; caution in severe impairment.

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Lidocaine ointment 5% may be prescribed. Spray may be prescribed as Lidocaine Spray 10%

XYLOCAINE®

May be prescribed as lidocaine spray 10%.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

Lidocaine hydrochloride (Non-proprietary)

Lidocaine hydrochloride 50 mg per 1 gram Lidocaine 5% ointment | 15 gram [P] £6.50 DT price = £6.18

Spray

Xylocaine (AstraZeneca UK Ltd)

Lidocaine 10 mg per 1 actuation Xylocaine 10mg/dose spray sugar-free | 50 ml [P] £6.29

Liquid

Laryngojet (UCB Pharma Ltd)

Lidocaine hydrochloride 40 mg per 1 mL Lidocaine 4% oromucosal solution | 1 pre-filled disposable injection [POM] £5.10

ANALGESICS > NON-STEROIDAL ANTI-INFLAMMATORY DRUGS

Benzydamine hydrochloride

INDICATIONS AND DOSE

Painful inflammatory conditions of oropharynx

- ▶ TO THE LESION USING MOUTHWASH
- ▶ Child 13–17 years: Rinse or gargle 15 mL every 1.5–3 hours as required usually for not more than 7 days, dilute with an equal volume of water if stinging occurs
- ▶ TO THE LESION USING OROMUCOSAL SPRAY
- ▶ Child 1 month–5 years (body-weight 4–7 kg): 1 spray every 1.5–3 hours, to be administered onto the affected area
- ▶ Child 1 month–5 years (body-weight 8–11 kg): 2 sprays every 1.5–3 hours, to be administered onto the affected area
- ▶ Child 1 month–5 years (body-weight 12–15 kg): 3 sprays every 1.5–3 hours, to be administered onto the affected area
- ▶ Child 1 month–5 years (body-weight 16 kg and above): 4 sprays every 1.5–3 hours, to be administered onto the affected area
- ▶ Child 6–11 years: 4 sprays every 1.5–3 hours, to be administered onto affected area
- ▶ Child 12–17 years: 4–8 sprays every 1.5–3 hours, to be administered onto affected area

SIDE-EFFECTS

- ▶ **Rare** Hypersensitivity reactions
- ▶ **Frequency not known** Occasional numbness or stinging

PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Benzydamine Oromucosal Spray 0.15% may be prescribed. Benzydamine mouthwash may be prescribed as Benzydamine Mouthwash 0.15%.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Spray

Muco-adhesive buccal tablet

► Hydrocortisone (Non-proprietary)

Hydrocortisone (as Hydrocortisone sodium succinate)

2.5 mg Hydrocortisone 2.5mg muco-adhesive buccal tablets sugar free sugar-free | 20 tablet [P] £5.81 DT price = £5.05

SALICYLIC ACID AND DERIVATIVES

Choline salicylate

● INDICATIONS AND DOSE

Mild oral and perioral lesions

► TO THE LESION

► Child 16–17 years: Apply 0.5 inch, apply with gentle massage, not more often than every 3 hours

● **CONTRA-INDICATIONS** Children under 16 years

CONTRA-INDICATIONS, FURTHER INFORMATION

► **Reye's syndrome** The CHM has advised that topical oral pain relief products containing salicylate salts should not be used in children under 16 years, as a cautionary measure due to the theoretical risk of Reye's syndrome.

● **CAUTIONS** Frequent application, especially in children, may give rise to salicylate poisoning

● **SIDE-EFFECTS** Transient local burning sensation

● **PRESCRIBING AND DISPENSING INFORMATION** When prepared extemporaneously, the BP states Choline Salicylate Dental Gel, BP consists of choline salicylate 8.7% in a flavoured gel basis.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

4 Oropharyngeal bacterial infections

Oropharyngeal bacterial infections

Antibacterial therapy for pericoronitis

Antibacterial required only in presence of systemic features of infection, or of trismus, or persistent swelling despite local treatment.

● Metronidazole p. 313, or *alternatively*, amoxicillin p. 320

► *Suggested duration of treatment* 3 days or until symptoms resolve.

Antibacterial therapy for gingivitis: acute necrotising ulcerative

Antibacterial required only if systemic features of infection.

● Metronidazole, or *alternatively*, amoxicillin

► *Suggested duration of treatment* 3 days or until symptoms resolve.

Antibacterial therapy for periapical or periodontal abscess

Antibacterial required only in severe disease with cellulitis or if systemic features of infection.

● Amoxicillin, or *alternatively*, metronidazole

► *Suggested duration of treatment* 5 days.

Antibacterial therapy for periodontitis

Antibacterial used as an adjunct to debridement in severe disease or disease unresponsive to local treatment alone.

- Metronidazole, or *alternatively in children over 12 years*, doxycycline below

Antibacterial therapy for throat infections

Most throat infections are caused by viruses and many do not require antibacterial therapy. Consider antibacterial, if history of valvular heart disease, or marked systemic upset, if peritonsillar cellulitis or abscess, or if at increased risk from acute infection (e.g. in immunosuppression, cystic fibrosis); prescribe antibacterial for beta-haemolytic streptococcal pharyngitis.

- Phenoxymethylpenicillin p. 319
- ▶ In severe infection, initial parenteral therapy with benzylpenicillin sodium p. 318, then oral therapy with phenoxymethylpenicillin or amoxicillin (or ampicillin p. 321). **Avoid** amoxicillin if possibility of glandular fever.
- ▶ *Suggested duration of treatment* 10 days.
- If penicillin-allergic, clarithromycin p. 309 (or azithromycin p. 308 or erythromycin p. 310)
- ▶ *Suggested duration of treatment* 10 days

ANTIBACTERIALS > TETRACYCLINES AND RELATED DRUGS

Doxycycline

• INDICATIONS AND DOSE

Treatment of recurrent aphthous ulceration

▶ BY MOUTH USING SOLUBLE TABLETS

- ▶ Child 12–17 years: 100 mg 4 times a day usually for 3 days, dispersible tablet can be stirred into a small amount of water then rinsed around the mouth for 2–3 minutes, it should preferably not be swallowed

- **UNLICENSED USE** Not licensed for use in children under 12 years. Not licensed for severe aphthous ulceration.
- **CAUTIONS** Alcohol dependence
- **INTERACTIONS** The metabolism of doxycycline may be influenced by antiepileptics.
- **SIDE-EFFECTS** Anorexia · anxiety · dry mouth · flushing · tinnitus
- **RENAL IMPAIRMENT** Use with caution (avoid excessive doses).
- **PATIENT AND CARER ADVICE** Counselling on administration advised. Photosensitivity Patients should be advised to avoid exposure to sunlight or sun lamps.
- **PROFESSION SPECIFIC INFORMATION**
Dental practitioners' formulary

5 Oropharyngeal fungal infections

Oropharyngeal fungal infections

Overview

Fungal infections of the mouth are usually caused by *Candida* spp. (candidiasis or candidosis). Different types of oropharyngeal candidiasis are managed as follows:

Thrush

Acute pseudomembranous candidiasis (thrush), is usually an acute infection but it may persist for months in patients receiving inhaled corticosteroids, cytotoxics, or broad-spectrum antibacterials. Thrush also occurs in patients with serious systemic disease associated with reduced immunity such as leukaemia, other malignancies, and HIV infection. Any predisposing condition should be managed appropriately. When thrush is associated with corticosteroid inhalers, rinsing the mouth with water (or cleaning a child's teeth) immediately after using the inhaler may avoid the problem. Treatment with nystatin p. 663 or miconazole p. 663 may be needed. Fluconazole p. 352 is effective for unresponsive infections or if a topical antifungal drug cannot be used. Topical therapy may not be adequate in immunocompromised children and an oral triazole antifungal is preferred.

Acute erythematous candidiasis

Acute erythematous (atrophic) candidiasis is a relatively uncommon condition associated with corticosteroid and broad-spectrum antibacterial use and with HIV disease. It is usually treated with fluconazole.

Angular cheilitis

Angular cheilitis (angular stomatitis) is characterised by soreness, erythema and fissuring at the angles of the mouth. It may represent a nutritional deficiency or it may be related to orofacial granulomatosis or HIV infection. Both yeasts (*Candida* spp.) and bacteria (*Staphylococcus aureus* and beta-haemolytic streptococci) are commonly involved as interacting, infective factors. While the underlying cause is being identified and treated, it is often helpful to apply miconazole cream or fusidic acid ointment p. 336; if the angular cheilitis is unresponsive to treatment, hydrocortisone with miconazole cream or ointment p. 698 can be used.

Immunocompromised patients

See advice on prevention of fungal infections under *Immunocompromised children* in Antifungals, systemic use p. 349.

Antiseptic mouthwashes can have a role in the prevention of oral candidiasis in immunocompromised children.

Drugs used in oropharyngeal candidiasis

Nystatin is not absorbed from the gastro-intestinal tract and is applied locally (as a suspension) to the mouth for treating local fungal infections. Miconazole is used by local application (as an oral gel) in the mouth but it is also absorbed to the extent that potential interactions need to be considered. Miconazole also has some activity against Gram-positive bacteria including streptococci and staphylococci. In neonates, nystatin oral suspension or miconazole oral gel is used for the treatment of oropharyngeal candidiasis; to prevent re-infection it is important to ensure that the mother's breast nipples and the teats of feeding bottles are cleaned adequately.

Fluconazole given by mouth is reliably absorbed; it is used for infections that do not respond to topical therapy or when topical therapy cannot be used. Itraconazole p. 353 can be used for fluconazole-resistant infections.

If candidal infection fails to respond after 1 to 2 weeks of treatment with antifungal drugs the child should be sent for investigation to eliminate the possibility of underlying disease. Persistent infection may also be caused by re-infection from the genito-urinary or gastro-intestinal tract.

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

Miconazole

● INDICATIONS AND DOSE

Prevention and treatment of oral candidiasis

► BY MOUTH USING ORAL GEL

- Neonate: 1 mL 2–4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be smeared around the inside of the mouth after feeds.
- Child 1 month–1 year: 1.25 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be smeared around the inside of the mouth after feeds
- Child 2–17 years: 2.5 mL 4 times a day treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared, to be administered after meals, retain near oral lesions before swallowing (dental prostheses and orthodontic appliances should be removed at night and brushed with gel)

Prevention and treatment of intestinal candidiasis

► BY MOUTH USING ORAL GEL

- Child 4 months–17 years: 5 mg/kg 4 times a day (max. per dose 250 mg 4 times a day) treatment should be continued for at least 7 days after lesions have healed or symptoms have cleared

● **UNLICENSED USE** Not licensed for use in children under 4 months of age or during first 5–6 months of life of an infant born pre-term.

● **CONTRA-INDICATIONS** Infants with impaired swallowing reflex

● **CAUTIONS** Avoid in Acute porphyrias p. 562

● **INTERACTIONS** → Appendix 1 (antifungals, imidazole).

● SIDE-EFFECTS

► **Common or very common** Nausea · rash · vomiting

► **Very rare** Diarrhoea (usually on long term treatment) · hepatitis · rash · Stevens-Johnson syndrome · toxic epidermal necrolysis

● **PREGNANCY** Manufacturer advises avoid if possible—toxicity at high doses in *animal* studies.

● **BREAST FEEDING** Manufacturer advises caution—no information available.

● **HEPATIC IMPAIRMENT** Avoid.

● **DIRECTIONS FOR ADMINISTRATION** Oral gel should be held in mouth, after food.

● **PRESCRIBING AND DISPENSING INFORMATION** Flavours of oral gel may include orange.

● **PATIENT AND CARER ADVICE** Patients or carers should be given advice on how to administer miconazole oromucosal gel.

● PROFESSION SPECIFIC INFORMATION

Dental practitioners' formulary

Miconazole Oromucosal Gel may be prescribed.

● **EXCEPTIONS TO LEGAL CATEGORY** 15-g tube of oral gel can be sold to the public.

6 Oropharyngeal viral infections

Oropharyngeal viral infections

Management

Viral infections are the most common cause of a sore throat. It is usually a self-limiting condition which does not benefit from anti-infective treatment. Adequate analgesia may be all that is required.

Children with varicella–zoster infection often develop painful lesions in the mouth and throat. Benzydamine hydrochloride p. 660 may be used to provide local analgesia. Chlorhexidine mouthwash or gel p. 656 will control plaque accumulation if toothbrushing is painful and will also help to control secondary infection in general.

In severe herpetic stomatitis systemic aciclovir p. 381 or valaciclovir p. 383 may be used for oral lesions associated with herpes zoster. Aciclovir and valaciclovir are also used to prevent frequently recurring herpes simplex lesions of the mouth particularly when associated with the initiation of erythema multiforme. See the treatment of labial herpes simplex infections.

Skin conditions, management

Topical preparations

When prescribing topical preparations for the treatment of skin conditions in children, the site of application, the condition being treated, and the child's (and carer's) preference for a particular vehicle all need to be taken into consideration.

Vehicles

The British Association of Dermatologists list of preferred unlicensed dermatological preparations (specials) is available at www.bad.org.uk.

The vehicle in topical preparations for the skin affects the degree of hydration, has a mild anti-inflammatory effect, and aids the penetration of the active drug. Therefore, the vehicle, as well as the active drug, should be chosen on the basis of their suitability for the child's skin condition.

Applications are usually viscous solutions, emulsions, or suspensions for application to the skin (including the scalp) or nails.

Collodions are painted on the skin and allowed to dry to leave a flexible film over the site of application.

Creams are emulsions of oil and water and are generally well absorbed into the skin. They may contain an antimicrobial preservative unless the active ingredient or basis is intrinsically bactericidal and fungicidal. Generally, creams are cosmetically more acceptable than ointments because they are less greasy and easier to apply.

Gels consist of active ingredients in suitable hydrophilic or hydrophobic bases; they generally have a high water content. Gels are particularly suitable for application to the face and scalp.

Lotions have a cooling effect and may be preferred to ointments or creams for application over a hairy area. Lotions in alcoholic basis can sting if used on broken skin. *Shake lotions* (such as calamine lotion) contain insoluble powders which leave a deposit on the skin surface.

Ointments are greasy preparations which are normally anhydrous and insoluble in water, and are more occlusive than creams. They are particularly suitable for chronic, dry lesions. The most commonly used ointment bases consist of soft paraffin or a combination of soft, liquid, and hard paraffin. Some ointment bases have both *hydrophilic* and *lipophilic* properties; they may have occlusive properties on the skin surface, encourage hydration, and also be miscible with water;

they often have a mild anti-inflammatory effect. *Water-soluble ointments* contain macrogols which are freely soluble in water and are therefore readily washed off; they have a limited but useful role where ready removal is desirable.

Pastes are stiff preparations containing a high proportion of finely powdered solids such as zinc oxide and starch suspended in an ointment. They are used for circumscribed lesions such as those which occur in lichen simplex, chronic eczema, or psoriasis. They are less occlusive than ointments and can be used to protect inflamed, lichenified, or excoriated skin.

Dusting powders are used only rarely. They reduce friction between opposing skin surfaces. Dusting powders should not be applied to moist areas because they can cake and abrade the skin. Talc is a lubricant but it does not absorb moisture; it can cause respiratory irritation. Starch is less lubricant but absorbs water.

Dilution

The BP directs that creams and ointments should **not** normally be diluted but that should dilution be necessary care should be taken, in particular, to prevent microbial contamination. The appropriate diluent should be used and heating should be avoided during mixing; excessive dilution may affect the stability of some creams. Diluted creams should normally be used within 2 weeks of preparation.

Suitable quantities for prescribing

Suitable quantities of dermatological preparations to be prescribed for specific areas of the body		
Area of body	Creams and Ointments	Lotions
Face	15–30 g	100 ml
Both hands	25–50 g	200 ml
Scalp	50–100 g	200 ml
Both arms or both legs	100–200 g	200 ml
Trunk	400 g	500 ml
Groins and genitalia	15–25 g	100 ml
These amounts are usually suitable for children 12–17 years for twice daily application for 1 week; smaller quantities will be required for children under 12 years. These recommendations do not apply to corticosteroid preparations.		

Excipients and sensitisation

Excipients in topical products rarely cause problems. If a patch test indicates allergy to an excipient, products containing the substance should be avoided (see also Anaphylaxis). The following excipients in topical preparations are associated, rarely, with sensitisation; the presence of these excipients is indicated in the entries for topical products. See also Excipients, under General Guidance.

- Beeswax
- Benzyl alcohol
- Butylated hydroxyanisole
- Butylated hydroxytoluene
- Cetostearyl alcohol (including cetyl and stearyl alcohol)
- Chlorocresol
- Edetic acid (EDTA)
- Ethylenediamine
- Fragrances
- Hydroxybenzoates (parabens)
- Imidurea
- Isopropyl palmitate
- N-(3-Chloroallyl)hexaminium chloride (quaternium 15)
- Polysorbates
- Propylene glycol
- Sodium metabisulfite
- Sorbic acid
- Wool fat and related substances including lanolin (purified versions of wool fat have reduced the problem)

Neonates

Caution is required when prescribing topical preparations for neonates—their large body surface area in relation to body mass increases susceptibility to toxicity from systemic absorption of substances applied to the skin. Topical preparations containing potentially sensitising substances such as corticosteroids, aminoglycosides, iodine, and parasitocidal drugs should be avoided. Preparations containing alcohol should be avoided because they can dehydrate the skin, cause pain if applied to raw areas, and the alcohol can cause necrosis. In *preterm neonates*, the skin is more fragile and offers a poor barrier, especially in the first fortnight after birth. Preterm infants, especially if below 32 weeks corrected gestational age, may also require special measures to maintain skin hydration.

1 Dry and scaling skin disorders

Emollient and barrier preparations

Borderline substances

The preparations marked 'ACBS' are regarded as drugs when prescribed in accordance with the advice of the Advisory Committee on Borderline Substances for the clinical conditions listed. Prescriptions issued in accordance with this advice and endorsed 'ACBS' will normally not be investigated.

Emollients

Emollients hydrate the skin, soften the skin, act as barrier to water and external irritants, and are indicated for all dry or scaling disorders. Their effects are short-lived and they should be applied frequently even after improvement occurs. They are useful in dry and eczematous disorders, and to a lesser extent in psoriasis; they should be applied immediately after washing or bathing to maximise the effect of skin hydration. The choice of an appropriate emollient will depend on the severity of the condition, the child's (or

carer's) preference, and the site of application. Ointments may exacerbate acne and folliculitis. Some ingredients rarely cause sensitisation and this should be suspected if an eczematous reaction occurs. The use of aqueous cream as a leave-on emollient may increase the risk of skin reactions, particularly in eczema.

Preparations such as **aqueous cream** and **emulsifying ointment** can be used as soap substitutes for handwashing and in the bath; the preparation is rubbed on the skin before rinsing off completely. The addition of a bath oil may also be helpful.

Urea is occasionally used with other topical agents such as corticosteroids to enhance penetration of the skin.

Emollient bath and shower preparations

In dry skin conditions soap should be avoided.

The quantities of bath additives recommended for older children are suitable for an adult-size bath. Proportionately less should be used for a child-size bath or a washbasin; recommended bath additive quantities for younger children reflect this.

Barrier preparations

Barrier preparations often contain water-repellent substances such as dimeticone p. 682, natural oils, and paraffins, to help protect the skin from abrasion and irritation; they are used to protect intact skin around stomas and pressure sores, and as a barrier against nappy rash. In neonates, barrier preparations which do not contain potentially sensitising excipients are preferred. Where the skin has broken down, barrier preparations have a limited role in protecting adjacent skin. Barrier preparations with zinc oxide or titanium salts are used to aid healing of uninfected, excoriated skin.

Nappy rash (Dermatitis)

The first line of treatment is to ensure that nappies are changed frequently and that tightly fitting water-proof pants are avoided. The rash may clear when left exposed to the air and a barrier preparation, applied with each nappy change, can be helpful. A mild corticosteroid such as hydrocortisone 0.5% or 1% p. 692 can be used if inflammation is causing discomfort, but it should be avoided in neonates. The barrier preparation should be applied after the corticosteroid preparation to prevent further damage. Preparations containing hydrocortisone should be applied for no more than a week; the hydrocortisone should be discontinued as soon as the inflammation subsides. The occlusive effect of nappies and waterproof pants may increase absorption of corticosteroids (see cautions). If the rash is associated with candidal infection, a topical antifungal such as clotrimazole cream p. 678 can be used. Topical antibacterial preparations can be used if bacterial infection is present; treatment with an oral antibacterial may occasionally be required in severe or recurrent infection. Hydrocortisone may be used in combination with antimicrobial preparations if there is considerable inflammation, erosion, and infection.

Emollients

In the *neonate*, a preservative-free paraffin-based emollient hydrates the skin without affecting the normal skin flora; substances such as olive oil are also used. The development of blisters (epidermolysis bullosa) or ichthyosis may be alleviated by applying liquid and white soft paraffin ointment while awaiting dermatological investigation.

DERMATOLOGICAL DRUGS > BARRIER PREPARATIONS

Barrier creams and ointments

● INDICATIONS AND DOSE

For use as a barrier preparation

- ▶ TO THE SKIN

DERMOL® 200 SHOWER EMOLLIENT

Dry and pruritic skin conditions including eczema and dermatitis

- ▶ TO THE SKIN
- ▶ Child: To be applied to the skin or used as a soap substitute

DERMOL® 600® BATH EMOLLIENT

Dry and pruritic skin conditions including eczema and dermatitis

- ▶ TO THE SKIN
- ▶ Child 1–23 months: 5–15 mL/bath, not to be used undiluted
- ▶ Child 2–17 years: 15–30 mL/bath, not to be used undiluted

DERMOL® WASH EMULSION

Dry and pruritic skin conditions including eczema and dermatitis

- ▶ TO THE SKIN
- ▶ Child: To be applied to the skin or used as a soap substitute

EMULSIDERM®

Dry skin conditions including eczema and ichthyosis

- ▶ TO THE SKIN
- ▶ Child 1–23 months: 5–10 mL/bath, alternatively, to be rubbed into dry skin until absorbed
- ▶ Child 2–17 years: 7–30 mL/bath, alternatively, to be rubbed into dry skin until absorbed

OILATUM® PLUS

Topical treatment of eczema, including eczema at risk from infection

- ▶ TO THE SKIN
- ▶ Child 6–11 months: 1 mL/bath, not to be used undiluted
- ▶ Child 1–17 years: 1–2 capfuls/bath, not to be used undiluted

IMPORTANT SAFETY INFORMATION

FIRE HAZARD WITH PARAFFIN-BASED EMOLLIENTS

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Patients should be told to keep away from fire or flames, and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

These preparations make skin and surfaces slippery—particular care is needed when bathing.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.
- **PRESCRIBING AND DISPENSING INFORMATION** Preparations containing an antibacterial should be avoided unless infection is present or is a frequent complication.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

- ▶ **Dermol Wash** (Dermal Laboratories Ltd)
Benzalkonium chloride 1 mg per 1 gram, Chlorhexidine hydrochloride 1 mg per 1 gram, Isopropyl myristate 25 mg per 1 gram, Liquid paraffin 25 mg per 1 gram | Dermol Wash cutaneous emulsion | 200 ml [P] £3.55

Bath additive

EXCIPIENTS: May contain Acetylated lanolin alcohols, isopropyl palmitate, polysorbates

- ▶ **Dermol 600** (Dermal Laboratories Ltd)
Benzalkonium chloride 5 mg per 1 gram, Isopropyl myristate 250 mg per 1 gram, Liquid paraffin 250 mg per 1 gram | Dermol 600 bath emollient | 600 ml [P] £7.55
- ▶ **Emulsiderm** (Dermal Laboratories Ltd)
Benzalkonium chloride 5 mg per 1 gram, Isopropyl myristate 250 mg per 1 gram, Liquid paraffin 250 mg per 1 gram | Emulsiderm emollient | 300 ml [P] £3.85 | 1000 ml [P] £12.00
- ▶ **Oilatum Plus** (GlaxoSmithKline Consumer Healthcare)
Triclosan 20 mg per 1 gram, Benzalkonium chloride 60 mg per 1 gram, Liquid paraffin light 525 mg per 1 gram | Oilatum Plus bath additive | 500 ml [GSL] £6.98

Emollient bath and shower products, colloidal oatmeal-containing

• INDICATIONS AND DOSE

Endogenous and exogenous eczema | Xeroderma | Ichthyosis

- ▶ TO THE SKIN
- ▶ Child 2–17 years: 20–30 mL/bath, alternatively apply to wet skin and rinse

IMPORTANT SAFETY INFORMATION

These preparations make skin and surfaces slippery—particular care is needed when bathing.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

• MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Bath additive

EXCIPIENTS: May contain Beeswax, fragrances

- ▶ **Aveeno** (Johnson & Johnson Ltd)
Aveeno bath oil | 250 ml (ACBS) £4.49

Emollient bath and shower products, paraffin-containing

• INDICATIONS AND DOSE**AQUAMAX[®] WASH****Dry skin conditions**

- ▶ TO THE SKIN
- ▶ Child: To be applied to wet or dry skin and rinse

CETRABEN[®] BATH**Dry skin conditions, including eczema**

- ▶ TO THE SKIN
- ▶ Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.
- ▶ Child 1 month–11 years: 0.5–1 capful/bath, alternatively, to be applied to wet skin and rinse
- ▶ Child 12–17 years: 1–2 capfuls/bath, alternatively, to be applied to wet skin and rinse

DERMALO[®]**Dermatitis | Dry skin conditions, including ichthyosis****▶ TO THE SKIN**

- ▶ Child: To be applied to wet or dry skin and rinse, or apply to dry skin after showering

E45[®] BATH OIL**Endogenous and exogenous eczema, xeroderma, and ichthyosis****▶ TO THE SKIN**

- ▶ Neonate: 5 mL/bath, alternatively, to be applied to wet skin and rinse.
- ▶ Child 1 month–11 years: 5–10 mL/bath, alternatively, to be applied to wet skin and rinse
- ▶ Child 12–17 years: 15 mL/bath, alternatively, to be applied to wet skin and rinse

E45[®] WASH CREAM**Endogenous and exogenous eczema, xeroderma, and ichthyosis****▶ TO THE SKIN**

- ▶ Child: To be used as a soap substitute

HYDROMOL[®] BATH AND SHOWER EMOLLIENT**Dry skin conditions | Eczema | Ichthyosis****▶ TO THE SKIN**

- ▶ Neonate: 0.5 capful/bath, alternatively apply to wet skin and rinse.
- ▶ Child 1 month–11 years: 0.5–2 capfuls/bath, alternatively apply to wet skin and rinse
- ▶ Child 12–17 years: 1–3 capfuls/bath, alternatively apply to wet skin and rinse

LPL 63.4[®]**Dry skin conditions****▶ TO THE SKIN**

- ▶ Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.
- ▶ Child 1 month–11 years: 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
- ▶ Child 12–17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

OILATUM[®] EMOLLIENT BATH ADDITIVE**Dry skin conditions including dermatitis and ichthyosis****▶ TO THE SKIN**

- ▶ Neonate: 0.5 capful/bath, alternatively, to be applied to wet skin and rinse.
- ▶ Child 1 month–11 years: Apply 0.5–2 capfuls/bath, alternatively, to be applied to wet skin and rinse
- ▶ Child 12–17 years: 1–3 capfuls/bath, alternatively, to be applied to wet skin and rinse

OILATUM® JUNIOR BATH ADDITIVE**Dry skin conditions including dermatitis and ichthyosis**

► TO THE SKIN

- Neonate: 0.5 capful/bath, alternatively, apply to wet skin and rinse.
- Child 1 month–11 years: 0.5–2 capfuls/bath, alternatively, apply to wet skin and rinse
- Child 12–17 years: 1–3 capfuls/bath, alternatively, apply to wet skin and rinse

QV® BATH OIL**Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus**

► TO THE SKIN

- Neonate: 5 mL/bath, alternatively, to be applied to wet skin and rinse.
- Child 1–11 months: 5 mL/bath, alternatively, to be applied to wet skin and rinse
- Child 1–17 years: 10 mL/bath, alternatively, to be applied to wet skin and rinse

QV® GENTLE WASH**Dry skin conditions including eczema, psoriasis, ichthyosis, and pruritus**

► TO THE SKIN

- Child: To be used as a soap substitute

ZEROLATUM®**Dry skin conditions | Dermatitis | Ichthyosis**

► TO THE SKIN

- Child 1 month–11 years: 5–10 mL/bath
- Child 12–17 years: 15–20 mL/bath

IMPORTANT SAFETY INFORMATION**FIRE HAZARD WITH PARAFFIN-BASED EMOLLIENTS**

Emulsifying ointment or 50% Liquid Paraffin and 50% White Soft Paraffin Ointment in contact with dressings and clothing is easily ignited by a naked flame. The risk is greater when these preparations are applied to large areas of the body, and clothing or dressings become soaked with the ointment. Patients should be told to keep away from fire or flames, and not to smoke when using these preparations. The risk of fire should be considered when using large quantities of any paraffin-based emollient.

These preparations make the skin and surfaces slippery—particular care is needed when bathing.

- **DIRECTIONS FOR ADMINISTRATION** Emollient bath additives should be added to bath water; hydration can be improved by soaking in the bath for 10–20 minutes. Some bath emollients can be applied to wet skin undiluted and rinsed off. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

● **INDICATIONS AND DOSE****AQUADRATE®****Dry, scaling, and itching skin**

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily, to be applied thinly

BALNEUM® CREAM**Dry skin conditions**

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily

BALNEUM® PLUS CREAM**Dry, scaling, and itching skin**

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily

CALMURID®**Dry, scaling, and itching skin**

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily, apply a thick layer for 3–5 minutes, massage into area, and remove excess. Can be diluted with aqueous cream (life of diluted cream is 14 days). Half-strength cream can be used for 1 week if stinging occurs

DERMATONICS ONCE HEEL BALM®**Dry skin on soles of feet**

- ▶ TO THE SKIN
- ▶ Child 12–17 years: Apply once daily

E45® ITCH RELIEF CREAM**Dry, scaling, and itching skin**

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily

EUCERIN® INTENSIVE CREAM**Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis**

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily, to be applied thinly and rubbed into area

EUCERIN® INTENSIVE LOTION

Dry skin conditions including eczema, ichthyosis, xeroderma, and hyperkeratosis

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily, to be applied sparingly and rubbed into area

FLEXITOL®

Dry skin on soles of feet and heels

- ▶ TO THE SKIN
- ▶ Child 12–17 years: Apply 1–2 times a day

HYDROMOL® INTENSIVE

Dry, scaling, and itching skin

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily, to be applied thinly

IMUDERM® EMOLLIENT

Dry skin conditions including eczema, psoriasis or dermatitis

- ▶ TO THE SKIN
- ▶ Child: Apply to skin or use as a soap substitute

NUTRAPLUS®

Dry, scaling, and itching skin

- ▶ TO THE SKIN
- ▶ Child: Apply 2–3 times a day

- **DIRECTIONS FOR ADMINISTRATION** Emollients should be applied immediately after washing or bathing to maximise the effect of skin hydration. Emollient preparations contained in tubs should be removed with a clean spoon or spatula to reduce bacterial contamination of the emollient. Emollients should be applied in the direction of hair growth to reduce the risk of folliculitis.

2 Infections of the skin

Skin infections

Antibacterial preparations

Topical antibacterial preparations are used to treat localised bacterial skin infections caused by Gram-positive organisms (particularly by staphylococci or streptococci). Systemic antibacterial treatment is more appropriate for deep-seated skin infections.

Problems associated with the use of topical antibacterials include bacterial resistance, contact sensitisation, and superinfection. In order to minimise the development of resistance, antibacterials used systemically (e.g. fusidic acid p. 336) should not generally be chosen for topical use. *Resistant organisms* are more common in hospitals, and whenever possible swabs should be taken for bacteriological examination before beginning treatment.

Neomycin sulfate p. 675 applied topically may cause sensitisation and cross-sensitivity with other aminoglycoside antibacterials such as gentamicin p. 293 may occur. Topical antibacterials applied over large areas can cause systemic toxicity; ototoxicity with neomycin sulfate and with polymyxins p. 676 is a particular risk for neonates and children with renal impairment.

Superficial bacterial infection of the skin may be treated with a topical antiseptic such as povidone-iodine p. 633 which also softens crusts, or hydrogen peroxide p. 657 1% cream.

Bacterial infections such as *impetigo* and *folliculitis* can be treated with a short course of topical fusidic acid; mupirocin p. 677 should be used only to treat meticillin-resistant *Staphylococcus aureus*.

For extensive or long-standing impetigo, an oral antibacterial such as flucloxacillin p. 325 (or clarithromycin p. 309 in children with penicillin-allergy), should be used. A mild antiseptic may help to soften crusts. Mild antiseptics may be useful in reducing the spread of infection, but there is little evidence to support the use of topical antiseptics alone in the treatment of impetigo.

Cellulitis, a rapidly spreading deeply seated inflammation of the skin and subcutaneous tissue, requires systemic antibacterial treatment. Lower leg infections or infections spreading around wounds are almost always cellulitis. *Erysipelas*, a superficial infection with clearly defined edges (and often affecting the face), is also treated with a systemic antibacterial.

Staphylococcal scalded-skin syndrome requires urgent treatment with a systemic antibacterial, such as flucloxacillin.

Mupirocin is not related to any other antibacterial in use; it is effective for skin infections, particularly those due to Gram-positive organisms but it is not indicated for pseudomonal infection. Although *Staphylococcus aureus* strains with low-level resistance to mupirocin are emerging,

it is generally useful in infections resistant to other antibacterials. To avoid the development of resistance, mupirocin or fusidic acid should not be used for longer than 10 days and local microbiology advice should be sought before using it in hospital. In the presence of mupirocin-resistant MRSA infection, a topical antiseptic, such as povidone-iodine p. 656, or alcohol, can be used; their use should be discussed with the local microbiologist.

Mupirocin ointment contains macrogols; extensive absorption of macrogols through the mucous membranes or through application to thin or damaged skin may result in renal toxicity, especially in neonates. Mupirocin nasal ointment is formulated in a paraffin base and may be more suitable for the treatment of MRSA-infected open wound in neonates.

Metronidazole p. 676 gel is used topically in children to reduce the odour associated with anaerobic infections and for the treatment of periorificial rosacea; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

Retapamulin p. 678 can be used for impetigo and other superficial bacterial skin infections caused by *Staphylococcus aureus* and *Streptococcus pyogenes* that are resistant to first-line topical antibacterials. However, it is not effective against MRSA.

Silver sulfadiazine p. 677 is licensed for the prevention and treatment of infection in burns but the use of appropriate dressings may be more effective. Systemic effects may occur following extensive application of silver sulfadiazine; its use is not recommended in neonates.

Antibacterial preparations also used systemically

Fusidic acid is a narrow-spectrum antibacterial used for staphylococcal infections. Fusidic acid has a role in the treatment of impetigo.

An ointment containing fusidic acid is used in the fissures of angular cheilitis when associated with staphylococcal infection. See Oropharyngeal fungal infections p. 662 for further information on angular cheilitis.

Metronidazole is used topically to treat rosacea and to reduce the odour associated with anaerobic infections; oral metronidazole is used to treat wounds infected with anaerobic bacteria.

Antifungal preparations

Most localised fungal infections are treated with topical preparations. To prevent relapse, local antifungal treatment should be continued for 1–2 weeks after the disappearance of all signs of infection. Systemic therapy is necessary for scalp infection or if the skin infection is widespread, disseminated or intractable; although topical therapy may be used to treat some nail infections, systemic therapy is more effective. Specimens of scale, nail or hair should be sent for mycological examination before starting treatment, unless the diagnosis is certain.

Dermatophytoses

Ringworm infection can affect the scalp (tinea capitis), body (tinea corporis), groin (tinea cruris), hand (tinea manuum), foot (tinea pedis, athlete's foot), or nail (tinea unguium, onychomycosis). Tinea capitis is a common childhood infection that requires systemic treatment with an oral antifungal; additional application of a topical antifungal, during the early stages of treatment, may reduce the risk of transmission. A topical antifungal can also be used to treat asymptomatic carriers of scalp ringworm.

Tinea corporis and tinea pedis infections in children respond to treatment with a topical imidazole (clotrimazole p. 678, econazole nitrate p. 678, or miconazole p. 679) or terbinafine cream p. 680. Nystatin p. 663 is less effective against tinea.

Compound benzoic acid ointment (Whitfield's ointment) has been used for ringworm infections but it is cosmetically less acceptable than proprietary preparations.

Antifungal dusting powders are of little therapeutic value in the treatment of fungal skin infections and may cause skin irritation; they may have some role in preventing re-infection.

Antifungal treatment may not be necessary in asymptomatic children with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. However, topical application of tioconazole p. 679 may be useful for treating early onychomycosis when involvement is limited to mild distal disease, or for superficial white onychomycosis, or where there are contra-indications to systemic therapy. Chronic paronychia on the fingers (usually due to a candidal infection) should be treated with topical clotrimazole or nystatin, but these preparations should be used with caution in children who suck their fingers. Chronic paronychia of the toes (usually due to dermatophyte infection) can be treated with topical terbinafine.

Pityriasis versicolor

Pityriasis (tinea) versicolor can be treated with ketoconazole shampoo p. 678 or **selenium sulfide** shampoo. Topical imidazole antifungals such as clotrimazole, econazole nitrate and miconazole or topical terbinafine are alternatives, but large quantities may be required.

If topical therapy fails, or if the infection is widespread, pityriasis versicolor is treated systemically with an azole antifungal. Relapse is common, especially in the immunocompromised.

Candidiasis

Candidal skin infections can be treated with topical imidazole antifungals clotrimazole p. 678, econazole nitrate p. 678, or miconazole p. 679; topical terbinafine p. 680 is an alternative. Topical application of nystatin p. 663 is also effective for candidiasis but it is ineffective against dermatophytosis. Refractory candidiasis requires systemic treatment generally with a triazole such as fluconazole p. 352; systemic treatment with griseofulvin p. 357 or terbinafine is **not appropriate** for refractory candidiasis. See the treatment of oral candidiasis and for the management of nappy rash.

Angular cheilitis

Miconazole cream is used in the fissures of angular cheilitis when associated with *Candida*.

Compound topical preparations

Combination of an imidazole and a mild corticosteroid (such as hydrocortisone 1% p. 411) may be of value in the treatment of eczematous intertrigo and, in the first few days only, of a severely inflamed patch of ringworm. Combination of a mild corticosteroid with either an imidazole or nystatin may be of use in the treatment of *intertriginous eczema* associated with candida.

Antiviral preparations

Aciclovir p. 683 cream is used for the treatment of initial and recurrent labial, cutaneous, and genital *herpes simplex infections* in children; treatment should begin as early as possible. Systemic treatment is necessary for buccal or vaginal infections or if cold sores recur frequently.

Herpes labialis

Aciclovir cream can be used for the treatment of initial and recurrent labial herpes simplex infections (cold sores). It is best applied at the earliest possible stage, usually when prodromal changes of sensation are felt in the lip and before vesicles appear.

Penciclovir cream is also licensed for the treatment of herpes labialis; it needs to be applied more frequently than aciclovir cream.

Parasitocidal preparations

Suitable quantities of parasitocidal preparations

Area of body	Skin creams	Lotions	Cream rinses
Scalp (head lice)		50–100 mL	50–100 mL
Body (scabies)	30–60 g	100 mL	
Body (crab lice)	30–60 g	100 mL	

These amounts are usually suitable for a child 12–17 years for single application.

Scabies

Permethrin p. 683 is used for the treatment of *scabies* (*Sarcoptes scabiei*); malathion p. 682 can be used if permethrin is inappropriate.

Benzyl benzoate is an irritant and should be avoided in children; it is less effective than malathion and permethrin.

Ivermectin p. 361 (available from 'special-order' manufacturers or specialist importing companies) by mouth has been used, in combination with topical drugs, for the treatment of hyperkeratotic (crusted or 'Norwegian') scabies that does not respond to topical treatment alone.

Application

Although acaricides have traditionally been applied after a hot bath, this is **not** necessary and there is even evidence that a hot bath may increase absorption into the blood, removing them from their site of action on the skin.

All members of the affected household should be treated simultaneously. Treatment should be applied to the whole body including the scalp, neck, face, and ears. Particular attention should be paid to the webs of the fingers and toes and lotion brushed under the ends of nails. It is now recommended that malathion and permethrin should be applied twice, one week apart; in the case of benzyl benzoate in adults, up to 3 applications on consecutive days may be needed. It is important to warn users to reapply treatment to the hands if they are washed. Patients with hyperkeratotic scabies may require 2 or 3 applications of acaricide on consecutive days to ensure that enough penetrates the skin crusts to kill all the mites.

Itching

The *itch* and *eczema* of scabies persists for some weeks after the infestation has been eliminated and treatment for pruritus and eczema may be required. Application of crotamiton p. 707 can be used to control itching after treatment with more effective acaricides. A topical corticosteroid may help to reduce itch and inflammation after scabies has been treated successfully; however, persistent symptoms suggest that scabies eradication was not successful. Oral administration of a **sedating antihistamine** at night may also be useful.

Head lice

Dimeticone p. 682 is effective against head lice (*Pediculus humanus capitis*) and acts on the surface of the organism. Malathion, an organophosphorus insecticide, is an alternative, but resistance has been reported. Benzyl benzoate is licensed for the treatment of head lice but it is not recommended for use in children.

Head lice infestation (pediculosis) should be treated using lotion or liquid formulations only if live lice are present. Shampoos are diluted too much in use to be effective. A contact time of 8–12 hours or overnight treatment is recommended for lotions and liquids; a 2-hour treatment is not sufficient to kill eggs.

In general, a course of treatment for head lice should be 2 applications of product 7 days apart to kill lice emerging from any eggs that survive the first application. All affected household members should be treated at the same time.

Wet combing methods

Head lice can be mechanically removed by combing wet hair meticulously with a plastic detection comb (probably for at least 30 minutes each time) over the whole scalp at 4-day intervals for a minimum of 2 weeks, and continued until no lice are found on 3 consecutive sessions; hair conditioner or vegetable oil can be used to facilitate the process.

Several devices for the removal of head lice such as combs and topical solutions, are available and some are prescribable on the NHS.

The Drug Tariffs can be accessed online at:

- National Health Service Drug Tariff for England and Wales: www.ppa.org.uk/ppa/edt_intro.htm
- Health and Personal Social Services for Northern Ireland Drug Tariff: www.dhsspsni.gov.uk/pas-tariff
- Scottish Drug Tariff: www.isdscotland.org/Health-topics/Prescribing-and-Medicines/Scottish-Drug-Tariff/

Crab lice

Permethrin and malathion are used to eliminate *crab lice* (*Phthirus pubis*); permethrin is not licensed for treatment of crab lice in children under 18 years. An aqueous preparation should be applied, allowed to dry naturally and washed off after 12 hours; a second treatment is needed after 7 days to kill lice emerging from surviving eggs. All surfaces of the body should be treated, including the scalp, neck, and face (paying particular attention to the eyebrows and other facial hair). A different insecticide should be used if a course of treatment fails.

Parasitocidal preparations

Dimeticone coats head lice and interferes with water balance in lice by preventing the excretion of water; it is less active against eggs and treatment should be repeated after 7 days.

Malathion is recommended for *scabies*, *head lice* and *crab lice*. The risk of systemic effects associated with 1–2 applications of malathion p. 682 is considered to be very low; however, except in the treatment of hyperkeratotic scabies in children, applications of malathion liquid repeated at intervals of less than 1 week or application for more than 3 consecutive weeks should be **avoided** since the likelihood of eradication of lice is not increased.

Permethrin p. 683 is effective for *scabies*. It is also active against *head lice* but the formulation and licensed methods of application of the current products make them unsuitable for the treatment of head lice. Permethrin is also effective against *crab lice* but it is not licensed for this purpose in children under 18 years.

2.1 Bacterial skin infections

ANTIBACTERIALS > AMINOGLYCOSIDES

Neomycin sulfate

• INDICATIONS AND DOSE

Bacterial skin infections

► TO THE SKIN

- Child: Apply up to 3 times a day, for short-term use only

- **UNLICENSED USE** *Neomycin Cream BPC*—no information available.

- **CONTRA-INDICATIONS** Neonates

- **CAUTIONS** If large areas of skin are being treated ototoxicity may be a hazard in children, particularly in those with renal impairment.

- **INTERACTIONS** → Appendix 1 (aminoglycosides).

- **SIDE-EFFECTS** Sensitisation (cross sensitivity with other aminoglycosides may occur)

- **RENAL IMPAIRMENT** Ototoxicity may be a hazard if large areas of skin are treated.
- **LESS SUITABLE FOR PRESCRIBING** Neomycin sulfate cream is less suitable for prescribing.

MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: cream

ANTIBACTERIALS > NITROIMIDAZOLE DERIVATIVES

Metronidazole

- **DRUG ACTION** Metronidazole is an antimicrobial drug with high activity against anaerobic bacteria and protozoa.

INDICATIONS AND DOSE

ACEA®

Acute inflammatory exacerbation of rosacea

- TO THE SKIN
- Child 1–17 years: Apply twice daily, to be applied thinly

ANABACT®

Malodorous fungating tumours and malodorous gravitational and decubitus ulcers

- TO THE SKIN
- Child: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

METROGEL®

Acute inflammatory exacerbation of rosacea

- TO THE SKIN
- Child 1–17 years: Apply twice daily, to be applied thinly

Malodorous fungating tumours

- TO THE SKIN
- Child: Apply 1–2 times a day, to be applied to clean wound and covered with non-adherent dressing

METROSA®

Acute exacerbation of rosacea

- TO THE SKIN
- Child 1–17 years: Apply twice daily, to be applied thinly

ROSICED®

Inflammatory papules and pustules of rosacea

- TO THE SKIN
- Child 1–17 years: Apply twice daily for 6 weeks (longer if necessary)

ROZEX® CREAM

Inflammatory papules, pustules and erythema of rosacea

- TO THE SKIN
- Child 1–17 years: Apply twice daily

ROZEX® GEL

Inflammatory papules, pustules and erythema of rosacea

- TO THE SKIN
- Child 1–17 years: Apply twice daily

Adjunct to short-term treatment of infection in pressure sores

- ▶ TO THE SKIN
- ▶ Child: (consult product literature)

- **UNLICENSED USE** No age range specified by manufacturer.

- **CONTRA-INDICATIONS** Not recommended for neonates

- **CAUTIONS** G6PD deficiency

CAUTIONS, FURTHER INFORMATION

- ▶ Large areas Plasma-sulfadiazine concentrations may approach therapeutic levels with *side-effects* and *interactions* as for sulfonamides if large areas of skin are treated.

- **INTERACTIONS** → Appendix 1 (sulfonamides)—if large amounts given.
May inactivate enzymatic debriding agents—concomitant use may be inappropriate.

- **SIDE-EFFECTS** Allergic reactions · argyria (following treatment of large areas of skin or prolonged use) · burning · itching · leucopenia · rashes

SIDE-EFFECTS, FURTHER INFORMATION

- ▶ Severe blood and skin disorders Owing to the association of sulfonamides with severe blood and skin disorders, treatment should be stopped immediately if blood disorders or rashes develop.

Leucopenia developing 2–3 days after starting treatment of burns patients is reported usually to be self-limiting and silver sulfadiazine need not usually be discontinued provided blood counts are monitored carefully to ensure return to normality within a few days.

- **ALLERGY AND CROSS-SENSITIVITY** Contra-indicated in patients with sensitivity to sulfonamides.

- **PREGNANCY** Risk of neonatal haemolysis and methaemoglobinemia in third trimester.

- **BREAST FEEDING** Small risk of kernicterus in jaundiced infants and of haemolysis in G6PD-deficient infants.

- **HEPATIC IMPAIRMENT** Manufacturer advises caution if significant impairment.

- **RENAL IMPAIRMENT** Manufacturer advises caution if significant impairment.

- **MONITORING REQUIREMENTS** Monitor for leucopenia.

- **DIRECTIONS FOR ADMINISTRATION** Apply with sterile applicator.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates, propylene glycol

- ▶ **Flamazine** (Smith & Nephew Healthcare Ltd)

Sulfadiazine silver 10 mg per 1 gram Flamazine 1% cream | 20 gram [PoM] £2.91 | 50 gram [PoM] £3.85 DT price = £3.85 | 250 gram [PoM] £10.32 DT price = £10.32 | 500 gram [PoM] £18.27 DT price = £18.27

ANTIBACTERIALS > OTHER**Bacitracin with polymyxin B****● INDICATIONS AND DOSE****Bacterial skin infections**

- ▶ TO THE SKIN
- ▶ Child: Apply twice daily, can be applied more frequently if required

- **UNLICENSED USE** Licensed for use in children (age range not specified by manufacturer).

- **CAUTIONS** Nephrotoxicity · neurotoxicity

CAUTIONS, FURTHER INFORMATION

If large areas of skin are being treated nephrotoxicity and neurotoxicity may be a hazard, particularly in children with renal impairment.

- **SIDE-EFFECTS** Contact sensitisation

- **RENAL IMPAIRMENT** Renal impairment increases the risk of nephrotoxicity and neurotoxicity.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

- ▶ **Polyfax** (Teva UK Ltd)

Bacitracin zinc 500 unit per 1 gram, Polymyxin B sulfate 10000 unit per 1 gram Polyfax ointment | 4 gram [PoM] £3.26 | 20 gram [PoM] £4.62 DT price = £4.62

Mupirocin**● INDICATIONS AND DOSE****Bacterial skin infections, particularly those caused by Gram-positive organisms (except pseudomonal infection)**

- ▶ TO THE SKIN
- ▶ Child: Apply up to 3 times a day for up to 10 days

- **UNLICENSED USE** Mupirocin ointment is licensed for use in children (age range not specified by manufacturer). *Bactroban*® cream not recommended for use in children under 1 year.

- **SIDE-EFFECTS** Burning sensation · local reactions · pruritus · rash · urticaria

- **PREGNANCY** Manufacturer advises avoid unless potential benefit outweighs risk—no information available.

- **BREAST FEEDING** No information available.

- **RENAL IMPAIRMENT** Manufacturer advises caution when mupirocin ointment used in moderate or severe impairment because it contains macrogols (polyethylene glycol).

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol)

► **Bactroban** (GlaxoSmithKline UK Ltd)

Mupirocin (as Mupirocin calcium) 20 mg per 1 gram Bactroban 2% cream | 15 gram [PoM] £5.26 DT price = £5.26

Ointment

Mupirocin 20 mg per 1 gram Mupirocin 2% ointment | 15 gram [PoM] £9.50 DT price = £4.38

► **Bactroban** (GlaxoSmithKline UK Ltd)

Mupirocin 20 mg per 1 gram Bactroban 2% ointment | 15 gram [PoM] £4.38 DT price = £4.38

Retapamulin

● INDICATIONS AND DOSE

Superficial bacterial skin infection caused by *Staphylococcus aureus* and *Streptococcus pyogenes* (if resistant to first line topical antibacterials)

► TO THE SKIN

► Child 9 months–17 years: Apply twice daily for 5 days, to be applied thinly, maximum area of skin treated 2% of body surface area, review treatment if no response within 2–3 days

● **CONTRA-INDICATIONS** Contact with eyes · contact with mucous membranes

● **SIDE-EFFECTS** Contact dermatitis · localised erythema · localised irritation · localised pain · pruritus

● NATIONAL FUNDING/ACCESS DECISIONS

Scottish Medicines Consortium (SMC) Decisions

The *Scottish Medicines Consortium* has advised (March 2008) that retapamulin (*Altargo*®) is **not** recommended for use within NHS Scotland for the treatment of superficial skin infections.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Ointment

CAUTIONARY AND ADVISORY LABELS 28

EXCIPIENTS: May contain Butylated hydroxytoluene

► **Altargo** (GlaxoSmithKline UK Ltd)

Retapamulin 10 mg per 1 gram Altargo 10mg/g ointment | 5 gram [PoM] £7.89

2.2 Fungal skin infections

ANTIFUNGALS > IMIDAZOLE ANTIFUNGALS

Clotrimazole

● INDICATIONS AND DOSE

Fungal skin infections

► TO THE SKIN

► Child: Apply 2–3 times a day

● **CAUTIONS** Contact with eyes and mucous membranes should be avoided

● **SIDE-EFFECTS** Local irritation · erythema · hypersensitivity reactions · itching · mild burning sensation

SIDE-EFFECTS, FURTHER INFORMATION

Treatment should be discontinued if side-effects are severe.

● **PREGNANCY** Minimal absorption from skin; not known to be harmful.

● **PRESCRIBING AND DISPENSING INFORMATION** Spray may be useful for application of clotrimazole to large or hairy areas of the skin.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug. Forms available from special-order manufacturers include: powder

Liquid

► **Canesten (clotrimazole)** (Bayer Plc)

Clotrimazole 10 mg per 1 ml Canesten 1% solution | 20 ml [P] £2.30 DT price = £2.30

Cream

EXCIPIENTS: May contain Benzyl alcohol, cetostearyl alcohol (including cetyl and stearyl alcohol), polysorbates

► **Clotrimazole (Non-proprietary)**

Clotrimazole 10 mg per 1 gram Clotrimazole 1% cream | 20 gram [P] £2.79 DT price = £1.04 | 50 gram [P] £5.45 DT price = £2.60

► **Canesten (clotrimazole)** (Bayer Plc)

Clotrimazole 10 mg per 1 gram Canesten 1% cream | 20 gram [P] £2.14 DT price = £1.04 | 50 gram [P] £3.50 DT price = £2.60
Canesten Antifungal 1% cream | 20 gram [P] £1.85 DT price = £1.04

Combinations available: **Hydrocortisone with clotrimazole**, p. 697

Econazole nitrate

● INDICATIONS AND DOSE

Fungal skin infections

► TO THE SKIN

► Child: Apply twice daily

Fungal nail infections

► BY TRANSUNGUAL APPLICATION

► Child: Apply once daily, applied under occlusive dressing

● **CAUTIONS** Avoid contact with eyes and mucous membranes

● SIDE-EFFECTS

Burning sensation · erythema · hypersensitivity reactions · itching · occasional local irritation

SIDE-EFFECTS, FURTHER INFORMATION

Treatment should be discontinued if side-effects are severe.

● **PREGNANCY** Minimal absorption from skin; not known to be harmful.

● MEDICINAL FORMS

There can be variation in the licensing of different medicines containing the same drug.

Cream

EXCIPIENTS: May contain Butylated hydroxyanisole, fragrances

► **Pevaryl** (Janssen-Cilag Ltd)

Econazole nitrate 10 mg per 1 gram Pevaryl 1% cream | 30 gram [P] £3.71

Ketoconazole

● INDICATIONS AND DOSE

Treatment of seborrhoeic dermatitis and dandruff

► TO THE SKIN USING SHAMPOO

► Child 12–17 years: Apply twice weekly for 2–4 weeks, leave preparation on for 3–5 minutes before rinsing

Prophylaxis of seborrhoeic dermatitis and dandruff

► TO THE SKIN USING SHAMPOO

► Child 12–17 years: Apply every 1–2 weeks, leave preparation on for 3–5 minutes before rinsing

Treatment of pityriasis versicolor

► TO THE SKIN USING SHAMPOO

- Child 12–17 years: Apply once daily for maximum 5 days, leave preparation on for 3–5 minutes before rinsing

Prophylaxis of pityriasis versicolor

► TO THE SKIN USING SHAMPOO

- Child 12–17 years: Apply once daily for up to 3 days before sun exposure, leave preparation on for 3–5 minutes before rinsing

- **CAUTIONS** Avoid contact with eyes · avoid contact with mucous membranes
 - **INTERACTIONS** → Appendix 1 (antifungals, imidazole).
 - **SIDE-EFFECTS** Erythema · hypersensitivity reactions · itching · mild burning sensation · occasional local irritation
- SIDE-EFFECTS, FURTHER INFORMATION**
Treatment should be discontinued if side-effects are severe.
- **NATIONAL FUNDING/ACCESS DECISIONS**
NHS restrictions Ketoconazole cream is not prescribable on the NHS except for seborrhoeic dermatitis and pityriasis versicolor and endorsed 'SLS'
 - **EXCEPTIONS TO LEGAL CATEGORY** Can be sold to the public for the prevention and treatment of dandruff and seborrhoeic dermatitis of the scalp as a shampoo formulation containing ketoconazole maximum 2%, in a pack containing maximum 120 mL and labelled to show a maximum frequency of application of once every 3 days.

● **MEDICINAL FORMS**

There can be variation in the licensing of different medicines containing the same drug.

Shampoo

EXCIPIENTS: May contain Imidurea

► **Ketoconazole (Non-proprietary)**

Ketoconazole 20 mg per 1 gram Ketoconazole 2% shampoo | 120 mL [PoM] £3.00 DT price = £2.71

Terbinafine

● **INDICATIONS AND DOSE****Tinea pedis**

► TO THE SKIN USING CREAM

- Child: Apply 1–2 times a day for up to 1 week, to be applied thinly

► BY MOUTH USING TABLETS

- Child 1–17 years (body-weight 10–19 kg): 62.5 mg once daily for 2–6 weeks
- Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 2–6 weeks
- Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 2–6 weeks

Tinea corporis

► TO THE SKIN USING CREAM

- Child: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks

► BY MOUTH USING TABLETS

- Child 1–17 years (body-weight 10–19 kg): 62.5 mg once daily for 4 weeks
- Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 4 weeks
- Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 4 weeks

Tinea cruris

► TO THE SKIN USING CREAM

- Child: Apply 1–2 times a day for up to 1–2 weeks, to be applied thinly, review treatment after 2 weeks

► BY MOUTH USING TABLETS

- Child 1–17 years (body-weight 10–19 kg): 62.5 mg once daily for 2–4 weeks
- Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 2–4 weeks
- Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 2–4 weeks

Tinea capitis

► BY MOUTH USING TABLETS

- Child 1–17 years (body-weight 10–19 kg): 62.5 mg once daily for 4 weeks
- Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 4 weeks
- Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 4 weeks

Dermatophyte infections of the nails

► BY MOUTH USING TABLETS

- Child 1–17 years (body-weight 10–19 kg): 62.5 mg once daily for 6 weeks–3 months (occasionally longer in toenail infections)
- Child 1–17 years (body-weight 20–39 kg): 125 mg once daily for 6 weeks–3 months (occasionally longer in toenail infections)
- Child 1–17 years (body-weight 40 kg and above): 250 mg once daily for 6 weeks–3 months (occasionally longer in toenail infections)

Cutaneous candidiasis | Pityriasis versicolor

► TO THE SKIN USING CREAM

- Child: Apply 1–2 times a day for 2 weeks, to be applied thinly, review treatment after 2 weeks

- **UNLICENSED USE** Not licensed for use in children.

● **CAUTIONS**

- With oral use Autoimmune disease (risk of lupus-erythematosus-like effect) · psoriasis (risk of exacerbation)
- With topical use Contact with eyes and mucous membranes should be avoided

● **INTERACTIONS**

- With oral use Appendix 1 (terbinafine).

● **SIDE-EFFECTS**► **Common or very common**

- With oral use Abdominal discomfort · anorexia · arthralgia · diarrhoea · dyspepsia · headache · myalgia · nausea · rash · urticaria

► **Uncommon**

- With oral use Taste disturbance

► **Rare**

- With oral use Cholestasis · dizziness · hepatitis · hypoaesthesia · jaundice · liver toxicity · malaise · paraesthesia

► **Very rare**

- With oral use Alopecia · blood disorders · lupus erythematosus-like effect · neutropenia · photosensitivity · serious skin reactions · Stevens-Johnson syndrome · thrombocytopenia · toxic epidermal necrolysis

► **Frequency not known**

- With oral use Disturbances in smell · exacerbation of psoriasis · hearing disturbances · influenza-like symptoms · pancreatitis · rhabdomyolysis · vasculitis

- With topical use Erythema · hypersensitivity reactions · itching · mild burning sensation · occasional local irritation

SIDE-EFFECTS, FURTHER INFORMATION

- Liver toxicity
- With oral use Discontinue treatment if liver toxicity develops (including jaundice, cholestasis and hepatitis).
- Serious skin reactions
- With oral use Discontinue treatment in progressive skin rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis).
- Topical application
- With topical use Treatment should be discontinued if side effects are severe.

● PREGNANCY

- With topical use Manufacturer advises use only if potential benefit outweighs risk—*animal* studies suggest no adverse effects.
- With oral use Manufacturer advises use only if potential benefit outweighs risk—no information available.

● BREAST FEEDING

- With topical use Manufacturer advises avoid—present in milk. Less than 5% of the dose is absorbed after topical application of terbinafine; avoid application to mother's chest.
- With oral use Avoid—present in milk.

● HEPATIC IMPAIRMENT

- With oral use Manufacturer advises avoid—elimination reduced.

● RENAL IMPAIRMENT
